SS_Registration	Monitors registration failures and attempts on the Signaling Server.
SS_SIPStats	Monitors Signaling Server SIP trunk statistics: incoming voice and fax calls, and outgoing voice and fax calls. **NOTE:** This script supports CS1000 versions 4.0 and later.
VGMC_CallQuality	Monitors channel statistics of the VGMC, Media Gateway Controller, and MC32S: audio setups, voice time, average and maximum jitter, maximum average latency, and lost packets.

52.1 Alarms

Use this Knowledge Script to monitor CS1000 alarms. Call Servers, Signaling Servers, Media Gateways, MGCs, ECMs, NRSs, VGMCs and SIPL send alarms to the proxy agent computer using SNMP traps.

When setting parameters for this script, you will be asked to provide a list of alarm identifiers (system messages) to include or exclude from monitoring. System messages are discussed in the CS1000 *Software Input/Output System Message* publication (Avaya publication number 553-3001-411). Their format consists of a multi-letter code followed by a multi-digit alarm number, such as AUD000 or SRPT194.

Running this Knowledge Script job consumes approximately 20 MB of memory, per instance, on the proxy agent computer.

This script can launch an Action Knowledge Script that triggers NetIQ Vivinet Diagnostics to diagnose the problem when QoS alarms are raised. For more information, see the Help for the Action_DiagnoseNortelIPT Knowledge Script.

52.1.1 Prerequisites

- Install the Windows SNMP service. If you installed the service *before* you installed the AppManager for CS1000 module, then you do not need to do anything else. If you installed the service *after* you installed the module, then stop and restart the proxy agent computer before using this script.
- Configure CS1000 devices to send SNMP traps to the proxy agent computer. For more information, see "Identifying the SNMP Trap Receiver" on page 3188.
- The AppManager for Avaya CS1000 module is incompatible with the Avaya Telephony Manager application, which competes with the module for UDP port 162. AppManager will not receive SNMP traps if Telephony Manager is installed.
- The AppManager for Avaya CS1000 module is incompatible with NetIQ SNMP Trap Receiver (Trap Receiver), which competes with the module for UDP port 162. AppManager will not receive SNMP traps if Trap Receiver is installed.

52.1.2 Resource Objects

NortelCS Call Server

NortelCS Signaling Server

NortelCS VGMC

NortelCS Media Gateway Controller

NortelCS MC32S

NortelCS Network Routing Server

NortelCS Enterprise Common Manager

NortelCS SIP Line

NOTE: In most circumstances, the Alarms Knowledge Script raises events for alarms (traps) received from the CS1000 component on which you run the job. The component ID property of each trap identifies the source of the trap. For example, a component ID of "CS" identifies the Call Server. The component ID also determines which resource object an event is raised against.

For environments in which a co-resident server hosts multiple applications, the component ID may not correctly identify the source of a trap. When the component ID incorrectly identifies the source of a trap, events are raised against the incorrect resource object.

For example, if a co-resident server hosts the Call Server, the Signaling Server, and the Network Routing Server (NRS), the component ID may indicate a trap was received from the NRS. In addition, the event will be raised against the NRS object. However, experience may tell you that the trap actually came from the Signaling Server.

To ensure events are raised for all traps received from all components on a co-resident server, run the Alarms Knowledge Script on the co-resident server parent object so that all component child objects are monitored. If you run the Alarms job on only the Signaling Server, for example, AppManager will not raise an event for the Signaling Server trap that is incorrectly identified as an NRS trap.

52.1.3 Default Schedule

By default, this script runs on an asynchronous schedule.

52.1.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Notes for the "critical to monitor" and QoS alarm categories: • If you "Include" selected alarm identifiers in a category, AppManager raises events for those alarm identifiers plus the identifiers that are, by default, included in the category. • If you "Include only" selected alarm identifiers in a category, AppManager raises events *only* for those identifiers. *AppManager will not raise events for the other identifiers included in the category*. • If you "Exclude" selected alarm identifiers from a category, AppManager raises events for all alarm identifiers included in the category *except* those you specifically excluded. • If you accept the default settings in the *Alarm identifiers* parameters, "Exclude" and blank, AppManager raises events for all identifiers in the category, because you excluded nothing from the category.	
Monitor "critical to monitor" alarms?	Select **Yes** to monitor alarms in the "critical to monitor" category. The default is Yes.
Include or exclude alarms?	Select whether you want to **Include**, **Include only**, or **Exclude** the alarm identifiers you specify in the following parameter. • Select **Include** to *add* the listed identifiers to the "critical to monitor" category. • Select **Include only** to include *only* the listed identifiers in the "critical to monitor" category. • Select **Exclude** to exclude the listed identifiers from the "critical to monitor" category. This is the default option. By default, the "critical to monitor" category includes all alarms designated as "critical to monitor" in the CS1000 *Software Input/Output System Messages* publication (Avaya publication number 553-3001-411).

Parameter	How to Set It
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the “critical to monitor” category. The default is an empty list.
Monitor QoS alarms?	Select **Yes** to monitor the proxy agent computer for alarms in the QoS category. The default is Yes.
Include or exclude alarms?	Select whether you want to **Include**, **Include only**, or **Exclude** the alarm identifiers you specify in the *Alarm identifiers* parameter. • Select **Include** to *add* the listed identifiers to the QoS category. • Select **Include only** to include *only* the listed identifiers in the QoS category. • Select **Exclude** to exclude the listed identifiers from the QoS category. This is the default option. By default, the QoS category includes the following alarms for CS1000 versions 4.0 and later: ITG1028, ITG2028, ITG3028, ITG4028, ITG4043, ITG4044, QOS0012, QOS0013, QOS0014, QOS0015, QOS0017, QOS0018, QOS0019, QOS0020, QOS0022, QOS0024, QOS0026, QOS0028, QOS0030, QOS0032, QOS0034, QOS0036, QOS0038, QOS0039, QOS0040, QOS0041, QOS0042, QOS0043
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the “QoS” category. The default is an empty list.
Phone filter	
Include or exclude phones?	You can use IP addresses to further filter the results of the QoS alarm monitoring. Select whether you want to **Include only** or **Exclude** the IP addresses you specify in *Phone IP addresses* or *Phone IP address ranges*. AppManager will monitor — or exclude — QoS alarms related to the calling and called phones that belong to the IP addresses. • Select **Include only** to monitor QoS alarms *only* the listed phone IP addresses. • Select **Exclude** to exclude listed phone IP addresses from QoS alarm monitoring. This is the default option
Phone IP addresses	Provide a comma-separated list of the IP addresses of the phones you want to monitor for QoS alarms. For example: `10.14.2.21,10.14.3.100,10.14.1.50`
Phone IP address ranges	Type a comma-separated list of IP address ranges for the phones you want to monitor for QoS alarms. For example: `10.14.2.21-10.14.3.100,10.14.1.10-10.14.1.50`
Launch Diagnostics when the following alarm is received ...	
Warning packet loss QOS0022?	Select **Yes** to launch Vivinet Diagnostics to diagnose the problem when the QOS0022 alarm is raised. The default is unselected.
Warning latency QOS0024?	Select **Yes** to launch Vivinet Diagnostics to diagnose the problem when the QOS0024 alarm is raised. The default is unselected.
Warning jitter QOS0026?	Select **Yes** to launch Vivinet Diagnostics to diagnose the problem when the QOS0026 alarm is raised. The default is unselected.
Warning R-factor QOS0028?	Select **Yes** to launch Vivinet Diagnostics to diagnose the problem when the QOS0028 alarm is raised. The default is Yes.
Unacceptable packet loss QOS0030?	Select **Yes** to launch Vivinet Diagnostics to diagnose the problem when the QOS0030 alarm is raised. The default is unselected.

Parameter	How to Set It
Unacceptable latency QOS0032?	Select **Yes** to launch Vivinet Diagnostics to diagnose the problem when the QOS0032 alarm is raised. The default is unselected.
Unacceptable jitter QOS0034?	Select **Yes** to launch Vivinet Diagnostics to diagnose the problem when the QOS0034 alarm is raised. The default is unselected.
Note for the following alarm categories: AppManager raises an event **only** for those alarm identifiers you specifically include, or it raises an event for all alarm identifiers **except** those you specifically exclude. If you accept the default of an empty list in the *Alarm identifiers* parameters, AppManager raises events for **all** alarm identifiers.	
Monitor critical alarms?	Select **Yes** to monitor alarms in the critical category. The default is unselected.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. • Select **Include only** to include *only* the listed identifiers in the critical category. • Select **Exclude** to exclude the listed identifiers from the critical category. This is the default value. By default, the critical category includes all alarms with critical severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the critical category. The default is an empty list.
Monitor major alarms?	Select **Yes** to monitor alarms in the major category. The default is unselected.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. • Select **Include only** to include *only* the listed identifiers in the major category. • Select **Exclude** to exclude the listed identifiers from the major category. This is the default option. By default, the major category includes all alarms with major severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the major category. The default is an empty list.
Monitor minor alarms?	Select **Yes** to monitor alarms in the minor category. The default is unselected.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. • Select **Include only** to include *only* the listed identifiers in the minor category. • Select **Exclude** to exclude the listed identifiers from the minor category. This is the default option. By default, the minor category includes all alarms with minor severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the minor category. The default is an empty list.
Monitor warning alarms?	Select **Yes** to monitor alarms in the warning category. The default is unselected.

Parameter	How to Set It
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. • Select **Include only** to include *only* the listed identifiers in the warning category. • Select **Exclude** to exclude the listed identifiers from the warning category. This is the default option. By default, the warning category includes all alarms with warning severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the warning category. The default is an empty list.
Monitor info alarms?	Select **Yes** to monitor alarms in the informational category. The default is unselected.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. • Select **Include only** to include *only* the listed identifiers in the informational category. • Select **Exclude** to exclude the listed identifiers from the informational category. This is the default option. By default, the informational category includes all alarms with informational severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the informational category. The default is an empty list.
Monitor cleared alarms?	Select **Yes** to monitor alarms in the cleared category. The default is unselected.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. • Select **Include only** to include *only* the listed identifiers in the cleared category. • Select **Exclude** to exclude the listed identifiers from the cleared category. This is the default option. By default, the cleared category includes all alarms with cleared severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the cleared category. The default is an empty list.
Monitor indeterminate alarms?	Select **Yes** to monitor alarms in the indeterminate category. The default is unselected.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. • Select **Include only** to include *only* the listed identifiers in the indeterminate category. • Select **Exclude** to exclude the listed identifiers from the indeterminate category. By default, the indeterminate category includes all alarms with indeterminate severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the indeterminate category. The default is an empty list.
Event Severities	

Parameter	How to Set It
Severity - Critical alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a critical alarm is detected. The default is 10.
Severity - Major alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a major alarm is detected. The default is 15.
Severity - Minor alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a minor alarm is detected. The default is 20.
Severity - Warning alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a warning alarm is detected. The default is 25.
Severity - Info alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which an informational alarm is detected. The default is 30.
Severity - Cleared alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a cleared alarm is detected. The default is 30.
Severity - Indeterminate alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which an indeterminate alarm is detected. The default is 30.

52.1.5 Understanding an Alarms Event Message

The message on the Message tab of an event raised by the Alarms script provides not only a brief description of the event, but also recommends any corrective action you can take. AppManager retrieves the recommended actions from a database provided by Avaya.

In the following example, the Alarms script raised an event for the ITS2008 alarm on a Signaling Server:

```
NTP index: ITS2008
Nortel CS device:SIG_SERV
Alarm: Terminal connection status: 10.40.101.112 lost
```

The Message tab for this event provided the following "Help" and "Recommended Action" for the alarm:

```
Help for ITS2008:
Terminal connection status: <terminalIP><ok/lost>.

Recommended action for ITS2008:
1. Alarm may indicate random occurrence that is not service impacting; note
occurrence time and date for further follow-up. If any service-impacting problems
occur at the same time, further analysis is required immediately.
2. If alarm persists, log into device and capture maintenance report log (if possible) and send
the text to Nortel support staff via email. Follow any steps described above for
the specific alarm.
```

Occasionally, more than one Help is available for an alarm. In this case, all Helps are shown first:

```
NTP index: XMI0002
Extra diagnostic information: 18 MGATE
Help for XMI0002 XFIL 1:
Main fiber interface (MFI) local is operational.

Help for XMI0002 XFIR 2:
Expansion fiber interface (EFI) remote is operational in first expansion cabinet.

Help for XMI0002 XFIR 3:
Expansion fiber interface (EFI) remote is operational in second expansion cabinet.

Help for XMI0002 I s c:
Card polling re-established.
```

Any Recommended Actions will follow the Helps. It is possible, though, for no Recommended Actions to be available.

The Event tab in an Alarms event message provides a one-line *Message* that briefly describes the problem detailed on the Message tab. For CS1000 version 5.x and 6.0 alarms, the message can look something like this example:

```
Critical alarm IOD0040: Raleigh CS1K:RTP:CS [10.42.1.11]
```

The format of this message is defined as follows:

```
<severity>alarm<index>: <navigation system name>:<navigation site
name>:<component> [<component IP address>]
```

The navigation system name and navigation site name are taken from the SNMP Configuration information you set in Element Manager.

52.1.6 Identifying the SNMP Trap Receiver

Configure CS1000 to send SNMP traps to the CS1000 proxy agent computer. The configuration procedures are different for CS1000 versions 4.0 and later.

- "Configuring the Trap Receiver in Version 6.0 and Later" on page 3188
- "Configuring the Trap Receiver in Version 5.x" on page 3188
- "Configuring the Trap Receiver in Version 4.50" on page 3189
- "Configuring the Trap Receiver in Version 4.0" on page 3189

52.1.6.1 Configuring the Trap Receiver in Version 6.0 and Later

Use Unified Communications Manager or Element Manager to configure the trap receiver. To use Element Manager to configure the trap receiver, see "Configuring the Trap Receiver in Version 5.x" on page 3188.

To configure the trap receiver using Unified Communications Manager:

1. Navigate to **Network**, click **CS1000 Services**, and then click **SNMP Profiles**.
2. Click **SNMP Profile**.
3. Select the SNMP profile you want to use. Or, to create a new profile, click **Add** and specify a new name for an **Alarm** type of profile.
4. In the **Trap Destination IP address** field, provide the IP address of the proxy agent computer to which the Avaya devices should sent SNMP traps.
5. Click **Save**.
6. Click **SNMP Distribution**, and then select all Avaya devices that should send SNMP traps to the proxy agent computer.
7. Click **Assign**.
8. In the **Alarm Profile** field, select the SNMP profile name from .

52.1.6.2 Configuring the Trap Receiver in Version 5.x

Use Element Manager to configure the trap receiver.

To configure the trap receiver:

1. Navigate to **System**, click **Alarms**, and then click **SNMP**.
2. In the **Trap Destination IP address** field, provide the IP address of the proxy agent computer to which you want to send Call Server traps.

52.1.6.3 Configuring the Trap Receiver in Version 4.50

Use Element Manager to configure the trap receiver.

To configure the trap receiver:

1. Navigate to **System** and click **SNMP**.
    - In the **SNMP trap destination address** field, type the IP address of the proxy agent computer to which you want to send Call Server traps.
2. Navigate to **IP Telephony > Nodes > Configuration**.
    - Select the node ID for which you want to enable SNMP traps.
    - Click **Edit** and then select **SNMP** on the Edit page.
    - Click **Add** to create a new **IP address** field, and then enter the IP address of the proxy agent computer to which you want to send SNMP traps. Repeat for each IP address you want to add.
    - Select **Enable SNMP traps**.
    - Click **Save and Transfer**.
3. Repeat the items in for each additional node ID you want to configure.

52.1.6.4 Configuring the Trap Receiver in Version 4.0

Use Element Manager to configure the trap receiver.

To configure the trap receiver:

1. Navigate to **Configuration**, click **IP Telephony**, and then click **SNMP Configuration**.
    - In the **SNMP trap destination address** field, type the IP address of the proxy agent computer to which you want to send Call Server traps.
2. Navigate to **Configuration**, click **IP Telephony**, and then click **Node Summary**.
    - Select the node ID for which you want to enable SNMP traps.
    - Click **Edit** and then click **SNMP**.
    - Click **Add** to create new **IP address** and **Subnet mask** fields, and then type the IP address and subnet mask of the proxy agent computer to which you want to send SNMP traps. Repeat for each IP address and subnet mask you want to add.
    - Select **Enable SNMP traps**.
    - Click **Save and Transfer**.
3. Repeat the items in for each additional node ID you want to configure.

52.2 BMZ_CallQuality

Run this Knowledge Script to monitor blocked calls, peak bandwidth, and call quality metrics for Bandwidth Management Zones (BMZs) for intrazone and interzone traffic. AppManager retrieves call quality statistics from the Zone Traffic MIB on the Signaling Server. For CS1000 version 6.0 and later, AppManager retrieves statistics from the Zone Traffic MIB on the Call Server.

You can use BMZs to prioritize or restrict the amount of bandwidth that can be consumed by voice traffic.

This script raises an event if zone statistics are unavailable, if the percentage of calls blocked and the percentage of peak bandwidth exceed the thresholds you set, and if call quality metrics exceed the thresholds you set in Element Manager more than *n* times in one hour. In addition, this script generates data streams for the call quality metrics you choose to monitor.

AppManager supports BMZ monitoring for CS1000 versions 4.50 and later.

52.2.1 Prerequisites

- For Signaling Server version 4.50, install Avaya patch `MPLR21714`. The patch requires configuration of the Call Server. Obtain the patch and its Readme from your Avaya support and maintenance provider.
- Configure BMZ QoS threshold levels in CS1000 Element Manager. For more information, see "Setting Bandwidth Management Zone Thresholds" on page 3194.
- For CS1000 versions 4.50 and 5.x, create user account **snmpqosq**. For more information, see "Enabling Access to the Signaling Server QoS MIB for CS1000 version 5.x" on page 3194.
- For CS1000 versions 4.50 and 5.x, ensure no user or application is logged into the Call Server when the Signaling Server attempts to retrieve zone statistics from the Call Server. The Signaling Server uses a special login to issue Overlay commands that allow it to retrieve zone statistics. The Signaling Server cannot retrieve statistics from a Call Server that is in use at the time of retrieval.

52.2.2 Understanding BMZ Call Data

The BMZ_CallQuality script monitors QoS and other IP statistics.

The Terminal Proxy Server in the Signaling Server extracts QoS statistics from the IP phones in an active call by periodically polling the phones during the length of the call. A Quality Detail Record (QDR) is created at the end of a call. A QDR is created for each segment of a call that is modified, perhaps by being transferred, conferenced, put on hold, or muted.

The QDR summarizes the overall **call quality** as good, warning, or unacceptable. Once created, the QDR is forwarded to the Call Server to be aggregated into interzone and intrazone statistics.

In addition to a summary of overall call quality, the QDR also contains QoS statistics that are collected for the duration of the call with respect to the incoming media stream: **latency**, **jitter**, **packet loss, and Listening R-factor**.

Peak bandwidth is the highest bandwidth reported in a call. Peak bandwidth and **average bandwidth** are expressed as percentages of the bandwidths configured for the zone.

The QDR contains QoS statistics *only* for Phase 2 phones.

The QDR categorizes each QoS statistic as good, warning, or unacceptable. The thresholds for these categories are user-configurable. The BMZ_CallQuality script raises events if a QoS statistic exceeds or falls below a threshold you set.

52.2.3 Resource Objects

Bandwidth Management Zone objects

For CS1000 versions 4.50 and 5.x, BMZ objects are children of the Signaling Server object. Run this script on only one Signaling Server per Call Server. All zones for your CS1000 deployment are displayed under every Signaling Server object. Limit your monitoring to one Signaling Server per Call Server to prevent this script from gathering duplicate data and generating duplicate data streams.

For CS1000 version 6.0 and later, BMZ objects are children of the Call Server.

You can run this script on a top-level object, and then use the Objects tab to select the specific BMZ objects you want to monitor.

52.2.4 Default Schedule

By default, this script runs at ten minutes past the hour. Do not change this schedule. The Zone Traffic MIB is updated on the hour. By retrieving call quality metrics at ten minutes past the hour, you receive most recent data. Because the MIB is updated only once each hour, you do not need to run this script more than once an hour.

52.2.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if zone statistics are inaccessible?	Select **Yes** to raise an event if BMZ statistics are inaccessible. The default is Yes. BMZ statistics are inaccessible if the Zone Traffic MIB from which they are retrieved does not respond to SNMP queries before the end of the interval specified in the *Timeout* parameter.
Timeout	Specify the length of time AppManager should attempt to access the Zone Traffic MIB before raising an event indicating zone statistics are inaccessible. The default is 300 seconds, which is equal to 300 attempts. **NOTE:** For CS1000 versions 4.50 and 5.x, AppManager cannot access the MIB if a user or application is logged into the Call Server, and will retry the attempt once each second during the timeout interval.
Event severity when zone statistics are inaccessible	Set the severity level, from 1 to 40, to indicate the importance of an event in which BMZ statistics cannot be retrieved. The default is 15.
Select traffic type	Select the type of call traffic you want to monitor: • **Interzone**: calls made between zones • **Intrazone**: calls made within a zone • **Interzone and intrazone**: calls made between and within zones. This is the default selection.
Interzone	
Event Notification	

Parameter	How to Set It
Raise event if % of calls blocked exceeds threshold?	Select **Yes** to raise an event if the percentage of blocked interzone calls exceeds the threshold you set. The default is Yes. AppManager calculates the percentage of calls blocked as: $\frac{callsBlocked}{callsMade+callsBlocked}$
Event severity when % of calls blocked exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of blocked interzone calls exceeds the threshold you set. The default is 15.
Raise event if peak bandwidth exceeds threshold?	Select **Yes** to raise an event if the percentage of interzone peak bandwidth exceeds the threshold you set. The default is Yes.
Event severity when peak bandwidth exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of interzone peak bandwidth exceeds the threshold you set. The default is 15.
Raise event if call quality exceeds threshold?	Select **Yes** to raise an event if interzone call quality exceeds one or more of the thresholds you set in the Call Quality parameters. The default is Yes.
Event severity when call quality exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which interzone call quality exceeds one or more of the thresholds you set in the Call Quality parameters. The default is 15.
Monitoring	
Threshold - Maximum % of calls blocked	Specify the highest percentage of calls that can be blocked in one hour in interzone traffic before an event is raised. The default is 15%.
Threshold - Maximum peak bandwidth	Specify the highest percentage of peak bandwidth utilization that can occur in one hour in interzone traffic before an event is raised. The default is 90%.
Call Quality	
Threshold - Maximum occurrences of listen R-factor warnings	Specify the maximum number of times in one hour the listen R-factor value can fall below the warning threshold in interzone traffic before an event is raised. The default is 0. You set the R-factor threshold in Element Manager.
Threshold - Maximum occurrences of unacceptable lost packets	Specify the maximum number of times in one hour the unacceptable lost packets threshold can be exceeded in interzone traffic before an event is raised. The default is 0. You set the lost packets threshold in Element Manager.
Threshold - Maximum occurrences of unacceptable jitter	Specify the maximum number of times in one hour the unacceptable jitter threshold can be exceeded in interzone traffic before an event is raised. The default is 0. You set the jitter threshold in Element Manager. Jitter is the mean deviation of the difference in RTP data packet spacing at the receiver compared to the sender for a pair of packets.

Parameter	How to Set It
Threshold - Maximum occurrences of unacceptable latency	Specify the maximum number of times in one hour the unacceptable latency threshold can be exceeded in interzone traffic before an event is raised. The default is 0. You set the latency threshold in Element Manager. Latency is the average value of the difference between the time stamp indicated by the senders of messages and the timestamp of the receivers, measured when the messages are received. The average is obtained by adding all of the estimates, then dividing by the number of received messages.
Intrazone	
Event Notification	
Raise event if % of calls blocked exceeds threshold?	Select **Yes** to raise an event if the percentage of intrazone calls blocked exceeds the threshold you set. The default is Yes. AppManager calculates the percentage of calls blocked as: $\frac{callsBlocked}{callsMade+callsBlocked}$
Event severity when % of calls blocked exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of intrazone calls blocked exceeds the threshold you set. The default is 15.
Raise event if peak bandwidth exceeds threshold?	Select **Yes** to raise an event if the percentage of intrazone peak bandwidth exceeds the threshold you set. The default is Yes.
Event severity when peak bandwidth exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of intrazone peak bandwidth exceeds the threshold you set. The default is 15.
Raise event if call quality exceeds threshold?	Select **Yes** to raise an event if intrazone call quality exceeds one or more of the thresholds you set in the Call Quality parameters. The default is Yes.
Event severity when call quality exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which intrazone call quality exceeds one or more of the thresholds you set in the Call Quality parameters. The default is 15.
Monitoring	
Threshold - Maximum % of calls blocked	Specify the highest percentage of calls that can be blocked in one hour in intrazone traffic before an event is raised. The default is 15%.
Threshold - Maximum peak bandwidth	Specify the highest percentage of peak bandwidth utilization that can occur in one hour in intrazone traffic before an event is raised. The default is 90%.
Call Quality	
Threshold - Maximum occurrences of listen R-factor warnings	Specify the maximum number of times in one hour the listen R-factor value can fall below the warning threshold in intrazone traffic before an event is raised. The default is 0. You set the R-factor threshold in Element Manager.
Threshold - Maximum occurrences of unacceptable lost packets	Specify the maximum number of times in one hour the unacceptable lost packets threshold can be exceeded in intrazone traffic before an event is raised. The default is 0. You set the lost packets threshold in Element Manager.

Parameter	How to Set It
Threshold - Maximum occurrences of unacceptable jitter	Specify the maximum number of times in one hour the unacceptable jitter threshold can be exceeded in intrazone traffic before an event is raised. The default is 0. You set the jitter threshold in Element Manager. Jitter is the mean deviation of the difference in RTP data packet spacing at the receiver compared to the sender for a pair of packets.
Threshold - Maximum occurrences of unacceptable latency	Specify the maximum number of times in one hour the unacceptable latency threshold can be exceeded in intrazone traffic before an event is raised. The default is 0. You set the latency threshold in Element Manager. Latency is the average value of the difference between the time stamp indicated by the senders of messages and the timestamp of the receivers, measured when the messages are received. The average is obtained by adding all of the estimates, then dividing by the number of received messages.
Collect data?	Select **Yes** to collect data for reports and graphs. The default is unselected. This script generates the following data streams, depending on the type of traffic you choose to monitor: • Total number of sampling intervals • Total intrazone/interzone calls • Total intrazone/interzone calls blocked • Average bandwidth percentage of intrazone/interzone traffic • Peak bandwidth percentage of intrazone/interzone traffic • Number of instances of unacceptable latency in intrazone/interzone traffic • Number of instances of unacceptable packet loss in intrazone/interzone traffic • Number of instances of unacceptable jitter in intrazone/interzone traffic • Number of instances of listen R-factor warnings in intrazone/interzone traffic

52.2.6 Setting Bandwidth Management Zone Thresholds

Before gathering Bandwidth Management Zone (BMZ) call quality metrics with the BMZ_CallQuality script, configure QoS zone basis threshold levels in CS1000 Element Manager.

To configure BMZ QoS thresholds:

1. Navigate to **Configuration**, click **IP Telephony**, and then click **Quality Of Service Thresholds**.

   or

   In version 5.x, navigate to **System**, click **IP Network**, and then click **QoS Thresholds**.
2. Set the **Warning** and **Unacceptable** thresholds appropriate for your environment. Call quality metrics that fall outside of the thresholds more than *n* times in an hour will be identified by the BMZ_CallQuality script.
3. Click **Submit**.
4. Use Element Manager or Overlay 43 to perform a Call Server data dump.

52.2.7 Enabling Access to the Signaling Server QoS MIB for CS1000 version 5.x

Enable SNMP access to the QoS MIB (`QoS-MIB.mib`) on the Signaling Server. A dedicated Limited Access Password (LAPW) user account named `snmpqosq` provides this access. Create the user account in Overlay 117.

The QoS MIB is also known as the zone traffic report MIB.

For more information about creating the user account, see the "MIBs" chapter of the document titled *Communication Server 1000 Fault Management — SNMP* (document NN43001-719, version 01.03).

52.3 CallCapacity

Use this Knowledge Script to retrieve the calculated call capacity utilization (CCU) value from the Host Resource MIB on a Call Server. This script raises an event if CCU exceeds the threshold you set. In addition, this script generates a data stream for CCU.

Rated call capacity (RCC) is a function of idle time and the number of call attempts in an hour for a Call Server. It represents the maximum level at which a Call Server's CPU can operate and still maintain a high grade of service. RCC assumes the highest call traffic peak during a busy hour is 30% higher than the average traffic level. CCU is an indicator of the call traffic load on the Call Server and is calculated as follows:

$$CCU = 100[\frac{CallAttempts}{RCC}]$$

The CallCapacity script retrieves the result of this calculation from the Host Resource MIB.

52.3.1 Prerequisites

- CS1000 Call Server, version 4.50 or 5.0. The CallCapacity script **does not support** other versions of the Call Server. Avaya removed the call capacity metric beginning with version 5.5 of the Call Server.
- AppManager for Network Device, build 6.2.24.0, at minimum

52.3.2 Resource Object

NortelCS Call Server

52.3.3 Default Schedule

By default, this script runs every five minutes.

52.3.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if call capacity utilization exceeds threshold?	Select **Yes** to raise an event if call capacity utilization exceeds the threshold you set. The default is Yes.
Event severity when call capacity utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which call capacity utilization exceeds the threshold. The default is 10.
Monitoring	
Threshold - Maximum call capacity utilization	Specify the highest percentage of call capacity utilization that must be reached before an event is raised. The default is 80%.

Parameter	How to Set It
Collect data?	Select **Yes** to collect data for charts, reports, and graphs. When enabled, data collection returns the percentage of call capacity utilization for the Call Server. The default is unselected. **NOTE:** The CCU value is not available from the Call Server until 24 hours after a system restart. During that 24-hour window, only negative values are returned until the correct value is available. Therefore, the data stream for the CallCapacity script will be “0” until the correct CCU value has been calculated.

52.4 GetOMReport

Use this Knowledge Script to retrieve the latest Operational Measurement (OM) report from the Signaling Server, the VGMC, the MGC, and the MC32S. This script also retrieves the previous OM Report, if one is available.

Run GetOMReport on the Signaling Server resource object before running the following scripts:

- SS_CallQuality
- SS_H323Stats
- SS_Registration
- SS_SIPStats

Run GetOMReport on the VGMC, MGC, and MC32S resource objects before running the VGMC_CallQuality Knowledge Script.

52.4.1 Prerequisites

- The GetOMReport Knowledge Script automatically uses FTP to retrieve the OM Report from the Signaling Server, the VGMC, the MGC, and MC32S. Configure special FTP requirements in AppManager Security Manager. For more information, see "Configuring FTP Server Parameters" on page 3199.
- The script hangs in Running state unless you configured all required SNMP community strings, PDT passwords, and SL1 Level 1 logins and passwords, and ensured you cannot ping the TLAN interface of the CS1000 device.

52.4.2 Resource Objects

NortelCS Signaling Server

NortelCS VGMC

NortelCS Media Gateway Controller

NortelCS MC32S

52.4.3 Default Schedule

By default, this script runs once every hour, at five minutes past the hour. Do not change the default. Devices collect data for the OM Report at the top of each hour. You receive the most recent data if you retrieve the OM Report at five minutes past the hour.

By default, the call quality-related NortelCS Knowledge Scripts run once every hour, at ten minutes past the hour. Under most circumstances, you do not need to change the default schedule. Devices collect data for the Operational Measurement (OM) report at the top of each hour. The GetOMReport Knowledge Script retrieves the OM Report at five minutes past the hour. And you have to run GetOMReport before you can run the CallQuality scripts.

You probably run multiple instances of each script in order to collect the data you need. Running several virtually identical jobs at the same time could put a heavy strain on CPU usage.

If you want to run multiple instances of any NortelCS script, you should offset the schedules just a bit, one or two minutes, so you are not running all of the jobs at the same time.

Keep in mind the following:

- OM Reports are retrieved by the GetOMReport Knowledge Script
- OM Reports are collected hourly, at five minutes past the hour (by default)
- OM Reports are requested from Signaling Servers, VGMCs, MC32Ss, and MGCs by using SNMP, but are transferred by using FTP
- OM Reports generally grow to as large as 200K
- Multiple FTP sessions can interfere with SNMP requests for other OM Reports, thereby making the OM Reports unavailable

To alleviate FTP contention or to reduce bandwidth requirements, consider creating multiple GetOMReport jobs. Stagger the times by using the Schedule tab to change the **Starting at** time in the Frequency panel.

NOTE: Do not set the **Starting at** time for later than 12:58:00. You do not want to miss the creation of the OM Report, which happens on the hour.

52.4.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if NortelCS_GetOMReport fails?	Select **Yes** to raise an event when this Knowledge Script fails to retrieve the latest OM Report. The default is Yes.
Event severity if NortelCS_GetOMReport fails	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the GetOMReport job fails. The default is 15.
FTP timeout	Specify the number of seconds to allow for the transfer of the OM Report before the job times out. The default is 60 seconds.

52.4.5 Configuring FTP Server Parameters

The AppManager for Avaya CS1000 module uses a built-in FTP (File Transfer Protocol) server to transfer Operational Measurement (OM) reports. If your FTP requirements do not fall within the category of "special" as defined below, you can use the built-in FTP server as-is. You do not need to complete the procedures in this topic.

If you have special FTP requirements, use the procedures in this topic to configure FTP parameters in AppManager Security Manager *before* you run the GetOMReport Knowledge Script.

If you do not have special FTP requirements, **do not** complete the following procedures. "Special" FTP requirements are defined as one or both of the following:

- You want to use IIS as the FTP server.
- Your proxy agent computer has two or more network interface cards (NICs).

52.4.5.1 Configuration for Using Two or More NICs

Whether you use the built-in FTP server or the IIS FTP server, configure AppManager Security Manager when your proxy agent computer has two or more NICs (network interface cards). Configure Security Manager in the following instances:

- You have a preference as to which NIC is used in the FTP process
- One NIC has access to the ELAN and the others do not

NOTE:
- If one NIC has access to the ELAN and another has access to the TLAN, ensure the binding order is such that the NIC connected to the ELAN is listed first.
- If you use NetIQ Vivinet Diagnostics to diagnose VoIP quality problems in your CS1000 environment, the proxy agent computer *must* also have TLAN connectivity.

On the Custom tab of Security Manager, complete the following fields:

Field	Description
Label	`NortelCS_FTP_IPAddress`
Sub-label	• *For a single CS1000 device*, type the IP address of the Signaling Server, VGMC, MC32S, or MGC. • *For all CS1000 devices*, type `default`. All devices will FTP OM Reports to the FTP server listening on the IP address you specify in the **Value 1** field.
Value 1	IP address of the FTP server that resides on the proxy agent computer. By identifying this IP address, you tell incoming connections which IP address to use when the computer has more than one NIC. This IP address should have access to the ELAN

52.4.5.2 Configuration for Using IIS as the FTP Server

To use IIS as the FTP server, configure the root directory, the login username, and the login password into AppManager Security Manager.

- "Configuring the Root Directory" on page 3200
- "Configuring the Login Username and Password" on page 3201

Configuring the Root Directory

Identify the IIS FTP root directory path in AppManager Security Manager. Ensure the FTP path is write enabled.

On the Custom tab of Security Manager, complete the following fields:

Field	Description
Label	`NortelCS_FTP_Path`
Sub-label	• *For a single CS1000 device*, type the IP address of the Signaling Server, VGMC, MC32S, or MGC. • *For all CS1000 devices*, type `default`. All devices will FTO the OM Reports to the FTP server directory path you specify in the **Value 1** and **Value 2** fields.
Value 1	Root directory of the FTP server. The FTP server root directory, called “local path” in IIS, must be write enabled.
Value 2	File directory path, relative to the root directory, of the folder where OM Report files are to be saved. If this value is not specified, the OM Report files are saved in the root directory path. **NOTE:** Virtual directory paths for IIS FTP are not supported.

Configuring the Login Username and Password

In AppManager Security Manager, configure the login username and password required for accessing the IIS FTP server.

On the Custom tab of Security Manager, complete the following fields:

Field	Description
Label	`NortelCS_FTP_Login`
Sub-label	• *For a single CS1000 device*, type the IP address of the Signaling Server, VGMC, MC32S, or MGC. • *For all CS1000 devices*, type `default`.
Value 1	Login user name required for accessing the IIS FTP server. The user name should have access to the file directory, or root directory if the file directory is not specified.
Value 2	Login password associated with the user name you entered in the **Value 1** field
Extended application support	Encrypts the password in Security Manager. You must select this option.

52.5 HealthCheck

Use this Knowledge Script to monitor the state of the Call Server, Signaling Server, Media Gateway Controller (MGC), Voice Gateway Media Card (VGMC), MC32S (a 32-channel VGMC), Enterprise Common Manager (ECM), Network Routing Server (NRS), and SIP Gateway (SIPL). This script raises an event if a device is not responsive or is in an abnormal state. In addition, this script generates data streams for device availability or state.

52.5.1 Resource Objects

NortelCS Call Server

NortelCS Signaling Server

NortelCS VGMC

NortelCS Media Gateway Controller

NortelCS MC32S

NortelCS Network Routing Server

NortelCS Enterprise Common Manager

NortelCS SIPL

52.5.2 Default Schedule

By default, this script runs every five minutes.

52.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if health check fails?	Select **Yes** to raise an event when the selected device is unresponsive or in an abnormal state. The default is Yes.
Event severity if health check failed	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the selected device is unresponsive or in an abnormal state. The default is 15.
Collect data?	Select **Yes** to collect availability data for reports and graphs. 100 indicates the device is available. 0 indicates the device is in any state that is not normal, or there is no response to SNMP. The default is unselected.

52.5.4 Understanding Event Messages

The following are two common error messages, accompanied by an explanation, a likely cause, and any operator action that may be needed.

<Device> unresponsive to SNMP:<IP address>

Explanation: The Call Server, MGC, Signaling Server, VGMC, MC32S, ECM, NRS, or SIPL is not responding to SNMP.

Likely cause: Normal message when item is unresponsive.

Operator action: Restart the device.

<Device> in abnormal state:IP address>

Explanation: The Call Server, MGC, Signaling Server, VGMC, MC32S, ECM, or NRS is not running in the proper state.

Likely cause: Normal message when state is abnormal.

Operator action: Change the state of the device.

52.6 PhoneInventory

Use this Knowledge Script to create an inventory of IP phones based on data in the Call Server Entity MIB. The inventory is in `.CSV` format. This script raises an event if no IP phones are found.

52.6.1 Prerequisite

For CS1000 versions 4.0 and later, populate the Entity MIB with IP phone information. For more information, see "Configuring the Call Server to Count IP Phones " on page 3205.

52.6.2 Resource Object

NortelCS Call Server

52.6.3 Default Schedule

By default, this script runs once.

52.6.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if NortelCS_PhoneInventory succeeds?	Select **Yes** to raise an event if the PhoneInventory job succeeds in creating an inventory. The default is Yes.
Event severity if NortelCS_PhoneInventory succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PhoneInventory job succeeds in creating an inventory. The default is 30.
Raise event if NortelCS_PhoneInventory fails?	Select **Yes** to raise an event if the PhoneInventory job fails for any reason. The default is Yes.
Event severity if NortelCS_PhoneInventory fails	Set the severity level, between 1 and 40, to indicate the importance of an event in which the PhoneInventory job fails. The default is 15.
Raise event if no IP phones are found?	Select **Yes** to raise an event if no IP phones are found in the Entity MIB. The default is Yes.
Event severity if no IP phones are found	Set the severity level, between 1 and 40, to indicate the importance of an event in which the Entity MIB contains no IP phones. The default is 15.

Parameter	How to Set It
Report directory's pathname	Specify the full local or UNC path to the root of the directory in which you want to save the phone inventory report, which will be titled `NortelCS_PhoneInventory_<IP address of Call Server>.csv`. Ensure the `NetIQmc` service (NetIQ AppManager Client Resource Monitor) is configured to run as a user that has access to the UNC path. The default setting of "local system" does not have access to the UNC path. Without access to the path, AppManager cannot save the inventory to the output folder. Leave this field blank to save the inventory report to the default location: `c:\Program Files\NetIQ\temp`

52.6.5 Configuring the Call Server to Count IP Phones

The PhoneInventory Knowledge Script job uses SNMP to query the Entity MIB on the Call Server and counts the number of IP telephones in the Entity MIB. However, for this process to work, you must issue two or three commands in Overlay 117:

- Tell the Call Server to generate the inventory report once every midnight
- Tell the Call Server to include the IP telephones from the inventory report in the Entity MIB
- Optional: Tell the Call Server to generate the inventory report immediately

NOTE: Do not issue the following commands if you are using CS1000 version 3.0. The following instructions apply only for versions 4.0 and later.

Issue the commands *before* running Discovery_NortelCS. If you run discovery before issuing the commands, AppManager raises an event indicating phone counting was unsuccessful because AppManager expects to find at least one phone.

Issue the following commands in Overlay 117:

```
INV MIDNIGHT SETS
INV ENTITY SETS ON
```

These two commands generate an inventory report at midnight and add the phones from the inventory report to the Entity MIB. Once the phones are added to the MIB, rerun Discovery_NortelCS.

If you do not want to wait until midnight to generate the inventory report and add the phones to the Entity MIB, issue a third Overlay 117 command:

```
INV GENERATE SETS
```

NOTE: The inventory report can take hours to complete, based on the number of phones, which is why it normally runs at midnight. Because the task that generates the inventory report on the CS1000 runs at a low priority, it should not interfere with call processing.

52.7 SS_CallQuality

Use this Knowledge Script to monitor call quality statistics on the Avaya Signaling Server: audio setups, voice time, average and maximum jitter, latency, lost packets, listening R-factor, and Mean Opinion Score (MOS). This script raises an event if a statistic exceeds the threshold you set. In addition, this script generates the following data streams:

- **Total number of audio setups**, which is the number of call legs established in a call. A simple call may have only one audio setup, but a conference call or a call on hold can have multiple audio setups.
- **Average and maximum percentage of lost data packets**, calculated based on the number of expected packets and the number of packets actually received. The number of packets received includes those that were late or duplicates. Packets that arrive late are not counted as lost. The presence of duplicate packets can result in a negative value for lost data.
- **Average and minimum listening MOS on the phones** (CS1000 versions 4.0 and later only). The Listening MOS value represents the overall quality of a call from the listener's perspective. The MOS is a number between 1 and 5. A MOS of 5 is excellent. A MOS of 1 is unacceptably bad. The MOS calculation considers measured items plus jitter buffer size. AppManager uses a modified version of the ITU (International Telecommunications Union) G.107 standard E-model equation to calculate the MOS. This algorithm is used to evaluate the quality of a transmission by factoring in the "mouth to ear" characteristics of a speech path.
- **Average and minimum listening R-factor on the phones** (CS1000 versions 4.0 and later only). The E-model equation that calculates MOS also calculates R-factor. R-factors range from 100 (excellent) to 0 (poor), and are a direct measure of call quality or transmission quality with respect to codec type and quality factors such as packet loss and delay. A Listening R-factor score represents call or transmission quality from a listener's perspective.
- **Total voice time**, in seconds, for all calls of a particular set type during the reporting period.
- **Average and maximum jitter for each selected phone model**. Jitter is the mean deviation of the difference in RTP data packet spacing at the receiver compared to the sender for a pair of packets.
- **Average and maximum latency for each selected phone model**. Latency is the average value of the difference between the time stamp indicated by the senders of messages and the timestamp of the receivers, measured when the messages are received. The average is obtained by adding all of the estimates, then dividing by the number of received messages.

For more information, see "Understanding How Data Streams are Calculated" on page 3208.

52.7.1 Tip for Using This Script

You can use the SS_CallQuality script to retrieve data about every CS1000 phone type in your environment. However, data streams are based on *all* selected phone types, not *each* selected phone type. So if you run SS_CallQuality and choose to monitor all phones types, you will not be able to tell which phone type is responsible for a high percentage of lost packets, for example.

To ensure the SS_CallQuality script provides values for individual phone types, run the script once for each phone type. For instance, run SS_CallQuality once to monitor the i2004 model phones. Then run it again to monitor i2050 model phones.

Note that phone model names changed with CS1000 versions 4.50, 5.0, and 6.0. The phone models you monitor on a 4.50 Signaling Server may not exist on a 5.0 Signaling Server.

52.7.2 Prerequisite

Run GetOMReport before running this script.

52.7.3 Resource Object

NortelCS Signaling Server

52.7.4 Default Schedule

By default, this script runs once every hour, at ten minutes past the hour. Do not change the default. Devices collect data for the OM Report on the hour. The GetOMReport Knowledge Script retrieves the OM Report at five minutes past the hour.

If you change the default schedule for this script, you risk not getting the latest data.

52.7.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if audio setups exceed threshold?	Select **Yes** to raise an event if the number of audio setups exceeds the threshold you set. The default is unselected.
Event severity if audio setups exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of audio setups exceeds the threshold you set. The default is 15.
Raise event if voice time exceeds threshold?	Select **Yes** to raise an event if the duration of voice time exceeds the threshold you set. The default is unselected.
Event severity if voice time exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the amount of voice time exceeds the threshold you set. The default is 15.
Raise event if call quality threshold crossed?	Select **Yes** to raise an event if any of the call quality statistics exceeds or fails to meet the threshold you set. The default is Yes.
Event severity if call quality threshold crossed	Set the severity level, between 1 and 40, to indicate the importance of an event raised when any of the call quality statistics (MOS, R-factor, lost packets, maximum jitter, or maximum latency) exceeds or fails to meet) the threshold you set. The default is 15.
Monitoring	
Threshold - Maximum audio setups	Specify the highest number of audio setups that can occur before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.

Parameter	How to Set It
Threshold - Maximum voice time	Specify the largest amount of voice time that can accrue before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.
Call Quality	
Score	Select whether you want to set a threshold for **R-factor** or **MOS**.
Threshold - Minimum listen R-factor	Specify the minimum R-factor score can that occur before an event is raised. The default is 70.
Threshold - Minimum listen MOS	Specify the minimum Mean Opinion Score (MOS) that can occur before an event is raised. The default is 3.6.
Threshold - Maximum lost packets	Specify the highest percentage of packets that can be lost before an event is raised. The default is 1%.
Threshold - Maximum jitter	Specify the highest amount of jitter that can occur before an event is raised. The default is 60 milliseconds.
Threshold - Maximum latency	Specify the highest amount of latency that can occur before an event is raised. The default is 400 milliseconds.
Collect data?	Select **Yes** to collect data for reports and graphs. When enabled, data collection returns several data streams based on the thresholds you set. The default is unselected.
Phone model selection	Type a regular expression that defines which phone models you want to monitor. For example, type `2007` to monitor only the 2007 phone model. Type `.*2004` to monitor any phone model name that contains 2004, such as 3Pi2004, i2004, 2004, and 2004P2. Type `i200[124]` to monitor phone models i2001, i2002, and i2004. Leave this parameter blank to monitor all phone models. The default is blank.

52.7.6 Understanding How Data Streams are Calculated

This topic applies to call metrics monitored by the following Knowledge Scripts:

- SS_CallQuality
- SS_H323Stats
- SS_Registration
- SS_SIPStats
- VGMC_CallQuality

AppManager retrieves CS1000 call metrics (audio setups, voice time, jitter, latency, R-factor, MOS, registration, and lost packets) from the Operational Measurement (OM) Reports created each hour on the Signaling Server, VGMC, MC32S, and MGC.

OM Reports provide call data per phone *model*, not per phone. For example, the OM Report identifies the average jitter for all of the i2004 model phones, but does not identify the jitter value for each phone of that model. In addition, the OM Report collects average and maximum values for jitter and latency, but only a single value for R-factor, voice time, registration, and audio setups.

Therefore, when you run a data collection script, it is important to understand that the resulting data streams are based on groups of phone types and are limited by the type of raw data available in the OM Report. The following table illustrates how each data stream is calculated:

Data Stream	What the OM Report Provides	How Data Stream is Calculated
Total number of audio setups	Total number of audio setups for each phone model	AppManager finds the total number of audio setups from all of the phone models you choose to monitor. For example, you choose to monitor three phone types. The total number of audio setups for type A is 3, for type B is 6, and for type C is 9. The total of these three values is 18, which is the value represented by the data stream.
Average jitter	Average amount of jitter for each phone model	AppManager computes a weighted average of all the phone models you choose to monitor, based on the OM Report values for total voice time and average jitter. For example, you choose to monitor three phone types. The average amount of jitter for type A is 1 ms, for type B is 2 ms, and for type C is 3 ms. The amount of voice time for the three phone types is 2, 3, and 4 seconds, respectively. AppManager computes the weighted average using the following formula, in which AJ = average jitter and VT = voice time: $\frac{(AJ_a \times VT_a)+(AJ_b \times VT_b)+(AJ_c \times VT_c)}{VT_a+VT_b+VT_c}$ In the formula, the products of average jitter and voice time for each phone type are added together and then divided by the sum of the voice time values. In this example, the computed weighted average jitter is 2.222.
Maximum jitter	Maximum amount of jitter for each phone model	AppManager finds the highest amount of maximum jitter from all of the phone models you choose to monitor. For example, you choose to monitor three phone types. The maximum amount of jitter for type A is 1 ms, for type B is 2 ms, and for type C is 3 ms. The maximum of these three values is 3 ms, which is the value represented by the data stream.
Average latency	Average amount of latency for each phone model	AppManager computes a weighted average of all the phone models you choose to monitor, based on the OM Report values for total voice time and average latency. For example, you choose to monitor three phone types. The average amount of latency for type A is 1 ms, for type B is 2 ms, and for type C is 3 ms. The amount of voice time for the three phone types is 2, 3, and 4 seconds, respectively. AppManager computes the weighted average using the following formula, in which AL = average latency and VT = voice time: $\frac{(AL_a \times VT_a)+(AL_b \times VT_b)+(AL_c \times VT_c)}{VT_a+VT_b+VT_c}$ In the equation, the products of average latency and voice time for each phone type are added together and then divided by the sum of the voice time values. In this example, the computed weighted average latency is 2.222.

Data Stream	What the OM Report Provides	How Data Stream is Calculated
Maximum latency	Maximum amount of latency for each phone model	AppManager finds the highest amount of maximum latency from all of the phone models you choose to monitor. For example, you choose to monitor three phone types. The maximum amount of latency for type A is 1 ms, for type B is 2 ms, and for type C is 3 ms. The maximum of these three values is 3 ms, which is the value represented by the data stream.
Average percentage of lost packets	Total percentage of lost packets for each phone model	AppManager computes a weighted average of all the phone models you choose to monitor, based on the OM Report values for total voice time and lost packets. For example, you choose to monitor three phone types. The percentage of lost packets for type A is 1%, for type B is 2%, and for type C is 3%. The amount of voice time for the three phone types is 2, 3, and 4 seconds, respectively. AppManager computes the weighted average using the following formula, in which LP = lost packets and VT = voice time: $\frac{(LP_a \times VT_a)+(LP_b \times VT_b)+(LP_c \times VT_c)}{VT_a+VT_b+VT_c}$ In the equation, the products of lost packets and voice time for each phone type are added together and then divided by the sum of the voice time values. In this example, the computed weighted average percentage of lost packets is 2.222.
Maximum percentage of lost packets	Maximum percentage of lost packets for each phone model	AppManager finds the highest percentage of lost packets from all of the phone models you choose to monitor. For example, you choose to monitor three phone types. The total percentage of lost packets for type A is 3, for type B is 6, and for type C is 9. The highest of these three values is 9, which is the value represented by the data stream.
Average listen MOS	N/A	AppManager converts the average R-factor value into MOS using a conversion formula provided by the ITU (International Telecommunications Union).
Minimum listen MOS	N/A	AppManager converts the minimum R-factor value into MOS using a conversion formula provided by the ITU (International Telecommunications Union).

Data Stream	What the OM Report Provides	How Data Stream is Calculated
Average listen R-factor	An R-factor value for each phone model	AppManager computes a weighted average of all the phone models you choose to monitor, based on the OM Report values for total voice time and R-factor. For example, you choose to monitor three phone types. The R-factor value for type A is 99, for type B is 97 and for type C is 95. The amount of voice time for the three phone types is 2, 3, and 4 seconds, respectively. AppManager computes the weighted average using the following formula, in which RF = R-factor and VT = voice time: $\frac{(RF_a \times VT_a)+(RF_b \times VT_b)+(RF_c \times VT_c)}{VT_a+VT_b+VT_c}$ In the equation, the products of R-factor and voice time for each phone type are added together and then divided by the sum of the voice time values. In this example, the computed weighted average listen R-factor is 96.56.
Minimum listen R-factor	An R-factor value for each phone model	AppManager finds the lowest R-factor value from all of the phone models you choose to monitor. For example, you choose to monitor three phone types. The R-factor value for type A is 99, for type B is 97 and for type C is 95. The lowest of these three values is 95, which is the value represented by the data stream.
Total registration attempts	A registration value for each phone model	AppManager finds the total number of registration attempts from all of the phone models you choose to monitor. For example, you choose to monitor three phone types. The total number of registration attempts for type A is 3, for type B is 6, and for type C is 9. The total of these three values is 18, which is the value represented by the data stream.
Total registration failures	A registration value for each phone model	AppManager finds the total number of registration failures from all of the phone models you choose to monitor. For example, you choose to monitor three phone types. The total number of registration failures for type A is 3, for type B is 6, and for type C is 9. The total of these three values is 18, which is the value represented by the data stream.
Total unregistration attempts	An unregistration value for each phone model	AppManager finds the total number of unregistration attempts from all of the phone models you choose to monitor. For example, you choose to monitor three phone types. The total number of unregistration attempts for type A is 3, for type B is 6, and for type C is 9. The total of these three values is 18, which is the value represented by the data stream.
Total voice time	Total amount of voice time for each phone model. This value includes the voice time for both phase 1 and phase 2 phones.	AppManager finds the total amount of voice time from all of the phone models you choose to monitor. For example, you choose to monitor three phone types. The total amount of voice time for type A is 20 seconds, for type B is 25, and for type C is 30. The total amount of these three values is 75, which is the value represented by the data stream.

52.8 SS_H323Stats

Use this Knowledge Script to monitor H.323 virtual trunk statistics for the Avaya Signaling Server: incoming voice and fax calls, and outgoing voice and fax calls. This script raises an event if a statistic exceeds the threshold you set. In addition, this script generates the following data streams:

- **Maximum amount of voice time** on the H.323 virtual trunk for all calls of a particular set type during the reporting period.
- **Number of incoming attempted and completed voice calls** for the H.323 or SIP virtual trunk. The number of completed calls is subtracted from the number of attempted calls to calculate the number of incomplete incoming voice calls.
- **Number of outgoing attempted and completed voice calls** for the H.323 or SIP virtual trunk. The number of completed calls is subtracted from the number of attempted calls to calculate the number of incomplete outgoing voice calls.
- **Number of incoming attempted and completed FAX calls** for the H.323 or SIP virtual trunk. The number of completed calls is subtracted from the number of attempted calls to calculate the number of incomplete incoming FAX calls.
- **Number of outgoing attempted and completed FAX calls** for the H.323 or SIP virtual trunk. The number of completed calls is subtracted from the number of attempted calls to calculate the number of incomplete outgoing FAX calls.

For more information, see "Understanding How Data Streams are Calculated" on page 3208.

52.8.1 Prerequisite

Run GetOMReport before running this script.

52.8.2 Resource Object

NortelCS Signaling Server

52.8.3 Default Schedule

By default, this script runs once every hour, at ten minutes past the hour. Do not change the default. Devices collect data for the OM Report on the hour. The GetOMReport Knowledge Script retrieves the OM Report at five minutes past the hour.

If you change the default schedule for this script, you risk not receiving the latest data.

52.8.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	

Parameter	How to Set It
Raise event if voice time exceeds threshold?	Select **Yes** to raise an event if the duration of voice time exceeds the threshold you set. The default is unselected.
Event severity if voice time exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the amount of voice time is greater than the threshold you set. The default is 15.
Raise event if incomplete incoming voice calls exceed threshold?	Select **Yes** to raise an event if the number of incomplete incoming voice calls exceeds the threshold you set. The default is Yes.
Event severity if incomplete incoming voice calls exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of incomplete incoming voice calls exceeds the threshold you set. The default is 15.
Raise event if incomplete outgoing voice calls exceed threshold?	Select **Yes** to raise an event if the number of incomplete outgoing voice calls exceeds the threshold you set. The default is Yes.
Event severity if incomplete outgoing voice calls exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of incomplete outgoing voice calls exceeds the threshold you set. The default is 15.
Raise event if incomplete incoming fax calls exceed threshold?	Select **Yes** to raise an event if the number of incomplete incoming fax calls exceeds the threshold you set. The default is Yes.
Event severity if incomplete incoming fax calls exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of incomplete incoming fax calls exceeds the threshold you set. The default is 15.
Raise event if incomplete outgoing fax calls exceed threshold?	Select **Yes** to raise an event if the number of incomplete outgoing fax calls exceeds the threshold you set. The default is Yes.
Event severity if incomplete outgoing fax calls exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of incomplete outgoing fax calls exceeds the threshold you set. The default is 15.
Monitoring	
Threshold - Maximum voice time	Specify the largest amount of voice time that can accrue before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.
Threshold - Maximum incomplete incoming voice calls	Specify the largest number of incomplete incoming voice calls that can occur before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.
Threshold - Maximum incomplete outgoing voice calls	Specify the largest number of incomplete outgoing voice calls that can occur before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.
Threshold - Maximum incomplete incoming fax calls	Specify the largest number of incomplete incoming fax calls that can occur before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.

Parameter	How to Set It
Threshold - Maximum incomplete outgoing fax calls	Specify the largest number of incomplete outgoing fax calls that can occur before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.
Collect data?	Select **Yes** to collect data for reports and graphs. When enabled, data collection returns data streams based on the thresholds you set. The default is unselected.

52.9 SS_Registration

Use this Knowledge Script to monitor registration attempts and failures on the Avaya Signaling Server. This script raises an event if the number of registration failures or attempts exceeds the threshold you set. In addition, this script generates the following data streams:

- Total number of registration attempts
- Total number of registration failures
- Total number of unregistration attempts

For more information, see "Understanding How Data Streams are Calculated" on page 3208.

52.9.1 Tip for Using This Script

You can to use the SS_Registration script to retrieve data about every CS1000 phone type in your environment. However, data streams are based on *all* selected phone types, not *each* selected phone type. So if you run SS_Registration and choose to monitor all phones types, you will not be able to tell which phone type is responsible for a high number of registration failures, for example.

The only way you can ensure the SS_Registration script provides values for individual phone types is to run the script once for each phone type. For instance, run SS_Registration once to monitor the i2004 model phones. Then run it again to monitor i2050 model phones.

Note that phone model names changed with CS1000 version 4.50, 5.0, and 6.0. The phone models you monitor on a 4.50 Signaling Server may not exist on a 5.0 Signaling Server.

52.9.2 Prerequisite

Run GetOMReport before running this script.

52.9.3 Resource Object

NortelCS Signaling Server

52.9.4 Default Schedule

By default, this script runs once every hour, at ten minutes past the hour. Do not change the default. Devices collect data for the OM Report on the hour. The GetOMReport Knowledge Script retrieves the OM Report at five minutes past the hour.

If you change the default schedule for this script, you risk not getting the latest data.

52.9.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if registration attempts exceed threshold?	Select **Yes** to raise an event if the number of registration attempts exceeds the threshold you set. The default is unselected.
Event severity if registration attempts exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of registration attempts exceeds the threshold you set. The default is 15.
Raise event if registration failures exceed threshold?	Select **Yes** to raise an event if the number of registration failures exceeds the threshold you set. The default is Yes.
Event severity if registration failures exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of registration failures exceeds the threshold you set. The default is 15.
Raise event if unregistration attempts exceed maximum?	Select **Yes** to raise an event if the number of unregistration attempts exceeds the threshold you set. The default is unselected.
Event severity if unregistration attempts exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of unregistration attempts exceeds the threshold you set. The default is 15.
Monitoring	
Threshold - Maximum registration attempts	Specify the largest number of registration attempts that can occur before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.
Threshold - Maximum registration failures	Specify the largest number of registration failures that can occur before an event is raised. The default is 0.
Threshold - Maximum unregistration attempts	Specify the largest number of unregistration attempts that can occur before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.
Collect data?	Select **Yes** to collect data for reports and graphs. When enabled, data collection returns data streams based on the thresholds you set. The default is unselected.
Phone model selection	Type a regular expression that defines which phone models you want to monitor. For example: • Type `2007` to monitor only the 2007 phone model. • Type `.*2004` to monitor any phone model name that contains 2004, such as 3Pi2004, i2004, 2004, and 2004P2. • Type `i200[124]` to monitor phone models i2001, i2002, and i2004. Leave this parameter blank to monitor all phone models. The default is blank.

52.10 SS_SIPStats

Use this Knowledge Script to monitor SIP virtual trunk statistics for the Avaya Signaling Server: incoming voice and fax calls, and outgoing voice and fax calls. This script raises an event if a statistic exceeds the threshold you set.

- **Maximum amount of voice time** on the SIP virtual trunk for all calls of a particular set type during the reporting period.
- **Number of incoming attempted and completed voice calls** for the H.323 or SIP virtual trunk. The number of completed calls is subtracted from the number of attempted calls to calculate the number of incomplete incoming voice calls.
- **Number of outgoing attempted and completed outgoing voice calls** for the H.323 or SIP virtual trunk. The number of completed calls is subtracted from the number of attempted calls to calculate the number of incomplete outgoing voice calls.
- **Number of incoming attempted and completed FAX calls** for the H.323 or SIP virtual trunk. The number of completed calls is subtracted from the number of attempted calls to calculate the number of incomplete incoming FAX calls.
- **Number of outgoing attempted and completed FAX calls** for the H.323 or SIP virtual trunk. The number of completed calls is subtracted from the number of attempted calls to calculate the number of incomplete outgoing FAX calls.

For more information, see "Understanding How Data Streams are Calculated" on page 3208.

This script supports CS1000 version 4.0 and later.

52.10.1 Prerequisite

Run GetOMReport before running this script.

52.10.2 Resource Object

NortelCS Signaling Server

52.10.3 Default Schedule

By default, this script runs once every hour, at ten minutes past the hour. Do not change the default. Devices collect data for the OM Report on the hour. The GetOMReport Knowledge Script retrieves the OM Report at five minutes past the hour.

If you change the default schedule for this script, you risk not getting the latest data.

52.10.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if voice time exceeds threshold?	Select **Yes** to raise an event if the duration of voice time exceeds the threshold you set. The default is unselected.
Event severity if voice time exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the amount of voice time exceeds the threshold you set. The default is 15.
Raise event if incomplete incoming voice calls exceed threshold?	Select **Yes** to raise an event if the number of incomplete incoming voice calls exceeds the threshold you set. The default is Yes.
Event severity if incomplete incoming voice calls exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of incomplete incoming voice calls exceeds the threshold you set. The default is 15.
Raise event if incomplete outgoing voice calls exceed threshold?	Select **Yes** to raise an event if the number of incomplete outgoing voice calls exceeds the threshold you set. The default is Yes.
Event severity if incomplete outgoing voice calls exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of incomplete outgoing voice calls exceeds the threshold you set. The default is 15.
Raise event if incomplete incoming fax calls exceed threshold?	Select **Yes** to raise an event if the number of incomplete incoming fax calls exceeds the threshold you set. The default is Yes.
Event severity if incomplete incoming fax calls exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of incomplete incoming fax calls exceeds the threshold you set. The default is 15.
Raise event if incomplete outgoing fax calls exceed threshold?	Select **Yes** to raise an event if the number of incomplete outgoing fax calls exceeds the threshold you set. The default is Yes.
Event severity if incomplete outgoing fax calls exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of incomplete outgoing fax calls exceeds the threshold you set. The default is 15.
Monitoring	
Threshold - Maximum voice time	Specify the largest amount of voice time that can accrue before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.
Threshold - Maximum incomplete incoming voice calls	Specify the largest number of incomplete incoming voice calls that can occur before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.
Threshold - Maximum incomplete outgoing voice calls	Specify the largest number of incomplete outgoing voice calls that can occur before an event is raised. The default is 0.
Threshold - Maximum incomplete incoming fax calls	Specify the largest number of incomplete incoming fax calls that can occur before an event is raised. The default is 0.
Threshold - Maximum incomplete outgoing fax calls	Specify the largest number of incomplete outgoing fax calls that can occur before an event is raised. The default is 0.

Parameter	How to Set It
Collect data?	Select **Yes** to collect data for reports and graphs. When enabled, data collection returns data streams based on the thresholds you set. The default is unselected.

52.11 VGMC_CallQuality

Use this Knowledge Script to monitor channel statistics for the Avaya Voice Gateway Media Card (VGMC), Media Gateway Controller (MGC), and MC32S: audio setup, voice time, jitter, lost packets, and channel latency. This script raises an event if a statistic exceeds the threshold you set. In addition, this script generates the following data streams:

- **Total number of audio setups**, which is the number of call legs established in a call. A simple call may have only one audio setup, but a conference call or a call on hold can have multiple audio setups.
- **Total amount of voice time** for all calls of a particular set type during the reporting period.
- **Average and maximum jitter**. Jitter is the mean deviation of the difference in RTP data packet spacing at the receiver compared to the sender for a pair of packets.
- **Average percentage of lost packets**, calculated based on the number of expected packets and the number of packets actually received. The number of packets received includes those that were late or duplicates. Packets that arrive late are not counted as lost. The presence of duplicate packets could result in a negative lost data amount.
- **Average channel latency** (not available from VGMCs). Latency is the average value of the difference between the time stamp indicated by the senders of messages and the timestamp of the receivers, measured when the messages are received. The average is obtained by adding all of the estimates, then dividing by the number of received messages.

For more information, see "Understanding How Data Streams are Calculated" on page 3208.

52.11.1 Prerequisite

Run GetOMReport before running this script.

52.11.2 Resource Objects

NortelCS VGMC

NortelCS Media Gateway Controller

NortelCS MC32S

52.11.3 Default Schedule

By default, this script runs once every hour, at ten minutes past the hour. Do not change the default. Devices collect data for the OM Report on the hour. The GetOMReport Knowledge Script retrieves the OM Report at five minutes past the hour.

If you change the default schedule for this script, you risk not retrieving the latest data.

52.11.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if audio setups exceed threshold?	Select **Yes** to raise an event if the number of audio setups exceeds the threshold you set. The default is unselected.
Event severity if audio setups exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the number of audio setups exceeds the threshold you set. The default is 15.
Raise event if voice time exceeds threshold?	Select **Yes** to raise an event if the duration of voice time exceeds the threshold you set. The default is unselected.
Event severity if voice time exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the amount of voice time exceeds the threshold you set. The default is 15.
Raise event if call quality exceeds threshold?	Select **Yes** to raise an event if any of the call quality statistics exceeds the threshold you set. The default is Yes.
Event severity if call quality exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event raised when the call quality statistics (maximum lost packets or maximum jitter) exceed the threshold you set. The default is 15.
Monitoring	
Threshold - Maximum audio setups	Specify the highest number of audio setups that can occur before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.
Threshold - Maximum voice time	Specify the largest amount of voice time that can accrue before an event is raised. The default is 0. **NOTE:** The default value has no significance and is not a recommended threshold value.
Call Quality	
Threshold - Maximum lost packets	Specify the highest average percentage of packets that can be lost before an event is raised. The default is 1%.
Threshold - Maximum jitter	Specify the highest amount of jitter that can occur before an event is raised. The default is 60 milliseconds.
Threshold - Maximum average latency	Specify the highest amount of average channel latency that can occur before an event is raised. The default is 60 milliseconds.
Collect data?	Select **Yes** to collect data for reports and graphs. When enabled, data collection returns data streams based on the thresholds you set. The default is unselected.

53 NortelCS2x Knowledge Scripts

AppManager for Nortel CS2x provides Knowledge Scripts for monitoring Nortel Communication Server 2000 and 2100 resources.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
AddPhone	Adds Nortel IP phones to the AppManager console for monitoring by the PhoneQuality and PhoneDiagnostic Knowledge Scripts.
CallActivity	Monitors completed and peak active calls.
CallAlert	Monitors for mid-call alerts raised when voice quality thresholds are exceeded. Can launch Vivinet Diagnostics to diagnose the problem if alerts are received.
CallFailures	Monitors the following line maintenance logs for call failure data: 101, 102, 104, 105, 115, 138, and 160. You can monitor all or some of these logs.
CallQuality	Monitors end-of-call voice quality statistics: jitter, latency, packet loss, MOS (Mean Opinion Score), and R-Value.
CollectorHealth	Starts the collector services and monitors their activity and availability.
LogQuery	Monitors the number of logs in user-specified reports.
OMQuery	Monitors the contents of specified fields in OM Reports.
PhoneDiagnostic	Launches Vivinet Diagnostics on-demand to diagnose call quality between two specified phones.
PhoneInventory	Creates an inventory of the phones configured for an Element Manager.
PhoneQuality	Monitors mid-call voice quality statistics: jitter, latency, packet loss, MOS (Mean Opinion Score), and R-Value.
RemovePhone	Removes a Nortel IP phone from the AppManager console.
RetrieveConfigData	Retrieves station configuration information from individual CICM Element Managers and stores it in the Nortel CS2x supplemental database for monitoring by the PhoneInventory script.
SetupSupplementalDB	Creates a Nortel CS2x supplemental database in which to store log files, OM Reports, call details, QoS information, and station configuration information.
Recommended Knowledge Script Group	Performs essential monitoring of your Nortel CS2x environment.

53.1 AddPhone

Use this Knowledge Script to add Nortel IP phones (stations) to the AppManager console. This script raises an event if specified phones are added successfully or cannot be added.

You must add a phone before you can monitor it with the PhoneQuality or PhoneDiagnostic Knowledge Script.

Use the RemovePhone Knowledge Script to remove a phone.

53.1.1 Prerequisites

- Run Discovery_NortelCS2x or SetupSupplementalDB to create the supplemental database.
- Run RetrieveConfigData to populate the supplemental database. The IP addresses and Directory Numbers (DNs) of the phones you want to add must have an entry in the supplemental database, or the AddPhone job will fail.

53.1.2 Resource Object

NortelCS2x Station Folder

53.1.3 Default Schedule

By default, this script runs once.

53.1.4 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the AddPhone job fails. The default is 5.
Configuration Settings	
Directory Numbers of phones to add	Provide the DNs of the phones you want to add. You can provide one DN or a list of DNs. If you enter a list, separate the entries with a comma. For example: 74567,74569,74571. **NOTE:** If you have more DNs than is convenient to enter in this field, you can list the DNs in a separate file and then use the following parameter to access that file.

Description	How To Set It

Full path to file with list of Directory Numbers of phones to add	Provide the full path to a file that contains a list of the Directory Numbers you want to add. Each address in the file should be on a separate line. For example:
	`74567`
	`74569`
	`74571`
	Because the file must be accessible from the agent computer, the path must be a local directory on the agent computer or a UNC path.
	Important If you provide a UNC path, then the `netiqmc` service must have access to the path.

Allow non-existent phones to be added?	Select **Yes** to add non-existent phones. A phone is non-existent if its number is not in the station table. You can add a non-existent phone if you are sure the phone is valid. For example, you may have just plugged in the phone and do not want to wait for a station table update to test it. The default is unselected.
Default Configuration Settings for Non-Existent Phones	
Default node ID	Provide the alpha-numeric CICM node identifier for the phone you want to add, such as `cicm-005`.
Default terminal ID	Provide the terminal identifier of the phone you want to add, which is usually a MAC address. For example, `31-38-00-0A-E4-01-DA-82`.
Event Notification	
Raise event if all phones are added successfully?	Select **Yes** to raise an event if each phone is successfully added to the AppManager console. The default is Yes.
Event severity when all phones are added successfully	Set the event severity level, from 1 to 40, to reflect the importance of an event in which each phone is added successfully. The default is 25.
Raise event if too many phones to add?	Select **Yes** to raise an event if, by running this job, you will have added more than 500 phones per office configured in the AppManager console. The default is Yes.
Event severity when too many phones to add	Set the event severity level, from 1 to 40, to reflect the importance of an event in which you have attempted to add more than 500 phones to an office configured in the AppManager console. The default is 15.

53.2 CallActivity

Use this Knowledge Script to monitor call activity on a selected CS2x. This script raises an event if the number of completed calls and the maximum number of concurrent active calls exceed the thresholds you set. In addition, this script generates data streams for completed and active calls.

This script uses the data collected by the OM file collector service and stored in the supplemental database.

53.2.1 Prerequisites

- Run Discovery_NortelCS2x or SetupSupplementalDB to create the supplemental database.
- Run CollectorHealth to start the OM file collector service.

53.2.2 Resource Object

NortelCS2x

53.2.3 Default Schedule

By default, this script runs every five minutes.

You may notice a large difference between the timestamp of the data point (generated every five minutes on the default schedule) and the timestamp of the OM Report that provides the data for this script. The OM Report interval varies, but is typically every five, 30, or 60 minutes. The timestamp of the OM Report represents the beginning of the interval. For example, if the OM Report for the calls made from 9:00 to 9:30 is sent at 9:30, the timestamp is 9:00. The data point will have a timestamp of a few minutes past 9:30, depending on when the five-minute default interval ends.

53.2.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CallActivity job fails. The default is 5.
Raise event if data collector reports an error?	Select **Yes** to raise an event if the OM file collector service reports an error. The default is Yes. An error affects the entire data-collection connection and all data associated with that connection.
Event severity when data collector reports an error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the OM file collector service reports an error. The default is 5.
Raise event if data collector reports a transaction error?	Select **Yes** to raise an event if the OM file collector service reports a transaction error. The default is Yes.

Parameter	How to Set It
Event severity when data collector reports a transaction error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the OM file collector service reports a transaction error. The default is 10.
Raise event if data collector reports a warning?	Select **Yes** to raise an event if the OM file collector service reports a warning. The default is Yes.
Event severity when data collector reports a warning	Set the severity level, from 1 to 40, to indicate the importance of an event in which the OM file collector service reports a warning. The default is 15.
Troubleshooting	
Select time range	Select a **Specific** or **Sliding** date/time range for which the query should search for data. The default time range is fixed at 24 hours. **NOTE:** This parameter is valid only when you select **Run once** on the Schedule tab.
Location Filter	
Include or exclude specific locations	Select the IEMS systems for which you want to monitor call activity. • Select **Include only** to monitor call activity from the system specified in the *Location* parameter. • Select **Exclude** to monitor call activity for all systems except the system specified in the *Location* parameter. The default is Exclude.
Location	Provide the name of the IEMS system that you want to include or exclude from monitoring.
Monitor Total Completed Calls	
Event Notification	
Raise event if total number of completed calls exceeds threshold?	Select **Yes** to raise an event if the number of completed calls exceeds the threshold you set. The default is Yes.
Threshold - Maximum total number of completed calls	Specify the maximum number of calls that can be completed before an event is raised. The default is 100 active call.
Event severity when total number of completed calls exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of completed calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for total number of completed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls completed during the monitoring period. The default is Yes.
Monitor Concurrent Active Calls	
Event Notification	
Raise event if maximum number of concurrent active calls exceeds threshold?	Select **Yes** to raise an event if the maximum number of concurrent active calls exceeds the threshold you set. The default is Yes. *Concurrent active calls* are calls that are in progress at the same time during a monitoring interval. Use this set of parameters to monitor the maximum number of concurrent calls that are in progress at any point in time. For example, during a five-minute interval, ten calls are active at one moment, seven calls are active at another, and three active at yet another moment. Therefore, for this interval, the maximum number of concurrent active calls is ten.

Parameter	How to Set It
Threshold - Maximum number of concurrent active calls	Specify the maximum number of concurrent calls that can be active at any point in time before an event is raised. The default is 100 active calls.
Event severity when number of concurrent active calls exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of concurrent active calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for maximum number of concurrent active calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the maximum number of concurrent calls that were active during the monitoring period. The default is Yes.

53.3 CallAlert

Use this Knowledge Script to monitor mid-call alerts (vqalerts) generated when voice quality metrics exceed or fall below a threshold you set on the CICM Element Manager. This script raises an event if vqalerts are generated. You can filter results by vqalert and by phone, and you can launch NetIQ Vivinet Diagnostics to diagnose the problem if vqalerts are generated. For more information, see "Triggering Call and Phone Quality Diagnoses" on page 3267.

53.3.1 Prerequisites

- Run Discovery_NortelCS2x or SetupSupplementalDB to create the supplemental database.
- Run CollectorHealth to start the QoS syslog collector service.

53.3.2 Resource Object

NortelCS2x

53.3.3 Default Schedule

By default, this script runs on an asynchronous schedule.

53.3.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CallAlert job fails. The default is 5.
Raise event if data collector reports an error?	Select **Yes** to raise an event if the QoS syslog collector service reports an error. The default is Yes. An error affects the entire data-collection connection and all data associated with that connection.
Event severity when data collector reports an error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the QoS syslog collector service reports an error. The default is 10.
Raise event if data collector reports a warning?	Select **Yes** to raise an event if the QoS syslog collector service reports a warning. The default is Yes.
Event severity when data collector reports a warning	Set the severity level, from 1 to 40, to indicate the importance of an event in which the QoS syslog collector service reports a warning. The default is 15.
Monitor Settings	

Parameter	How to Set It
Perform traceroute and launch Vivinet Diagnostics when voice quality alert is received?	Select **Yes** to send a traceroute request to the CICM Element Manager and to launch Vivinet Diagnostics to diagnose the problem if vqalerts are received. The default is Yes.
Length of time to wait for traceroute responses	Specify the maximum length of time that the CallAlert job should wait for a response to traceroute requests to the CICM Element Manager. The CallAlert job will fail if the response time is longer than you specify. The default is 120 seconds.
Raise event if voice quality alert is received?	Select **Yes** to raise an event if vqalerts are generated when voice quality metrics exceed the threshold you set on the CICM Element Manager. The default is Yes.
Event severity when voice quality alert is received	Set the severity level, from 1 to 40, to indicate the importance of an event in which vqalerts are generated when voice quality metrics exceed the threshold you set on the CICM Element Manager. The default is 15.
Include or exclude specific voice quality alerts	Indicate how to monitor the vqalerts you select in the *Alert filter* parameters. The default is Exclude. • Select **Include** to monitor only the selected vqalerts. • Select **Exclude** to monitor all vqalerts *except* those that you select.
Alert Filter	
Minor alert: packet loss threshold crossed?	Select **Yes** to monitor the number of minor alerts generated when packet loss (LRA-Loss Rate Average) exceeds the threshold you set in Element Manager. The default is unselected.
Minor alert: one-way latency threshold crossed?	Select **Yes** to monitor the number of minor alerts generated when one-way latency (OWDA-One Way Delay Average) exceeds the threshold you set in Element Manager. The default is unselected.
Minor alert: round-trip latency threshold crossed?	Select **Yes** to monitor the number of minor alerts generated when round-trip latency (RTA-Round Trip Average) exceeds the threshold you set in Element Manager. The default is unselected.
Minor alert: jitter threshold crossed?	Select **Yes** to monitor the number of minor alerts generated when jitter (JA-Jitter Average) exceeds the threshold you set in Element Manager. The default is unselected.
Minor alert: R-factor threshold crossed?	Select **Yes** to monitor the number of minor alerts generated when the R-factor value (LRF-Listening R Factor) falls below the threshold you set in Element Manager. The default is unselected.
Major alert: packet loss threshold crossed?	Select **Yes** to monitor the number of major alerts generated when packet loss exceeds the threshold you set in Element Manager. The default is unselected.
Major alert: one-way latency threshold crossed?	Select **Yes** to monitor the number of major alerts generated when one-way latency exceeds the threshold you set in Element Manager. The default is unselected.
Major alert: round-trip latency threshold crossed?	Select **Yes** to monitor the number of major alerts generated when round-trip latency exceeds the threshold you set in Element Manager. The default is unselected.
Major alert: jitter threshold crossed?	Select **Yes** to monitor the number of major alerts generated when jitter exceeds the threshold you set in Element Manager. The default is unselected.
Major alert: R-factor threshold crossed?	Select **Yes** to monitor the number of major alerts generated when the R-factor value falls below the threshold you set in Element Manager. The default is unselected.

Parameter	How to Set It
Include or exclude specific phones	You can further filter your results by monitoring vqalerts only for phones you specify in the *Phone filter* parameters. The default is Exclude. • Select **Include** to monitor vqalerts only for the selected phones. • Select **Exclude** to monitor vqalerts for all phones *except* those that you select.
Phone Filter	
Enterprise Network Association Name	Provide the network name associated with the phones for which you want to monitor vqalerts. This network name identifies a grouping of phones behind a firewall.
Phone Enterprise IP address	For the phones associated with the *Enterprise Network Association Name*, provide the IP address used as the bearer path before it gets to the firewall. Separate multiple addresses with a comma. An asterisk (*) is an acceptable wildcard.

53.4 CallFailures

Use this Knowledge Script to monitor LINE (line maintenance) logs. The line maintenance subsystem generates LINE logs for specific occurrences, as detailed below. This script monitors LINE logs retrieved through telnet from the IEMS and collected by the log collector service.

You can monitor all or some of the following LINE logs, which are related to call failures:

- **LINE101**, generated when the system or the user runs a diagnostic test that fails.
- **LINE102**, generated when the system changes the line state from call processing busy (CPB) to lockout (LO). LINE 102 often indicates a facility problem.
- **LINE104**, generated when a problem occurs during call processing or when bearer path integrity issues are detected.
- **LINE105**, indicates permanent signal, usually a phone left offhook, but may be a line or equipment problem
- **LINE115**, generated at the termination of a call that is connected to the DMS switch but originated from another line.
- **LINE138**, generated when a call routes to a treatment, such as automated voice response.
- **LINE160**, generated when the called party does not answer within the ringing timeout period.

The purpose of this script is twofold:

- **Monitoring**. In monitoring mode, this script checks the database tables at each specified interval for new records that match your query. In the first iteration of the job, this script finds the last record in a table and checks back one interval from there. In subsequent iterations, this script checks for new records that match the query in each interval.
- **Troubleshooting**. In troubleshooting mode, this script runs once and checks the database tables for calls whose disconnect time is within the range you select in the *Select call disconnect time range* parameter. Select **Run once** on the Schedule tab to run this script in troubleshooting mode. The managed object does not collect call quality statistics unless this script is running, which could pose a problem should you want, for example, to troubleshoot a call that occurred five minutes ago. To perform troubleshooting as needed, also run CollectorHealth to start the collector services, which populate the Nortel CS2x supplemental database with data you can use for troubleshooting.

53.4.1 Prerequisites

- Run Discovery_NortelCS2x or SetupSupplementalDB to create the supplemental database.
- Run CollectorHealth to start the log collector service.

53.4.2 Resource Object

NortelCS2x

53.4.3 Default Schedule

By default, this script runs every five minutes.

53.4.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CallFailures job fails. The default is 5.
Raise event if data collector reports an error?	Select **Yes** to raise an event if the log collector service reports an error. The default is Yes. An error affects the entire data-collection connection and all data associated with that connection.
Event severity when data collector reports an error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the log collector service reports an error. The default is 5.
Raise event if data collector reports a transaction error?	Select **Yes** to raise an event if the log collector service reports a transaction error. The default is Yes. A transaction error affects a single record encountered during the data-collection connection. If there are many transaction errors for the same record, only the most recent transaction error is posted for each iteration of the connection.
Event severity when data collector reports a transaction error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the log collector service reports a transaction error. The default is 10.
Raise event if data collector reports a warning?	Select **Yes** to raise an event if the log collector service reports a warning. The default is Yes.
Event severity when data collector reports a warning	Set the severity level, from 1 to 40, to indicate the importance of an event in which the log collector service reports a warning. The default is 15.
Include log details?	Select **Yes** to include log details in the events raised by this script. Leave this parameter unselected to suppress log details. When you select Yes, an event includes the following columns: • Severity • Report Name • Report Number • Report Time • SequenceSS (a unique identifier for a log) • SequenceDD (a unique identifier for a log) • Event Type • Event ID • Report Details
Maximum table size	If you selected Yes for *Include log details?*, specify the maximum number of rows of log detail that you want to return in events raised by this script. The default is 25 rows.
Troubleshooting	

Parameter	How to Set It
Select call disconnect time range	Select a **Specific** or **Sliding** date/time range for which the query should search for data. The default time range is fixed at 24 hours. **NOTE:** This parameter is valid only when you select **Run once** on the Schedule tab.
Log Filter	
Include or exclude specific Logs	Use this parameter to filter the Logs you monitor. • Select **Include only** to monitor only Logs that contain the descriptive text you provide in the *Failure log description text* parameter. • Select **Exclude** to monitor all Logs except those that contain the descriptive text you provide in the *Failure log description text* parameter. The default is Exclude.
Failure log description text	Provide descriptive text that identifies the Logs you want to include in or exclude from monitoring, such as a location or an event ID.
Monitor Number of LINE Logs	
Event Notification	
Raise event if number of LINE logs exceeds threshold?	Select **Yes** to raise an event if the number of all LINE logs generated exceeds the threshold you set. The default is Yes. Enable this parameter to monitor all LINE logs: LINE101, LINE102, LINE104, LINE105, LINE115, LINE138, and LINE160. Use the LINE-specific parameters to monitor individual LINE logs.
Threshold - Maximum number of LINE logs	Specify the maximum number of LINE logs that can be generated before an event is raised. The default is 100 logs.
Event severity when number of LINE logs exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of LINE logs exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of LINE logs?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of LINE logs generated during the monitoring period. The default is Yes.
Monitor Number of LINE101 Logs	
Event Notification	
Raise event if number of LINE101 logs exceeds threshold?	Select **Yes** to raise an event if the number of LINE101 logs exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of LINE101 logs	Specify the maximum number of LINE101 logs that can be generated before an event is raised. The default is 100 logs.
Event severity when number of LINE101 logs exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of LINE101 logs exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of LINE101 logs?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of LINE101 logs generated during the monitoring period. The default is Yes.
Monitor Number of LINE102 Logs	
Event Notification	

Parameter	How to Set It
Raise event if number of LINE102 logs exceeds threshold?	Select **Yes** to raise an event if the number of LINE102 logs exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of LINE102 logs	Specify the maximum number of LINE102 logs that can be generated before an event is raised. The default is 100 logs.
Event severity when number of LINE102 logs exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of LINE102 logs exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of LINE102 logs?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of LINE102 logs generated during the monitoring period. The default is Yes.
Monitor Number of LINE104 Logs	
Event Notification	
Raise event if number of LINE104 logs exceeds threshold?	Select **Yes** to raise an event if the number of LINE104 logs exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of LINE104 logs	Specify the maximum number of LINE104 logs that can be generated before an event is raised. The default is 100 logs.
Event severity when number of LINE104 logs exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of LINE104 logs exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of LINE104 logs?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of LINE104 logs generated during the monitoring period. The default is Yes.
Monitor Number of LINE105 Logs	
Event Notification	
Raise event if number of LINE105 logs exceeds threshold?	Select **Yes** to raise an event if the number of LINE105 logs exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of LINE105 logs	Specify the maximum number of LINE105 logs that can be generated before an event is raised. The default is 100 logs.
Event severity when number of LINE105 logs exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of LINE105 logs exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of LINE105 logs?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of LINE105 logs generated during the monitoring period. The default is Yes.
Monitor Number of LINE115 Logs	
Event Notification	
Raise event if number of LINE115 logs exceeds threshold?	Select **Yes** to raise an event if the number of LINE115 logs exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum number of LINE115 logs	Specify the maximum number of LINE115 logs that can be generated before an event is raised. The default is 100 logs.
Event severity when number of LINE115 logs exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of LINE115 logs exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of LINE115 logs?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of LINE115 logs generated during the monitoring period. The default is Yes.
Monitor Number of LINE138 Logs	
Event Notification	
Raise event if number of LINE138 logs exceeds threshold?	Select **Yes** to raise an event if the number of LINE138 logs exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of LINE138 logs	Specify the maximum number of LINE138 logs that can be generated before an event is raised. The default is 100 logs.
Event severity when number of LINE138 logs exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of LINE138 logs exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of LINE138 logs?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of LINE138 logs generated during the monitoring period. The default is Yes.
Monitor Number of LINE160 Logs	
Event Notification	
Raise event if number of LINE160 logs exceeds threshold?	Select **Yes** to raise an event if the number of LINE160 logs exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of LINE160 logs	Specify the maximum number of LINE160 logs that can be generated before an event is raised. The default is 100 logs.
Event severity when number of LINE160 logs exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of LINE160 logs exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of LINE160 logs?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of LINE160 logs generated during the monitoring period. The default is Yes.

53.5 CallQuality

Use this Knowledge Script to monitor end-of-call voice quality statistics. This script raises an event when a monitored statistic exceeds or falls below the threshold you set. In addition, this script generates data streams for all monitored statistics. Event messages present call quality statistics for both legs of a call, from the sending and receiving phones, on a single line in the event detail, if data for both legs is available.

This script monitors the QoS Collector Application records that the CBM pushes to the QoS file collector service, as well as the QoS syslog records sent by the CICM Element Manager to the QoS syslog collector service:

MOS (Mean Opinion Score)
The quality of a VoIP transmission based on the "mouth-to-ear" characteristics of a speech path. A MOS of 5 is considered excellent. A MOS of 1 is unacceptably bad.

R-Value
Call quality value derived from delays and equipment impairment factors. An R-Value can be mapped to an estimated MOS. R-Values range from 100 (excellent) to 0 (poor).

Jitter
Also called delay variation, jitter is the mean deviation of the difference in packet spacing between the receiving phone and the sending phone.

Latency
The time taken for a packet of data to be sent by a phone, travel, and be received by another phone.

Packet loss
Percentage of packets lost or dropped between the sending and receiving phone.

NOTE: You can trigger NetIQ Vivinet Diagnostics to diagnose the problem when monitored voice quality statistics exceed the thresholds you set. For more information, see "Triggering Call and Phone Quality Diagnoses" on page 3267.

The purpose of this script is twofold:

- **Monitoring**. In monitoring mode, this script checks the database tables at each specified interval for new records that match your query. In the first iteration of the job, this script finds the last record in a table and checks back one interval from there. In subsequent iterations, this script checks for new records that match the query in each interval.
- **Troubleshooting**. In troubleshooting mode, this script runs once and checks the database tables for calls whose disconnect time is within the range you select in the *Select call disconnect time range* parameter. Select **Run once** on the Schedule tab to run this script in troubleshooting mode. AppManager does not collect call quality statistics unless this script is running, which could pose a problem should you want, for example, to troubleshoot a call that occurred five minutes ago. To perform troubleshooting as needed, also run CollectorHealth to start the collector services, which populate the Nortel CS2x supplemental database with data you can use for troubleshooting.

53.5.1 Prerequisites

- Run Discovery_NortelCS2x or SetupSupplementalDB to create the supplemental database.
- Run CollectorHealth to start the QoS syslog collector service.

53.5.2 Resource Object

NortelCS2x IEMS

53.5.3 Default Schedule

By default, this script runs every five minutes.

53.5.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CallQuality job. The default is 5.
Raise event if data collector reports an error?	Select **Yes** to raise an event if the collector services report an error. The default is Yes. An error affects the entire data-collection connection and all data associated with that connection.
Event severity when data collector reports an error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the collector services report an error. The default is 5.
Raise event if data collector reports a transaction error?	Select **Yes** to raise an event if the collector services report a transaction error. The default is Yes. A transaction error affects a single record encountered during the data-collection connection. If there are many transaction errors for the same record, only the most recent transaction error is posted for each iteration of the connection.
Event severity when data collector reports a transaction error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the collector services report a transaction error. The default is 10.
Raise event if data collector reports a warning?	Select **Yes** to raise an event if the collector services report a warning. The default is Yes.
Event severity when data collector reports a warning	Set the severity level, from 1 to 40, to indicate the importance of an event in which the collector services report a warning. The default is 15.

Parameter	How to Set It
Include call details?	Select **Yes** to include call details in the events raised by this script. Leave this parameter unselected to suppress call details. When you select Yes, an event message includes the following columns: • Listening Avg MOS • Listening Avg R-Value • Average Jitter (ms) • Average Latency (ms) • Lost Packets (%) • Transmit Codec • Receive Codec • IP Address • MAC Address • Equipment • Connect Time • Disconnect Time • Duration (seconds)
Maximum table size	If you selected Yes for *Include call details?*, specify the maximum number of rows of call detail to return in events raised by this script. The default is 25 rows.
Raise event if no records found?	Select **Yes** to raise an event if there are no call quality records to monitor in the Nortel CS2x supplemental database. Note that this does not mean there are no records with call quality data, but that there are no records at all. The default is unselected.
Event severity when no records found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no call quality records were found. The default is 25.
Monitor Settings	
Perform traceroute and launch Vivinet Diagnostics when voice quality alert is received?	Select **Yes** to send a traceroute request to the CICM Element Manager and to launch Vivinet Diagnostics to diagnose the problem if vqalerts are received. The default is Yes.
Length of time to wait for traceroute responses	Specify the maximum length of time that the CallQuality job should wait for a response to traceroute requests to the CICM Element Manager. The CallQuality job will fail if the response time is longer than you specify. The default is 120 seconds.
Query Filters	No matter how many calls match the filters you select, an event message displays only the first 50 calls.
Minimum duration	Use this parameter to filter out records whose call duration is less than the value you specify. Accept the default of 0 seconds to ignore the filter for minimum duration.
Maximum duration	Use this parameter to filter out records whose call duration is greater than or equal to the value you specify. Accept the default of 0 seconds to ignore the filter for maximum duration.
Troubleshooting	

Parameter	How to Set It
Select call disconnect time range	Select a **Specific** or **Sliding** date/time range for which the query should search for data. The default time range is fixed at 24 hours. **NOTE:** This parameter is valid only when you select **Run once** on the Schedule tab.
Monitor Average MOS	
Event Notification	
Raise event if average MOS falls below threshold?	Select **Yes** to raise an event if the average MOS value falls below the threshold you set. The default is Yes.
Threshold - Minimum average MOS	Specify the lowest average MOS value that must occur to prevent an event from being raised. The default is 3.60.
Event severity when average MOS falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average MOS value falls below the threshold you set. The default is 5.
Data Collection	
Collect data for average MOS?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the average MOS value during the monitoring period. The default is unselected.
Monitor Average R-Value	
Event Notification	
Raise event if average R-Value falls below threshold?	Select **Yes** to raise an event if the average R-Value falls below the threshold you set. The default is Yes.
Threshold - Minimum average R-Value	Specify the lowest average R-Value that must occur to prevent an event from being raised. The default is 70.
Event severity when average R-Value falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average R-Value falls below the threshold. The default is 5.
Data Collection	
Collect data for average R-Value?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the average R-Value during the monitoring period. The default is unselected.
Monitor Average Jitter	
Event Notification	
Raise event if average jitter exceeds threshold?	Select **Yes** to raise an event if the average jitter value exceeds the threshold. The default is Yes.
Threshold - Maximum average jitter	Specify the highest average jitter value that can occur before an event is raised. The default is 60 milliseconds.
Event severity when average jitter exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average jitter value exceeds the threshold. The default is 15.
Data Collection	
Collect data for average jitter?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the average amount of jitter that occurred during the monitoring period. The default is unselected.
Monitor Average Latency	
Event Notification	

Parameter	How to Set It
Raise event if average latency exceeds threshold?	Select **Yes** to raise an event if the average latency value exceeds the threshold. The default is Yes.
Threshold - Maximum average latency	Specify the highest amount of average latency that can occur before an event is raised. The default is 400 milliseconds.
Event severity when average latency exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average latency value exceeds the threshold. The default is 15.
Data Collection	
Collect data for average latency?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the average amount of latency that occurred during the monitoring period. The default is unselected.
Monitor Average Packet Loss	
Event Notification	
Raise event if average packet loss exceeds threshold?	Select **Yes** to raise an event if the average packet loss value exceeds the threshold. The default is Yes.
Threshold - Maximum average packet loss	Specify the highest amount of average packet loss that can occur before an event is raised. The default is 1%.
Event severity when average packet loss exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average packet loss value exceeds the threshold. The default is 15.
Data Collection	
Collect data for average packet loss?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of average packet loss that occurred during the monitoring period. The default is unselected.

53.6 CollectorHealth

Use this Knowledge Script to start the collector services and monitor their activity and availability. This script raises an event when a collector service is unavailable and when activity falls below the threshold you set. In addition, this script generates data streams for activity and availability of the following collector services:

- Log collector service, which receives logs from the IEMS
- OM file collector service, which receives OM Reports from the IEMS
- QoS file collector service, which receives end-of-call QoS Collector Application records from the CBM
- QoS syslog collector service, which receives syslogs from the CICM Element Manager

53.6.1 Prerequisites

- Configure the sFTP server user name and password in AppManager Security Manager. The OM and QoS syslog collector services receive data over secure FTP (sFTP). For more information, see "Troubleshooting" on page 3244.
- Run Discovery_NortelCS2x or SetupSupplementalDB to create the supplemental database.

53.6.2 Resource Object

NortelCS2x Data Collector

Run only one CollectorHealth job per data collector resource.

53.6.3 Default Schedule

By default, this script runs every five minutes.

53.6.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CollectorHealth job. The default is 5.
Raise event if data collector reports an error?	Select **Yes** to raise an event if a collector service reports an error. The default is Yes. An error affects the entire data-collection connection and all data associated with that connection.

Parameter	How to Set It
Event severity when data collector reports an error	Set the severity level, from 1 to 40, to indicate the importance of an event in which a collector service reports an error. The default is 5.
Raise event if data collector reports a transaction error?	Select **Yes** to raise an event if a collector service reports a transaction error. The default is Yes. A transaction error affects a single record encountered during the data-collection connection. If there are many transaction errors for the same record, only the most recent transaction error is posted for each iteration of the connection.
Event severity when data collector reports a transaction error	Set the severity level, from 1 to 40, to indicate the importance of an event in which a collector service reports a transaction error. The default is 10.
Raise event if data collector reports a warning?	Select **Yes** to raise an event if a collector service reports a warning. The default is Yes.
Event severity when data collector reports a warning	Set the severity level, from 1 to 40, to indicate the importance of an event in which a collector service reports a warning. The default is 15.
Monitor Collector Availability	
Event Notification	
Raise event if collector service is unavailable?	Select **Yes** to raise an event if a collector service is unavailable. The default is Yes.
Event severity when collector service is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which a collector service is unavailable. The default is 5.
Data Collection	
Collect data for collector service availability?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns 0 if a collector service is unavailable and 100 if a collector service is available. The default is Yes.
Remediation	
Automatically start/restart collector service?	Select **Yes** to send a start request to a collector service. The start request allows the collector service to begin collecting data and populating the supplemental database. Data collection continues until the CollectorHealth job is stopped. If the collector service stops for any reason, it is restarted. The default is Yes. If you disable this parameter, the CollectorHealth job passively monitors collector service requests from other Knowledge Scripts. However, the CollectorHealth job does not request any data collection.
Monitor Collector Activity	
Event Notification	
Raise event if collector activity falls below threshold?	Select **Yes** to raise an event if collector service activity falls below the threshold you set. The default is Yes.
Threshold - Minimum collector activity	Specify the minimum number of transactions a collector service must perform to prevent an event from being raised. The default is 1 transaction per monitoring period.
Event severity collector activity falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which collector service activity falls below the threshold. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for collector activity?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of collector transactions during the monitoring period. The default is Yes.

53.6.5 Troubleshooting

Review the following topics for answers to questions you may have.

53.6.5.1 CollectorHealth Job Fails Password Authentication

Problem: The CollectorHealth job fails with the following error message:

```
Password authentication failed to <computer name>.
```

Cause: Most likely, the incorrect sFTP server user name and password are configured in AppManager Security Manager. The OM and QoS file collector services attempt to access the sFTP server using the user name and password configured in Security Manager. After *n* failed attempts (depending on how the switch is configured), the switch locks out the collector services and ignores subsequent login attempts.

Solution: Provide the correct user name and password in Security Manager. After the lockout expires, login succeeds and the CollectorHealth job runs successfully.

53.6.5.2 Log Collector Service Unavailable After a Power Outage

Problem: After a power outage, the CollectorHealth job raises an event indicating that the Log collector service is "unable to connect" to the IEMS.

Cause: Most likely, the IEMS service has not recovered from the power outage.

Solution: Verify the status of the IEMS service. If the service is down, issue the following command:

```
servstart iems
```

53.7 LogQuery

Use this Knowledge Script to monitor the number of logs in reports you specify. This script raises an event when the number of logs in the report exceeds the threshold you set.

This script uses the data collected by the log collector service.

The purpose of this script is twofold:

- **Monitoring**. In monitoring mode, this script checks the database tables at each specified interval for new records that match your query. In the first iteration of the job, this script finds the last record in a table and checks back one interval from there. In subsequent iterations, this script checks for new records that match the query in each interval.
- **Troubleshooting**. In troubleshooting mode, this script runs once and checks the database tables for calls whose disconnect time is within the range you select in the *Select call disconnect time range* parameter. Select **Run once** on the Schedule tab to run this script in troubleshooting mode. AppManager does not collect call quality statistics unless this script is running, which could pose a problem should you want, for example, to troubleshoot a call that occurred five minutes ago. To perform troubleshooting as needed, also run CollectorHealth to start the collector services, which populate the Nortel CS2x supplemental database with data you can use for troubleshooting.

53.7.1 Monitoring Examples

The following table provides examples of report name and report number combinations you can use to monitor specific activities. Provide the report name in the *Report name* parameter and the report number in the *Report number* parameter.

Activity	Report	Number
Equipment down	PM	102
Equipment up	PM	106

53.7.2 Prerequisites

- Run Discovery_NortelCS2x or SetupSupplementalDB to create the supplemental database.
- Run CollectorHealth to start the log collector service.

53.7.3 Resource Object

NortelCS2x IEMS

53.7.4 Default Schedule

By default, this script runs every five minutes.

53.7.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the LogQuery job fails. The default is 5.
Raise event if data collector reports an error?	Select **Yes** to raise an event if the log collector service reports an error. The default is Yes. An error affects the entire data-collection connection and all data associated with that connection.
Event severity when data collector reports an error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the log collector service reports an error. The default is 5.
Raise event if data collector reports a transaction error?	Select **Yes** to raise an event if the log collector service reports a transaction error. The default is Yes. A transaction error affects a single record encountered during the data-collection connection. If there are many transaction errors for the same record, only the most recent transaction error is posted for each iteration of the connection.
Event severity when data collector reports a transaction error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the log collector service reports a transaction error. The default is 10.
Raise event if data collector reports a warning?	Select **Yes** to raise an event if the log collector service reports a warning. The default is Yes.
Event severity when data collector reports a warning	Set the severity level, from 1 to 40, to indicate the importance of an event in which the log collector service reports a warning. The default is 15.
Include details?	Select **Yes** to include log details in the events raised by this script. Leave this parameter unselected to suppress log details. When you select Yes, an event includes the following columns: • Severity • Report Name • Report Number • Report Time • SequenceSS (a unique identifier for a log) • SequenceDD (a unique identifier for a log) • Event Type • Event ID • Report Details
Maximum table size	If you selected Yes for *Include details?*, specify the maximum number of rows of log detail that you want to return in events raised by this script. The default is 25 rows.
Troubleshooting	
Select log time range	Select a **Specific** or **Sliding** date/time range for which the query should search for data. The default time range is fixed at 24 hours. **NOTE:** This parameter is valid only when you select **Run once** on the Schedule tab.

Parameter	How to Set It
Report name	Provide the name of the log report you want to query.
Report number	Provide the ID number of the log report you want to query.
Include or exclude specific reports	Select the filter to use when querying log reports. • Select **Include only** to use only the log report specified in the *Log report description* parameter. • Select **Exclude** to query for all log reports except the report specified in the *Log report description* parameter. The default is Exclude.
Log report filter	
Log report description	Use this parameter to further filter the logs in the report you want to query. Provide a text explanation of the log you want to include or exclude from querying. An asterisk (*) is an acceptable wildcard. For example, to filter for any log that mentions a CICM, type `*CICM*`.
Monitor Number of Logs	
Event Notification	
Raise event if number of logs exceeds threshold?	Select **Yes** to raise an event if the number of logs in the specified report exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of logs	Specify the maximum number of logs that can be in the specified report before an event is raised. The default is 100 logs.
Event severity when number of logs exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of logs in the specified report exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of logs?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of line logs found in the specified report. The default is Yes.

53.8 OMQuery

Use this Knowledge Script to monitor the value of a specified field in a specified table in an OM Report. This script raises an event when the value of the specified field exceeds the threshold you set.

This script uses the data collected by the OM file collector service.

The purpose of this script is twofold:

- **Monitoring**. In monitoring mode, this script checks the database tables at each specified interval for new records that match your query. In the first iteration of the job, this script finds the last record in a table and checks back one interval from there. In subsequent iterations, this script checks for new records that match the query in each interval.
- **Troubleshooting**. In troubleshooting mode, this script runs once and checks the database tables for calls whose disconnect time is within the range you select in the *Select call disconnect time range* parameter. Select **Run once** on the Schedule tab to run this script in troubleshooting mode. AppManager does not collect call quality statistics unless this script is running, which could pose a problem should you want, for example, to troubleshoot a call that occurred five minutes ago. To perform troubleshooting as needed, also run CollectorHealth to start the collector services, which populate the Nortel CS2x supplemental database with data you can use for troubleshooting.

53.8.1 Monitoring Examples

The following table provides examples of table/field name combinations you can use to monitor specific activities. Provide the table name in the *Table name* parameter and the field name in the *Field name* parameter.

Activity	Table	Field Name
Originating line calls	LMD	NTERMATT
Terminating line calls	LMD	NORIGATT
Outgoing trunk calls	OFZ	NORIG
Incoming trunk calls	OFZ	NIN
Blocked terminations: not enough channels or network resources to complete calls	LMD	TERMBLK
Blocked originations: not enough channels or network resources to originate calls	LMD	ORIGBLK
Blocked trunk calls	OFZ	TRMBLK
Failed originations, other than blocked: bad signaling, partial dial tone, bad dial tone	LMD	ORIGFAIL
Failed terminations, other than blocked	LMD	PERCLFL
Peripheral origination denied, device overload	PMOVLD	PORGDENY
Peripheral termination denied, device overload	PMOVLD	PTRMDENY
Calls lost due to equipment being down	PM	PMSBTCO

53.8.2 Prerequisites

- Run Discovery_NortelCS2x or SetupSupplementalDB to create the supplemental database.
- Run CollectorHealth to start the OM file collector service.

53.8.3 Resource Object

NortelCS2x IEMS

53.8.4 Default Schedule

By default, this script runs every five minutes.

53.8.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the OMQuery job fails. The default is 5.
Raise event if data collector reports an error?	Select **Yes** to raise an event if the OM file collector service reports an error. The default is Yes. An error affects the entire data-collection connection and all data associated with that connection.
Event severity when data collector reports an error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the OM file collector service reports an error. The default is 5.
Raise event if data collector reports a transaction error?	Select **Yes** to raise an event if the OM file collector service reports a transaction error. The default is Yes. A transaction error affects a single record encountered during the data-collection connection. If there are many transaction errors for the same record, only the most recent transaction error is posted for each iteration of the connection.
Event severity when data collector reports a transaction error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the OM file collector service reports a transaction error. The default is 10.
Raise event if data collector reports a warning?	Select **Yes** to raise an event if the OM file collector service reports a warning. The default is Yes.
Event severity when data collector reports a warning	Set the severity level, from 1 to 40, to indicate the importance of an event in which the OM file collector service reports a warning. The default is 15.

Parameter	How to Set It
Include details?	Select **Yes** to include OM Report details in the events raised by this script. Leave this parameter unselected to suppress details. When you select Yes, an event includes the following columns: • NumFound • Table Name • Field Name • Location
Maximum table size	If you selected Yes for *Include details?*, specify the maximum number of rows of detail that you want to return in events raised by this script. The default is 25 rows.
Troubleshooting	
Select OM time range	Select a **Specific** or **Sliding** date/time range for which the query should search for data. The default time range is fixed at 24 hours. **NOTE:** This parameter is valid only when you select **Run once** on the Schedule tab.
Table name	Provide the name of the table that you want to query in the OM Report.
Field name	Provide the alpha-numeric identifier of the field in the table that you want to query. **Hints** • When running this script in monitoring mode, provide only one field name for this parameter. • When running this script in troubleshooting mode, leave this parameter blank.
Include or exclude specific locations	Select the IEMS systems for which you want to query OM Reports. • Select **Include only** to query only the OM Reports from the system specified in the *Location* parameter. • Select **Exclude** to query OM Reports for all systems except the system specified in the *Location* parameter. The default is Exclude.
Location	Provide the name of the IEMS system that you want to include or exclude from the querying of OM Reports.
Monitor OM Value	
Event Notification	
Raise event if value of OM Report exceeds threshold?	Set to **Yes** to raise an event if the value of the specified field in the OM Report exceeds the threshold you set. The default is Yes.
Threshold - Maximum value of OM Report	Indicate the maximum value allowed in the specified field in the OM Report. An event is raised if the value exceeds the threshold you set. The default is 100 units. **NOTE:** The value of the data stream generated by the script is a sum of the contents of all instances of the field you identified in the *Field name* parameter. AppManager applies the threshold to the data stream value.
Event severity when value of OM Report exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the value of the specified field in the OM Report exceeds the threshold you set. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for value of OM Report?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the value of the specified field in the OM Report. The default is Yes.

53.9 PhoneDiagnostic

Use this Knowledge Script to invoke NetIQ Vivinet Diagnostics to diagnose call quality between the phone on which you run this script and another specified phone. This script's sole purpose is to invoke Vivinet Diagnostics on-demand, without waiting for a problem to be identified by the CallQuality or PhoneQuality Knowledge Script jobs.

This Knowledge Script job raises an event that launches the Action_DiagnoseVoIPQuality Knowledge Script, which in turn invokes Vivinet Diagnostics. For more information, see "Triggering Call and Phone Quality Diagnoses" on page 3267.

53.9.1 Prerequisites

- Run Discovery_NortelCS2x or SetupSupplementalDB to create the Nortel CS2x supplemental database.
- Run CollectorHealth to start the QoS syslog collector service to populate the supplemental database with call quality data.
- Run RetrieveConfigData to populate the supplemental database with phone configuration data.
- Run AddPhone to add the phones you want to monitor to the AppManager console.

53.9.2 Resource Object

NortelCS2x Station Object

53.9.3 Default Schedule

By default, this script runs on an asynchronous schedule.

53.9.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PhoneDiagnostic job fails. The default is 5.
Raise event if data collector reports an error?	Select **Yes** to raise an event if the QoS syslog collector service reports an error. The default is Yes. An error affects the entire data-collection connection and all data associated with that connection.
Event severity when data collector reports an error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the QoS syslog collector service reports an error. The default is 10.

Parameter	How to Set It
Raise event if data collector reports a warning?	Select **Yes** to raise an event if the QoS syslog collector service reports a warning. The default is Yes.
Event severity when data collector reports a warning	Set the severity level, from 1 to 40, to indicate the importance of an event in which the QoS syslog collector service reports a warning. The default is 15.
Monitor Settings	
Length of time to wait for traceroute responses	Specify the maximum length of time that the PhoneDiagnostic job should wait for a response to traceroute requests to the CICM Element Manager. The PhoneDiagnostic job will fail if the response time is longer than you specify. The default is 120 seconds.
Far End (Remote) Phone Settings	
Select remote phone by	Select the category by which you want to choose the phone you want to monitor. Select **Terminal**, **DN**, or **IPAddress**. The default is DN.
Selection criteria	Based on your selection in *Select remote phone by*, provide details for the phone you want to monitor. Vivinet Diagnostics diagnoses call quality between this phone and the phone on which you run this script. • *If you selected Terminal*, provide the terminal address of the phone you want to monitor. • *If you selected DN*, provide the Directory Number of the phone you want to monitor • *If you selected IPAddress*, provide the IP address of the phone you want to monitor.

53.10 PhoneInventory

Use this Knowledge Script to create an inventory of the phones configured for a CICM Element Manager.

You choose both the search criteria for the inventory report and the location of the output folder. The inventory report is written to the computer on which the AppManager agent is running, unless you specify a UNC path: `\\servername\sharename\directoryname\filename`. If you specify a UNC path, ensure the `NetIQmc` service is running as an account that has proper permissions on the UNC path.

53.10.1 Prerequisites

- Run Discovery_NortelCS2x or SetupSupplementalDB to create the supplemental database.
- Run RetrieveConfigData to populate the supplemental database with phone configuration information.

53.10.2 Resource Object

NortelCS2x

53.10.3 Default Schedule

By default, this script runs once.

53.10.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PhoneInventory job fails. The default is 5.
Raise event if phone inventory succeeds?	Select **Yes** to raise an event when a phone inventory report is successfully generated. The default is Yes.
Event severity when phone inventory succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a phone inventory report is successfully generated. The default is 25.
Raise event if no records found?	Set to **Yes** to raise an event when the PhoneInventory job finds no phones based on the criteria you selected. The default is Yes
Event severity when no records found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the PhoneInventory job found no phones based on the criteria you selected. The default is 25.
Search Options	

Parameter	How to Set It
Select phones by	Select the filter by which you want to select the phones for the inventory report. Choose one of the following: • Node • Terminal • DN (Directory Number, the default) • Station Type • Network Name • Network ID • IP Address
Selection criteria	Provide the selection criteria for the phones to include in the inventory report. You can specify the actual item or you can specify a pattern by using the * wildcard. For example, to monitor all the phones in the ADM building, type `ADM*`. You can enter multiple criteria by separating each item with a comma. For example: `ADM0009A*,ADM0009B*` The criteria you enter must be of the same type as the *Select phones by* parameter. So if *Select phones by* is Terminal, then the criteria must be terminal names or patterns. If *Select phones by* is DN, then the criteria must be phone extension numbers. **NOTE:** Only the following characters are acceptable in this field: • Numbers • Uppercase and lowercase letters • Periods • Commas • Asterisks (*) • Underscores • Spaces
List only phones with status of	To further filter the list of phones, select a status. Only phones of this status type, matching the criteria you specified in *Selection criteria* and *Select phones by*, are included in the inventory report. Choose one of the following: • Any • Logged In • Logged Out
Result File Options	
Full path to output folder for result file	Type the full path or a UNC path to a location on the agent computer in which to save the inventory .csv file. The default path is `c:\Program Files\NetIQ\Temp\NetIQ_Debug\PhoneInventory.csv`
Sort by	Select **Name** to sort the contents of the inventory report in order by phone name, specifically by the “node” column and then by the “terminalid” column. Select **DN** to sort the contents of the inventory report in order by Directory Number, specifically by the “ud_pDN” column (Primary Directory Number) column. The default is DN.

53.11 PhoneQuality

Use this Knowledge Script to monitor real-time voice quality statistics from active calls on IP phones. This script raises one event per call if monitored statistics exceed or fall below the threshold you set. In addition, this script generates data streams for each monitored statistic.

This script monitors the mid-call QoS records for the Phase 2 IP phones on which you run this script. The QoS syslog collector service receives those records from the Call Server and pushes those records to the supplemental database.

MOS (Mean Opinion Score)
Represents the quality of a VoIP transmission by factoring in the "mouth-to-ear" characteristics of a speech path. A MOS of 5 is considered excellent; a MOS of 1 is unacceptably bad.

R-Value
Call quality value derived from delays and equipment impairment factors. An R-Value can be mapped to an estimated MOS. R-Values range from 100 (excellent) to 0 (poor).

Jitter
Also called delay variation, jitter is the mean deviation of the difference in packet spacing between the calling phone and the called phone.

Latency
The time taken for a data packet to be sent by a phone, travel, and be received by another phone.

Packet loss
Packets lost or dropped between the calling and called phone

NOTE: You can trigger NetIQ Vivinet Diagnostics to diagnose the problem when monitored voice quality statistics exceed the thresholds you set. For more information, see "Triggering Call and Phone Quality Diagnoses" on page 3267.

53.11.1 Prerequisites

- Run Discovery_NortelCS2x or SetupSupplementalDB to create the Nortel CS2x supplemental database.
- Run RetrieveConfigData to populate the supplemental database with phone configuration data.
- Run AddPhone to add the phones you want to monitor to the AppManager console.
- Run CollectorHealth to start the QoS syslog collector service.

53.11.2 Resource Object

NortelCS2x Station Object

53.11.3 Default Schedule

By default, this script runs on an asynchronous schedule.

53.11.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the PhoneQuality job. The default is 5.
Raise event if data collector reports an error?	Select **Yes** to raise an event if the QoS syslog collector service reports an error. The default is Yes. An error affects the entire data-collection connection and all data associated with that connection.
Event severity when data collector reports an error	Set the severity level, from 1 to 40, to indicate the importance of an event in which the QoS syslog collector service reports an error. The default is 10.
Raise event if data collector reports a warning?	Select **Yes** to raise an event if the QoS syslog collector service reports a warning. The default is Yes.
Event severity when data collector reports a warning	Set the severity level, from 1 to 40, to indicate the importance of an event in which the QoS syslog collector service reports a warning. The default is 15.
Monitor Settings	
Data collection interval for voice quality metrics	Specify how often the PhoneQuality script should collect phone quality statistics from the supplemental database. The default is 30 seconds, the minimum is 15 seconds, and the maximum is 1000000 seconds.
Perform traceroute and launch Vivinet Diagnostics when voice quality alert is received?	Select **Yes** to send a traceroute request to the CICM Element Manager and to launch Vivinet Diagnostics to diagnose the problem if vqalerts are received. The default is Yes.
Length of time to wait for traceroute responses	Specify the maximum length of time that the PhoneQuality job should wait for a response to traceroute requests to the CICM Element Manager. The PhoneQuality job will fail if the response time is longer than you specify. The default is 120 seconds.
Monitor Interval MOS	
Event Notification	
Raise event if interval MOS falls below threshold?	Select **Yes** to raise an event if the MOS value during the data collection interval falls below the threshold you set. The default is Yes.
Threshold - Minimum interval MOS	Specify the minimum MOS value that must occur during the data collection interval to prevent an event from being raised. The default is 3.60.
Event severity when interval MOS falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the MOS value during the data collection interval falls below the threshold. The default is 5.
Data Collection	
Collect data for interval MOS?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the MOS value during the data collection period. The default is Yes.
Monitor Interval R-Value	
Event Notification	
Raise event if interval R-Value falls below threshold?	Select **Yes** to raise an event if the R-Value during the data collection interval falls below the threshold you set. The default is Yes.
Threshold - Minimum interval R-Value	Specify the lowest R-Value that must occur during the data collection interval to prevent an event from being raised. The default is 70.

Parameter	How to Set It
Event severity when interval R-Value falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the R-Value during the data collection interval falls below the threshold. The default is 5.
Data Collection	
Collect data for interval R-Value?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the R-Value during the data collection interval. The default is unselected.
Monitor Interval Jitter	
Event Notification	
Raise event if interval jitter exceeds threshold?	Select **Yes** to raise an event if the jitter value during the data collection interval exceeds the threshold you set. The default is Yes.
Threshold - Maximum interval jitter	Specify the highest jitter value that can occur during the data collection interval before an event is raised. The default is 60 milliseconds.
Event severity when jitter exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the jitter value exceeds the threshold. The default is 15.
Data Collection	
Collect data for interval jitter?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of jitter that occurred during the data collection interval. The default is unselected.
Monitor Interval Latency	
Event Notification	
Raise event if interval latency exceeds threshold?	Select **Yes** to raise an event if the latency value during the data collection interval exceeds the threshold you set. The default is Yes.
Threshold - Maximum interval latency	Specify the highest amount of latency that can occur during the data collection interval before an event is raised. The default is 400 milliseconds.
Event severity when interval latency exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the latency value during the data collection interval exceeds the threshold. The default is 15.
Data Collection	
Collect data for interval latency?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of latency that occurred during the data collection interval. The default is unselected.
Monitor Interval Packet Loss	
Event Notification	
Raise event if interval packet loss exceeds threshold?	Select **Yes** to raise an event if the packet loss value during the data collection interval exceeds the threshold. The default is Yes.
Threshold - Maximum interval packet loss	Specify the highest percentage of packet loss that can occur during the data collection interval before an event is raised. The default is 1%.
Event severity when interval packet loss exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the packet loss value during the data collection interval exceeds the threshold. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for interval packet loss?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of packet loss that occurred during the monitoring period. The default is unselected.

53.12 RemovePhone

Use this Knowledge Script to remove IP phones (stations) from the AppManager console. This Knowledge Script is not available for use if you never used AddPhone to add an IP station.

When this Knowledge Script job runs successfully, the resource object for an IP station is deleted from the AppManager console. The job itself is not deleted, nor is the event that the job creates because the event is associated with the parent object: `NortelCS2x:<computer name>` object. However, you can set a global preference to ensure that an event is deleted when the associated object is deleted.

To delete associated events:

1. From the File menu, select **Preferences**.
2. Click **Repository**, and then click **Event**.
3. Select **Remove associated events when jobs are deleted**.

TIP:

- When you run this script, verify your selected phones in the Objects tab to avoid removing a phone that you want to keep.
- Before attempting to remove a phone, stop any monitoring jobs that are running on the phone.

53.12.1 Resource Object

NortelCS2x Station Object

53.12.2 Default Schedule

By default, this script runs once.

53.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of the failure of the RemovePhone job. The default is 5.
Event Notification	
Raise event if phones are removed successfully?	Select **Yes** to raise an event if the selected IP stations are successfully removed from AppManager console. The default is Yes.
Event severity when phones are removed successfully	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the selected IP stations are successfully removed from the AppManager console. The default is 25.

53.13 RetrieveConfigData

Use this Knowledge Script to retrieve station configuration information from individual CICM Element Managers. This script stores the configuration information in the Nortel CS2x supplemental database, where it can be monitored by the PhoneInventory and PhoneDiagnostic Knowledge Scripts.

53.13.1 Prerequisites

- Run Discovery_NortelCS2x or SetupSupplementalDB to create the supplemental database.
- Configure the CICM Element Manager user name and password in AppManager Security Manager.

53.13.2 Resource Object

NortelCS2x

53.13.3 Default Schedule

By default, this script runs once every day at 3 AM, so as to perform CPU-intensive functions at a time when Element Managers are least busy.

To populate the supplemental database immediately, change the schedule to **Run Once**.

53.13.4 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of the failure of the RetrieveConfigData job. The default is 5.
Raise event if configuration retrieval succeeds?	Select **Yes** to raise an event if the RetrieveConfigData job successfully stores station configuration information in the Nortel CS2x supplemental database. The default is unselected.
Event severity when configuration retrieval succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which configuration information is successfully stored in the NortelCS2x supplemental database. The default is 25.

53.14 SetupSupplementalDB

Use this Knowledge Script to create the Nortel CS2x supplemental database, including the tables and stored procedures needed to store logs, OM Reports, QoS and call detail records, and station configuration information. In addition, this script creates a SQL Server job that removes old records from the supplemental database.

When you create the supplemental database, you specify how long data is retained before being deleted. AppManager automatically deletes any records older than the retention age you specify.

53.14.1 Understanding the Supplemental Database

The Nortel CS2x supplemental database is a Microsoft SQL Server database you create locally on the proxy agent computer or on a specified remote computer. The log, OM, QoS syslog, and QoS file collector services receive data from the IEMS, the CICM, the CBM, and the Call Server, and then store that data in the supplemental database.

- The CollectorHealth Knowledge Script verifies that collectors are receiving data and starts the process by which the collectors push their data to the supplemental database.
- The CallActivity, CallFailures, CallQuality, LogQuery, and OMQuery, and PhoneQuality Knowledge Scripts query the supplemental database for the data you specify.
- The RetrieveConfigData Knowledge Script populates the supplemental database with station information used by the PhoneInventory and PhoneDiagnostic Knowledge Scripts.

To create and use the supplemental database:

1. **Create the database**. Create one Nortel CS2x supplemental database per office supported by a Communication Server solution. You can create the supplemental database when you run Discovery_NortelCS2x or SetupSupplementalDB.
2. **Populate the database**. Run CollectorHealth and RetrieveConfigData to populate the Nortel CS2x supplemental database.
3. **Monitor the data in the database**. Depending on your monitoring objectives, run the following scripts to analyze the data in the database.
   - CallActivity monitors active and completed calls.
   - CallFailures monitors LINE (line maintenance) logs.
   - CallQuality monitors end-of-call voice quality statistics: jitter, latency, lost data, MOS, and R-Value.
   - LogQuery monitors logs in specified log reports.
   - OMQuery monitors specified fields in the OM Report.
   - PhoneDiagnostic invokes NetIQ Vivinet Diagnostics to diagnose call quality between two phones.
   - PhoneInventory creates an inventory of the phones configured in a CICM Element Manager.
   - PhoneQuality monitors real-time, mid-call voice quality statistics from active calls on IP phones.

53.14.2 Resource Object

NortelCS2x IEMS

53.14.3 Default Schedule

By default, this script runs once.

53.14.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the SetupSupplementalDB job. The default is 5.
Raise event if database setup succeeds?	Select **Yes** to raise an event if creation of the Nortel CS2x supplemental database is successful. The default is unselected.
Event severity when database setup succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the success of the creation of the Nortel CS2x supplemental database. The default is 25.
Number of days to keep supplemental database records	Specify the number of days you want to keep records in the Nortel CS2x supplemental database. Data older than that is discarded. The default is 14 days.
SQL Server computer name	Specify the hostname or IP address of the remote SQL Server computer on which you want to create the Nortel CS2x supplemental database. Leave this parameter blank to create the supplemental database on the proxy agent (local) computer. For either a remote or local supplemental database, configure the SQL Server user name and password in AppManager Security Manager. For a remote supplemental database, set up the remote SQL Server computer.
SQL Server instance name	Specify the name of the SQL Server instance on the computer on which you want to create the Nortel CS2x supplemental database. Leave this parameter blank to accept the default instance name.

Parameter	How to Set It
Start pruning job on supplemental database?	**For all supported versions of SQL Server, except SQL Server 2005 Express**: Set to **Yes** to create a SQL job that deletes data from the supplemental database. The SQL job runs every night. Data is deleted from the supplemental database based on the value you specify in the *Number of days to keep call detail records* parameter. The default is Yes. **For SQL Server 2005 Express**: Set to **No**. The pruning job is not supported for SQL Server 2005 Express. **To manually delete data from the supplemental database**: 1. Run the following stored procedure from a command line: `osql -E -S <sql server> -n -d <database> -Q "exec dbo.Task_NortelCS2x_Pruning"` where <`sql server`> is the name of the server that hosts the supplemental database, and where <`database`> is the name of the supplemental database. For example: `osql -E -S SuppDBNortelCS2x -n -d NortelCS2x_S8300-Cluster -Q "exec dbo.Task_NortelCS2x_Pruning"` 2. Configure a Windows Scheduled Task to schedule pruning at an interval of your choosing. The process for configuring a Windows Scheduled Task varies according to your version of Microsoft Windows. Consult your Windows documentation for more information.

53.15 Recommended Knowledge Script Group

The following Knowledge Scripts in the AppManager for Nortel CS2x module are members of the NortelCS2x recommended Knowledge Script Group (KSG).

- CallActivity
- CallFailures
- CallQuality
- CollectorHealth

You can find the NortelCS2x KSG on the RECOMMENDED tab of the Knowledge Script pane of the Operator Console.

All the scripts in the KSG have their parameters set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab, and then run the NortelCS2x group on a Nortel CS2x resource.

Run the KSG from the Master view, not the NortelCS2x view. In order to use the Discovery_NortelCS2x Knowledge Script in a monitoring policy, the view must include root objects, which are not visible in the NortelCS2x view.

The NortelCS2x KSG enables a "best practices" usage of AppManager for monitoring your Nortel CS2x environment. You can use this KSG with AppManager monitoring policies. A monitoring policy, which enables you to efficiently and consistently monitor all the resources in your environment, uses a set of pre-configured Knowledge Scripts to automatically monitor resources as they appear in the TreeView. For more information, see "About Policy-Based Monitoring" in the AppManager Help.

A KSG is composed of a subset of a module's Knowledge Scripts. The script that belongs to a KSG is a different copy of the original script you access from the NortelCS2x tab. If you modify a script that belongs to a KSG, the parameter settings of the original script in the NortelCS2x tab are not affected.

In some cases, default script parameter settings are different when the script is deployed as part of a KSG, as opposed to when it is deployed alone. The default settings of a script within a group depend on its monitoring purpose within the larger group, and on the intended monitoring scope of that group.

If you modify or remove a script associated with the NortelCS2x KSG and want to restore it to its original form, you can reinstall AppManager for Nortel CS2x on the repository computer or check in the appropriate script from the `AppManager\qdb\kp\NortelCS2x` directory.

53.16 Triggering Call and Phone Quality Diagnoses

You can use NetIQ Vivinet Diagnostics to diagnose problems identified by NortelCS2x Knowledge Scripts.

Using the existing methodology of launching an Action script based on an event, AppManager can launch Action_DiagnoseVoIPQuality to trigger Vivinet Diagnostics in the following instances. The Action script runs by default only if Vivinet Diagnostics 2.3 or later is installed on the computer on which the script is running.

- To diagnose the problem for events raised by the CallQuality and PhoneQuality Knowledge Scripts.
- You can use the PhoneDiagnostic Knowledge Script to trigger Vivinet Diagnostics on demand, rather than waiting for a problem to be identified by the CallQuality and PhoneQuality Knowledge Scripts.

You can also use the CallAlert Knowledge Script to trigger Vivinet Diagnostics to diagnose the problems indicated by vqalerts.

To trigger Vivinet Diagnostics:

1. When setting parameter values for the CallQuality, PhoneQuality, or PhoneDiagnostic Knowledge Scripts, click the **Action** tab. Action_DiagnoseVoIPQuality is selected by default.
2. Click **Properties** and enter values for all parameters for Action_DiagnoseVoIPQuality.
3. Click **OK** to run the CallQuality, PhoneQuality, or PhoneDiagnostic Knowledge Script jobs.

The event message for the Action_DiagnoseVoIPQuality job provides a hyperlink to a .dgv file, which is the Diagnosis. Click the link to view the Diagnosis in the Vivinet Diagnostics console. For more information, see the *User Guide for Vivinet Diagnostics* and the Help for the Action_DiagnoseVoIPQuality Knowledge Script.

54 NT Knowledge Scripts

The NT category provides Knowledge Scripts for monitoring Microsoft Windows servers and workstations. This category also includes reporting scripts you can use to create meaningful reports about your Microsoft Windows servers and workstations.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
ConfigRemoteServiceDown	Loads the parameters specific to a local monitored computer and makes them available to the RemoteServiceDownLR Knowledge Script.
ConfigServiceDown	Loads the parameters specific to a local monitored computer and makes them available to the ServiceDownLR Knowledge Script.
CpuByProcess	Monitors CPU usage for each process and the total CPU usage for all processes.
CpuLoaded	Monitors total CPU usage and queue length to determine CPU load.
CpuResource	Monitors user CPU, the number of active processes, the number of threads, and the number of interrupts per second.
DiskSpace	Monitors logical drives for the percentage of disk space used, the amount of free space in megabytes, and the percentage of disk growth.
DNSConnectivity	Checks connectivity between a managed computer and its DNS server.
FailedLogon	Monitors the number of failed non-interactive logon attempts, for example, failed `net use` attempts, since the last interval.
FileChanged	Checks for changes to a specified file in the last monitoring interval.
FilesCompare	Compares the size, time stamp, and attributes of two files.
FileSizeSum	Monitors the total size of two specified files.
FilesOpen	Monitors the number of open files that were opened remotely, for example, by a user who remotely logged onto the computer.
FindFiles	Monitors logical drives for files that match your filtering criteria.
FolderFileCount	Monitors folders for the number of files that match your filtering criteria.
FolderSize	Monitors the size of folders containing files matching your filtering criteria.

Knowledge Script	What It Does
IntervalCounter	Monitors the change in any performance monitor counter.
LogicalDiskStats	Monitors logical disk transfers, disk reads, disk writes, operation time, and queue length.
MemByProcess	Monitors memory use for each process and total memory usage for all processes.
MemUtil	Monitors physical memory, virtual memory, and the paging files.
NetSession	Lists the network sessions connected to a computer.
NetworkBusy	Monitors the traffic on the network interface cards on a Windows computer.
PagingHigh	Monitors paging activity per second.
PhysicalDiskStats	Monitors physical disk transfers, disk reads, disk writes, operation time, and queue length.
PortHealth	Checks whether system ports are working properly.
PrinterHealth	Checks for print job problems, such as a paused or jammed printer, and the printer queue length.
PrinterQueue	Monitors a printer's queue length.
ProcessDown	Determines whether specified processes are running.
Processes	Monitors the number of processes.
ProcessUp	Checks whether a specified process is running and, optionally, terminates the process.
RegistryChange	Monitors changes in the registry.
RemoteServiceDown	Detects if any service on a remote computer is down.
RemoteServiceDownLR	Using parameters you specified with the ConfigRemoteServiceDown Knowledge Script, this script runs on a group of computers to detect whether services on remote computers are down.
Report_CPULoad	Generates a detailed report about CPU usage and queue length.
Report_CPULoadSummary	Generates a summary report about CPU usage and queue length.
Report_CPUResource	Generates a detailed report about the use of CPU resources, including the number of active processes, threads, and interrupts per second, and the utilization of CPU resources in user mode.
Report_CPUResourceSummary	Generates a summary report about the use of CPU resources.
Report_CPUUsageofProcessesSummary	Generates a summary report about CPU usage per named process, and total CPU usage by all named processes.
Report_FilesOpen	Generates a report about the number of files open during a specified period.
Report_LogicalDiskAvailSummary	Generates a summary report about the available space (in MB) for a logical disk.
Report_LogicalDiskUsageSummary	Generates a summary report about the percentage of disk space used and the amount of free space.
Report_MemoryUtilization	Generates a detailed report about the use of physical and virtual memory, and paging files.

Knowledge Script	What It Does
Report_MemoryUtilizationSummary	Generates a summary report about the use of physical and virtual memory, and paging files.
Report_NetworkBusy	Generates a report about the use of bandwidth on network interface cards.
Report_PagingHigh	Generates a report about the number of reads and writes per second to the page file.
Report_PhysicalDiskIO	Generates a report about the number of reads, writes, and transfers per second for a physical disk.
Report_PhysicalDiskQueueLength	Generates a report about physical disk queue length.
Report_PrinterHealth	Generates a report about print job problems and printer queue length.
Report_Process	Generates a report about the number of processes running during a specified period.
Report_TopCPUProcs	Generates a report about the total CPU used by all processes and which processes consume the most CPU resources.
Report_TopMemoryProcs	Generates a report about the total memory used by all processes and which processes consume the most memory.
RunAwayProcesses	Detects runaway processes by sampling CPU usage.
ServerBusy	Monitors the Windows server activity for network clients.
ServerBytes	Monitors the number of bytes per second transferred to and from a target computer.
ServerError	Monitors the number of sessions that errored out during the monitoring interval.
ServerTimeout	Monitors the number of sessions that timed out during the monitoring interval.
ServiceChange	Detects changes to the status and start type for Windows services.
ServiceDown	Monitors the stopped and started status of Microsoft Windows services and, optionally, starts services that are stopped.
ServiceDownLR	Using parameters you specified with the ConfigServiceDown Knowledge Script, this script can run on a group of computers to detect whether specified services are down and if so, optionally restart them.
ServiceHung	Checks whether any Windows services are hung.
ServiceRemove	Detects if any Windows services are added or removed in the monitoring interval.
SharedFiles	Monitors open network shared files.
SystemUpTime	Tracks the number of hours a computer has been operational since it was last rebooted.
TopCpuProcs	Monitors total CPU used by all processes and which processes consume the most CPU resources.
TopMemoryProcs	Monitors the total memory used by all processes and which processes consume the most memory.
TrustRelationship	Tests the domain trust relationship from a trusting domain to specified trusted domains.

Knowledge Script	What It Does
UnixRemoteProcessDown	Monitors applications on remote UNIX computers where you cannot easily install a UNIX agent.

54.1 ConfigRemoteServiceDown

Use this Knowledge Script to set parameter values in the local repository of the computer where you run the script. The values are used by the RemoteServiceDownLR script when it runs on that computer.

Using this pair of scripts, you can set up the computers in a group so that when the RemoteServiceDownLR script runs on the group, it can run with different parameter values on each computer. This is particularly useful for enforcing monitoring policies.

54.1.1 Resource Objects

Windows 2000 Server and later

54.1.2 Default Schedule

The default schedule for this script is **Run once**.

54.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event when job completes?	Set to **y** to raise an event when the job completes, with or without errors. The default is y.
List of computers	Specify one or more computers to monitor, separating each computer name with a comma (,) and no space.
Full path to file with a list of computers	Specify the full path to and name of a text file containing a list of computers. Put each computer on a separate line; no commas or spaces. The job supports a maximum file size of 32KB. If the file size exceeds 32KB, the job stops and raises an error event message: `Out of string space`.
List of services	Specify the name of one or more services to monitor, separating each name with a comma (,) and no space. The default is `NetIQmc`.
Event severity when job completes	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ConfigRemoteServiceDown job completes, with or without errors. The default is 25 (blue event indicator).

54.2 ConfigServiceDown

Use this Knowledge Script to set parameter values in the local repository of the computer on which you run the script. The values are used by the ServiceDownLR script when it runs on that computer. Using this pair of scripts, you can set up the computers in a group so that when the ServiceDownLR script runs on the group, it can run with different parameter values on each computer. This is particularly useful for enforcing monitoring policies.

54.2.1 Resource Objects

Windows 2000 Server or later

54.2.2 Default Schedule

The default schedule for this script is **Run once**.

54.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event when job completes?	Select **Yes** to raise an event when the job completes, with or without errors. The default is Yes.
List of services	Specify one or more services to monitor. Use an asterisk (*) to monitor all “automatic” services. Use a comma to separate multiple service names. The default is `EventLog`.
List of excluded services	Specify one or more services to exclude from monitoring. Use an asterisk (*) to exclude all “automatic” services. Use a comma to separate multiple service names.
Event severity when job completes	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ConfigServiceDown job completes, with or without errors. The default is 25 (blue event indicator).

54.3 CpuByProcess

Use this Knowledge Script to monitor whether specified processes have exceeded CPU thresholds. This script monitors CPU usage for each named process, as well as the total CPU usage for all named processes.

To determine CPU usage, this script checks the percentage of processor time that the threads for each process used to execute instructions.

If a process is not found, the script assumes that the process is not running, and reports zero as the CPU result.

NOTE:

- This script does not detect invalid process names. If you enter an invalid process name, the script assumes that the process is not running, and reports zero as the CPU result.
- If the CPU usage for the named processes exceeds the threshold limit, an event is raised. However, this is not applicable for Windows System Idle Process. The System Idle Process indicates the percentage of idle CPU resources. If no applications are running, this process indicates a high idle capacity. The high percentage exceeds the threshold and raises an event indicating that the System Idle Process consumes high CPU resources. You can safely ignore this event message because the high percentage refers to the high idle capacity and not high CPU usage.

54.3.1 Resource Objects

Windows 2000 Server or later

54.3.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Create event for each process that exceeds the threshold?	Select **Yes** to raise an event if any individual process exceeds the CPU usage threshold you specify. The default is Yes.
Severity – Individual process CPU high	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. The default is 8 (red event indicator).
Create event if the sum of all processes exceeds the threshold?	Select **Yes** to raise an event if the CPU usage by all processes exceeds the threshold you specify. The default is Yes.
Severity – Total process CPU high	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage for all processes exceeds the threshold. The default is 15 (yellow event indicator).

Description	How to Set It
Severity – Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the CpuByProcess job fails unexpectedly. The default is 5 (red event indicator).
Data Collection	
Collect data for each process?	Select **Yes** to collect data for charts and reports, for each process you monitor. The default is unselected.
Collect data for all processes?	Select **Yes** to collect data for charts and reports, for all processes you monitor. The default is unselected.
Monitoring	
Processes	Specify the names of the processes you want to monitor. Separate the names with commas (,) and no spaces.
Maximum threshold for CPU for each process	Specify the maximum CPU usage allowed for *each* monitored process before an event is raised. The default is 60%.
Maximum threshold for CPU for all processes	Specify the maximum CPU usage allowed for *all* monitored processes before an event is raised. The default is 95%.

54.4 CpuLoaded

Use this Knowledge Script to monitor total CPU usage and queue length to determine whether the CPU is overloaded. This script raises an event when CPU usage and CPU queue length values exceed the thresholds you set.

54.4.1 Resource Objects

CPU folder or any individual CPU icon (for multiprocessor systems)

54.4.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the CpuLoaded job fails. The default is 5 (red event indicator).
Raise event if total system CPU exceeds threshold?	Select **Yes** to raise an event if total system CPU usage exceeds the threshold you set. The default is Yes. This script raises an event when the following occur: • Total system CPU exceeds the threshold AND • *Threshold - Maximum processor queue length* is exceeded OR set to 0.
Event severity when total system CPU exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which system CPU usage exceeds the threshold. The default is 10 (red event indicator).
Raise event if any individual CPU exceeds threshold?	Select **Yes** to raise an event if CPU usage for any monitored server exceeds the usage threshold you set. The default is unselected. This script raises an event when the following occur: • Individual CPU exceeds the threshold AND • *Threshold - Maximum processor queue length* is exceeded OR set to 0.
Event severity when individual CPU exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which individual CPU usage exceeds the threshold. The default is 15 (yellow event indicator).
Monitoring	

Description	How to Set It
Use virtual machine performance counters if available?	Select **Yes** to monitor VMware performance counter data on virtual machines, if available, instead of physical host counters. The default is Yes. VMware performance counters do not provide processor queue length data. If you select Yes, only CPU usage data is monitored. **Important** VMware allows virtual machines to obtain more than 100% of its CPU, so if you select Yes for this parameter, you may see CPU utilization data that is greater than 100%.
Thresholds	
Threshold - Maximum total system CPU	Specify the maximum total system CPU usage allowed before an event is raised. The default is 95%.
Threshold - Maximum individual CPU	Specify the maximum individual CPU usage allowed before an event is raised. The default is 98%.
Threshold - Maximum processor queue length	Specify the maximum number of processes the CPU queue can contain before an event is raised. CPU queue length indicates how many processes are ready to run. The default is 2 processes. **NOTE:** To ignore processor queue length and monitor only CPU usage, set this threshold to 0.
Data Collection	
Collect data for total system utilization?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the overall percentage of CPU time used. The default is unselected. The detail data contains information about the percentage of CPU usage and the threshold for percentage of CPU usage.
Collect data for individual processor utilization?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of CPU time used for each processor in one datastream per processor. The default is unselected. The detail data contains information about the percentage of CPU usage and the threshold for percentage of CPU usage.
Collect data for processor queue length?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of threads waiting to execute on all processors. The default is unselected. The detail data contains information about processor queue length and the threshold for processor queue length.

54.4.4 Example of How this Script Is Used

This script monitors both the percentage of CPU used and processor queue length. By itself, high CPU usage might not indicate a problem. Instead, consider the following factors:

- Queue length
- How you are using the computers monitored
- Your overall strategy for the environment

For example, in a **transactional** environment you can have a computer with CPU usage at 90% consistently. The computer has no room for growth, but if the queue length remains low and stable (never

more than two or three threads waiting), the computer can be sized perfectly for maximum efficiency. If the queue length increases and threads are waiting, you may have a problem that needs to be addressed.

In a **batch** environment, however, you can set the script to run during off-peak hours when the batch jobs are not running. The script can raise an event if CPU usage is over 50% and any thread is waiting (queue length at 0) to ensure the computer has enough CPU headroom for batch jobs to run.

Other factors to consider are long range plans, such as the number of users you expect to support, how long you expect to support them, and how much room you need for growth. For example, you can set the CPU usage threshold lower to warn you to off-load some processing or order new systems.

54.4.4.1 Monitoring Multi-Processor Systems

On a multi-processor system, the total CPU utilization is the average percentage of time that all the processors on the system are busy executing non-idle threads. For example:

- If all processors are always busy, this is 100%.
- If all processors are 50% busy, this is 50%.
- If 25% of the processors are busy, this is 25%.

54.4.4.2 Monitoring Overall or Individual CPU Load

Monitor load for each CPU individually to gain more specific information about what is really happening on a system. For example, if you monitor overall load and see CPU usage is 100%, you do not know as much about the resource usage as seeing that CPU 0 is running at 90% and CPU 1 is running at 10%.

54.4.4.3 Handling Spikes

Because CPU and queue length are often subject to temporary spikes, set a short interval (two to five minutes), but raise an event only after thresholds are exceeded in three consecutive periods.

54.4.4.4 Collecting Data for Trend Analysis

This script can be set to collect data to help you identify usage trends for your servers. For example, if CPU usage increases, you can plan for growth. To perform this type of analysis, run a second job that collects data at a less-frequent interval.

54.5 CpuResource

Use this Knowledge Script to monitor CPU resource consumption for users, the number of active processes, the number of threads, and the number of interrupts per second. This script raises an event if a monitored value exceeds the threshold you specify.

54.5.1 Resource Object

CPU folder

54.5.2 Default Schedule

The default schedule for this script is **Every 10 minutes**.

54.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if any threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. The default is n.
Maximum CPU user utilization threshold	Specify the maximum CPU usage allowed in user mode before an event is raised. The default is 90%.
Maximum number of processes threshold	Specify the maximum number of processes that can be running before an event is raised. The default is 80.
Maximum number of threads threshold	Specify the maximum number of threads that can be running before an event is raised. The default is 500.
Maximum interrupts per second threshold	Specify the maximum number of interrupts per second allowed before an event is raised. The default is 600.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

54.6 DiskSpace

Use this Knowledge Script to monitor logical drives for the percentage of disk space used, the amount of free space in megabytes, and the percentage of disk growth between iterations.

Each time it runs, this script automatically monitors all logical disks on a server and all shared drives in a cluster. The owner of the quorum disk, which determines the current state of the cluster, monitors the space on shared drives. You can override automatic monitoring by providing a specific list of drives to monitor. Also, you can provide a list of drives to exclude from monitoring.

This script raises an event if the percentage of used space exceeds the threshold you set, if the amount of free space falls below the threshold you set, or if the percentage of disk growth exceeds the threshold you set.

NOTE:

- In a cluster, this script runs on the primary node to monitor disk growth. If failover occurs, this script begins monitoring disk growth on the secondary node. The first iteration of the Knowledge Script job after failover reports the disk size of the secondary node as being the same as that of the primary node. The job begins reporting disk growth during the second and subsequent iterations after failover.
- Because clustered virtual servers do not support maintenance mode, the *Maintenance Mode* option is unavailable for clustered virtual servers in AppManager.

The ReportAM_CurrentDiskSpaceUsage report uses data collected by the NT_DiskSpace script. Ensure you archive data detail when running the Knowledge Scripts to collect data. You must disable the *Do not archive data detail* option in the Advanced tab of the Knowledge Script properties dialog box to allow automatic data archiving.

To use the DiskSpace Knowledge Script, you must install the AppManager for Microsoft Windows module, version 7.6.x.0 or later, on your agent computers.

54.6.1 Resource Object

Logical disk object

54.6.2 Default Schedule

By default, this script runs every five minutes.

54.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Event severity when job fails?	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the DiskSpace job fails. The default is 5.

Parameter	How to Set It
Raise an event if threshold is crossed?	Select **Yes** to raise an event if the amount of available disk space falls below the threshold you set, if the percentage of disk utilization exceeds the threshold you set, and if the percentage of disk growth exceeds the threshold you set. The default is Yes. When you enable this parameter, the script raises one event that details the disk usage for all monitored logical drives. **NOTE:** If you run this script on a cluster, the script raises one event per monitored node in that cluster.
Raise a separate event for individual drives?	Select **Yes** to raise an event if the amount of available disk space falls below the threshold you set or the percentage of disk utilization exceeds the threshold you set. The default is unselected. When you enable this parameter, the script raises separate events that detail the disk usage for each monitored logical drive.
Event severity when a threshold is crossed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of available disk space falls below the threshold you set or the percentage of disk utilization exceeds the threshold you set. The default is 5.
Do not raise events if disk growth thresholds are crossed?	Select **Yes** to limit the number of events that occur by not raising an event any time the disk growth thresholds are crossed. The default is unselected.
Only raise events when both disk space and disk utilization thresholds are crossed?	Select **Yes** to raise an event only when *both* disk space and disk utilization thresholds are crossed. The default is unselected.
Use XML format for event message?	Select **Yes** to format event detail messages in XML. Leave this parameter unselected to format event detail messages in plain text. Events formatted in XML display results in tables. Events in plain text display results in rows of unformatted text.
Raise event if information cannot be retrieved for removable devices?	Select **Yes** to raise an event if information about a removable device cannot be retrieved. The default is unselected. In general, if a device is plugged in, it should be queryable.
Event severity when disk information cannot be retrieved	Set the event severity level, from 1 to 40, to indicate the importance of an event in which removable device information cannot be retrieved. The default is 35.
Disk Space Monitoring	
Drives to monitor	To monitor network drives, provide the UNC paths to the logical drives you want to monitor. Separate more than one path with a comma, such as `\\server01\C$,\\server02\D$` **NOTE:** The Log On As account under which the AppManager agent runs must have permission to access the UNC path. Leave this parameter blank to automatically monitor all logical drives.

Parameter	How to Set It
Drives to exclude	Provide a comma-separated list of the drives you do not want to monitor. This script automatically monitors all drives except those listed in this parameter. You can use regular expressions in this parameter. For more details about regular expressions, see the following Microsoft web pages: • http://msdn.microsoft.com/en-us/library/6wzad2b2.aspx • http://msdn.microsoft.com/en-us/library/1400241x.aspx You can also use the asterisk (*) as a wildcard at the end of a string.
Monitor mount points?	Select **Yes** to allow the script to monitor mount points (mapped drives). The default is Yes.
Ignore disks with minimal total size?	Select **Yes** to exclude disks of a certain size from monitoring. Use the *Threshold - Minimum disk size for monitoring* parameter to set the minimum monitoring requirement. The default is Yes.
Minimum size for disk monitoring	Specify the minimum size requirement for disk monitoring. Disks of less than *n* MB are excluded from monitoring The default is 100 MB.
Thresholds	
Global threshold - Minimum available disk space	Specify the minimum amount of disk space that must be available to prevent an event from being raised. The default is 100 MB. This threshold applies to all disks unless you provide a per-disk threshold value in the *Per-disk threshold - Minimum available disk space* parameter.
Global threshold - Maximum disk utilization	Specify the maximum percentage of disk utilization that can occur before an event is raised. The default is 90%. This threshold applies to all disks unless you provide a per-disk threshold value in the *Per-disk threshold - Maximum disk utilization in %* parameter.
Global threshold - Maximum percentage of disk growth	Specify the percentage of disk growth that can occur before an event is raised. The default is 25%. For example, if you set this parameter to 30%, this script raises an event if the size of the disk is 30% larger than it was during the previous script iteration. This threshold applies to all disks unless you provide a per-disk threshold value in the *Per-disk threshold - Maximum percentage of disk growth in %* parameter.
Apply per disk thresholds?	Select **Yes** to set different thresholds for individual disks. The default is unselected. **NOTE:** If you are monitoring mount points, label them in the following manner: `C:\MOUNT=100000,D:\MOUNT=90000`
Per-disk threshold - Minimum available disk space in MB	Specify the minimum amount of disk space that must be available on individual disks to prevent an event from being raised. Use commas to separate multiple thresholds. For example: `C=90500,D=550` In this example, the threshold for minimum disk space on the C: disk is 90500 MB. The threshold for the D: disk is 550 MB.
Per-disk threshold - Maximum disk utilization in %	Specify the maximum percentage of disk utilization that can occur on individual disks before an event is raised. Use commas to separate multiple thresholds. For example: `C=50,D=80` In this example, the threshold for maximum disk utilization on the C: disk is 50%. The threshold for the D: disk is 80%.

Parameter	How to Set It
Per-disk threshold - Maximum percentage of disk growth in %	Specify the maximum percentage of disk growth that can occur on individual disks before an event is raised. Use commas to separate multiple thresholds. For example: `C=5,D=10` In this example, the threshold for maximum disk growth on the C: disk is 5%. The threshold for the D: disk is 10%.
Data Collection	
Collect data for available disk space?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of available disk space for the selected drives. The default is unselected.
Collect data for disk utilization?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns utilization details for logical disk space (%), used space (%), threshold (%), total space (MB), free space (MB). The default is unselected.
Collect data for disk growth?	Select Yes to collect data for charts and reports. If enabled, data collection returns the percentage of disk growth from the previous iteration to the current iteration. The default is unselected.

54.7 DNSConnectivity

Use this Knowledge Script to check connectivity between a managed computer and its DNS server. This script raises an event if the connection to the DNS server fails.

54.7.1 Resource Objects

Windows 2000 Server or later

54.7.2 Default Schedule

The default schedule for this script is **Every hour**.

54.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the connection to the DNS server fails. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • **100** – the DNS lookup and connection to the DNS server were successful, or • **0** – the connection is not successful. The default is n.
Remote DNS hostname	Specify the name of the DNS server whose connection should be checked. If you do not enter a hostname, the default DNS server for the managed computer is used. The default is `wns1.HOME.net`.
DNS domain name	Provide the name of the DNS domain for the specified DNS server. Leave blank to use the local domain for the managed computer. The default is `HOME.net`.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the connection to the DNS server fails. The default is 8 (red event indicator).

54.8 FailedLogon

Use this Knowledge Script to monitor the number of failed non-interactive logon attempts to the server since the last interval. The result is always zero for the first interval so that the script can establish a baseline for subsequent checks.

For example, this script raises an event if you run this script on a computer and unsuccessfully attempt to log onto that computer using the `net use` command. This script does **not** raise an event for a failed interactive logon attempt, even a failed interactive login attempt from a remote desktop.

Use this script to determine whether password guessing programs are being used on the server. If you use this script to monitor events, the script raises an event for each failed logon attempt. If you choose to collect data, the script reports the total number of logon failures.

54.8.1 Resource Objects

Windows 2000 Server or later

54.8.2 Default Schedule

The default schedule for this script is **Every hour**.

54.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the number of failed logon attempts exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total number of logon failures. The default is n.
Failed logon threshold	Specify the maximum number of failed logon attempts allowed before an event is raised. The default is 0. If you are seeing too many insignificant events from users entering passwords incorrectly, determine a "typical" logon failure pattern (for example 5 per 24 hours) and set this parameter accordingly.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of failed logon attempts exceeds the threshold. The default is 5 (red event indicator).

54.9 FileChanged

Use this Knowledge Script to determine whether a specified file has changed since the last monitoring interval. This script compares the current size, time stamp, and attributes for a file to the size, time stamp, and attribute settings found for the file the last time the script ran.

You can choose to raise an event if the size, time stamp, or attribute indicates the file has been modified, or raise an event if any of these properties indicates the file has *not* been changed since the last monitoring interval.

Because this script checks the file properties rather than the file content, you can use this script with almost any file type.

Because this script can raise an event if a particular file has changed or when a file you expect to change has not been modified, you can use the script many different ways to monitor your environment.

For example, you might have an application that runs nightly regression tests and generates a report of the results. You can use this script to raise an event when the time stamp for the regression report is not modified, indicating that the test harness might have failed or other problems occurred in producing the expected report. If no event is raised, you can assume that a new report was generated successfully.

In addition, because you can selectively monitor file size, modification time, and attributes, and set severity levels for these properties independently, you can get clearer insight into the changes made to key files and respond accordingly. For example, you can monitor the file modification time for a file and receive a warning or raise an informational event when this property changes. You can raise a critical severity event or receive an e-mail message if a file's attribute changes to read-only or suddenly becomes writable.

54.9.1 Resource Objects

Windows 2000 Server or later

54.9.2 Default Schedule

The default schedule for this script is **Every 24 hours**.

54.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Create event if file size changed?	Select **Yes** to raise an event if the file size has changed since the last time the job ran. The default is unselected.
Severity - Size changed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the file size has changed. The default is 15 (yellow event indicator).
Create event if file time changed?	Select **Yes** to raise an event if the modification time of the file has changed since the last time the job ran. The default is Yes.

Description	How to Set It
Severity - Time changed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the modification time has changed. The default is 15 (yellow event indicator).
Create event if file attribute changed?	Select **Yes** to raise an event if an attribute of the file has changed since the last time the job ran. The default is unselected.
Severity - Attribute changed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the file attribute has changed. The default is 15 (yellow event indicator).
Create event if file does not exist?	Select **Yes** to raise an event if the file you want to monitor does not exist. By default, events are not raised.
Severity - File does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the file does not exist. The default is 15 (yellow event indicator).
Severity - Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the FileChanged job fails unexpectedly. The default is 5 (red event indicator).
Monitoring	
File path	Specify the full path to the file you want to monitor. For example: `C:\Temp\myfile.txt`
Monitor file for...	**...changes**. Select this option to raise events when there are changes to the file. **...no changes**. Select this option to raise events when there are no changes to the file.

54.10 FilesCompare

Use this Knowledge Script to compare the sizes, time stamps, and attributes of two files. You can choose which properties to compare and the event severity if the script finds differences between the specified properties.

Because this script checks the file properties rather than the file content, you can use this script with almost any file type.

54.10.1 Resource Objects

Windows 2000 Server or later

54.10.2 Default Schedule

The default schedule for this script is **Every 10 minutes**.

54.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if sizes are different?	Set to **y** to raise an event if the file size of File #1 is different from the file size for File #2. The default is y.
Raise event if modification times are different?	Set to **y** to raise an event if the file modification time for File #1 is different from the file modification time for File #2. The default is y.
Raise event if attributes are different?	Set to **y** to raise an event if the file attributes for File #1 are different from the file attributes for File #2. The default is y.
Compare file #1	Provide the full path to the first file to compare. For example: `C:\Temp\myfile.doc`.
Compare file #2	Provide the full path to the second file to compare.
Event severity level for size difference	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a size difference exists. The default is 5 (red event indicator).
Event severity level for time difference	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a time difference exists. The default is 5 (red event indicator).
Event severity level for attribute difference	Set the event severity level, from 1 to 40, to indicate the importance of an event in which an attribute difference exists. The default is 5 (red event indicator).

54.11 FileSizeSum

Use this Knowledge Script to monitor the total size of two files. This script raises an event if the total size of the two files exceeds the threshold you set.

54.11.1 Resource Objects

Windows 2000 Server or later

54.11.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Create event if the sum of the size of both files is above the threshold?	Select **Yes** to raise an event if the total size of both files exceeds the threshold you set. The default is Yes.
Severity - Sum size above threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the size of both files exceeds the threshold. The default is 15 (yellow event indicator).
Create event if any file is missing?	Select **Yes** to raise an event if either of the specified files is missing. The default is Yes.
Severity - File missing	Set the event severity level, from 1 to 40, to indicate the importance of an event if either of the specified files is missing. The default is 15 (yellow event indicator).
Severity - Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the FileSizeSum job fails unexpectedly. The default is 5 (red event indicator).
Data Collection	
Collect file size sum data?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total size of the two files you specify. The default is unselected.
Monitoring	
Select first file ...	Click **Browse [...]** to select the first of the two files to monitor.
Select second file ...	Click **Browse [...]** to select the second of the two files to monitor.
Sum size threshold	Specify the maximum file size allowed before an event is raised. The default is 2. **NOTE:** Select units for the file size in the *File size scale* parameter.

Description	How to Set It
File size scale	Select the unit of file size. The choices are: • bytes • kilobytes • megabytes • gigabytes • terabytes The default is megabytes.

54.12 FilesOpen

Use this Knowledge Script to monitor the number of files currently open through a shared network drive or by a user who logged onto the computer remotely, for example, by using the `net use` command. This script does *not* raise an event if a file is opened by a user who interactively logged onto the computer.

54.12.1 Resource Objects

Windows 2000 Server or later

54.12.2 Default Schedule

The default schedule for this script is **Every 30 minutes**.

54.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the number of open files exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. The default is n.
Maximum number of files open threshold	Specify the maximum number of files that can be open before an event is raised. The default is 200.
Event severity level for open files	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of open files exceeds the threshold. The default is 5 (red event indicator).
Event severity level for an unexpected Knowledge Script error	Set the event severity level, from 1 to 40, to indicate the importance of an event in which FilesOpen job fails unexpectedly. The default is 35 (magenta event indicator).

54.13 FindFiles

Use this Knowledge Script to monitor the number of files that match a set of criteria. This script raises an event if the number of matching files exceeds the threshold you specify. This job fails if the time required to find a file exceeds the schedule interval.

54.13.1 Resource Object

Misc Device folder

54.13.2 Default Schedule

The default schedule for this script is **Every 24 hours**.

54.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if threshold is exceeded?	Select **Yes** to raise an event if the number of files found that match your criteria exceeds the threshold you specify. The default is Yes.
Severity – Exceeded threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of matching files exceeds the threshold. The default is 11 (yellow event indicator).
Raise event if a folder cannot be accessed?	Select **Yes** to raise an event if the folder you specify in the *Root folder to begin the search* parameter does not exist or cannot be accessed because the account under which the NetIQ Client Resource Monitor service (`NetIQmc`) is running does not have permission to open the folder. The default is unselected.
Severity - Folder not accessible	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the specified folder does not exist or cannot be accessed. The default is 25 (blue event indicator).
Severity - Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the FindFiles job fails unexpectedly. The default is 5 (red event indicator).
Data Collection	
Collect file count data?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of files that match your filtering criteria. The default is unselected.
Monitoring	
Logical drive letter(s) to search	Provide a comma-separated list, with no spaces, of the letters representing the logical drives you want to search. For example: `C,D`.
Root folder to begin the search	Provide the path to the folder on each drive where the search should begin. For example, enter `Documents and Settings\Administrator\My Documents` to begin searching in the `My Documents` folder. The default is `users`.

Description	How to Set It
File name(s), can use * and ? wildcards	Provide the filenames to search for. Use the * wildcard to represent any number of characters. Use the ? wildcard to represent any single character. The default is *.* (all files). You can enter only one filename here, but with the use of wildcards, you can search for multiple files.
Search subfolders?	Select **Yes** to search any subfolders of the root folder in which your search begins. The default is unselected.
File count threshold	Specify the maximum number of files that can be found that match your criteria before an event is raised. The default is 500.
File Filters	
File Attributes Filter	
File attribute operator	Select the operator (AND or OR) to apply to the criteria in the *File Attributes Filter* parameters. For example, instruct the script to search for files that have the *Archive attribute* AND the *Hidden attribute*. The default is OR.
Archive attribute	Select **Yes** to search for files that have the Archive attribute. The default is Yes.
Hidden attribute	Select **Yes** to search for files that have the Hidden attribute. The default is Yes.
Read-only attribute	Select **Yes** to search for files that have the Read-only attribute. The default is Yes.
System attribute	Select **Yes** to search for files that have the System attribute. The default is Yes.
Date Modified Filter	
Apply date modified filter?	Select **Yes** to apply a search filter that considers the date on which a file was modified. The default is unselected.
Select time range	Click **Browse [...]** to open the time browser. Set a specific or sliding date/time range for the date/time on which files were modified. The default is a sliding range of 1 Day with the End now option selected. A specific date/time range defines a specific start and end date and time, for example: `1/1/2004 12:00 AM to 1/31/2004 11:59 PM.` A sliding date/time range defines a time range relative to the start time of the Knowledge Script job. For example, a sliding date/time range of 1 Day extends from 12:00 AM of the previous day to 11:59 PM of the previous day (the entire 24-hour period of the day prior to the day the script runs). The **End now** option for the sliding date/time range extends the time range up to the start time of the Knowledge Script job. For example, if the job runs at 3:00 PM with a sliding range of 1 Day, then the time range covered is 12:00 AM of the previous day to 3:00 PM of the current day.
File Size Filter	
Apply file size filter?	Select **Yes** to apply a search filter that considers the size of a file. The default is unselected.
File size	Set the number of units that define the file size. The type of units are set in the *File size scale* parameter. The default is 2.
File size scale	Set the type of unit that defines the file size (for example, kilobytes). The default is megabytes.
File size operator	Select the operator that defines the file size (for example, less than 2 megabytes). The default is greater than.

54.14 FolderFileCount

Use this Knowledge Script to monitor the number of files in a folder that match a set of criteria. This script raises an event if the number of matching files per folder exceeds the threshold you specify.

54.14.1 Resource Object

Misc Device folder

54.14.2 Default Schedule

The default schedule for this script is **Every 24 hours**.

54.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if threshold is exceeded?	Select **Yes** to raise an event if the number of files found matching your criteria exceeds the threshold you specify. The default is Yes.
Severity - Exceeded threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of matching files exceeds the threshold. The default is 11 (yellow event indicator).
Raise event if a folder cannot be accessed?	Select **Yes** to raise an event if the folder you specify in the *Root folder to begin the search* parameter does not exist or cannot be accessed because the account under which the NetIQ Client Resource Monitor service (`NetIQmc`) is running does not have permission to open the folder. The default is unselected.
Severity - Folder not accessible	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the specified folder does not exist or cannot be accessed. The default is 25 (blue event indicator).
Severity - Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the FolderFileCount job fails unexpectedly. The default is 5 (red event indicator).
Data Collection	
Collect file count data?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of folders with a file count that exceeds your threshold and the number of files per folder that match your filtering criteria. The default is unselected.
Monitoring	
Logical drive letter(s) to search	Type a comma-separated list, with no spaces, of the letters representing the logical drives you want to search. For example: `C,D`.

Description	How to Set It
Root folder to begin the search	Type the path to the folder on each drive where you want to begin searching. For example, `Documents and Settings\Administrator\My Documents` to begin searching in the `My Documents` folder. The default is `users`.
File name(s), can use * and ? wildcards	Type the filenames to search for. Use the `*` wildcard to represent any number of characters; use the `?` wildcard to represent any single character. The default is `*.*` (all files). You can enter only one filename here, but with the use of wildcards, you can search for multiple files.
Search subfolders?	Select **Yes** to search any subfolders of the root folder in which your search begins. The default is unselected.
File count threshold per folder	Specify the maximum number of files per folder that can be found that match your criteria before an event is raised. The default is 500.
File Filters	
File Attributes Filter	
File attribute operator	Select the operator (AND or OR) to apply to the criteria in the *File Attributes Filter* parameters. For example, instruct the script to search for files that have the *Archive attribute* AND the *Hidden attribute*. The default is OR.
Archive attribute	Select **Yes** to search for files that have the Archive attribute. The default is unselected.
Hidden attribute	Select **Yes** to search for files that have the Hidden attribute. The default is unselected.
Read-only attribute	Select **Yes** to search for files that have the Read-only attribute. The default is unselected.
System attribute	Select **Yes** to search for files that have the System attribute. The default is unselected.
Date Modified Filter	
Apply date modified filter?	Select **Yes** to apply a search filter that considers the date on which a file was modified. The default is unselected.
Select time range	Click **Browse [...]** to set a specific or sliding date/time range for the date/time on which files were modified. The default is a sliding range of 1 Day with the End now option selected. A specific date/time range defines a specific start and end date and time, for example: 1/1/2004 12:00 AM to 1/31/2004 11:59 PM. A sliding date/time range defines a time range relative to the start time of the Knowledge Script job. For example, a sliding date/time range of 1 Day extends from 12:00 AM of the previous day to 11:59 PM of the previous day (the entire 24-hour period of the day prior to the day the script runs). The **End now** option for the sliding date/time range extends the time range up to the start time of the Knowledge Script job. For example, if the job runs at 3:00 PM with a sliding range of 1 Day, then the time range covered is 12:00 AM of the previous day to 3:00 PM of the current day.
File Size Filter	

Description	How to Set It
Apply file size filter?	Select **Yes** to apply a search filter that considers the size of a file. The default is unselected.
File size	Specify the number of units that define the file size. The type of units are set in the *File size scale* parameter. The default is 10.
File size scale	Specify the type of unit that defines the file size (for example, kilobytes). The default is megabytes.
File size operator	Specify the operator that defines the file size (for example, less than 10 megabytes). The default is greater than.

54.15 FolderSize

Use this Knowledge Script to monitor the size of folders containing files that match a set of criteria. For example, you can monitor for folders over 100 MB that contain `MPG` or `JPG` files, and you can further refine your criteria to only include `MPG` or `JPG` files over a particular size. This script raises an event if the size of any folder exceeds the threshold you specify.

54.15.1 Resource Object

Misc Device folder

54.15.2 Default Schedule

The default schedule for this script is **Every 24 hours**.

54.15.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if threshold is exceeded?	Select **Yes** to raise an event if the size of a folder containing files matching your criteria exceeds the threshold you specify. The default is Yes.
Severity - Exceeded threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the folder size exceeds the threshold. The default is 11 (yellow event indicator).
Raise event if a folder cannot be accessed?	Select **Yes** to raise an event if the folder you specify in the *Root folder to begin the search* parameter does not exist or cannot be accessed because the account under which the NetIQ Client Resource Monitor service (`NetIQmc`) is running does not have permission to open the folder. The default is unselected.
Severity - Folder not accessible	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the specified folder does not exist or cannot be accessed. The default is 25 (blue event indicator).
Severity - Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the FolderSize job fails. The default is 5 (red event indicator).
Data Collection	
Collect folder count data?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of folders whose file size exceeds the threshold. The default is unselected.
Monitoring	
Logical drive letter(s) to search	Type a comma-separated list, with no spaces, of the letters representing the logical drives you want to search. For example: `C,D`.

Description	How to Set It
Root folder to begin the search	Type the path to the folder on each drive in which you want to begin searching. For example, enter `Documents and Settings\Administrator\My Documents` to begin searching in the `My Documents` folder. The default is `users`.
File name(s), can use * and ? wildcards	Type the filenames to search for. Use the `*` wildcard to represent any number of characters; use the `?` wildcard to represent any single character. The default is `*.*` (all files). You can enter only one filename here, but with the use of wildcards, you can search for multiple files.
Search subfolders?	Select **Yes** to search any subfolders of the root folder in which your search begins. The default is Yes.
Folder size threshold	Specify the number of units that define the folder size. The type of units is set in the *Folder size scale* parameter. The default is 10.
Folder size scale	Specify the type of unit that defines the folder size (for example, kilobytes). The default is megabytes.
Folder size operator	Specify the operator that defines the folder size (for example, less than 10 megabytes). The default is greater than.
File Filters	
File Attributes Filter	
File attribute operator	Select the operator (AND or OR) to apply to the criteria in the *File Attributes Filter* parameters. For example, instruct the script to search for files that have the *Archive attribute* AND the *Hidden attribute*. The default is OR.
Archive attribute	Select **Yes** to search for files that have the Archive attribute. The default is unselected.
Hidden attribute	Select **Yes** to search for files that have the Hidden attribute. The default is unselected.
Read-only attribute	Select **Yes** to search for files that have the Read-only attribute. The default is unselected.
System attribute	Select **Yes** to search for files that have the System attribute. The default is unselected.
Date Modified Filter	
Apply date modified filter?	Select **Yes** to apply a search filter that considers the date on which a file was modified. The default is unselected.

Description	How to Set It
Select time range	Click **Browse [...]** to set a specific or sliding date/time range for the date on which files were modified. The default is a sliding range of 1 Day with the End now option selected. A specific date/time range defines a specific start and end date and time, for example: `1/1/2004 12:00 AM to 1/31/2004 11:59 PM.` A sliding date/time range defines a time range relative to the start time of the Knowledge Script job. For example, a sliding date/time range of 1 Day extends from 12:00 AM of the previous day to 11:59 PM of the previous day (the entire 24-hour period of the day prior to the day the script runs). The **End now** option for the sliding date/time range extends the time range up to the start time of the Knowledge Script job. For example, if the job runs at 3:00 PM with a sliding range of 1 Day, then the time range covered is 12:00 AM of the previous day to 3:00 PM of the current day.
File Size Filter	
Apply file size filter?	Select **Yes** to apply a search filter that considers the size of a file. The default is unselected.
File size	Specify the number of units that define the file size. The type of units are set in the *File size scale* parameter. The default is 5.
File size scale	Specify the type of unit that defines the file size (for example, kilobytes). The default is megabytes.
File size operator	Specify the operator that defines the file size (for example, less than 5 megabytes). The default is greater than.

54.16 IntervalCounter

Use this Knowledge Script to monitor changes in any performance monitor counter. You can specify a consecutive number of times that the *Counter delta value threshold* parameter must be exceeded before the script raises an event. This script automatically raises an event if it does not find the counter to monitor.

This script collects the counter value delta between script executions for the object\counter\instance you are monitoring. A negative counter value delta indicates that the counter value has decreased.

54.16.1 Prerequisites

Requirements for Windows Server 2012, Windows 8, Windows 7, Windows 2008 R2, and Windows 2008:

The Log On As account under which the AppManager agent runs for these Windows operating systems must be a domain account and belong to the Administrator local group.

Requirements for Windows Server 2003:

- The Log On As account under which the AppManager agent runs on Windows Server 2003 must belong to the Performance Monitor Users policy.
- If the Operator Console or Control Center is installed on Windows Server 2003, the user account under which the console application runs must belong to the Performance Monitor Users policy.

  To check the local policy:

  1. At a Command Prompt, type `gpedit.msc` and press `Enter`.
  2. In the Group Policy snap-in, double-click **Computer Configuration > Windows Settings > Security Settings > Local Policies > User Rights Assignment**.
  3. In the **Local Setting** column, ensure the appropriate user account belongs to the **Performance Monitor Users** policy.
- If the Operator Console or Control Center is installed on Windows Server 2003, the Remote Registry service on the console computer must be running. If the Remote Registry service is down when you attempt to configure this script by browsing counter information on the remote computer, the console displays an error message that indicates AppManager was unable to connect to the remote computer.

Requirements for Windows Vista:

If the Operator Console or Control Center is installed on Windows Vista, the Remote Registry service on the console computer must be running. If the Remote Registry service is down when you attempt to configure this script by browsing counter information on the remote computer, the console becomes unresponsive.

54.16.2 Resource Objects

Any discovered Windows computer or application server, such as Exchange Server, SQL Server, or Proxy Server

54.16.3 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.16.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Set to **y** to collect data for charts and reports. When enabled, data collection returns the counter value delta between script executions for the object, counter, or instance you are monitoring. The default is n.
Event when over threshold?	Set to **y** to raise an event if the counter value exceeds the threshold. The default is y.
Counter delta value threshold	Specify the maximum allowed value for the difference between the counter value from the previous job iteration and the current job iteration. The default is 600.
Counter to monitor	Enter the object, counter, or instance name, or click **Browse [...]** to select the object, counter, and instances to monitor. The default is `Objects\Threads\`. **NOTE:** You can also start the System Monitor and click **Add [+]** in the toolbar. Use the format: `<object>\<counter>\<instance>\`. You can enter multiple instances, separated by commas. For example: `Process\% Privileged Time\mapisp32,mqsvc`. If the counter does not have an instance name, end the string with a backslash: `Process\% Privileged Time\`. If an instance is a parent of multiple instances (for example, if you have a logical disk 0 with partitions C: and D:), enter the complete instance name exactly as displayed in the Performance Monitor (for example, `"0 ==> C:"`).
Consecutive times	Specify the maximum number of consecutive times the counter must exceed the threshold before this script raises an event. The default is 1.
Event severity level - Over threshold	Set the event severity level, from 1 to 40 to indicate the importance of an event in which the counter value exceeds threshold. The default is 8 (red event indicator).
Event severity level...	Set the event severity level, from 1 to 40 to indicate the importance of an event in which the monitored counter or instance cannot be found. The default is 15 (yellow event indicator).

54.17 LogicalDiskStats

Use this Knowledge Script to monitor logical disk I/O and busy statistics gathered from performance counter values in Performance Monitor:

- Disk transfers per second
- Disk reads per second
- Disk writes per second
- Disk operation time in milliseconds
- Disk queue length

This script raises an event if a monitored value exceeds the threshold you specify.

Each time it runs, this script automatically monitors all logical disks on a server and all shared drives in a cluster. When this script runs on a cluster virtual server object, it monitors statistics for all shared drives that are active at the time. When this script runs on a physical Windows server, it monitors statistics for those drives that are not shared as part of a cluster, such as local fixed drives and removable drives.

NOTE: Because clustered virtual servers do not support maintenance mode, the *Maintenance Mode* option is unavailable for clustered virtual servers in AppManager.

You can choose to exclude any drive from monitoring or to monitor mount points configured on logical drives. Mount points must be configured as described in the following Microsoft Knowledge Base article: http://support.microsoft.com/kb/280297. Performance counter values are not created for mount points configured incorrectly. Therefore, this script raises an event when mounts points are not configured correctly, indicating an error when reading the disk.

This script ignores CD-ROMs, floppy drives, or other removable media whose size cannot be determined.

54.17.1 Resource Object

Logical disk object

54.17.2 Default Schedule

By default, this script runs every 30 minutes.

54.17.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the LogicalDiskStats job fails. The default is 15.
Logical Disk I/O	

Parameter	How to Set It
Raise event if disk transfers exceed threshold?	Select **Yes** to raise an event if the number disk transfers per second exceeds the threshold you set. The default is Yes.
Event severity when disk transfers exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event in which the number of times data is transferred on a disk exceeds the threshold you set. The default is 8.
Threshold - Maximum disk transfers per second	Specify the maximum number of disk transfers that can occur per second before an event is raised. The default is 80.
Raise event if disk reads exceed threshold?	Select **Yes** to raise an event if the number of disk reads per second exceeds the threshold you set. The default is Yes.
Event severity when disk reads exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event in which the number of times data is read from a disk exceeds the threshold you set. The default is 8.
Threshold - Maximum disk reads per second	Specify the maximum number of disk reads that can occur per second before an event is raised. The default is 50.
Raise event if disk writes exceed threshold?	Select **Yes** to raise an event if the number of disk writes per second exceeds the threshold you set. The default is Yes.
Event severity when disk writes exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event in which the number of times data is written to a disk exceeds the threshold you set. The default is 8.
Threshold - Maximum disk writes per second	Specify the maximum number of disk writes that can occur per second before an event is raised. The default is 50.
Logical Disk Busy	
Raise event if disk operation time exceeds threshold?	Select **Yes** to raise an event if the length of time per disk operation exceeds the threshold you set. The default is Yes.
Event severity when disk operation time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the length of time it takes for a disk operation to complete exceeds the threshold you set. The default is 5.
Threshold - Maximum disk operation time	Specify the maximum length of time that a disk operation can take to complete before an event is raised. The default is 100 milliseconds.
Raise event if disk queue length exceeds threshold?	Select **Yes** to raise an event if the number of requests in the disk queue exceeds the threshold you set. The default is Yes.
Event severity when disk queue length exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of requests in the disk queue exceeds the threshold you set. The default is 5
Threshold - Maximum disk queue length	Specify the maximum number of requests that can be in queue before an event is raised. The default is 1 request.
Monitoring	
Drives to exclude	Provide a comma-separated list of the drives you do not want to monitor. This script automatically monitors all drives except those listed in this parameter. The asterisk (*) is an acceptable wildcard. For example, to exclude the C: drive and disks or mount points that begin with `\crate`, specify the following: `c:,e:\crate*`
Monitor mount points?	Select **Yes** to allow the script to monitor mount points (mapped drives). The default is Yes.

Parameter	How to Set It
Data Collection	
Logical Disk I/O	
Collect data for disk transfers per second?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of disk transfers per second for the monitoring period. The default is unselected.
Collect data for disk reads per second?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of disk reads per second for the monitoring period. The default is unselected.
Collect data for disk writes per second?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of disk writes per second for the monitoring period. The default is unselected.
Logical Disk Busy	
Collect data for disk operation time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the length of disk operations, in milliseconds, for the monitoring period. The default is unselected.
Collect data for disk queue length?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of requests in queue for the monitoring period. The default is unselected.
Dynamically enumerate logical disks to monitor?	Select **Yes** to enable the script to look for new logical disks to monitor. The default is unselected. When this parameter is enabled, dynamic enumeration occurs each time the script runs, allowing the script to be aware of changes in configuration (disks added or removed) since the last time the script ran. The script will monitor new disks and will not attempt to monitor disks that have been removed. When this parameter is disabled, the script is not aware of changes in configuration. At every iteration, it will monitor the same disks found during the first iteration.

54.18 MemByProcess

Use this Knowledge Script to monitor process memory usage. This script monitors individual memory use for each specified process, and the total memory use for all specified processes. If a process is not found, this script assumes that the process is not currently running, and reports 0 as the memory result.

You can use this script to monitor multiple processes with the same name, such as the process spawned by each instance of `svchost.exe` running on the same computer.

NOTE:

- This script does not detect invalid process names. If you type an invalid process name, the script assumes that the process is not running, and reports 0 as the result.
- This script raises an event if the memory usage for a named process exceeds the threshold, with one exception: the Windows System Idle process. The System Idle process indicates the percentage of idle CPU resources. If no applications are running, this process indicates a high idle capacity. The high percentage exceeds the threshold and raises an event indicating that the System Idle Process consumes high CPU resources. You can safely ignore this event message because the high percentage refers to the high idle capacity and not high CPU usage.

54.18.1 Resource Objects

Windows 2000 Server or later

54.18.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.18.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Create event for each process that exceeds the threshold?	Select **Yes** to raise an event if the memory for an individual process exceeds the threshold you specify. The default is Yes.
Severity - Individual process memory high	Set the event severity level, from 1 to 40, to indicate the importance of an event in which individual process memory usage exceeds the threshold. The default is 8 (red event indicator).
Create event if the sum of all processes exceeds the threshold?	Select **Yes** to raise an event if the memory usage for all processes exceeds the threshold you specify. The default is Yes.
Severity – Total process memory high	Set the event severity level, from 1 to 40, to indicate the importance of an event in which total process memory usage exceeds the threshold. The default is 15 (yellow event indicator).

Description	How to Set It
Severity – Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the MemByProcess job fails unexpectedly. The default is 5 (red event indicator).
Data Collection	
Collect data for each process?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns data for individual processes you are monitoring, including process name, memory utilization, and the memory utilization threshold you specified. The default is unselected. **NOTE:** If a process is not found, the script assumes that the process is not currently running, and reports 0 as the memory result.
Collect data for all processes?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns data for all processes you are monitoring, including the process count, total memory utilization, and the memory utilization threshold you specified. The default is unselected. **NOTE:** If a process is not found, the script assumes that the process is not currently running, and reports 0 as the memory result.
Monitoring	
Processes	Provide one or more process names, separated by commas (,) and no spaces. The default is `explorer,lsass`. **NOTE:** Under circumstances where multiple instances of a process are running on a computer (for example, `svchost`), Windows adds a number to each successive instance of the process beginning with the second instance (for example, `svchost`, `svchost#1`, `svchost#2`). You can monitor each process instance by entering the process name, including the added number. **To see a list of distinct process names:** 1. From the Control Panel, double-click **Administrative Tools** and then double-click **Performance**. 2. Click **Add** (+). 3. From the Performance object list, select **Process**. 4. Click **Select instances from list** and then scroll to find the process names. 5. Click **Add**. **NOTE:** The value of the *Processes* parameter must be an exact match (including case-sensitivity) of the process name in the Performance Object field of PerfMon.
Maximum threshold for memory for each process	Specify the maximum amount of memory each process can use before an event is raised. The default is 20000. Use the *Memory scale* parameter to define the threshold scale.
Maximum threshold for memory for all processes	Specify the maximum amount of memory all processes can use before an event is raised. The default is 32000. Use the *Memory scale* parameter to define the threshold scale.
Memory scale	Select the scale for the memory threshold you specify: bytes, kilobytes, megabytes, gigabytes, terabytes. The default is kilobytes.

54.19 MemUtil

Use this Knowledge Script to monitor usage of physical memory, virtual memory, and paging files. This script raises an event if the usage of a monitored item exceeds the threshold. In addition, this script generates datastreams for all monitored items.

54.19.1 Resource Objects

Physical memory object

Virtual memory object

Paging files folder

54.19.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.19.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the MemUtil job fails. The default is 5.
Raise event if physical memory usage exceeds threshold?	Select **Yes** to raise an event if physical memory usage exceeds the threshold you set. The default is Yes.
Event severity when physical memory usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which physical memory usage exceeds the threshold you set. The default is 5.
Raise event if virtual memory usage exceeds threshold?	Select **Yes** to raise an event if virtual memory usage exceeds the threshold you set. The default is Yes.
Event severity when virtual memory usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which virtual memory exceeds the threshold you set. The default is 5.
Raise event if paging file usage exceeds threshold?	Select **Yes** to raise an event if paging file usage exceeds the threshold you set. The default is Yes.
Event severity when paging file usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which paging file usage exceeds the threshold. The default is 5.
Monitoring	

Description	How to Set It
Use virtual machine performance counters if available?	Select **Yes** to monitor VMware performance counter data on virtual machines, if available, instead of physical host counters. The default is Yes. VMware performance counters do not provide virtual memory or paging file data. If you select Yes, only physical memory usage data is monitored. **Important** VMware allows virtual machines to obtain more than 100% of its CPU, so if you select Yes for this parameter, you may see CPU utilization data that is greater than 100%.
Thresholds	
Threshold - Maximum physical memory usage	Specify the maximum percentage of physical memory that can be in use before an event is raised. The default is 90%.
Threshold - Maximum virtual memory usage	Specify the maximum percentage of virtual memory that can be in use before an event is raised. The default is 90%.
Threshold - Maximum paging file usage	Specify the maximum percentage of the paging file that can be in use before an event is raised. The default is 70%.
Data Collection	
Collect data for physical memory usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of physical memory usage during the monitoring period. The default is unselected.
Collect data for virtual memory usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of virtual memory usage during the monitoring period. The default is unselected.
Collect data for paging file usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the size of the paging file during the monitoring period. The default is unselected.

54.20 NetSession

Use this Knowledge Script to list the network sessions connected to a computer. This script raises an event if the number of sessions exceeds the threshold you specify. In addition, this script generates datastreams for the number of connected sessions.

54.20.1 Resource Objects

Windows 2000 Server or later

54.20.2 Default Schedule

The default schedule for this script is **Every hour**.

54.20.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the number of sessions exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. The default is n.
Maximum connected sessions threshold	Specify the maximum number of sessions that can be connected at one time before an event is raised. The default is 100.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of sessions exceeds the threshold. The default is 8 (red event indicator).

54.21 NetworkBusy

Use this Knowledge Script to monitor the traffic on network interface cards (NICs). This script raises an event if the network interface's bandwidth utilization exceeds the threshold you specify. This script skips interface card number 1 as a loopback.

NOTE: This script uses the Network Interface Performance Monitor counter to perform its monitoring task. If this performance counter is not available, install the SNMP services to make the counter available.

54.21.1 Resource Objects

Non-WAN wrapper network interface cards

Network interface folder

54.21.2 Default Schedule

The default schedule for this script is **Every 30 minutes**.

54.21.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the network interface's bandwidth utilization exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the percentage of network bandwidth in use. The default is n.
Ignore network interfaces with no bandwidth counter data?	Set to **y** to ignore network interfaces that have a bandwidth counter value of zero, which prevents the module from raising events on unplugged interfaces. The default is n.
Maximum percentage network utilization threshold	Specify the maximum percentage of network bandwidth that can be in use before an event is raised. The default is 35%.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which bandwidth utilization exceeds the threshold. The default is 5 (red event indicator).
Network interfaces to exclude	List the display names of all active interfaces that you do not want to be monitored. Separate each interface name with a comma, without any spaces. You can use the asterisk (*) as a wildcard at the end of a string, along with regular expressions for interface names. The default is: `*Loopback*,*Pseudo*,*isatap*,*tunnel*`. These settings exclude the set of interfaces that are part of the operating system and do not map to actual network cards.

54.22 PagingHigh

Use this Knowledge Script to monitor reads and writes per second to the pagefile. This script raises an event if the number of reads and writes per second exceeds the threshold you specify. In addition, this script generates datastreams for the number of read and writes per second.

54.22.1 Resource Objects

Windows 2000 Server or later

54.22.2 Default Schedule

The default schedule for this script is **Every 10 minutes**.

54.22.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the number of reads and writes exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. When enabled, data collection returns the number of reads and writes per second during the monitoring interval. The default is n.
Maximum pagefile activity per second threshold	Specify the maximum number of reads and writes to the pagefile allowed per second before an event is raised. The default is 200.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of reads and writes per second exceeds the threshold. The default is 5 (red event indicator).

54.23 PhysicalDiskStats

Use this Knowledge Script to monitor physical disk I/O and busy values:

- Disk transfers per second
- Disk reads per second
- Disk writes per second
- Disk operation time in milliseconds
- Disk queue length

This script raises an event if a monitored value exceeds the threshold you specify.

NOTE: Because clustered virtual servers do not support maintenance mode, the *Maintenance Mode* option is unavailable for clustered virtual servers in AppManager.

54.23.1 Resource Objects

Physical disk object

54.23.2 Default Schedule

By default, this script runs every 30 minutes.

54.23.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Physical Disk I/O Notification	
Raise event if disk transfers exceed threshold	Select **Yes** to raise an event if the number disk transfers per second exceeds the threshold you set. The default is Yes.
Event severity when disk transfers exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event in which the number of times data is transferred on a disk exceeds the threshold you set. The default is 8.
Raise event if disk reads exceed threshold?	Select **Yes** to raise an event if the number of disk reads per second exceeds the threshold you set. The default is Yes.
Event severity when disk reads exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event in which the number of times data is read from a disk exceeds the threshold you set. The default is 8.
Raise event if disk writes exceed threshold?	Select **Yes** to raise an event if the number of disk writes per second exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Event severity when disk writes exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event in which the number of times data is written to a disk exceeds the threshold you set. The default is 8.
Physical Disk Busy Notification	
Raise event if disk operation time exceeds threshold?	Select **Yes** to raise an event if the length of time per disk operation exceeds the threshold you set. The default is Yes.
Event severity when disk operation time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the length of time it takes for a disk operation to complete exceeds the threshold you set. The default is 5.
Raise event if disk queue length exceeds threshold?	Select **Yes** to raise an event if the number of requests in the disk queue exceeds the threshold you set. The default is Yes.
Event severity when disk queue length exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of requests in the disk queue exceeds the threshold you set. The default is 5
Raise event if job fails?	Select **Yes** to raise an event if the PhysicalDiskStats job fails. The default is Yes.
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the PhysicalDiskStats job fails. The default is 15.
Data Collection	
Physical Disk I/O Data Collection	
Collect data for disk transfers per second?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of disk transfers per second for the monitoring period. The default is unselected.
Collect data for disk reads per second?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of disk reads per second for the monitoring period. The default is unselected.
Collect data for disk writes per second?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of disk writes per second for the monitoring period. The default is unselected.
Physical Disk Busy Data Collection	
Collect data for disk operation time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the length of disk operations, in milliseconds, for the monitoring period. The default is unselected.
Collect data for disk queue length?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of requests in queue for the monitoring period. The default is unselected.
Monitoring	
Physical Disk I/O Monitoring	
Threshold - Maximum disk transfers per second	Specify the maximum number of disk transfers that can occur per second before an event is raised. The default is 80.
Threshold - Maximum disk reads per second	Specify the maximum number of disk reads that can occur per second before an event is raised. The default is 50.
Threshold - Maximum disk writes per second	Specify the maximum number of disk writes that can occur per second before an event is raised. The default is 50.
Physical Disk Busy Monitoring	

Parameter	How to Set It
Threshold - Maximum disk operation time	Specify the maximum length of time that a disk operation can take to complete before an event is raised. The default is 100 milliseconds.
Threshold - Maximum disk queue length	Specify the maximum number of requests that can be in queue before an event is raised. The default is 1 request.

54.24 PortHealth

Use this Knowledge Script to check whether system ports are working properly. This script raises an event if a port is not operating. In addition, this script generates datastreams for port availability.

54.24.1 Resource Objects

Windows 2000 Server or later

54.24.2 Default Schedule

The default schedule for this script is **Every 10 minutes**.

54.24.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if a port is not operating. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • 100 – the port is operating properly • 0 – the port is not operating The default is n.
Network addresses	Provide the network addresses for which you want to check port availability. Separate the addresses with commas (,) and no spaces. Use the format: `<host_ID>:<port_number>`. The host ID can be a hostname or IP address. For example: `www.storm.com:8008,1.10.10.10:30`. The default is `www.netiq.com:80`.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a port is not operating. The default is 8 (red event indicator).

54.25 PrinterHealth

Use this Knowledge Script to monitor the health of printers. This script checks whether any specified printer is paused or if the printer queue length exceeds the threshold you specify, and raises an event if either condition exists. This script also raises an event if it finds general printing errors such as a printer that is out of paper or jammed.

You can set this script to discover printers dynamically each time it runs. If you discover printers dynamically, printers that were not discovered when you ran Discovery_NT are not reflected in the Navigation pane or the TreeView pane.

NOTE: To run this script successfully, avoid using special characters such as, /, -, and # when defining the printer name on the monitored computers. Also, if you run the Discovery_NT Knowledge Script and then delete a local or network printer, run Discovery_NT again.

54.25.1 Resource Objects

Printer folder, if dynamically enumerating printers. If you are not enumerating printers dynamically, you can run this script on the Printer folder or individual printer objects. You can run this script only on a local printer.

54.25.2 Default Schedule

The default schedule for this script is **Every 10 minutes**.

54.25.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if a specified printer is paused, if the printer queue length exceeds the threshold you specify, or if the script finds general printing errors. The default is y. This script displays the following event messages when it detects a general printer error: Door Open, Paper Jam, Offline, No Paper, Toner Low, or Service Request.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of print jobs at each interval. The default is n.
Dynamically enumerate at each interval?	Set to **y** to dynamically observe connected printers at each monitoring interval. The default is y.
Maximum printer queue length threshold	Specify the maximum number of print jobs that can be waiting in the queue before an event is raised. The default is 10.
Maximum print job size threshold	Specify the maximum print job size allowed before an event is raised. The default is 200 KB.
Event severity level for printer paused	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the printer is not responding and no jobs are being processed. The printer is off-line, or out of paper or toner, for example. The default is 3 (red event indicator).

Description	How to Set It
Event severity level for printer busy	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of jobs in the printer queue exceeds the threshold. The default is 5 (red event indicator).
Event severity level for job size threshold crossed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the size of the print job exceeds the threshold. The default is 1 (red event indicator).

54.26 PrinterQueue

Use this Knowledge Script to monitor a printer's queue length. This script checks the number of queued print jobs for a specified printer. You need to specify the name of the computer that serves the printer and the printer's share name. This script raises an event if the number of queued jobs exceeds the threshold you specify. In addition, this script generates datastreams for queue length.

NOTE:

- Before running this script, ensure the AppManager agent service, `NetIQmc`, is set to run as a domain user account user in the same domain as, or a domain trusted by, the target computer. Use the **Services** Control Panel to identify an account for the service to run as.
- To run this Knowledge Script successfully, *avoid* using special characters such as, **/**, **-**, and **#** when defining the printer name on the monitored computers. Also, if you run the Discovery_NT Knowledge Script and *then* delete a local or network printer, run Discovery_NT again.

54.26.1 Resource Objects

Windows 2000 Server or later

NOTE: This script is not supported on 64-bit systems.

54.26.2 Default Schedule

The default schedule for this script is **Every hour**.

54.26.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the number of queued jobs exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of queued print jobs at each interval. The default is n.
Print server's hostname	Provide the name of the computer that serves the printer you want to monitor.
Server's share name for printer	Provide the name of the share used by the printer server for the printer you want to monitor.
Maximum print queue threshold	Specify the maximum number of print jobs that can be waiting in the queue before an event is raised. The default is 10.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of queued jobs exceeds the threshold. The default is 8 (red event indicator).

54.27 ProcessDown

Use this Knowledge Script to determine whether specified processes are running. This script raises an event if a specified process is not running. In addition, this script generates a datastream for process availability.

54.27.1 Resource Objects

Windows 2000 Server or later

54.27.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.27.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the process you selected for monitoring is not running. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns data for each named process, either: • **100** – the process is running; or • **0** – the process is not running. The default is n.
Processes	Provide one or more process names, separated by commas (,) and no spaces. Do not specify the file extension of the process. For example: `clock,tcpsvcs` **Tip** To monitor processes, AppManager retrieves the name of the performance counter instance associated with the process. If a PID (process identifier) is appended to the counter instance name, you do not need to indicate the PID in this parameter. Use an asterisk (*) instead. For example: • Use an asterisk (*) after the process name to monitor all processes that begin with the string you provide. For example: `clock,tcpsvcs*` • Use an asterisk (*) before the process name to monitor all processes that end with the string you provide. For example: `clock,*tcpsvcs`
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a selected process is not running. The default is 8 (red event indicator).

54.28 Processes

Use this Knowledge Script to monitor the number of active processes. This script raises an event if the number of active processes exceeds the threshold you specify. In addition, this script generates datastreams for active processes.

54.28.1 Resource Objects

Windows 2000 Server or later

54.28.2 Default Schedule

The default schedule for this script is **Every 30 minutes**.

54.28.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the number of active processes exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. The default is n.
Maximum total processes threshold	Specify the maximum number of active processes allowed before an event is raised. The default is 80.
Number of top processes to be displayed	Specify the number of top processes to display in the detail event or data message. Type 0 to display all processes. The default is 10.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active processes exceeds the threshold. The default is 5 (red event indicator).

54.29 ProcessUp

Use this Knowledge Script to check whether a specified process is running. This script raises an event if the specified process is running, and can automatically terminate the process if you choose. In addition, this script generates datastreams for process status.

54.29.1 Resource Objects

Windows 2000 Server or later

54.29.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.29.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Create event if process is found running?	Select **Yes** to raise an event if one or more of the processes you specified in the *Processes* parameter are running. The default is Yes.
Severity - Process running	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a specified process is running. The default is 10 (red event indicator).
Create event if process is not running?	Select **Yes** to raise an event if a process you specified in the *Processes* parameter is not running. The default is unselected.
Severity - Process not running	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a specified process is not running. The default is 10 (red event indicator).
Create event if process is successfully terminated?	Select **Yes** to raise an event a process you specified in the *Processes* parameter is successfully terminated. The default is Yes. **NOTE:** If you set this parameter to **Yes**, also set the *Kill the running process?* parameter to **Yes**.
Severity – Process successfully terminated	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a process is successfully stopped. The default is 25 (blue event indicator).
Create event if process cannot be terminated?	Select **Yes** to raise an event if a process you specified in *Processes* cannot be terminated. By default, events are enabled. **NOTE:** If you set this parameter to **Yes**, also set the *Kill the running process?* parameter to **Yes**.
Severity – Failed to kill process	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a specified process cannot be terminated. The default is 10 (red event indicator).
Severity – Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ProcessUp job fails unexpectedly. The default is 5 (red event indicator).
Data Collection	

Description	How to Set It
Collect data for process status?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns: • *n* – the number of specified processes that are running, or • **0** – the process is not running. The default is unselected.
Monitoring	
Processes	Provide one or more process names, separated by commas (,) and no spaces. Specify a process name without an extension and use the following format for multiple instances of a process: `iexplore (first instance),iexplore#1 (second instance),iexplore#2 (third instance)`
Kill the running process?	Select **Yes** to automatically stop a specified process. If there are multiple instances of a specified process, all instances are stopped. The default is No.

54.30 RegistryChange

Use this Knowledge Script to monitor changes in the registry information on 32-bit and 64-bit Windows systems. This script raises an event if a key or value is added, deleted, or changed in the registry. In addition, this script generates datastreams for registry changes.

From a specified path, this script searches the registry for changes to registry keys and sub-keys. This information can be valuable in helping you understand the behavior and configuration of the computers you are monitoring, but it can also be expensive in terms of processing time. Because each registry level can contain many sub-keys to check, this script can require a significant period of time to run if you check two or three levels deep in the registry tree.

On 64-bit Windows systems, this script can be configured to monitor registry information for 32-bit or 64-bit programs. For example, to monitor changes to:

- The key that specifies what programs should be run at startup, set the value of the *Monitor 32-bit program registry keys on a 64-bit system?* parameter to **n**, and specify the following registry key:

  `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Run`

- Keys associated with a 32-bit application such as AppManager, set the value of the *Monitor 32-bit program registry keys on a 64-bit system?* parameter to **y**, and specify the registry exactly as it would be specified on a 32-bit system. For example:

  `HKEY_LOCAL_MACHINE\Software\NetIQ\AppManager\4.0`

54.30.1 Resource Objects

Windows 2000 Server or later

54.30.2 Default Schedule

The default schedule for this script is **Every 30 minutes**.

If you set this script to check sub-key levels, adjust the schedule. For example, if you are checking two or three sub-levels deep, set this script to run once a day during off-peak hours.

54.30.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if a key or value is added, deleted, or changed in the registry. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of changes to the registry since the last time the job ran. The detail message includes specific information about each change. The default is n.

Description	How to Set It
Monitor 32-bit program registry keys on a 64-bit system?	On a 64-bit Windows system, set this parameter to **y** to monitor registry information for 32-bit programs. The default value, n, enables you to monitor registry information for 64-bit programs. On a 32-bit Windows system, this parameter is not applicable and will be ignored. **Tip** To monitor registry information for 32-bit programs and 64-bit programs, configure separate Knowledge Script jobs.
Root key	Type the registry root. Valid root options are: • HKEY_LOCAL_MACHINE • HKEY_CLASSES_ROOT • HKEY_CURRENT_USER • HKEY_USERS The default is HKEY_LOCAL_MACHINE.
Path name	Specify the path to the registry keys to monitor. The default path is SYSTEM\CurrentControlSet\Services. To specify the path to registry information for a 32-bit or 64-bit program, specify a path under HKEY_LOCAL_MACHINE\Software. Although the registry keys for 32-bit programs on a 64-bit system are stored under the HKEY_LOCAL_MACHINE\Software\Wow6432Node key, do **not** specify the Wow6432Node component of the path. Instead, specify the path without the Wow6432Node component, and set the value of the *Monitor 32-bit program registry keys on a 64-bit system?* parameter to **y**. **NOTE:** Use a specific path to the key you want to monitor. Any key can have many sub-levels, and the level specified by this path is always considered level 1.
Sub-level	Specify the number of descendent key levels to monitor, counting the path itself as level 1. The maximum number of key sub-levels you can monitor is 3. The default is 2.
Exceptions	Specify any sub-keys to exclude from monitoring. Exceptions are case-sensitive. Separate sub-keys using commas (,) and no spaces. For example, to exclude CmdLine and SetupType under the Setup sub-key, type: SYSTEM\Setup\CmdLine,SYSTEM\Setup\SetupType.
Event severity level for registry change	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a change in the registry occurs. The default is 8 (red event indicator).
Event severity level for an unexpected Knowledge Script error	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the RegistryChange job fails. The default is 35 (magenta event indicator).

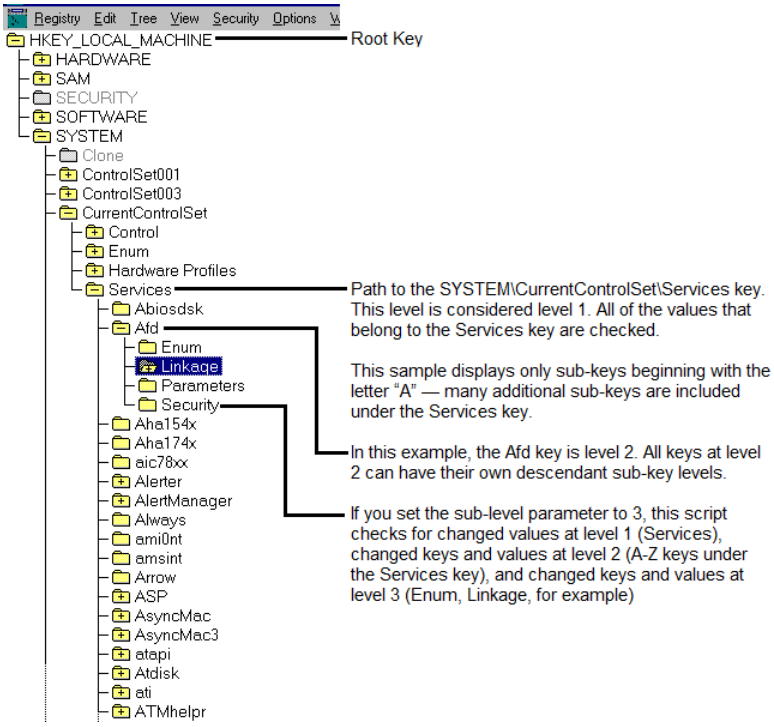
54.30.4 Example of How this Script Is Used

This script traverses the registry to check for changes to registry keys and sub-keys. This information can be extremely valuable in understanding the behavior and configuration of the computers you are monitoring but it can also be expensive in terms of processing time. To understand the impact of running this script, consider the following registry example.

If you set the *Path name* parameter to SYSTEM\CurrentControlSet\Services, the key becomes the first level of monitoring (sub-level 1) and all the keys at that level are checked for changes. If you set the *Sub-level* parameter to 3 for this job, the script then monitors all the values for all the sub-keys under the SYSTEM\CurrentControlSet\Services key and all the values for the sub-keys under the

SYSTEM\CurrentControlSet\Services sub-key folders. With these settings, you can monitor a large number of key values but might put undue strain on your system.

As you can see in the following example, each sub-key level you monitor can contain many sub-keys and sub-key values:



One way to control the number of key values you monitor is by choosing the base path carefully. For example, you can set the `Path name` to a specific sub-key such as `SYSTEM\CurrentControlSet\Services\EventLog`. Depending on the number of sub-keys under the base path, however, you might also need to consider how best to set the sub-level parameter.

For example, if you set the *Path name* to `SYSTEM\CurrentControlSet\Services\EventLog` and the *Sub-level* parameter to `3`, the `EventLog` key becomes sub-level 1 and is checked for changes to values. The `EventLog` key contains the `Application`, `Security`, and `System` sub-keys, which as sub-level 2, are checked for new keys and values. Each of these sub-level 2 keys branches further, yielding dozens more keys at sub-level 3, each with values to check.

Because the number of monitored values can expand quickly, it is important to consider either narrowing the key path and sub-levels to check or lengthening the monitoring interval for this script to run effectively.

54.31 RemoteServiceDown

Use this Knowledge Script to monitor services on remote computers. You can specify the computers to monitor either directly using the *Machine list* parameter, or in a file containing a list of computer names or addresses.

This script tries to communicate with each of the remote computers in the *Machine list* parameter. This script raises an event if a named service is down or a specified computer cannot be reached from the computer where this script is running.

This script displays event information even if the remote computer is in maintenance mode.

NOTE: The AppManager agent does not need to be installed on the remote computer you want to monitor, nor does the remote computer need to exist in the Navigation pane or the TreeView pane.

When configuring an action for the RemoteServiceDown script, configure the Location to run on the MS (management server) or on a Proxy (a particular managed client computer).

If you instead configure an action to run on the managed client (MC), when a remotely monitored computer is placed into maintenance mode or scheduled maintenance mode, AppManager ignores any event conditions detected on the remote computer but does not disable the action.

54.31.1 Resource Objects

Windows 2000 Server or later

54.31.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.31.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if a specified service is down or if a specified computer cannot be reached from the computer where this script is running. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns data for each named service, either: • **100** – the service is running; or • **0** – the service is not running. The default is n.
Collect data only on down?	Set to **y** to collect data for charts and reports only when named services are down. If enabled, data collection returns a value of 0 when a service is down. Enable this parameter only if the *Collect data?* parameter is enabled. The default is n.

Description	How to Set It
Machine list	Specify the names of the computers to be monitored. Separate multiple names with commas (,) and no spaces. For example: `AppSrvr,Storm,CorpSrvr`.

File name for machine list	Provide the full path to the file containing the list of computers to test. The file should contain the hostname or IP address for each computer in one or more lines. Each line can have multiple computer names, separated by commas and no spaces. For example:
	`NYC01,NYC02`
	`SALES01,10.15.221.5,SFO01`
	`LABMACH,QATEST`
	The job supports a maximum file size of 32KB. If the file size exceeds 32KB, the job stops and raises an error event message: `Out of string space`.

Services	Provide the names of the services to be monitored. Separate multiple names with commas (,) and no spaces. The default is the NetIQ AppManager Agent service: `NetIQmc`.
Auto-start service?	Set to **y** to automatically restart down services. The default is y.
Event severity level for service down; auto-start failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and auto-start failed. The default is 5 (red event indicator).
Event severity level for service down; auto-start succeeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and auto-start succeeded. The default is 25 (blue event indicator).
Event severity level for service down; don't auto-start	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and you have selected not to restart it. The default is 18 (yellow event indicator).
Event severity level for service not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a selected service cannot be found. The default is 8 (red event indicator).

54.32 RemoteServiceDownLR

Use this Knowledge Script to monitor services on remote computers. You specify the computers and services to monitor. A service that is detected as down can be restarted. The Windows services include those that are not discovered by AppManager, such as `WinLogon` or `NetIQ Corporationms`.

Before running this script, run the ConfigRemoteServiceDown Knowledge Script to store a list of computers and services in the local repository on the target computer.

After you run ConfigRemoteServiceDown on each target computer in a group, you can use RemoteServiceDownLR in a monitoring policy for the group. On each computer, RemoteServiceDownLR knows what to monitor because ConfigRemoteServiceDown has stored that information in the local repository.

This script displays event information even if the remote computer is in maintenance mode.

NOTE: The AppManager agent does not need to be installed on the remote computer you want to monitor, nor does the remote computer need to exist in the Navigation pane or the TreeView pane.

54.32.1 Resource Objects

Windows 2000 Server or later

54.32.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.32.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if a service is down. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns service status. The default is n.
Collect data only on service down?	Set to **y** to collect data only when a service is down. If enabled, and if the *Collect data?* parameter is also enabled, this script returns a value of 0 to indicate that a service is down. The default is n.
Auto-start service?	Set to **y** to automatically restart down services. The default is y.
Event severity when service down; auto-start failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and auto-start failed. The default is 5 (red event indicator).
Event severity when service down; auto-start succeeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and auto-start succeeded. The default is 25 (blue event indicator).

Description	How to Set It
Event severity when service down; auto-start disabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and you have selected not to restart it. The default is 18 (yellow event indicator).
Event severity level for service not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a selected service cannot be found. The default is 8 (red event indicator).

54.33 Report_CPULoad

Use this Knowledge Script to generate a detailed report about CPU usage and queue length. Using this report, you can aggregate the data by minute, hour, or day, and calculate statistics for each period, for example, the average value per hour.

This report uses data collected by the CpuLoaded script.

54.33.1 Resource Object

Report agent

54.33.2 Default Schedule

The default schedule for this script is **Run once**.

54.33.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** provides all the datastreams on a single page The default is By computer.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregation by	Select the time period by which the data in your report is presented. Select **Minute**, **Hour**, or **Day**. The default is Hour.
Aggregation interval	Specify the intervals to use to aggregate the data in the report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a **Table** or **Chart** of datastream values in the report, or choose **Both**. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.
Select output folder	Select the parameters for your report's output folder. The default folder name is NT_CPULoad.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. The default is n. The job ID helps you correlate a specific instance of a Report script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title for your report is NT CPU Load.
Add time stamp to title?	Set to y to append a time stamp to the title of the report, making each title unique. The default is n. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.34 Report_CPULoadSummary

Use this Knowledge Script to generate a summary report about CPU usage and queue length. Using this report, you can make a statistical analysis of the data point values, for example, the average or maximum value over a period.

This report uses data collected by the CpuLoaded script.

54.34.1 Resource Objects

Report agent

54.34.2 Default Schedule

The default schedule for this script is **Run once**.

54.34.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Select the style	Select the style for the first page of your report: • **By computer** displays one value for each computer you selected. • **By legend** displays one value for each different legend (the legend is a truncated form of the datastream legend visible in the Operator Console). • **By computer and legend** displays one value for each unique legend from each computer. The default is By computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the time range of the report. • **Minimum**. The minimum value of data points for the time range of the report. • **Maximum**. The maximum value of data points for the time range of the report. • **Min/Avg/Max**. The minimum, average, and maximum values of data points for the time range of the report. • **Range**. The range of values in the datastream (maximum - minimum = range). • **StandardDeviation**. The measure of how widely values are dispersed from the mean. • **Sum**. The total value of data points for the time range of the report. • **Close**. The last value for the time range of the report. • **Change**. The difference between the first and last values for the time range of the report (close - open = change). • **Count**. The number of data points for the time range of the report. The default is Average.
Select sorting or display options	Specify whether to sort data in your report or how to display the data: • **No sort**. Data is not sorted. • **Sort**. Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right). • **Top %**. Chart only the top N % of selected data (sorted by default). • **Top N**. Chart only the top N of selected data (sorted by default). • **Bottom %**. Chart only the bottom N % of data (sorted by default). • **Bottom N**. Chart only the bottom N of selected data (sorted by default). The default is No sort.
Percentage (%) or count for top or bottom of chart	Specify a number for either the percent or count defined in *Select sorting or display options* (for example, Top 10%, or Top 10). The default is 25.
Truncate top or bottom?	Set to **yes** to truncate the top or bottom data in your report. If set to yes, the data table displays only the top or bottom N or % (for example, only the top 10%). If set to no, the table displays all data. The default is no.
Show totals on the table?	Set to **yes** to display additional calculations for each column of numbers in a table. If enabled, the following values are listed at the end of the table: • **Report Average**. An average of all values in a column. • **Report Minimum**. The minimum value in a column. • **Report Maximum**. The maximum value in a column. • **Report Total**: The total of all values in a column. The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.

Description	How to Set It
Select output folder	Select the parameters for the report's output folder. The default folder prefix is NT_CPULoadSummary.
Add job ID to output folder name?	Set to **yes** to add the job ID to the name of the output folder. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT CPU Load Summary.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.35 Report_CPUResource

Use this Knowledge Script to generate a detailed report about the use of CPU resources, including the number of active processes, threads, and interrupts per second, and the utilization of CPU resources in user mode. Using this report, you can aggregate the data by minute, hour, or day, and calculate statistics for each period, for example, the average value per hour.

This report uses data collected by the CpuResource script.

54.35.1 Resource Object

Report agent

54.35.2 Default Schedule

The default schedule for this script is **Run once**.

54.35.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers. Each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer. • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** provides all the datastreams on a single page The default is By computer.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregation by	Select the time period by which the data in your report is presented. Select **Minute**, **Hour**, or **Day**. The default is Hour.
Aggregation interval	Specify the intervals to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_CPUResource.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT CPU Resource.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.36 Report_CPUResourceSummary

Use this Knowledge Script to generate a summary report about the use of CPU resources, including the number of active processes, threads, and interrupts per second, and the utilization of CPU resources in user mode. Using this report, you can develop a statistical summary of the data you select, for example, the average value of data points over the period you define for the report.

This report uses data collected by the CpuResource script.

54.36.1 Resource Object

Report agent

54.36.2 Default Schedule

The default schedule for this script is **Run once**.

54.36.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Select the style	Select the style for the first page of your report: • **By computer** displays one value for each computer you selected. • **By legend** displays one value for each different legend (the legend is a truncated form of the datastream legend visible in the Operator Console). • **By computer and legend** displays one value for each unique legend from each computer. The default is By computer and legend.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the time range of the report. • **Minimum**. The minimum value of data points for the time range of the report. • **Maximum**. The maximum value of data points for the time range of the report. • **Min/Avg/Max**. The minimum, average, and maximum values of data points for the time range of the report. • **Range**. The range of values in the datastream (maximum - minimum = range). • **StandardDeviation**. The measure of how widely values are dispersed from the mean. • **Sum**. The total value of data points for the time range of the report. • **Close**. The last value for the time range of the report. • **Change**. The difference between the first and last values for the time range of the report (close - open = change). • **Count**. The number of data points for the time range of the report. The default is Average.
Select sorting or display options	Specify whether to sort data in your report or how to display the data: • **No sort**. Data is not sorted. • **Sort**. Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right). • **Top %**. Chart only the top N % of selected data (sorted by default). • **Top N**. Chart only the top N of selected data (sorted by default). • **Bottom %**. Chart only the bottom N % of data (sorted by default). • **Bottom N**. Chart only the bottom N of selected data (sorted by default). The default is No sort.
Percentage (%) or count for top or bottom of chart	Specify a number for either the percent or count defined in *Select sorting or display options* (for example, Top 10%, or Top 10). The default is 25.
Truncate top or bottom?	Set to **yes** to truncate the top or bottom data in your report. If set to yes, the data table displays only the top or bottom N or % (for example, only the top 10%). If set to no, the table displays all data. The default is no.
Show totals on the table?	Set to **yes** to display additional calculations for each column of numbers in a table. If set to yes, the following values are listed at the end of the table: • **Report Average**. An average of all values in a column. • **Report Minimum**. The minimum value in a column. • **Report Maximum**. The maximum value in a column. • **Report Total**: The total of all values in a column. The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.

Description	How to Set It
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_CPUResourceSummary.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT CPU Resource Summary.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.37 Report_CPUUsageofProcessesSummary

Use this Knowledge Script to generate a summary report about CPU usage per named process, and total CPU usage by all named processes. Processes are named when you configure the CpuByProcess script. Using this report, you can develop a statistical summary of the data you select, for example, the average value of data points over the period you define for the report.

This report uses data collected by the CpuByProcess script.

54.37.1 Resource Object

54.37.2 Default Schedule

The default schedule for this script is **Run once**.

54.37.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Select the style	Select the style for the first page of your report: • **By computer** displays one value for each computer you selected. • **By legend** displays one value for each different legend (the legend is a truncated form of the datastream legend visible in the Operator Console). • **By computer and legend** displays one value for each unique legend from each computer. The default is By computer and legend.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the time range of the report. • **Minimum**. The minimum value of data points for the time range of the report. • **Maximum**. The maximum value of data points for the time range of the report. • **Min/Avg/Max**. The minimum, average, and maximum values of data points for the time range of the report. • **Range**. The range of values in the datastream (maximum - minimum = range). • **StandardDeviation**. The measure of how widely values are dispersed from the mean. • **Sum**. The total value of data points for the time range of the report. • **Close**. The last value for the time range of the report. • **Change**. The difference between the first and last values for the time range of the report (close - open = change). • **Count**. The number of data points for the time range of the report. The default is Average.
Select sorting or display options	Specify whether to sort data in your report or how to display the data: • **No sort**. Data is not sorted. • **Sort**. Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right). • **Top %**. Chart only the top N % of selected data (sorted by default). • **Top N**. Chart only the top N of selected data (sorted by default). • **Bottom %**. Chart only the bottom N % of data (sorted by default). • **Bottom N**. Chart only the bottom N of selected data (sorted by default). The default is No sort.
Percentage (%) or count for top or bottom of chart	Specify a number for either the percent or count defined in *Select sorting or display options* (for example, Top 10%, or Top 10). The default is 25.
Truncate top or bottom?	Set to **yes** to truncate the top or bottom data in your report. If set to yes, the data table displays only the top or bottom N or % (for example, only the top 10%). If set to no, the table displays all data. The default is no.
Show totals on the table?	Set to **yes** to display additional calculations for each column of numbers in a table. If set to yes, the following values are listed at the end of the table: • **Report Average**. An average of all values in a column. • **Report Minimum**. The minimum value in a column. • **Report Maximum**. The maximum value in a column. • **Report Total**: The total of all values in a column. The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.

Description	How to Set It
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_CPUUsageofProcessesSummary.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT CPU Usage of Processes Summary.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.38 Report_FilesOpen

Use this Knowledge Script to generate a report about the number of files open during a specified period. Using this report, you can aggregate data by minute, hour, or day, and calculate statistics for each period, for example, the average value per hour.

This report uses data collected by the FilesOpen script.

54.38.1 Resource Object

Report agent

54.38.2 Default Schedule

The default schedule for this script is **Run once**.

54.38.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** provides all the datastreams on a single page The default is By computer.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregation by	Select the time period by which the data in your report is presented. Select **Minute**, **Hour**, or **Day**. The default is Hour.
Aggregation interval	Specify the intervals to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_FilesOpen.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters.The default title is NT Files Open.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of the report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.39 Report_LogicalDiskAvailSummary

Use this Knowledge Script to generate a summary report about the amount of free space (in MB) on a logical disk. Using this report, you can develop a statistical summary of the data you select, for example, the average value of data points over the period you define for the report.

54.39.1 Resource Object

Report agent

54.39.2 Default Schedule

The default schedule for this script is **Run once**.

54.39.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Select the style	Select the style for the first page of your report: • **By computer** displays one value for each computer you selected. • **By legend** displays one value for each different legend (the legend is a truncated form of the datastream legend visible in the Operator Console). • **By computer and legend** displays one value for each unique legend from each computer. The default is By computer and legend.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the time range of the report. • **Minimum**. The minimum value of data points for the time range of the report. • **Maximum**. The maximum value of data points for the time range of the report. • **Min/Avg/Max**. The minimum, average, and maximum values of data points for the time range of the report. • **Range**. The range of values in the datastream (maximum - minimum = range). • **StandardDeviation**. The measure of how widely values are dispersed from the mean. • **Sum**. The total value of data points for the time range of the report. • **Close**. The last value for the time range of the report. • **Change**. The difference between the first and last values for the time range of the report (close - open = change). • **Count**. The number of data points for the time range of the report. The default is Average.
Select sorting or display options	Specify whether to sort data in your report or how to display the data: • **No sort**. Data is not sorted. • **Sort**. Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right). • **Top %**. Chart only the top N % of selected data (sorted by default). • **Top N**. Chart only the top N of selected data (sorted by default). • **Bottom %**. Chart only the bottom N % of data (sorted by default). • **Bottom N**. Chart only the bottom N of selected data (sorted by default). The default is No sort.
Percentage (%) or count for top or bottom of chart	Specify a number for either the percent or count defined in *Select sorting or display options* (for example, Top 10%, or Top 10). The default is 25.
Truncate top or bottom?	Set to **yes** to truncate the top or bottom data in your report. If set to yes, the data table displays only the top or bottom N or % (for example, only the top 10%). If set to no, the table displays all data. The default is no.
Show totals on the table?	Set to **yes** to display additional calculations for each column of numbers in a table. If set to yes, the following values are listed at the end of the table: • **Report Average**. An average of all values in a column. • **Report Minimum**. The minimum value in a column. • **Report Maximum**. The maximum value in a column. • **Report Total**: The total of all values in a column. The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.

Description	How to Set It
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_LogicalDiskAvailSummary.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT Logical Disk Available Summary.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.40 Report_LogicalDiskUsageSummary

Use this Knowledge Script to generate a summary report about the percentage of disk space used and the amount of free space (in MB). Using this report, you can develop a statistical summary of the data you select, for example, the average value of data points over the period you define for the report.

54.40.1 Resource Object

Report agent

54.40.2 Default Schedule

The default schedule for this script is **Run once**.

54.40.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Select the style	Select the style for the first page of your report: • **By computer** displays one value for each computer you selected. • **By legend** displays one value for each different legend (the legend is a truncated form of the datastream legend visible in the Operator Console). • **By computer and legend** displays one value for each unique legend from each computer. The default is By computer and legend.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the time range of the report. • **Minimum**. The minimum value of data points for the time range of the report. • **Maximum**. The maximum value of data points for the time range of the report. • **Min/Avg/Max**. The minimum, average, and maximum values of data points for the time range of the report. • **Range**. The range of values in the datastream (maximum - minimum = range). • **StandardDeviation**. The measure of how widely values are dispersed from the mean. • **Sum**. The total value of data points for the time range of the report. • **Close**. The last value for the time range of the report. • **Change**. The difference between the first and last values for the time range of the report (close - open = change). • **Count**. The number of data points for the time range of the report. The default is Average.
Select sorting or display options	Specify whether to sort data in your report or how to display the data: • **No sort**. Data is not sorted. • **Sort**. Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right). • **Top %**. Chart only the top N % of selected data (sorted by default). • **Top N**. Chart only the top N of selected data (sorted by default). • **Bottom %**. Chart only the bottom N % of data (sorted by default). • **Bottom N**. Chart only the bottom N of selected data (sorted by default). The default is No sort.
Percentage (%) or count for top or bottom of chart	Specify a number for either the percent or count defined in *Select sorting or display options* (for example, Top 10%, or Top 10). The default is 25.
Truncate top or bottom?	Set to **yes** to truncate the top or bottom data in your report. If set to yes, the data table displays only the top or bottom N or % (for example, only the top 10%). If set to no, the table displays all data. The default is no.
Show totals on the table?	Set to **yes** to display additional calculations for each column of numbers in a table. If set to yes, the following values are listed at the end of the table: • **Report Average**. An average of all values in a column. • **Report Minimum**. The minimum value in a column. • **Report Maximum**. The maximum value in a column. • **Report Total**: The total of all values in a column. The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.

Description	How to Set It
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_LogicalDiskUsageSummary.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT Logical Disk Usage Summary.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.41 Report_MemoryUtilization

Use this Knowledge Script to generate a report about the use of physical and virtual memory, and paging files. Using this report, you can aggregate data by minute, hour, or day, and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the MemUtil script.

54.41.1 Resource Object

Report agent

54.41.2 Default Schedule

The default schedule for this script is **Run once**.

54.41.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** provides all the datastreams on a single page The default is By computer.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregation by	Select the time period by which the data in your report is presented. Select **Minute**, **Hour**, or **Day**. The default is Hour.
Aggregation interval	Specify the intervals to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_MemoryUtilization.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT Memory Utilization.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.42 Report_MemoryUtilizationSummary

Use this Knowledge Script to generate a summary report about the use of physical and virtual memory, and paging files. Using this report, you can develop a statistical summary of the data you select, for example, the average value of data points over the period you define for the report.

This report uses data collected by the MemUtil script.

54.42.1 Resource Object

Report agent

54.42.2 Default Schedule

The default schedule for this script is **Run once**.

54.42.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Select the style	Select the style for the first page of your report: • **By computer** displays one value for each computer you selected. • **By legend** displays one value for each different legend (the legend is a truncated form of the datastream legend visible in the Operator Console). • **By computer and legend** displays one value for each unique legend from each computer. The default is By computer and legend.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the time range of the report. • **Minimum**. The minimum value of data points for the time range of the report. • **Maximum**. The maximum value of data points for the time range of the report. • **Min/Avg/Max**. The minimum, average, and maximum values of data points for the time range of the report. • **Range**. The range of values in the datastream (maximum - minimum = range). • **StandardDeviation**. The measure of how widely values are dispersed from the mean. • **Sum**. The total value of data points for the time range of the report. • **Close**. The last value for the time range of the report. • **Change**. The difference between the first and last values for the time range of the report (close - open = change). • **Count**. The number of data points for the time range of the report. The default is Average.
Select sorting or display options	Specify whether to sort data in your report or how to display the data: • **No sort**. Data is not sorted. • **Sort**. Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right). • **Top %**. Chart only the top N % of selected data (sorted by default). • **Top N**. Chart only the top N of selected data (sorted by default). • **Bottom %**. Chart only the bottom N % of data (sorted by default). • **Bottom N**. Chart only the bottom N of selected data (sorted by default). The default is No sort.
Percentage (%) or count for top or bottom of chart	Specify a number for either the percent or count defined in *Select sorting or display options* (for example, Top 10%, or Top 10). The default is 25.
Truncate top or bottom?	Set to **yes** to truncate the top or bottom data in your report. If set to yes, the data table displays only the top or bottom N or % (for example, only the top 10%). If set to no, the table displays all data. The default is no.
Show totals on the table?	Set to **yes** to display additional calculations for each column of numbers in a table. If set to yes, the following values are listed at the end of the table: • **Report Average**. An average of all values in a column. • **Report Minimum**. The minimum value in a column. • **Report Maximum**. The maximum value in a column. • **Report Total**: The total of all values in a column. The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.

Description	How to Set It
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_MemoryUtilizationSummary.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT Memory Utilization Summary.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.43 Report_NetworkBusy

Use this Knowledge Script to generate a report about the use of bandwidth on network interface cards. Using this report, you can aggregate data by minute, hour, or day, and calculate statistics for each period, for example, the average value per hour.

This report uses data collected by the NetworkBusy script.

54.43.1 Resource Object

Report agent

54.43.2 Default Schedule

The default schedule for this script is **Run once**.

54.43.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** provides all the datastreams on a single page The default is By computer.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregation by	Select the time period by which the data in your report is presented. Select **Minute**, **Hour**, or **Day**. The default is Hour.
Aggregation interval	Specify the intervals to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_NetworkBusy.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT Network Busy.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.44 Report_PagingHigh

Use this Knowledge Script to generate a report about the number of reads and writes per second to the pagefile. Using this report, you can aggregate data by minute, hour, or day, and calculate statistics for each period, for example, the average value per hour.

This report uses data collected by the PagingHigh script.

54.44.1 Resource Object

Report agent

54.44.2 Default Schedule

The default schedule for this script is **Run once**.

54.44.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** provides all the datastreams on a single page The default is By computer.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregation by	Select the time period by which the data in your report is presented. Select **Minute**, **Hour**, or **Day**. The default is Hour.
Aggregation interval	Specify the intervals to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_PagingHigh.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT Paging High.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.45 Report_PhysicalDiskIO

Use this Knowledge Script to generate a report about the number of reads, writes, and transfers per second for a physical disk. Using this report, you can aggregate data by minute, hour, or day, and calculate statistics for each period, for example, the average value per hour.

54.45.1 Resource Object

Report agent

54.45.2 Default Schedule

The default schedule for this script is **Run once**.

54.45.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** provides all the datastreams on a single page The default is By computer.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregation by	Select the time period by which the data in your report is presented. Select **Minute**, **Hour**, or **Day**. The default is Hour.
Aggregation interval	Specify the intervals to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_PhysicalDiskIO.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters.The default title is NT Physical Disk IO.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.46 Report_PhysicalDiskQueueLength

Use this Knowledge Script to generate a report about physical disk queue length. Using this report, you can aggregate data by minute, hour, or day, and calculate statistics for each period, for example, the average value per hour.

54.46.1 Resource Object

Report agent

54.46.2 Default Schedule

The default schedule for this script is **Run once**.

54.46.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** provides all the datastreams on a single page The default is By computer.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregation by	Select the time period by which the data in your report is presented. Select **Minute**, **Hour**, or **Day**. The default is Hour.
Aggregation interval	Specify the intervals to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_PhysicalDiskQueueLength.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. By default, the job ID is not included. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT Physical Disk Queue Length.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.47 Report_PrinterHealth

Use this Knowledge Script to generate a report about printer health. Printer health is determined by whether or not the printer is paused, and the queue length for printer jobs. Using this report, you can aggregate data by minute, hour, or day, and calculate statistics for each period, for example, the average value per hour.

This report uses data collected by the PrinterHealth script.

54.47.1 Resource Object

Report agent

54.47.2 Default Schedule

The default schedule for this script is **Run once**.

54.47.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** provides all the datastreams on a single page The default is By computer.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregation by	Select the time period by which the data in your report is presented. Select **Minute**, **Hour**, or **Day**. The default is Hour.
Aggregation interval	Specify the intervals to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_PrinterHealth.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. By default, the job ID is not included. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT Printer Health.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.48 Report_Process

Use this Knowledge Script to generate a report about the number of processes running during a specified period. Using this report, you can aggregate data by minute, hour, or day, and calculate statistics for each period, for example, the average value per hour.

This report uses data collected by the Processes script.

54.48.1 Resource Object

Report agent

54.48.2 Default Schedule

The default schedule for this script is **Run once**.

54.48.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** provides all the datastreams on a single page The default is By computer.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregation by	Select the time period by which the data in your report is presented. Select **Minute**, **Hour**, or **Day**. The default is Hour.
Aggregation interval	Specify the intervals to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Specify whether to include a table or chart, or both, of datastream values in the report. The default is Table.
Select chart style	Select the graphic properties for the charts in your report. The default chart style is Bar.
Select output folder	Select the parameters for your report's output folder. The default folder prefix is NT_Process.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default title is NT Process.
Add time stamp to title?	Set to **yes** to add a time stamp to the title of your report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.49 Report_TopCPUProcs

Use this Knowledge Script to generate a report about the total CPU used by all processes and which processes consume the most CPU resources.

This report uses data collected by the TopCpuProcs script.

54.49.1 Resource Object

Report agent

54.49.2 Default Schedule

The default schedule for this script is **Run once**.

54.49.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report. **NOTE:** For this report, select only one View, and up to 15 computers or server groups. The data wizard allows you to select more, but if you do, the Finish button is disabled. This mechanism prevents you from selecting too much data for the report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Select output folder	Select the parameters for your report's output folder. The default prefix for the folder name is NT_TopCPUProcs.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.50 Report_TopMemoryProcs

Use this Knowledge Script to generate a report about the total memory used by all processes and which processes consume the most memory resources.

This report uses data collected by the TopMemoryProcs script.

54.50.1 Resource Object

Report agent

54.50.2 Default Schedule

The default schedule for this script is **Run once**.

54.50.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report. **NOTE:** Select only one View, and up to 15 computers or server groups. The data wizard allows you to select more, but if you do, the Finish button is disabled. This mechanism prevents you from selecting too much data for the report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Select output folder	Select the parameters for your report's output folder. The default prefix for the folder name is NT_TopMemoryProcs.
Add job ID to output folder name?	Set to **yes** to add the job ID to the report's output folder name. The default is no. A job ID lets you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters.
Event notification	
Event for report success?	Set to **yes** to raise an event if the report is successfully generated. The default is yes.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report is generated successfully. The default is 35 (magenta event indicator).
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a generated report contains no data. The default is 25 (blue event indicator).

Description	How to Set It
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which report generation fails. The default is 5 (red event indicator).

54.51 RunAwayProcesses

Use this Knowledge Script to detect runaway processes on the specified computer by repeatedly sampling CPU usage for processes. This script raises an event if a process exceeds the CPU usage threshold in the number of consecutive samples taken (one at each interval).

For example, if this script detects that the process `cmd` has exceeded the CPU usage threshold for five consecutive monitoring periods, it might indicate that the process is trapped in an infinite loop or has encountered other problems. In addition to raising an event to notify you of the problem, you can stop any detected runaway processes. The detail message shows the list of processes being sampled.

54.51.1 Resource Objects

Windows 2000 Server or later

54.51.2 Default Schedule

The default schedule for this script is **Every 30 minutes**.

54.51.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if a process exceeds the CPU usage threshold in the number of consecutive samples taken (one at each interval). The default is y.
Collect data?	Set to **y** to collect data for charts and reports. When enabled, data collection returns the CPU usage for runaway processes. The default is n.
Maximum CPU usage threshold for runaway processes	Specify the maximum percentage of CPU time any process can be using when sampled before an event is raised. The default is 90%.
Number of consecutive samples	Specify the number of consecutive samples to take before raising an event. The default is 3.
Number of runaway processes	Specify the number of processes to display in a detail event or data message. Type 0 for all processes. The default is 5.
Ignore these processes	Specify the names of any processes to exclude from sampling. Separate the names with commas (,) and no space. The default is `SQLSERVR`.
Never kill these processes	Specify the names of any processes that should never be stopped. Separate the names with commas (,) and no spaces. The default is `EXPLORER,NetIQmc,NetIQccm,NetIQms,SERVICES,LSASS,WINLOGON,svchost`. If you stop these processes, your computer restarts.
Kill runaway process when detected?	Set to **y** to automatically stop a process. AppManager does not stop any process you specify in the *Never kill these processes* parameter. The default is n.
Event severity level for runaway processes detected	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a runaway process is detected. The default is 5 (red event indicator).

Description	How to Set It
Event severity level for killed runaway process	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a runaway process is stopped. The default is 10 (red event indicator).
Event severity level for failed to kill runaway process	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a runaway process cannot be stopped. The default is 10 (red event indicator).

54.52 ServerBusy

Use this Knowledge Script to monitor Windows server activity for network clients. This script raises an event if the number of active sessions or the number of open files exceeds the threshold you specify.

54.52.1 Resource Objects

Windows 2000 Server or later

54.52.2 Default Schedule

The default schedule for this script is **Every 10 minutes**.

54.52.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the number of active sessions or the number of open files exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. When enabled, data collection returns the number of active sessions and the number of open files. The default is n.
Maximum number of active sessions threshold	Specify the maximum number of client computers that can be connected to the server before an event is raised. The default is 50.
Maximum number of opened files threshold	Specify the maximum number of files that can be opened by network clients before an event is raised. The default is 200.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

54.53 ServerBytes

Use this Knowledge Script to monitor the rate of bytes transferred to and from the target computer. Because the transfer rate can vary dramatically depending on the activity being performed, you can click the **Advanced** tab and set the number of consecutive occurrences to a value greater than 1 to filter out insignificant spikes. The detail message includes the number of bytes sent and received per second.

54.53.1 Resource Objects

Windows 2000 Server or later

54.53.2 Default Schedule

The default schedule for this script is **Every 30 minutes**.

54.53.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the number of bytes transferred per second exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. When enabled, data collection returns the number of bytes transferred per second. The default is n.
Maximum bytes transferred per second threshold	Specify the maximum number of bytes that can be transferred (sent and received) per second before an event is raised. The default is 800,000 bytes.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of bytes transferred per second exceeds the threshold. The default is 25 (blue event indicator).

54.54 ServerError

Use this Knowledge Script to monitor the number of sessions that errored out during the monitoring interval. This script tracks only the number of sessions that failed and were closed and dropped in an error state since the last time the script ran (delta value). This script raises an event if the number of the errored-out sessions exceeds the threshold you specify.

54.54.1 Resource Objects

Windows 2000 Server or later

54.54.2 Default Schedule

The default schedule for this script is **Every 30 minutes**.

54.54.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the number of errored-out sessions exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. When enabled, data collection returns the number of errored-out sessions. The default is n.
Maximum errored-out sessions threshold	Specify the maximum number of errored-out sessions allowed before an event is raised. The default is 2.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 8 (red event indicator).

54.55 ServerTimeout

Use this Knowledge Script to monitor the number of sessions that timed out during the monitoring interval. To conserve resources, Windows servers automatically disconnect sessions that are idle for a set period. If a session's idle time exceeds the autodisconnect parameter for the server, the session times out and is closed. This script tracks the number of sessions that timed out since the last time the script ran (delta value) and raises an event if the number of the timed-out sessions exceeds the threshold you specify.

54.55.1 Resource Objects

Windows 2000 Server or later

54.55.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

54.55.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the number of the timed-out sessions exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. When enabled, data collection returns the number of timed-out sessions. The default is n.
Maximum timed-out sessions threshold	Specify the maximum number of timed-out sessions allowed before an event is raised. The default is 2.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 25 (blue event indicator).

54.56 ServiceChange

Use this Knowledge Script to detect changes to the status and startup type of Windows services. This script raises an event if the status (such as running, stopped, or pending), or startup type (such as manual, automatic, or disabled) of any service changes. For example, this script raises an event if a service startup type changes from Automatic to Manual.

54.56.1 Resource Objects

Windows 2000 Server or later

54.56.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.56.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ServiceChange job fails unexpectedly. The default is 5 (red event indicator).
Monitor Services	
Services to monitor (comma-separated list, or use * to monitor all services)	Specify the names of the services you want to monitor, separating multiple names with commas and no spaces. You can specify the internal service names or the service names displayed in the Control Panel. Type an asterisk (*) to check all services.The default is EventLog.
Event Notification	
Raise event if the start-type of a monitored service changes?	Set to **Yes** to raise an event if the startup type of a monitored service changes. The default is Yes.
Event severity level for service start-type changed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the service start-type changes. The default is 10 (red event indicator).
Raise event if the status of a monitored service changes?	Set to **Yes** to raise an event if the status of a monitored service changes. The default is Yes.
Event severity level for service status changed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the service status changes. The default is 10 (red event indicator).
Data Collection	

Description	How to Set It
Collect data for monitored services?	Set to **Yes** to collect data for charts and reports. If enabled, data collection returns: • **100** – service is unchanged, or • **0** – service is not running or has changed. The default is not selected.

54.57 ServiceDown

Use this Knowledge Script to monitor whether specified Microsoft Windows services are stopped or started, and, optionally, start any service that is stopped. This script allows you to monitor Windows Services that are not discovered by AppManager, such as the `WinLogon` or `NetIQms` services.

TIP: Use the General_ServiceDown script to monitor services that are discovered by AppManager.

54.57.1 Resource Objects

Windows 2000 Server or later

54.57.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.57.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ServiceDown job fails unexpectedly. The default is 5 (red event indicator).
Monitor Services	
Services to monitor (comma-separated list, or use * to monitor all services)	Specify the names of the services you want to monitor, separating multiple names with commas. For example: `MSSQLServer,SQLServerAgent,PrintSpooler`. The default is `EventLog,WinMgmt`. You can specify both long and short service names, the internal service names, or the service names displayed in the Control Panel. Type an asterisk (`*`) to monitor all service startup types specified in the *Service start-type filter* parameter.

Description	How to Set It
Service start-type filter (only used when monitoring all services)	Select the startup type for the services you want to monitor. The startup types include: • All • Automatic (services that start during the boot process) • Automatic - Delayed Start (services that start shortly after the boot process) • Automatic - Trigger Start (services that start after a specified triggering event) • Automatic [excludes Delayed and/or Trigger Start] • Manual (services that you manually start) • Manual - Trigger Start (services that you manually start after a specified triggering event) • Manual [excludes Trigger Start] • Disabled (services that have been set to not start) Use this parameter along with the *Services to monitor* parameter to monitor services by their startup types instead of their names. For example, if you enter "*" in the *Services to monitor* parameter and then select **Manual**, the script monitors all services whose startup type is Manual. The default is Automatic. **Notes** • The script uses this parameter only when you enter an asterisk (*) in the *Services to monitor* parameter. • Be careful when using an asterisk (*) in the *Services to monitor* parameter along with the **Manual** option. In this situation, if you also select the *Also start services that were last stopped normally* parameter, AppManager starts all Manual services.
Services to exclude (comma-separated list)	Specify the names of the services you want to exclude from monitoring, separating multiple names with commas. You can specify the internal service names or the service names displayed in the Control Panel.
Start services that stopped abnormally?	Select **Yes** to automatically start services that stopped abnormally. The default is Yes.
Also start services that were last stopped normally?	Select **Yes** to automatically start a service that stopped normally, perhaps as the result of a stop request from another process or human interaction. The default is unselected.
Service start timeout	Set the maximum number of seconds to wait after initiating the start command before reporting that the service could not be started. If the service is not running after the specified amount of time, this script reports that the service did not start in the time you specified. The default is 30 seconds.
Monitor Dependent Services	
Monitor dependent services?	Select **Yes** to monitor services that are dependent upon the other services you chose to monitor. The default is Yes.
Start dependent services?	Select **Yes** to automatically start a stopped service that is dependent upon a stopped monitored service. AppManager starts dependent services after the monitored service is started. The default is unselected. The options you choose for start-type filter and service start timeout apply to dependent services as well. **NOTE:** If you enable this parameter, you must also enable the *Monitor dependent services?* parameter.
Event Notification	

Description	How to Set It
Raise event if a service is stopped and should not be started?	Select **Yes** to raise an event if a service is stopped and this script is not set to start the service. The default is Yes.
Event severity when a service is stopped and should not be started	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a stopped service is not set to be started. The default is 5 (red event indicator).
Raise event if a service is stopped and cannot be started?	Select **Yes** to raise an event if a service is stopped and this script cannot start the service. The default is Yes.
Event severity when a service is stopped and cannot be started	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a stopped service cannot be started. The default is 10 (red event indicator).
Raise event if a stopped service is started successfully?	Select **Yes** to raise an event if AppManager successfully starts a stopped service. The default is Yes.
Event severity when a stopped service is started successfully	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully starts a stopped service. The default is 25 (blue event indicator).
Raise event if a service was last stopped normally?	Select **Yes** to raise an event if a service was last stopped normally. If enabled, an event is raised only if *Also start services that were last stopped normally* is not selected. The default is Yes.
Event severity when a services was last stopped normally	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service stopped normally and was not set to be started. The default is 30 (blue event indicator).
Raise event if a monitored service does not exist?	Select **Yes** to raise an event if a service specified in the *Services to monitor* parameter does not exist. The default is Yes.
Event severity when a monitored service does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service cannot be found. The default is 8 (red event indicator).
Raise event if a monitored service is disabled?	Select **Yes** to raise an event if a service is disabled. The default is Yes. AppManager cannot automatically start disabled services.
Event severity when a monitored service is disabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service is disabled. The default is 12 (yellow event indicator).
Data Collection	
Collect data for monitored services?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns a separate datastream for each service you monitor: • **100** – the service is started • **0** – the service is stopped • **50** – the service is stopped and was successfully started The data detail message includes the name of the service, the start type, and the status. The default is unselected.

Description	How to Set It
Collect data for dependent services?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns a separate datastream for each dependent service you monitor: • **100** – the service is started • **0** – the service is stopped • **50** – the service is stopped and was successfully started The data detail message includes the name of the dependent service, the start type, and the status. The default is unselected.

54.58 ServiceDownLR

Use this Knowledge Script to detect whether specified services on the computer on which you run the script are down. A service detected as down can be restarted.The Windows services include those that are not discovered by AppManager, such as `WinLogon` or `NetIQms`.

This script requires that you first use the ConfigServiceDown Knowledge Script to store a list of services in the local repository on the computer where ServiceDownLR runs.

Once you have run ConfigServiceDown on each computer in a group, you can use ServiceDownLR in a monitoring policy for the group. On each computer, ServiceDownLR knows what to monitor because ConfigServiceDown previously stored that information in the local repository.

54.58.1 Resource Objects

Windows 2000 Server or later

54.58.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.58.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if any service is down?	Set to **y** to raise an event if services are down. The default is y.
Collect data for service status?	Set to **y** to collect data for charts and reports. If enabled, data collection returns a separate datastream for each service you monitor: • **100** – the service is started • **0** – the service is stopped • **50** – the service is stopped and was successfully started The data detail message includes the name of the service, the start type, and the status. The default is n.
Collect data only on service down?	Set to **y** to collect data only when a service is down. If set to y, returns a value of 0. Enable this parameter only if the *Collect data?* parameter is enabled. The default is n.
Auto-start service?	Set to **y** to automatically restart down services. The default is y.
Event severity when service down; auto-start failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and auto-start fails. The default is 5 (red event indicator).
Event severity when service down; auto-start succeeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and auto-start succeeds. The default is 25 (blue event indicator).

Description	How to Set It
Event severity when service down; auto-start disabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and the *Auto-start service?* parameter is set to n. The default is 18 (yellow event indicator).
Event severity when service not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a specified service is not found. The default is 8 (red event indicator).
Event severity when Knowledge Script error occurs	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ServiceDownLR job fails unexpectedly. The default is 35 (magenta event indicator).

54.59 ServiceHung

Use this Knowledge Script to detect if a Windows service is hung. A hung service is a service in a Start-Pending, Stop-Pending, Continue-Pending, or Pause-Pending state for a number of consecutive intervals. This script raises an event if any service is detected as hung. The service can then be stopped or restarted.

54.59.1 Resource Objects

Windows 2000 Server or later

54.59.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.59.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if a service is detected as hung. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • **100** – the service is up, or • **0** – the service is hung. The default is n.
Services	Provide the names of the services you want to monitor, separating the names with commas (,) and no spaces. You can specify the internal service names or the service names displayed in the Control Panel. Type an asterisk (*) to check all services whose startup type is Automatic. The default is `EventLog`.
Maximum number of consecutive iterations before service is considered hung	Specify the maximum number of consecutive times a service can be in a Start-Pending, Stop-Pending, Continue-Pending, or Pause-Pending state before it is considered hung. The default is 2.
Kill the hung service?	Set to **y** to automatically stop hung services. The default is y.
Auto-start killed service?	Set to **y** to automatically restart the service after stopping it. The default is y.
Event severity level for auto-start failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is hung and an attempt to restart it was not successful. The default is 5 (red event indicator).
Event severity level for auto-start succeeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is hung and was restarted successfully. The default is 25 (blue event indicator).
Event severity level for don't auto-start	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is hung and the *Auto-start killed service?* parameter is disabled. The default is 18 (yellow event indicator).

Description	How to Set It
Event severity level for failed to retrieve service status	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a specified service could not be found. The default is 10 (red event indicator).
Event severity level for failed to kill service	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is hung and could not be stopped. The default is 10 (red event indicator).

54.60 ServiceRemove

Use this Knowledge Script to detect when Windows services are added or removed in the monitoring interval. This script raises an event when changes are made to the services installed on the target computer. The script monitors only changes in the list of automatic services (startup type), including installations and uninstallations of services in automatic startup and changing a service from automatic to disabled/manual or vice-versa.

NOTE: If a computer is restarted after a service is removed, the agent counters are reset. Once the counters are reset, AppManager cannot detect the service removal and does not raise an event.

54.60.1 Resource Objects

Windows 2000 Server or later

54.60.2 Default Schedule

The default schedule for this script is **Every 30 minutes**.

54.60.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event when changes are made to the services installed on the target computer. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of services currently installed. The default is n.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which service changes are detected. The default is 12 (yellow event indicator).

54.61 SharedFiles

Use this Knowledge Script to monitor and list shared files that are open. This script raises an event if the number of open shared files exceeds the threshold you specify. Run this script on the server that hosts the shared files.

54.61.1 Prerequisite

Before running this script, ensure that the AppManager Client Resource Monitor service (`netiqmc.exe`) is set to log on as a domain user account in the same domain as, or a domain trusted by, the target computer.

54.61.2 Resource Objects

Windows 2000 Server or later

54.61.3 Default Schedule

The default schedule for this script is to **Every 5 minutes**.

54.61.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the number of open shared files exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of shared files currently open. The detail message lists the shared files with file IDs and lock information. The default is n.
Maximum number of shared files open threshold	Specify the maximum number of shared files that can be open at one time before an event is raised. The default is 100.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of open shared files exceeds the threshold. The default is 8 (red event indicator).

54.62 SystemUpTime

Use this Knowledge Script to monitor the system up time for a Windows server or workstation. This script tracks the number of hours that the computer has been operational since it was last rebooted. This script raises an event if the computer was rebooted within the monitoring interval.

To monitor whether a computer has gone down for reasons other than being placed in maintenance mode, use the General_MachineDown Knowledge Script.

54.62.1 Resource Objects

Windows 2000 Server or later

54.62.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.62.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the computer was rebooted within the monitoring interval. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of hours the system has been up. The default is n.
Event severity level for system reboot	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the computer was rebooted. The default is 8 (red event indicator).
Event severity level for an unexpected Knowledge Script error	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SystemUpTime job fails unexpectedly. The default is 35 (magenta event indicator).

54.63 TopCpuProcs

Use this Knowledge Script to monitor total CPU resources used by all processes and which processes consume the most CPU resources. This script raises an event if the percentage of CPU usage exceeds the threshold you specify. In addition, this script generates a datastream for processor usage.

54.63.1 Resource Object

CPU folder

54.63.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.63.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Create event if processor utilization is over the threshold?	Set to **Yes** to raise an event if the percentage of CPU time used exceeds the threshold you specify. The default is Yes.
Severity - Processor utilization over the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. The default is 10 (red event indicator).
Number of processes to include in detail message	Specify the number of top processes to display in the detail message (event or data). Enter 0 to display all processes. The default is 10. **NOTE:** Limit the number of processes included in the detail message to the top five to ten processes. In most cases, including all processes increases the size of the detail message without providing much more useful information. Typically, the top few processes are the most significant and the most userful for troubleshooting purposes.
Severity - Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the TopCpuProcs job fails unexpectedly. The default is 5 (red event indicator).
Data Collection	
Collect processor utilization data?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the process name, ID, and utilization percentage (%) for the number of processes you set in *Number of processes to include in detail message*. The default is unselected. **NOTE:** If the value you set in *Number of processes to include in detail message* is greater than the number of processes running on the computer, the event detail message only contains the list of running processes; AppManager does not include blank lines to represent the non-running processes.
Monitoring	
Threshold – Total processor utilization	Specify the maximum percentage of CPU resources that can be in use for all processes before an event is raised. The default is 85%.

54.64 TopMemoryProcs

Use this Knowledge Script to monitor total memory (in KB) usage for all processes and to identify which processes consume the most memory. This script raises an event if memory usage exceeds the threshold you specify. In addition, this script generates a datastream for memory utilization.

54.64.1 Resource Object

Memory folder

54.64.2 Default Schedule

The default schedule for this script is **Every 5 minutes**.

54.64.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Create event if memory utilization exceeds the threshold?	Select **Yes** to raise an event if memory usage exceeds the threshold you specify. The default is Yes.
Severity – Memory utilization over the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory usage exceeds the threshold. The default is 10 (red event indicator).
Number of processes to include in detail message	Specify the number of top processes to display in the detail message (event or data). Enter 0 to display all processes. The default is 10. **NOTE:** Limit the number of processes included in the detail message to the top five to ten processes. In most cases, including all processes increases the size of the detail message without providing much more useful information. Typically, the top few processes are the most significant and the most useful for troubleshooting purposes.
Severity – Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the TopMemoryProcs job fails unexpectedly. The default is 5 (red event indicator).
Data Collection	
Collect memory utilization data?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the process name, ID, and memory utilization (in KB), as well as job configuration information for each data point value. The default is unselected.
Monitoring	
Threshold – Total memory utilization	Specify the maximum amount of memory that can be in use for all processes before an event is raised. The default is 5120 KB.
Threshold – Size scale	Select the scale for the total memory utilization threshold you specify (kilobytes, megabytes, gigabytes, terabytes). The default is kilobytes.

54.65 TrustRelationship

Use this Knowledge Script to test the domain trust relationship from the computer where you run this script to a specified domain. The domain of the managed computer running this script is considered the *trusting* or resource domain. The domains you specify as script properties are the domains you expect to be trusted domains. This script raises an event if there are problems with the domain trust, such as when a trusted password is no longer valid or the Primary Domain Controller of the trusting domain cannot be located.

NOTE: Before running this script, be sure the `netiqmc` and `netiqccm` services are set to run as a domain user account with Administrator privileges in both the trusting and trusted domains. For example, to test whether Domain A still trusts Domain B, the agent services must run as an account with domain Administrator privileges in both Domain A and Domain B. Use the Services Control Panel to identify an account for the service to run as.

54.65.1 Resource Objects

Windows 2000 Server or later

54.65.2 Default Schedule

The default schedule for this script is **Every 30 minutes**.

54.65.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if there are problems with the domain trust relationships. The default is y.
Collect data?	Specify whether to collect data for charts and reports. If enabled, data collection returns: • **100** – the domain of the managed computer trusts the domains entered, or • **0** – the trust relationship is broken. The default is n.
Trusted domains	Provide a list of trusted domains, separated by commas with no spaces. Trusted domains contain resources that computers in other domains can use.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which there are problems with the domain trust relationships. The default is 8 (red event indicator).

54.66 UnixRemoteProcessDown

Use this Knowledge Script to monitor applications on remote UNIX computers where you cannot easily install a UNIX agent. This script uses a proxy UNIX agent, installed on another computer, to monitor processes on the remote UNIX computer.

If a monitored process is found to be down, this script can restart it automatically, using a script or command you supply. Be sure to read the help for the *Scripts or commands to restart processes* parameter before proceeding.

You can specify the process names to be monitored in the *Processes to monitor* parameter, or you can provide a configuration file in XML format to specify processes to monitor and what steps to take to restart them if they are down. For more information, see "Remote Process Monitoring Using a Configuration File " on page 3408.

54.66.1 Resource Object

UNIX Machine folder

54.66.2 Default Schedule

The default interval for this script is **Every 20 seconds**.

54.66.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if process is down?	Select **Yes** to raise an event if a monitored process is down. The default is Yes.
Event severity when process is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a process is down. The default is 10.
Raise event if process is running?	Select **Yes** to raise an event if a monitored process is running. The default is unselected.
Event severity when process is running	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored process is running. The default is 25.
Remote Host Connection	
Configure access to the remote managed computers by specifying their root password. All of the remote computers must use the same root password. This script can use SSH with root password authentication or Telnet to communicate with the remote managed computer.	
Password for root user account	To use Secure Shell (SSH) for the connection to the remote computers, ensure that SSH with root authentication is enabled on the remote UNIX computers where you want to install the UNIX agent. For this parameter, specify the password for the root user to securely access the remote UNIX computers. This script does not support SSH root authentication with an RSA key.

Description	How to Set It

Connection Transport	This script can use SSH with root password authentication or Telnet to communicate with the remote managed computers.
	
	If you select the **Telnet/FTP** option (the default), the Telnet prompt on the remote computer must end with a space or one of the following characters: %, >, #, $
	
	The following is an example of a supported Telnet prompt:
	
	`user@hostname>`
	
	Here is an example of an unsupported Telnet prompt:
	
	`<user@hostname:/tmp - 2005-Mar-09>`
	`->`
	
	In the example above, the last character in the first line of the two-line prompt is a line feed character, which is not supported.

Telnet non-root user account	If you selected Telnet to connect to the remote UNIX computers, specify a non-root user account to use for the connection. When connecting to a remote UNIX computer using Telnet and FTP, this script switches from the non-root user to the root user.
Telnet non-root user account password	If you selected Telnet as the connection transport medium, specify the password for the non-root user account to connect to the remote UNIX computers.
Monitoring Source Configuration	
Full path to configuration file for remote monitoring	Supply a full directory path to an XML file to use for communications with the remote UNIX computer. The default is c:\temp\`config.xml`
Manual Configuration	
Hostnames or IP addresses where processes are to be monitored	Supply a list of hostnames or IP addresses of the UNIX computers where processes are to be monitored. Separate multiple hostnames with commas (,) and no spaces. Supply IP addresses in dotted notation, such as 23.45.678.9. Separate multiple IP addresses with commas and no spaces.
Processes to monitor	Supply the names of the UNIX application processes to monitor. Separate multiple process names with commas and no spaces. You can also enter a Perl regular expression here if you want to exclude and include processes on various platforms using one argument. See "Running this Knowledge Script" on page 3407 for more information.

Description	How to Set It
Scripts or commands to restart processes (comma-separated	Supply one of the following: • a list of full directory paths to script files to use to restart any processes that are found to be down, or • a list of commands to use to restart these processes. There is no need to supply a value for this parameter if you specify "n" for the *Restart process if down?* parameter. If you configure this script to restart a process, specify a list of restart commands or shell scripts that contain the restart commands. Do not execute restart commands in the foreground. When executing a restart command in the foreground, this script cannot run at its next scheduled interval until after all the restart commands have completed. When specifying: • A list of commands to run on the remote computer, run each command in the background by adding an ampersand (&) and separating each command with a comma. If this script is configured to use Telnet/FTP, you can restart a process in the background by adding an ampersand (&) to each command. If this script is configured to use SSH/SFTP, use a shell script on the remote computer to restart the processes in the background and ensure that `stdout` and `stderr` are redirected to a log file. When configured to use SSH/SFTP, this script always executes a command to restart a process in the foreground. • A shell script on the remote computer that restarts the processes you want, in the shell script, add an ampersand (&) to each restart command—and ensure that `stdout` and `stderr` are redirected to a log file—to restart a process in the background.
Restart process if down? (y/n for each process, comma-separated)	Provide a list specifying "y" or "n" for each process in the *Processes to monitor* parameter. Specify y for a process if you want this script to restart it on the remote computer if it is found to be down. The commands or scripts you specified for the previous parameter will be used. Separate the list of Ys and Ns with commas and no spaces.

54.66.4 Running this Knowledge Script

The UnixRemoteProcessDown script requires the proxy UNIX agent to run as the root user account. To enable this script, you must run the AppManager installation program (the `AMxx_UNIX_setup.exe` file) on the proxy computer. An extra "helper" file will be installed: `UnixRemoteProcessDown.exe`.

To use this script to monitor the up and down status of the UNIX agent, specify `nqmagt` in the list of processes to monitor. If the `nqmagt` process is down, you can specify a restart command to restart the agent:

```
/etc/init.d/nqmdaemon start
```

This script can use either the Secure Shell (SSH) program with root password authentication or Telnet to make a secure connection to the remote UNIX computer. By default, Telnet is used, but you can select SSH/SFTP from the *Connection Transport* parameter to use Secure Shell instead. If you choose to use Telnet, you must supply a non-root user account name and password.

NOTE: Proxy monitoring with this script is possible only if the SSH program is installed on the target computer, or if the Telnet protocol is enabled on it.

You can also supply a Perl regular expression for the *Names of processes to monitor* parameter to check for a specific string. For example, you can exclude and include processes on various platforms using one argument. A process may be running out of the `/usr`, the `/opt`, or the `/var` directory, but you are not sure where. Or perhaps a process is running out of different locations on different platforms. If you enter

```
(/usr|/opt)/[processname]
```

for the *Names of processes to monitor* parameter, the script would monitor the process that is running in `/usr` OR in `/opt` but NOT in `/var`.

54.66.5 Remote Process Monitoring Using a Configuration File

The UnixRemoteProcessDown script includes an option to use a configuration file in XML format to supply monitoring instructions to the agent. In such a file, you can supply a list of processes to monitor on a given remote UNIX computer, specify how to restart these processes, and indicate whether to restart these processes.

By default, the script looks for the following configuration file:

```
c:\temp\config.xml
```

However, you can supply a different file as the value for the *Full path to configuration file for remote monitoring* parameter.

Following is an example of a valid XML configuration file that tells the UNIX agent which processes to monitor and what to do if the processes are not running:

```
<?xml version="1.0" encoding="utf-8" ?>
<SERVERS>
  <SERVER name="uws3">
    <PROCESS name="nqmagt" startupscript="/etc/init.d/nqmdaemon start" restart="y"/>
    <PROCESS name="xntpd"  startupscript="/etc/init.d/xntpd start" restart="n"/>
  </SERVER>
  <SERVER name="uws19">
    <PROCESS name="inetd"  startupscript="/etc/init.d/inetsvc start" restart="n"/>
    <PROCESS name="init"  startupscript="/etc/init.d/init start" restart="n"/>
  </SERVER>
</SERVERS>
```

55 NTAdmin Knowledge Scripts

The NTAdmin category provides Knowledge Scripts for performing Windows administrative tasks or special one-time activities. To run Knowledge Scripts in this category, you need to be defined as a user with administrator privileges on the computer on which you run the scripts.

Some Knowledge Scripts perform AppManager administrative tasks or operations that should be restricted to a limited number of users. To control access to these Knowledge Scripts, the scripts are only made available to users who are assigned to the Administrator role through AppManager Security Manager.

Most of the administrative Knowledge Scripts are in the Action, AMAdmin, and NTAdmin categories, and by default these Knowledge Scripts are designated as being for administrators only. For more information, see the *Administrator Guide for AppManager*.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
AddGroup	Adds a local or domain Windows group account.
AddGroupViaAD	Adds a domain group account to Active Directory.
AddUser	Adds a local or domain Windows user account.
AddUserViaAD	Adds a domain user account to Active Directory.
ChangePassword	Changes the password for a specified local or domain user account.
CheckServicePack	Compares the Windows service pack level on a managed computer to a specified level.
CloseSharedFiles	Closes a shared file and removes the file lock.
DeleteGroup	Deletes a local or domain Windows group account.
DeleteUser	Deletes a local or domain Windows user account.
FileCheck	Checks whether a particular file exists.
ModifyServiceConfig	Changes the configuration for specified services.
RegistrySet	Sets or creates a Windows registry key.
RestartService	Schedules a service to automatically stop and restart a service after a specified time interval.
RunDOS	Runs a non-interactive DOS command.
SNMPSet	Sets a value for a selected SNMP MIB variable.
SyncTime	Synchronizes the system time among computers.

Knowledge Script	What It Does
UnixAgentHealthProxy	Checks the availability of a remote managed UNIX computer and monitors the health of the remote UNIX agent. This Knowledge Script uses a proxy Windows agent to monitor remote UNIX agents.

55.1 AddGroup

Use this Knowledge Script to add a Windows domain group account or local group account. Domain groups are added to the domain associated with the managed computer where the script runs. This script raises an event when the operation is successful or when it fails.

NOTE: You cannot create a local group on a Windows Domain Controller.

55.1.1 Prerequisite

Before running this script, ensure that the AppManager Client Resource Monitor service (`netiqmc.exe`) is set to log on as a domain user account in the same domain as, or a domain trusted by, the target computer.

55.1.2 Resource Objects

Windows 2000 Server or later

55.1.3 Default Schedule

The default interval for this script is **Run once**.

55.1.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Name of group to be added	Provide the name of the domain group account to add. If you enter a group name for a Windows 2000 server domain controller exceeding the limit Active Directory can display in the **Name** column, the group name is displayed as S-1-5-21-952230801-75384649-2348082356-1114. To view the true group name and to verify that the group was created correctly, select **Users** in Active Directory Users and Computers and double-click the group name in the **Name** column. Active Directory Users and Computers displays the group name in **Group name (pre-Windows 2000)**.
Event if group was added?	Set to **y** to raise an event if the domain group was added. The default is n.
Event if group was not added?	Set to **y** to raise an event if the domain group was not added. The default is y.
Add local group?	Set to **y** to create a local group account on the computer where the script job is running. If set to n, you must enable *Add domain group?* to add a domain group. The default is n.
Add domain group?	Set to **y** to associate the domain group account with the domain of the computer where the script job is running. If set to n, you must enable *Add local group?* to add a local group. The default is y.

Parameter	How to Set It
Event severity: Group was not added	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a domain group was not added. The default is 12 (yellow event indicator).
Event severity: Group was added	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a domain group was added. The default is 25 (blue event indicator).

55.2 AddGroupViaAD

Use this Knowledge Script to add a domain group account to Active Directory. You must run this script on a computer that is a Domain Controller. The group is added to the domain associated with the managed computer where the script runs. This script raises an event when the operation is successful or when it fails.

55.2.1 Prerequisite

Before running this script, ensure that the AppManager Client Resource Monitor service (`netiqmc.exe`) is set to log on as a domain user account in the same domain as, or a domain trusted by, the target computer.

55.2.2 Resource Objects

Windows 2000 Server or later

55.2.3 Default Schedule

The default interval for this script is **Run once**.

55.2.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Name of group to be added	Provide the name of the domain group account to add. If you enter a group name for a Windows 2000 server domain controller exceeding the limit Active Directory can display in the **Name** column, the group name is displayed as S-1-5-21-952230801-75384649-2348082356-1114. To view the true group name and verify that the group was created correctly, select **Users** in Active Directory Users and Computers and double-click the group name in the **Name** column. Active Directory Users and Computers displays the group name in **Group name (pre-Windows 2000)**.
Event if group was added?	Set to **y** to raise an event if the domain group was added. The default is n.
Event if group was not added?	Set to **y** to raise an event if the domain group was not added. The default is y.
Event severity: Group was not added	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a domain group was not added. The default is 12 (yellow event indicator).
Event severity: Group was added	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a domain group was added. The default is 25 (blue event indicator).

55.3 AddUser

Use this Knowledge Script to add a domain user account or local user account. A domain user account is added to the domain associated with the managed computer where the script runs. This script raises an event when the operation succeeds or fails.

NOTE: You cannot create a local user on a Windows Domain Controller.

55.3.1 Prerequisite

Before running this script, ensure that the AppManager Client Resource Monitor service (`netiqmc.exe`) is set to log on as a domain user account in the same domain as, or a domain trusted by, the target computer.

55.3.2 Resource Objects

Windows 2000 Server or later

55.3.3 Default Schedule

The default interval for this script is **Run once**.

55.3.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Name of user to be added	Provide the name of the user account to add.
Password of user to be added	Provide the password of the user account to add.
Event if user was added?	Set to **y** to raise an event if the user was added. The default is n.
Event if user was not added?	Set to **y** to raise an event if the user was not added. The default is y.
Add domain user?	Set to **y** to add the user as a domain user in the current client's domain. If set to y, the user account is associated with the domain of the computer where the script is running. If set to n, a local user account is created on the computer where the script is running. The default is y.
Event severity: User was not added	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the user was not added. The default is 12 (yellow event indicator).
Event severity: User was added	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the user was added. The default is 25 (blue event indicator).

55.4 AddUserViaAD

Use this Knowledge Script to add a user account to Active Directory. You must run this script on a computer that is a Domain Controller. The user account is added to the domain associated with the computer where the script runs. This script raises an event when the operation is successful or when it fails.

55.4.1 Prerequisite

Before running this script, ensure that the AppManager Client Resource Monitor service (`netiqmc.exe`) is set to log on as a domain user account in the same domain as, or a domain trusted by, the target computer.

55.4.2 Resource Objects

Windows 2000 Server or later

55.4.3 Default Schedule

The default interval for this script is **Run once**.

55.4.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Name of user to be added	Provide the name of the user account to add.
Password of user to be added	Provide the password of the user account to add.
Event if user was added?	Set to **y** to raise an event if the user account was added. The default is y.
Event if user was not added?	Set to **y** to raise an event if the user account was not added. The default is y.
Event severity: User was not added	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the user was not added. The default is 12 (yellow event indicator).
Event severity: User was added	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the user was added. The default is 25 (blue event indicator).

55.5 ChangePassword

Use this Knowledge Script to change the password for a specified domain user account or local user account. This script raises an event when the change password operation is successful or when it fails.

55.5.1 Prerequisite

Before running this script, ensure that the AppManager Client Resource Monitor service (`netiqmc.exe`) is set to log on as a domain user account in the same domain as, or a domain trusted by, the target computer.

55.5.2 Resource Objects

Windows 2000 Server or later

55.5.3 Default Schedule

The default interval for this script is **Run once**.

55.5.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Name of user account	Provide the name of the user account whose password should be changed. The default is guest.
New password for user account	Provide the new password for the user account.
Is the account a domain user?	Set to **y** to change the password for a domain user account. Set to **n** to change the password for a local user account. If set to y, the affected domain user account is one associated with the domain of the managed client where the Knowledge Script job is running. The default is y.
Event if password was changed	Set to **y** to raise an event if the password is changed successfully. The default is n.
Event if password was not changed	Set to **y** to raise an event if the password is not changed. The default is y.
Event severity: Password was not changed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the password was not changed. The default is 12 (yellow event indicator).
Event severity: Password was changed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the password was changed. The default is 25 (blue event indicator).

55.6 CheckServicePack

Use this Knowledge Script to compare the installed version of a Microsoft Windows service pack to a specified minimum threshold. This script raises an event if the version of the service pack installed on the target computer falls below the minimum threshold.

This script queries the computer's registry to determine the current service pack level.

55.6.1 Resource Objects

Windows 2000 Server or later

55.6.2 Default Schedule

The default interval for this script is **Weekly**.

55.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Create event if service pack does not meet minimum?	Select **Yes** to raise an event if the version of the service pack installed on the target computer falls below the threshold. The default is Yes.
Severity - Service pack does not meet minimum	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the service pack version falls below the threshold. The default is 8 (red event indicator).
Severity - Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the CheckServicePack job fails. The default is 8 (red event indicator).
Data Collection	
Collect service pack data?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the target computer's configuration, including the Windows version and service pack number. The default is unselected.
Monitoring	
Check Windows 2000 Service Pack?	Select **Yes** to check the Windows 2000 Service Pack level on the target computer. The default is Yes.
Threshold – Service pack minimum	Specify the minimum version of the Windows 2000 service pack that must be installed to prevent an event from being raised. For example, to check whether Service Pack 4 (or later) is installed, enter 4. The default is 4.
Check Windows XP Service Pack?	Select **Yes** to check the Windows XP service pack level on the target computer. The default is Yes.
Threshold – Service pack minimum	Specify the minimum version of the Windows XP service pack that must be installed to prevent an event from being raised. For example, to check whether Service Pack 1 (or later) is installed, enter 1. The default is 3.

Parameter	How to Set It
Check Windows 2003 Service Pack?	Select **Yes** to check the Windows Server 2003 service pack level on the target computer. The default is Yes.
Threshold - Service pack minimum	Specify the minimum version of the Windows Server 2003 service pack that must be installed to prevent an event from being raised. For example, to check whether Service Pack 1 (or later) is installed, enter 1. The default is 2.
Check Windows Vista Service Pack?	Select **Yes** to check the Windows Vista service pack level on the target computer. The default is Yes.
Threshold - Service pack minimum	Specify the minimum version of the Windows Vista service pack that must be installed to prevent an event from being raised. For example, to check whether Service Pack 1 (or later) is installed, enter 1. The default is 2.
Check Windows Server 2008 Service Pack?	Select **Yes** to check the Windows Server 2008 service pack level on the target computer. The default is Yes.
Threshold - Service pack minimum	Specify the minimum version of the Windows Server 2008 service pack that must be installed to prevent an event from being raised. For example, to check whether Service Pack 1 (or later) is installed, enter 1. The default is 2.
Check Windows 7 Service Pack?	Select **Yes** to check the Windows 7 service pack level on the target computer. The default is Yes.
Threshold - Service pack minimum	Specify the minimum version of the Windows 7 service pack that must be installed to prevent an event from being raised. For example, to check whether Service Pack 1 (or later) is installed, enter 1. The default is 0.
Check Windows Server 2008 R2 Service Pack?	Select **Yes** to check the Windows Server 2008 R2 service pack level on the target computer. The default is Yes.
Threshold - Service pack minimum	Specify the minimum version of the Windows Server 2008 R2 service pack that must be installed to prevent an event from being raised. For example, to check whether Service Pack 1 (or later) is installed, enter 1. The default is 0.
Check Windows 8 Service Pack?	Select **Yes** to check the Windows 8 service pack level on the target computer. The default is Yes.
Threshold - Service pack minimum	Specify the minimum version of the Windows 8 service pack that must be installed to prevent an event from being raised. For example, to check whether Service Pack 1 (or later) is installed, enter 1. The default is 0.
Check Windows Server 2012 Service Pack?	Select **Yes** to check the Windows Server 2012 service pack level on the target computer. The default is Yes.
Threshold - Service pack minimum	Specify the minimum version of the Windows Server 2012 service pack that must be installed to prevent an event from being raised. For example, to check whether Service Pack 1 (or later) is installed, enter 1. The default is 0.

55.7 CloseSharedFiles

Use this Knowledge Script to close one or more shared files and remove corresponding file locks. You must run this script on the server where the file is shared.

You must specify a shared file by its file identifier. You can view the file identifier in one of the following ways:

- At a Command Prompt, run the `net file` command to see a list of files, corresponding identifiers, and lock information.
- See the NT SharedFiles Knowledge Script.

55.7.1 Prerequisite

Before running this script, ensure that the AppManager Client Resource Monitor service (`netiqmc.exe`) is set to log on as a domain user account in the same domain as, or a domain trusted by, the target computer.

55.7.2 Resource Objects

Windows 2000 Server or later

55.7.3 Default Schedule

The default interval for this script is **Run once**.

55.7.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
List of file identifiers	Specify the file identifier for each file you want to close. Use a comma to separate multiple identifiers. The default is 1,2,3.
Event if file was closed?	Set to **y** to raise an event if the file is closed successfully. The default is n.
Event if file was not closed?	Set to **y** to raise an event if the file is not closed. The default is y.
Event severity: File was not closed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the file was not closed. The default is 12 (yellow event indicator).
Event severity: File was closed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the file was closed. The default is 25 (blue event indicator).

55.8 DeleteGroup

Use this Knowledge Script to delete a specified domain group account or local group account. This script raises an event when the group is deleted successfully or when the deletion fails.

55.8.1 Prerequisite

Before running this script, ensure that the AppManager Client Resource Monitor service (`netiqmc.exe`) is set to log on as a domain user account in the same domain as, or a domain trusted by, the target computer.

55.8.2 Resource Objects

Windows 2000 Server or later

55.8.3 Default Schedule

The default interval for this script is **Run once**.

55.8.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Name of the group to be deleted	Provide the name of the group account you want to delete.
Event if group is deleted?	Set to **y** to raise an event if the group account is deleted successfully. The default is n.
Event if group is not deleted?	Set to **y** to raise an event if the group account is not deleted. The default is y.
Delete local group?	Set to **y** to delete a local group. If set to n, you must enable *Delete domain group?* to delete a domain group. The default is n.
Delete domain group?	Set to **y** to delete a domain group account. If set to n, enable *Delete local group?* to delete a local group. If set to y, the domain account affected is one associated with the domain of the computer where the job is running. The default is y.
Event severity: Group was not deleted	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the group was not deleted. The default is 12 (yellow event indicator).
Event severity: Group was deleted	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the group was deleted. The default is 25 (blue event indicator).

55.9 DeleteUser

Use this Knowledge Script to delete a specified domain user account or local user account. This script raises an event when the user account is deleted successfully or when the deletion fails.

55.9.1 Prerequisite

Before running this script, ensure that the AppManager Client Resource Monitor service (`netiqmc.exe`) is set to log on as a domain user account in the same domain as, or a domain trusted by, the target computer.

55.9.2 Resource Objects

Windows 2000 Server or later

55.9.3 Default Schedule

The default interval for this script is **Run once**.

55.9.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Name of the user to be deleted	Provide the name of the user account you want to delete.
Event if user is deleted?	Set to **y** to raise an event if the user account is deleted successfully. The default is n.
Event if user is not deleted?	Set to **y** to raise an event if the user account is not deleted. The default is y.
Delete domain user?	Set to **y** to delete a domain user account. Set to **n** to delete a local user account. If set to n, the local user account affected is one associated with the domain of the computer where the script is running. The default is y.
Event severity: User was not deleted	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the user was not deleted. The default is 12 (yellow event indicator).
Event severity: User was deleted	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the user was deleted. The default is 25 (blue event indicator).

55.10 FileCheck

Use this Knowledge Script to check whether a particular file exists on one or more computers. This script raises an event if it finds the file you specified.

55.10.1 Resource Objects

Windows 2000 Server or later

55.10.2 Default Schedule

The default interval for this script is **Run once**.

55.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Full path to file	Provide the full path to the file you want to check, for example: `%systemroot%\system32\clock.exe` **Notes** • If you include spaces in the filepath, the event details include a broken link to the file. • If the file is on a network-mounted drive, the computer where you run this script must be running with a Windows domain account that can access the remote drive. Otherwise, the job may report an error because it cannot access files on the remote drive.
Event when found?	Set to **y** to raise an event if the specified file is found. If set to n, an event is raised when the file cannot be found. The default is y.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the specified file is found or not found. The default is 5 (red event indicator).

55.11 ModifyServiceConfig

Use this Knowledge Script to change the configuration for specified services. To apply your changes, you must manually restart the services. This script raises an event indicating whether the service configuration change you specified was successful.

55.11.1 Resource Objects

Windows 2000 Server or later

55.11.2 Default Schedule

The default interval for this script is **Run once**.

55.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
List of services	Provide the names of the services whose configurations you want to modify, separating the names with commas (,). Enter the internal service names or the service names displayed in the Services Control Panel.
Collect data?	Set to **y** to collect data. If enabled, data collection returns: • **100** – service successfully modified, or • **0** – service modification failed. The default is n.
Service type	Select a new service type. Valid types are: • own • share • interact • kernel • filesys Select NO_CHANGE to keep the current configuration. Default is NO_CHANGE.
Start type	Select a new start type. Valid types are: • boot • system • auto • demand • disabled Select NO_CHANGE to keep the current configuration. Default is NO_CHANGE.

Parameter	How to Set It
Error control	Select the level of error control. Valid types are: • normal • severe • critical • ignore Select NO_CHANGE to keep the current configuration. Default is NO_CHANGE.
Log On As account	Specify the system or user account name for the service to log on as. Although most services log on as a system account, you can configure some services to log on using special user accounts. Default is NO_CHANGE. **NOTE:** The account you specify here must already have the right to log on as a service.
Password for Log On As account	Specify the password for the logon user account.
Display name of the service	Provide a new display name for the service. The default is NO_CHANGE.
Event severity: Service was changed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the service was changed. The default is 20 (yellow event indicator).
Event severity: Service was not changed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the service was not changed. The default is 8 (red event indicator).

55.12 RegistrySet

Use this Knowledge Script to set or create a Windows registry key. You can specify a list of computers where you want to set the key value, either directly using the *List of computers* parameter or in a file containing a list of computer names or addresses. This script creates a new key if the specified key does not exist. In addition, this script raises an event if the set operation fails. This script can also raise an event if the set operation completes successfully.

On 64-bit Windows systems, you can configure this script to set registry information for 32-bit or 64-bit programs.

- To set registry information for a 64-bit application, disable the *Set 32-bit program registry keys on a 64-bit system?* parameter and specify the registry path and key under `HKEY_LOCAL_MACHINE\Software`.
- To set registry information for a 32-bit application, enable the *Set 32-bit program registry keys on a 64-bit system?* parameter and specify the registry path and key exactly as it would be specified on a 32-bit system, under `HKEY_LOCAL_MACHINE\Software`.

55.12.1 Resource Objects

Windows 2000 Server or later

55.12.2 Default Schedule

The default interval for this script is **Run once**.

55.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event when set?	Set to **y** to raise an event when the registry key is set successfully. The default is n.
Set 32-bit program registry keys on a 64-bit system?	On a 64-bit Windows system, set this parameter to **y** to set registry information for 32-bit programs. The default value, n, enables you to set registry information for 64-bit programs. On a 32-bit Windows system, this parameter is not applicable and will be ignored. **Tip** To set registry information for 32-bit programs and 64-bit programs, configure separate jobs.
Root key	Specify the registry root. Valid root options are: • `HKEY_LOCAL_MACHINE` • `HKEY_CLASSES_ROOT` • `HKEY_CURRENT_USER` • `HKEY_USERS` The default is `HKEY_LOCAL_MACHINE`.

Parameter	How to Set It
Full path to registry key	Provide the full path to the registry key. You can enter any path under the root key as long as you have write permission. The default path is: `Software\NetIQ\AppManager\4.0\NetIQmc\Tracing` To specify the path to the registry key for a 32-bit or 64-bit program, specify a path under `HKEY_LOCAL_MACHINE\Software`. **NOTE:** Although the registry keys for 32-bit programs on a 64-bit system are stored under the key `HKEY_LOCAL_MACHINE\Software\Wow6432Node`, **do not** specify the `Wow6432Node` component of the path. Instead, specify the path without the `Wow6432Node` component, and enable the *Set 32-bit program registry keys on a 64-bit system?* parameter.
Key name	Specify the name of the key to set or create. The default is `TraceMC`.
Key type	Specify the type for the key. Valid types are: • `REG_SZ` • `REG_MULTI_SZ` • `REG_DWORD` • `REG_EXPAND_SZ` The default is `REG_DWORD`.
Value of the key	Specify the value to which the registry key should be set. Hex values can be entered in the form 0x*nnnn*. Default is 1.
Null character	Specify the character separator for `REG_MULTI_SZ` type. For example to set *foo bar*, you need to be able to indicate the blank space between *foo* and *bar* (foo+bar). The default is +. **NOTE:** Choose a character that is not part of the name.
List of computers (comma separated)	Specify the computers for which you want to set this value. If you leave this parameter blank, the registry key located on the local computer is set. To set the value for multiple computers, enter the hostname or IP address for each computer in a comma-separated list. For example: `CORP01,ENGR02,10.15.221.5.`

Full path to file with list of computers	To set values for more computers than is convenient to enter one at a time in the *List of computers* parameter, create a file that contains a list of the computers you want to monitor.
	
	Provide the full path to the file containing a list of the computers whose registry key values you want to set. The file should contain the hostname or IP address for each computer in one or more lines. Each line can have multiple computer names, separated by commas. For example:
	
	`NYC01,NYC02`
	`SALES01,10.15.221.5,SFO01`
	`LABMACH, QATEST`

Severity: Key was set	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the key is set. The default is 16 (yellow event indicator).
Severity: Key was not set	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the key is not set. The default is 5 (red event indicator).

55.13 RestartService

Use this Knowledge Script to schedule a service to automatically stop and restart after a specified interval. You can also have the script restart any services that depend on the ones you have stopped. This script raises an event if it fails to restart a service. Note that you cannot use this script to stop the NetIQ Client Resource Monitor (`netiqmc`) agent service.

55.13.1 Resource Objects

Windows 2000 Server or later

55.13.2 Default Schedule

The default schedule for this script is **Daily**.

55.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Create event if service restarts successfully?	Select **Yes** to raise an event if the script successfully restarts a service and, optionally, its dependent services. The default is Yes.
Severity - Service restarted	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script successfully restarts a service. The default is 25 (blue event indicator).
Create event if service restart fails?	Select **Yes** to raise an event if the script fails to restart a service. The default is Yes.
Severity - Service start failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script fails to restart a service. The default is 5 (red event indicator).
Severity - Service stop failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script fails to stop a service. The default is 5 (red event indicator).
Create event if service is missing?	Select **Yes** to raise an event if a specified service is missing. The default is unselected.
Severity - Service missing	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a specified service is missing. The default is 8.
Create event if service is disabled?	Select **Yes** to raise an event if the script disables a service. The default is Yes.
Severity - Service disabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script disables a service. The default is 12.
Create event if service is shut down normally?	Select **Yes** to raise an event if the script shuts down a service normally. The default is Yes.

Parameter	How to Set It
Severity - Service shut down normally	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script shuts down a service normally. The default is 30.
Severity - Job Failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the RestartService job fails unexpectedly. The default is 10 (red event indicator).
Data Collection	
Collect data?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns: • **100** – service was restarted successfully, or • **0** – service did not restart. The default is unselected.
Administration	
Service list	Provide the names of the services to you want to stop. Separate each name with a comma (,) and no spaces. The default is `Alerter,Messenger`.
Service start/stop delay	Specify the number of seconds to wait after a service is stopped before attempting to automatically restart it. The default is 30.
Restart dependent services?	Select **Yes** to also restart any services that depend on the services you stopped. The default is Yes. For example, if you stop the `MSSQLSERVER` service, the `SQLSERVERAGENT` service is also stopped. You can use this parameter to restart the agent service along with the server.
Service start/stop retry count	Specify the number of times to attempt to restart a service after it has stopped. The default is 3 times.
Restart service if shut down normally?	Select **Yes** to restart a service that is shut down normally. By default, this script restarts services that are shut down normally.

55.14 RunDOS

Use this Knowledge Script to run a non-interactive DOS command. This script raises an event if an unexpected exit code is raised. For example, use this script to run a batch command for virus scanning, disk backup, or logging an entry in a trouble ticket system.

55.14.1 Resource Objects

Windows 2000 Server or later

55.14.2 Default Schedule

The default schedule for this script is **Every 30 minutes**.

55.14.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Create event if command executes successfully?	Select **Yes** to raise an event if the DOS command you specified executes successfully. The default is unselected.
Severity - Command executed successfully	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the specified DOS command executes successfully. The default is 25 (blue event indicator).
Create event if process failed to execute?	Select **Yes** to raise an event if the DOS command you specified did not execute successfully. The default is Yes.
Severity - Command failed to execute	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the specified DOS command did not execute successfully. The default is 5 (red event indicator).
Severity - Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the RunDOS job fails unexpectedly. The default is 5 (red event indicator).
Data Collection	
Collect exit code data?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns exit code data; including the specified command string, current exit code, normal exit code, and explanation. The default is unselected.
Administration	
Normal/Expected exit code	Specify the exit (return) code expected when the command runs and exits normally (successfully). The default is 0.
Command or full path to script file	Specify the DOS command or script filename to run. For example, `C:\temp\myscript.bat`. Do not use a command that requires input. **NOTE:** If the command you are entering includes quotation marks ("), enclose the quoted string in a second set of quotation marks. For example, if the DOS command is `net send "message"` you would enter: `net send ""message""`.

Parameter	How to Set It
Full path to command output file	Provide the full path and filename to specify a file to write command output. If you do not specify the full path, AppManager creates the file in `%systemroot%\System32\` or `%systemroot%\SysWOW64`.
Full path to error output file	Provide the full path and filename to specify a file to write error output. If you do not specify the full path, AppManager creates the file in `%systemroot%\System32\` or `%systemroot%\SysWOW64`.
Append to output files?	Select **Yes** to add information to the command and error output files. The default is Yes.
Time to wait for process to complete	Specify the maximum number of seconds the specified DOS command or script file should take to execute. The default is 10. Set to 0 to run the DOS command without checking the exit code.

55.15 SNMPSet

Use this Knowledge Script to perform an SNMP v1 `Set` operation for the selected SNMP MIB variable. You can specify a list of computers where you want to set the variable value directly using the *List of computers* parameter or in a file containing a list of computer names or addresses. This script raises an event if the `Set` operation encounters an error and, optionally, if the `Set` operation completes successfully. This script requires the Microsoft SNMP Service to be running and security for the service set to allow Read and Write privileges.

55.15.1 Prerequisite

By default, the security for the Microsoft SNMP Service is typically set to the read-only permission level. To use this script, the Microsoft SNMP Service must be set to the read/write permission level. For more information, see the following topics:

- "Checking SNMP Service Rights" on page 3432
- "Changing the Permission Level for the SNMP Service" on page 3433

55.15.2 Resource Objects

Windows server or HP SIM server

55.15.3 Default Schedule

The default interval for this script is **Run once**.

55.15.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise an event if the `Set` operation completes successfully. The default is n. This script always raises an event if the `Set` operation encounters an error.
Object identifier	For the MIB variable, specify the MIB object identifier in the OID notation (for example `.1.2.3.456.78`) or ODE notation (for example, `system.sysUptime.0`). The default is `system.sysContact.0`. If you are using the object identifier (OID), you must include the dot (.) at the beginning of the identifier. If you are using the object descriptor (ODE), use a case-sensitive descriptor. You can use the object descriptor if the `mib.bin` file has been compiled on the agent machine (in the `%windir%/system32` directory). For information about compiling the `mib.bin`, see the Windows Resource Kit.

Parameter	How to Set It
Community string	Provide a valid SNMP community string name. Leave this parameter blank to use the SNMP community name entered in AppManager Security Manager. The default is public.
Set type	Specify the data type for the MIB variable to set. Valid values are: • OCTETSTRING • INTEGER • COUNTER • GAUGE • TIMETICKS • IPADDRESS The default is OCTETSTRING.
Set value	Specify the value you want to set.
List of computers	Specify the computers whose values you want to set. If you leave this parameter blank, this script sets the SNMP MIB variable located on the managed computer where the Knowledge Script job is running. To set the value for multiple computers, enter the hostname or IP address for each computer in a comma-separated list. For example: CORP01,ENGR02,10.15.221.5
Full path to file	To set values on more computers than is convenient to list one at a time in the *List of computers* parameter, create a file containing a list of the computers whose values you want to set. Enter the full path to the file. The file should contain the hostname or IP address for each computer in one or more lines. Each line can have multiple computer names, separated by commas. For example: NYC01,NYC02 SALES01,10.15.221.5,SFO01 LABMACH, QATEST
Event severity: Variable was not set	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the specified value was not set. The default is 5 (red event indicator). This script always raises an event when a Set operation fails.
Event severity: Variable was set	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the variable was set. Default is 16 (yellow event indicator). The *Event?* parameter must be enabled to raise an event for a successful Set operation.
Threshold for attempts to contact SNMP agent	Specify the maximum number of times the script should try to contact the SNMP agent before raising an event. The default is 3 times.
Threshold (in seconds) for a response	Specify the maximum number of seconds the script should wait for a response from the SNMP agent before timing out and raising an event. The default is 5 seconds.

55.15.5 Checking SNMP Service Rights

By default, the Microsoft SNMP Service is typically configured with Read-only permission. This configuration will prevent the SNMPSet Knowledge Script from setting any values. You can check your current configuration for any computer using the Services Control Panel.

To check the rights associated with the Microsoft SNMP Service:

1. In the Services Control Panel, select the Microsoft SNMP Service, and then click the **Security** tab.
2. Verify the rights associated with the community name you are using for the computer are `READ WRITE`.

55.15.6 Changing the Permission Level for the SNMP Service

To change the rights associated with the Microsoft SNMP Service:

1. In the Services Control Panel, select the Microsoft SNMP Service, and then click the **Security** tab.
2. Select the community name you are using, then click **Edit**.
3. Select the `READ WRITE` permission level from the Community rights list.
4. Click **OK**.

55.16 SyncTime

Use this Knowledge Script to synchronize the system time among computers. This script uses the Windows `net time` command to synchronize the system time to a specified Windows computer, such as the Primary Domain Controller in a workgroup. If you do not specify a computer name, the Domain Controller for the local computer is used. This script raises an event if the time synchronization operation fails.

55.16.1 Resource Objects

Windows 2000 Server or later

55.16.2 Default Schedule

The default schedule for this script is **Daily**.

55.16.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise an event if the time synchronization operation fails. The default is y.
Name of computer with standard time	Specify the name of the computer whose system time you want the target computers synchronized to match. If you do not specify a computer name, this script uses the Domain Controller associated with the managed computer on which the script is running.
Event severity	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the time synchronization operation fails. The default is 12 (yellow event indicator).

55.17 UnixAgentHealthProxy

Run this Knowledge Script on a proxy Windows agent to remotely monitor the health of UNIX agents. This script performs the following tasks:

- Checks the availability of a managed UNIX computer by first sending an ICMP Echo request to the managed UNIX computer. If the remote computer does not respond, this script sends an ICMP Echo request to the managed UNIX computer's default router and raises an event.
- Monitors the health of the UNIX agent by checking a time stamp value created by the UNIX agent. Normally, the UNIX agent creates a time stamp value every 90 seconds. If the age of the time stamp value exceeds the threshold, this script raises an event and restarts the UNIX agent.

Use this script to validate the health of the UNIX agent on a scheduled basis or for diagnostic purposes (for example, if there are gaps in data collection). This script can detect a problem with a remote agent and reliably notify the AppManager administrator.

The remote UNIX computer to be monitored must be accessible through the network from the computer where the proxy Windows agent is installed. To use this script to monitor more than one remote managed UNIX computer, all the computers you want must be accessible using the same **root** user account information.

NOTE: If you specify an incorrect password for the root account when running this script with Secure Shell (SSH) as the connection method to the remote UNIX or Linux computer, the script raises an event that incorrectly states that the login attempt was successful. If you see an event message similar to the event message below, you must update the job properties to specify the correct root password and start the job:

```
Output: Permission denied at /usr/netiq/UnixAgent/bin/UnixAgentHealthProxy.pl
More Info: "SSH login OK to <machine> with root Using SSH/SFTP combination."
```

55.17.1 Resource Objects

A managed UNIX computer where the AppManager UNIX agent is installed. The UNIX agent must be configured to run as the root user account.

55.17.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

To avoid raising false events, do not configure this script to run more frequently than the UNIX agent updates its time stamp. Ideally, the interval should be more than four minutes.

55.17.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	

Parameter	How to Set It
Raise event if age of timestamp exceeds threshold?	Set to **y** to raise an event if the age of the time stamp exceeds the threshold you set. The default is y.
Threshold – Maximum age of timestamp	Specify the maximum age a time stamp can attain before an event is raised. The minimum threshold is 3 minutes and the maximum threshold is 99999 minutes. The default is 9 minutes.
Event severity when age of timestamp exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the age of the time stamp exceeds the threshold. The default is 8.
Remote Host Connection	
UNIX computers to monitor (comma-separated)	Specify the IP addresses of the remote UNIX computers you want to monitor, separating the addresses with commas and no spaces.
Password for root user account	Specify the root user account password that the proxy agent computer must use to connect to the remote UNIX computer. This is a mandatory field.
Connection Transport	Specify the connection mode between the proxy agent computer and the monitored UNIX computer: • **Telnet/FTP** to connect using Telnet. • **SSH/FTP** to connect using SSH. This script can use either the Secure Shell (SSH) program with root password authentication or Telnet to make a secure connection to the remote UNIX or Linux computer. If you choose to use Telnet, you must supply a non-root user account name and password. **NOTE:** Telnet and FTP send your user name, password, and other information across the network in cleartext, making it easy for others to read this data.
Telnet non-root user account	Provide the Telnet non-root user account if you are using Telnet to connect to the monitored UNIX computer. Leave this parameter value blank if you are using SSH to connect to the monitored UNIX computer.
Telnet non-root user password	Provide the Telnet non-root user password if you are using Telnet to connect to the monitored UNIX computer. Leave this parameter value blank if you are using SSH to connect to the monitored UNIX computer.
Restart UNIX agent if age of timestamp exceeds threshold?	Set to **y** to restart the UNIX agent if the age of the time stamp exceeds the threshold you set. The default is y.

56 OCS Knowledge Scripts

Microsoft OCS combines enterprise-ready instant messaging, presence capabilities, conferencing, unified communications, and administrative controls in a single offering. OCS adds real-time conferencing hosted on servers inside the corporate firewall to existing features such as federation and public instant-messaging connectivity.

AppManager for Microsoft OCS provides the following Knowledge Scripts for monitoring OCS resources. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
ArchivedVoIPCallActivity	Monitors the various VoIP call metrics contained in the Monitoring database.
ConferenceCallActivity	Monitors the number of active conferences and how many users are in those conferences.
CWAIMFailures	Monitors the current IM session failures on the CWA server.
CWAIMSessionActivity	Monitors the current IM sessions on the Communicator Web Access (CWA) server.
CWAServerStatus	Monitors the CWA server status for throttling states.
CWAUserSessionActivity	Monitors the current user sessions on the CWA server.
CWAUserSessionFailures	Monitors the current session failures on the CWA server.
EdgeServerCallActivity	Monitors current call activity metrics for the Edge server.
EdgeServerCallFailures	Monitors current call failure metrics for the Edge server.
HealthCheck	Monitors the running status of primary services of the OCS server.
MCUStatus	Monitors the status of various services installed on the OCS server.
MediationServerCallActivity	Monitors inbound and outbound call activities on the Mediation server.
MediationServerCallFailures	Monitors the MediaRelay engine components of the Mediation server.
MediationServerHealth	Monitors server health metrics for the Mediation server.
MediationServerUsage	Monitors server resource usage for the Mediation server.
SessionCallActivity	Monitors data about the number of current sessions.
SessionCallFailures	Queries the Call Detail Record server to find any known session failures.
SystemUptime	Monitors the length of time a system has been up and running since a reboot.
SystemUsage	Monitors the total CPU usage of the server using OCS.

56.1 ArchivedVoIPCallActivity

Use this Knowledge Script to monitor the various Voice over IP (VoIP) call metrics contained in the Monitoring database. This script monitors the number of total VoIP calls made, the types of calls made, the average duration of calls, the number of redirected calls, and the number of calls per gateway.

A gateway is third-party hardware that connects Microsoft OCS with a public switched telephone network (PSTN), private branch exchange (PBX), or other phone system.

56.1.1 Resource Objects

OCS_ArchivingandCDRFolder

OCS_CDRObject

56.1.2 Default Schedule

The default interval for this script is **15 minutes**.

56.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Total Number of VoIP Calls	
Event Notification	
Raise event if total number of VoIP calls exceeds the threshold?	Set to Yes to raise an event if the number of VoIP calls exceeds the threshold. The default is Yes.
Threshold - Maximum total number of VoIP calls	Specify the maximum number of VoIP calls that can be active before an event is raised. The default is 20.
Event severity when total number of VoIP calls exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of VoIP calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for total number of VoIP calls?	Set to Yes to collect data about the number of VoIP calls. The default is Yes.
Monitor Total Number of UC to PSTN Calls	
Event Notification	

Description	How to Set It
Raise event if total number of UC to PSTN calls exceeds threshold?	Set to Yes to raise an event if the number of unified communications (UC) calls to public switched telephone network (PSTN) calls exceeds the threshold. The default is Yes.
Threshold - Maximum total number of UC to PSTN calls	Specify the maximum number of UC to PSTN calls that can be active before an event is raised. The default is 20.
Event severity when total number of UC to PSTN calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for total number of UC to PSTN calls?	Set to Yes to collect data about the number of UC to PSTN calls. The default is Yes.
Monitor Total Number of PSTN to UC Calls	
Event Notification	
Raise event if total number of PSTN to UC calls exceeds threshold?	Set to Yes to raise an event if the number of PSTN to UC calls exceeds the threshold. The default is Yes.
Threshold - Maximum total number of PSTN to UC calls	Specify the maximum number of PSTN to UC calls that can be active before an event is raised. The default is 20.
Event severity when total number of PSTN to UC calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for total number of PSTN to UC calls?	Set to Yes to collect data about the number of PSTN to UC calls. The default is Yes.
Monitor Average Duration of Calls	
Event Notification	
Raise event if average duration of calls exceeds threshold?	Set to Yes to raise an event if the average duration of calls exceeds the threshold. The default is Yes.
Threshold - Maximum average duration of calls	Specify the maximum average call duration that can occur before an event is raised. The default is 20.
Event severity when the average duration of calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the average duration of calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for average duration of calls?	Set to Yes to collect data about the average duration of calls. The default is Yes.
Monitor Number of Redirected Calls	
Event Notification	
Raise event if total number of redirected calls exceeds threshold?	Set to Yes to raise an event if the number of redirected, or transferred, calls exceeds the threshold. The default is Yes.
Threshold - Maximum total number of redirected calls	Specify the maximum number of calls that can be redirected before an event is raised. The default is 20.

Description	How to Set It
Event severity when total number of redirected calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of redirected calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of redirected calls?	Set to Yes to collect data about the number of redirected calls. The default is Yes.
Monitor Number of Calls per Gateway	
Event Notification	
Raise event if total number of calls per gateway exceeds threshold?	Set to Yes to raise an event if the number of calls per gateway exceeds the threshold. The default is Yes.
Threshold - Maximum total number of calls per gateway	Specify the maximum number of calls that the gateway can handle before an event is raised. The default is 20.
Event severity when total number of calls per gateway exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of calls per gateway?	Set to Yes to collect data about the number of calls per gateway. The default is Yes.

56.2 ConferenceCallActivity

Use this Knowledge Script to monitor the number of active conferences, and the number of users involved in those conferences, on an OCS server. The conference type can be instant message (IM), telephony, A/V, or Web.

56.2.1 Resource Object

OCS_ConferenceObject

56.2.2 Default Schedule

The default interval for this script is five minutes.

56.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor IM Conferences	
Event Notification	
Raise event if number of IM conferences exceeds threshold?	Set to Yes to raise an event if the number of instant message conferences exceeds the threshold. The default is Yes.
Threshold - Maximum IM conferences	Specify the maximum number of IM conferences that can be active before an event is raised. The default is 25.
Event severity when number of IM conferences exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of IM conferences exceeds the threshold. The default is 15.
Data Collection	
Collect data for IM conferences?	Set to Yes to collect data about the number of IM conferences. The default is No.
Monitor A/V Conferences	
Event Notification	
Raise event if number of A/V conferences exceeds threshold?	Set to Yes to raise an event if the number of A/V conferences exceeds the threshold. The default is Yes.
Threshold - Maximum A/V conferences	Specify the maximum number of A/V conferences that can be active before an event is raised. The default is 25.
Event severity when number of A/V conferences exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of A/V conferences exceeds the threshold. The default is 15.

Description	How to Set It
Data Collection	
Collect data for A/V conferences?	Set to Yes to collect data about the number of A/V conferences. The default is No.
Monitor Telephony Conferences	
Event Notification	
Raise event if number of telephony conferences exceeds threshold?	Set to Yes to raise an event if the number of telephony conferences exceeds the threshold. The default is Yes.
Threshold - Maximum telephony conferences	Specify the maximum number of telephony conferences that can be active before an event is raised. The default is 25.
Event severity when number of telephony conferences exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of telephony conferences exceeds the threshold. The default is 15.
Data Collection	
Collect data for telephony conferences?	Set to Yes to collect data about the number of telephony conferences. The default is Yes.
Monitor Web Conferences	
Event Notification	
Raise event if number of Web conferences exceeds threshold?	Set to Yes to raise an event if the number of Web conferences exceeds the threshold. The default is Yes.
Threshold - Maximum Web conferences	Specify the maximum number of Web conferences that can be active before an event is raised. The default is 25.
Event severity when number of Web conferences exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of Web conferences exceeds the threshold. The default is 15.
Data Collection	
Collect data for Web conferences?	Set to Yes to collect data about the number of Web conferences. The default is Yes.
Monitor IM Conference Users	
Event Notification	
Raise event if number of IM conference users exceeds threshold?	Set to Yes to raise an event if the number of IM conference users exceeds the threshold. The default is Yes.
Threshold - Maximum number of IM conference users	Specify the maximum number of IM conference users that can be active before an event is raised. The default is 10.
Event severity when number of IM conference users exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of IM conference users exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of IM conference users?	Set to Yes to collect data about the number of IM conference users. The default is Yes.
Monitor A/V Conference Users	
Event Notification	

Description	How to Set It
Raise event if number of A/V conference users exceeds threshold?	Set to Yes to raise an event if the number of A/V conference users exceeds the threshold. The default is Yes.
Threshold - Maximum number of A/V conference users	Specify the maximum number of A/V conference users that can be active before an event is raised. The default is 10.
Event severity when number of A/V conference users exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of A/V conference users exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of A/V conference users?	Set to Yes to collect data about the number of A/V conference users. The default is Yes.
Monitor Telephony Conference Users	
Event Notification	
Raise event if number of telephony conference users exceeds threshold?	Set to Yes to raise an event if the number of telephony conference users exceeds the threshold. The default is Yes.
Threshold - Maximum number of telephony conference users	Specify the maximum number of telephony conference users that can be active before an event is raised. The default is 10.
Event severity when number of telephony conference users exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of telephony conference users exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of telephony conference users?	Set to Yes to collect data about the number of telephony conference users. The default is Yes.
Monitor Web Conference Users	
Event Notification	
Raise event if number of Web conference users exceeds threshold?	Set to Yes to raise an event if the number of Web conference users exceeds the threshold. The default is Yes.
Threshold - Maximum number of Web conference users	Specify the maximum number of Web conference users that can be active before an event is raised. The default is 10.
Event severity when number of Web conference users exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of Web conference users exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of Web conference users?	Set to Yes to collect data about the number of Web conference users. The default is Yes.

56.3 CWAIMFailures

Use this Knowledge Script to monitor instant messaging (IM) failures on the Communicator Web Access (CWA) server.

This script raises an event if the number of user session failures for IM exceeds the specified threshold and generates a data stream for the number of IM session failures.

56.3.1 Resource Object

OCS_CWAServerObject

56.3.2 Default Schedule

The default interval for this script is 5 minutes.

56.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor IM Failures	
Event Notification	
Raise event if the number of IM failures exceeds threshold?	Set to Yes to raise an event if the number of instant messages that failed to be delivered exceeds the threshold. The default is Yes.
Threshold - Maximum IM failures	Specify the maximum number of IM failures that can be active before an event is raised. The default is 25.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of IM failures exceeds the threshold. The default is 15.
Data Collection	
Collect data for IM failures?	Set to Yes to collect data about the number of IM failures. The default is Yes.

56.4 CWAIMSessionActivity

Use this Knowledge Script to monitor current user session activity for instant messaging (IM) on the Communicator Web Access (CWA) server.

This script raises an event if the number of active user sessions for IM exceeds the specified threshold and generates a data stream for the number of active user sessions.

56.4.1 Resource Object

OCS_CWAServerObject

56.4.2 Default Schedule

The default interval for this script is 5 minutes.

56.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor IM Sessions	
Event Notification	
Raise event if the number of active IM sessions exceeds threshold?	Set to Yes to raise an event if the number of active IM sessions exceeds the threshold. The default is Yes.
Threshold - Maximum active IM user sessions	Specify the maximum number of IM sessions that can be active before an event is raised. The default is 100.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of IM user sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of IM sessions?	Set to Yes to collect data about the number of active IM sessions. The default is Yes.

56.5 CWAServerStatus

Use this Knowledge Script to monitor the throttling states of the Communicator Web Access (CWA) Server. Throttling is when the number of connections are slow as a result of being overloaded. You can turn the throttling feature on or off when you configure your OCS server.

This script generates an event if the health state of a CWA server is throttling due to low available memory, high system CPU usage, or both.

56.5.1 Resource Object

OCS_CWAServerObject

56.5.2 Default Schedule

The default interval for this script is 5 minutes.

56.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor CWA Server Throttling States	
Raise event if throttling is off?	Set to Yes to raise an event if the server throttling feature is off. The default is Yes. Note: The event for when server throttling is off is only raised on the first iteration of this script.
Event severity when throttling is off	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when throttling is off. The default is 20.
Raise event if throttling due to low available memory?	Set to Yes to raise an event if the cause of the server throttling is due to low available memory. The default is Yes.
Event severity when throttling due to low available memory	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the throttling state is low available memory. The default is 10.
Raise event if throttling due to high CPU usage?	Set to Yes to raise an event if the cause of the server throttling state is due to high CPU usage. The default is Yes.
Event severity when throttling due to high CPU usage	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the throttling state is high CPU usage. The default is 10.

Description	How to Set It
Raise event if throttling due to low available memory and high CPU usage?	Set to Yes to raise an event when the cause of the server throttling is due to both low available memory and high CPU usage. The default is Yes.
Event severity when throttling due to low available memory and high CPU usage	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the throttling state is low available memory and high CPU usage. The default is 5.

56.6 CWAUserSessionActivity

Use this Knowledge Script to monitor the current user sessions on a Communicator Web Access (CWA) server.

This script raises an event if the number of active user session exceeds the specified threshold and generates a data stream for the number of active user sessions.

56.6.1 Resource Object

OCS_CWAServerObject

56.6.2 Default Schedule

The default interval for this script is 5 minutes.

56.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor User Session Activity	
Event Notification	
Raise event if the number of active user sessions exceeds threshold?	Set to Yes to raise an event if the total number of active user sessions on the CWA server exceeds the threshold. The default is Yes.
Threshold - Maximum active user sessions	Specify the maximum number of active user sessions that can be active before an event is raised. The default is 100.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of active user sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for active user sessions?	Set to Yes to collect data about the number of active user sessions. The default is Yes.

56.7 CWAUserSessionFailures

Use this Knowledge Script to monitor the current user session failures on the Communicator Web Access (CWA) server.

This script raises an event if the number of user session failures exceeds the specified threshold and generates a data stream for the number of user session failures.

56.7.1 Resource Object

OCS_CWAServerObject

56.7.2 Default Schedule

The default interval for this script is 5 minutes.

56.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor User Session Failures	
Event Notification	
Raise event if the number of user session failures exceeds threshold?	Set to Yes to raise an event if the number of user session failures exceeds the threshold. The default is Yes.
Threshold - Maximum user session failures	Specify the maximum number of user session failures that can be active before an event is raised. The default is 25.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of user session failures exceeds the threshold. The default is 15.
Data Collection	
Collect data for user session failures?	Set to Yes to collect data about the number of user session failures. The default is Yes.

56.8 EdgeServerCallActivity

Use this Knowledge Script to monitor call activity metrics for an Edge Server, including the number of active server connections. Also monitors the number of connections that are slow as a result of being overloaded, also known as throttling. This script also monitors the number of disconnected server connections.

56.8.1 Resource Object

OCS_EdgeServerFolder

56.8.2 Default Schedule

The default interval for this script is five minutes.

56.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Active Server Connections	
Event Notification	
Raise event if the number of active server connections exceeds threshold?	Set to Yes to raise an event if the number of active server connections exceeds the threshold. The default is Yes.
Threshold - Maximum active server connections	Specify the maximum number of active server connections that can occur before an event is raised. The default is 100.
Event severity when the number of active server connections exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of active server connections exceeds the threshold. The default is 15.
Data Collection	
Collect data for active server connections?	Set to Yes to collect data about the active server connections. The default is Yes.
Monitor Throttled Connections	
Event Notification	
Raise event if number of throttled connections exceeds threshold?	Set to Yes to raise an event if the number of throttled connections exceeds the threshold. Throttled connections are when connections are slow as a result of being overloaded. The default is Yes.

Description	How to Set It
Threshold - Maximum throttled connections	Specify the maximum number of throttled connections that can occur before an event is raised. The default is 15.
Event severity when the number of throttled connections exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of throttled connections exceeds the threshold. The default is 15.
Data Collection	
Collect data for throttled connections?	Set to Yes to collect data about throttled connections. The default is Yes.
Monitor Disconnected Connections	
Event Notification	
Raise event if number of disconnected server connections exceeds threshold?	Set to Yes to raise an event if the number of disconnected server connections exceeds the threshold. The default is Yes.
Threshold - Maximum number of disconnected server connections	Specify the maximum number of disconnected server connections that can occur before an event is raised. The default is 25.
Event severity when the number of disconnected server connections exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of disconnected server connections exceeds the threshold. The default is 15.
Data Collection	
Collect data for disconnected server connections?	Set to Yes to collect data about disconnected server connections. The default is Yes.

56.9 EdgeServerCallFailures

Use this Knowledge Script to monitor current call failure metrics for an Edge server.

56.9.1 Resource Object

OCS_EdgeServerFolder

56.9.2 Default Schedule

The default interval for this script is 15 minutes.

56.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Connection Failures	
Event Notification	
Raise event if the number of connection failures exceeds threshold?	Set to Yes to raise an event if the number of connection failures exceeds the threshold. The default is Yes.
Threshold - Maximum connection failures	Specify the maximum number of connections that can fail before an event is raised. The default is 15.
Event severity when the number of connection failures exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of connection failures exceeds the threshold. The default is 15.
Data Collection	
Collect data for the number of connection failures?	Set to Yes to collect data about the number of connection failures. The default is Yes.

56.10 HealthCheck

Use this Knowledge Script to monitor the active status of services on an OCS server. You can run this script on a Front-end server, a Mediation server, or an Edge server to monitor the services on that server.

56.10.1 Resource Object

OCS_ServicesObject

56.10.2 Default Schedule

The default interval for this script is one minute.

56.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Services	
Start a service if it is stopped?	Set to Yes if you want to start a stopped service. The default is Yes.
Data Collection	
Collect data for service availability?	Set to Yes to collect data about service availability. The default is Yes.
Raise event if a service fails to start?	Set to Yes to raise an event if the service fails to start. The default is Yes.
Event severity when service fails to start	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service fails to start. The default is 5.
Raise event if a stopped service has been started?	Set to Yes to raise an event if the service has been started. The default is Yes.
Event severity when a stopped service has been started	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when a stopped service has been started again. The default is 25.
Raise event if service is disabled?	Set to Yes to raise an event if the service is disabled. The default is No.
Event severity when service is disabled	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service is disabled. The default is 15.

56.11 IIS_CpuHigh

Use this Knowledge Script to monitor the CPU utilization of the IIS server running the CWA site. This script raises an event if the threshold is exceeded. In addition, this script can generate data streams for CPU usage (%).

NOTE: With release 7.1 of AppManager for Microsoft OCS, the functionality for this Knowledge Script has been moved to the AppManager for Micosoft IIS module.

56.11.1 Resource Object

OCS_IIST_Server

56.11.2 Default Schedule

By default, this script runs every five minutes.

56.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event if CPU usage exceeds the threshold?	Set to **y** to raise an event if CPU usage exceeds the threshold. The default is y.
Collect data for CPU usage? (y/n)	Set to **y** to collect data about CPU usage for reports and graphs. The default is n.
Process names (separated by commas)	Enter the name of the application processes to monitor. Separate multiple entries with commas. For example: `inetinfo,dllhost`. The default is inetinfo. **NOTE:** Do not append .exe to the process names.
Threshold - Maximum CPU usage	Specify the maximum percentage of CPU resources the selected process can use before an event is raised. The default is 60%.
Event severity when CPU usage exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. The default is 8.

56.12 IIS_HealthCheck

Use this Knowledge Script to monitor service availability of the IIS server running the CWA site. This script raises an event if any server or Web site is not running. In addition, you can choose to automatically restart the IIS server or Web site. This script also raises an event if the blocked I/O queue length is longer than the specified threshold.

This script monitors only Web sites (servers), not FTP sites, NNTP sites, or SMTP sites..

NOTE: With release 7.1 of AppManager for Microsoft OCS, the functionality for this Knowledge Script has been moved to the AppManager for Micosoft IIS module.

56.12.1 Resource Objects

- OCS_IIST_Server
- OCS_IIST_FTPSRV
- OCS_IIST_W3SRV
- OCS_IIST_WebInst

56.12.2 Default Schedule

By default, this script runs every five minutes.

56.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Auto-start monitored server(s)? (y/n)	Set to **y** to automatically restart down servers. The default is y.
Event severity when auto-start fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the server is down and AppManager cannot restart it. The default is 5.
Event severity when auto-start succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the server was down and AppManager successfully restarted it. The default is 25.
Event severity when auto-start is set to "n"	Set the severity level, from 1 to 40, to indicate the importance of an event in which the server is down and AppManager has not been set to restart the service. The default is 18.
Event severity for blocked I/O requests	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of blocked I/O requests exceeds the threshold. The default is 5.
Threshold - Maximum blocked I/O requests	Specify the maximum queue length for blocked I/O requests. The default is 0 requests.
Monitor IIS server? (y/n)	Set to **y** to monitor the IIS server. The default is y.
Monitor FTP server? (y/n)	Set to **y** to monitor the FTP server. The default is n.

56.13 IIS_KillTopCPUProcs

Use this script to monitor the CPU utilization of IIS processes: dllhost, MTX, aspnet_wp, and w3wp and kills the process if it exceeds the specified threshold. .

NOTE: With release 7.1 of AppManager for Microsoft OCS, the functionality for this Knowledge Script has been moved to the AppManager for Micosoft IIS module.

56.13.1 Resource Object

OCS_IIST_Server

56.13.2 Default Schedule

By default, this script runs every three minutes.

56.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event if kill is successful or unsuccessful? (y/n)	Set to **y** to raise an event if the stop is successful or unsuccessful. The default is y.
Kill CPU intensive processes? (y/n)	Set to **y** to automatically stop any process whose CPU usage exceeds the threshold. The default is n.
Threshold - Maximum CPU usage	Specify the maximum percentage of CPU usage allowed by the `dllhost` and `mtx` processes before an event is raised. The default is 90%.
Event severity when CPU usage exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 10.
Event severity when kill fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot stop the process. The default is 10.
Event severity when kill succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully stopped the service. The default is 20.

56.14 IIS_MemoryHigh

Use this Knowledge Script to monitor the memory pool of the IIS server running the CWA site..

NOTE: With release 7.1 of AppManager for Microsoft OCS, the functionality for this Knowledge Script has been moved to the AppManager for Micosoft IIS module.

56.14.1 Resource Object

OCS_IIST_Server

56.14.2 Default Schedule

By default, this script runs every five minutes.

56.14.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event if threshold is exceeded? (y/n)	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data? (y/n)	Set to **y** to collect data for reports and graphs. If set to y, this script returns the named process's memory usage. The default is n.
Process names	Enter the name of the application process to monitor. Use a comma to separate multiple entries — do not use spaces. For example: `inetinfo,dllhost`. The default is inetinfo. **NOTE:** Do not append .exe to the process names.
Threshold - Maximum memory usage	Specify the maximum amount of memory the selected process can use before an event is raised. The default is 10000000 bytes.
Threshold - Maximum memory pool usage	Specify the maximum amount of memory pool the selected process can use before an event is raised. The default is 5000000 bytes.
Event severity when threshold is exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 8.

56.15 IIS_RestartServer

Use this Knowledge Script to restart the IIS server running the CWA Web site. This script raises an event if the server either successfully restarts or fails to restart. .

NOTE: With release 7.1 of AppManager for Microsoft OCS, the functionality for this Knowledge Script has been moved to the AppManager for Micosoft IIS module.

56.15.1 Resource Object

OCS_IIST_Server

56.15.2 Default Schedule

By default, this script runs once.

56.15.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Wait N seconds before restarting	Enter the number of seconds to wait after the server is stopped before attempting to automatically restart the server. The default is 5 seconds.
Event severity when stop fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the stop attempt fails. The default is 5.
Event severity when restart fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the restart attempt fails. The default is 5.
Event severity when status of service is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of the service is unavailable. The default is 10.
Event severity when stop succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the stop attempt succeeds. The default is 25.
Event severity when restart succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the restart attempt succeeds. The default is 25.

56.16 IIS_ServiceUpTime

Use this Knowledge Script to monitor the time since the last reboot for the IIS server running the CWA. This script raises an event if the amount of time the sites and services are running is less than the threshold you set. This script runs on IIS version 5 and later..

NOTE: With release 7.1 of AppManager for Microsoft OCS, the functionality for this Knowledge Script has been moved to the AppManager for Micosoft IIS module.

56.16.1 Resource Objects

- OCS_IIST_WebInst
- OCS_IIST_FTPInst

56.16.2 Default Schedule

By default, this script runs every hour.

56.16.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event if uptime falls below threshold? (y/n)	Set to **y** to raise an event if Web site or service uptime falls below the threshold. The default is y.
Collect data? (y/n)	Set to **y** to collect data about uptime for reports and graphs. The default is n.
Threshold - Minimum uptime (seconds)	Specify the minimum amount of time that discovered Web sites and services and FTP sites and services must be up to prevent an event from being raised. The default is 10000 seconds.
Event severity when uptime falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which uptime falls below the threshold. The default is 5.

56.17 MCUStatus

Use this Knowledge Script to monitor the health and draining state of a Multipoint Control Unit, or MCU. For example, IMMCU is an IM Conferencing server that runs as an IM service, and this script monitors the load for that server.

The different health states display the level of use as well as the number of users on the server.

56.17.1 Resource Object

OCS_MCUObject

56.17.2 Default Schedule

The default interval for this script is five minutes.

56.17.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor MCU Health State	
Raise event if health state is Loaded?	Set to Yes to raise an event if the health state is considered to be Loaded. The default is unchecked.
Event severity when health state is Loaded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the health state is Loaded. The default is 20.
Raise event if health state is Full?	Set to Yes to raise an event if the health state is considered to be Full. The default is Yes.
Event severity when health state is Full	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the health state is Full. The default is 15.
Monitor MCU Draining State	
Raise event if health state is Requesting to Drain?	Set to Yes to raise an event if the health state is Requesting to Drain, or attempting to close MCU services to reduce the load. The default is Yes.
Event severity when health state is Requesting to Drain	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the draining state is Requesting to Drain. The default is 15.
Rase event if health state is Draining?	Set to Yes to raise an event if the health state is set to Draining, the process of closing MCU services to reduce the load. The default is Yes.
Event severity when health state is Draining	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the health state is set to Draining. The default is 10.

56.18 MediationServerCallActivity

Use this Knowledge Script to monitor inbound and outbound calls on a Mediation server. A Mediation server is an optional component that you will need if you connect OCS to a phone system, such as a PSTN, POTS, PBX, or some other legacy system.

56.18.1 Resource Object

OCS_MediationFolder

56.18.2 Default Schedule

The default interval for this script is five minutes.

56.18.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Inbound Calls	
Event Notification	
Raise event if number of inbound calls exceeds threshold?	Set to Yes to raise an event if the number of inbound calls exceeds the threshold. The default is Yes.
Threshold - Maximum number of inbound calls	Specify the maximum number of inbound calls that can occur before an event is raised. The default is 15.
Event severity when the number of inbound calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of inbound calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for current inbound calls?	Set to Yes to collect data about the number of current inbound calls. The default is Yes.
Monitor Outbound Calls	
Event Notification	
Raise event if number of outbound calls exceeds threshold?	Set to Yes to raise an event if the number of outbound calls exceeds the threshold. The default is Yes.
Threshold - Maximum number of outbound calls	Specify the maximum number of outbound calls that can occur before an event is raised. The default is 15.
Event severity when the number of outbound calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of outbound calls exceeds the threshold. The default is 15.

Description	How to Set It
Data Collection	
Collect data for current outbound calls?	Set to Yes to collect data about the number of current outbound calls. The default is Yes.
Monitor Rejected Inbound Calls	
Event Notification	
Raise event if number of rejected inbound calls exceeds threshold?	Set to Yes to raise an event if the number of rejected inbound calls exceeds the threshold. Calls can be rejected if the mediation server or the third-party gateway is over capacity. The default is Yes.
Threshold - Maximum number of rejected inbound calls	Specify the maximum number of rejected inbound calls that can occur before an event is raised. The default is 15.
Event severity when the number of rejected inbound calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of rejected inbound calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for rejected inbound calls?	Set to Yes to collect data about the number of rejected inbound calls. The default is Yes.
Monitor Rejected Outbound Calls	
Event Notification	
Raise event if number of rejected outbound calls exceeds threshold?	Set to Yes to raise an event if the number of rejected outbound calls exceeds the threshold. Calls can be rejected if the mediation server or the third-party gateway is over capacity. The default is Yes.
Threshold - Maximum number of rejected outbound calls	Specify the maximum number of rejected outbound calls that can occur before an event is raised. The default is 15.
Event severity when the number of rejected outbound calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of rejected outbound calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for rejected outbound calls?	Set to Yes to collect data about the number of current rejected outbound calls. The default is Yes.

56.19 MediationServerCallFailures

Use this Knowledge Script to monitor current call failure metrics for the Mediation server. A Mediation server is an optional component that you will need if you connect OCS to a phone system, such as a PSTN, POTS, PBX, or some other legacy system.

56.19.1 Resource Object

OCS_MediationObject

56.19.2 Default Schedule

The default interval for this script is five minutes.

56.19.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Call Failures	
Event Notification	
Raise event if number of call failures exceeds threshold?	Set to Yes to raise an event if the number of call failures exceeds the threshold. The default is Yes.
Threshold - Maximum call failures	Specify the maximum number of calls that can fail before an event is raised. The default is 10 percent.
Event severity when number of call failures exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of call failures exceeds the threshold. The default is 10.
Data Collection	
Collect data for call failures?	Set to Yes to collect data about the number of call failures. The default is Yes.

56.20 MediationServerHealth

Use this Knowledge Script to track the global health of the Mediation server, an optional component that you will need if you connect OCS to a phone system, such as a PSTN, POTS, PBX, or some other legacy system. Health statuses include disabled, normal, light load, heavy load, and overload. The script also monitors total packet drops and TCP disconnects because the received packet is out of sync.

56.20.1 Resource Object

OCS_MediationFolder

56.20.2 Default Schedule

The default interval for this script is five minutes.

56.20.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Health State	
Raise event if global health status is Heavy Load?	Set to Yes to raise an event if the global health status is heavy load. A health status of Heavy Load occurs when attempts to initiate new calls through the mediation server fail. The default is Yes.
Event severity when global health status is Heavy Load	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of conferences exceeds the threshold. The default is 15.
Raise event if global health status is Overloaded?	Set to Yes to raise an event if the global health status is Overloaded. The default is Yes.
Event severity when global health status is overloaded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of conferences exceeds the threshold. The default is 10.
Monitor Dropped RTP Packets	
Event Notification	
Raise event if number of dropped RTP packets exceeds threshold?	Set to Yes to raise an event if the number of dropped RTP packets exceeds the threshold. The default is Yes.
Threshold - Maximum dropped RTP packets	Specify the number of dropped RTP packets that can occur before an event is raised. The default is 5.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the threshold is exceeded. The default is 15.

Description	How to Set It
Data Collection	
Collect data for dropped RTP packets per second?	Set to Yes to collect data about dropped RTP packets per second. The default is Yes.
Monitor TCP Disconnects	
Event Notification	
Raise event if number of TCP disconnects exceeds threshold?	Set to Yes to raise an event if the number of TCP disconnects exceeds the threshold. The default is Yes.
Threshold - Maximum number of TCP disconnects	Specify the number of TCP disconnects that can occur before an event is raised. The default is 10.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the threshold is exceeded. The default is 10.
Data Collection	
Collect data for TCP disconnects?	Set to Yes to collect data about number of TCP disconnects. The default is Yes.

56.21 MediationServerUsage

Use this Knowledge Script to monitor the overall usage of the Mediation server, an optional component that you will need if you connect OCS to a phone system, such as a PSTN, POTS, PBX, or some other legacy system. Server usage data includes the number of overloaded conferences and the average time for processing audio packets.

56.21.1 Resource Object

OCS_MediationObject

56.21.2 Default Schedule

The default interval for this script is five minutes.

56.21.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Overloaded Conferences	
Event Notification	
Raise event if the number of overloaded conferences exceeds threshold?	Set to Yes to raise an event if the number of overloaded conferences exceeds the threshold. The default is Yes.
Threshold - Maximum overloaded conferences	Specify the maximum number of overloaded conferences that can occur before an event is raised. The default is 50.
Event severity when overloaded conferences exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of overloaded conferences exceeds the threshold. The default is 15.
Data Collection	
Collect data for overloaded conferences?	Set to Yes to collect data about the number of overloaded conferences. The default is Yes.
Monitor Average Audio Packet Processing Time	
Event Notification	
Raise event if the average time exceeds threshold?	Set to Yes to raise an event if the average audio packet processing time exceeds the threshold. The default is Yes.
Threshold - Maximum average time	Specify the highest average processing time that can occur before an event is raised. The default is one second.

Description	How to Set It
Event severity when average time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the average time exceeds the threshold. The default is 10.
Data Collection	
Collect data for average time to process audio packets?	Set to Yes to collect data about the average processing time. The default is Yes.

56.22 SessionCallActivity

Use this Knowledge Script to monitor the session initiation rate for an OCS server. These sessions can include the following types: instant message (IM), file transfer, remote assistance, application sharing, audio, video, or telephony sessions.

This script gets session initiation data from the SessionDetails and Media Tables of the `LcsCDR` back-end database of the OCS Monitoring server. This script reports the number of sessions initiated per minute between two consecutive job iterations.

NOTE: In OCS, sessions have only two users, while conferences contain three or more users.

56.22.1 Resource Object

OCS_ArchivingAndCDRObject

OCS_CDRObject

56.22.2 Default Schedule

The default interval for this script is five minutes.

56.22.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor IM Sessions	
Event Notification	
Raise event if number of IM sessions exceeds threshold?	Set to Yes to raise an event if the number of IM sessions exceeds the threshold. The default is Yes.
Threshold - Maximum IM sessions	Specify the maximum number of IM sessions that can occur before an event is raised. The default is 25.
Event severity when number of IM sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of IM sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for IM sessions?	Set to Yes to collect data about the number of IM sessions. The default is unchecked.
Monitor File Transfer Sessions	

Description	How to Set It
Event Notification	
Raise event if number of file transfer sessions exceeds threshold?	Set to Yes to raise an event if the number of file transfer sessions exceeds the threshold. The default is Yes.
Threshold - Maximum file transfer sessions	Specify the maximum number of file transfer sessions that can occur before an event is raised. The default is 25.
Event severity when number of file transfer sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of file transfer sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for file transfer sessions?	Set to Yes to collect data about the number of file transfer sessions. The default is unchecked.
Monitor Remote Assistance Sessions	
Event Notification	
Raise event if number of remote assistance sessions exceeds threshold?	Set to Yes to raise an event if the number of remote assistance sessions exceeds the threshold. The default is Yes.
Threshold - Maximum remote assistance sessions	Specify the maximum number of remote assistance sessions that can occur before an event is raised. The default is 25.
Event severity when number of remote assistance sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of remote assistance sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for remote assistance sessions?	Set to Yes to collect data about the number of remote assistance sessions. The default is unchecked.
Monitor Application Sharing Sessions	
Event Notification	
Raise event if number of application sharing sessions exceeds threshold?	Set to Yes to raise an event if the number of application sharing sessions exceeds the threshold. The default is Yes.
Threshold - Maximum application sharing sessions	Specify the maximum number of application sharing sessions that can occur before an event is raised. The default is 25.
Event severity when number of application sharing sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of application sharing sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for application sharing sessions?	Set to Yes to collect data about the number of application sharing sessions. The default is unchecked.
Monitor Audio Sessions	
Event Notification	
Raise event if number of audio sessions exceeds threshold?	Set to Yes to raise an event if the number of audio sessions exceeds the threshold. The default is Yes.
Threshold - Maximum audio sessions	Specify the maximum number of audio sessions that can occur before an event is raised. The default is 25.

Description	How to Set It
Event severity when number of audio sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of audio sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for audio sessions?	Set to Yes to collect data about the number of audio sessions. The default is unchecked.
Monitor Video Sessions	
Event Notification	
Raise event if number of video sessions exceeds threshold?	Set to Yes to raise an event if the number of video sessions exceeds the threshold. The default is Yes.
Threshold - Maximum video sessions	Specify the maximum number of video sessions that can occur before an event is raised. The default is 25.
Event severity when number of video sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of video sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for video sessions?	Set to Yes to collect data about the number of video sessions. The default is unchecked.
Monitor Telephony Sessions	
Event Notification	
Raise event if number of telephony sessions exceeds threshold?	Set to Yes to raise an event if the number of telephony sessions exceeds the threshold. The default is Yes.
Threshold - Maximum telephony sessions	Specify the maximum number of telephony sessions that can occur before an event is raised. The default is 25.
Event severity when number of telephony sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of telephony sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for telephony sessions?	Set to Yes to collect data about the number of telephony sessions. The default is unchecked.
Monitor Meeting Sessions	
Event Notification	
Raise event if number of meeting sessions exceeds threshold?	Set to Yes to raise an event if the number of meeting sessions exceeds the threshold. The default is Yes.
Threshold - Maximum meeting sessions	Specify the maximum number of meeting sessions that can occur before an event is raised. The default is 25.
Event severity when number of meeting sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of meeting sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for meeting sessions?	Set to Yes to collect data about the number of meeting sessions. The default is unchecked.

56.23 SessionCallFailures

Use this Knowledge Script to monitor session failure metrics for an OCS server. These sessions can include the following types: instant message (IM), file transfer, remote assistance, application sharing, audio, video, or telephony sessions.

NOTE: In OCS, sessions have only two users, while conferences contain three or more users.

This script calulates failed sessions from the SessionDetails and Media Tables of the `LcsCDR` back-end database of the OCS Monitoring server. This script reports the number of session failures per minute between two consecutive job iterations.

The SessionCallFailures script considers sessions with the following SIP Status codes as failed:

400, 401, 402, 403, 405, 406, 407, 408, 410, 413, 414, 415, 416, 420, 421, 423, 481, 482, 483, 485, 488, 493, 500, 501, 502, 503, 504, 505, 513, 600, 606

For mopre information about SIP status codes, see: www.rfc-ref.org/RFC-TEXTS/3261/chapter21.html.

56.23.1 Resource Object

OCS_ArchivingAndCDRObject

OCS_CDRObject

56.23.2 Default Schedule

The default interval for this script is five minutes.

56.23.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Session Failures	
Event Notification	
Raise event if number of session failures exceeds threshold?	Set to Yes to raise an event if the number of session failures exceeds the threshold. The default is Yes.
Threshold - Maximum session failures	Specify the maximum number of session failures that can occur before an event is raised. The default is 5.
Event severity when number of session failures exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of session failures exceeds the threshold. The default is 15.

Description	How to Set It
Data Collection	
Collect data for session failures?	Set to Yes to collect data about the number of session failures. The default is No.

56.24 SystemUptime

Use this Knowledge Script to monitor how long a server remains up and running after a reboot.

56.24.1 Resource Object

OCS

56.24.2 Default Schedule

The default interval for this script is five minutes.

56.24.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Raise event if system reboot detected?	Set to Yes to raise an event if the system has rebooted. The default is Yes.
Event severity when system reboot detected	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the system has rebooted. The default is 10.
Monitor System Uptime	
Data Collection	
Collect data for system uptime?	Set to Yes to collect data about system uptime, in hours. The default is Yes.

56.25 SystemUsage

Use this Knowledge Script to monitor the total CPU and memory usage on an OCS server and the contributions of each OCS service to this usage.

56.25.1 Resource Object

OCS_ServicesObject

OCS_ServicesFolder

56.25.2 Default Schedule

The default interval for this script is five minutes.

56.25.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Service CPU Usage	
Event Notification	
Raise event if service CPU usage exceeds threshold?	Set to Yes to raise an event if the percentage of total CPU usage for the service exceeds the threshold. The default is Yes.
Threshold - Maximum CPU usage	Specify the maximum percentage of the CPU that can be used by the service before an event is raised. The default is 65%.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the maximum CPU usage for the service exceeds the threshold. The default is 15.
Data Collection	
Collect data for service CPU usage?	Set to Yes to collect data about CPU usage for the service. The default is Yes.
Monitor Total CPU Usage	
Event Notification	
Raise event if total CPU usage exceeds threshold?	Set to Yes to raise an event if the percentage of total CPU usage exceeds the threshold. The default is Yes.
Threshold - Maximum total CPU usage	Specify the maximum percentage of the total CPU that can be used before an event is raised. The default is 80%.

Description	How to Set It
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the maximum CPU usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for total CPU usage?	Set to Yes to collect data about total CPU usage. The default is Yes.
Monitor Service Memory Usage	
Event Notification	
Raise event if service memory usage exceeds threshold?	Set to Yes to raise an event if the percentage of total memory usage by the service exceeds the threshold. The default is Yes.
Threshold - Maximum service memory usage	Specify the maximum percentage of memory used by the service that can be used before an event is raised. The default is 65%.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the maximum memory used by a the service exceeds the threshold. The default is 15.
Data Collection	
Collect data for service memory usage?	Set to Yes to collect data about total memory usage for the service. The default is Yes.
Monitor Total Memory Usage	
Event Notification	
Raise event if total memory usage exceeds threshold?	Set to Yes to raise an event if the percentage of total memory usage exceeds the threshold. The default is Yes.
Threshold - Maximum total memory usage	Specify the maximum percentage of the total memory that can be used before an event is raised. The default is 80%.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the maximum total memory usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for total memory usage?	Set to Yes to collect data about total memory usage. The default is Yes.

57 Oracle Knowledge Scripts

AppManager for Oracle Database on Windows provides the following Knowledge Scripts for monitoring Oracle Database resources. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
AlertLog	Scans the Oracle Database Alert log for a search string that you specify.
BGProc	Monitors the total memory usage and the total number of physical read/write (I/O) operations per second for Oracle background processes.
Block	Monitors block-level database activity.
BlockingSessions	Monitors the number of user sessions that are blocking other processes from accessing the Oracle database.
Cache	Monitors the frequency with which requested data and resources are retrieved from the buffer cache, data dictionary, and library cache.
CallRate	Monitors the demand placed on a database instance from all sources.
CallsPerTransaction	Monitors the demand placed on a database instance by each transaction.
ConfigDB	Updates AppManager with information about the Oracle databases you want to monitor.
ConsistentChangeRatio	Monitors the extent to which applications exercise the read consistency mechanism to ensure database consistency.
ContinuedRowRatio	Monitors rows that span more than one database block.
DatabaseDown	Monitors a database and its services to verify whether they are running.
DatafileSpace	Monitors the size of an Oracle datafile.
DiskSpaceAvail	Monitors the amount of disk space available for the archive log file, the background process log file, and user log files.
OpenCursors	Monitors the percentage of cursors opened per session, as well as the total number of cursors open in the system.
RecursiveToUserCallRatio	Monitors the ratio of recursive calls to overall database user calls.
RedoLogContention	Monitors the number of times that a process attempts to write an entry in the redo log buffer.
RedoLogSpaceWaitRatio	Monitors the redo log space wait ratio, which measures memory allocation.

Knowledge Script	What It Does
Report_BackgroundProcess	Generates a report about total memory use, and the total number of physical read/write operations per second for Oracle background processes.
Report_CacheHitRatio	Generates a report about buffer cache hit ratio, data dictionary hit ratio, and library cache hit ratio for Oracle servers.
Report_DatabaseAvailability	Generates a report about the up/down status of Oracle databases, and the OracleServer, OracleListener, and OracleStart services.
Report_DatafileSpace	Generates a report about the size (in MB) of Oracle Database data files.
Report_DiskSpaceAvailable	Generates a report about the amount of disk space (in MB) available for the archive, background process, and user log files.
Report_TablespaceAvailable	Generates a report about the free disk space available for tablespaces, disk space used by tablespaces, and the size of tablespaces.
Report_TransactionRate	Generates a report about the number of transactions per second for Oracle databases.
Report_UserLocks	Generates a report about the number of user-held locks on an Oracle database.
RollBackSegmentContention	Monitors the ratio of wait counts to total requests in the rollback segment.
RowSourceRatio	Monitors the row source ratio, which measures the percentage of rows that were retrieved using full table scans.
RunSql	Runs SQL statements.
SegmentExtentAvail	Monitors the percentage of extents (extensions of free space) available to each segment in a tablespace.
SortOverflowRatio	Monitors the sort overflow ratio, which measures the number of sorts that are using temporary segments.
SysStat	Retrieves statistics from the `V$SYSSTAT` table, which stores all the key statistics for a database instance.
TablespaceAvail	Monitors the percentage of disk space available to all the tablespaces in a database.
TopCpuUsers	Monitors the CPU time for current user sessions.
TopIOUsers	Monitors physical reads and writes (I/O) for current user sessions.
TopLockUsers	Monitors the current number of user-held locks on an Oracle database.
TopMemoryUsers	Monitors memory usage (User Global Area and PGA) for current user sessions.
TransactionRate	Monitors the transaction rate for an Oracle database.
UserCallsPerParse	Monitors the number of user calls per parse.
UserRollbackRatio	Monitors the user rollback ratio for an Oracle database, which indicates the percentage of attempted application transactions that fail.
UserSessions	Monitors the total number of user sessions accessing an Oracle database.

57.1 How Knowledge Scripts Access Oracle Databases

To gather the statistics and resource information needed to monitor an Oracle Database, an Oracle Knowledge Script must log on to that database. The Oracle user account controls access to the Oracle Database. The Oracle user's Windows and SQL Server privileges have no effect on access to an Oracle database.

When you run a Knowledge Script on an Oracle Database, you specify an Oracle Database user account that has been set up on that database for the *Username* parameter. The corresponding password is retrieved from the Oracle repository and sent, in encrypted format, to the AppManager agent on the Oracle Database server. The password is decrypted by the AppManager agent, which uses it to log on to the Oracle Database and run the Knowledge Script.

When you install the AppManager for Oracle Database module on an Oracle Database server, the setup program gathers a single Oracle Database user account name. In addition, it gathers the corresponding password for each database. The Oracle Database user account name must be the same on all databases, but each database can have a unique password associated with that user account.

Having a single Oracle user account is a requirement only to ensure that discovery succeeds. After discovery, you can use the Oracle user account gathered during installation to begin running Oracle Knowledge Scripts immediately, or you can use the AppManager Security Manager to store additional Oracle user account names and passwords in the AppManager repository.

NOTE: Oracle Knowledge Scripts provide one parameter for specifying an Oracle user account name to be used to log on to the databases you want to monitor. To run a single Knowledge Script job on multiple databases, each database must be configured with the same Oracle username.

57.2 AlertLog

Use this Knowledge Script to scan the Oracle Alert log for entries that match a search string that you specify. You can set a threshold for the maximum number of occurrences of the search string found during any single scan of the log file. You can also specify a list of Oracle databases that you do not want to monitor with this script.

Each database maintains an Alert log file where it records database operations (such as creating or dropping a database) and error conditions (such as deadlocks). This Knowledge Script provides a general-purpose tool for scanning a database's alert log for specific entries.

When this Knowledge Script starts, it does not scan existing entries in the Alert log, and therefore it does not return any results or collect data on its first scan. As it continues to run at the intervals specified on the **Schedule** tab, this Knowledge Script scans the Alert log for any new entries created since the last scan. If, during any single scan, the number of matching entries exceeds the threshold you specify, the job raises an event. The detail message returns the number of occurrences of the search string found.

57.2.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.2.2 Default Schedule

The default interval for this script is **Every 1 hour**.

57.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, this script returns the number of entries that matched the search string each time it scanned the Alert log. The default is n.
User name	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Databases to exclude	Specify a list of Oracle databases you want to ignore when monitoring. Use commas without spaces to separate multiple databases.

Description	How to Set It
Find (separate multiple strings with spaces)	Enter all or part of the string you want to search for. For this Knowledge Script, a “string” is any series of characters, not including spaces. You can specify multiple strings by separating each string with a space. For example, if you specify `ORA-600 ORA-1578`, the Knowledge Script searches for either of two “strings”: `ORA-600` or `ORA-1578`. The default values represent the most common Oracle error codes you might want to search for: • `ORA-600. Internal error.` • `ORA-1578. Block corruption.` • `ORA-60. Deadlock error.`
Case sensitive?	Enter y if you want the search to distinguish between uppercase and lowercase letters. When you enter y, the Knowledge Script finds only the occurrences whose capitalization matches the capitalization of the Find string. The default is n.
Exact match?	Enter y if you want the Knowledge Script to find only the entries that match the Find string exactly. For example, if you set this parameter to y and enter “`ORA-60`” as the Find string, only “`ORA-60`” is considered a match. If you set this parameter to n and search for “`ORA-60`”, entries that contain “`ORA-60`”, such as “`ORA-600`”, are considered a match. The default is n.
Maximum threshold for occurrences found	Specify the maximum number of occurrences allowed during any single scan of the Alert log. If the number of occurrences of the Find string exceeds this threshold, an event is raised. The default is 1.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.3 BGProc

Use this Knowledge Script to monitor the total memory usage and the total number of physical read/write (I/O) operations per second for Oracle background processes. You can configure this Knowledge Script to monitor memory usage, read/write operations, or both. If the background processes being monitored exceed the threshold you set for total memory usage or the total number of read/write operations per second, this Knowledge Script raises an event.

Oracle background processes include `CKPT`, `DBW0`, `LGWR`, `PMON`, `RECO`, `SMON`, `SNP0`, and others. You can monitor all background processes or selected background processes.

57.3.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.3.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

57.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script collects the statistics you are monitoring: the total number of read/write operations per second, the total memory usage, or both, for all monitored background processes. The default is n.
User name	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Monitor read/write operations?	Set to y to monitor the number of physical read/write operations per second by background processes. When set to n, the Knowledge Script does not monitor this statistic (regardless of whether a threshold is specified) and does not collect data. The default is y.
Maximum threshold for read/write operations	Enter a threshold for the maximum number of physical read/write operations per second. The default is 50 read/write operations.

Description	How to Set It
Monitor memory usage?	Set to y to monitor the memory usage by background processes. When set to n, the Knowledge Script does not monitor this statistic (regardless of whether a threshold is specified) and does not collect data. The default is y.
Maximum threshold for memory usage	Enter a threshold, in megabytes, for the maximum amount of memory used by all background processes you are monitoring. The default is 50 MB.
Oracle background processes to monitor	Specify the names of the background processes you want to monitor. Separate the names with commas; do not use spaces. To monitor all Oracle background processes, enter an asterisk (*). Possible valid background process names include: • CKPT • DBW0 • LGWR • PMON • RECO • SMON • SNP0 • SNP1 The default is all (*) background processes.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.4 Block

Use this Knowledge Script to monitor block-level database activity. Oracle data blocks are the smallest unit of storage for a database; monitoring I/O activity at the block level can be a key performance indicator.

Use this Knowledge Script to monitor any combination of these statistics:

- **The number of block changes per transaction.** This block change rate measures the number of SQL Data Manipulation Language (DML) commands that each transaction performs (for example, to create and drop indexes). As the number of block changes increases, the efficiency of the database transaction and database performance decreases.
- **The number of times the Oracle Buffer Manager locates a database block per second.** This *block get* rate indicates the rate at which an application references the database. An increase in the block get rate suggests an increase in overall server load. A decrease in the block get rate without a decrease in load might indicate that you need to do some database tuning because there has been a slowdown in the number of database blocks requested and located per second.
- **The number of times database blocks are requested per committed transaction.** This *block visit* rate measures the database work load per completed transaction (including both successful and aborted database transactions).

You can set a threshold for each statistic you choose to monitor. If any threshold is exceeded, the Knowledge Script raises an event.

57.4.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.4.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script collects the statistics you choose to monitor: the number of block changes per transaction, the number of block get operations per second, and/or the number of block visits per transaction. The default is n.

Description	How to Set It
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Monitor block change rate?	Set to y to monitor the number of block changes per transaction. When set to n, the Knowledge Script does not monitor this statistic (regardless of whether a threshold is specified) and does not collect data. The default is y.
Maximum threshold for block changes	Enter a threshold for the maximum number of block changes per transaction. The default is 100 changes per transaction.
Monitor block get rate?	Set to y to monitor the number of times the Oracle Buffer Manager locates a database block per second. When set to n, the Knowledge Script does not monitor this statistic (regardless of whether a threshold is specified) and does not collect data. The default is y.
Maximum threshold for block gets	Enter a threshold for the maximum number of block get operations per second. The default is 100 `get` operations per second.
Monitor block visit rate?	Set to y to monitor the number of times database blocks are requested per committed transaction. When set to n, the Knowledge Script does not monitor this statistic (regardless of whether a threshold is specified) and does not collect data. The default is y.
Maximum threshold for block visits	Enter a threshold for the maximum number of block get operations per committed transaction. The default is 100 operations per committed transaction.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.5 BlockingSessions

Use this Knowledge Script to monitor the user sessions that are blocking other sessions and processes from accessing the Oracle Database. You can set a threshold for the number of sessions that are allowed to block other sessions and processes. If the number of blocking sessions exceeds this threshold, an event is raised.

57.5.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.5.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script collects the number of blocking sessions found. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for number of blocking sessions	Enter a threshold for the maximum number of user sessions allowed to block other processes. The default is 10 sessions.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.6 Cache

Use this Knowledge Script to monitor the frequency with which requested data and resources are retrieved from the cache. As this *hit ratio* (that is, the percentage of time that data or resources are retrieved from the cache) decreases, performance also decreases because Oracle must retrieve data from disk or reinitialize library objects in order to service the requests.

Use this Knowledge Script to monitor any combination of these statistics:

- The buffer cache hit ratio indicates the percentage of time that requested data is found in the Oracle buffer cache. This statistic reflects the effectiveness of the buffer cache and database performance.
- The data dictionary hit ratio indicates the percentage of time that requested data is found in the data dictionary. This statistic reflects the effectiveness of the data dictionary and database performance.
- The library cache hit ratio reflects the percentage of time that system pin requests to access objects in the library cache can be serviced without reinitializing or reloading library objects. Changes to the library cache hit ratio might occur when an application comes active, causing more SQL statements and stored procedures to be used.

You can set a threshold for each cache hit ratio you choose to monitor. If a cache hit ratio is less than any threshold you set, this Knowledge Script raises an error.

57.6.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.6.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

57.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script collects the statistics you choose to monitor: the buffer cache hit ratio, the data dictionary hit ratio, and/or the library cache hit ratio. The default is n.

Description	How to Set It
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Monitor buffer cache hit ratio?	Set to y to monitor the percentage of time that requested data is found in the Oracle buffer cache. When set to n, the Knowledge Script does not monitor this statistic (regardless of whether a threshold is specified) and does not collect data. The default is y.
Minimum threshold for buffer cache hit ratio	Enter a minimum percentage for the buffer cache hit ratio. If the actual hit ratio is lower than this threshold, an event is raised. Ideally, this percentage should be set relatively high, because the more frequently Oracle uses the buffer, the better your database performance. When the actual hit ratio falls below the threshold you set, the event alerts you that database performance has degraded. The default is 70%.
Monitor data dictionary hit ratio?	Set to y to monitor the percentage of time that requested data is found in the data dictionary. When set to n, the Knowledge Script does not monitor this statistic (regardless of whether a threshold is specified) and does not collect data. The default is y.
Minimum threshold for data dictionary hit ratio	Enter a minimum percentage for the data dictionary hit ratio. If the actual hit ratio is lower than this threshold, an event is raised. Ideally this percentage should be set high, because the more frequently Oracle uses the data dictionary to service requests, the better your database performance. When the actual hit ratio falls below the threshold you set, the event alerts you that database performance has degraded. The default is 90%.
Monitor library cache hit ratio?	Set to y to monitor the percentage of time that system pin requests to access objects in the library cache can be serviced without reinitializing or reloading library objects. When set to n, the Knowledge Script does not monitor this statistic (regardless of whether a threshold is specified) and does not collect data. The default is y.
Minimum threshold for library cache hit ratio	Enter a minimum percentage for the library cache hit ratio. If the actual hit ratio is lower than this threshold, an event is raised. Ideally, this percentage should be set extremely high because reinitializing or reloading library objects imposes a large performance hit. When the actual hit ratio falls below the threshold you set, the event alerts you that database performance has degraded. The default is 99%.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.7 CallRate

Use this Knowledge Script to monitor the demand placed on a database instance from all sources. This demand is determined by tracking the number of database calls per second from all applications and processes accessing the database instance. The database calls tracked include Parse, Execute, and Fetch statements. These calls are sometimes described as **user calls**. When the call rate (and thus the workload demand on the server) exceeds the threshold you set, an event is raised.

57.7.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.7.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the total user calls per second for all work sources. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for call rate	Enter a threshold for the maximum number of calls per second. The default is 100 calls per second.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.8 CallsPerTransaction

Use this Knowledge Script to monitor the demand placed on a database instance by each transaction. This demand is determined by tracking the number of database calls (for example, to parse, execute, and fetch data) per committed transaction. When the number of database requests per transaction exceeds the threshold you set, an event is raised.

57.8.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.8.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the number of database calls per transaction. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for calls per transaction	Enter a threshold for the maximum number of calls per transaction. The default is 100 calls per transaction.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.9 ConfigDB

Use this Knowledge Script to update AppManager for Oracle Database with the username, password, and additional system settings for the database that you want to monitor. If there is an error updating the AppManager for Oracle Database repository, an event is raised.

Note that when you install AppManager for Oracle Database, this information is automatically gathered for all existing Oracle databases. You only need to run this Knowledge Script on Oracle databases that you added after installing AppManager.

57.9.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.9.2 Default Schedule

The default interval for this script is **Run once**.

57.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is n.
Management server computer name	Specify the name of the computer on which the AppManager management server is installed.
Database names	Specify the name of the Oracle database that you want to be managed by AppManager. If you want to use a specific database or databases, list them in the following format, separated by commas as needed: *OracleHome*$*OracleDatabaseName* For example: OraDB11g$OR200 If you want to include all Oracle databases, enter an asterisk (*). The default database name is *.

Description	How to Set It
Oracle Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Password for Oracle Username	Specify the Oracle password for the user specified in the *Oracle Username* parameter.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.10 ConsistentChangeRatio

Use this Knowledge Script to monitor the extent to which applications exercise the read consistency mechanism to ensure database consistency.

The consistent change ratio is based on the number of requested database blocks that have changed since a read consistency point was taken as part of a query. When the ratio of changed database blocks to all requested database blocks exceeds the threshold you set, an event is raised.

57.10.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.10.2 Default Schedule

The default interval for this script is **Every 1 hour**.

57.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the percentage of requested database blocks that changed since the read operation. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for consistent change ratio	Enter a threshold for the maximum number of consistent read changes that should be allowed before generating an event. The default is 100.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.11 ContinuedRowRatio

Use this Knowledge Script to monitor rows that span more than one database block. This Knowledge Script monitors the ratio of **continued rows** that span more than one database block to all rows fetched. In most cases, this ratio should be close to zero. If the continued row ratio increases over time (indicating that more and more rows span multiple database blocks), it might mean that the `PCTFREE` storage parameter is set too low for one or more tables.

57.11.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.11.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

57.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the continued row ratio. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for continued row ratio	Enter a threshold for the ratio of continued rows to all rows fetched. The default ratio is 01.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.12 DatabaseDown

Use this Knowledge Script to monitor the status of a database and its associated OracleServer service.

It is possible for the OracleServer service to be running while its associated database is down. This Knowledge Script monitors the database and its OracleServer service at the same time and raises an event if it discovers that either one is not running.

In addition, you have the option of monitoring the Oracle Listener service (there is a single instance of this service per Oracle Server) and the OracleStart service associated with the database and raising an event if either one is down.

NOTE: Not all versions of Oracle include the OracleStart service. If you are using a version of Oracle that does not include the OracleStart service, the Oracle managed object automatically ignores any requests from the Knowledge Script to monitor this service. If the *Monitor the OracleStart service?* parameter is set to y, but the OracleStart service does not exist in the version of Oracle you are using, the Knowledge Script does not raise an event.

The detail message indicates which database or associated services are down.

57.12.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.12.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the value 100 every time it finds a resource is up and the value 0 every time it finds a resource is down. This provides a way to report on the percentage of system up time in any given period. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default user name is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.

Description	How to Set It
Monitor the OracleStart service?	Enter y to monitor the status of the `OracleStart` service associated with the database. If the service exists in your version of Oracle but is not running, an event is raised. Note that if you are using a version of Oracle that does not include the `OracleStart` service, the Oracle managed object automatically ignores any requests from the Knowledge Script to monitor this service, and no event is raised. The default is n.
Monitor the Oracle Listener service?	Set to y to monitor the status of the Oracle Listener service. If the service is not running, an event is raised. The default is no.
Name of Listener Service	Specify the name of an Oracle listener service when there is only one such listener used among multiple databases. This listener service's status is checked for each of the databases upon which the job is run.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.13 DatafileSpace

Use this Knowledge Script to monitor the size of an Oracle database's datafile. When the size of the datafile (in MB) exceeds the threshold you set, the script raises an event.

57.13.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on an Oracle Database icon, a single Knowledge Script job monitors every datafile for that database. When run on a single datafile icon, a single Knowledge Script monitors just that datafile.

57.13.2 Default Schedule

The default interval for this script is **Every 1 hour**.

57.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise an event when the datafile size exceeds the threshold you set. The default is y.
Ignore datafiles whose autoextend property is set to true	Set to y to ignore datafiles that are set to autoextend, which will prevent this script from raising a false event if the datafile size exceeds the threshold you set.The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the current size of the datafile (in MB). The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for a datafile	Enter a threshold, in megabytes, for the maximum size of a datafile. The default is 20 MB.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event in which the datafile size exceeds the threshold you set. The default is 5.

57.14 DiskSpaceAvail

Use this Knowledge Script to monitor the amount of disk space available for the archive log file, the background process log file, and user log files of a database. You can monitor the space available for all three or any combination. For example, you could turn off monitoring for the archive log and background process log files and monitor just the disk space available for the user logs.

For each type of log file, you can set a minimum threshold. If the amount of available disk space is less than any of the thresholds you set for a specific type of log file, the Knowledge Script raises an event.

57.14.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.14.2 Default Schedule

The default interval for this script is **Every 1 hour.**

57.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, this script returns the amount of free disk space for each type of log file that you are monitoring. The script returns only the data being monitored. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Monitor space available for the archive log?	Enter y to monitor the amount of disk space available for the database's archive log file. When set to n, the Knowledge Script does not monitor this statistic (regardless of whether a threshold is specified) and does not collect data. The default is y.

Description	How to Set It
Minimum threshold for archive log space	Specify the minimum amount of available disk space for the archive log file. If the amount of available space is less than this number, an event is raised. The default is 100.
Monitor space available for background process log?	Enter y to monitor the amount of space available for the database's background process log file. When set to n, the Knowledge Script does not monitor this statistic (regardless of whether a threshold is specified) and does not collect data. The default is y.
Minimum threshold for background process log space	Specify the minimum amount of available disk space for the background process log file. If the amount of available space is less than this number, an event is raised. The default is 100.
Monitor space available for user logs?	Enter y to monitor the amount of space available for the database's user log files. When set to n, the Knowledge Script does not monitor this statistic (regardless of whether a threshold is specified) and does not collect data. The default is y.
Minimum threshold for user log space	Specify the minimum amount of available disk space for user log files. If the amount of available space is less than this number, an event is raised. The default is 100.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.15 OpenCursors

Use this Knowledge Script to monitor the percentage of cursors opened per session, as well as the total number of cursors open in the system. In the Oracle environment, a **cursor** is a type of handle, or pointer, used to identify a query in the system. Cursors can be opened by users or by the system itself. A high number of open cursors can be caused by a programming error, and might result in performance problems. In the `init.ora` file, you can specify the maximum number of cursors that might be opened by a session.

In this Knowledge Script, you can specify a threshold for the maximum percentage of open cursors allowed per session. Note that this is a percentage of the number specified in the `open_cursor` parameter in the `init.ora` file. For example, the `init.ora` file specifies that 60 cursors might be open in a session. In the Knowledge Script, you specify a threshold percentage of 75%. In this case, the Knowledge Script raises an event when 75% of the 60 allowed cursors (or 45 cursors) are open in any session. You can also specify a threshold for the total number of open cursors allowed in the system. An event is raised if either threshold is exceeded.

57.15.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.15.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.15.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script collects the statistics you choose to monitor: the percentage of open cursors per session, and the total number of open cursors in the system. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.

Description	How to Set It
Number of open cursors in the system	Specify the total number of cursors that might be open in the system. The default is 1000.
Percentage of cursors opened per session	Specify the percentage of open cursors allowed per session. Note that this percentage is based on the number of open cursors allowed per session specified in the `init.ora` file. The default is 80%.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.16 RecursiveToUserCallRatio

Use this Knowledge Script to monitor the ratio of recursive calls to overall database user calls. A change in this ratio can reflect an application change or indicate a need to adjust the size of the shared pool. You can specify a ratio threshold. If the recursive-to-user call ratio exceeds the threshold you set, an event is raised.

57.16.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.16.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

57.16.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the recursive-to-user call ratio. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for recursive-to-user-call ratio	Enter a threshold for the maximum change in the recursive-to-user call ratio. The previous ratio is compared with the current ratio, and the difference is compared to the threshold. The default ratio is 10.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.17 RedoLogContention

Use this Knowledge Script to monitor the number of times that a process tries to write an entry in the redo log buffer. The number of retries should be low. A high number of retries can adversely affect system performance, as processes must wait for buffers. If a process has to make numerous attempts to write an entry in the redo log buffer, you might need to allocate more space to the redo log buffer.

You can set a threshold value for the maximum number of times a process can try to write an entry in the redo log buffer. If the number of retries exceeds the threshold you set, an event is raised.

57.17.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a single Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a single Knowledge Script monitors just that database.

57.17.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.17.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script collects the number of times that processes attempted to write entries to the redo log buffer. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for redo log buffer allocation retries	Enter a threshold for the maximum number of times that a process tries to write an entry to the redo log buffer. The default is 50.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.18 RedoLogSpaceWaitRatio

Use this Knowledge Script to monitor the redo log space wait ratio. The redo log space wait ratio measures memory allocation. The ratio reflects how often a server process had to wait before writing an entry in the redo log buffer. If this ratio increases, you might want to increase the size of the redo log buffer. When the redo log space wait ratio exceeds the threshold you set, an event is raised.

57.18.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.18.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.18.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the redo log space wait ratio. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for redo log space wait ratio	Enter a threshold for the redo log wait ratio. The default ratio is 0.0002.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.19 Report_BackgroundProcess

Use this Report script to generate a report about total memory use, and the total number of physical read/write operations per second for Oracle background processes. This report allows you to make a statistical analysis of the data point values (for example, the average or maximum value over a time period).

This report uses data collected by the BGProc Knowledge Script.

57.19.1 Resource Objects

Report agent

57.19.2 Default Schedule

The default schedule is **Run once**.

57.19.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time period covered by the report • **Minimum**: The minimum value of data points for the time period covered by the report • **Maximum**: The maximum value of data points for the time period covered by the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time period covered by the report • **Range**: The range of values in the data stream (maximum - minimum = range) • **Standard Deviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time period covered by the report • **Close**: The last value for the time period covered by the report • **Change**: The difference between the first and last values for the time period covered by the report (close - open = change) • **Count**: The number of data points for the time period covered by the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Enter a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to yes, the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to yes, additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to yes to include a table in the report that lists parameter settings for the report script. The default is yes.

Description	How to Set It
Include table?	Set to yes to include a table of data stream values in the report. The default is yes.
Include chart?	Set to yes to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to yes to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to yes to append a timestamp to the title of the report, making each title unique. The timestamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to yes to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.20 Report_CacheHitRatio

Use this Oracle_Report script to generate a report about buffer cache hit ratio, data dictionary hit ratio, and library cache hit ratio for Oracle servers. This report allows you to make a statistical analysis of the data point values (for example, the average or maximum value over a time period).

This report uses data collected by the Cache Knowledge Script.

57.20.1 Resource Objects

Report agent

57.20.2 Default Schedule

The default schedule is **Run once**.

57.20.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time period covered by the report • **Minimum**: The minimum value of data points for the time period covered by the report • **Maximum**: The maximum value of data points for the time period covered by the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time period covered by the report • **Range**: The range of values in the data stream (maximum - minimum = range) • **Standard Deviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time period covered by the report • **Close**: The last value for the time period covered by the report • **Change**: The difference between the first and last values for the time period covered by the report (close - open = change) • **Count**: The number of data points for the time period covered by the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Enter a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to yes, the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to yes, additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to yes to include a table in the report that lists parameter settings for the report script. The default is yes.

Description	How to Set It
Include table?	Set to yes to include a table of data stream values in the report. The default is yes.
Include chart?	Set to yes to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to y to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to yes to append a timestamp to the title of the report, making each title unique. The timestamp is made up of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to yes to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.21 Report_DatabaseAvailability

Use this Oracle_Report script to generate a report about the up/down status of Oracle databases, and the `OracleServer`, `OracleListener`, and `OracleStart` services.

This report uses data collected by the DatabaseDown Knowledge Script.

57.21.1 Resource Objects

Report agent

57.21.2 Default Schedule

The default schedule is **Run once**.

57.21.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Select the days of the week to include in your report.
Data settings	
Hours or percentage on chart	Select whether to illustrate availability by hours or by percentage.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Enter a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to yes, the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Report settings	

Description	How to Set It
Include parameter help card?	Set to yes to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to yes to include a table of data stream values in the report. The default is yes.
Include chart?	Set to yes to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to y to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to y to append a timestamp to the title of the report, making each title unique. The timestamp is made up of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to yes to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.22 Report_DatafileSpace

Use this Oracle_Report script to generate a report about the size (in MB) of Oracle Database data files. This report allows you to make a statistical analysis of the data point values (for example, the average or maximum value over a time period).

This report uses data collected by the DatafileSpace Knowledge Script.

57.22.1 Resource Objects

Report agent

57.22.2 Default Schedule

The default schedule is **Run once**.

57.22.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time period covered by the report • **Minimum**: The minimum value of data points for the time period covered by the report • **Maximum**: The maximum value of data points for the time period covered by the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time period covered by the report • **Range**: The range of values in the data stream (maximum - minimum = range) • **Standard Deviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time period covered by the report • **Close**: The last value for the time period covered by the report • **Change**: The difference between the first and last values for the time period covered by the report (close - open = change) • **Count**: The number of data points for the time period covered by the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Enter a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to yes, the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to yes, additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to yes to include a table in the report that lists parameter settings for the report script. The default is yes.

Description	How to Set It
Include table?	Set to yes to include a table of data stream values in the report. The default is yes.
Include chart?	Set to yes to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to yes to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	
Add time stamp to title?	Set to yes to append a timestamp to the title of the report, making each title unique. The timestamp is made up of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to yes to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.23 Report_DiskSpaceAvailable

Use this Oracle_Report script to generate a report about the amount of disk space (in MB) available for the archive, background process, and user log files. This report allows you to make a statistical analysis of the data point values (for example, the average or maximum value over a time period).

This report uses data collected by the DiskSpaceAvail Knowledge Script.

57.23.1 Resource Objects

Report agent

57.23.2 Default Schedule

The default schedule is **Run once**.

57.23.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time period covered by the report • **Minimum**: The minimum value of data points for the time period covered by the report • **Maximum**: The maximum value of data points for the time period covered by the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time period covered by the report • **Range**: The range of values in the data stream (maximum - minimum = range) • **Standard Deviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time period covered by the report • **Close**: The last value for the time period covered by the report • **Change**: The difference between the first and last values for the time period covered by the report (close - open = change) • **Count**: The number of data points for the time period covered by the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Enter a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to yes, the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to yes, additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to yes to include a table in the report that lists parameter settings for the report script. The default is yes.

Description	How to Set It
Include table?	Set to yes to include a table of data stream values in the report. The default is yes.
Include chart?	Set to yes to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to yes to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to yes to append a timestamp to the title of the report, making each title unique. The timestamp is made up of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to yes to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.24 Report_TablespaceAvailable

Use this Oracle_Report script to generate a report about the free disk space available for tablespaces, disk space used by tablespaces, and the size of tablespaces. This report allows you to make a statistical analysis of the data point values (for example, the average or maximum value over a time period).

This report uses data collected by the TablespaceAvail Knowledge Script.

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time period covered by the report • **Minimum**: The minimum value of data points for the time period covered by the report • **Maximum**: The maximum value of data points for the time period covered by the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time period covered by the report • **Range**: The range of values in the data stream (maximum - minimum = range) • **Standard Deviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time period covered by the report • **Close**: The last value for the time period covered by the report • **Change**: The difference between the first and last values for the time period covered by the report (close - open = change) • **Count**: The number of data points for the time period covered by the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Enter a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to yes, the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to yes, additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to yes to include a table in the report that lists parameter settings for the report script. The default is yes.

Description	How to Set It
Include table?	Set to yes to include a table of data stream values in the report. The default is yes.
Include chart?	Set to yes to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to yes to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to yes to append a timestamp to the title of the report, making each title unique. The timestamp is made up of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to yes to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.25 Report_TransactionRate

Use this Oracle_Report script to generate a report about the number of transactions per second for Oracle databases. This report allows you to make a statistical analysis of the data point values (for example, the average or maximum value over a time period).

This report uses data collected by the TransactionRate Knowledge Script.

57.25.1 Resource Objects

Report agent

57.25.2 Default Schedule

The default schedule is **Run once**.

57.25.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time period covered by the report • **Minimum**: The minimum value of data points for the time period covered by the report • **Maximum**: The maximum value of data points for the time period covered by the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time period covered by the report • **Range**: The range of values in the data stream (maximum - minimum = range) • **Standard Deviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time period covered by the report • **Close**: The last value for the time period covered by the report • **Change**: The difference between the first and last values for the time period covered by the report (close - open = change) • **Count**: The number of data points for the time period covered by the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Enter a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to yes, the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to yes, additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to yes to include a table in the report that lists parameter settings for the report script. The default is yes.

Description	How to Set It
Include table?	Set to yes to include a table of data stream values in the report. The default is yes.
Include chart?	Set to yes to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to yes to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to yes to append a timestamp to the title of the report, making each title unique. The timestamp is made up of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to yes to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.26 Report_UserLocks

Use this Oracle_Report script to generate a report about the number of user-held locks on an Oracle database. This report allows you to make a statistical analysis of the data point values (for example, the average or maximum value over a time period).

This report uses data collected by the TopLockUsers Knowledge Script.

57.26.1 Resource Objects

Report agent

57.26.2 Default Schedule

The default schedule is **Run once**.

57.26.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time period covered by the report • **Minimum**: The minimum value of data points for the time period covered by the report • **Maximum**: The maximum value of data points for the time period covered by the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time period covered by the report • **Range**: The range of values in the data stream (maximum - minimum = range) • **Standard Deviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time period covered by the report • **Close**: The last value for the time period covered by the report • **Change**: The difference between the first and last values for the time period covered by the report (close - open = change) • **Count**: The number of data points for the time period covered by the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Enter a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to yes, the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to yes, additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to yes to include a table in the report that lists parameter settings for the report script. The default is yes.

Description	How to Set It
Include table?	Set to yes to include a table of data stream values in the report. The default is yes.
Include chart?	Set to yes to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to yes to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to yes to append a timestamp to the title of the report, making each title unique. The timestamp is made up of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to y to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.27 RollBackSegmentContention

Use this Knowledge Script to monitor rollback segment contention for a database. In the Oracle environment, the **rollback segment** is a temporary location where changes are stored until the user makes the changes permanent. This Knowledge Script compares the number of requests waiting to access data from the rollback segment to the total number of requests for data during the monitoring interval. In the Knowledge Script, you can specify the maximum percentage of requests allowed to wait for data from the rollback segment. If the percentage of waiting requests exceeds the threshold you specify, an event is raised. If you find that too many processes are waiting to access the rollback segment, you might need to create an additional rollback segment.

57.27.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.27.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.27.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. The data is stored in the AppManager repository. When set to y, the script collects the number of requests waiting to access the rollback segment. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Percentage of unsuccessful requests	Specify the percentage of total requests that might be waiting to access data from the rollback segment. The default is 1%.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 5.

57.28 RowSourceRatio

Use this Knowledge Script to monitor the row source ratio. This ratio measures the percentage of rows that were retrieved using full table scans. Because a full table scan is less efficient than retrieving rows by row ID, this ratio gives you an indication of potential performance problems. If you observe an increase in this ratio, you might want to review other statistics to find the source of the problem. When this ratio exceeds the threshold you set, an event is raised.

57.28.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.28.2 Default Schedule

The default interval for this script is **Every 1 hour**.

57.28.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the ratio of rows retrieved using a full table scan. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for row source ratio	Enter a threshold for the row source ratio. The default ratio is .25.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.29 RunSql

Use this Knowledge Script to run a SQL statement. You can enter the SQL statement to be executed when you run this Knowledge Script, or you can load the statement from a script file. You specify the column to monitor and whether to monitor the value found in the column or the value's rate of change (changes per second).

NOTE: There is no syntax-checking mechanism from the Operator Console. Syntax checking is done by the Oracle server on the managed client when the job runs. If an error is detected, the Oracle server returns the error result to the Knowledge Script, and the job stops.

57.29.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a single Knowledge Script job runs the SQL statements on every database on that server. When run on a single Oracle Database icon, a single Knowledge Script runs the SQL statements just on that database.

57.29.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.29.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is n.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, this script returns the number of rows returned from the SQL statement. If you choose to monitor the column's rate of change and set this parameter to y, the script returns the change in the number of rows since the last time the SQL statement was run. The default is y.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479. **NOTE:** In general, permission to run specific SQL commands and statements is derived from the permissions granted to the user account name you are using to run this Knowledge Script.

Description	How to Set It
Load SQL script from file?	Set to y to load the SQL statement from a file. Set to n to enter the SQL statement in the **SQL statement** field. The default is n.
SQL script file (full path)	If you set the **Load SQL script** parameter to y, enter the complete path to the file that contains the SQL statement. For example: `F:\netiq\Sample.sql` **NOTE:** If the AppManager agent service (`NetIQmc`) is running as a system account, you cannot enter a path in UNC format (such as \\machine\dir\Sample.sql).
SQL statement	If you set the **Load SQL script** parameter to n, enter the SQL statement to be executed. The default statement selects all processes from the `V$PROCESS` table. **Tip:** Unless you are entering very simple queries, you might find typing a SQL statement into this field is error-prone. To avoid this, use the **SQL script file** parameter. Alternatively, if you have an AppManager Developer's license, you can check this Knowledge Script out of the repository, use the Knowledge Script Editor to paste the desired SQL statement into the **SQL statements** field, and then check the modified Knowledge Script back in.
Select column by column number?	Set to y to select a column by column number. Set to n to select a column by column name. The default is y (column number).
Column number	If you set the **Select column by column number?** parameter to y, enter the column number to use as the primary output value (the column you specify must contain numeric data). Entering 0 returns the number of rows returned from the SQL statement. Any other positive value returns the value for the specified column's first row of data. If the specified column is not a numeric field, an error is raised and the Knowledge Script returns an error.
Column name	If you set the **Select column by column number?** parameter to n, enter the column name to use as the primary output value (the column you specify must contain numeric data). The value for the specified column's first row of data is returned. If the specified column is not a numeric field, an error is raised and the Knowledge Script returns an error.
Legend	Enter a legend for the output of your SQL statement. The default is blank. If you leave this parameter blank, AppManager constructs a legend based on the column number. For example, if the column number is 0, the constructed legend is "`# Result Rows`". If the column number is greater than 0, the constructed legend is the specified column heading. If no heading exists, the constructed legend is: "`Column <num> Value`"
Monitor the column's rate of change?	Set to y to monitor the number of times the column's value changes per second. Set to n to monitor the actual value found in the column. The default is n.

Description	How to Set It
Condition: <, =, or >	Indicate the condition (less than, equal to, or greater than) you want to check for. This parameter is used in conjunction with the threshold parameter to control when events are raised. The default is greater than (>).
Value or rate threshold	Enter a threshold for the value you are monitoring. Depending on how you set the **Calculate column change rate?** parameter, this might indicate a threshold for the statistic's value or for the number of times the value changes per second. The value you set here is used in conjunction with the **Condition: <, =, or >** parameter to control when events are raised. The default is 1000.
Number of rows to be displayed	Specify the number of rows you want displayed in the detail message (event or data). The default is 5 rows. **NOTE:** You can enter 0 to indicate no limit (keep all output rows). However, currently the detail message is limited to 32K characters.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.29.4 Loading a SQL statement from a Script File

In many cases, you might find it useful to run a complex SQL statement using a SQL script file rather than entering the statement directly in the **SQL statement** parameter.

The example below illustrates how to use a SQL script loaded from a file to perform a custom monitoring task. This example monitors tablespaces, and collects the following information:

- Largest free extent in the tablespace
- Number of free extents in the tablespace
- Total free space in the tablespace
- Percentage of the tablespace's available space that is free

If the percentage of available tablespace is less than 5%, an event is raised. Here's how the key Knowledge Script parameters are set:

This Parameter:	Is Set to:
Event?	y
Collect data?	y
Load SQL script from file?	y
SQL script file (full path)	`D:\netiq\tblspace.sql`
Select column by column number?	y
Column number	5
Column name	pct_free

This Parameter:	Is Set to:
Legend	Percentage Free
Calculate column change rate?	n
Condition: <, =, or >	<
Value or rate threshold	5

The `tblspace.sql` script file contains the following SQL statement:

```
SELECT Tablespace_Name, Max_Blocks, Count_Blocks,
       Sum_Free_Blocks,
       100*Sum_Free_Blocks/Sum_Alloc_Blocks AS pct_free
FROM
       (SELECT Tablespace_Name, SUM(Blocks) Sum_Alloc_Blocks
       FROM dba_data_files GROUP BY Tablespace_Name),
       (SELECT Tablespace_Name FS_TS_NAME, MAX(Blocks)
       AS Max_Blocks, COUNT(Blocks) AS Count_Blocks,
       SUM(Blocks) AS Sum_Free_Blocks
       FROM dba_free_space GROUP BY Tablespace_Name)
WHERE Tablespace_Name = FS_TS_NAME
ORDER BY pct_free
```

57.30 SegmentExtentAvail

Use this Knowledge Script to monitor the percentage of extents (extensions of free space) available to each segment in a tablespace. You can set a threshold value for the minimum percentage of extents that should be available for each segment. For example, you might want each segment to have at least 70% of extents available. In addition, you can set a threshold for the maximum number of segments allowed to fall below this percentage before an event is raised. For example, you specify that 70% of extents should be available for each segment, and that four segments should be the maximum number of segments allowed to have less than 70% of their extents available. If four segments are found to have less than 70% of their extents available, an event is raised.

It is important to note that an event is raised only when *both* conditions are met. In the example described above, AppManager would not raise an event until four segments were found that had less than 70% of their extents available.

57.30.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a single Knowledge Script job runs the SQL statements on every database on that server. When run on a single Oracle Database icon, a single Knowledge Script runs the SQL statements just on that database.

57.30.2 Default Schedule

The default interval for this script is **Every 1 hour**.

57.30.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, this script returns the number of segments that have less than the specified percentage of extents available. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479. **NOTE:** In general, permission to run specific SQL commands and statements is derived from the permissions granted to the user account name you are using to run this Knowledge Script.

Description	How to Set It
Min. % of available extents for each segment	Specify the minimum percentage of extents available for each segment in a tablespace. The default is 80%.
Max. segments with more than above % of extents allocated	Specify the maximum number of segments allowed to have less than the specified percentage of extents available. The default is 5 segments.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red event indicator).

57.31 SortOverflowRatio

Use this Knowledge Script to monitor the sort overflow ratio. This ratio measures the number of sorts that are using temporary segments. An increase in this ratio indicates that more sort operations need to allocate work space on disk. If most sorts are of a moderate size, you might want to increase the sort area size to accommodate them. If the ratio exceeds the threshold you set, an event is raised.

57.31.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.31.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.31.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for charts and reports. When set to y, the script returns the ratio of the number of sorts using temporary segments versus the number that do not. For example, a ratio of .75 indicates that 3 out of 4 sorts are using temporary segments. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for sort overflow ratio	Enter a threshold for the sort overflow ratio. The default ratio is 0.75.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.32 SysStat

Use this Knowledge Script to retrieve statistics from a database's V$SYSSTAT table. This table stores all the key statistics for a database. You specify the statistic to monitor and the value and condition to check for. You can monitor either the statistic's **value** or **change rate** (changes per second) to raise an event.

57.32.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.32.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.32.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the current value of each specified statistic at each interval. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is system. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
V$SYSSTAT name	Specify the name of the statistic you want to monitor. For example, USER CALLS. For information about the fields in the V$SYSSTAT table, see your Oracle documentation (for example, Oracle8 Reference, Appendix C Statistics Descriptions). The default statistic is EXECUTE COUNT.
Monitor statistic's change rate?	When this parameter is set to y, the Knowledge Script monitors the number of times the statistic's value changes per second. When this parameter is set to n, the Knowledge Script monitors the value of the statistic. The default is y.

Description	How to Set It
Condition: <, =, or >	Indicate the condition (less than, equal to, or greater than) you want to check for. This parameter is used in conjunction with the **Value or rate threshold** parameter to control what raises an event. The default is greater than (>).
Value or rate threshold	Enter a threshold value for the specified statistic. Depending on how you set the **Monitor statistic's change rate?** parameter, this might indicate a threshold for the statistic's value or for the number of changes per second. The value you set here is used in conjunction with the **Condition (<, =, or >)** parameter to control what raises an event. The default is 100.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.32.4 Example of How This Script is Used

You can use this Knowledge Script to monitor either a statistic's **value** or its **change rate** (changes per second). To do this, you need to specify:

- The statistic to monitor
- Whether you want to monitor a value or a change rate
- The type of threshold condition for which you are monitoring (less than, greater than, or equal to)
- The value or change rate threshold

For example, to generate an event when there are more than 100 `Execute` calls in a monitoring interval:

This Parameter	Is Set to
Event?	y
`V$SYSSTAT` name	execute count
Monitor statistic's change rate?	n
Condition (<, =, or >)	>
Value or rate threshold	100

In some cases, monitoring a statistic's change rate is even more useful in measuring database performance and application efficiency than monitoring for a current value. For example, if the change rate for a statistic such as **execute count** begins to drop (with fewer execute statements processed per second), it suggests a performance bottleneck.

Consult your Oracle documentation for recommendations on setting thresholds for specific statistics.

57.33 TablespaceAvail

Use this Knowledge Script to monitor the disk space used by tablespaces.

This Knowledge Script can monitor:

- The amount of free disk space available for a tablespace as a percentage, as an absolute amount, or both.
- The amount of disk space used by a tablespace as a percentage, as an absolute amount, or both.
- The size of a tablespace.

This Knowledge Script monitors the disk space allocated to Oracle, not the disk space on the computer where Oracle is running.

By default, this Knowledge Script is configured to monitor the percentage of free disk space available to a tablespace and the percentage of disk space used by a tablespace. You can choose any combination of monitoring options and set thresholds for each one.

57.33.1 Resource Objects

- Oracle Server icon
- Oracle tablespace icon
- Individual tablespace icons

NOTE: When run on the Oracle server icon, a single Knowledge Script job monitors every tablespace in every database on that server. When run on a tablespaces icon, a single Knowledge Script job monitors every tablespace in the database. Or you can run a Knowledge Script job on a single tablespace icon.

57.33.2 Default Schedule

The default interval for this script is **Every 1 hour**.

57.33.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, this script returns statistics (percentage of free disk space or amount of disk space used) for each tablespace on which the script is running. The script returns only the data being monitored. The default is n.

Description	How to Set It
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Monitor percentage of free disk space for tablespace?	Enter y to monitor the percentage of disk space available to the tablespace. The default is y.
Minimum threshold for percentage of free disk space	Specify the minimum percentage of available disk space needed for the tablespace. If the amount of available space is less than this number, an event is raised. The default is 5 percent.
Monitor percentage of disk space used by tablespace?	Enter y to monitor the percentage of disk space used by the tablespace. The default is y.
Maximum threshold for percentage of disk space used	Specify the maximum percentage of disk space that the tablespace is allowed to use. If the percentage of disk space used by the tablespace exceeds this number, an event is raised. The default is 95%.
Monitor amount of free disk space for tablespace?	Enter y to monitor the amount of disk space available to the tablespace. The default is n.
Minimum threshold for amount of free disk space	Specify the minimum amount of available disk space (in MB) needed for the tablespace. If the amount of available space is less than this number, an event is raised. The default is 5 MB.
Monitor amount of disk space used?	Enter y to monitor the amount of disk space used by the tablespace. The default is n.
Maximum threshold for amount of disk space used	Specify the maximum amount of disk space (in MB) that the tablespace is allowed to use. If the amount of disk space used exceeds this number, an event is raised. The default is 1000 MB.
Monitor total size of tablespace?	Enter y if you want to monitor the total size of the tablespace. The default is n.
Maximum threshold for total size	Specify the maximum size (in MB) allowed for the tablespace. If the size of the tablespace is greater than this number, an event is raised. The default is 1024.

Description	How to Set It
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.34 TopCpuUsers

Use this Knowledge Script to monitor the CPU time for current user sessions. If the CPU usage exceeds the threshold you set, an event is raised. You can specify the number of top user sessions to display in the event and data detail messages. The detail message includes the CPU usage for each of the top *n* sessions, username, session ID, and program name.

57.34.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.34.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

57.34.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the total CPU time for the top *N* users. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for CPU cycles (1/100 sec)	Enter a threshold for the maximum number of CPU cycles per 1/100th of a second. The default is 50 CPU cycles.
Number of user sessions to display	Specify the number of top user sessions you want displayed in the detail message (event or data). Enter 0 if you want information for all user sessions displayed. The default is 10 user sessions.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.35 TopIOUsers

Use this Knowledge Script to monitor physical reads and writes (I/O) for current user sessions. If the number of physical reads/writes per second exceeds the threshold you set, an event is raised. You can specify the number of top user sessions to display in the event and data detail messages. The detail message includes the physical reads/writes per second for each of the top *N* sessions, username, session ID, and program name.

57.35.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.35.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

57.35.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the total number of physical reads/writes per second for the top *N* users. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for physical reads/writes	Enter a threshold for the maximum number of physical reads/writes per second. The default is 300 I/O operations.
Number of user sessions to display	Specify the number of top user sessions you want displayed in the detail message (event or data). Enter 0 if you want information for all user sessions displayed. The default is 10 user sessions.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.36 TopLockUsers

Use this Knowledge Script to monitor the current number of user-held locks on an Oracle database. If the number of locks exceeds the threshold you set, an event is raised. You can specify the number of top user sessions to display in the detail event and data messages. The detail message includes the number of locks held by each session, username, session ID, and program name.

57.36.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.36.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

57.36.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the current number of user-held locks. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for total user locks	Enter a threshold for the maximum number of user-held locks on an Oracle server. The default is 1000 locks.
Number of user sessions to display	Specify the number of top user sessions you want displayed in the detail message (event or data). Enter 0 if you want all user sessions displayed. The default is 10 user sessions.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.37 TopMemoryUsers

Use this Knowledge Script to monitor memory usage (User Global Area and Program Global Area) for current user sessions. If the user memory usage exceeds the threshold you set, an event is raised. You can specify the number of top user sessions to display in the event and data detail messages. The detail message includes the memory in bytes for each session, username, session ID, and program name.

57.37.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.37.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

57.37.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the total memory usage for the top *n* number of user sessions in MB. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for total user memory usage	Enter a threshold for the maximum memory for all user sessions in megabytes. The default is 10 MB.
Number of top memory user sessions to display	Specify the number of top user sessions you want displayed in the detail message (event or data). Enter 0 if you want information for all user sessions displayed. The default is 10 user sessions.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.38 TransactionRate

Use this Knowledge Script to monitor the transaction rate for an Oracle database. This Knowledge Script tracks the number of transactions per second and provides a basic measure of application workload.

Changes to your applications or to usage patterns can affect the transaction rate, but in general, an increase in the transaction rate suggests an increase in overall server load. If you observe a decrease in the transaction rate with the same number of connected users, it might indicate that you need to do some database tuning or investigate the reasons for the changes.

If the number of transactions per second exceeds the threshold you set, an event is raised.

57.38.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.38.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

57.38.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the current transaction rate. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for transaction rate	Enter a threshold for the maximum number of transactions per second. The default is 1 transaction per second.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.39 UserCallsPerParse

Use this Knowledge Script to monitor the number of user calls per parse. The number of user calls per parse indicates how well an application is managing its context area. Changes in this ratio might indicate changes to the application itself or to changing usage patterns, for example, because users are moving from one module to another more or less frequently.

Generally, if the ratio is greater than or equal to 1, it indicates the SQL statements are executing efficiently without frequent reparsing. If the ratio is less than 1, it indicates the private SQL area might be too small.

When the ratio of user calls (parse, execute, fetch) to total parse calls falls below the threshold you set, an event is raised.

57.39.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a Knowledge Script monitors only that database.

57.39.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

57.39.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the current user calls per parse ratio. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Minimum threshold for user calls per parse	Enter a threshold for the minimum number of user calls per parse. The default is 1 call per parse.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.40 UserRollbackRatio

Use this Knowledge Script to monitor the user rollback ratio for an Oracle Database server. The user rollback ratio indicates the percentage of attempted application transactions that fail. The ratio compares the number of transactions rolled back to the total number of transactions attempted.

Because rolling back a transaction uses significant system resources, an increase in this ratio suggests resources have been wasted in attempting to execute failed transactions. If you observe a continued increase in this ratio, it might indicate serious application or database performance problems. When the rollback ratio exceeds the threshold you set, an event is raised.

57.40.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a single Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a single Knowledge Script monitors just that database.

57.40.2 Default Schedule

The default interval for this script is **Every hour**.

57.40.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the current user rollback ratio. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for user rollback ratio	Enter a threshold for the maximum percentage of transaction rollbacks that should be allowed before generating an event. The default is 75 percent.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

57.41 UserSessions

Use this Knowledge Script to monitor the total number of user sessions accessing an Oracle database. If the total number of user sessions is higher than the threshold you set, an event is raised. You can specify the number of user sessions to display in the detail event and data message. The detail message includes the number of sessions for each user and the username.

57.41.1 Resource Objects

- Oracle Server folder
- Oracle Database icon

NOTE: When run on the Oracle Server folder, a single Knowledge Script job monitors every database on that server. When run on a single Oracle Database icon, a single Knowledge Script monitors just that database.

57.41.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

57.41.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to y to raise events. The default is y.
Collect data?	Set to y to collect data for use in graphs and reports. When set to y, the script returns the total number of user sessions. The default is n.
Username	Specify the Oracle username that this Knowledge Script uses to access the target databases. If you run this Knowledge Script on more than one database, each database must be configured with the same username. The default username is `system`. For more information, see "How Knowledge Scripts Access Oracle Databases" on page 3479.
Maximum threshold for total user sessions	Specify the maximum number of user sessions. The default is 100.
Number of user sessions to display	Specify the number of user sessions you want displayed in the detail message (event or data). Type *0* if you want all user sessions displayed. The default is 10.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

58 SolarisZones Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring Oracle Solaris Zones resources.

From the Knowledge Script view of Control Center, you can access more information about any Knowledge Script by selecting it and clicking **Help**. In the Operator Console, select any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
DaemonState	Monitors the state of the specified daemons and raises an event if any specified daemon is running or not running.
Inventory	Monitors inventory changes in the Solaris Zones module objects. Solaris Zones module objects include: SolarisZonesHost, Zones, Zone processing Unit, Zone Memory, Zone VNIC, and ZFS pools.
VnicIO	Monitors network statistics of VNICs configured with Zones and raises an event if the network statistics exceeds threshold.
ZFSHealth	Monitors ZFS pool health and raises an event if a pool is not online.
ZoneCpuByProcess	Monitors CPU utilization of specified processes and raises an event if CPU utilization exceeds threshold.
ZoneCPUUtil	Monitors CPU utilization of Zones and raises an event if CPU utilization exceeds threshold.
ZoneMemByProcess	Monitors memory utilization of specified processes and raises an event if memory utilization exceeds threshold (in percent and in MB).
ZoneMemoryUtil	Monitors memory utilization of Zones and raises an event if memory utilization exceeds threshold (in percent and in MB).

58.1 DaemonState

Use this Knowledge Script to monitor the state of the specified daemons and raises an event if any specified daemon is running or not running.

58.1.1 Resource Object

SolarisZones_HostFolder

58.1.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

58.1.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if daemons specified in the list are down?	Select **Yes** to raise an event if any of the daemons you specified for monitoring is down. The default is unselected.
Comma-separated list of daemons	Enter one or more daemon names, separated by commas and no spaces. The default is `pools`.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which any of the daemons you specified for monitoring is down. The default is 5.
Raise event if daemons specified in the list are not down?	Select **Yes** to raise an event if any of the daemons that you specified for monitoring is up and running. The default is unselected.
Comma-separated list of daemons	Enter one or more daemon names, separated by commas and no spaces. The default is `pools`.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which any of the daemons you specified for monitoring is down. The default is 5.
Raise event if POOLS daemon is down?	Select **Yes** to raise an event if the POOLS daemon is down. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the POOLS daemon is down. The default is 5.
Raise event if RCAP daemon is down?	Select **Yes** to raise an event if the RCAP daemon is down. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the RCAP daemon is down. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the DaemonState job fails to get the metrics of the specified daemons. The default is Yes.

Parameter	How to Set It
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the DaemonState job fails to get the metrics of the specified daemons. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the DaemonState job fails. The default is 5.

58.2 Inventory

Use this Knowledge Script to monitor changes in the Solaris Zones module objects. SolarisZones module objects include: Host running Solaris Zones, Zones, Zone Processing Unit, Zone Memory, Zone VNIC, and ZFS pools. You can configure this Knowledge Script to raise events when SolarisZones objects are added, removed, or if any object attribute changes.

This Knowledge Script detects inventory changes by comparing snapshots of monitored objects from successive iterations. The first time you run this script, it creates an inventory snapshot. A snapshot reflects the current state of the monitored objects on the SolarisZones host. In the second and subsequent iterations, this Knowledge Script creates a new inventory snapshot, compares it to the previous snapshot, and generates events based on selected options and differences between the snapshots.

Running this Knowledge Script once provides no information, you must run it at least twice for it to detect any inventory changes. NetIQ Corporation recommends you to run this Knowledge Script immediately after discovery, then continue to run it regularly, either periodically or asynchronously, to monitor inventory changes.

58.2.1 Considerations while Running this Script

The following points should be taken in to consideration while running this script:

- You cannot monitor the addition or removal of a Solaris Zones Host, because the AppManager agent runs in the host and if the host goes down, the agent will not be able to communicate with the AppManager server.
- You can only monitor a limited set of attributes for a Solaris Zones Host. If you want to monitor the entire Solaris Zones Host, then run the standard set of AppManager Unix module Knowledge Scripts in the global zone of the Solaris host.
- You can not add or remove the Zone Processing Unit and Zone Memory explicitly. Therefore, you can not monitor the addition or removal of these two objects. When you add or remove a Zone, the event that is triggered as a result of this action includes these objects.
- You can monitor only those Zones that are in *running* state. This script assumes that a Zone is removed if the Zone state is changed to any other state than *running* state.
- You can monitor the addition or removal of a Zone by selecting the *Raise event if Zone state is changed?* parameter. The detailed event message includes the old and new states, other attributes and child object information.

  For example, consider that a zone `zone01` is not present at iteration i. At iteration *i+1*, `zone01` is configured and running. For the *i+1* iteration, the event detailed message displays the current state as *running* and previous state as *not configured*. The *not configured* state is added for this module to indicate that the zone configuration was not present in the system. Such a state is not available in the Oracle Solaris Zones literature.

58.2.2 Object and Attribute Event Options

The Knowledge Script action depends on the combination of event options you select and the inventory object or attribute change that occurs.

The short and detailed event messages both include the following:

- The hierarchy where the change occurred
- The Knowledge Script iteration count where the change was detected

Each snapshot is given an iteration count, beginning with 1. The iteration count is indicated by a # character. For example, if the Knowledge Script detects a Zone attribute change when comparing snapshot six to snapshot five, it adds `[# 6]` to the event short and detailed messages.

For objects added or removed, the short message contains the object name, its position in the object hierarchy, and the iteration number where the change was detected. For object attribute changes, the short message contains the object name and the attribute that has changed.

The detailed message contains the information from the short message, but in natural language and in more detail. For example, if a few attributes have changed for an object, then the short message contains only the attribute names, but the detailed message contains both the old and new attribute values. In case of addition/removal, the short message contains the object name and location which was removed. The detailed message contains the last captured attributes before removal and the first captured attributes after addition, if available.

The changes monitored for each of the objects are listed below:

SolarisZones module object names	Explicit add/remove monitor	Explicit attribute change monitor
SolarisZonesHost	No	Yes
Zones	Yes	Yes
Zone Processing Unit	No	Yes
Zone Memory	No	Yes
Zone VNIC	Yes	Yes
ZFS Pools	Yes	Yes

58.2.2.1 Script Actions when Objects are Added or Removed

The following table summarizes possible script actions when an inventory object is added or removed. **Object** represents the option to raise an event when an inventory object is added or removed. **Attribute** represents the option to raise an event when an inventory object attribute is changed.

	Attribute=No	**Attribute=Yes**
Object=No	No event	Create an attribute change event: • If an object is removed, report that monitored attributes have changed from a finite value to empty • If an object is added, report that monitored attributes have changed from empty to a finite value.
Object=Yes	Create an object added or removed event. Attribute values for the added or removed object are not listed in the event detailed message. For Zones, the child instances are also added or removed and reported in the event detailed message	Create an object added or removed event and list the latest recorded attribute values in the event detailed message. For Zones, the child instances are also added or removed and reported in the event detailed message.

You initially select to monitor a specific attribute change or object addition/removal, and let the script run till iteration *i*. For iteration *i+1*, you change monitoring options by selecting or deselecting some specific option. The script will not create events for the newly changed monitoring objects when it compares snapshot *i+1* to snapshot *i*. The first change comparison related to a specific option will start at iteration *i+1* and *i+2*. If there are any changes, it will be detected and reported in iteration *i+2*.

For example, you first select not to monitor VNIC addition/removal or attribute change till iteration *i*. At iteration *i+1*, you change the options to monitor VNIC addition/removal and attribute change. The script captures the first monitored VNIC change between iterations *i+1* and *i+2*.

When a Zone object is added or removed, the Knowledge Script also adds or removes its child objects, Zone Processing Unit, Zone Memory, and VNIC. In this case, the child objects do not generate individual events. Instead, the top-level event detailed message includes that these child objects have been added or removed.

The event detailed message also lists the latest recorded attributes of the Zone and all the monitored child objects and their attributes. If a child object has its own **Object=No** option selected, it is not included in the top-level event description. Instead, the top-level event includes a message indicating the child object type is not being monitored.

NOTE: If you select not to monitor any of the zone objects (Zone state change, Zone attribute, Zone Process Unit attribute, and Zone memory attribute) and select to monitor only the associated VNIC, and the zone is added or removed, AppManager raises an event only for the VNIC.

If you select to monitor any one of the Zone objects, then AppManager raises an event for the Zone including the VNIC attribute changes.

58.2.2.2 Script Actions when Object Attributes are Changed

The following table summarizes possible script actions when an inventory object attribute is changed. **Object** represents the option to raise an event when an inventory object is added or removed. **Attribute** represents the option to raise an event when an inventory object attribute is changed.

	Attribute=No	**Attribute=Yes**
Object=No	No event	Create an attribute change event with the changes in the detailed message
Object=Yes	No event	Create an attribute change event with the changes in the detailed message

You initially select to monitor a specific attribute change or object addition/removal, and let the script run till iteration *i*. For iteration *i+1*, you change monitoring options by selecting or deselecting some specific option. The script will not create events for the newly selected monitoring objects when it compares snapshot *i+1* to snapshot *i*. The first change comparison related to a specific option will start at iteration *i+1* and *i+2*. If there are any changes, it will be detected and reported in iteration *i+2*.

58.2.2.3 Aggregate Events

This Knowledge Script can create events either separately or in aggregate. Each inventory object includes a parameter to raise separate events and there are three kinds of aggregation:

- Aggregate by host: This option aggregates all the changes that were captured between two iterations as one single event. The detailed message contains all the changes that occurred. If you select this

option, there will be only one event that captures the inventory changes other than the default notifications event and error reporting events.

If you aggregate events based on host, the script generates a single event for the changes to Zone, Host, and VNIC. Selecting this option overrides all the other aggregate options and the severity is based on the host attribute change severity.

- Aggregate by Zone: This option aggregates multiple changes in one Zone as a single event. If you select this option, the maximum events generated between two iterations are equivalent to the number of *running* zones. If you do not select this option, then there will be one event for each object type change in a zone.

  For example, if there are changes in the attribute and processing unit attribute of `zone01` and also changes in the attribute and memory attribute of `zone02`, the script generates two events, one for `zone01` and the other one for `zone02`. The `zone01` event contains the attribute change and processing attribute change. Similarly, the `zone02` event contains both the attribute change and memory attribute change. If you do not select this option, then there will be four events, two per zone, indicating each of the changes.

  The aggregation of events under this option includes changes to a Zone, Zone Processing Unit, Zone Memory, and VNIC. The severity for this event is based on the Zone severity value.

- Aggregate by ZFS: This option is similar to zone aggregation except that the script generates aggregate events for ZFS Pools. If you select this option, this script generate a single event for changes in different ZFS Pools.

You can use this feature to selectively reduce the number of events the Knowledge Script creates and aggregate events by inventory object type.

58.2.3 Snapshot Persistence

This Knowledge Script stores its last snapshot persistently in the UNIX agent. If you restart the agent, the Knowledge Script will continue to work with the snapshot last saved by the agent and the snapshot it creates when it resumes.

You can use snapshot persistence to review cumulative inventory changes that occur when the Knowledge Script is not running. Start the Knowledge Script with a set of options, take a snapshot, and stop the job. When you restart the Knowledge Script at some later time, it compares its first snapshot with the snapshot persistent in the UNIX agent and reports the inventory differences between the time the job stopped and the time it started again.

58.2.4 Snapshot Error Recovery

If there is an error fetching the snapshot or any part of the snapshot, the Knowledge Script does not compare or raise events for objects affected by the error. Instead, it creates an event for the error it encountered and discards the portion of the snapshot with the error, replacing it with the last known valid information. When the Knowledge Script can successfully fetch the part of the snapshot that previously had an error, it compares the part of the current snapshot to the corresponding part from the last valid snapshot.

For example, if the Knowledge Script successfully collects VNIC information through iteration i and fails to collect VNIC information in iteration $i + 1$ because of an error, it replaces the VNIC information in snapshot $i + 1$ with the last valid information from snapshot i. Note that the entire snapshot is not replaced, only the part with the error is replaced. If the VNIC information becomes available at some later iteration $i + k$, the VNIC comparison will resume by comparing snapshot $i + k$ to snapshot $i + k - 1$, which contains the last valid VNIC information from snapshot i.

58.2.5 Resource Objects

SolarisZones_HostFolder

58.2.6 Default Schedule

By default, this script runs daily.

58.2.7 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event when the Inventory job fails to get metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Inventory job fails to get metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Inventory job fails. The default is 5.
Host Monitoring Settings	
Raise event if host system attribute is changed?	Select **Yes** to raise an event when a host system attribute is changed on the SolarisZones server. The default is unselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the host system attribute is changed on the SolarisZones server. The default is 5.
Zone Monitoring Settings	
Raise event if Zone state is changed?	Select **Yes** to raise an event if a Zone state is changed on the SolarisZones server. The default is Yes.
Raise event if Zone attribute is changed?	Select **Yes** to raise an event if a Zone attribute is changed on the SolarisZones server. The default is Yes.
Raise event if Zone CPU attribute is changed?	Select **Yes** to raise an event if a Zone CPU attribute is changed for the SolarisZones server. The default is Yes.
Raise event if Zone memory attribute is changed?	Select **Yes** to raise an event when a Zone memory attribute is changed for the SolarisZones server. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which one of the following changes occur on a Zone on the SolarisZone server: • A Zone state is changed • A Zone attribute is changed • A Zone CPU attribute is changed • A Zone memory is changed The default is 5.
Raise event if VNIC is added or removed?	Select **Yes** to raise an event when a VNIC is added to or removed from the SolarisZones server. The default is Yes.

Parameter	How to Set It
Raise event if Zone VNIC attribute is changed?	Select **Yes** to raise an event when a Zone VNIC attribute is changed for the SolarisZones. The default is Yes.
Event severity	Set the event severity, from 1 to 40, to indicate the importance of an event in which one of the following changes occur on the SolarisZones server: • A VNIC is added to or removed • A Zone VNIC attribute is changed The default is 5.
Aggregate events under host?	Select **Yes** to raise a single aggregate event for all the changes on a SolarisZones host. The default is unselected.
Aggregate events per Zone?	Select **Yes** to raise a single aggregate event for all the changes on a Zone. The default is unselected.
Raise event if ZFS pool is added or removed?	Select **Yes** to raise an event if a ZFS pool is added to or removed from the SolarisZones server. The default is Yes.
Raise event if ZFS pool attribute is changed?	Select **Yes** to raise an event if ZFS pool attribute is changed on the SolarisZones server. The default is Yes.
Aggregate ZFS events?	Select **Yes** to raise a single aggregate event for all the changes on a ZFS pools. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which one of the following ZFS pool changes occur on the Solaris Zones server: • A ZFS pool is added to or removed • A ZFS pool attribute is changed The default is 5.

58.3 VnicIO

Use this Knowledge Script to monitor the network statistics of VNICs configured with Zones. This Knowledge Script raises an event if the network statistics exceeds the threshold, if set. If you have not set the max bandwidth, AppManager raises an event specifying that the max bandwidth for the specific VNIC is not set.

NOTE: VNIC feature is available only on Solaris 11.0 and later. Therefore, this Knowledge Script is supported only on Solaris 11 and later. You cannot run this Knowledge Script on Solaris 10.0.

The runtime data for default VNIC is not present in Solaris 11.0. Therefore, this Knowledge Script does not generate event for the default VNIC.

58.3.1 Resource Object

SolarisZones_VNICObj

58.3.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

58.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if sent bytes exceeds threshold?	Select **Yes** to raise an event if the sent bytes of a VNIC exceeds the threshold you set. The default is Yes.
Threshold value (bytes/sec)	Specify the maximum bytes that a VNIC can send in a second before an event is raised. The default is 8000000 bytes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the VNIC send bytes per second exceeds the threshold you set. The default is 5.
Raise event if received bytes exceeds threshold?	Select **Yes** to raise an event if the received bytes of a VNIC exceeds the threshold you set. The default is Yes.
Threshold value (bytes/sec)	Specify the maximum bytes that a VNIC can receive in a second before an event is raised. The default is 8000000 bytes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the VNIC received bytes per second exceeds the threshold you set. The default is 5.
Raise event if network bandwidth utilization exceeds its max value (if set)?	Select **Yes** to raise an event if the network bandwidth of a VNIC exceeds the maximum value you set. The default is unselected. If you select this parameter and max bandwidth value is not set, AppManager raises an event specifying that the max bandwidth for that specific VNIC has not been set.

Parameter	How to Set It
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the network bandwidth utilization of a VNIC exceeds the maximum value you set. The default is 5.
Raise event if interrupt rate exceeds threshold?	Select **Yes** to raise an event if the interrupts per second of a VNIC exceeds the threshold you set. The default is unselected.
Threshold value (interrupts/sec)	Specify the maximum interrupt rates of a VNIC in a second before an event is raised. The default is 1000000.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the VNIC interrupt rates per second exceed the threshold you set. The default is 5.
Raise event if input packet drops exceed threshold?	Select **Yes** to raise an event if the input packet drops of a VNIC exceed the threshold you set. The default is unselected.
Threshold value (in percent)	Specify the maximum input packet drops (in percent) compared to input packets of a VNIC in a second before an event is raised. The default is 50 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the input packet drops of a VNIC exceed the threshold you set. The default is 5.
Raise event if output packet drops exceed threshold?	Select **Yes** to raise an event if the output packet drops of a VNIC exceed the threshold you set. The default is unselected.
Threshold value (in percent)	Specify the maximum output packet drops (in percent) compared to output packets of a VNIC in a second before an event is raised. The default is 50 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the output packet drops of a VNIC exceed the threshold you set. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the VnicIO job fails to get VNIC metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the VnicIO job fails to get VNIC metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the VnicIO job fails. The default is 5.
Data Collection	
Collect data for bytes sent per second?	Select **Yes** to collect data for the sent bytes per second of VNICs. The default is unselected.
Collect data for bytes received per second?	Select **Yes** to collect data for the received bytes per second of VNICs. The default is unselected.

58.4 ZFSHealth

Use this Knowledge Script to monitor ZFS pool health. If a pool is not online, AppManager raises an event.

58.4.1 Resource Object

SolarisZones_ZFSPoolObj

58.4.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

58.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if ZFS pool is not online?	Select **Yes** to raise an event if a ZFS pool is not online. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZFS pool is not online. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the ZFSHealth job fails to get the ZFS pool metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZFSHealth job fails to get the ZFS pool metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZFSHealth job fails. The default is 5.

58.5 ZoneCpuByProcess

Use this Knowledge Script to monitor the CPU utilization for specified processes in a Zone. If a process is not found, the Knowledge Script assumes that the process is not currently running. If the CPU utilization for any monitored process exceeds the threshold you set, AppManager raises an event.

NOTE: This Knowledge Script does not detect invalid process names or process IDs. If you enter an invalid process name or process ID, the Knowledge Script assumes that the process is not running.

58.5.1 Resource Object

SolarisZones_ZoneObjFolder

58.5.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

58.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Monitoring Options	
Comma-separated list of process names or regular expressions	Enter one or more process names or regular expressions, separated by commas and no spaces. The default is `init`. **NOTE:** You can either specify this parameter or *Comma-separated list of process IDs* parameter to monitor the processes in a Zone.
Comma-separated list of process IDs	Enter one or more process IDs, separated by commas and no spaces. The default is `1`.
Event Settings	
Raise event if CPU utilization compared to pset exceeds threshold?	Select **Yes** to raise an event if the CPU utilization by the specified Zone processes compared to the pset exceeds the threshold you set. The default is Yes.
Threshold value (in percent)	Specify the maximum percent of CPU compared to pset that can be utilized by the specified Zone processes during any interval before an event is raised. The default is 99 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU utilization by the specified Zone processes compared to pset exceeds the threshold you set. The default is 5.
Raise event if any process is not running?	Select **Yes** to raise an event if any of the specified processes in a Zone is not running. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which any process in a Zone is not running. The default is 5.

Parameter	How to Set It
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the ZoneCpuByProcess job fails to get CPU utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneCpuByProcess job fails to get CPU utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneCpuByProcess job fails. The default is 5.
Data Collection	
Collect data for CPU utilization compared to pset?	Select **Yes** to collect data for the CPU utilization of the specified Zone processes compared to pset as a percent value. The default is unselected.

58.6 ZoneCPUUtil

Use this Knowledge Script to monitor the CPU utilization of the zones. This script raises an event if CPU utilization exceeds the threshold you set and also raises an event if CPU utilization exceeds the configured CPU cap that you set for the zone. This script monitors and collects data for the amount of actively used CPU utilization of the zones in percentage.

58.6.1 Resource Object

SolarisZones_ZoneObjFolder

58.6.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

58.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if CPU utilization compared to pset exceeds threshold?	Select **Yes** to raise an event if CPU utilization of the Zones compared to the pset exceeds the threshold you set. The default is Yes.
Threshold value (in percent)	Specify the maximum percent of CPU that can be utilized by the Zones during any interval before an event is raised. The default is 99 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU utilization by the Zones compared to the pset exceeds the threshold you set. The default is 5.
Raise event if CPU utilization compared to host exceeds threshold?	Select **Yes** to raise an event if CPU utilization of the Zones compared to the host exceeds the threshold you set. The default is unselected.
Threshold value (in percent)	Specify the maximum percent of CPU that can be utilized by the Zones during any interval before an event is raised. The default is 99 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU utilization of the Zones compared to the host exceeds the threshold you set. The default is 5.
Raise event if CPU utilization exceeds Zone CPU cap value?	Select **Yes** to raise an event if CPU utilization of a Zone exceeds the CPU cap value set for the Zone. The default is unselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU utilization of a Zone exceeds the CPU cap value set for the Zone. The default is 5.
Raise event if CPU utilization of any process compared to pset exceeds threshold?	Select **Yes** to raise an event if CPU utilization of any process in a Zone compared to pset exceeds the threshold you set. The default is unselected.

Parameter	How to Set It
Threshold value (in percent)	Specify the maximum percent of memory compared to pset that can be utilized by any process in a Zone during any interval before an event is raised. The default is 99 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU utilization of a Zone process compared to the pset exceeds the threshold you set. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the ZoneCPUUtil job fails to get memory utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneCPUUtil job fails to get memory utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneCPUUtil job fails. The default is 5.
Data Collection	
Collect data for CPU utilization compared to pset?	Select **Yes** to collect data for the total CPU utilization compared to the pset. The default is unselected.
Collect data for CPU utilization compared to host?	Select **Yes** to collect data for the total CPU utilization compared to host. The default is unselected.

58.7 ZoneMemByProcess

Use this Knowledge Script to monitor memory usage for specified processes in a Zone. If a process is not found, the Knowledge Script assumes that the process is not currently running. If the memory usage for any monitored process exceeds the threshold you set, AppManager raises an event.

NOTE: This Knowledge Script does not detect invalid process names or process IDs. If you enter an invalid process name or process ID, the Knowledge Script assumes that the process is not running.

58.7.1 Resource Object

SolarisZones_ZoneObjFolder

58.7.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

58.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Monitoring Options	
Comma-separated list of process names or regular expressions	Enter one or more process names or regular expressions, separated by commas and no spaces. The default is `init`. **NOTE:** You can either specify this parameter or *Comma-separated list of process IDs* parameter to monitor the processes in a Zone.
Comma-separated list of process IDs	Enter one or more process IDs, separated by commas and no spaces. The default is `1`.
Event Settings	
Raise event if memory utilization compared to system memory exceeds threshold?	Select **Yes** to raise an event if memory utilization by the specified Zone processes compared to the system memory exceeds the threshold you set. The default is Yes.
Threshold value (in percent)	Specify the maximum percent of memory that can be utilized by the specified Zone processes during any interval before an event is raised. The default is 30 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the memory utilization by the specified Zone processes compared to the system resource exceeds the threshold you set. The default is 5.
Raise event if memory utilization exceeds threshold?	Select **Yes** to raise an event if memory utilization by the specified Zone processes exceeds the threshold you set. The default is unselected.
Threshold value (in MB)	Specify the maximum memory that can be utilized by the specified processes in a Zone during any interval before an event is raised. The default is 50 MB.

Parameter	How to Set It
Event severity	Set the event severity, from 1 to 40, to indicate the importance of an event in which the memory utilization by the Zone processes exceeds the threshold you set. The default is 5.
Raise event if any process is not running?	Select **Yes** to raise an event if any of the specified processes in a Zone is not running. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which any process in a Zone is not running. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the ZoneMemByProcess job fails to get memory utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneMemByProcess job fails to get memory utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneMemByProcess job fails. The default is 5.
Data Collection	
Collect data for memory utilization compared to system memory in percent?	Select **Yes** to collect data for the memory utilization of the specified Zone processes compared to system memory as a percent value. The default is unselected.

58.8 ZoneMemoryUtil

Use this Knowledge Script to monitor the memory utilization of the Zones. This script raises an event if memory utilization exceeds the threshold you set and also raises an event when the Zone memory usage exceeds the configured memory cap set for the Zone. This script monitors and collects data for the amount of actively used Zone memory in MB and also in percentage of total system memory.

58.8.1 Resource Object

SolarisZones_ZoneObjFolder

58.8.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

58.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if memory utilization compared to system memory exceeds threshold?	Select **Yes** to raise an event if memory utilization of the Zones compared to the system memory exceeds the threshold you set. The default is Yes.
Threshold value (in percent)	Specify the maximum percent of memory that can be utilized by the Zones during any interval before an event is raised. The default is 80 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the memory utilization by the Zones compared to the system memory exceeds the threshold you set. The default is 5.
Raise event if memory utilization exceeds Zone memory cap value?	Select **Yes** to raise an event if memory utilization of a Zone exceeds the memory cap value set for the Zone. The default is unselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the memory utilization of a Zone exceeds the memory cap value set for the Zone. The default is 10.
Raise event if memory utilization exceeds threshold?	Select **Yes** to raise an event if memory utilization of the Zones exceeds the threshold you set. The default is unselected.
Threshold value (in MB)	Specify the maximum memory that can be utilized by the Zones during any interval before an event is raised. The default is 100 MB.
Event severity	Set the event severity, from 1 to 40, to indicate the importance of an event in which the memory utilization by the Zones exceeds the threshold you set. The default is 5.
Raise event if memory utilization of any process compared to system memory exceeds threshold?	Select **Yes** to raise an event if memory utilization of any process in a Zone compared to the system memory exceeds the threshold you set. The default is unselected.

Parameter	How to Set It
Threshold value (in percent)	Specify the maximum percent of memory compared to system memory that can be utilized by any process in a Zone during any interval before an event is raised. The default is 30 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the memory utilization of a Zone process compared to the system memory exceeds the threshold you set. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the ZoneMemoryUtil job fails to get memory utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneMemoryUtil job fails to get memory utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneMemoryUtil job fails. The default is 5.
Data Collection	
Collect data for memory utilization compared to system memory in percent?	Select **Yes** to collect data for the total memory utilization compared to the system memory as a percent value. The default is unselected.
Collect data for memory utilization in MB?	Select **Yes** to collect data for the total memory utilization as a megabyte (MB) value. The default is unselected.

59 Oracle-RT Knowledge Scripts

AppManager ResponseTime for Oracle provides a full set of Knowledge Scripts for monitoring AppManager response time.

Oracle-RT ADO Knowledge Scripts use Microsoft ActiveX Data Objects (ADO) that are built on the top of Microsoft OLE Database (OLEDB). If you are using ADO or OLEDB in production, you may find it inappropriate to use ODBC to evaluate client/server database performance.

These Knowledge Scripts support both ODBC and ADO. You can set ADO parameters to match those in the applications you are testing. You should be able to configure an ADO script in the same way you configure an `ADODB::Connection` on an in-house application.

ADO and ODBC scripts support Oracle statements. Be aware that some risk exists when running continuous `INSERT` and `DELETE` statements on a short schedule. By default, the transactions are in autocommit mode, meaning that any changes defined in the SQL statement will be automatically committed.

AppManager ResponseTime for Oracle supports executing stored procedures. Use one of the following formats in the SQL Statement field:

- Oracle native syntax: `BEGIN procedure_name; END;`
- ODBC syntax: `{CALL procedure_name}`

The ADO Knowledge Scripts let you select the driver provider (Microsoft or Oracle). Use the appropriate script and driver for the application you are testing.

You have the option to run these Knowledge Scripts as "Interactive User," which requires a user to be physically logged into the computer for the test to run. You might want to do this in environments where a firewall is preventing access to an Active Directory domain controller, or where the test computer is part of a workgroup and not part of a domain. With this feature, the user is not validated, so the test can proceed despite the lack of access to the domain. To run as interactive user, type `Interactive User` for the **Run As Username** parameter, and leave the **Password** and **Domain** parameters blank.

From within the Oracle-RT view of the Operator Console, you can select a Knowledge Script or report in the **Oracle-RT** tab of the Knowledge Script pane.

Collecting Data

If you choose to collect data, each Knowledge Script generates the following data streams:

- **Availability**

  This data stream returns one of two values (depending on the data stream format you selected):

- 1 or 100 = transaction was successful
- 0 = transaction was not successful

The Availability data point is an indication of whether the test succeeded or failed. If, for example, a connection to the AppManager Server was established but the test transaction failed to complete, the Availability data point will be 0 (not available, or not successful).

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, you can also collect up to 3 response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed.

Select a report by clicking the **Report** tab in the List pane, then the **Oracle-RT** tab in the Knowledge Script pane.

Following are the Knowledge Scripts in the Oracle-RT category:

Knowledge Script	What It Does
ADOQuery	Queries an Oracle Database server using ADO.
AdvancedADOQuery	Queries an Oracle Database server using ADO and advanced connection parameters.
ODBCQuery	Queries an Oracle Database server using ODBC.
Report_Oracle-RT	Reports availability and response time information gathered by several Oracle-RT Knowledge Scripts.

NOTE: You must be able to configure a Network Service or SID in order to use the Oracle-RT Knowledge Scripts.

59.1 ADOQuery

Use this Knowledge Script to query an AppManager server using ADO.

NOTE: To use this Knowledge Script, you must first discover the AppManager ResponseTime for Oracle clients.

59.1.1 Collecting Data

If you choose to collect data, this Knowledge Script generates the following data streams:

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to 3 response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 3573 for more information.
- **Availability**–Returns one of two values:
  - 1 or 100 = transaction was successful
  - 0 = transaction was not successful.

  The Availability data point is an indication of whether the transaction succeeded or failed.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console. See the description of the **Event on** parameter.

An event is raised whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The Oracle-RT engine can't be initialized. An initialization error is generated, but an Availability or Response Time data stream is *not* generated.
- The job transaction doesn't complete successfully. A transaction error is generated. Only an Availability data stream is generated, with a value of 0.

59.1.2 Resource Object

The Oracle-RT ADO client

59.1.3 Default Schedule

The default interval for this Knowledge Script is **Every 15 minutes**.

59.1.4 Setting Parameter Values

Be sure to set the **Integrated Security?** parameter correctly according to the security model you want to use:

- **For Oracle authentication**: Clear the **Yes** check box for the "Integrated security" parameter, then specify the Oracle Logon Username and Password parameters. Also, specify for the series of **Run As** Knowledge Script parameters a valid domain account under which to run the script.
- **Windows NT authentication** (for Oracle servers on Windows only): Select the **Yes** check box for the "Integrated security" parameter, and leave the Oracle Username and Password fields blank. The user defined in the **Run As** Knowledge Script parameters must be created as an external user at the AppManager server.

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select the **Yes** check box to collect data for graphs and reports. If enabled, returns: • 1 or 100 – Transaction completed successfully • 0 – Transaction did not complete successfully By default, data is collected.
Data stream format	Select the data stream format for the Availability data stream. Previous versions of AppManager ResponseTime for Oracle used a 0 ("not available") or 1 ("available") format to indicate availability. You now have the option to use a 0 ("not available") or 100 ("available") format. The default value is 0-100.
Raise event if transaction fails?	Select the **Yes** check box to raise an event when the server cannot be contacted. By default, events are enabled.
Event severity when transaction fails	Set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 5. If you disable availability failure events, this value is ignored.
Response Time	
Collect data for response time?	Select the **Yes** check box to collect data for graphs and reports. If enabled, the system returns the time taken to complete the ADO query. By default, data is collected. If you enable data collection, you also have the option to see a breakdown in the response times for the component parts of the query, such as the time taken to connect to the Oracle server. See the **Response Time Breakdown** parameters, below.
Threshold – Maximum response time (seconds)	Specify the maximum time, in seconds, that it can take to complete the ADO query before an event is raised. The default is 15 seconds.
Raise event when threshold is exceeded?	Select the **Yes** check box to raise an event when the response-time threshold is exceeded. By default, events are enabled.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable response time events, this value is ignored.
Response Time Breakdown	

Description	How to Set It
Collect data for connecting to Oracle server?	Select the **Yes** check box to collect response time data showing how much of the overall response time could be attributed to the time taken to establish a connection to the Oracle server. By default, breakdown data is not collected.
Collect data for executing SQL statement?	Select the **Yes** check box to collect response time data showing how much of the overall response time could be attributed to the time taken to execute the SQL statement. By default, breakdown data is not collected.
Collect data for fetching data?	Select the **Yes** check box to collect response time data showing how much of the overall response time could be attributed to the time taken to perform a `fetch` of the query data. By default, breakdown data is not collected.
Target computer	Enter the identifier to use to enable retrieval of data streams by AppManager Analysis Center v2.0 or later. The name of the Oracle server will be used in the data stream legend, if specified. If you're setting the **Event on** parameter (see below), the **Target computer** parameter lets you select the server where the event will appear in your console. Enter the name of the server, or click the browse button ([**...**]) to select from a list of available servers. The server you select must already be in the TreeView.
Network Service Name	Enter the Network Service Name or SID configured on the client.
Provider	Select the OLEDB Provider to use for the ADO connection. The following drivers are supported: Microsoft=Microsoft OLEDB Provider for Oracle (installed with MDAC). This is the default. Oracle=Oracle Provider for OLEDB (provided by Oracle).
Cursor location	Enter the location of the cursor service: • `CLIENT`: Uses client-side cursors supplied by a local cursor library. (Local services may allow many features not allowed by driver-supplied cursors; using this setting may provide some advantage in enabling features.) • `SERVER`: Uses data provider- or driver-supplied cursors. (These cursors may be flexible and allow for additional sensitivity to changes made to the data source by others.) This is the default.
SQL statement	Enter a SQL statement (1024-character maximum) that is compatible with the provider.

Description	How to Set It
Number of rows per fetch	Enter any positive integer or -1. Use an appropriate value according to the size of the result and of a single row. Default value is 1. If the SQL statement is a select, the engine uses the `GetRows()` method to retrieve the data, so you can fetch thousands of records at once. This could mean a huge performance improvement in production. A value of -1 attempts to retrieve all rows on a single fetch. Although this may show interesting results on a small database, it can easily become catastrophic if the result is large and the client computer has limited memory. You should change this value only if the `GetRows()` method is used in production with a value different than 1.
Integrated security?	Select the **Yes** check box to specify whether the authentication should be done on the Windows NT integrated security model. By default, authentication is not performed. **NOTE:** : This parameter is only supported with Oracle Database running on Windows.
Event on	Select the TreeView location where events should be displayed. Select either: • **Agent** (the client computer in the response-time tests). This is the default. • **Server** (the AppManager server being tested–see the **Target computer** parameter, above) • **Both**. The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
Oracle Logon	
Username	Set this value when you do *not* use integrated security. (This is the User ID part of the Connection Properties collection.)
Password	Set this value when you do *not* use integrated security. (This is the Password part of the Connection Properties collection.) Hard encryption is always used.
Run As	
Username	Enter the user ID associated with a specific user who has the required permissions to run this application. This value is also used for Integrated Security. Interactive User is also a possible value. Leave the **Password** and **Domain** parameters blank if you specify “Interactive User”.
Password	Enter the password associated with this user that is required to log on to the network and run the application.
Domain	Enter the domain associated with this user that is the domain name you are logging onto.
Administrators group on managed client	Enter the name of the Administrators Group on the managed client. Typically, this name is “`Administrators`”, except on some foreign-language operating systems. The default is “`Administrators`”.
Timeouts	

Description	How to Set It
Command timeout	Enter the number of seconds to wait while executing a command before terminating the attempt and generating an error. Default is 30 seconds.
Connection timeout	Enter the number of seconds to wait while establishing a connection before terminating the attempt and generating an error. Default is 15 seconds.

59.2 AdvancedADOQuery

Use this Knowledge Script to check the ability to query an AppManager server query using ADO and advanced connection parameters.

NOTE: To use this Knowledge Script, you must first discover the AppManager ResponseTime for Oracle clients.

59.2.1 Collecting Data

If you choose to collect data, this Knowledge Script generates the following data streams:

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to 3 response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 3573 below for more information.
- **Availability**–Returns one of two values:
  - 1 or 100 = transaction was successful
  - 0 = transaction was not successful.

  The Availability data point is an indication of whether the transaction succeeded or failed.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console. See the description of the **Event on** parameter, below.

An event is raised whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The Oracle-RT engine can't be initialized. An initialization error is generated, but an Availability or Response Time data stream is *not* generated.
- The job transaction doesn't complete successfully. A transaction error is generated. Only an Availability data stream is generated, with a value of 0.

59.2.2 Resource Object

The Oracle-RT ADO client

59.2.3 Default Schedule

The default interval for this script is **Every 15 minutes**.

59.2.4 Setting Parameter Values

Be sure to set the **Integrated Security?** parameter correctly, according to the security model you want to use:

- **For Oracle authentication**: Clear the **Yes** check box for the "Integrated security" parameter, then specify the Oracle Username and Password. Also, specify valid account information for the **Run As** Knowledge Script parameters. The Knowledge Script must have a valid domain account to run.
- **For Windows NT authentication** (for AppManager servers on Windows only): Select the **Yes** check box for the "Integrated security" parameter, and leave the Oracle Username and Password fields blank. The user defined in the **Run As** parameters must be created as an external user at the AppManager server.

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select the **Yes** check box to collect data for graphs and reports. If enabled, returns: • 1 or 100 – Transaction completed successfully • 0 – Transaction did not complete successfully By default, data is collected.
Data stream format	Select the data stream format for the Availability data stream. Previous versions of AppManager ResponseTime for Oracle used a 0 ("not available") or 1 ("available") format to indicate availability. You now have the option to use a 0 ("not available") or 100 ("available") format. The default value is 0-100.
Raise event if transaction fails?	Select the **Yes** check box to raise an event when the server cannot be contacted. By default, an event is raised.
Event severity when transaction fails	Set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 5. If you disable availability failure events, this value is ignored.
Response Time	
Collect data for response time?	Select the **Yes** check box to collect data for graphs and reports. If enabled, returns the time taken to complete the ADO query. By default, data is collected. If you enable data collection, you also have the option to see a breakdown in the response times for the component parts of the query, such as the time taken to connect to the Oracle server. See the **Response Time Breakdown** parameters, below.
Threshold – Maximum response time (seconds)	Specify the maximum time, in seconds, that it can take to complete the ADO query before an event is raised. The default is 15 seconds.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the response-time threshold is exceeded. By default, events are raised.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15 (yellow event indicator).
Response Time Breakdown	

Description	How to Set It
Collect data for connecting to Oracle server?	Select the **Yes** check box to collect response-time data showing how much of the overall response time could be attributed to the time taken to establish a connection to the Oracle server. By default, breakdown data is not collected.
Collect data for executing SQL statement?	Select the **Yes** check box to collect response-time data showing how much of the overall response time could be attributed to the time taken to execute the SQL statement. By default, breakdown data is not collected.
Collect data for fetching data?	Select the **Yes** check box to collect response-time data showing how much of the overall response time could be attributed to the time taken to perform a `fetch` of the query data. By default, breakdown data is not collected.
Target computer	Enter the identifier to use to enable retrieval of data streams by AppManager Analysis Center v2.0 or later. The name of the Oracle server will be used in the data stream legend, if specified. If you're setting the **Event on** parameter (see below), the **Target computer** parameter lets you select the server where the event will appear in your console. Enter the name of the server, or click the browse button (**[...]**) to select from a list of available servers. The server you select must already be in the TreeView.
Network Service Name	Enter the Network Service Name or SID configured on the client.
Provider	Select the OLEDB Provider to use for the ADO connection. Microsoft=Microsoft OLEDB Provider for Oracle (installed with MDAC). This is the default. Oracle=Oracle Provider for OLEDB (provided by Oracle).
Attributes	Specify the `ADODB::Connection` attributes as follows: • `NONE` (the default). No attributes. • `ABORTRETAINING`: Performs retaining aborts; i.e., calls `RollbackTrans` and automatically starts a new transaction. Not supported by all providers. • `COMMITRETAINING`: Performs retaining commits; i.e., calls CommitTrans and automatically starts a new transaction. Not supported by all providers. • `ABORTCOMITRETAINING`: A combination of `ABORTRETAINING` and `COMMITRETAINING`.
Cursor location	Enter the location of the cursor service: • `CLIENT`: Uses client-side cursors supplied by a local cursor library. (Local services may allow many features not allowed by driver-supplied cursors; using this setting may provide some advantage in enabling features.) • `SERVER`: Uses data provider- or driver-supplied cursors. (These cursors may be flexible and allow for additional sensitivity to changes made to the data source by others.) This is the default.

Description	How to Set It
Isolation level	Specify the level of transaction isolation for a Connection object as follows: • `UNSPECIFIED`: Provider is using a different isolation level than specified, but that level can't be determined. • `CHAOS`: You cannot overwrite pending changes from more highly isolated transactions. • `BROWSE`: You can view uncommitted changes in other transactions from one transaction. • `READUNCOMMITTED`: Same as `BROWSE`. • `CURSORSTABILITY`: You can view changes in other transactions from one transaction only after they have been committed. • `READCOMMITTED`: Same as `BROWSE`. This is the default. • `REPEATABLEREAD`: You cannot see changes made in other transactions from one transaction; however, requerying can retrieve new `Recordset` objects. • `ISOLATED`: Transactions are conducted in isolation from other transactions. • `SERIALIZABLE`: Same as `ISOLATED`.
Mode	Set the available permissions for modifying data in a connection, as follows: • `UNKNOWN`: Permissions have either not yet been set or cannot be determined. This is the default. • `READ`: Read-only permissions. • `WRITE`: Write-only permissions. • `READWRITE`: Read/write permissions. • `RECURSIVE`: Not supported at this time. • `SHAREDENYNONE`: Allows others to open a connection with any permission. Neither read nor write access can be denied to others. • `SHAREDENYREAD`: Prevents others from opening a connection with read permissions. • `SHAREDENYWRITE`: Prevents others from opening a connection with write permissions. • `SHAREEXCLUSIVE`: Prevents others from opening a connection.
SQL statement	Enter a SQL statement (1024-character maximum) that is compatible with the provider.
Number of rows per fetch	Enter any positive integer or -1. Use an appropriate value according to the size of the result and of a single row. Default value is 1. If the SQL statement is a `select`, the engine uses the `GetRows()` method to retrieve the data, so you can fetch thousands or records at once. This could mean a huge performance improvement in production. A value of -1 attempts to retrieve all rows on a single fetch. Although this may show interesting results on a small database, it can easily become catastrophic if the result is large and the client machine has limited memory. You should change this value only if the `GetRows()` method is used in production with a value different than 1.
Integrated security?	Specify whether the authentication should be done on the Windows NT Integrated Security model.

Description	How to Set It
Event on	Select the TreeView location where events should be displayed. Select either: • **Agent** (the client computer in the response-time tests). This is the default. • **Server** (the AppManager server being tested–see the **Target computer** parameter, above) • **Both**. The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
Oracle Logon	
Username	Set this value when you do *not* use Integrated Security. (This is the User ID part of the Connection Properties collection.)
Password	Set this value when you do *not* use Integrated Security. (This is the Password part of the Connection Properties collection.) Hard encryption is always used.
Run As	
Username	Enter the user ID associated with a specific user who has the required permissions to run this application. Required. Interactive User is also a possible value. Leave the Password and Domain parameters blank if you specify “Interactive User”.
Password	Enter the password associated with this user that is required to log on to the network and run the application.
Domain	Enter the domain associated with this user that is the domain name you are logging onto. **Required**.
Administrators group on managed client	Enter the name of the Administrators Group on the managed client. Typically, this name is “`Administrators`”, except on some foreign language operating systems. Default is “`Administrators`”.
Timeouts	
Command timeout	Enter the number of seconds to wait while executing a command before terminating the attempt and generating an error. Default is 30 seconds.
Connection timeout	Enter the number of seconds to wait while establishing a connection before terminating the attempt and generating an error. Default is 15 seconds.

59.3 ODBCQuery

Use this Knowledge Script to query an AppManager server using Open Database Connectivity (ODBC) and measure the response time.

NOTE: To use this Knowledge Script, you must first discover the AppManager ResponseTime for Oracle clients.

59.3.1 Collecting Data

If you choose to collect data, this Knowledge Script generates the following data streams:

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to 3 response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 3573 below for more information.
- **Availability**–Returns one of two values:
  - 1 or 100 = transaction was successful
  - 0 = transaction was not successful.

  The Availability data point is an indication of whether the transaction succeeded or failed.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console. See the description of the **Event on** parameter, below.

An event is generated whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The Oracle-RT engine can't be initialized. An initialization error is generated, but an Availability or Response Time data stream is *not* generated.
- The job transaction doesn't complete successfully. A transaction error is generated. Only an Availability data stream is generated, with a value of 0.

59.3.2 Resource Object

The Oracle-RT ODBC client

59.3.3 Default Schedule

The default interval for this script is **Every 15 minutes**.

59.3.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select the **Yes** check box to collect data for graphs and reports. If enabled, returns: • 1 or 100 – Transaction completed successfully • 0 – Transaction did not complete successfully By default, data is collected.
Data stream format	Select the data stream format for the Availability data stream. Previous versions of AppManager ResponseTime for Oracle used a 0 (“not available”) or 1 (“available”) format to indicate availability. You now have the option to use a 0 (“not available”) or 100 (“available”) format. The default value is 0-100.
Raise event if transaction fails?	Select the **Yes** check box to raise an event when the server cannot be contacted. By default, an event is raised.
Event severity when transaction fails	Set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 5. If you disable availability failure events, this value is ignored.
Response Time	
Collect data for response time?	Select the **Yes** check box to collect data for graphs and reports. If enabled, returns the time taken to complete the ODBC query. By default, data is collected. If you enable data collection, you also have the option to see a breakdown in the response times for the component parts of the query, such as the time taken to connect to the Oracle server. See the **Response Time Breakdown** parameters, below.
Threshold – Maximum response time (seconds)	Specify the maximum time, in seconds, that it can take to complete the ODCBC query before an event is raised. The default is 15 seconds.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the response-time threshold is exceeded. By default, events are enabled.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15 (yellow event indicator).
Response Time Breakdown	
Collect data for connecting to Oracle server?	Select the **Yes** check box to collect response-time data showing how much of the overall response time could be attributed to the time taken to establish a connection to the Oracle server. By default, breakdown data is not collected.
Collect data for executing SQL statement?	Select the **Yes** check box to collect response-time data showing how much of the overall response time could be attributed to the time taken to execute the SQL statement. By default, breakdown data is not collected.
Collect data for fetching data?	Select the **Yes** check box to collect response-time data showing how much of the overall response time could be attributed to the time taken to perform a `fetch` of the query data. By default, breakdown data is not collected.

Description	How to Set It
Target computer	Enter the identifier to use to enable retrieval of data streams by AppManager Analysis Center v2.0 or later. The name of the Oracle server will be used in the data stream legend, if specified. If you're setting the **Event on** parameter (see below), the **Target computer** parameter lets you select the server where the event will appear in your console. Enter the name of the server, or click the browse button ([**...**]) to select from a list of available servers. The server you select must already be in the TreeView.
Network Service Name	Enter the Network Service Name or SID configured on the client.
SQL statement	Set this value appropriately based on your DSN settings.
Event on	Select the TreeView location where events should be displayed. Select either: • **Agent** (the client computer in the response-time tests). This is the default. • **Server** (the AppManager server being tested–see the **Target computer** parameter, above) • **Both**. The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
Oracle Logon	
Username	Set this value appropriately based on your DSN settings.
Password	Set this value appropriately based on your DSN settings.
Run As	
Username	Enter the user ID associated with a specific user who has the required permissions to run this application. **Required**. Interactive User is a possible value. Leave the Password and Domain parameters blank if you specify "Interactive User".
Password	Enter the password associated with this user that is required to log on to the network and run the application.
Domain	Enter the domain associated with this user that is the domain name you are logging onto.
Administrators group on managed client	Enter the name of the Administrators Group on the managed client. Typically, this name is "`Administrators`", except on some foreign-language operating systems. Default is "`Administrators`".
Connection timeout	Enter the number of seconds to wait while establishing a connection before terminating the attempt and generating an error. Default is 15 seconds.

59.4 Report_Oracle-RT

Use this Report Script to generate a report detailing availability and response time for the following Oracle-RT Knowledge Scripts:

- ADOQuery
- AdvancedADOQuery
- ODBCQuery

59.4.1 Resource Object

AppManager repository

59.4.2 Default Schedule

The default schedule is **Run once**.

59.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	Use the following parameters to select the data for your report.
KS for report	Select the Knowledge Script on which to report: 1. Click the **...** button to show the Filter KS List dialog box. 2. Select a filter to narrow the list of Knowledge Scripts and click **OK** to display the list of Knowledge Scripts that met the filter specifications. **NOTE:** If you click **Cancel** from the Filter dialog box, all the Knowledge Scripts are displayed. 3. Highlight a SQL-RT Knowledge Script from the **Knowledge Script Name** list and click **Finish**.
Oracle-RT client(s)	Select the AppManager ResponseTime for Oracle client(s). Click the **...** button to show the **Select view(s) and a filter** dialog box. From the View(s) list, select from one to twenty-five views. Your subsequent selections are limited to computers or server groups that are visible in the selected views. Select one of the Filters options: • **View:** Includes all computers in the views you selected. • **Computer:** Select from individual computers in the views you selected. • **Server Group:** Select from server groups in the views you selected. **NOTE:** Selecting a server group includes all computers in that group.
Oracle Network Service or “All”	Type the name of the Oracle Network Service, or type “`All`” to designate all computers as Oracle Network Services. The default is “`All`”.

Description	How to Set It
Select time range	In the Select Date/Time Range dialog box, set specific start and end report information dates (good for historical or ad hoc reports), or a sliding range (the default) that sets the time range of data to include in the report. This option is useful for reports running on a regular schedule and is the default.
Select peak weekday(s)	In the Select Peak Weekday(s) dialog box, press **Shift** to select a contiguous day range, or **Ctrl** to select non-contiguous days.
Aggregation by	Select the time unit by which to aggregate data. Default is Hour. This works in conjunction with the next field (Aggregation interval), which determines the number of units for one interval of data aggregation.
Aggregation interval	Select the interval units in which to aggregate data. Default is 1. For example, if you aggregate by the Hour and select 1 here, data is aggregated once every hour.
Report Settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter card?	Select the **Yes** check box to specify whether to display a table of parameter values used in the report.
Include Availability Detail table?	Select the **Yes** check box to specify whether to display the Availability detail table as part of the report. By default, table is included.
Availability data stream format	Specify the data stream format. Options are 0-100 or 0-1. The default format is 0-100.
Include Availability chart?	Select the **Yes** check box to display the Availability chart as part of the report. By default, chart is included.
Threshold on Availability chart	Enter an integer for the percent. Default is 0 (no threshold is displayed).
Include Response Time Detail table?	Select the **Yes** check box to specify whether to display the Response Time Detail table as part of the report. By default, the table is included.
Include Response Time chart?	Select the **Yes** check box to specify whether to display the Response Time chart as part of the report. By default, the chart is included.
Units for Response Time report	Select the response time unit of msec (the default) or sec.
Threshold on Response Time chart (selected units)	Enter the units > 0, or use the default of 0. (Zero suppresses the threshold indicator in the chart.)
Select chart style	Select the **...** button to display the Chart Settings dialog box where you can set the appearance of the chart. The same parameters are used in both the Availability and Response Time charts, if both are produced. The default is Ribbon.
Select output folder	Select the **...** button to display the Publishing Options dialog box. From this dialog, specify the report filename and the report folder. You can specify a specific folder or have the system generate the folder each time the report runs.
Add job ID to output folder name?	Select the **Yes** check box to add a job ID to the output folder name.
Index-Report Title	Select the **...** button to display the Report Properties dialog box. From this dialog, you can configure report title settings and custom fields.
Add timestamp to title?	Select the **Yes** check box to add a timestamp to the report title. By default, the timestamp is not included.
Event Notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.

Description	How to Set It
Generate event on success?	Select the **Yes** check box raise an event when a report is generated. By default, events are enabled.
Severity level for report success	Set the severity level for a successful report. Default is 35.
Severity level for report with no data	Set the severity level for a report with no data. Default is 25.
Severity level for report failure	Set the severity level for a report with no data. Default is 5.

60 Oracle UNIX Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring Oracle RDBMS.

NOTE: Each Knowledge Script is configured to run at a specific interval. While you can change that interval to suit your needs, we recommend that you not use intervals of less than five minutes. Running at shorter intervals may have a negative impact on system performance.

From the Knowledge Script view of the Control Center Console, you can access more information about any Knowledge Script by selecting it and pressing **F1**. Or in the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
ActiveTransactions	Monitors the number of active transactions that are ongoing as a percentage of the maximum number of transactions that can be executed concurrently (set as an initialization parameter).
AlertLog	Scans the Oracle RDBMS alert log for entries that match a search string that you specify.
BGProc	Monitors the total memory usage and the total number of physical read/write (I/O) operations per second for Oracle RDBMS background processes.
Block	Monitors block-level database activity (visits per transaction and changes per transaction).
BlockingSessions	Monitors the user sessions that are blocking other sessions and processes from accessing the Oracle RDBMS.
BufferBusyWaits	Monitors the number of buffer busy waits and the number of logical reads, and computes a ratio between the two numbers (expressed as a percentage).
Cache	Monitors the frequency with which requested data and resources are retrieved from the cache.
CallRate	Monitors the demand placed on a database instance from all sources.
CallsPerTransaction	Monitors the demand placed on a database instance by each transaction.
ClusterInstanceDown	Monitors Oracle instances in a cluster and notifies you when an instance fails or becomes inactive.
ConsistentChangeRatio	Monitors the extent to which applications exercise the read consistency mechanism to ensure database consistency.
ContinuedRowRatio	Monitors rows that span more than one database block.

Knowledge Script	What It Does
DatabaseConnect	Checks the connectivity to Oracle databases.
DatabaseDown	Monitors the status of the background processes of a database.
DataFileSpace	Monitors the size of the datafile of an Oracle RDBMS.
DataRatios	Monitors the Consistent Change Ratio, Continued Row Ratio, Row Source Ratio, and Sort Overflow Ratio.
DiskSpaceAvail	Monitors the amount of disk space available for the archive log file, the background process log file, and user log files of a database.
FreeListWaits	Monitors the number of freelist waits and the total number of data requests, and computes a ratio of the two numbers.
HealthCheck	Monitors Oracle instances in a cluster, the connectivity to Oracle databases, and the status of the background process of Oracle database.
Listener	Monitors Oracle listeners running on the host.
Memory	Monitors the Oracle background processes, buffer busy waits, cache, and freelist waits.
MostExecutedSQLStatements	Determines which SQL statements are being executed on a given Oracle Database most frequently.
OpenCursors	Monitors the percentage of cursors opened per session, as well as the total number of cursors open in the system.
Performance	Monitors the open cursors, CPU time for current user sessions, physical reads and writes (I/O) for current user sessions, the current number of user-held locks on an Oracle Database, and memory usage (User Global Area and Program Global Area) for current user sessions.
RedoLog	Monitors the number of times that a process tries to write an entry in the redo log buffer, the number of redo logs not archived, if archiving is turned on for a given Oracle Database, and the redo log space wait ratio.
RedoLogContention	Monitors the number of times that a process tries to write an entry in the redo log buffer.
RedoLogsNotArchived	Monitors the number of redo logs which are not being archived, if archiving is turned on for a given Oracle Database.
RedoLogSpaceWaitRatio	Monitors the redo log space wait ratio.
RollbackSegmentContention	Monitors rollback segment contention for a database.
RowSourceRatio	Monitors the row source ratio.
RunSql	Runs a SQL statement.
ScheduledJobs	Monitors the scheduled job status in the New Oracle Scheduler.
SegmentExtentAvail	Monitors the percentage of extents (extensions of free space) available to each segment in a tablespace.
SetMonitoringOptions	Sets the various monitoring options available for OracleUNIX jobs, especially in clustered environments.
SortOverflowRatio	Monitors the sort overflow ratio.
SysStat	Monitors statistics from `V_$SYSSTAT` table of an Oracle Database.
TablespaceAvail	Monitors the disk space used by tablespaces.

Knowledge Script	What It Does
TopCpuUsers	Monitors the CPU time for current user sessions
TopIOUsers	Monitors physical reads and writes (I/O) for current user sessions.
TopLockUsers	Monitors the current number of user-held locks on an Oracle RDBMS.
TopMemoryUsers	Monitors memory usage (User Global Area and Program Global Area) for current user sessions.
TopResourceConsumingSQL	Determines which SQL queries for Oracle Database are consuming the most resources per execution on their UNIX hosts.
Transaction	Monitors the number of active transactions, the demand placed on a database instance from all sources, the demand placed on a database instance by each transaction, and the transaction rate for an Oracle Database.
TransactionRate	Monitors the transaction rate for an Oracle RDBMS.
UpdateInstances	Updates the list of Oracle databases/instances on each UNIX host used to update authentication information in the AppManager Service Manager and for discovery of new databases.
User	Monitors the number of user calls per parse, the user rollback ratio for an Oracle RDBMS, the total number of user sessions accessing an Oracle RDBMS, and the user sessions that are blocking other sessions and processes from accessing the Oracle Database.
UserCallsPerParse	Monitors the number of user calls per parse.
UserRollbackRatio	Monitors the user rollback ratio for an Oracle RDBMS.
UserSessions	Monitors the total number of user sessions accessing an Oracle RDBMS.

Running All Knowledge Scripts

To run Knowledge Script using SYSDBA authentication, ensure that the user account used to run the UNIX agent is a member of the Oracle Database Administrator (OSDBA) group.

To run all of the Knowledge Scripts in the OracleUNIX category, your account must grant you SELECT permissions for all of the following tables:

List of Tables
DBA_DATA_FILES
DBA_FREE_SPACE
DBA_JOBS
DBA_SCHEDULER_JOBS
DBA_SEGMENTS
DBA_TABLESPACES
DBA_TEMP_FILES
DBA_USERS
GV_$INSTANCE (for Oracle RAC monitoring only)
V_$ARCHIVE_DEST
V_$BGPROCESS
V_$DATABASE
V_$DATAFILE
V_$INSTANCE
V_$LIBRARYCACHE
V_$LOCK
V_$LOG
V_$PARAMETER
V_$PROCESS
V_$ROWCACHE
V_$SESSION
V_$SESSTAT
V_$SGASTAT
V_$SORT_SEGMENT
V_$SQLAREA
V_$SQLAREA
V_$STATNAME
V_$SYSSTAT
V_$SYSTEM_EVENT
V_$TRANSACTION
V_$VERSION
V_$WAITSTAT

60.1 ActiveTransactions

Use this Knowledge Script to retrieve the number of active transactions that are ongoing, and the maximum number of transactions that can be executed concurrently (set as an initialization parameter). This script computes a ratio, expressed as a percentage, of the two numbers. When you enable data collection, the percentage is stored in the repository. You can set multiple thresholds for the maximum ratio, and the job raises an event when any of the thresholds exceeds the value you specified.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$PARAMETER
V_$TRANSACTION
V_$VERSION
```

60.1.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and collects the number of active transactions and the number of total transactions. The ratio of active transactions over total transactions is then computed.

60.1.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for the ratio of active transactions to maximum concurrent transactions?	Set to **y** to collect data for charts and reports. If data collection is enabled, returns the ratio of active transactions to maximum concurrent transactions as a percentage (%). By default, data is not collected.
Raise event if ratio exceeds threshold?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job raises events.
Threshold – ratio of active transactions to max concurrent transactions	Specify a threshold for the maximum ratio of active transactions to maximum concurrent transactions, expressed as a percentage. The default for this threshold is 95%.

Description	How to Set It
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 5 (red event indicator).
Raise event if ratio exceeds threshold?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – ratio of active transactions to max concurrent transactions	Specify a threshold for the maximum ratio of active transactions to maximum concurrent transactions, expressed as a percentage. The default for this threshold is 80%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 15 (yellow event indicator).
Raise event if ratio exceeds threshold?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – ratio of active transactions to max concurrent transactions	Specify a threshold for the maximum ratio of active transactions to maximum concurrent transactions, expressed as a percentage. The default for this threshold is 60%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 25 (blue event indicator).
Raise event if ratio exceeds threshold?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – ratio of active transactions to max concurrent transactions	Specify a threshold for the maximum ratio of active transactions to maximum concurrent transactions, expressed as a percentage. The default value is 40%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 35 (magenta event indicator).

60.2 AlertLog

Use this Knowledge Script to scan the Oracle RDBMS alert log for entries that match a specified search string. You can set a maximum threshold for the number of occurrences of the string found during any single scan of the alert log. If during any single scan of the alert log the number of matching entries exceeds the threshold, the job raises an event.

Each database maintains an alert log where it records database operations (such as creating or dropping a database) and error conditions (such as deadlocks). This script provides a general-purpose tool for scanning a database's alert log for specific entries.

The first interval of this script does not scan existing entries, and does not collect data. Instead, it sets a pointer to the end of the alert log so that only new entries are read. Each subsequent iteration of the script scans the alert log for entries created since the previous scan. Information in the Event Properties dialog box states the number of occurrences of the search string that were found. The lines containing matches found in the log are also included in the event details.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$PARAMETER
V_$VERSION
```

NOTE: When the Oracle alert log reaches its maximum size, Oracle renames the file for archiving purposes and creates a new alert log with the original filename. If this script attempts to open the alert log between the time the old file is renamed and the new file is created, the job raises an event because the script cannot find the file. The next iteration of the script (when the alert log is available) should function as expected.

This script attempts to open the alert log associated with the relevant Oracle instance. Oracle instance alert logs use the naming convention alert_<instance name>.

60.2.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.2.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for number of matching log entries?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the number of entries that matched the search string. By default, data is not collected.
String(s) to find in log (separate multiple strings with semicolons)	Enter all or part of the strings you want to find in the log. For this script, a string is any series of characters (including spaces, if doing an exact match search). You can specify multiple strings by separating each string with a semicolon (;). For example, if you specify `ORA-600;ORA-1578` the script searches for either of two strings: `ORA-600` or `ORA-1578`. The default values represent the most common Oracle RDBMS error codes: • `ORA-600` (internal error) • `ORA-1578` (block corruption) • `ORA-60` (deadlock error)
Optional file with string(s) to find in log (one search string per line)	Specify the full path to a file that contains strings to search for in the alert log (one search string per line). If a path is specified, the strings specified in the previous parameter (**String(s) to find in log**) are ignored. By default, no path is specified.
Search Options	
Execute a case-sensitive search?	Set to **y** to find only case-sensitive matches of the search string. By default, the search is not case-sensitive.
Find only entries that exactly match?	Set to **y** to find only entries that match the exact search string character-for-character and whole word-for whole word. For example, a search for "`ORA-60`" will not return a match for "`ORA-600`". By default, only exact matches are found.
Raise event if threshold exceeded?	Select the **Yes** check box to raise an event when the number of log entries found that match the search criteria exceeds the threshold you set. By default, events are enabled.
Threshold – Maximum number of entries found	Enter a threshold for the maximum number of log entries that can be found to match the search criteria during any single scan of the alert log. If the number of entries matches or exceeds the threshold, the job raises an event. The default value is 0 entries.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.3 BGProc

Use this Knowledge Script to monitor the total number of physical read/write (I/O) operations per second and/or the total memory usage for Oracle RDBMS background processes. If the total number of read/write operations per second or the total memory usage exceeds the threshold, the job raises an event.

Oracle RDBMS background processes include CKPT, DBW0, LGWR, PMON, RECO, SMON, SNP0, and others. You can monitor all or individual background processes.

The account you use to run this script must have SELECT permissions for the following tables:

```
V_$BGPROCESS
V_$PROCESS
V_$SESSION
V_$SESSTAT
V_$STATNAME
V_$VERSION
```

60.3.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.3.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

60.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target Oracle RDBMSs. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use SYSDBA authentication, leave this parameter blank. The default value is blank.
Collect data for memory usage and I/O of Oracle processes?	Set to **y** to collect data for charts and reports. If data collection is enabled, returns the number of read/write operations per second, and/or the total memory usage for all monitored background processes. By default, data is not collected.

Description	How to Set It
Oracle background processes to monitor	Enter the names of the background processes you want to monitor. Separate the names with commas; do not use spaces. To monitor all Oracle RDBMS background processes, enter an asterisk (*). Possible valid background process names include: • CKPT • DBW0 • LGWR • PMON • RECO • SMON • SNP0 • SNP1 The default value is (*) (all background processes).
Monitor read/write operations?	Select the **Yes** check box to monitor the number of physical read/write operations per second by background processes. By default, monitoring is performed.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the number of physical read/write operations per second exceeds the threshold you set. By default, events are not enabled.
Threshold – Maximum number of read/write operations	Enter a threshold for the maximum number of physical read/write operations per second. The default value is 5 read/write operations per second.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 15 (yellow event indicator).
Monitor memory usage?	Select the **Yes** check box to monitor the total memory usage by background processes. By default, monitoring is performed.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the memory utilization of the monitored processes exceeds the threshold you set. By default, events are not enabled.
Threshold – Maximum memory usage	Enter a threshold (in MB) for the maximum amount of memory used by all background processes you are monitoring. The default value is 15 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 15 (yellow event indicator).

60.4 Block

Use this Knowledge Script to monitor block-level database activity. Oracle RDBMS data blocks are the smallest unit of storage for a database. Monitoring I/O activity at the block level can be a key indicator of database performance.

Use this script to monitor any combination of the following statistics:

- The number of block changes per transaction. This **block change rate** measures the number of SQL Data Manipulation Language (DML) commands that each transaction performs (for example, to create and drop indexes). As the number of block changes increases, the efficiency of the database transaction and database performance decreases.
- The number of times the Oracle RDBMS buffer manager locates a database per second. This **block get rate** indicates the rate at which an application references the database. An increase in the block get rate suggests an increase in overall server load. A decrease in the block get rate without a decrease in load may indicate that you need to do some database tuning because there has been a slowdown in the number of database blocks requested and located per second.
- The number of times database blocks are requested per committed transaction. This **block visit rate** measures the database work load per completed transaction (including both successful and aborted database transactions).

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.4.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.4.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.

Description	How to Set It
Collect data for block activity?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the statistics you choose to collect: • The number of block changes per transaction • The number of block `get` operations per second • The number of block visits per transaction By default, data is not collected.
Monitor block change rate?	Select the **Yes** check box to monitor the block change rate, the number of block changes per transaction. By default, monitoring is performed.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the block change rate exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum block change rate	Enter a threshold for the maximum number of block changes per transaction before the job raises an event. The default value is 100 changes per transaction.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).
Monitor block get rate?	Select the **Yes** check box to monitor the block get rate, the number of times the Oracle RDBMS buffer manager locates a database block per second. By default, monitoring is performed.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the block get rate exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum block get rate	Enter a threshold for the maximum number of block get operations per second before the job raises an event. The default value is 100 get operations per second.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).
Monitor block visit rate?	Select the **Yes** check box to monitor the block visit rate, the number of times database blocks are requested per committed transaction. By default, monitoring is performed.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the block visit rate exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum block visit rate	Enter a threshold for the block visit rate, the maximum number of block get operations per committed transaction. The default value is 100 operations per committed transaction.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.5 BlockingSessions

Use this Knowledge Script to monitor the user sessions that are blocking other sessions and processes from accessing the Oracle Database. You can set a maximum threshold for the number of sessions that are allowed to block other sessions and processes. If the number of blocking sessions exceeds the threshold, the job raises an event.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$LOCK
V_$VERSION
```

60.5.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.5.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for number of blocking sessions?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the number of blocking sessions per interval. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the number of blocking sessions exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum number of blocking sessions	Enter a threshold for the maximum number of user sessions allowed to block other user sessions and processes during the monitoring interval. The default value is 10 sessions.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.6 BufferBusyWaits

Use this Knowledge Script to retrieve the number of buffer busy waits and the number of logical reads, and compute a ratio between the two numbers (expressed as a percentage). When you enable data collection, the repository stores the ratio. You can set multiple thresholds for the maximum ratio, and the job raises an event when any of the thresholds exceeds the value you specified. A higher ratio indicates an increased contention for buffers in the SGA memory of Oracle Database.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSTEM_EVENT
V_$SYSSTAT
V_$VERSION
```

60.6.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and collects the number of buffer busy waits and the number of logical reads. The ratio of buffer waits over logical reads is then computed.

60.6.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for ratio of buffer busy waits to logical reads?	Set to **y** to collect data for charts and reports. If data collection is enabled, returns the ratio of buffer busy waits to logical reads as a percentage (%). By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, events are enabled.
Threshold – Maximum ratio of buffer busy waits to logical reads	Specify a threshold for the maximum ratio of buffer busy waits to logical reads. The default for this threshold is.95.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 5 (red event indicator).

Description	How to Set It
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the ratio exceeds the threshold specified below. By default, the job does not raise events.
Threshold –- Maximum ratio of buffer busy waits to logical reads	Specify a threshold for the maximum ratio of buffer busy waits to logical reads. The default value is .80.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 15 (yellow event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold –- Maximum ratio of buffer busy waits to logical reads	Specify a threshold for the maximum ratio of buffer busy waits to logical reads. The default value is .60.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 25 (blue event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold –- Maximum ratio of buffer busy waits to logical reads	Specify a threshold for the maximum ratio of buffer busy waits to logical reads. The default value is .40.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 35 (magenta event indicator).

60.7 Cache

Use this Knowledge Script to monitor the frequency with which requested data and resources are retrieved from the cache. As this hit ratio (that is, the percentage of time that data or resources are retrieved from the cache) decreases, performance also decreases because data that must be retrieved from disk or library objects must be reinitialized in order to service the requests.

Use this script to monitor any combination of the following statistics:

- The *buffer cache hit ratio* indicates the percentage of time that requested data you can find in the buffer cache.
- The *data dictionary hit ratio* indicates the percentage of time that requested data you can find in the data dictionary.
- The *library cache hit ratio* indicates the percentage of time that the system requests to access objects in the library cache and you can service without re-initializing or reloading library objects. Changes to the library cache hit ratio may occur when an application becomes active, causing more SQL statements and stored procedures to be used.

You can set a threshold for each cache hit ratio you choose to monitor. If a cache hit ratio falls below a threshold you set, the job raises an event.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$LIBRARYCACHE
V_$ROWCACHE
V_$SYSSTAT
V_$VERSION
```

60.7.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.7.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.

Description	How to Set It
Collect data for monitored metrics?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the statistics you choose to collect: • The buffer cache hit ratio • The data dictionary hit ratio • The library cache hit ratio By default, data is not collected.
Monitor buffer cache hit ratio?	Select the **Yes** check box to monitor the percentage of time that requested data you can find in the buffer cache. By default, monitoring is performed.
Raise event if threshold is not met?	Select the **Yes** check box to raise an event if the buffer cache hit ratio exceeds the threshold you set. By default, the job raises an event.
Threshold – Minimum buffer cache hit ratio	Enter a minimum threshold for the buffer cache hit ratio. If the actual hit ratio falls below than this threshold, the job raises an event. Ideally, you should set this percentage relatively high because the more frequently Oracle RDBMS uses the buffer, the better your database performance. When the actual hit ratio falls below the threshold you set, the event alerts you that database performance has degraded. The default value is 70%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Monitor data dictionary hit ratio?	Select the **Yes** check box to monitor the percentage of time that requested data you can find in the data dictionary. By default, monitoring is performed.
Raise event if threshold is not met?	Select the **Yes** check box to raise an event if the data dictionary hit ratio falls below the threshold you set. By default, the job raises an event. .
Threshold – Minimum data dictionary hit ratio	Enter a minimum threshold for the data dictionary hit ratio. If the actual hit ratio falls below this threshold, the job raises an event. Ideally you should set this percentage high because the more frequently Oracle RDBMS uses the data dictionary to service requests, the better your database performance. When the actual hit ratio falls below the threshold you set, the event alerts you that database performance has deteriorated. The default value is 90%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Monitor library cache hit ratio?	Select the **Yes** check box to monitor the percentage of time that system pin requests to access objects in the library cache you can service without re-initializing or reloading library objects. By default, monitoring is performed.
Raise event if threshold is not met?	Select the **Yes** check box to raise an event if the library cache hit ratio falls below the threshold you set. By default, the job raises events.

Description	How to Set It
Threshold – Minimum library cache hit ratio	Enter a minimum threshold for the library cache hit ratio. If the actual hit ratio falls below this threshold, the job raises an event. Ideally, you should set this percentage extremely high because re-initializing or reloading library objects imposes a significant performance hit. When the actual hit ratio falls below the threshold you set, the event alerts you that database performance has degraded. The default value is 95%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).

60.8 CallRate

Use this Knowledge Script to monitor the demand placed on a database instance from all sources. This demand is determined by tracking the number of database calls per second from all applications and processes accessing the database `instance`. The database calls that are tracked include `Parse`, `Execute`, and `Fetch` statements. These calls are sometimes described as **user calls**. When the call rate (and thus the workload demand on the server) exceeds the threshold you set, the job raises an event.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.8.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.8.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for call rate?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the total user calls per second for all work sources. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the maximum number of calls per second exceeds the threshold. By default, the job raises events.
Threshold – Maximum call rate	Enter a threshold for the maximum number of calls per second allowed before the job raises an event. The default value is 100 calls per second.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.9 CallsPerTransaction

Use this Knowledge Script to monitor the demand placed on a database instance by each transaction. This demand is determined by tracking the number of database calls (for example, to parse, execute, and fetch data) per committed transaction. When the number of database requests per transaction exceeds the threshold, the job raises an event.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.9.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.9.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for number of calls per transaction?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the number of database calls per transaction. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the number of calls per transaction exceeds the threshold. By default, the job raises events.
Threshold – Maximum number of calls per transaction	Enter a threshold for the maximum number of database calls per transaction allowed before the job raises an event. The default value is 100 calls per transaction.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.10 ClusterInstanceDown

Use this Knowledge Script to be notified when an Oracle instance in a cluster fails or becomes inactive.

Run this Knowledge Script for Oracle RAC monitoring only. This Knowledge Script uses the `srvctl` command functionality to fetch the statuses of all the cluster instances.

The account you use to run this script must have `SELECT` permissions for the following tables:

`V_$VERSION`
`GV_$INSTANCE` (for Oracle RAC monitoring only)

60.10.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and determines if the instance running on that host is active or inactive.

60.10.2 Default Schedule

The default schedule for this script is **Every 10 minutes**.

60.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	For RAC cluster monitoring, enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** This parameter must not be blank if you are deploying RAC cluster monitoring. If you are deploying non-RAC cluster monitoring, this parameter is ignored. The default value is blank.
Collect data for instance status?	Set to **y** to collect data for charts and reports. If you enable data collection, the script returns the status of each instance: • 100–instance is running • 0–instance is down By default, data is not collected.
RAC Instance Exclude Filter	Select the **Yes** check box to to exclude RAC instances.
RAC Instance to be excluded for status check [comma separated]	Enter the names of the RAC instances you want to exclude.
Raise event if instance is down or if unable to check status?	Select the **Yes** check box to raise an event when the instance is down. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event detecting that an instance is down. The default severity level is 10 (red event indicator).

60.11 ConsistentChangeRatio

Use this Knowledge Script to monitor the extent to which applications exercise the read consistency mechanism to ensure database consistency.

The consistent change ratio is based on the number of database changes and database reads. "Consistent changes" refers to the number of times a consistent `Get` had to retrieve an old version of a database block because of updates that occurred after the cursor had been opened. When the ratio of consistent changes to consistent `Gets` exceeds the threshold, the job raises an event. The ratio is recalculated each time the script runs, based on the data collected during that monitoring interval.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.11.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.11.2 Default Schedule

The default interval for this script is **Every 1 hour**.

60.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data **for consistent change ratio**?	Set to **y** to collect data for charts and reports. When you enable data collection, the script returns the ratio of consistent changes to consistent gets. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the consistent change ratio exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum consistent change ratio	Enter a threshold for the maximum ratio of consistent block changes to consistent block gets during the monitoring interval. The default ratio is 0.01 consistent changes/consistent gets.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.12 ContinuedRowRatio

Use this Knowledge Script to monitor rows that span more than one database block. This script monitors the ratio of continued rows fetched to all rows fetched.

In most cases, this ratio should be close to zero. If the continued row ratio increases over time (indicating that more and more rows span multiple database blocks), it may mean that the `PCTFREE` storage parameter is set too low for one or more tables. If the continued row ratio exceeds the threshold, the job raises an event. The ratio is recalculated each time the script runs, based on the data collected during that interval.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.12.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.12.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

60.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for continued row ratio?	Set to **y** to collect data for charts and reports. When you enable data collection, the script returns the continued row ratio. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the continued row ratio exceeds the threshold. By default, the job raises events.
Threshold – Maximum continued row ratio (0.0 to 1.0)	Enter a threshold for the maximum ratio of continued rows fetched to all rows fetched. Enter values from 0.0 to 1.0, inclusive. The default ratio is 0.01.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.13 DatabaseConnect

Use this Knowledge Script to monitor the connectivity and login capability of Oracle databases on UNIX and Linux systems. This script attempts to connect to the database you select. If the connection attempt is successful, this script reports the status of the database and of its login capability. If the connection attempt is unsuccessful, an event is raised.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$INSTANCE
V_$VERSION
```

60.13.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.13.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for connection and login status?	Set to **y** to collect data for charts and reports. If you enable data collection, the script returns the status of the database and of its login capability. By default, data is not collected.
Raise event if unable to connect?	Select the **Yes** check box to raise an event if an attempt to connect to the Oracle database is unsuccessful. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).
Raise event with database and login status?	Select the **Yes** check box to raise an event providing information on the database and login status. By default, the job does not raise events.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 35 (magenta event indicator).

60.14 DatabaseDown

Use this Knowledge Script to monitor the status of a database. This script checks whether the Oracle RDBMS background processes are running and whether a local connection can be made.

Each Oracle instance has a default set of background processes that must be running. An event is raised if any of the processes that you specified for monitoring in the **Background processes to monitor** parameter are down, or if a connection cannot be made to the database instance.

The account you use to run this script must have `SELECT` permissions for the following table:

`V_$VERSION`

60.14.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.14.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for process and connection status?	Set to **y** to collect data for charts and reports. When you enable data collection, the script returns the following values: • 100–all specified processes are running and a connection attempt was successful • 80–one or more processes was down but a connection attempt was successful • 0–no processes were running and/or a connection attempt failed This provides a way to report on the percentage of system uptime in any given period. By default, data is not collected.
Background processes to monitor (comma-separated, no spaces)	Enter the names of Oracle RDBMS background processes you want to monitor, separated by commas and no spaces. The default value is: `LGWR,PMON,SMON,RECO,DBWO,DBWR.`

Description	How to Set It
Create blackout file for a database if it appears to be down?	Select the **Yes** check box if the script should create a file in the blackout directory so that no further jobs are run on this database. The SetMonitoringOptions script must be run to set the blackout directory before this file can be created. By default, the file is not created.
Raise event if a process is down or unable to connect?	Select the **Yes** check box to raise an event if an Oracle database or background process is detected down. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 15 (yellow event indicator).

60.15 DataFileSpace

Use this Knowledge Script to monitor the size of an Oracle RDBMS datafile. When the size of the datafile (in MB) exceeds the threshold, the job raises an event.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$VERSION
V_$DATAFILE
```

60.15.1 Resource Objects

Individual Oracle RDBMS UNIX Datafiles. When dropped on a single datafile, the script monitors only that datafile.

60.15.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.15.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for datafile size?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the current size of the datafile (in MB). By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if a datafile exceeds the size threshold you set. By default, the job raises events.
Threshold – Maximum datafile size	Enter a threshold for the maximum size a datafile can reach (in MB) before AppManager raises an event. The default value is 20 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).

60.16 DataRatios

Use this Knowledge Script to monitor the following data ratios:

- **Consistent Change Ratio**: the extent to which applications exercise the read consistency mechanism to ensure database consistency.

  The consistent change ratio is based on the number of database changes and database reads. "Consistent changes" refers to the number of times a consistent `Get` had to retrieve an old version of a database block because of updates occurring after the cursor had been opened. When the ratio of consistent changes to consistent `Gets` exceeds the threshold, the job raises an event. The ratio is recalculated each time the script runs, based on the data collected during that monitoring interval.

- **Continued Row Ratio**: the rows that span more than one database block and the ratio of continued rows fetched to all rows fetched.

  In most cases, this ratio should be close to zero. If the continued row ratio increases over time (indicating that more and more rows span multiple database blocks), it may mean that the `PCTFREE` storage parameter is set too low for one or more tables. If the continued row ratio exceeds the threshold, the job raises an event. The ratio is recalculated each time the script runs, based on the data collected during that interval.

- **Row Source Ratio**: the row source ratio for an Oracle RDBMS database. This ratio measures the percentage of rows retrieved using full table scans. Because a full table scan is less efficient than retrieval by row ID, this ratio gives you an indication of potential database performance problems. If you see an increase in this ratio, you may want to review other statistics to find the source of the problem. When this ratio exceeds the threshold, the job raises an event.

- **Sort Overflow Ratio**: the sort overflow ratio. This ratio compares the number of sorts that are using temporary segments to the total number of sorts. If the sort overflow ratio exceeds the threshold you set, the job raises an event.

  An increase in the sort overflow ratio indicates that more sort operations are allocating work space on disk. If an excessive number of sorts are allocating work space on disk, you may want to increase the sort area size.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.16.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.16.2 Default Schedule

The default interval for this script is **Every 1Hour**.

60.16.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Ratios	
Consistent Change Ratio	Select the **Yes** check box to monitor Consistent Change Ratio.
Continued Row Ratio	Select the **Yes** check box to monitor Continued Row Ratio.
Row Source Ratio	Select the **Yes** check box to monitor Row Source Ratio.
Sort Overflow Ratio	Select the **Yes** check box to monitor Sort Overflow Ratio.
Event Notification	
Raise event if threshold is exceeded for Consistent Change Ratio?	Select the **Yes** check box to raise an event if the consistent change ratio exceeds the threshold you set. By default, the job raises events.
Raise event if threshold is exceeded for Continued Row Ratio?	Select the **Yes** check box to raise an event if the continued row ratio exceeds the threshold you set. By default, the job raises events.
Raise event if threshold is exceeded for Row Source Ratio?	Select the **Yes** check box to raise an event if the percentage of rows retrieved using a full table scan exceeds the threshold you set. By default, the job raises events.
Raise event if threshold is exceeded for Sort Overflow Ratio?	Select the **Yes** check box to raise an event if the sort overflow ratio exceeds the threshold you set. By default, the job raises events.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Data Collection	
Collect data for Consistent Change Ratio?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the script returns the ratio of consistent changes to consistent gets. By default, data is not collected.
Collect data for Continued Row Ratio?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the script returns the continued row ratio. By default, data is not collected.
Collect data for Row Source Ratio?	Select the **Yes** check box to collect data for graphs and reports. When you enable data collection, the script returns the percentage of rows retrieved using a full tables scan. By default, data is not collected.

Description	How to Set It
Collect data for Sort Overflow Ratio?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the script returns the ratio of the number of sorts using temporary segments versus the number that of sorts that are not using temporary segments. For example, a ratio of .75 indicates that 3 out of 4 sorts are using temporary segments. By default, data is not collected.
Monitoring	
Threshold – Maximum consistent change ratio	Enter a threshold for the maximum ratio of consistent block changes to consistent block gets during the monitoring interval. The default ratio is 0.01 consistent changes/consistent gets.
Threshold – Maximum continued row ratio [0.0 to 1.0]	Enter a threshold for the maximum ratio of continued rows fetched to all rows fetched. Enter values from 0.0 to 1.0, inclusive. The default ratio is 0.01..
Threshold – Maximum row source ratio	Enter a maximum threshold for the row source ratio. The default ratio is .25.
Threshold – Maximum sort overflow ratio?	Enter a threshold for the maximum sort overflow ratio allowed before the job raises an event. The default ratio is .75.

60.17 DiskSpaceAvail

Use this Knowledge Script to monitor the amount of disk space available for the archive log file, the background process log file, and user log files for a database. You can monitor the space available for all three, or for any combination of the three. For example, you could turn off monitoring for the archive log and background process log files and monitor just the disk space available for the user logs.

You can set a minimum threshold for each type of log file. If the amount of available disk space falls below any threshold, the job raises an event.

This Knowledge Script supports Automatic Storage Management (ASM).

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$ARCHIVE_DEST
V_$PARAMETER
V_$VERSION
```

60.17.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.17.2 Default Schedule

The default interval for this script is **Every hour**.

60.17.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for available disk space?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the amount of free disk space for each type of log file that you are monitoring. By default, data is not collected.
Monitor space available for the archive log?	Select the **Yes** check box to monitor the amount of disk space available for thearchive log file of the database. By default, monitoring is performed.
Raise event if threshold is not met?	Select the **Yes** check box to raise an event if space available for the archive log falls below the minimum threshold. By default, the job raises events.

Description	How to Set It
Threshold – Minimum archive log space	Enter a threshold for the minimum available disk space for the archive log file. If the available space falls below this threshold, the job raises an event. The default value is 100 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Monitor space available for background process log?	Select the **Yes** check box to monitor the amount of space available for the background process log file of the database. By default, monitoring is performed.
Raise event if threshold is not met?	Select the **Yes** check box to raise an event if space available for the background process log file falls below the threshold. By default, the job raises events.
Threshold – Minimum background process log space	Enter a threshold for the minimum available disk space for the background process log file. If the amount of available space falls below this threshold, the job raises an event. The default value is 100 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Monitor space available for user logs?	Select the **Yes** check box to monitor the amount of space available for the user log files of the database. By default, monitoring is performed.
Raise event if threshold is not met?	Select the **Yes** check box to raise an event if space available for the user log file falls below the threshold. By default, the job raises events.
Threshold – Minimum user log space	Enter a threshold for the minimum available disk space for user log files. If the amount of available space falls below this threshold, the job raises an event. The default value is 100 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).

60.18 FreeListWaits

Use this Knowledge Script to retrieve the number of freelist waits and the total number of data requests, and to compute a ratio of the two numbers. You can set multiple thresholds for the ratio of freelist waits to data requests, and the job raises events when any one of the thresholds exceeds the value you specified.

The account you use to run this script must have SELECT permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
V_$WAITSTAT
```

60.18.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and collects the number of freelist waits and the number of total data requests. The ratio of freelist waits to total data requests is then computed.

60.18.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.18.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use SYSDBA authentication, leave this parameter blank. The default value is blank.
Collect data for ratio of freelist waits to total data requests?	Set to **y** to collect data for charts and reports. If data collection is enabled, returns the ratio of freelist waits to total data requests. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, events are enabled.
Threshold –- Maximum ratio of freelist waits to data requests	Specify a threshold for the maximum ratio of freelist waits to total data requests. The default for this threshold is .95.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 5 (red event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.

Description	How to Set It
Threshold –- Maximum ratio of freelist waits to data requests	Specify a threshold for the maximum ratio of freelist waits to total data requests. The default for this threshold is .80.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 15 (yellow event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold –- Maximum ratio of freelist waits to data requests	Specify a threshold for the maximum ratio of freelist waits to total data requests. The default for this threshold is .60.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 25 (blue event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold –- Maximum ratio of freelist waits to data requests	Specify a threshold for the maximum ratio of freelist waits to total data requests. The default for this threshold is .40.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 35 (magenta event indicator).

60.19 HealthCheck

Use this Knowledge Script to monitor the following parameters:

- **Cluster Instance Down**: notify when an Oracle instance in a cluster fails or becomes inactive.

  Run this Knowledge Script for Oracle RAC monitoring only. This Knowledge Script uses the `srvctl` command functionality to fetch the statuses of all the cluster instances.

- **Database Connect**: the connectivity and login capability of Oracle databases on UNIX and Linux systems. This script attempts to connect to the database you select. If the connection attempt is successful, this script reports the status of the database and of its login capability. If the connection attempt is unsuccessful, an event is raised.

- **Database Down**: the status of a database. This script checks whether the Oracle RDBMS background processes are running and whether a local connection can be made.

  Each Oracle instance has a default set of background processes that must be running. An event is raised if any of the processes that you specified for monitoring in the **Background processes to monitor** parameter are down, or if a connection cannot be made to the database instance.

The account you use to run this script must have `SELECT` permissions for the following tables:

`V_$INSTANCE`
`V_$VERSION`
`GV_$INSTANCE` (for Oracle RAC monitoring only)

60.19.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.19.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.19.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. Note To use SYSDBA authentication, leave this parameter blank. The default value is blank.
Health Check	

Description	How to Set It
Cluster Instance Down	Select the **Yes** check box to monitor Cluster Instance Down.
Database Connect	Select the **Yes** check box to monitor Database Connect.
Database Down	Select the **Yes** check box to monitor Database Down.
Data Collection	
Collect data for instance status?	Set to **y** to collect data for charts and reports. If you enable data collection, the script returns the status of each instance: • 100–instance is running • 0–instance is down By default, data is not collected.
Collect data for connection and login status?	Set to **y** to collect data for charts and reports. If you enable data collection, the script returns the status of the database and of its login capability. By default, data is not collected.
Collect data for process and connection status?	Set to **y** to collect data for charts and reports. When you enable data collection, the script returns the following values: • 100–all specified processes are running and a connection attempt was successful • 80–one or more processes was down but a connection attempt was successful • 0–no processes were running and/or a connection attempt failed This parameter provides a way to report on the percentage of system uptime in any given period. By default, data is not collected.
Event Notification	
Raise event if instance is down or if unable to check status?	Select the **Yes** check box to raise an event when the instance is down. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event detecting that an instance is down. The default severity level is 10 (red event indicator).
Raise event if unable to connect?	Select the **Yes** check box to raise an event if an attempt to connect to the Oracle database is unsuccessful. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).
Raise event with database and login status?	Select the **Yes** check box to raise an event providing information on the database and login status. By default, the job does not raise events.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 35 (magenta event indicator).

Description	How to Set It
Raise event if a process is down or unable to connect?	Select the **Yes** check box to raise an event if an Oracle database or background process is detected down. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 15 (yellow event indicator).
Monitoring	
Background processes to monitor [comma-separated, no spaces]	Enter the names of Oracle RDBMS background processes you want to monitor, separated by commas and no spaces. The default value is: `LGWR,PMON,SMON,RECO,DBWO,DBWR.`
Create blackout file for a database if it appears to be down?	Select the **Yes** check box if the script should create a file in the blackout directory so that no further jobs are run on this database. The SetMonitoringOptions script must be run to set the blackout directory before this file can be created. By default, the file is not created.

60.20 Listener

Use this Knowledge Script to monitor Oracle listeners running on the host. This script can attempt to connect to each Oracle database using the service name. If the local connection attempt fails, or the service name connection attempt fails, or if an error occurs while running the job, an event is generated.

If you enable the **Restart listeners that are not running?** parameter, you have three options to specify the listeners that should be restarted. If the databases where you plan to drop the script share a single listener, you can specify the Oracle Home where the listener resides and, optionally, the name of the listener in the script itself. If the name is not specified, the job will start the default listener in that Oracle Home.

NOTE: If you choose to have this script restart an Oracle listener that is not running, the UNIX account running the NetIQ UNIX agent must have write permissions on the `$ORACLE_HOME/network/log` folder if listener logging is enabled.

If the databases where you plan to drop the script use multiple listeners, you should specify this information in either a file that is created to identify the listeners that each `$ORACLE_SID` uses or in the default `oratab` file. If a file is created for this purpose, the path should be specified in the script, and it should have the following format:

```
$ORACLE_SID:LISTENER HOME:[LISTENER NAME]
```

where `$ORACLE_SID` is the name of the database instance, `LISTENER HOME` is the `$ORACLE_HOME` of the listener that should be restarted for this instance when no listener that can be used to connect to that instance is running, and `LISTENER NAME` is the name of this listener. It is not required to specify the name of the listener, as the default listener in the Oracle Home of the listener specified can be started, but if any text is presented in this column, it will be interpreted as a listener name.

Example: A Linux host has two `$ORACLE_HOME` directories, one of version 8.1.7 and one of version 9.2.0. This environment requires that each database use a listener of its own version. Thus, the following file is created for restarting the listeners:

```
Orasid817:/oracle/product/8.1.7
Orasid920:/oracle/product/9.2.0:lsnr_new
```

In this case, the default listener in `$ORACLE_HOME/oracle/product/8.1.7` will be restarted when a listener is not running that knows about the `Orasid817` database. For the `Orasid920` database, the `lsnr_new` listener will be started from the version 9.2.0 Oracle Home.

If the path to a file containing listener information is not specified yet you have selected for listeners to be restarted, the script will use the default `oratab` file on the host to locate listener information. When this is the case, an entry in the `$ORACLE_SID` column labeled `LSNR` must exist, and the `$ORACLE_HOME` value for this identifier will be used to restart the default listener.

Example:

`/etc/oratab` file

```
#
# ORACLE_SID:$ORACLE_HOME:<N:Y>
#
Orasid817:/oracle/product/8.1.7:Y
LSNR:/oracle/product/9.2.0:N
```

In this example, the format of the `oratab` is maintained, and the third column does not specify a listener name. This is because when the `oratab` file is read for listener information, there will be no use of listener names. The default listener in the Oracle Home specified for the `LSNR` entry will always be restarted.

NOTE: This is an easy but restrictive way to specify the listener information. You should only use this option if you are running a single listener per host, yet are dropping a single job on multiple hosts where you can specify this type of information uniformly.

The account you use to run this script must have SELECT permissions for the following table:

V_$VERSION

60.20.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.20.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.20.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use SYSDBA authentication, leave this parameter blank. The default value is blank.
Collect data for success or failure of listener monitoring?	Set to **y** to collect data for charts and reports. If data collection is enabled, returns the current status of the listener process and the length of time it has been running. By default, data is not collected.
Monitor Oracle background processes?	Select the **Yes** check box to monitor Oracle background processes. By default, monitoring is enabled.
Background processes to monitor (comma-separated, no spaces)	Enter the names of Oracle RDBMS background processes you want to monitor, separated by commas and no spaces. The default value is PMON,LGWR,SMON,RECO.
Attempt a connection using service name?	Select the **Yes** check box to attempt a connection using a service name (tnsnames alias). By default, the connection is not attempted.
Location of tnsnames.ora	Specify the directory that can be used to set the $TNS_ADMIN environment variable so that the tnsnames.ora file can be found during the connection attempt using the service name. This value can be a specific folder, or it can be relative to the $ORACLE_HOME for the respective database. If $ORACLE_HOME is specified as part of the path, the script substitutes the appropriate folder path for this variable at the time the job is executed. The default location is: $ORACLE_HOME/network/admin.

Description	How to Set It
Service Name	Specify the service name you want to use for the connection attempt. By default, this name is usually the `$ORACLE_SID` value for the database. If `$ORACLE_SID` is specified as part of the name, the script substitutes the appropriate value for the respective database at the time the job is executed. In addition, domain names may be appended to `$ORACLE_SID` or the value specified (for example, `$ORACLE_SID.netiq.eng`). The default for this parameter is `$ORACLE_SID`.
Number of databases per host to attempt a service connection	Select the number of databases per host for which a service connection should be attempted. Options include 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 15, 20, 50, or ALL. The default value is ALL.
Restart listeners that are not running?	Select the **Yes** check box to restart listeners or specified background process(es) that are not running. By default, listeners are not restarted.
Number of attempts to restart a given listener	If you enabled the **Restart listeners that are not running?** parameter, enter the number of times the job should attempt to restart a listener that is not running before the job raises a failure event (see the **Raise event if unable to restart a listener?** parameter below). The default value is 1.
Options for specifying listener(s) to restart	Enter values below for the following parameters if you enabled the **Restart listeners that are not running?** parameter. These parameters let you select listeners to restart if they are detected as not running.
Oracle Home of listener to restart	Enter the Oracle Home where the listener to be restarted resides. The default value is blank.
Name of listener to restart	Enter the name of the listener to restart. If you do not enter a name here, the job attempts to restart the default listener. The default value is blank.
Path to file with information on listener(s) to restart (leave blank to use oratab file)	Enter a full path and filename for a file containing the names and Oracle Homes of listeners that should be restarted if they are detected down. Use this parameter to restart multiple listeners. If you do not enter a path and filename here, the job uses the default `oratab` file for the Oracle Home listed above for the **Oracle Home of listener** parameter.
Raise event if listener or background process(es) not running?	Select the **Yes** check box to raise an event when the listener or specified background processes are not running. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).
Raise event with status of any restart attempt?	Select the **Yes** check box to raise an event giving the status of any attempts to restart listeners that are not running. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 30 (magenta event indicator).
Raise event if connection attempts fail?	Select the **Yes** check box to raise an event if the connection attempts fail. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).

Description	How to Set It
Raise event with status if listener running and connection(s) successful?	Select the **Yes** check box to raise an event with uptime information when listener is running and the connection is successful. By default, the job does not raise events.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 40 (magenta event indicator).

60.21 Memory

Use this Knowledge Script to monitor the following parameters:

- **Freelist Waits**: retrieve the number of freelist waits and the total number of data requests, and to compute a ratio of the two numbers. You can set multiple thresholds for the ratio of freelist waits to data requests, and the job raises events when any one of the thresholds exceeds the value you specified.
- **Buffer Busy Waits**: retrieve the number of buffer busy waits and the number of logical reads, and compute a ratio between the two numbers (expressed as a percentage). When you enable data collection, the repository stores the ratio. You can set multiple thresholds for the maximum ratio, and the job raises an event when any of the thresholds exceeds the value you specified. A higher ratio indicates an increased contention for buffers in the SGA memory of Oracle database.
- **Cache**: the frequency with which requested data and resources are retrieved from the cache. As this hit ratio (that is, the percentage of time that data or resources are retrieved from the cache) decreases, performance also decreases because data that must be retrieved from disk or library objects must be reinitialized in order to service the requests.

  Use this script to monitor any combination of the following statistics:

  - The *buffer cache hit ratio* indicates the percentage of time that requested data you can find in the buffer cache.
  - The *data dictionary hit ratio* indicates the percentage of time that requested data you can find in the data dictionary.
  - The *library cache hit ratio* indicates the percentage of time that system requests to access objects in the library cache you can service without re-initializing or reloading library objects. Changes to the library cache hit ratio may occur when an application becomes active, causing more SQL statements and stored procedures to be used.

  You can set a threshold for each cache hit ratio you choose to monitor. If a cache hit ratio falls below a threshold you set, the job raises an event.
- **BGProc**: the total number of physical read/write (I/O) operations per second and/or the total memory usage for Oracle RDBMS background processes. If the total number of read/write operations per second or the total memory usage exceeds the threshold, the job raises an event.

  Oracle RDBMS background processes include `CKPT`, `DBW0`, `LGWR`, `PMON`, `RECO`, `SMON`, `SNP0`, and others. You can monitor all or individual background processes.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
V_$WAITSTAT

V_$LIBRARYCACHE
V_$ROWCACHE
V_$SYSTEM_EVENT

V_$BGPROCESS
V_$PROCESS
V_$SESSION
V_$SESSTAT
V_$STATNAME
```

60.21.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.21.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.21.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Memory	
Freelist Waits	Select the **Yes** check box to monitor the Freelist Waits.
Buffer busy Waits	Select the **Yes** check box to monitor the Buffer Busy Waits.
Cache	
Monitor buffer cache hit ratio?	Select the **Yes** check box to monitor the percentage of time that requested data you can find in the buffer cache. By default, monitoring is performed.
Monitor data dictionary hit ratio?	Select the **Yes** check box to monitor the percentage of time that requested data you can find in the data dictionary. By default, monitoring is performed.
Monitor library cache hit ratio?	Select the **Yes** check box to monitor the percentage of time that system pin requests to access objects in the library cache you can service without re-initializing or reloading library objects. By default, monitoring is performed.
BGProc	

Description	How to Set It
Oracle background porcesses to monitor	Enter the names of the background processes you want to monitor. Separate the names with commas; do not use spaces. To monitor all Oracle RDBMS background processes, enter an asterisk (*). Possible valid background process names include: • CKPT • DBW0 • LGWR • PMON • RECO • SMON • SNP0 • SNP1 The default value is (*) (all background processes).
Monitor read/write operations?	Select the **Yes** check box to monitor the number of physical read/write operations per second by background processes. By default, monitoring is performed.
Monitor memory usage?	Select the **Yes** check box to monitor the total memory usage by background processes. By default, monitoring is performed.
Event Notification	
Raise event if threshold is exceeded for ratio of freelist waits to total data requests?	
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, events are enabled.
Threshold – Maximum ratio of freelist waits to data requests	Specify a threshold for the maximum ratio of freelist waits to total data requests. The default for this threshold is .95.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 5 (red event indicator).
Raise event if ratio exceeds threshold?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – Maximum ratio of freelist waits to data requests	Specify a threshold for the maximum ratio of freelist waits to total data requests. The default for this threshold is .80.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 15 (yellow event indicator).
Raise event if ratio exceeds threshold?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.

Description	How to Set It
Threshold – Maximum ratio of freelist waits to data requests	Specify a threshold for the maximum ratio of freelist waits to total data requests. The default for this threshold is .60.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 25 (blue event indicator).
Raise event if ratio exceeds threshold?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – Maximum ratio of freelist waits to data requests	Specify a threshold for the maximum ratio of freelist waits to total data requests. The default for this threshold is .40.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 35 (magenta event indicator).
Raise event if threshold is exceeded for ratio of buffer busy waits to logical reads?	
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the specified limit. By default, events are enabled.
Threshold – Maximum ratio of buffer busy waits to logical reads	Specify a threshold for the maximum ratio of buffer busy waits to logical reads. The default for this threshold is.95.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 5 (red event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the ratio exceeds the threshold specified below. By default, the job does not raise events.
Threshold – Maximum ratio of buffer busy waits to logical reads	Specify a threshold for the maximum ratio of buffer busy waits to logical reads. The default value is.80.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 15 (yellow event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – Maximum ratio of buffer busy waits to logical reads	Specify a threshold for the maximum ratio of buffer busy waits to logical reads. The default value is.60.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 25 (blue event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – Maximum ratio of buffer busy waits to logical reads	Specify a threshold for the maximum ratio of buffer busy waits to logical reads. The default value is .40.

Description	How to Set It
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 35 (magenta event indicator).
Raise event for cache?	
Raise event if threshold is not met?	Select the **Yes** check box to raise an event if the buffer cache hit ratio exceeds the threshold you set. By default, the job raises an event.
Threshold – Minimum buffer cache ratio	Enter a minimum threshold for the buffer cache hit ratio. If the actual hit ratio falls below than this threshold, the job raises an event. Ideally, you should set this percentage relatively high because the more frequently Oracle RDBMS uses the buffer, the better your database performance. When the actual hit ratio falls below the threshold you set, the event alerts you that database performance has degraded. The default value is 70%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Raise event if threshold is not met?	Select the **Yes** check box to raise an event if the data dictionary hit ratio falls below the threshold you set. By default, the job raises an event. .
Threshold – Minimum data dictionary hit ratio	Enter a minimum threshold for the data dictionary hit ratio. If the actual hit ratio falls below this threshold, the job raises an event. Ideally you should set this percentage high because the more frequently Oracle RDBMS uses the data dictionary to service requests, the better your database performance. When the actual hit ratio falls below the threshold you set, the event alerts you that database performance has deteriorated. The default value is 90%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Raise event if threshold is not met?	Select the **Yes** check box to raise an event if the library cache hit ratio falls below the threshold you set. By default, the job raises events.
Threshold – Minimum library cache hit ratio	Enter a minimum threshold for the library cache hit ratio. If the actual hit ratio falls below this threshold, the job raises an event. Ideally,you should set this percentage extremely high because re-initializing or reloading library objects imposes a significant performance hit. When the actual hit ratio falls below the threshold you set, the event alerts you that database performance has degraded. The default value is 95%.

Description	How to Set It
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Raise event for Oracle Background processes?	
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the number of physical read/write operations per second exceeds the threshold you set. By default, events are not enabled.
Threshold – Maximum read/write operations rate	Enter a threshold for the maximum number of physical read/write operations per second. The default value is 5 read/write operations per second.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 15 (yellow event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the memory utilization of the monitored processes exceeds the threshold you set. By default, events are not enabled.
Threshold – Maximum memory usage	Enter a threshold (in MB) for the maximum amount of memory used by all background processes you are monitoring. The default value is 15 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 15 (yellow event indicator).
Data Collection	
Collect data for ratio of freelist waits to total data requests?	Select the **Yes** check box to collect data for charts and reports. If data collection is enabled, returns the ratio of freelist waits to total data requests. By default, data is not collected.
Collect data for ratio of buffer busy waits to logical reads?	Select the **Yes** check box to collect data for charts and reports. If data collection is enabled, returns the ratio of buffer busy waits to logical reads as a percentage (%). By default, data is not collected.
Collect data for Cache?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the statistics you choose to collect: • The buffer cache hit ratio • The data dictionary hit ratio • The library cache hit ratio By default, data is not collected.

Description	How to Set It
Collect data for memory usage and I/O of Oracle processes?	Select the **Yes** check box to collect data for charts and reports. If data collection is enabled, returns the number of read/write operations per second, and/or the total memory usage for all monitored background processes. By default, data is not collected.

60.22 MostExecutedSQLStatements

Use this Knowledge Script to determine which SQL queries or statements are being executed on a given Oracle database most frequently. This script identifies the *N* most frequently executed queries and returns the results in an event. You set a value for *N* using the **Number of SQL statements to retrieve** parameter.

When you enable data collection, the most frequently executed SQL statements are stored in the repository.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SQLAREA
V_$VERSION
```

60.22.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and collects the *N* most executed SQL statements or queries.

60.22.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.22.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for most executed SQL statements?	Set to **y** to collect data for charts and reports. If data collection is enabled, returns the top *N* most frequently executed SQL statements. Set a value for *N* using the **Number of SQL statements to retrieve** parameter (see below). By default, data is not collected.
Number of SQL statements to retrieve	The number of most frequently executed SQL queries to be retrieved by the job. The default value is 10. The maximum is 30.
Raise event if error occurs during retrieval?	Select the **Yes** check box to raise an event if an error occurs during the retrieval of SQL statements. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 10 (red event indicator).

Description	How to Set It
Raise event with results from query?	Select the **Yes** check box to raise an event with details of the query results. By default, the job does not raise events.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 40 magenta event indicator).

60.23 OpenCursors

Use this Knowledge Script to monitor the percentage of cursors opened per session, as well as the total number of cursors open in the system. In the Oracle RDBMS environment, a *cursor* is a type of handle (or pointer) used to identify a query in the system. Cursors can be opened by users or by the system itself. A high number of open cursors can be caused by a programming error, and may cause database performance problems. In the `init.ora` file, you can specify the maximum number of cursors that may be opened by a session.

In this script, you can specify a maximum threshold for the percentage of open cursors allowed per session–a percentage of the number specified for the `open_cursor` parameter in the `init.ora` file. For example, if the `init.ora` file specifies that 60 cursors may be open in a session, and you set a maximum threshold of 75%, the script raises an event when 75% of the 60 allowed cursors (or 45 cursors) are open in any session.

You can also specify a maximum threshold for the total number of open cursors allowed in the system. The job raises an event if either threshold exceeds the value you specified.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$PARAMETER
V_$VERSION
```

60.23.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.23.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.23.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for number of open cursors?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the total number of open cursors in the system. By default, data is not collected.

Description	How to Set It
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the number of cursors open in the system exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum number of open cursors in system	Specify a maximum threshold for the number of cursors that may be open in the system. The default value is 1000 open cursors.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the percentage of cursors opened per session exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum percentage of cursors opened per session	Specify a maximum threshold for the percentage of open cursors per session. Note that this percentage is based on the number of open cursors allowed per session specified in the `init.ora` file. The default value is 80%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).

60.24 Performance

Use this Knowledge Script to monitor the following parameters:

- **Top CPU Users**: the CPU time for current user sessions. If the CPU utilization exceeds the threshold, the job raises an event.

  You can specify the number of user sessions with the highest CPU utilization to display in the Event Properties dialog box. The Event Properties dialog box includes the CPU usage for each of the top *N* sessions, username, session ID, and program name. Enter 0 to display all user sessions.

  This script requires that the Oracle `timed_statistics` parameter be turned on (set to `TRUE`) for the database you are monitoring.

- **Top IO Users**: physical reads and writes (I/O) for current user sessions. If the number of physical reads/writes per second (the physical read/write operations rate) exceeds the threshold you set, the job raises an event.

  You can specify the number of user sessions with the highest physical read/write operations rate to display in the Event Properties dialog box. Information in the Event Properties dialog box includes the physical reads/writes per second for each of the top *N* sessions, username, session ID, and program name.

  This script requires that the Oracle `timed_statistics` parameter is turned on for the database you are monitoring.

- **Top Lock Users**: the current number of user-held locks on an Oracle database. If the number of locks exceeds the threshold, the job raises an event.

  You can specify the number of user sessions holding the most locks to display in the Event Properties dialog box, or enter 0 to display all sessions. Information in the Event Properties dialog box includes the number of locks held by each session, username, session ID, and program name.

- **Top Memory Users**: memory utilization (User Global Area and Program Global Area) for current user sessions. If the memory utilization exceeds the threshold, the job raises an event.

  You can specify the number of user sessions with the highest memory usage to display in the Event Properties dialog box. Information in the Event Properties dialog box includes the memory in bytes for each session, username, session ID, and program name. Enter 0 for the **Number of top user sessions to display** parameter if you want to include memory utilization statistics for all user sessions in the event details.

- **Open Cursors:** the percentage of cursors opened per session, as well as the total number of cursors open in the system. In the Oracle RDBMS environment, a *cursor* is a type of handle (or pointer) used to identify a query in the system. Cursors can be opened by users or by the system itself. A high number of open cursors can be caused by a programming error, and may cause database performance problems. In the `init.ora` file, you can specify the maximum number of cursors that may be opened by a session.

  In this script, you can specify a maximum threshold for the percentage of open cursors allowed per session–a percentage of the number specified for the `open_cursor` parameter in the `init.ora` file. For example, if the `init.ora` file specifies that 60 cursors may be open in a session, and you set a maximum threshold of 75%, the script raises an event when 75% of the 60 allowed cursors (or 45 cursors) are open in any session.

  You can also specify a maximum threshold for the total number of open cursors allowed in the system. The job raises an event if either threshold exceeds the value you specified.

The account you use to run this script must have SELECT permissions for the following tables:

```
DBA_USERS
V_$SESSION
V_$SESSTAT
V_$STATNAME
V_$VERSION

V_$LOCK

V_$PARAMETER
```

60.24.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.24.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.24.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use SYSDBA authentication, leave this parameter blank. The default value is blank.
Performance	
Top CPU Users	Select the **Yes** check box to monitor the Top CPU Users.
Top IO Users	Select the **Yes** check box to monitor the Top IO Users.
Top Lock Users	Select the **Yes** check box to monitor the Top Lock Users.
Top Memory Users	Select the **Yes** check box to monitor the Top Memory Users.
Open Cursors	Select the **Yes** check box to monitor the Open Cursors.
Event Notification	
Raise event if threshold exceeded for Top CPU Users?	Select the **Yes** check box to raise an event if the CPU usage of any user session exceeds the threshold you set. By default, the job raises events.
Raise event if threshold exceeded for Top IO Users?	Select the **Yes** check box to raise an event if the physical read/write operations of any single user session exceed the threshold you set. By default, the job raises events.

Description	How to Set It
Raise event if threshold exceeded for Top Lock Users?	Select the **Yes** check box to raise an event if the number of user-held locks on the server exceeds the threshold you set. By default, the job raises events.
Raise event if threshold exceeded for Top Memory Users?	Select the **Yes** check box to raise an event if the total memory usage of any user session exceeds the threshold you set. By default, the job raises events.
Raise event if threshold is exceeded for Total Number of Open Cursors in the System?	Select the **Yes** check box to raise an event if the number of cursors open in the system exceeds the threshold you set. By default, the job raises events.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Raise event if threshold is exceeded for Percentage of Cursors Opened per Session?	Select the **Yes** check box to raise an event if the percentage of cursors opened per session exceeds the threshold you set. By default, the job raises events.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).
Data Collection	
Collect data for Top CPU Users?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the total CPU time for the top *N* users. By default, data is not collected.
Collect data for Top IO Users?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the total number of physical reads/writes per second for the top *N* users. By default, data is not collected.
Collect data for Top Lock Users?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the current number of user-held locks by the user sessions with the highest number of locks. By default, data is not collected.
Collect data for Top Memory Users?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the total memory usage (in MB) for the top *N* user sessions. By default, data is not collected.
Collect data for Open Cursor?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the total number of open cursors in the system. By default, data is not collected.
Monitoring	

Description	How to Set It
Number of user sessions of display [Not Applicable to Open Cursor Counters]	Specify the number of user sessions you want displayed in the Event Properties dialog box. Enter **0** if you want information for all user sessions. The default value is 15 user sessions.
Threshold – Maximum amount of CPU time for a user session	Enter a threshold for the maximum number of CPU cycles per 1/100th of a second that a single user session can use before the job raises an event. The default value is 50 CPU cycles per 1/100th of a second.
Threshold – Maximum read/write operations for a user session	Enter a threshold for the maximum number of physical reads/writes per second allowed before the job raises an event. The default value is 300 read/write operations.
Threshold – Maximum number of locks held by a user session	Enter a threshold for the maximum number of user-held locks on an Oracle RDBMS. The default value is 35 locks.
Threshold – Maximum amount of memory for a user session	Enter a threshold for the maximum total memory usage (in MB) for any user session. The default value is 10 MB.
Threshold – Maximum percentage of cursors opened per session	Specify a maximum threshold for the percentage of open cursors per session. Note that this percentage is based on the number of open cursors allowed per session specified in the `init.ora` file. The default value is 80%.
Threshold – Maximum number of open cursors in system	Specify a maximum threshold for the number of cursors that may be open in the system. The default value is 1000 open cursors.

60.25 RedoLog

Use this Knowledge Script to monitor the following parameters:

- **Redo Log Contention**: the number of times that a process tries to write an entry in the redo log buffer. The job raises an event and than stores data if the number of tries is different for subsequent iterations of the script.

  The number of retries should be low. A high number of retries can adversely affect system performance, as processes must wait for buffers. If a process has to make numerous attempts to write an entry in the redo log buffer, you may need to allocate more space to the redo log buffer.

  You can set a threshold value for the maximum number of times a process can try to write an entry in the redo log buffer. If the number of retries exceeds the threshold, an event is raised.

- **Redo Log Space Wait Ratio**: the redo log space wait ratio. The redo log space wait ratio measures memory allocation. The ratio reflects the number of times the background process was requested to allocate space within the redo file per number of redo log entries. If this ratio increases, you may want to increase the size of the redo log buffer.

  When the redo log space wait ratio exceeds the threshold you set, the job raises an event.

- **Redo Logs Not Archived**: retrieve the number of redo logs that are not being archived, if archiving is turned on for a given Oracle database. The number of redo logs not archived is returned and compared against the thresholds you specify. The Knowledge Script retrieves the archive status for an Oracle database from the AppManager repository, which is updated during discovery. To enable archiving, you must rediscover the Oracle UNIX resources if the redo log archive is enabled after you discover resources.

  When you enable data collection, the number of redo logs not archived is stored in the repository. You can set multiple thresholds for the number of redo logs not archived, with varying severities, and the job raises an event when any of these thresholds exceeds the value you specified.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SGASTAT
V_$SYSSTAT
V_$VERSION

V_$LOG
```

60.25.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.25.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.25.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Redo Log	
Redo Log Contention	Select the **Yes** check box to monitor Redo Log Contention.
Redo Log Space wait Ratio	Select the **Yes** check box to monitor Redo Log Space Wait Ratio.
Redo Log Not Archived	Select the **Yes** check box to monitor Redo Log Not Archived.
Event Notification	
Raise event if threshold is exceeded for Redo Log Contention?	Select the **Yes** check box to raise an event if the number of times that a process tries to rewrite an entry to the redo log buffer exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum redo log buffer allocation retries	Enter a threshold for the maximum number of times that a process may try to rewrite an entry to the redo log buffer before the job raises an event. The default value is 50 retries.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).
Raise event if threshold is exceeded for Redo Log Space Wait Ratio?	Select the **Yes** check box to raise an event if the redo log space wait ratio exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum redo log space wait ratio	Enter a maximum threshold for the redo log space wait ratio. The default ratio is 0.0002.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Raise event if threshold is exceeded for Redo Logs not archived?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, events are enabled.
Threshold – Maximum number of redo logs not archived	Specify a threshold for the maximum number of redo logs that have not been archived. The default value is 6 redo logs.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 5 (red event indicator).
Raise event if threshold is exceeded for Redo Logs not archived?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – Maximum number of redo logs not archived	Specify a threshold for the maximum number of redo logs that have not been archived. The default for this threshold is 4 redo logs.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 15 (yellow event indicator).

Description	How to Set It
Raise event if threshold is exceeded for Redo Logs not archived?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – Maximum number of redo logs not archived	Specify a threshold for the maximum number of redo logs that have not been archived. The default for this threshold is 2 redo logs.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 25 (blue event indicator).
Raise event if threshold is exceeded for Redo Logs not archived?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – Maximum number of redo logs not archived	Specify a threshold for the maximum number of redo logs that have not been archived. The default for this threshold is 1 redo log.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 35 (magenta event indicator).
Data Collection	
Collect data for Redo Log Contention?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the number of times that processes attempted to write entries to the redo log buffer. By default, data is not collected.
Collect data for Redo Log Space Wait Ratio?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the redo log space wait ratio. By default, data is not collected.
Collect data for Redo Log not archived?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the number of redo logs not archived. By default, data is not collected.

60.26 RedoLogContention

Use this Knowledge Script to monitor the number of times that a process tries to write an entry in the redo log buffer for a scheduled interval of time. The job raises an event and than stores data if the number of tries is different for subsequent iterations of the script.

The number of retries should be low. A high number of retries can adversely affect system performance, as processes must wait for buffers. If a process has to make numerous attempts to write an entry in the redo log buffer, you may need to allocate more space to the redo log buffer.

You can set a threshold value for the maximum number of times a process can try to write an entry in the redo log buffer. If the number of retries exceeds the threshold, the job raises an event.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SGASTAT
V_$SYSSTAT
V_$VERSION
```

60.26.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.26.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.26.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for redo log write attempts?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the number of times that processes attempted to write entries to the redo log buffer. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the number of times that a process tries to rewrite an entry to the redo log buffer exceeds the threshold you set. By default, the job raises events.

Description	How to Set It
Threshold – Maximum number of redo log buffer allocation retries	Enter a threshold for the maximum number of times that a process may try to rewrite an entry to the redo log buffer before the job raises an event. The default value is 50 retries.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.27 RedoLogsNotArchived

Use this Knowledge Script to retrieve the number of redo logs that are not being archived, if archiving is turned on for a given Oracle database. The number of redo logs not archived is returned and compared against the thresholds you specify. The Knowledge Script retrieves the archive status for an Oracle database from the AppManager repository, which is updated during discovery. To enable archiving, you must rediscover the Oracle UNIX resources if the redo log archive is enabled after you discover resources.

When you enable data collection, the number of redo logs not archived is stored in the repository. You can set multiple thresholds for the number of redo logs not archived, with varying severities, and the job raises an event when any of these thresholds exceed the values you specified.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$LOG
V_$VERSION
```

60.27.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and checks for `ARCHIVING` log mode before proceeding to monitor that database. The job then collects the number of redo logs that have not been archived. This data is collected and stored in the repository if you have enabled data collection.

60.27.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.27.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for number of redo logs not archived?	Set to **y** to collect data. If data collection is enabled, returns the number of redo logs not archived. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, events are enabled.
Threshold – Maximum number of redo logs not archived	Specify a threshold for the maximum number of redo logs that have not been archived. The default value is 6 redo logs.

Description	How to Set It
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 5 (red event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – Maximum number of redo logs not archived	Specify a threshold for the maximum number of redo logs that have not been archived. The default for this threshold is 4 redo logs.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 15 (yellow event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – Maximum number of redo logs not archived	Specify a threshold for the maximum number of redo logs that have not been archived. The default for this threshold is 2 redo logs.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 25 (blue event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold – Maximum number of redo logs not archived	Specify a threshold for the maximum number of redo logs that have not been archived. The default for this threshold is 1 redo log.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 35 (magenta event indicator).

60.28 RedoLogSpaceWaitRatio

Use this Knowledge Script to monitor the redo log space wait ratio. The redo log space wait ratio measures memory allocation. The ratio reflects the number of times the background process was requested to allocate space within the redo file per number of redo log entries. If this ratio increases, you may want to increase the size of the redo log buffer.

When the redo log space wait ratio exceeds the threshold you set, the job raises an event.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.28.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.28.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.28.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for redo log space wait ratio?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the redo log space wait ratio. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the redo log space wait ratio exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum redo log space wait ratio	Enter a maximum threshold for the redo log space wait ratio. The default ratio is 0.0002.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).

60.29 RollbackSegmentContention

Use this Knowledge Script to monitor rollback segment contention for a database. In the Oracle RDBMS environment, the **rollback segment** is a temporary location where changes are stored until the user makes the changes permanent. This script compares the number of requests waiting to access data from the rollback segment to the total number of requests for data during the monitoring interval.

You can specify the maximum percentage of requests allowed to wait for data from the rollback segment. If the percentage of waiting requests exceeds the threshold you set, the job raises an event. Such an event probably indicates that too many processes are waiting to access the rollback segment, in which case, you may need to create additional rollback segments.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
V_$WAITSTAT
```

60.29.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.29.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.29.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for rollback segment contention?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the percentage of requests waiting to access the rollback segment. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the percentage of total requests that are waiting to access the rollback segment exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum percentage of requests waiting for access	Enter the maximum percentage of total requests that can be waiting to access data from the rollback segment before the job raises an event. The default value is 1%.

Description	How to Set It
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).

60.30 RowSourceRatio

Use this Knowledge Script to monitor the row source ratio for an Oracle RDBMS. This ratio measures the percentage of rows retrieved using full table scans. Because a full table scan is less efficient than retrieval by row ID, this ratio gives you an indication of potential database performance problems. If you see an increase in this ratio, you may want to review other statistics to find the source of the problem. When this ratio exceeds the threshold, the job raises an event.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.30.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.30.2 Default Schedule

The default interval for this script is **Every hour**.

60.30.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for row source ratio?	Set to **y** to collect data for use in graphs and reports. When you enable data collection, the script returns the percentage of rows retrieved using a full table scan. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the percentage of rows retrieved using a full table scan exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum row source ratio	Enter a maximum threshold for the row source ratio. The default ratio is .25.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.31 RunSql

Use this Knowledge Script to run a SQL statement. The statement can be entered directly in the script or loaded from a file. You specify the column to monitor, by number or name, and whether to monitor the value found in the column or the value's rate of change (changes per second). You can also specify a string that the script can search for in the retrieved rows.

This script is designed to execute simple SQL statements, for example, a statement that returns the size of a table or the number of columns in a table. There is a limit of 10000 characters for the entire statement when it is contained in a file, and a limit of 1000 characters when the statement is entered via the **SQL statement** parameter. Regardless of the source of the SQL statement, there is a limit of 100 columns retrieved by a `SELECT` statement, and a limit of 8 KB for the size of each row retrieved.

This script supports SQL statements using the `number`, `character`, `date`, and `raw` data types. However, only a column returning numeric data can be selected to monitor.

The account you use to run this script must have `SELECT` permissions for `V_$VERSION` and any table the script is run against.

60.31.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.31.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.31.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data specified in the SQL query?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the number of rows returned from the SQL statement. If you choose to monitor the column's rate of change and set this parameter to y, the script returns the change in the number of rows since the last time the SQL statement was run. By default, data is collected.

Description	How to Set It
Legend	Enter a legend for the output of your SQL statement. The default value is blank. If you leave this parameter blank, AppManager constructs a legend based on the column number. For example, if the column number is 0, the constructed legend is "# Result Rows". If the column number is greater than 0, the constructed legend is the specified column heading. If no heading exists, the constructed legend is: "Column <num> Value".
Load SQL script from file?	Select the **Yes** check box to load a SQL script from a file. By default, this parameter is disabled.
SQL script file (full path)	If you set the **Load SQL script from file?** parameter to Yes, enter the complete path to the file that contains the SQL statement. For example: `/netiq/Sample.sql`.
SQL statement	If you set the **Load SQL script from file?** parameter to no, enter the SQL statement to be executed. The default statement selects all processes from the `V_$PROCESS` table: `SELECT * FROM V_$PROCESS` **Tip** Unless you are entering very simple queries, you may find typing a SQL statement into this field is error-prone. To avoid errors, use the **Load SQL script from file?** parameter. Or, if you have an AppManager Developer's license, you can check this script out of the repository, use the Knowledge Script Editor to paste the desired SQL statement into the **SQL statement** parameter, then check in the modified script.
Select column by number, or name?	Set to `Number` or `Name`: • `Number`–to select the column by number • `Name`–to select the column by name.
Column number to retrieve	If you set the **Select column by number or name?** parameter to `Number`, enter the column number to use as the primary output value. The column you specify must contain numeric data. Entering 0 returns the number of rows returned from the SQL statement. Any other positive value returns the value for the specified column's first row of data. If the specified column is not a numeric field, the job raises an event. The default value is 1.
Column name to retrieve	If you set the **Select column by number or name?** parameter to `Name`, enter the column name to use as the primary output value. The column you specify must contain numeric data. The value for the specified column's first row of data is returned. If the specified column is not a numeric field, the job raises an event.. The default value is blank.
Number of rows to display	Enter the number of rows you want displayed in the Event Properties dialog box. The default value is 5 rows. **NOTE:** You can enter 0 to indicate no limit (keep all output rows). Currently, however, the message in the Event Properties dialog box is limited to 32K characters.
Monitor the column's value or rate of change?	Set to `Value` to monitor the column's value. Set to `Change` to monitor the column's rate of change (per second). The default value is `Value`.

Description	How to Set It
Raise event when threshold is exceeded or not met?	Select the **Yes** check box to raise an event when a threshold is crossed. By default, the job does not raise events.
Condition: <, =, or >	Indicate the condition (less than, equal to, or greater than) you want to check for. This parameter is used in conjunction with the **Threshold – Value or rate of change** parameter to control when the job raises events. The default value is > , indicating that the job raises an event if the value retrieved exceeds (is greater than) the value specified in the threshold.
Threshold – Value or rate of change	Enter a threshold for the value or rate you are monitoring. Depending on how you set the **Monitor the column's value or rate of change?** parameter, this may indicate a threshold for the statistic's value or for the number of times the value changes per second. The value you set here is used in conjunction with the **Condition: <, =, or >** parameter to control when the job raises events. The default value is 1,000.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).
Raise event for string found in row results?	Select the **Yes** check box to raise an event if the string you specify below you can find in the row results. By default, the job does not raise events.
String(s) to find in results (separate multiple strings with semicolons)	Enter a string (text) to search for in row results. If you enter multiple strings, separate them with semicolons (;) and no spaces. The default value is blank.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 15 (yellow event indicator).

60.32 ScheduledJobs

Use this Knowledge Script to monitor the scheduled job status in the New Oracle Scheduler. When the scheduled job fails, the job raises an event.

The account you use to run this script must have `SELECT` permissions for the following tables:

`dba_jobs`
`dba_scheduler_jobs` (use the New Oracle Scheduler with Oracle RDBMS 10g Release 1 and later.)

60.32.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.32.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.32.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for Oracle Scheduled Jobs?	Set to **y** to collect data for Oracle scheduled jobs. When there are no failed jobs, the data value is 0. By default, data is not collected.
Include Jobs Scheduled with New Oracle Scheduler?	Select the **Yes** check box to include jobs scheduled with the New Oracle Scheduler. **NOTE:** : You can use the New Oracle Scheduler with Oracle RDBMS 10g Release 1 and later. By default, this parameter is disabled.
Raise event if Jobs Failed?	Select the **Yes** check box to raise an event when the scheduled jobs fail. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.33 SegmentExtentAvail

Use this Knowledge Script to monitor either the percentage or number of extents (extensions of free space) available to each segment in a tablespace. Use the **Minimum percentage of extents available per segment** or **Minimum number of extents available per segment** parameter to define how many available extents a monitored segment should have.

You can then set multiple threshold values for the minimum number or percentage of extents that should be available for each segment. For example, you may want each segment to have at least 1,400 or 70% of extents available. You can set thresholds for the maximum number of segments that can fall below this value before the job raises an event.

In the above example, if you specify that 70% of extents should be available for each segment, and that 4 segments should be the maximum number allowed to have less than 70% of their extents available, then if 4 segments are found to have less than 70% of their extents available, the job raises an event.

NOTE: The job raises an event only when *both* conditions are met. In the example described above, this script would not raise an event until 4 segments were found that had less than 70% of their extents available.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
DBA_SEGMENTS
V_$VERSION
```

60.33.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.33.2 Default Schedule

The default interval for this script is **Every hour**.

60.33.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for number of segments with too few available extents?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the number of segments with less than the specified percentage or number of extents available. By default, data is not collected.

Description	How to Set It
Units for available extents per segment	Set to **Percentage** to monitor the percentage of available extents per segment. Set to **Number** to monitor the number of available extents per segment. The default value is Percentage.
Minimum percentage of extents available per segment	Enter the minimum percentage of extents that should be available for each segment in a tablespace. This parameter is used when you have selected "`Percentage`" for the Units for available extents per segment parameter (see above). The default value is 80%.
Minimum number of extents available per segment	Enter the minimum number of extents that should be available for each segment in a tablespace. This parameter is used when you have selected "`Number`" for the Units for available extents per segment parameter (see above). The default value is 10 extents.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the number of extents that fail to meet the minimum value you set for available extents within a tablespace exceeds the maximum threshold (see below). By default, events are enabled.
Threshold – Maximum number of segments with too few extents available	Enter a threshold for the maximum number of segments whose number or percentage of available extents failed to meet the minimum requirement specified above. If the number of segments not meeting this requirement exceeds this threshold, the job raises an event. The default value is 0 segments.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 35 (magenta event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the number of extents that fail to meet the minimum value you set for available extents within a tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum number of segments with too few extents available	Enter a threshold for the maximum number of segments whose number or percentage of available extents failed to meet the minimum requirement specified above. If the number of segments not meeting this requirement exceeds this threshold, the job raises an event. The default value is 5 segments.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 25 (blue event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the number of extents that fail to meet the minimum value you set for available extents within a tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum number of segments with too few extents available	Enter a threshold for the maximum number of segments whose number or percentage of available extents failed to meet the minimum requirement specified above. If the number of segments not meeting this requirement exceeds this threshold, the job raises an event. The default value is 10 segments.

Description	How to Set It
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 15 (yellow event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the number of extents that fail to meet the minimum value you set for available extents within a tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Number of segments with too few extents available	Enter a threshold for the maximum number of segments whose number or percentage of available extents failed to meet the minimum requirement specified above. If the number of segments not meeting this requirement exceeds this threshold, the job raises an event. The default value is 50 segments.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 5 (red event indicator).

60.34 SetMonitoringOptions

Use this Knowledge Script to set the various monitoring options available with AppManager for Oracle (UNIX). You can set the location where files reside whose filenames contain the names of databases to be "blacked out" (not monitored) while they are down due to scheduled activities such as maintenance. Enter a full path to a directory containing filenames whose names indicate which databases to exclude from OracleUNIX jobs.

To reset this script, you can enable one or more parameters but leave their values blank and then run the job. For example, if you enable the **Set option for blackout monitoring?** parameter but leave the next parameter, **Full path to directory with database names to exclude**, blank, the next time you run the job, you overwrite the previous value with a blank value. This is the recommended way to reset the blackout monitoring option or any of the clustering options.

This script also lets you specify whether to monitor tablespaces with temporary contents, and/or those with autoextensible datafiles.

NOTE: Use this script to specify monitoring options for running jobs in a clustered environment. AppManager for Oracle (UNIX) supports monitoring both RAC and non-RAC clustered environments. For details, see the topics below.

60.34.1 Monitoring in a RAC Clustered Environment

An Oracle RAC cluster consists of one database and multiple Oracle instances that share that common database. Each instance runs on a separate node. The Oracle RAC software knows which instances are active and which are inactive.

The following information must be supplied by the SetMonitoringOptions script to enable monitoring in a RAC environment:

- Service name for the RAC cluster
- Directory containing the `tnsnames.ora` file (only if this file is in the non-default location). The default location is `$ORACLE_HOME/network/admin`.

NOTE: AppManager for Oracle (UNIX) requires that you configure Transparent Application Failover (TAF). TAF is an Oracle configuration that allows a client to attempt to connect to an instance, and if that attempt fails, to attempt to connect to a different instance. TAF is configured by default during Oracle RAC installations, but in rare cases may subsequently have been manually disabled. In this scenario, you must reconfigure TAF to enable monitoring by AppManager for Oracle (UNIX). For more information, see the *Oracle Net Services Administrator's Guide*.

60.34.2 Monitoring in a Non-RAC Clustered Environment

You can also use Oracle in non-RAC clusters. In this kind of cluster, third-party cluster software (VERITAS, Sun Cluster, etc.) installed on the nodes controls which Oracle instances are active. This software makes a required resource available only on active nodes. The required available resource is a file, directory, or device that resides in the file system.

The full path to this resource must be supplied by the SetMonitoringOptions script to enable monitoring in a non-RAC environment.

60.34.3 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.34.4 Default Schedule

The default interval for this script is **Run once**.

60.34.5 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Set option for blackout monitoring?	Select the **Yes** check box if you should set blackout location upon executing this job iteration. By default, this parameter is disabled.
Full path to directory with database names to exclude	Specify the directory where files reside whose filenames include database names for databases that should not be monitored (databases to “black out”). The default value is blank (no databases blacked out).
Set option for monitoring temporary tablespaces?	Select the **Yes** check box if you should set the option for monitoring tablespaces with temporary contents upon executing this job iteration. By default, this option is not set.
Monitor temporary tablespaces?	Select the **Yes** check box to monitor those tablespaces with temporary contents. Clear the box to skip monitoring such tablespaces. By default, monitoring is performed.
Set option for monitoring autoextensible tablespaces?	Select the **Yes** check box if you should set the option for monitoring tablespaces with autoextensible datafiles upon executing this job iteration. By default, this option is not set.
Monitor tablespaces with autoextensible datafiles?	Select the **Yes** check box to monitor those tablespaces with datafiles that autoextend. Clear the box to skip monitoring such tablespaces. By default, monitoring is performed.
Set option for monitoring Oracle RAC?	Select the **Yes** check box if you should set the option for monitoring computers running Oracle RAC upon executing this job iteration. By default, this option is not set.
Service name for the RAC cluster	Enter the service name identifying the Oracle RAC environment upon which the job will run. This allows the Oracle UNIX/Linux managed object to connect to Oracle on the host and determine which nodes are active. The parameter is blank by default.

Description	How to Set It
Directory containing `tnsnames.ora` file (if not in default location)	Enter the path to the folder containing the `tnsnames.ora` file. This is normally what the `$TNS_ADMIN` environment variable is set to for Oracle to resolve service names. The default location is normally: `$ORACLE_HOME/network admin`. This parameter is blank by default. **NOTE:** The default location is used if a directory is not specified here.
Set option for monitoring non-RAC cluster?	Select the **Yes** check box if you should set the option for monitoring computers running as part of a cluster where Oracle RAC is not installed upon executing this job. By default, this option is not set.
Path to a required available resource	Enter the path to a resource (file, directory, device, etc.) that must be available to the computer running the Oracle UNIX/Linux managed object in order for jobs to execute successfully. This can be a resource that a node in a cluster requires in order for that node to have access to Oracle. This parameter is blank by default.
Raise event if unable to set monitoring options?	Select the **Yes** check box to raise an event when the monitoring options could not be set. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 15 (yellow event indicator).
Raise event to display options currently set?	Select the **Yes** check box to raise an event providing a summary of the current settings for monitoring options. By default, the job does not raise events.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 40 (magenta event indicator).

60.35 SortOverflowRatio

Use this Knowledge Script to monitor the sort overflow ratio. This ratio compares the number of sorts that are using temporary segments to the total number of sorts. If the sort overflow ratio exceeds the threshold you set, the job raises an event.

An increase in the sort overflow ratio indicates that more sort operations are allocating work space on disk. If an excessive number of sorts are allocating work space on disk, you may want to increase the sort area size.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.35.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.35.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.35.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for sort overflow ratio?	Set to **y** to collect data for charts and reports. When you enable data collection, the script returns the ratio of the number of sorts using temporary segments versus the number that do not. For example, a ratio of .75 indicates that 3 out of 4 sorts are using temporary segments. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the sort overflow ratio exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum sort overflow ratio	Enter a threshold for the maximum sort overflow ratio allowed before the job raises an event. The default ratio is .75.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).

60.36 SysStat

Use this Knowledge Script to monitor statistics from a database's V_$SYSSTAT table. This table stores all the key statistics for a database. You specify the statistic to monitor, and the value and condition (greater than, less than, or equal to) to check. If the **value** or **change rate** (changes per second) of a monitored statistic crosses a threshold, the job raises an event.

The account you use to run this script must have SELECT permissions for the following tables:

V_$SYSSTAT
V_$VERSION

60.36.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.36.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.36.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use SYSDBA authentication, leave this parameter blank. The default value is blank.
Collect data for a V_$SYSSTAT statistic?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the current value of the specified statistic at each interval. By default, data is not collected.
V_$SYSSTAT statistic to monitor	Enter the name of the statistic you want to monitor–for example, USER CALLS. For information about the fields in the V_$SYSSTAT table, see your Oracle RDBMS documentation (for example, in the Oracle8 Reference, see "Appendix C: Statistics Descriptions"). The default statistic is EXECUTE COUNT.
Monitor change rate, or value of statistic?	When you select Change rate, the script monitors the number of times the value of the monitored statistic changes per second. When you select Value, the script monitors the value of the statistic. The default value is Change rate.

Description	How to Set It
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the threshold you set is crossed. By default, the job raises events.
Condition: <, =, or >	Indicate the condition (less than, equal to, or greater than) you want to check. This parameter is used in conjunction with the **Threshold – Change rate or value** parameter to control when the job raises an event. The default value is > (greater than).
Threshold – Change rate or value	Enter a threshold value or rate for the specified statistic. Depending on how you set the **Monitor change rate or value of statistic?** parameter, this may indicate a threshold for the value of the statistic or for the number of changes in that value per second. The value you set here is used in conjunction with the **Condition: <, =, or >** parameter to control when the job raises an event. The default value is 100.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.37 TablespaceAvail

Use this Knowledge Script to monitor the disk space used by Oracle tablespaces.

This script can monitor the following:

- The amount of free disk space available for a tablespace (as a percentage, absolute amount, or both)
- The amount of disk space used by a tablespace (as a percentage, absolute amount, or both)
- The size of a tablespace

This script monitors only the disk space allocated to an Oracle database, not the total disk space on the computer where Oracle RDBMS is running.

By default, this script is set to monitor the percentage of free disk space available to a tablespace and the percentage of disk space used by a tablespace. You can choose any combination of monitoring options and set multiple thresholds for each one.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
DBA_DATA_FILES
DBA_FREE_SPACE
DBA_TABLESPACES
DBA_TEMP_FILES
V_$SORT_SEGMENT
V_$VERSION
```

60.37.1 Resource Objects

Individual Oracle RDBMS UNIX Tablespace icons. When run on an individual tablespace, the Knowledge Script job monitors only that tablespace.

60.37.2 Default Schedule

The default interval for this script is **Every hour**.

60.37.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.

Description	How to Set It
Collect data for amount of disk space used and free, and total tablespace size?	Set to **y** to collect data for charts and reports. When you enable data collection, and if monitoring of each metric is enabled, the Knowledge Script returns the following statistics for each tablespace on which the script is running: • percentage of disk space free within the tablespace • percentage of disk space used within the tablespace • amount of disk space free within the tablespace • amount of disk space used within the tablespace • total size of tablespace By default, data is not collected.
Absolute path of the file containing comma separated information related to tablespaces to be excluded	Enter the absolute path of the file containing information related to tablespaces that you want to exclude from raising events. Specifiy the required values in the following token entries: • 1 - name of the tablespace. • 2 - the threshold value for percentage of free space within the tablespace from which you can raise events. • 3 - the threshold value for percentage of used space within the tablespace from which you can raise events. • 4 - the threshold value for amount of free space within the tablespace from which you can raise events. • 5 - the threshold value for amount of used space within the tablespace from which you can raise events. • 6 - the threshold value for total size of the tablespace from which you can raise events. For example: system, 95, 10, 100„3000 **NOTE:** If you do not want to specify a threshold value for a particular token, leave it empty as noted in the preceding example.
Monitor percentage of free space within tablespace?	Select the **Yes** check box to monitor free space as a percentage. Expand this parameter to see threshold and severity parameters. By default, monitoring is enabled.
Raise event if threshold is not met?	Select the **Yes** check box to raise an event when the percentage of free disk space within a tablespace fails to meet the minimum threshold (see below). By default, events are enabled.
Threshold – Minimum percentage of free space	Enter a threshold for the minimum percentage of free disk space within the tablespace that must be found to prevent an event from being raised. The default value is 5%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 5 (red event indicator).
Raise event if threshold is not met?	Select the **Yes** check box to raise an event when the percentage of free disk space within a tablespace fails to meet the minimum threshold (see below). By default, the job does not raise events.
Threshold – Minimum percentage of free space	Enter a threshold for the minimum percentage of free disk space within the tablespace that must be found to prevent an event from being raised. The default value is 20%.

Description	How to Set It
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 15 (yellow event indicator).
Raise event if threshold is not met?	Select the **Yes** check box to raise an event when the percentage of free disk space within a tablespace fails to meet the minimum threshold (see below). By default, the job does not raise events.
Threshold – Minimum percentage of free space	Enter a threshold for the minimum percentage of free disk space within the tablespace that must be found to prevent an event from being raised. The default value is 40%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 25 (blue event indicator).
Raise event if threshold is not met?	Select the **Yes** check box to raise an event when the percentage of free disk space within a tablespace fails to meet the minimum threshold (see below). By default, the job does not raise events.
Threshold – Minimum percentage of free space	Enter a threshold for the minimum percentage of free disk space within the tablespace that must be found to prevent an event from being raised. The default value is 60%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 35 (magenta event indicator).
Monitor percentage of space used within tablespace?	Select the **Yes** check box to monitor used disk space as a percentage. Expand this parameter to see threshold and severity parameters. By default, monitoring is not performed.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the percentage of used disk space within a tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum percentage of space used	Enter a threshold for the maximum percentage of disk space that the tablespace can use. If the percentage of used disk space exceeds this threshold, the job raises an event. The default value is 95%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 5 (red event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the percentage of used disk space within a tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum percentage of space used	Enter a threshold for the maximum percentage of disk space that the tablespace can use. If the percentage of used disk space exceeds this threshold, the job raises an event. The default value is 80%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 15 (yellow event indicator).

Description	How to Set It
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the percentage of used disk space within a tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum percentage of space used	Enter a threshold for the maximum percentage of disk space that the tablespace can use. If the percentage of used disk space exceeds this threshold, the job raises an event. The default value is 60%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 25 (blue event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the percentage of used disk space within a tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum percentage of space used	Enter a threshold for the maximum percentage of disk space that the tablespace can use. If the percentage of used disk space exceeds this threshold, the job raises an event. The default value is 40%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 35 (magenta event indicator).
Monitor amount of free space within tablespace?	Select the **Yes** check box to monitor free space as an amount, in MB. Expand this parameter to see threshold and severity parameters. By default, monitoring is not performed.
Raise event if threshold is not met?	Select the **Yes** check box to raise an event when the percentage of free disk space within a tablespace fails to meet the minimum threshold (see below). By default, the job does not raise events.
Threshold – Minimum amount of free space	Enter a threshold for the minimum amount of free disk space within the tablespace that must be found to prevent an event from being raised. The default value is 50 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 5 (red event indicator).
Raise event if threshold is not met?	Select the **Yes** check box to raise an event when the percentage of free disk space within a tablespace fails to meet the minimum threshold (see below). By default, the job does not raise events.
Threshold – Minimum amount of free space	Enter a threshold for the minimum amount of free disk space within the tablespace that must be found to prevent an event from being raised. The default value is 100 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 15 (yellow event indicator).
Raise event if threshold is not met?	Select the **Yes** check box to raise an event when the percentage of free disk space within a tablespace fails to meet the minimum threshold (see below). By default, the job does not raise events.

Description	How to Set It
Threshold – Minimum amount of free space	Enter a threshold for the minimum amount of free disk space within the tablespace that must be found to prevent an event from being raised. The default value is 200 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 25 (blue event indicator).
Raise event if threshold is not met?	Select the **Yes** check box to raise an event when the percentage of free disk space within a tablespace fails to meet the minimum threshold (see below). By default, the job does not raise events.
Threshold – Minimum amount of free space	Enter a threshold for the minimum amount of free disk space within the tablespace that must be found to prevent an event from being raised. The default value is 500 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 35 (magenta event indicator).
Monitor amount of space used within tablespace?	Select the **Yes** check box to monitor used disk space as an amount, in MB. Expand this parameter to see threshold and severity parameters. By default, monitoring is not performed.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the amount of used disk space within a tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum amount of space used	Enter a threshold for the maximum amount of disk space that the tablespace can use. If the amount of used disk space exceeds this threshold, the job raises an event. The default value is 1000 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 5 (red event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the amount of used disk space within a tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum amount of space used	Enter a threshold for the maximum amount of disk space that the tablespace can use. If the amount of used disk space exceeds this threshold, the job raises an event. The default value is 400 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 15 (yellow event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the amount of used disk space within a tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum amount of space used	Enter a threshold for the maximum amount of disk space that the tablespace can use. If the amount of used disk space exceeds this threshold, the job raises an event. The default value is 200 MB.

Description	How to Set It
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 25 (blue event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the amount of used disk space within a tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum amount of space used	Enter a threshold for the maximum amount of disk space that the tablespace can use. If the amount of used disk space exceeds this threshold, the job raises an event. The default value is 100 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 35 (magenta event indicator).
Monitor total size of tablespace?	Select the **Yes** check box to monitor the total size, in MB, of the tablespace. Expand this parameter to see threshold and severity parameters. By default, monitoring is not performed.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the total size of the tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum total size of tablespace	Enter a threshold for the maximum size (in MB) that the tablespace can reach. If the size of the tablespace exceeds this threshold, the job raises an event. The default value is 2000 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 5 (red event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the total size of the tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum total size of tablespace	Enter a threshold for the maximum size (in MB) that the tablespace can reach. If the size of the tablespace exceeds this threshold, the job raises an event. The default value is 800 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 15 (yellow event indicator).
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the total size of the tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum total size of tablespace	Enter a threshold for the maximum size (in MB) that the tablespace can reach. If the size of the tablespace exceeds this threshold, the job raises an event. The default value is 400 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 25 (blue event indicator).

Description	How to Set It
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event when the total size of the tablespace exceeds the maximum threshold (see below). By default, the job does not raise events.
Threshold – Maximum total size of tablespace	Enter a threshold for the maximum size (in MB) that the tablespace can reach. If the size of the tablespace exceeds this threshold, the job raises an event. The default value is 200 MB.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 35 (magenta event indicator).

60.38 TopCpuUsers

Use this Knowledge Script to monitor the CPU time for current user sessions. If the CPU utilization exceeds the threshold, the job raises an event.

You can specify the number of user sessions with the highest CPU utilization to display in the Event Properties dialog box. The Event Properties dialog box includes the CPU usage for each of the top *N* sessions, username, session ID, and program name. Enter 0 to display all user sessions.

This script requires that the Oracle `timed_statistics` parameter be turned on (set to `TRUE`) for the database you are monitoring.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
DBA_USERS
V_$SESSION
V_$SESSTAT
V_$STATNAME
V_$VERSION
```

60.38.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.38.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

60.38.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for CPU usage of top N user sessions?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the total CPU time for the top *N* users. By default, data is not collected.
Number of user sessions to display	Specify the number of user sessions you want displayed in the Event Properties dialog box. Enter **0** if you want information for all user sessions. The default value is 15 user sessions.

Description	How to Set It
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the CPU usage of any user session exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum amount of CPU time for a user session	Enter a threshold for the maximum number of CPU cycles per 1/100th of a second that a single user session can use before the job raises an event. The default value is 50 CPU cycles per 1/100th of a second.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.39 TopIOUsers

Use this Knowledge Script to monitor physical reads and writes (I/O) for current user sessions. If the number of physical reads/writes per second (the physical read/write operations rate) exceeds the threshold you set, the job raises an event.

You can specify the number of user sessions with the highest physical read/write operations rate to display in the Event Properties dialog box. Information in the Event Properties dialog box includes the physical reads/writes per second for each of the top *N* sessions, username, session ID, and program name.

This script requires that the Oracle `timed_statistics` parameter is turned on for the database you are monitoring.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
DBA_USERS
V_$SESSION
V_$SESSTAT
V_$STATNAME
V_$VERSION
```

60.39.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.39.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

60.39.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for I/O activity of top N user sessions?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the total number of physical reads/writes per second for the top *N* users. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the physical read/write operations of any single user session exceed the threshold you set. By default, the job raises events.

Description	How to Set It
Threshold – Maximum physical read/write operations for a user session	Enter a threshold for the maximum number of physical reads/writes per second allowed before the job raises an event. The default value is 300 read/write operations.
Number of user sessions to display	Specify the number of top user sessions you want displayed in the Event Properties dialog box. Enter 0 if you want to see information for all user sessions. The default value is 10 user sessions.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.40 TopLockUsers

Use this Knowledge Script to monitor the current number of user-held locks on an Oracle database. If the number of locks exceeds the threshold, the job raises an event.

You can specify the number of user sessions holding the most locks to display in the Event Properties dialog box, or enter 0 to display all sessions. Information in the Event Properties dialog box includes the number of locks held by each session, username, session ID, and program name.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
DBA_USERS
V_$LOCK
V_$SESSION
V_$VERSION
```

60.40.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.40.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

60.40.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for locks held by top N user sessions?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the current number of user-held locks by the user sessions with the highest number of locks. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the number of user-held locks on the server exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum number of locks held by a user session	Enter a threshold for the maximum number of user-held locks on an Oracle RDBMS. The default value is 35 locks.

Description	How to Set It
Number of user sessions to display	Specify the number of user sessions with the most locks that you want displayed in the Event Properties dialog box. Enter 0 if you want all user sessions displayed. The default value is 10.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.41 TopMemoryUsers

Use this Knowledge Script to monitor memory utilization (User Global Area and Program Global Area) for current user sessions. If the memory utilization exceeds the threshold, the job raises an event.

You can specify the number of user sessions with the highest memory usage to display in the Event Properties dialog box. Information in the Event Properties dialog box includes the memory in bytes for each session, username, session ID, and program name. Enter 0 for the **Number of top user sessions to display** parameter if you want to include memory utilization statistics for all user sessions in the event details.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
DBA_USERS
V_$SESSION
V_$SESSTAT
V_$STATNAME
V_$VERSION
```

60.41.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.41.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

60.41.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for memory used by top N user sessions?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the total memory usage (in MB) for the top *N* user sessions. You determine how many sessions are included in this total by setting the **Number of top user sessions to display** parameter. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the total memory usage of any user session exceeds the threshold you set. By default, the job raises events.

Description	How to Set It
Threshold – Maximum amount of memory for a user session	Enter a threshold for the maximum total memory usage (in MB) for any user session. The default value is 10 MB.
Number of user sessions to display	Specify the number of user sessions with the highest memory utilization that you want displayed in the event detail message. Enter 0 if you want to see information for all user sessions. The default value is 15 user sessions.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).

60.42 TopResourceConsumingSQL

Use this Knowledge Script to determine which SQL queries for Oracle database are consuming the most resources on their UNIX hosts. This script identifies the top *N* queries consuming the most memory, disk I/O, and CPU time. The job raises an event with results of the job, and/or if the job results in a failure to retrieve data.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
DBA_USERS
V_$SQLAREA
V_$VERSION
```

60.42.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and collects the *N* SQL queries using the most CPU time, disk I/O, and memory.

60.42.2 Default Schedule

The default schedule for this script is **Every hour**.

60.42.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for top resource-consuming SQL statements?	Set to **y** to collect data for charts and reports. If data collection is enabled, returns the top *N* SQL statements consuming the most resources. The parameters below let you choose which resources to monitor. Set a value for *N* using the **Number of SQL statements to retrieve** parameter. By default, data is not collected.
Monitor SQL statements consuming the most disk I/O?	Select the **Yes** check box to monitor SQL statements consuming the most disk I/O. By default, disk I/O is monitored.
Monitor SQL statements consuming the most memory?	Select the **Yes** check box to monitor SQL statements consuming the most memory. By default, memory usage is monitored.
Monitor SQL statements consuming the most CPU time?	Select the **Yes** check box to monitor SQL statements consuming the most CPU time. By default, CPU utilization is monitored. **NOTE:** You cannot use this metric on Oracle databases prior to version 9.0.

Description	How to Set It
Number of SQL statements to retrieve	The number of most executed SQL queries to be retrieved by the job. The default value is 10. The maximum is 30.
Raise event if error occurs during retrieval?	Select the **Yes** check box to raise an event when an error occurs during job execution. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 10 (red event indicator.
Raise event with results from query?	Select the **Yes** check box to raise an event with the results of the query. By default, the job does not raise events.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 40 (magenta event indicator).

60.43 Transaction

Use this Knowledge Script to monitor the following parameters:

- **Active Transactions**: retrieve the number of active transactions that are ongoing, and the maximum number of transactions that can be executed concurrently (set as an initialization parameter). This script computes a ratio, expressed as a percentage, of the two numbers. When you enable data collection, the percentage is stored in the repository. You can set multiple thresholds for the maximum ratio, and the job raises an event when any of the thresholds exceeds the value you specified.
- **Call Rate**: the demand placed on a database instance from all sources. This demand is determined by tracking the number of database calls per second from all applications and processes accessing the database `instance.` The database calls that are tracked include `Parse, Execute`, and `Fetch` statements. These calls are sometimes described as **user calls**. When the call rate (and thus the workload demand on the server) exceeds the threshold you set, the job raises an event.
- **Calls Per Transaction**: the demand placed on a database instance by each transaction. This demand is determined by tracking the number of database calls (for example, to parse, execute, and fetch data) per committed transaction. When the number of database requests per transaction exceeds the threshold, the job raises an event.
- **Transaction Rate**: the transaction rate for an Oracle database. This script tracks the number of transactions per second to provide a basic measurement of application workload. In addition, this script raises an event if the number of transactions per second exceeds the threshold you set.

  Changes to your applications or to application usage patterns can affect the transaction rate, but in general, an increase in the transaction rate suggests an increase in overall server load. If you see a decrease in the transaction rate with the same number of connected users, it may indicate that you need to do some database tuning or investigate the reasons for the changes.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION

V_$PARAMETER
V_$TRANSACTION
```

60.43.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.43.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.43.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Monitoring	
Monitor ratio of active transactions?	Set to **y** to monitor the ratio of active transactions.
Monitor call rate?	Set to **y** to monitor the ratio of call rate.
Monitor calls made per transaction?	Set to **y** to monitor the calls made per transaction.
Monitor transaction rate?	Set to **y** to monitor the transaction rate.
Event Notification	
Event option for the ratio of active transactions to maximum concurrent transactions	
Raise event if ratio exceeds threshold?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job raises events.
Threshold - ratio of active transactions to max concurrent transactions	Specify a threshold for the maximum ratio of active transactions to maximum concurrent transactions, expressed as a percentage. The default for this threshold is 95%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 5 (red event indicator).
Raise event if ratio exceeds threshold?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold - ratio of active transactions to max concurrent transactions	Specify a threshold for the maximum ratio of active transactions to maximum concurrent transactions, expressed as a percentage. The default for this threshold is 80%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 15 (yellow event indicator).
Raise event if ratio exceeds threshold?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold - ratio of active transactions to max concurrent transactions	Specify a threshold for the maximum ratio of active transactions to maximum concurrent transactions, expressed as a percentage. The default for this threshold is 60%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 25 (blue event indicator).

Description	How to Set It
Raise event if ratio exceeds threshold?	Select the **Yes** check box to raise an event if the threshold exceeds the value you specified. By default, the job does not raise events.
Threshold - ratio of active transactions to max concurrent transactions	Specify a threshold for the maximum ratio of active transactions to maximum concurrent transactions, expressed as a percentage. The default value is 40%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 35 (magenta event indicator).
Event option for call rate	
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the maximum number of calls per second exceeds the threshold. By default, the job raises events.
Threshold – Maximum call rate	Enter a threshold for the maximum number of calls per second allowed before the job raises an event. The default value is 100 calls per second.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).
Event option for calls made per transaction	
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the number of calls per transaction exceeds the threshold. By default, the job raises events.
Threshold – Maximum number of calls per transaction	Enter a threshold for the maximum number of database calls per transaction allowed before the job raises an event. The default value is 100 calls per transaction.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).
Event option for transaction rate	
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the transaction rate exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum transaction rate	Enter a threshold for the maximum number of transactions per second allowed before an event is raised. The default value is 1 transaction per second.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).
Collect Data	

Description	How to Set It
Collect data for the ratio of active transactions to maximum concurrent transactions?	Set to **y** to collect data for charts and reports. If you enable data collection, the Knowledge Script returns the ratio of active transactions to maximum concurrent transactions as a percentage (%). By default, data is not collected.
Collect data for call rate?	Set to **y** to collect data for charts and reports. If you enable data collection, the Knowledge Script returns the total user calls per second for all work sources. By default, data is not collected.
Collect data for calls made per transaction?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the current transaction rate (transactions/second). By default, data is not collected.
Collect data for transaction rate?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the current transaction rate (transactions/second). By default, data is not collected.

60.44 TransactionRate

Use this Knowledge Script to monitor the transaction rate for an Oracle database. This script tracks the number of transactions per second to provide a basic measurement of application workload. In addition, this script raises an event if the number of transactions per second exceeds the threshold you set.

Changes to your applications or to application usage patterns can affect the transaction rate, but in general, an increase in the transaction rate suggests an increase in overall server load. If you see a decrease in the transaction rate with the same number of connected users, it may indicate that you need to do some database tuning or investigate the reasons for the changes.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.44.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.44.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

60.44.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for transaction rate?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the current transaction rate (transactions/second). By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the transaction rate exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum transaction rate	Enter a threshold for the maximum number of transactions per second allowed before an event is raised. The default value is 1 transaction per second.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 10 (red event indicator).

60.45 UpdateInstances

Use this Knowledge Script to update the list of Oracle databases/instances on each UNIX host.

NOTE: This script cannot be run to update environments in all cases. If you do not use a `listener.ora` file to maintain listener information, or if you install a new Oracle version on the host, we recommend that you log in to the host and run the `ckoracle` utility. This utility will prompt you to enter required information for newly added or deleted Oracle databases/instances.

60.45.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

NOTE: You must run the Discovery_OracleUNIX script after running the UpdateInstances script to pick up any changes in the environment.

If databases have been deleted, you must delete the Oracle UNIX objects from the TreeView. This cannot be done by the module or AppManager itself.

60.45.2 Default Schedule

The default interval for this script is Run Once.

60.45.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Required Parameter(s)	
Oracle Home to use as the client (usually that of the newest Oracle version)	Specify the Oracle Home directory that should be used as the client. If multiple versions of Oracle RBDMS are installed on the host, this is usually the Oracle Home directory of the newest version of Oracle. The default value is blank.
Optional Parameter(s)	
Location of `sqlnet.ora`, `listener.ora`, `tnsnames.ora (TNS_ADMIN)`	Specify the directory where the Oracle Net/Net 8 files reside (such as the `tnsnames.ora`, `listener.ora`, and `sqlnet.ora`). It is only necessary to set this parameter when the files are not in the default location for each Oracle Home (`$ORACLE_HOME/network/admin`). The default value is blank.
Oracle Username	Enter the username that OracleUNIX jobs will use for authentication with Oracle RDBMS during execution. This username will be passed to the NetIQ Security Manager. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.

Description	How to Set It
Password for the Oracle Username	Specify the password for the Oracle Username specified in the previous parameter. This password will be encrypted and passed to the AppManager Security Manager along with the Oracle username. The default value is blank.
Are all databases using the same listener?	Select the **Yes** check box if one listener is being used on the UNIX host, then specify the details of that listener below. By default, this parameter is disabled.
Name of listener	Specify the name of the listener that is being used on the UNIX host. This parameter is only used when you set the Are all databases using the same listener? to **Yes**. The default value is `LISTENER`.
Port used by listener	Enter the port number of that the listener is listening on for the UNIX host. This parameter is only used when you set the Are all databases using the same listener? to **Yes**. The default value is 1521.
Raise event if error occurs updating instances?	Select the **Yes** check box to raise an event when an error is detected while attempting to update the list of Oracle instances. By default, events are enabled.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 10 (red event indicator).
Raise event with current instance info if successfully updated?	Select the **Yes** check box to raise an event with the information collected on Oracle instances on the host during the update. By default, the job does not raise events.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event for successfully setting the monitoring options. The default severity level is 40 (magenta event indicator).

60.46 User

Use this Knowledge Script to monitor the following parameters:

- **User Calls Per Parse**: the ratio of parse count (hard) to the number of user calls as a percentage. The number of user calls that result in a parse indicates how well an application is managing its context area. Changes in this ratio may indicate changes to the application itself, or to changing usage patterns (For example, because users are moving from one module to another, more or less frequently).

  Generally, if the ratio of parsed calls to total user calls is low, it indicates that the SQL statements are executing efficiently without frequent reparsing. Otherwise, it may indicate that the private SQL area is too small.

  This script raises an event when the percentage of user calls that are parsed exceeds the threshold you set.

- **User Sessions**: the total number of user sessions accessing an Oracle database. If the total number of user sessions crosses the threshold, the job raises an event.

  You can specify the number of user sessions to display in the Event Properties dialog box. The Event Properties dialog box displays the total number of user sessions exceeding the threshold. Information in the graph includes the number of sessions for each user and the username.

- **User Rollback Ratio**: the user rollback ratio for an Oracle RDBMS Database. The user rollback ratio indicates the percentage of attempted application transactions that fail. The ratio compares the number of transactions rolled back to the total number of transactions attempted.

  Because rolling back a transaction uses significant system resources, an increase in this ratio suggests resources have been wasted in attempting to execute failed transactions. If you see a continued increase in this ratio, it may indicate serious application or database performance problems. This script raises an event when the rollback ratio exceeds the threshold.

- **Blocking Sessions**: the user sessions that are blocking other sessions and processes from accessing the Oracle database. You can set a maximum threshold for the number of sessions that are allowed to block other sessions and processes. If the number of blocking sessions exceeds the threshold, the job raises an event.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$LOCK
V_$VERSION

DBA_USERS
V_$SESSION
```

60.46.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.46.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.46.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
User	
User Calls Per Parse	Select the **Yes** check box to monitor User Calls Per Parse.
User Sessions	Select the **Yes** check box to monitor User Sessions.
User Rollback Ratio	Select the **Yes** check box to monitor User Callback Ratio.
Blocking Sessions	Select the **Yes** check box to monitor Blocking Sessions.
Event Notification	
Raise event if threshold is exceeded for User Calls Per Parse?	Select the **Yes** check box to raise an event if the ratio of parses per user call exceeds the threshold you set. By default, the job raises events.
Raise event if threshold is exceeded for User Sessions?	Select the **Yes** check box to raise an event if the number of user sessions exceeds the threshold. By default, the job raises events.
Raise event if threshold is exceeded for User Rollback Ratio?	Select the **Yes** check box to raise an event if the number of user transaction rollbacks exceeds the threshold. By default, the job raises events.
Raise event if threshold is exceeded for Blocking Sessions?	Select the **Yes** check box to raise an event if the number of blocking sessions exceeds the threshold you set. By default, the job raises events.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).
Data Collection	
Collect data for User Calls Per Parse?	Select the **Yes** check box to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the current percentage of user calls that are parsed. By default, data is not collected.
Collect data forUser Sessions?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the total number of user sessions. By default, data is not collected.
Collect data for User Rollback Ratio?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the current user rollback ratio. By default, data is not collected.

Description	How to Set It
Collect data for Blocking Sessions?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the number of blocking sessions per interval. By default, data is not collected.
Monitoring	
Threshold – Maximum Parses Per User Call	Enter a threshold for the maximum ratio of parsed calls to total user calls allowed before an event is raised. The default value is 0.2.
Threshold – Maximum total user sessions	Enter a threshold for maximum number of user sessions. The default value is 75 user sessions.
Number of user sessions to display	Specify the number of user sessions you want displayed in the Event Properties dialog box. Enter 0 if you want all user sessions displayed. The default value is 10 user sessions.
Threshold – Maximum user rollback ratio	Enter a threshold for the maximum percentage of transaction rollbacks allowed before the job raises an event. The default value is 75%.
Threshold – Maximum number of blocking sessions	Enter a threshold for the maximum number of user sessions allowed to block other user sessions and processes during the monitoring interval. The default value is 10 sessions.

60.47 UserCallsPerParse

Use this Knowledge Script to monitor the ratio of parse count (hard) to the number of user calls as a percentage. The number of user calls that result in a parse indicates how well an application is managing its context area. Changes in this ratio may indicate changes to the application itself, or to changing usage patterns (For example, because users are moving from one module to another, more or less frequently).

Generally, if the ratio of parsed calls to total user calls is low, it indicates that the SQL statements are executing efficiently without frequent reparsing. Otherwise, it may indicate that the private SQL area is too small.

This script raises an event when the percentage of user calls that are parsed exceeds the threshold you set.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.47.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.47.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

60.47.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for parses per user call?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the current percentage of user calls that are parsed. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the ratio of parses per user call exceeds the threshold you set. By default, the job raises events.
Threshold – Maximum ratio of parses per user call	Enter a threshold for the maximum ratio of parsed calls to total user calls allowed before an event is raised. The default value is 0.2.

Description	How to Set It
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.48 UserRollbackRatio

Use this Knowledge Script to monitor the user rollback ratio for an Oracle RDBMS Database. The user rollback ratio indicates the percentage of attempted application transactions that fail. The ratio compares the number of transactions rolled back to the total number of transactions attempted.

Because rolling back a transaction uses significant system resources, an increase in this ratio suggests resources have been wasted in attempting to execute failed transactions. If you see a continued increase in this ratio, it may indicate serious application or database performance problems. This script raises an event when the rollback ratio exceeds the threshold.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
V_$SYSSTAT
V_$VERSION
```

60.48.1 Resource Objects

Oracle Database folders. When you drop a script on an Oracle Database folder, a job executes on that database and monitors only that database.

60.48.2 Default Schedule

The default interval for this script is **Every hour**.

60.48.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for user rollback ratio?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the current user rollback ratio. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the number of user transaction rollbacks exceeds the threshold. By default, the job raises events.
Threshold – Maximum user rollback ratio	Enter a threshold for the maximum percentage of transaction rollbacks allowed before the job raises an event. The default value is 75%.
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

60.49 UserSessions

Use this Knowledge Script to monitor the total number of user sessions accessing an Oracle database. If the total number of user sessions crosses the threshold, the job raises an event.

You can specify the number of user sessions to display in the Event Properties dialog box. The Event Properties dialog box displays the total number of user sessions exceeding the threshold. Information in the graph includes the number of sessions for each user and the username.

The account you use to run this script must have `SELECT` permissions for the following tables:

```
DBA_USERS
V_$SESSION
```

60.49.1 Resource Objects

Oracle RDBMS Server icon, or Oracle RDBMS icon. When dropped on the Oracle RDBMS Server icon, a single script job monitors every database on that server. When dropped on an Oracle RDBMS icon, the script monitors only that database.

60.49.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

60.49.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the username that this script needs to access the target databases. If you run this script on more than one database, configure each database with the same username. **NOTE:** To use `SYSDBA` authentication, leave this parameter blank. The default value is blank.
Collect data for number of user sessions?	Set to **y** to collect data for charts and reports. When you enable data collection, the Knowledge Script returns the total number of user sessions. By default, data is not collected.
Raise event if threshold is exceeded?	Select the **Yes** check box to raise an event if the number of user sessions exceeds the threshold. By default, the job raises events.
Threshold – Maximum total user sessions	Enter a threshold for maximum number of user sessions. The default value is 75 user sessions.
Number of user sessions to display	Specify the number of user sessions you want displayed in the Event Properties dialog box. Enter 0 if you want all user sessions displayed. The default value is 10 user sessions.

Description	How to Set It
Severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

61 PhoneQuality Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring the voice quality of Cisco IP phones. From within the Operator Console, you can select a Knowledge Script in the Knowledge Script pane and press **F1** for complete details.

Knowledge Script	What It Does
AddCiscoPhone	Adds a Cisco IP phone to the TreeView pane.
CiscoPhoneQuality	Polls Cisco phones for voice quality statistics.
RemovePhone	Removes an IP phone from the TreeView pane.

61.1 AddCiscoPhone

Use this Knowledge Script to add a Cisco IP phone to the TreeView pane. You must add a phone before you can monitor it with the CiscoPhoneQuality script.

When polling a phone to get device information, the Knowledge Script job has a 20-second timeout period for each phone that it is attempting to contact. If you are adding many phones at one time, this Knowledge Script job may take quite a while if phones cannot be contacted.

TIP:

- If you use the Cisco CallManager Extension Mobility feature, then you know that it allows a Cisco IP phone to assume different configurations based on the user who is logged into the phone. When you add an Extension Mobility-enabled phone with the AddCiscoPhone script, the details of the phone, including directory number, are also based on the user who is logged in. If no user is logged in, then phone details are based on your CallManager configuration. In some cases, the phone details may indicate a directory number of 0000. In others, the phone may not be added at all because the CallManager configuration for the directory number is blank. You should add the phone at a time when the regular user is logged on.
- After running AddCiscoPhone for the first time, press [F5] to refresh the Operator Console. Refreshing ensures that all PhoneQuality Knowledge Scripts are visible on the **PhoneQuality** tab of the Knowledge Script pane.

61.1.1 Resource Object

PHONEQ_CISCOPHONEF

61.1.2 Default Schedule

By default, this script runs once.

61.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the AddCiscoPhone job fails. The default is 5.
Configuration Settings	
List of Cisco phone IP addresses	Type the IP addresses (in dotted notation) of the Cisco phone that you want to monitor. You can type one address or a list of addresses. If you type a list, separate the addresses with a comma, like so: `10.46.4.15,10.46.4.149`. **NOTE:** If you have more addresses than is convenient to enter in this field, you can list the addresses in a separate file and then use the following parameter to access that file.

Description	How To Set It

Full path to file with list of Cisco phone IP addresses	Type the full path to a file that contains a list of the IP addresses. Each address in the file should be on a separate line, like so:
	`10.46.4.15`
	`10.46.4.149`
	Because the file must be accessible from the agent, the path must be a local directory on the agent computer or a UNC path.
	Important If you type a UNC path, then the `netiqmc` service must be running as a user that has access to the path.

Event Notification	
Raise event if phone added successfully?	Select **Yes** to raise an event if the phone is successfully added to the TreeView pane. The default is Yes.
Event severity when phone added successfully	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the phone is added successfully. The default is 25.
Raise event if phone cannot be added?	Select **Yes** to raise an event if the phone cannot be added to the TreeView pane. The default is Yes.
Event severity when phone cannot be added	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the phone cannot be added to the TreeView pane. The default is 40.

61.2 CiscoPhoneQuality

Use this Knowledge Script to poll Cisco IP phones for voice quality statistics on active calls.

AppManager for IP Phone Quality collects or calculates the following call quality metrics:

- **Jitter**. Both average and maximum jitter are collected, if available on the monitored phone. Jitter, known to adversely affect call quality, indicates a variance in the arrival rate of datagrams sent during a VoIP call.

  When a datagram is sent, the sending phone gives it a timestamp. When the datagram is received, the receiving phone adds another timestamp. These two timestamps are used to calculate the datagram's transit time. If the transit times for datagrams within the same call are different, the call contains jitter. In a telephone call, jitter's effect may be similar to the effect of packet loss: some words may be missing or garbled.

  The amount of jitter in a call depends on the degree of difference between the datagrams' transit times. If the transit time for all datagrams is the same (no matter how long it took for the datagrams to arrive), the call contains no jitter. If the transit times differ slightly, the call contains some jitter. Jitter values provide a short-term measurement of network congestion and can also show the effects of queuing within the network.

- **Interval packet loss**. The percentage of packet loss is calculated from the number of packets received and the number of packets lost since the last poll. Measuring the packet loss that occurs during each interval, instead of over the entire call, provides a better indication of whether packet loss is occurring in short, dense periods. Short, dense periods of packet loss have a more severe impact on VoIP quality than loss that is spread over a longer period of time.

- **Listening R-value and listening MOS**. Using the performance metrics collected from monitored call, AppManager calculates an R-value, which summarizes the quality of the VoIP transmission.

  NetIQ uses a modified version of the ITU G.107 standard E-Model equation to make the R-value calculation. The E-Model algorithm evaluates the quality of a voice transmission by factoring in the "mouth-to-ear" characteristics of a speech path. These characteristics were derived from studies of user satisfaction with varying levels of transmission clarity and stability.

  The output of the E-Model's complex calculation is a single score called an *R-value*, which is derived from delays and equipment impairment factors.

  R-values range from 100 (excellent) to 0 (poor). Closely related to an R-value is an estimated Mean Opinion Score (MOS). MOS scores range from 1.0 to 5.0, where 2.6 and below indicate nearly all users are dissatisfied with the call, and 4.3 and above indicate that users are very satisfied with the call. AppManager for IP Phone Quality uses metrics available from the phones to calculate VoIP metrics: the codec and the number of lost data packets. The result of the calculation is a *listening* R-value and a *listening* MOS. The term "listening" indicates that the values do not include "interactive" or "conversational" characteristics such as delay.

Among the details within a quality data stream is the following information:

- Remote IP address and port number
- Number of datagrams sent and lost for packet loss statistics
- Codec for MOS and R-value statistics

Although this information can be useful, over time it can take up a significant amount of space in the repository. To gather only data points, and not the data discussed above, click the Advanced tab and select **Collect only data point** in the Data options panel.

61.2.1 Understanding Polling Intervals

The most significant feature of AppManager for IP Phone Quality is the *polling interval*. Polling is the process by which AppManager contacts the IP phone for call quality statistics; the interval is the frequency with which the polling takes place.

You control the polling interval using the parameters in the CiscoPhoneQuality Knowledge Script. Before you set these parameters, however, you should understand the two types of intervals: *no call in progress* and *call in progress*.

- Initially, a phone is polled according to the "no call in progress" polling interval, which is less frequent than the "call in progress" interval, consisting of three possible states:
  - No call is in progress, and there have been no calls since the last polling period. In this state, the Knowledge Script performs no actions, such as gathering data or generating events.
  - No call is in progress, but there was a call since the last polling period. In this state, the Knowledge Script again takes no action. In this state, however, a call has been missed. A call of shorter duration than your polling interval can begin and end before AppManager has a chance to poll again.
  - A call is in progress. The polling interval is speeded up according to the "call in progress" interval, and data points and events are generated.
- Once in the "call in progress" state, polling continues at the faster rate until the phone call ends. The generation of data points and events also continues until the phone call ends. Once the call ends, polling resumes at the "no call in progress" interval.

61.2.2 Understanding When Events are Raised

If, while AppManager is polling an IP phone, a call quality metric falls below or exceeds a threshold, then AppManager raises an event while the call is active. However, AppManager raises *only* one event per call.

For instance, if the jitter threshold is crossed, then AppManager will raise an event. If, 30 seconds later during the same call, the MOS threshold is crossed, AppManager will not raise another event.

61.2.3 Configuring a Diagnosis Action

By raising only one event per call, you are guaranteed to invoke NetIQ Vivinet Diagnostics only once per call, fIf you use Vivinet Diagnostics to diagnose call quality problems between your IP phones. Use the **Actions** tab to configure Action_DiagnoseVoIPQuality to trigger Vivinet Diagnostics run a Diagnosis when an event is raised.

On the Actions tab, click **New**. In the **Action** list, select **Action_DiagnoseVoIPQuality**. Click **Properties** and set the parameters for the Action script. For more information, see the script's Help.

For more information about triggering a Diagnosis, see the *Vivinet Diagnostics User Guide*.

61.2.4 Deciding Which Phones to Monitor

AppManager for IP Phone Quality is intended to monitor a limited number of phones. You should monitor no more than 100 phones.

If you need to monitor more than 100 phones, consider these guidelines:

- CPU usage on the agent computer is affected by the number of calls in progress.
- A Windows XP computer with a 1.5 GHz processor should be able to handle 100 in-progress calls.
- To monitor more than 100 in-progress calls, consider getting a faster computer or change the Polling interval when call is in progress parameter to a higher value for less-frequent polling.

When deciding which phones to monitor, consider the number of locations that you have and whether a phone is used often. For on-going monitoring, you may, for example, choose to monitor the receptionist's phone at each location. And, you can monitor additional phones on an as-needed basis for troubleshooting.

61.2.5 Prerequisites

- In order for AppManager to collect call quality statistics from Cisco IP phones, you must enable the Web interface on each phone that you want to monitor.
- Run AddCiscoPhone to add phones to the TreeView of the Operator Console.

61.2.6 Resource Object

PHONEQ_CISCOPHONEOBJ

61.2.7 Default Schedule

By default, this script runs on an asynchronous schedule.

61.2.8 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of the failure of the CiscoPhoneQuality job. The default is 5.
Monitor Settings	
Polling interval when no call is in progress	Specify the number of seconds that will elapse between polling instances when no call is in progress. The default is 120 seconds.
Polling interval when call is in progress	Specify the number of seconds that will elapse between polling instances when a call *is* in progress. The default is 30 seconds.

Description	How To Set It
Additional fixed delay for MOS/R-value calculation	Enter an amount of delay (in milliseconds) that you want to add to a call. This amount of delay is in addition to the three other types of delay that are associated with calculating MOS and R-value: • Network delay in one direction. This value is not available from the phones and so is set to 0 for calculating MOS and R-value. A network delay of 0 provides a “Listening” MOS/R-value because it does not take into consideration the interaction of a t wo-way conversation. • Packetization delay. This value is fixed, based on the type of codec being used. • Jitter buffer delay. This value is fixed, based on the type and size of the jitter buffer being used.
Event Notification	
Raise event if error occurs during polling?	Select **Yes** to raise an event if an error occurs during the polling of the selected IP phone. The default is Yes. Among the possible errors are the inability of AppManager to contact the IP phone and the improper formatting of the gathered statistics.
Event severity when error occurs during polling	Set the event severity level, from 1 to 40, to reflect the importance of an event in which an error occurred during phone polling. The default is 5.
Monitor Listening MOS	
Event Notification	
Raise event if Listening MOS falls below threshold?	Select **Yes** to raise an event if the value of Listening MOS falls below the threshold that you set. The default is Yes.
Threshold - Minimum Listening MOS	Specify the lowest Listening MOS value that can be calculated before an event is raised. The default is 3.6.
Event severity when Listening MOS falls below threshold	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the Listening MOS value falls below the threshold you set. The default is 5.
Data Collection	
Collect data for Listening MOS?	Select **Yes** to collect Listening MOS data for charts and graphs. The default is Yes. The Listening MOS data stream is calculated based on the statistics available from the phone.
Monitor Listening R-value	
Event Notification	
Raise event if Listening R-value falls below threshold?	Select **Yes** to raise an event if the Listening R-value falls below the threshold that you set. The default is unchecked.
Threshold - Minimum Listening R-value	Specify the lowest Listening R-value that can be calculated before an event is raised. The default is 70.
Event severity when Listening R-value falls below threshold	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the Listening R-value falls below the threshold you set. The default is 5.
Data Collection	

Description	How To Set It
Collect data for Listening R-value?	Select **Yes** to collect Listening R-value data for charts and graphs. The default is unselected. The Listening R-value data stream is calculated based on the statistics available from the phone.
Monitor Average Jitter	
Event Notification	
Raise event if average jitter exceeds threshold?	Select **Yes** to raise an event if the amount of average jitter exceeds the threshold that you set. The default is Yes.
Threshold - Maximum average jitter	Specify the highest amount of average jitter that can be achieved before an event is raised. The default is 60 milliseconds.
Event severity when average jitter exceeds threshold	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the amount of average jitter exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for average jitter?	Select **Yes** to collect average jitter data for charts and graphs. The default is Yes. The average jitter data stream is calculated by the phone and represents the average jitter, so far, over the duration of the call.
Monitor Maximum Jitter	
Event Notification	
Raise event if maximum jitter exceeds threshold?	Select **Yes** to raise an event if the amount of maximum jitter exceeds the threshold that you set. The default is Yes.
Threshold - Highest maximum jitter	Specify the highest amount of maximum jitter that can be achieved before an event is raised. The default is 60 milliseconds.
Event severity when maximum jitter exceeds threshold	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the amount of maximum jitter exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for maximum jitter?	Select **Yes** to collect maximum jitter data for charts and graphs. The default is Yes. The maximum jitter data stream is calculated by the phone and represents the maximum jitter, so far, over the duration of the call.
Monitor Interval Packet Loss	
Event Notification	
Raise event if interval packet loss exceeds threshold?	Select **Yes** to raise an event if the percentage of interval packet loss exceeds the threshold that you set. The default is Yes.
Threshold - Maximum interval packet loss	Specify the highest percentage of interval packet loss that can occur before an event is raised. The default is 1%.
Event severity when interval packet loss exceeds threshold	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the percentage of interval packet loss exceeds the threshold you set. The default is 15.
Data Collection	

Description	How To Set It
Collect data for interval packet loss?	Select **Yes** to collect interval packet loss data for charts and graphs. The default is Yes. The interval packet loss data stream is calculated based on the number of lost and received packets (these metrics are provided by the phone). Represents the percentage of packets lost over the previous polling interval. By calculating the percentage of packet loss on an interval, you get a better indication of the density of any packet loss.

61.2.9 Troubleshooting

Consult the following topics for solutions to problems and answers for frequently asked questions. For help with any issue, contact Technical Support: www.netiq.com/support.

Problem	Description
Phone details shown as "unknown"	**Problem**: In the Details tab, the description of a phone indicates "unknown." **Solution**: Phone details do not appear in the Details tab if they are not available from the phone's Web interface. The availability of phone details varies by phone model and firmware version. Ensure you have enabled the Web interface for each phone you want to monitor.
Datastreams not created for CiscoPhoneQuality job	**Problem**: As you run a CiscoPhoneQuality Knowledge Script job, you notice that no datastreams are being collected, even though you enabled data collection. In addition, no events are raised to indicate that the phone cannot be polled. **Solution**: Verify one or both of the following possible causes: • Was the call in progress for less time than the polling interval that is configured in the Knowledge Script? The script collects data only while a call is in progress. If the call begins and ends between polling instances, AppManager will miss the call. • Is the locale of the phone set to a language other than English? The Phone Quality managed object makes use of the Row Status value found on the phone's Streaming Statistics Web page to determine when a call is in progress. When the locale is set to English, this value is "Active." NetIQ has tested the Phone Quality module with several locales, including German, French, Italian, and Japanese. If you believe that the Phone Quality managed object is not recognizing the locale of your phone, contact NetIQ Technical Support and provide the following information:

Problem	Description
Directory number is “0000” or blank	**Problem**: After adding a phone, you notice that the Directory Number in the phone details is either “0000” or is blank. **Solution**: More than likely, the phone you added has the Extension Mobility feature enabled. If you use the CallManager Extension Mobility feature, then you know that it allows a Cisco IP phone to assume different configurations based on the user who is logged into the phone. When you add an Extension Mobility-enabled phone with the AddCiscoPhone script, the details of the phone, including directory number, are also based on the user who is logged in. If no user is logged in, then phone details are based on your CallManager configuration. In some cases, the phone details may indicate a directory number of 0000. In others, the phone may not be added at all because the CallManager configuration for the directory number is blank. You should add the phone at a time when the regular user is logged on. In addition, understand that the TreeView and data stream legends are not automatically updated when a directory number changes because a different user has logged on.

61.3 RemovePhone

Use this Knowledge Script to remove an IP phone from the TreeView pane.

When this Knowledge Script job runs successfully, the data source object in the TreeView pane is deleted. In addition, the job itself is also deleted, which is a normal side-effect of removing a TreeView object. The event that this job creates is not deleted because it is associated with the parent object (`PhoneQuality:<computer name>` object). However, you can set global preferences to to delet an event when the object and job are deleted.

To remove an event when a job is deleted:

1. On the File menu in the Operator Console, select **Preferences**, select **Repository**, and then select **Event**.
2. Select **Remove associated events when jobs are deleted**.
3. Click **OK**.

Tips

- After running this script on the object of the phone that you want to remove, double-check your selection in the Objects tab. By specifically selecting a phone object from the Objects tab, you will not accidentally remove a phone that you want to keep.
- Before attempting to remove a phone, stop any monitoring jobs that are running on the phone.

61.3.1 Resource Object

PHONEQ_CISCOPHONEOBJ

61.3.2 Default Schedule

By default, this script runs once.

61.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of the failure of the RemovePhone job. The default is 5.
Event Notification	
Raise event if phone removal succeeds?	Select **Yes** to raise an event if the phone is successfully removed from the TreeView pane. The default is Yes.
Event severity when phone removal succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the phone is successfully removed from the TreeView pane. The default is 25.

Description	How To Set It
Raise event if phone removal fails?	Select **Yes** to raise an event if the phone removal attempt fails. The default is Yes.
Event severity when phone removal fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the phone removal attempt fails. The default is 15.

62 PowerShell Knowledge Scripts

AppManager for Microsoft Windows provides the following Knowledge Scripts for monitoring the PowerShell scripting and command environment. PowerShell is made up of hundreds of executable objects called *cmdlets*, pronounced command-lets.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. Or in the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
RunCommand	Runs a specified PowerShell command.

62.1 RunCommand

Use this Knowledge Script to run the Microsoft Windows PowerShell cmdlet, PowerShell script (`.PS1` file), or code blocks you specify. This script raises an event with the command results and generates a datastream with the value returned by the command.

You can also use this script to run any command that can be run from a Windows PowerShell command prompt, such as `dir c:\temp`. PowerShell accepts commands in cmdlet, `.PS1`, and Windows `cmd.exe` formats.

The PowerShell_RunCommand script makes a number of callback and helper functions available to the PowerShell commands or scripts being run. For more information, see Appendix A, "Using PowerShell Callback and Helper Functions" in the management guide.

62.1.1 Prerequisites

- Microsoft Windows PowerShell version 1.0 or later
- Microsoft .NET Framework version 3.0
- AppManager for Windows version 7.6 or later

62.1.2 Resource Object

PowerShell folder

62.1.3 Default Schedule

By default, this script runs once.

62.1.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Event Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the RunCommand job fails. The default is 5.
PowerShell Command	

Parameter	How to Set It
PowerShell scripts, cmdlets, or code blocks to execute	Provide the PowerShell scripts, cmdlets, or code blocks you want to run. You can string multiple commands together. For example: This command returns all lines in all log files in the `C:\Temp` directory that contain the text strings *Error:* followed by *CPU*, with any number of characters (zero or more) between the two strings. Ensure your command contains no syntax errors. The RunCommand job will fail if the command contains syntax errors. **Note** Double quotation marks within a command are automatically doubled up, unless the only double-quotes in the command are already doubled up because they represent empty strings.In this situation, you can work around this issue by adding a final statement to the command. For example: `$foo -eq ""; [void] "x"` where the `;` separates this final statement from the rest of the statements, and the `[void] "x"` has no actual effect on the command execution, but it enables the script to recognize that all double-quotes in the command need to be doubled up. **Restrictions** • You can run scripts that have pathnames with spaces, but you need to use the *call operator* (&), such as: `& 'C:\Program Files\My Files\Agent.ps1'` The quotes (either single or double-quotes) around the full pathname are required if the path contains spaces. • PowerShell scripts (`.PS1` files) must be located on the computer on which you run the RunCommand script. The RunCommand script cannot run remote PowerShell scripts.
Event Notification	
Raise event with result of command?	Select **Yes** to raise an event when the command you run returns text or numeric results. The default is Yes.
Format results as	Select whether to format command results in a **Table** or a **List** or to apply no formatting. Select **Unformatted** if the command returns results that are already formatted. The default is Unformatted.
Event title	Provide text to use as the title of the event.
Event severity	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a command returns text or numeric results. The default is 25.
Raise event only if result contains specified pattern?	Select **Yes** to raise an event if the command returns text that matches the expression you provide in the *Pattern to find in the results* parameter. The default is unselected. This parameter is valid only if the *Raise event with result of command* parameter is enabled.

Parameter	How to Set It
Pattern to find in the results	Provide the text you want to compare to the command results. The following wildcards are acceptable: • ***** - matches zero or more instances of a character. • **?** - matches exactly one instance of a character. • **[ ]** - matches exactly one instance of any character between the square brackets, including ranges. Examples: • `[abc][def]` matches “ad,” “bad,” and “ace,” but not “bleary.” • `[a-z][a-z]` matches text that contains two adjacent alphabetic characters. • `foo?  Bar` matches “food bar” and “This is a food bar!” but not “foobar” or “foo bar.” • `*maximum mailbox*` matches “user smith has reached maximum mailbox size.”
Raise event only if numeric result crosses threshold?	Select **Yes** to raise an event if the command returns a numeric value that exceeds or falls below the threshold you set in the *Threshold value parameter*. The default is unselected. This parameter is valid only if the *Raise event with result of command* parameter is enabled.
Select operator to compare numeric result to threshold	Select the operator with which to compare the command results to the threshold value. Choose from one of the following: • Greater than • Less than • Greater than or equal to • Less than or equal to An event is raised if the command results do not match the threshold value based on the operator you choose. The default is Greater than.
Threshold value	Provide the numeric value to compare with the command results. An event is raised if the command results do not match the threshold value based on the option you choose in the *Select operator to compare numeric result to threshold* parameter. The default is 0.
Metric name to include in event title	Provide the name of the metric for which the command returns numeric results. For example, specify the name of a Performance Monitor counter. The name of the metric will be part of the title of the event raised when the numeric result crosses the threshold.
Raise event if command returns no results?	Select **Yes** if the command you run returns no results. The default is unselected. **Hint** You can use this parameter to raise an event when a command that *should* return text or numeric results does not return any results. Enable this parameter and disable the *Raise event with result of command?* parameter.
Event severity when command returns no results	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a command does not return text or numeric results. The default is 5.
Data Collection	

Parameter	How to Set It
Collect data for numeric command result?	Select **Yes** to collect data for charts and reports. This parameter is valid only if the *Raise event only if numeric result crosses threshold?* parameter is enabled. The default is unselected. Use the following parameters to format the wording and units of datastream legends.
Name of monitored metric	Provide the name of the metric for which the command returns numeric results. For example, specify the name of a Performance Monitor counter. The name of the metric will be part of the datastream legend.
Name of monitored resource	Provide the name of the device associated with the metric for which the command returns numeric results. For example, specify the hostname of a computer. The name of the device will be part of the datastream legend.
Datastream units	Identify the unit of measure associated with the metric for which the command returns numeric results. For example, specify `MB` or `Mbytes`. The unit of measure will be part of the datastream legend.

63 PowerVM Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring PowerVM resources.

From the Knowledge Script view of Control Center, you can access more information about any Knowledge Script by selecting it and clicking **Help**. In the Operator Console, select any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
PowerVM_CpuPoolUtil	Monitors CPU pool utilization.
PowerVM_Inventory	Monitors changes to the managed systems, LPARs, CPU Pools, physical volume groups, and physical volumes on the PowerVM server.
PowerVM_LPARCpuUtil	Monitors CPU utilization by LPAR.
PowerVM_ManagedSystemCpuUtil	Monitors CPU utilization of the management server.
PowerVM_ManagedSystemMemUtil	Monitors memory utilization of the management server.
PowerVM_PhysicalVolumeDiskSpaceUtil	Monitors PowerVM disk space utilization for physical volumes.
PowerVM_PhysicalVolumeGroupDiskSpaceUtil	Monitors PowerVM disk space utilization for physical volume groups.

63.1 PowerVM_CpuPoolUtil

Use this Knowledge Script to monitor the PowerVM CPU pool utilization. This script raises an event if CPU pool utilization exceeds the thresholds you set.

63.1.1 Resource Objects

PowerVM_CPUPoolFolder
PowerVM_CPUPoolObj

63.1.2 Default Schedule

By default, this script runs every 15 minutes.

63.1.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event when CPU pool utilization exceeds threshold?	Select **Yes** to raise an event when CPU pool utilization exceeds the threshold you set. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU resource pool utilization exceeds the threshold you set. The default is 5.
Raise event when number of LPARs associated with CPU pool exceeds threshold?	Select **Yes** to raise an event when the number of LPARs associated with the CPU resource pool exceeds the threshold you set. The default is deselected.
Event severity	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of LPARs associated with the CPU resource pool exceeds the threshold you set. The default is 5.
Raise event when AppManager fails to get metrics?	Select **Yes** to raise an event when the PowerVM_CpuPoolUtil job fails to get CPU pool resource metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PowerVM_CpuPoolUtil job fails to get CPU resource pool metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PowerVM_CpuPoolUtil job fails. The default is 5.
Data Collection Options	
Collect data for CPU pool utilization in percent?	Select **Yes** to collect CPU resource pool usage as a percent value. The default is deselected.
Monitoring Options	

Parameter	How to Set It
Threshold - Maximum total CPU pool utilization in percent	Specify the maximum percent of CPU resource pool utilization during any interval before an event is raised. The default is 80.
Threshold - Maximum number of LPARs associated with CPU pool	Specify the maximum number of LPARs that may be associated with the CPU resource pool during any interval before an event is raised. The default is 0.

63.2 PowerVM_Inventory

Use this Knowledge Script to monitor changes to the managed system, CPU pool, LPAR, volume group, and physical volume objects on PowerVM servers. You can configure this Knowledge Script to raise events when PowerVM objects are added or removed, or when an object attribute changes.

This Knowledge Script detects inventory changes by comparing snapshots of monitored objects from successive iterations. The first time you run this script, it creates an inventory snapshot. A snapshot reflects the current state of the monitored objects on the PowerVM server. In the second and subsequent iterations, this Knowledge Script creates a new inventory snapshot, compares it to the previous snapshot, and generates events based on selected options and differences between the snapshots.

Running this Knowledge Script once provides no information, you must run it at least twice for it to detect any inventory changes. NetIQ Corporation recommends you run this Knowledge Script immediately after discovery, then continue to run it regularly, either periodically or asynchronously, to monitor inventory changes.

63.2.1 Object and Attribute Event Options

Each inventory object has two event options that can generate an event when:

- An object is added or removed
- An object attribute is changed

The Knowledge Script action depends on the combination of event options you select and the inventory object or attribute change that occurs.

The short and detailed event messages both include the following:

- The hierarchy where the change occurred
- The Knowledge Script iteration count where the change was detected

Each snapshot is given an iteration count, beginning with 1. The iteration count is indicated by a `#` character. For example, if the Knowledge Script detects an LPAR attribute change when comparing snapshot six to snapshot five, it adds `[# 6]` to the event short and long messages.

For objects added or removed, the short message contains the object name, its position in the object hierarchy, and the iteration number where the change was detected. For object attribute changes, the short message contains the object name and the attribute that changed.

The detailed message contains the information from the short message, but in natural language. If available, the detailed message also lists the attribute values.

63.2.1.1 Script Actions when Objects are Added or Removed

The following table summarizes possible script actions when an inventory object is added or removed. **Object** represents the option to raise an event when an inventory object is added or removed. **Attribute** represents the option to raise an event when an inventory object attribute is changed.

	Attribute=No	Attribute=Yes
Object=No	No event	Create an attribute change event: • If an object is removed, report that monitored attributes have changed from a finite value to empty • If an object is added, report that monitored attributes have changed from empty to a finite value.
Object=Yes	Create an object added or removed event. Attribute values for the added or removed object are not listed in the event detailed message. For managed systems or physical volume groups, the child instances are also added or removed and reported in the event detailed message	Create an object added or removed event and list the last recorded attribute values in the event detailed message. For managed systems and physical volume groups, the child instances are also added or removed and reported in the event detailed message.

If you initially select **Object=Yes** and **Attribute=No** for an inventory object, then after some iteration *i* select **Attribute=Yes** and restart the script before iteration *i + 1*, the script will not create events for the option change when it compares snapshot *i + 1* to snapshot *i*. Changes will be detected and reported beginning with the comparison of snapshot *i + 2* to snapshot *i + 1* in iteration *i + 2*.

If you initially select **Object=No** and/or **Attribute=No** for an inventory object, then later select **Object=Yes** and/or **Attribute=Yes** between iteration *i* and *i + 1*, the script will not create events for the option change when it compares snapshot *i + 1* to snapshot *i*. Changes will be detected and reported beginning with the comparison of snapshot *i + 2* to snapshot *i + 1* in iteration *i + 2*.

Managed systems and physical volume groups are top-level objects that have child objects. When a managed system or physical volume group object is added or removed, the Knowledge Script also adds or removes its child objects. The event detailed message lists the child objects and their monitored attributes.

Child objects do not generate individual events. If a child has its own **Object=No** option selected, it is not included in the top-level event. Instead, the top-level event includes a message indicating the child object type is not being monitored.

For example, consider the following inventory option settings:

- Raise event when managed systems are added or removed
- Raise event when LPARs, physical volume groups, and physical volumes are added or removed, and when their attributes are changed
- Do not raise an event when CPU pools are added or removed or when their attributes are changed

If a managed system is removed, the Knowledge Script creates one removal event for the managed system. The LPARs, physical volume groups, and physical volumes that are children to the managed system are also reported as removed in the event detailed message and will not create additional events. CPU pools subordinate to the managed system are not reported because CPU pool monitoring is deselected, but the event detailed message includes a message stating that CPU pools are not being monitored.

Physical volume groups exhibit a similar behavior. When the Knowledge Script adds or removes a physical volume group, it also adds or removes its child physical volumes and lists them in the event detailed message.

63.2.1.2 Script Actions when Object Attributes are Changed

The following table summarizes possible script actions when an inventory object attribute is changed. **Object** represents the option to raise an event when an inventory object is added or removed. **Attribute** represents the option to raise an event when an inventory object attribute is changed.

	Attribute=No	Attribute=Yes
Object=No	No event	Create an attribute change event with the changes in the detailed message
Object=Yes	No event	Create an attribute change event with the changes in the detailed message

If you initially select **Object=No** and/or **Attribute=No** for an inventory object, then later select **Object=Yes** and/or **Attribute=Yes** between iteration *i* and *i + 1*, the script will not create events for the option change when it compares snapshot *i + 1* to snapshot *i*. Changes will be detected and reported beginning with the comparison of snapshot *i + 2* to snapshot *i + 1* in iteration *i + 2*.

63.2.1.3 Aggregate Events

This Knowledge Script can create events either separately or in aggregate. Each inventory object includes a parameter to raise separate events:

- If deselected, the Knowledge Script will create a single event for all changes that occur to the inventory object type.
- If selected, the Knowledge Script will create a separate event for each change and each affected object in the inventory object type.

For example, if five LPAR attributes change during an iteration:

- If **Raise separate events for each LPAR** is **deselected** (the default), the Knowledge Script creates one event whose event detailed message includes each LPAR and attribute affected by the change.
- If **Raise separate events for each LPAR** = **Yes**, the Knowledge Script creates five attribute change events for each affected LPAR. If the change affects six LPARs, the Knowledge Script creates 30 events.

By default, the parameters are deselected and the Knowledge Script creates a single event for each inventory object type. You can use this feature to selectively reduce the number of events the Knowledge Script creates and aggregate events by inventory object type.

63.2.2 Snapshot Persistence

This Knowledge Script stores its last snapshot persistently in the UNIX agent. If you restart the agent, the Knowledge Script will continue to work with the snapshot last saved by the agent and the snapshot it creates when it resumes.

You can use snapshot persistence to review cumulative inventory changes that occur when the Knowledge Script is not running. Start the Knowledge Script with a set of options, take a snapshot, and stop the job. When you restart the Knowledge Script at some later time, it compares its first snapshot with the snapshot persistent in the UNIX agent and reports the inventory differences between the time the job stopped and the time it started again.

63.2.3 Snapshot Error Recovery

If there is an error fetching the snapshot or any part of the snapshot, the Knowledge Script does not compare or raise events for objects affected by the error. Instead, it creates an event for the error it

encountered and discards the portion of the snapshot with the error, replacing it with the last known valid information. When the Knowledge Script can successfully fetch the part of the snapshot that previously had an error, it compares the part of the current snapshot to the corresponding part from the last valid snapshot.

For example, if the Knowledge Script successfully collects CPU pool information through iteration *i* and fails to collect CPU pool information in iteration *i + 1* because of an error, it replaces the CPU pool information in snapshot *i + 1* with the last valid information from snapshot *i*. Note that the entire snapshot is not replaced, only the part with the error. If the CPU pool information becomes available at some later iteration *i + k*, the CPU pool comparison will resume by comparing snapshot *i + k* to snapshot *i + k – 1*, which contains the last valid CPU pool information from snapshot *i*.

63.2.4 Resource Objects

PowerVM_MonitorHostFolder

63.2.5 Default Schedule

By default, this script runs daily.

63.2.6 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Raise event when AppManager fails to get metrics?	Select **Yes** to raise an event when the PowerVM_Inventory job fails to get metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PowerVM_Inventory job fails to get metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PowerVM_Inventory job fails. The default is 5.
Managed System Monitoring Settings	
Raise event when managed system is added or removed?	Select **Yes** to raise an event when a managed system is added to or removed from the PowerVM server. The default is Yes.
Raise event when managed system attribute is changed?	Select **Yes** to raise an event when a managed system default or additional attribute is changed on the PowerVM server. The default is deselected.
Raise separate events for each managed system?	Select **Yes** to raise a separate event for each managed system in instances where condition changes affect multiple managed systems on the PowerVM server. The default is deselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which one of the following changes occur on the PowerVM server: • A managed system is added to or removed • A managed system attribute is changed The default is 5.

Parameter	How to Set It
LPAR Monitoring Settings	
Raise event when LPAR is added or removed?	Select **Yes** to raise an event when an LPAR is added to or removed from a managed system on the PowerVM server. The default is Yes.
Raise event when LPAR attribute is changed?	Select **Yes** to raise an event when an LPAR default or additional attribute is changed on the PowerVM server. The default is deselected.
Raise separate events for each LPAR?	Select **Yes** to raise a separate event for each LPAR in instances where condition changes affect multiple LPARs on the PowerVM server. The default is deselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which one of the following changes occur on the PowerVM server: • An LPAR is added to or removed • An LPAR attribute is changed The default is 5.
CPU Pool Monitoring Settings	
Raise event when CPU pool is added or removed?	Select **Yes** to raise an event when a CPU pool is added to or removed from the PowerVM server. The default is Yes.
Raise event when CPU pool attribute is changed?	Select **Yes** to raise an event when a CPU default or additional attribute is changed for the PowerVM server. The default is deselected.
Raise separate events for each CPU pool?	Select **Yes** to raise a separate event for each CPU memory pool in instances where conditions affect multiple CPU pools on the PowerVM server. The default is deselected.
Event severity	Set the event severity, from 1 to 40, to indicate the importance of an event in which one of the following changes occur on the PowerVM server: • A CPU pool is added to or removed • A CPU attribute is changed The default is 5.
Physical Volume Group Monitoring Settings	
Raise event when physical volume group is added or removed?	Select **Yes** to raise an event when a physical volume group is added to or removed from the PowerVM server. The default is Yes.
Raise event when physical volume group attribute is changed?	Select **Yes** to raise an event when a physical volume group attribute is changed on the PowerVM server. The default is deselected.
Raise separate events for each volume group?	Select **Yes** to raise a separate event for each physical volume group in instances where condition changed affect multiple physical volume groups. The default is deselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which one of the following changes occur on the PowerVM server: • A physical volume group is added to or removed • A physical volume group attribute is changed The default is 5.
Physical Volume Monitoring Settings	
Raise event when physical volume is added or removed to volume group?	Select **Yes** to raise an event when a physical volume is added to or removed from a physical volume group on the PowerVM server. The default is Yes.
Raise event when physical volume attributes is changed?	Select **Yes** to raise an event when a physical volume attribute is changed on the powerVM server. The default is deselected.

Parameter	How to Set It
Raise separate events for each physical volume?	Select **Yes** to raise a separate event for each physical volume in instances where condition changes affect multiple physical volumes on the PowerVM server. The default is deselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which one of the following occur on the PowerVM server: • A physical volume is added to or removed from a physical volume group • A physical volume attribute is changed The default is 5.

63.3 PowerVM_LPARCpuUtil

Use this Knowledge Script to monitor PowerVM CPU utilization by LPAR. This script raises an event if LPAR CPU utilization exceeds the threshold you set.

63.3.1 Resource Objects

PowerVM_LPARFolder
PowerVM_LPARObj

63.3.2 Default Schedule

By default, this script runs every 15 minutes.

63.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event when CPU utilization exceeds threshold?	Select **Yes** to raise an event when an LPAR CPU utilization percentage exceeds the threshold you set. The default is Yes.
Event severity	Set the severity, from 1 to 40, to indicate the importance of an event in which an LPAR CPU utilization percentage exceeds the threshold you set.
Raise event when AppManager fails to get metrics?	Select **Yes** to raise an event when the PowerVM_LPARCpuUtil job fails to get LPAR CPU utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PowerVM_LPARCpuUtil job fails to get LPAR CPU utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PowerVM_LPARCpuUtil job fails.The default is 5.
Data Collection Options	
Collect data for LPAR CPU utilization in percent?	Select **Yes** to collect LPAR CPU utilization as a percent value. The default is deselected.
Collect data for LPAR CPU utilization in proc units?	Select **Yes** to collect LPAR CPU utilization as a number of processing units. The default is deselected.
Monitoring Options	
Threshold - Maximum LPAR CPU utilization in percent	Set the maximum percent of LPAR CPU utilization during any interval before an event is raised. The default is 80.

63.4 PowerVM_ManagedSystemCpuUtil

Use this Knowledge Script to monitor the PowerVM management server CPU utilization. This script raises an event if the management server CPU utilization exceeds the threshold you set.

63.4.1 Resource Objects

PowerVM_ManagedSystemFolder

63.4.2 Default Schedule

By default, this script runs every 15 minutes.

63.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event when total CPU utilization in percent exceeds threshold?	Select **Yes** to raise an event when the managed system total CPU utilization exceeds the threshold you set. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of event in which the managed system total CPU utilization exceeds the threshold you set. The default is 5.
Raise event when total CPU utilization in proc units exceeds threshold?	Select **Yes** to raise an event when the total CPU utilization in processing units (cores) exceeds the threshold you set. The default is deselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU utilization for any LPAR exceeds the threshold you set. The default is 5.
Raise event when AppManager fails to get metrics?	Select **Yes** to raise an event when the PowerVM_ManagedSystemCpuUtil job fails to get CPU utilization metrics. The default is Yes.
Event severity	Set the event severity, from 1 to 40, to indicate the importance of an event in which the PowerVM_ManagedSystemCpuUtil job fails to get CPU utilization metrics. The default is 5.
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the PowerVM_ManagedSystemCpuUtil job fails. The default is 5.
Data Collection Options	
Collect data for total CPU utilization in percent	Select **Yes** to collect CPU utilization data as a percent value. The default is deselected.
Collect data for total CPU utilization in proc units	Select **Yes** to collect CPU utilization data as a processing units (cores) value. The default is deselected.
Monitoring Options	

Parameter	How to Set It
Threshold - Maximum managed system total CPU utilization in percent	Set the maximum percentage of managed system CPU utilization before an event is raised. The default is 80.
Threshold - Maximum managed system total CPU utilization in proc units	Set the maximum amount of managed system CPU utilization in processing units before an event is raised. There is no default.

63.5 PowerVM_ManagedSystemMemUtil

Use this Knowledge Script to monitor the PowerVM management server memory utilization. This script raises an event if management server memory utilization exceeds the threshold you set.

63.5.1 Resource Objects

PowerVM_ManagedSystemFolder

63.5.2 Default Schedule

By default, this script runs every 15 minutes.

63.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event when memory utilization in percent exceeds threshold?	Select **Yes** to raise an event when the managed system memory utilization exceeds the threshold you set. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the managed system memory utilization exceeds the threshold you set. The default is 5.
Raise event when free memory is below threshold?	Select **Yes** to raise an event when the managed system free memory amount falls below the threshold you set. The default is deselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the managed system free memory amount falls below the threshold you set. The default is 5.
Raise event when AppManager fails to get metrics?	Select **Yes** to raise an event when the PowerVM_ManagedSystemMemUtil job fails to get managed system memory utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which he PowerVM_ManagedSystemMemUtil job fails to get managed system memory utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PowerVM_ManagedSystemMemUtil job fails. The default is 5.
Data Collection Options	
Collect data for used memory in percent?	Select **Yes** to collect managed system memory utilization as a percent value. The default is deselected.
Collect data for free memory in MB?	Select **Yes** to collect managed system free memory as a megabyte (MB) value. The default is deselected.
Monitoring Options	

Parameter	How to Set It
Threshold - Maximum managed system total memory utilization in percent	Specify the managed system total memory utilization percentage during any interval before an event is raised. The default is 80.
Threshold - Minimum managed system free memory in MB	Specify the amount of managed system free memory in MB during any interval below which an event is raised. The default is 100.

63.6 PowerVM_PhysicalVolumeDiskSpaceUtil

Use this Knowledge Script to monitor disk space utilization for a PowerVM physical volume. This Knowledge Script raises an event if total physical volume disk space utilization exceeds the threshold you set.

63.6.1 Resource Objects

PowerVM_PhysicalVolumeObj

63.6.2 Default Schedule

By default, this script runs every hour.

63.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event when disk space utilization in percent exceeds threshold?	Select **Yes** to raise an event when physical volume disk space utilization in percent exceeds the threshold you set. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the physical volume disk space utilization in percent exceeds the threshold you set. The default is 5.
Raise event when free disk space is below threshold?	Select **Yes** to raise an event when physical volume free disk space falls below the threshold you set. The default is deselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which physical volume free disk space falls below the threshold you set. The default is 5.
Raise event when AppManager fails to get metrics?	Select **Yes** to raise an event when the PowerVM_PhysicalVolumeDiskSpaceUtil job fails to get physical volume disk space utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PowerVM_PhysicalVolumeDiskSpaceUtil job fails to get physical volume disk space utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PowerVM_PhysicalVolumeDiskSpaceUtil fails. The default is 5.
Data Collection Options	
Collect data for used disk space in percent?	Select **Yes** to collect physical volume used disk space as a percent value. The default is deselected.
Collect data for free disk space in MB?	Select **Yes** to collect data for physical volume free disk space as a megabyte (MB) value. The default is deselected.

Parameter	How to Set It
Monitoring Options	
Threshold - Maximum physical volume total disk space utilization in percent	Set the maximum percentage of physical volume disk space utilization during any interval before an event is raised. The default is 80.
Threshold - Minimum physical volume free disk space in MB	Set the minimum physical volume free disk space in MB during any interval before an event is raised. The default is 100.

63.7 PowerVM_PhysicalVolumeGroupDiskSpaceUtil

Use this Knowledge Script to monitor disk space utilization for a PowerVM physical volume group. This knowledge script raises an event if the total disk space utilization exceeds the threshold you set.

63.7.1 Resource Objects

PowerVM_PhysicalVolumeGroupFolder
PowerVM_PhysicalVolumeGroupObj

63.7.2 Default Schedule

By default, this script runs every hour.

63.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event when disk space utilization in percent exceeds threshold?	Select **Yes** to raise an event when the physical volume group disk space utilization in percent exceeds the threshold you set. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the physical volume group disk space utilization in percent exceeds the threshold you set. The default is 5.
Raise event when free disk space is below threshold?	Select **Yes** to raise an event when the physical volume group free disk space falls below the threshold you set. The default is deselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the physical volume group free disk space falls below the threshold you set. The default is 5.
Raise event when AppManager fails to get metrics?	Select **Yes** to raise an event when the PowerVM_PhysicalVolumeGroupDiskSpaceUtil job fails to get physical volume group disk space utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PowerVM_PhysicalVolumeGroupDiskSpaceUtil job fails to get physical volume group disk space utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the PowerVM_PhysicalVolumeGroupDiskSpaceUtil job fails. The default is 5.
Data Collection Options	
Collect data for used disk space in percent?	Select **Yes** to collect physical volume group disk space utilization as a percent value. The default is deselected.
Collect data for free disk space in MB?	Select **Yes** to collect data for physical volume group free disk space as a megabyte (MB) value. The default is deselected.

Parameter	How to Set It
Monitoring Options	
Threshold - Maximum physical volume group total disk space utilization in percent	Set the maximum physical volume group disk space utilization in percent during any interval before an event is raised. the default is 80.
Threshold - Minimum physical volume group free disk space in MB	Set the minimum physical volume group free disk space in MB during any interval before an event is raised. The default is 100.

64 ReportADSI Knowledge Scripts

The ReportADSI category provides the following templates for generating reports based on data in Active Directory. From within the Operator Console, you can select one of the AppManager for Microsoft Active Directory in the Knowledge Script pane and press **F1** for complete details.

Report Script	Report Contents
ADObjects	Summarizes the properties and related values of objects in an Active Directory domain.
GroupMembership	Summarizes all the members that belong to an Active Directory group.
LocalService	Summarizes the services running on a managed computer in an Active Directory domain.
LocalUser	Summarizes the local user accounts on a managed computer in an Active Directory domain.
ReplicationLatency	Generates a report about Active Directory replication latency.
ReplSysVol	Reports on the consistency of files in the SysVol folder of the Report Agent's corresponding domain controller and the SysVol folders of that domain controller's replication partners.
ServerRoles	Summarizes the Active Directory roles for each server in the forest.
UserAccountsDisabled	Generates a report listing disabled and locked accounts in an Active Directory domain.
UserBadPasswordCount	Summarizes the number of failed logins due to bad passwords for accounts in an Active Directory domain.
UserMemberOfMoreThanOneGroup	Summarizes the number of members that belong to more than one group in an Active Directory domain.
UserPasswordExpired	Summarizes the number of accounts with expired passwords in an Active Directory domain.

64.1 ADObjects

Use this Knowledge Script to summarize the properties and related values of objects in an Active Directory domain. The report contains information for the selected organizational unit or common name object and for all sub-objects.

64.1.1 Resource Object

Report Agent > Active Directory > <Active Directory domain>

64.1.2 Default Schedule

The default schedule is **Run once**.

64.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
Select OU or CN name	Click **Browse [...]** to select the organizational unit or common name object for which you want to create a report.
Report Settings	
Include table of parameter values?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Output folder	Click **Browse [...]** to select the name and location of the folder in which the report will be saved.
Add job ID to output folder name?	Set to **Yes** to append the job ID to the name of the output folder. The default is unchecked. A job ID helps make the correlation between a specific instance of a Report Script and the corresponding report.
Report properties	Click **Browse [...]** to set report properties as desired.
Add timestamp to title?	Set to **Yes** to append a timestamp to the title of the report, making each title unique. The default is unchecked. The timestamp is made up of the date and time the report was generated. By adding a timestamp, you can run consecutive iterations of the same report without overwriting previous output.
Include Error Table?	Set to **Yes** to include a table in the report that lists any errors encountered when running the report. The default is Yes.
Omit property when value not found?	Set to **Yes** to omit any properties that do not have a value specified. The default is Yes.
ADsPath link address	Specifies the default Microsoft MSDN URL for ADsPath information. This link is provided in the report for reference purposes.

Description	How to Set It
Class link address	Specifies the default Microsoft MSDN URL for Class information. All classes referenced in the report are associated with hyperlinks based upon this URL.
Property link address	Specifies the default Microsoft MSDN URL for Property information. All properties referenced in the report are associated with hyperlinks based upon this URL.
Schema link address	Specifies the default Microsoft MSDN URL for Schema information. This link is provided in the report for reference purposes.
Event Notification	
Raise event for report success?	Set to **Yes** to raise an event when the report is successfully generated. The default is unchecked.
Event severity for report success	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta event indicator).
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated, but contains no data. The default is 25 (blue event indicator).
Event severity for report with error(s)	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is generated with some errors. The default is 15 (yellow event indicator).
Event severity for report failure	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (magenta event indicator).

64.2 GroupMembership

Use this Knowledge Script to create a list of all the members that belong to an Active Directory group. The report contains information for the selected organizational unit or common name object and for all sub-objects.

64.2.1 Resource Object

Report Agent > Active Directory > <Active Directory domain>

64.2.2 Default Schedule

The default schedule is **Run once**.

64.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
Select OU or CN name	Click **Browse [...]** to select the organizational unit or common name object for which you want to create a report.
Report Settings	
Include table of parameter settings?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is unchecked.
Output folder	Click **Browse [...]** to select the name and location of the folder in which the report will be saved.
Add job ID to output folder name?	Set to **Yes** to append the job ID to the name of the output folder. The default is unchecked. A job ID helps make the correlation between a specific instance of a Report Script and the corresponding report.
Report properties	Click **Browse [...]** to set report properties as desired.
Add timestamp to title?	Set to **Yes** to append a timestamp to the title of the report, making each title unique. The default is unchecked. The timestamp is made up of the date and time the report was generated. By adding a timestamp, you can run consecutive iterations of the same report without overwriting previous output.
Include Error Table?	Set to **Yes** to include a table in the report that lists any errors encountered when running the report. The default is Yes.
Event Notification	
Raise event for report success?	Set to **Yes** to raise an event when the report is successfully generated. The default is Yes.

Description	How to Set It
Event severity for report success	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta event indicator).
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated but contains no data. The default is 25 (blue event indicator).
Event severity for report with error(s)	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is generated with some errors. The default is 15 (yellow event indicator).
Event severity for report failure	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (magenta event indicator).

64.3 LocalService

Use this Knowledge Script list the services running on a managed computer in an Active Directory domain.

64.3.1 Resource Object

Report Agent > Active Directory

64.3.2 Default Schedule

The default schedule is **Run once**.

64.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
Target computer	Click **Browse [...]** to select the computer whose Active Directory services the report will list.
Report Settings	
Include table of parameter settings?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Output folder	Click **Browse [...]** to select the name and location of the folder in which the report will be saved.
Add job ID to output folder name?	Set to **Yes** to append the job ID to the name of the output folder. The default is unchecked. A job ID helps make the correlation between a specific instance of a Report Script and the corresponding report.
Report properties	Click **Browse [...]** to set report properties as desired.
Add timestamp to title?	Set to **Yes** to append a timestamp to the title of the report, making each title unique. The default is unchecked. The timestamp is made up of the date and time the report was generated. By adding a timestamp, you can run consecutive iterations of the same report without overwriting previous output.
Include Error Table?	Set to **Yes** to include a table in the report that lists any errors encountered when running the report. The default is Yes.
ADsPath link address	Specifies the default Microsoft MSDN URL for ADsPath information. This link is provided in the report for reference purposes.
Class link address	Specifies the default Microsoft MSDN URL for Class information. All classes referenced in the report are associated with hyperlinks based upon this URL.

Description	How to Set It
Property link address	Specifies the default Microsoft MSDN URL for Property information. All properties referenced in the report are associated with hyperlinks based upon this URL.
Schema link address	Specifies the default Microsoft MSDN URL for Schema information. This link is provided in the report for reference purposes.
Event Notification	
Raise event for report success?	Set to **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity for report success	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta event indicator).
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated but contains no data. The default is 25 (blue event indicator).
Event severity for report with error(s)	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is generated with some errors. The default is 15 (yellow event indicator).
Event severity for report failure	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (magenta event indicator).

64.4 LocalUser

Use this Knowledge Script list the local user accounts on a managed computer in an Active Directory domain.

64.4.1 Resource Object

Report Agent > Active Directory

64.4.2 Default Schedule

The default schedule is **Run once**.

64.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
Target computer	Click **Browse [...]** to select the computer that is the subject of your report.
Report Settings	
Include table of parameter settings?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Output folder	Click **Browse [...]** to select the name and location of the folder in which the report will be saved.
Add job ID to output folder name?	Set to **Yes** to append the job ID to the name of the output folder. The default is unchecked. A job ID helps make the correlation between a specific instance of a Report Script and the corresponding report.
Report properties	Click **Browse [...]** to set report properties as desired.
Add timestamp to title?	Set to **Yes** to append a timestamp to the title of the report, making each title unique. The default is unchecked. The timestamp is made up of the date and time the report was generated. By adding a timestamp, you can run consecutive iterations of the same report without overwriting previous output.
Include Error Table?	Set to **Yes** to include a table in the report that lists any errors encountered when running the report. The default is Yes.
ADsPath link address	Specifies the default Microsoft MSDN URL for ADsPath information. This link is provided in the report for reference purposes.
Class link address	Specifies the default Microsoft MSDN URL for Class information. All classes referenced in the report are associated with hyperlinks based upon this URL.
Property link address	Specifies the default Microsoft MSDN URL for Property information. All properties referenced in the report are associated with hyperlinks based upon this URL.

Description	How to Set It
Schema link address	Specifies the default Microsoft MSDN URL for Schema information. This link is provided in the report for reference purposes.
Event Notification	
Raise event for report success?	Set to **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity for report success	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta event indicator).
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated but contains no data. The default is 25 (blue event indicator).
Event severity for report with error(s)	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is generated with some errors. The default is 15 (yellow event indicator).
Event severity for report failure	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (magenta event indicator).

64.5 ReplicationLatency

Use this Knowledge Script to report on Active Directory replication latency. This script summarizes the average, maximum, and minimum values of the data streams collected by the AD_ReplicationLatency Knowledge Script, or another script you select, within the time range you select.

64.5.1 Resource Object

Report Agent > Active Directory

64.5.2 Default Schedule

The default schedule is **Run once**.

64.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse [...]** to select the computers for your report.
Select time range	Click **Browse [...]** to set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse [...]** to select the days of the week to include in your report.
Aggregation interval	Select the time interval by which the data in your report is aggregated. Possible values range from 1 to 90 hours. Default is 1 hour.
Report Settings	
Include table of parameter settings?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include table?	Set to **Yes** to include a table of data stream values in the report. The default is Yes.
Include chart?	Set to **Yes** to include a chart of data stream values in the report. The default is unchecked.
Select chart style	Click **Browse [...]** to define the graphic properties of the charts in your report.
Series style (Average)	Select a graphical style for the average value series in the chart. The default value is Line.
Chart title	Enter a title to assign to the chart of values.
Select output folder	Click **Browse [...]** to select the name and location of the folder in which the report will be saved.

Description	How to Set It
Add job ID to output folder name?	Set to **Yes** to append the job ID to the name of the output folder. The default is unchecked. A job ID helps make the correlation between a specific instance of a Report Script and the corresponding report.
Select properties	Click **Browse [...]** to set report properties as desired.
Add timestamp to title?	Set to **Yes** to append a timestamp to the title of the report, making each title unique. The default is unchecked. The timestamp is made up of the date and time the report was generated. By adding a timestamp, you can run consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event for report success?	Set to **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity for report success	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta event indicator).
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated but contains no data. The default is 25 (blue event indicator).
Event severity for report with error(s)	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is generated with some errors. The default is 15 (yellow event indicator).
Event severity for report failure	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (magenta event indicator).

64.6 ReplSysVol

Use this Knowledge Script to display information about the consistency of files in the SysVol folder of the Report agent's corresponding domain controller and the files in the SysVol folders of any replication partners of that domain controller.

You can return a list of all files whose content does not match.

The report lists each replication partner, and for each partner, the following columns of information:

- **File Compare**. If all files in the SysVol folder also exist on the replication partner, a value of `OK` is displayed in this column. Any files that exist in the SysVol folder but do not exist on the replication partner are listed here.
- **File Size Match**. If all matching files in the SysVol folder and the replication partner's SysVol folder match in size, a value of `OK` is displayed in this column. Any files with a disparity in size are listed here.
- **File Content Match**. If you enable the *Discover all files that do not match file content* parameter and all files match for content, a value of `OK` is displayed in this column. If any files do not match for content, those files are listed here.

  If you disable the *Discover all files that do not match file content* parameter and all files match for content, a value of `OK` is displayed in this column. If a non-matching file is found, comparison of file content stops with that file, and a value of `Testing Stopped` is displayed in this column.

64.6.1 Resource Object

Report Agent > Active Directory > <Active Directory domain>

64.6.2 Default Schedule

The default schedule is **Run once**.

64.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Discover all files that do not match file content?	Set to **Yes** to return a list of all files in the replication partner's SysVol folder whose content is different than the content of matching files in the SysVol folder of the Report Agent's corresponding domain controller. The default is Yes.
Report Settings	
Include table of parameter settings?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Output folder	Click **Browse [...]** to select the name and location of the folder in which the report will be saved.

Description	How to Set It
Add job ID to output folder name?	Set to **Yes** to append the job ID to the name of the output folder. The default is unchecked. A job ID helps make the correlation between a specific instance of a Report Script and the corresponding report.
Report properties	Click **Browse [...]** to set report properties as desired.
Add timestamp to title?	Set to **Yes** to append a timestamp to the title of the report, making each title unique. The default is unchecked. The timestamp is made up of the date and time the report was generated. By adding a timestamp, you can run consecutive iterations of the same report without overwriting previous output.
Include Error Table?	Set to **Yes** to include a table in the report that lists any errors encountered when running the report. The default is Yes.
Event Notification	
Raise event for report success?	Set to **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity for report success	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta event indicator).
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated but contains no data. The default is 25 (blue event indicator).
Event severity for report with error(s)	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is generated with some errors. The default is 15 (yellow event indicator).
Event severity for report failure	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (magenta event indicator).

64.7 ServerRoles

Use this Knowledge Script to display the Active Directory roles for each server in the forest. Active Directory roles include FSMO, Global Catalog, Bridgehead, and Inter-Site Topology Generator.

64.7.1 Resource Object

Report Agent > Active Directory > <Active Directory domain>

64.7.2 Default Schedule

The default schedule is **Run once**.

64.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
Include forest domain naming master?	Set to **Yes** to include the forest domain naming master in the report. The default is Yes.
Include forest schema master?	Set to **Yes** to include the forest schema master in the report. The default is Yes.
Include domain infrastructure masters?	Set to **Yes** to include domain infrastructure masters in the report. The default is Yes.
Include domain PDC emulators?	Set to **Yes** to include domain PDC emulators in the report. The default is Yes.
Include domain RID masters?	Set to **Yes** to include domain RID masters in the report. The default is Yes.
Include global catalogs?	Set to **Yes** to include global catalogs in the report. The default is Yes.
Include bridgeheads?	Set to **Yes** to include bridgeheads in the report. The default is Yes.
Include Inter-Site Topology Generators (ISTG)?	Set to **Yes** to include Inter-Site Topology Generators in the report. The default is Yes.
Report Settings	
Include table of parameter settings?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Output folder	Click **Browse [...]** to select the name and location of the folder in which the report will be saved.
Add job ID to output folder name?	Set to **Yes** to append the job ID to the name of the output folder. The default is unchecked. A job ID helps make the correlation between a specific instance of a Report Script and the corresponding report.
Report properties	Click **Browse [...]** to set report properties as desired.

Description	How to Set It
Add timestamp to title?	Set to **Yes** to append a timestamp to the title of the report, making each title unique. The default is unchecked. The timestamp is made up of the date and time the report was generated. By adding a timestamp, you can run consecutive iterations of the same report without overwriting previous output.
Include Error Table?	Set to **Yes** to include a table in the report that lists any errors encountered when running the report. The default is Yes.
Event Notification	
Raise event for report success?	Set to **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity for report success	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta event indicator).
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated but contains no data. The default is 25 (blue event indicator).
Event severity for report with error(s)	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is generated with some errors. The default is 15 (yellow event indicator).
Event severity for report failure	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (magenta event indicator).

64.8 UserAccountsDisabled

Use this Knowledge Script to generate a report listing disabled and locked accounts in an Active Directory domain. The report contains information for the selected organizational unit or common name object and for all sub-objects.

64.8.1 Resource Object

Report Agent > Active Directory > <Active Directory domain>

64.8.2 Default Schedule

The default schedule is **Run once**.

64.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select OU or CN name	Click **Browse [...]** to select the organizational unit or common name object for which you want to create a report.
Select object classes	Indicates the object classes to include for the selected organizational unit or common name object. The default is computer and user.
Report Settings	
Include table of parameter settings?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Output folder	Click **Browse [...]** to select the name and location of the folder in which the report will be saved.
Add job ID to output folder name?	Set to **Yes** to append the job ID to the name of the output folder. The default is unchecked. A job ID helps make the correlation between a specific instance of a Report Script and the corresponding report.
Report properties	Click **Browse [...]** to set report properties as desired.
Add timestamp to title?	Set to **Yes** to append a timestamp to the title of the report, making each title unique. The default is unchecked. The timestamp is made up of the date and time the report was generated. By adding a timestamp, you can run consecutive iterations of the same report without overwriting previous output.
Include Error Table?	Set to **Yes** to include a table in the report that lists any errors encountered when running the report. The default is Yes.
Event Notification	

Description	How to Set It
Raise event for report success?	Set to **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity for report success	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta event indicator).
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated but contains no data. The default is 25 (blue event indicator).
Event severity for report with error(s)	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is generated with some errors. The default is 15 (yellow event indicator).
Event severity for report failure	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (magenta event indicator).

64.9 UserBadPasswordCount

Use this Knowledge Script to list the number of failed logins due to bad passwords for accounts in an Active Directory domain. You can set a threshold for the maximum number of login failures due to bad passwords. Any account that exceeds the threshold you set is included in the report. The report contains information for the selected organizational unit or common name object and for all sub-objects.

64.9.1 Resource Object

Report Agent > Active Directory > <Active Directory domain>

64.9.2 Default Schedule

The default schedule is **Run once**.

64.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
Select OU or CN name	Click **Browse [...]** to select the organizational unit or common name object for which you want to create a report.
Select object classes	Indicates the object classes to include for the selected organizational unit or common name object. The default is computer and user.
Threshold – Maximum number of login failures due to bad passwords	Specify a threshold for the number of login failures due to bad password attempts. Any user account that exceeds this threshold is included in the report. The default is 0.
Report Settings	
Include table of parameter settings?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Output folder	Click **Browse [...]** to select the name and location of the folder in which the report will be saved.
Add job ID to output folder name?	Set to **Yes** to append the job ID to the name of the output folder. The default is unchecked. A job ID helps make the correlation between a specific instance of a Report Script and the corresponding report.
Report properties	Click **Browse [...]** to set report properties as desired.
Add timestamp to title?	Set to **Yes** to append a timestamp to the title of the report, making each title unique. The default is unchecked. The timestamp is made up of the date and time the report was generated. By adding a timestamp, you can run consecutive iterations of the same report without overwriting previous output.

Description	How to Set It
Include Error Table?	Set to **Yes** to include a table in the report that lists any errors encountered when running the report. The default is Yes.
Event Notification	
Raise event for report success?	Set to **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity for report success	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta event indicator).
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated but contains no data. The default is 25 (blue event indicator).
Event severity for report with error(s)	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is generated with some errors. The default is 15 (yellow event indicator).
Event severity for report failure	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (magenta event indicator).

64.10 UserMemberOfMoreThanOneGroup

Use this Knowledge Script to list the number of members that belong to more than one group in an Active Directory domain. The report contains information for the selected organizational unit or common name object and for all sub-objects.

64.10.1 Resource Object

Report Agent > Active Directory > <Active Directory domain>

64.10.2 Default Schedule

The default schedule is **Run once**.

64.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
Select OU or CN name	Click **Browse [...]** to select the organizational unit or common name object for which you want to create a report.
Select object classes	Indicates the object classes to include for the selected organizational unit or common name object. The default is computer and user.
Report settings	
Include table of parameter settings?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Output folder	Click **Browse [...]** to select the name and location of the folder in which the report will be saved.
Add job ID to output folder name?	Set to **Yes** to append the job ID to the name of the output folder. The default is unchecked. A job ID helps make the correlation between a specific instance of a Report Script and the corresponding report.
Report properties	Click **Browse [...]** to set report properties as desired.
Add timestamp to title?	Set to **Yes** to append a timestamp to the title of the report, making each title unique. The default is unchecked. The timestamp is made up of the date and time the report was generated. By adding a timestamp, you can run consecutive iterations of the same report without overwriting previous output.
Include Error Table?	Set to **Yes** to include a table in the report that lists any errors encountered when running the report. The default is Yes.
Event Notification	

Description	How to Set It
Raise event for report success?	Set to **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity for report success	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta event indicator).
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated but contains no data. The default is 25 (blue event indicator).
Event severity for report with error(s)	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is generated with some errors. The default is 15 (yellow event indicator).
Event severity for report failure	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (magenta event indicator).

64.11 UserPasswordExpired

Use this Knowledge Script to list the number of accounts with expired passwords in an Active Directory domain. The report contains information for the selected organizational unit or common name object and for all sub-objects.

64.11.1 Resource Object

Report Agent > Active Directory > <Active Directory domain>

64.11.2 Default Schedule

The default schedule is **Run once**.

64.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
Select OU or CN name	Click **Browse [...]** to select the organizational unit or common name object for which you want to create a report.
Select object classes	Indicates the object classes to include for the selected organizational unit or common name object. The default is computer and user.
Report Settings	
Include table of parameter settings?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Output folder	Click **Browse [...]** to select the name and location of the folder in which the report will be saved.
Add job ID to output folder name?	Set to **Yes** to append the job ID to the name of the output folder. The default is unchecked. A job ID helps make the correlation between a specific instance of a Report Script and the corresponding report.
Report properties	Click **Browse [...]** to set report properties as desired.
Add timestamp to title?	Set to **Yes** to append a timestamp to the title of the report, making each title unique. The default is unchecked. The timestamp is made up of the date and time the report was generated. By adding a timestamp, you can run consecutive iterations of the same report without overwriting previous output.
Include Error Table?	Set to **Yes to** include a table in the report that lists any errors encountered when running the report. The default is Yes.
Event Notification	

Description	How to Set It
Raise event for report success?	Set to **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity for report success	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta event indicator).
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated but contains no data. The default is 25 (blue event indicator).
Event severity for report with error(s)	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is generated with some errors. The default is 15 (yellow event indicator).
Event severity for report failure	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (magenta event indicator).

65 ReportAM Knowledge Scripts

The ReportAM category provides the following AppManager Knowledge Scripts for generating reports based on data collected by Knowledge Script jobs.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	Description
AgentMaintenance	The maintenance history of any computer on which you installed an AppManager agent.
AggValueHistory	Average, minimum, or maximum values aggregated by hour, day, week, or month over a specified time period.
ApplicationInfo	The monitored applications on computers in your AppManager environment.
AvgMaxMinValue	The average, maximum and minimum values of datastreams collected by Knowledge Script jobs.
AvgValueByDay	The average daily value of datastreams collected by Knowledge Script jobs.
AvgValueByHr	The average values per hour of datastreams collected by Knowledge Script jobs.
AvgValueByMin	The average values per minute of datastreams collected by Knowledge Script jobs.
Chart2HTML	Converts the contents of an XML file to an HTML page containing a chart and/or table of AppManager repository data.
Compare24Hours	Twenty-four average, minimum, or maximum hourly values for today, last week, last month, and the last three months.
Compare24HoursLD	Twenty-four average, minimum, or maximum hourly values for today, last week, last month, and the last three months. Use this report for data sets over 1.5 GB.
CompDeploy	The total number of instances of each AppManager component installed on computers in an AppManager site.
CompLic	Summary of AppManager license compliance.
CompVersion	The version number of AppManager components installed on all computers in an AppManager site.
CurrentDiskSpaceUsage	The used and free space on logical disks.
DataStream	High-level information about datastreams collected by Knowledge Script jobs.

Knowledge Script	Description
DataSummary	Statistical analysis of selected datastreams.
DeletedObjects	Objects that have been permanently deleted from the Navigation pane or the TreeView.
DetailData	Information returned by Knowledge Scripts that prepare data for presentation in an XML format.
DFSSummary	Details of the Distributed File System service on specified computers.
EventArchiveSummary	Summary of events from the ArchiveEvent table in the AppManager repository.
EventSeveritySummary	Number and severity of events raised by Knowledge Script jobs on specified computers.
EventStatisticsSummary	Summary of events per computer, listed by monitored application.
EventSummary	Summary of events per computer.
FRSSummary	Details of the File Replication service on specified computers.
GeneralCounter	Average, maximum or minimum value of selected datastreams.
GeneralMachineDown	Computers that were detected as down during a specified time period.
GroupPolicySummary	Summary of Group Policy settings for specified computers.
Inventory	Details of a specified application on a computer, or all components of a computer.
JobInfo	Details of Knowledge Script jobs.
JobSummary	Knowledge Script job, monitoring policy, action, and event information for each computer in an AppManager repository.
LastDataPoint	Value of the most recently collected data point in a datastream.
ModuleUsage	The number of different AppManager modules in use.
NetworkInterface	Details of the network interface components on specified computers.
NTLogicalDisk	Details of the logical disks on specified computers.
NTPhysicalDisk	Details of the physical disks on specified computers.
PerfOverview	A separate chart for each selected datastream.
PerfOverviewLD	A separate chart for each selected datastream. Use this report for data sets over 1.5 GB.
PlainDataInfo	Details of data points in specified datastreams.
PrinterSummary	Details of the printers and printer drivers installed on specified computers.
SerLevAvailability	Percentage of time specified services were up or down.
SQLDBInfo	Details of the databases managed by SQL Servers on specified computers.
SystemUpTime	Up- and downtime (by percent) of monitored computers.
SystemUpTimePie	Up- and downtime (by percent) of monitored computers. This report uses only a pie chart.
WatchList	Top or bottom N computers (by number or percent) generating the selected datastreams.

65.1 AgentMaintenance

Use this Knowledge Script to generate a report about the maintenance history of any computer on which you installed an AppManager agent. The report lists the type of maintenance (scheduled or ad hoc), and the beginning and ending dates and times of the maintenance period.

65.1.1 Resource Object

Report agent

65.1.2 Default Schedule

The default schedule is **Run once**.

65.1.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer name.
Select time range	Filter data in your report by a specific or sliding time range. The default is Sliding
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).

Parameter	How To Set It
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.2 AggValueHistory

Use this Knowledge Script to generate a report from data in the archive and aggregate tables.

If you choose to move data from the archive table to the aggregate tables, that data is then aggregated by hour, day, and month.

Briefly, the aggregation process works as follows:

- A preference is specified for the number of months' worth of data to keep in the archive table (for example, the three most recent months' worth).

  For all older data, an hourly average, minimum, maximum, sum, and count value are calculated. Those hourly values are then moved to the hourly aggregate table: ArcAvgHourlyData. Each hour's worth of data is then represented by five data points: average, minimum, maximum, sum, and count.

- The hourly aggregate table keeps three months' worth of data.

  For all older data, a daily average, minimum, maximum, sum, and count value are calculated. Those daily values are then moved to the daily aggregate table (ArcAvgDailyData). Each day's worth of data is then represented by five data points (average, minimum, maximum, sum, and count).

- The daily aggregate table keeps six months' worth of data.

  For all older data, a monthly average, minimum, maximum, sum, and count value are calculated. Those monthly values are then moved to the monthly aggregate table (ArcAvgMonthlyData). Each month's worth of data is then represented by five data points (average, minimum, maximum, sum, and count).

- The monthly aggregate table keeps data indefinitely.

Once information is moved from the source table to the destination table, it is deleted from the source table.

This script lets you generate a report that gives the hourly, daily, weekly, or monthly average, minimum or maximum value for selected datastreams over the time range you specify (for example, the monthly average of memory used by SQL Server processes over the last year).

65.2.1 Resource Object

Report agent

65.2.2 Default Schedule

The default schedule is **Run once**.

65.2.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **By Knowledge Script** provides links to pages showing all datastreams collected by a Knowledge Script (each page shows all datastreams collected from all computers on which the script has run) • **All datastreams on one page** generates a report with all data on a single page
Select time range	Filter the data in your report by a specific or sliding time range. The default is Sliding.
Select average, minimum, or maximum	Select the type of value you want to represent in your report.
Aggregation interval	Select the time period by which the data in your report is aggregated: • Hourly • Daily • Weekly • Monthly
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.

Parameter	How To Set It
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.3 ApplicationInfo

Use this Knowledge Script to generate a report detailing the monitored applications on computers in your AppManager environment. Details include application and build numbers, installation directories, and path and log information.

65.3.1 Resource Object

Report agent

65.3.2 Default Schedule

The default schedule is **Run once**.

65.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computers	Filter the data in your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.4 AvgMaxMinValue

Use this Knowledge Script to generate a report detailing the average, maximum and minimum values of datastreams collected by Knowledge Script jobs.

65.4.1 Resource Object

Report agent

65.4.2 Default Schedule

The default schedule is **Run once**.

65.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Select peak weekday(s)	Filter the data for your report by the days of the week.
Aggregation interval	Select the number of hours by which the data in your report is aggregated.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.
Series style (average)	Select a graphical style for the average value series in the charts in your report.
Chart title	Provide a title for the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.

Parameter	How To Set It
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.5 AvgValueByDay

Use this Knowledge Script to generate a report detailing the average daily value of datastreams collected by Knowledge Script jobs.

65.5.1 Resource Object

Report agent

65.5.2 Default Schedule

The default schedule is **Run once**.

65.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **By Knowledge Script** provides links to pages showing all datastreams collected by a Knowledge Script (each page shows all datastreams collected from all computers on which the script has run) • **All datastreams on one page** generates a report with all data on a single page
Select time range	Filter the data for your report by a specific or sliding time range.
Select peak weekday(s)	Filter the data for your report by the days of the week.
Aggregation interval	Select the number of days by which the data in your report is aggregated.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)

Parameter	How To Set It
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.6 AvgValueByHr

Use this Knowledge Script to generate a report detailing the average values per hour of datastreams collected by Knowledge Script jobs.

65.6.1 Resource Object

Report agent

65.6.2 Default Schedule

The default schedule is **Run once**.

65.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **By Knowledge Script** provides links to pages showing all datastreams collected by a Knowledge Script (each page shows all datastreams collected from all computers on which the script has run) • **All datastreams on one page** generates a report with all data on a single page
Select time range	Filter the data in your report by a specific or sliding time range. The default is Sliding.
Select peak weekday(s)	Filter the data in your report by days of the week.
Aggregation interval	Select the number of hours by which the data in your report is aggregated.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.

Parameter	How To Set It
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.7 AvgValueByMin

Use this Knowledge Script to generate a report detailing the average values per minute of datastreams collected by Knowledge Script jobs.

65.7.1 Resource Object

Report agent

65.7.2 Default Schedule

The default schedule is **Run once**.

65.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **By Knowledge Script** provides links to pages showing all datastreams collected by a Knowledge Script (each page shows all datastreams collected from all computers on which the script has run) • **All datastreams on one page** generates a report with all data on a single page
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Select peak weekday(s)	Filter the data for your report by days of the week.
Aggregation interval	Select the number of minutes by which the data in your report is aggregated.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.

Parameter	How To Set It
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.8 Chart2HTML

Use this Knowledge Script to generate an HTML page containing a chart and/or table of the data referenced in an XML file. Export data from a report to an XML file using the **Report to XML** command on the Export menu in the AppManager Chart Console.

To use this script successfully, the XML file must be saved to a folder accessible by the report agent.

65.8.1 Resource Object

Report agent

65.8.2 Default Schedule

The default schedule is **Run once**.

65.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
XML input file	Specify the full path to the .XML file generated from the AppManager Chart Console.
Select output folder	Set parameters for the output folder.
Chart type	Select the type of data display you want in the report: • Chart (chart only) • Data (table only) • Chart and Data (chart and table)
Time frame	Select the time frame for data in the report: • All (all data referenced by the XML file) • Today (any data from the day the report script is run – 12 A.M. to 11:59:59 P.M.) • Yesterday (any data from the day before the report script is run – 12 A.M. to 11:59:59 P.M.) • This Week (any data from the week during which the report script is run – 12 A.M. Sunday to the time of the report) • This Month (any data from the month during which the report script is run – 12 A.M. of the first day to the time of the report) • This Year (any data from the year during which the report script is run – 12 A.M. January 1 to the time of the report)
Fit into one graph?	Set to **y** to fit all data into a single graph. The default is y.
Report title	Provide a title for the report.

Parameter	How To Set It
Severity for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.9 Compare24Hours

Use this Knowledge Script to generate a report that compares the average, minimum or maximum values per hour of selected datastreams for periods of 1 day, 1 week, 1 month, and 3 months. You can limit the scope of the report by selecting data from specific days of the week (for example Monday through Friday only).

If you expect the data sets from which you are deriving values to exceed 1.5 GB, use the Compare24HoursLD Knowledge Script.

The time periods illustrated in the report are:

- Today
- Last Week
- Last Month
- Last 3 Months

For example:

- Today = 4-1-06, 12 A.M. to 11:59:59 P.M.
- Last Week = 3-24-06, 12 A.M. to 3-30-06, 11:59:59 P.M. (the previous seven days)
- Last Month = 3-1-06, 12 A.M. to 3-31-06, 11:59:59 P.M. (all days of the previous month; for example, if Today is any day in April, then Last Month = all days in March)
- Last 3 Months = 1-1-06, 12 A.M. to 3-31-06, 11:59:59 P.M. (all days of the previous three months; for example, if Today is any day in April, then Last 3 Months = all days in January, February, and March)

Twenty-four values are given for each time period, from 12 A.M. to 11 P.M. For each time period, the values are based on different quantities of data. For example:

- 12 A.M. Today is an average of one hour's worth of data (12 A.M. to 12:59:59 A.M. for one day)
- 12 A.M. Last Week is an average of seven hours' worth of data (12 A.M. to 12:59:59 A.M. for each day of the week)
- 12 A.M. Last Month is an average of 31 hours' worth of data (12 A.M. to 12:59:59 A.M. for each day of the month)
- 12 A.M. Last 3 Months is an average of 90 hours' worth of data (12 A.M. to 12:59:59 A.M. for each day of the three months)

This report always compares these four time periods, and so there is no option to select the time range.

All time periods are relative to the day you start the report.

65.9.1 Resource Object

Report agent

65.9.2 Default Schedule

The default schedule is **Run once**.

65.9.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select peak weekday(s)	Filter the data for your report by days of the week.
Select average, minimum, or maximum	Select the type of value you want to represent in your report.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style (Today)	Define the graphic properties of the chart in your report, and for the chart series representing values for the Today time period.
Series style (Last Time Periods)	Select the series style for the last three time periods represented in the report. This parameter lets you select a series style different from the Today series in order to easily differentiate the time periods.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.10 Compare24HoursLD

Use this Knowledge Script instead of Compare24Hours when the data sets from which you are deriving values exceed the ADO limit of 1.5 GB. When data sets exceed this size limit, the report agent cannot process the data. Use this script to process data on the SQL Server managing the AppManager repository and return the aggregated value to the report agent.

Use this script to generate a report that compares the average, minimum or maximum values per hour of selected datastreams for periods of 1 day, 1 week, 1 month, and 3 months. You can limit the scope of the report by selecting data from specific days of the week (for example Monday through Friday only).

The time periods illustrated in the report are:

- Today
- Last Week
- Last Month
- Last 3 Months

For example:

- Today = 4-1-06, 12 A.M. to 11:59:59 P.M.
- Last Week = 3-24-06, 12 A.M. to 3-30-06, 11:59:59 P.M. (the previous seven days)
- Last Month = 3-1-06, 12 A.M. to 3-31-06, 11:59:59 P.M. (all days of the previous month; for example, if Today is any day in April, then Last Month = all days in March)
- Last 3 Months = 1-1-06, 12 A.M. to 3-31-06, 11:59:59 P.M. (all days of the previous three months; for example, if Today is any day in April, then Last 3 Months = all days in January, February, and March)

Twenty-four values are given for each time period, from 12 A.M. to 11 P.M. For each time period, the values are based on different quantities of data. For example:

- 12 A.M. Today is an average of one hour's worth of data (12 A.M. to 12:59:59 A.M. for one day)
- 12 A.M. Last Week is an average of seven hours' worth of data (12 A.M. to 12:59:59 A.M. for each day of the week)
- 12 A.M. Last Month is an average of 31 hours' worth of data (12 A.M. to 12:59:59 A.M. for each day of the month)
- 12 A.M. Last 3 Months is an average of 90 hours' worth of data (12 A.M. to 12:59:59 A.M. for each day of the three months)

This report always compares these four time periods, and so there is no option to select the time range.

All time periods are relative to the day you start the report.

65.10.1 Resource Object

Report agent

65.10.2 Default Schedule

The default schedule is **Run once**.

65.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select peak weekday(s)	Filter the data for your report by days of the week.
Select average, minimum, or maximum	Select the type of value you want to represent in your report.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style (Today)	Define the graphic properties of the chart in your report, and for the chart series representing values for the Today time period.
Series style (Last Time Periods)	Select the series style for the last three time periods represented in the report. This parameter lets you select a series style different from the Today series in order to easily differentiate the time periods.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.11 CompDeploy

Use this Knowledge Script to generate a report detailing the total number of instances of each AppManager component installed on computers in an AppManager site (for example, the number of IIS and Exchange managed objects).

65.11.1 Resource Object

Report agent

65.11.2 Default Schedule

The default schedule is **Run once**.

65.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.12 CompLic

Use this Knowledge Script to generate a report summarizing AppManager license compliance.

A separate license is required for each managed application on each computer. For example, if you are using AppManager to manage Microsoft SQL Server on ten different computers, then you are required to have ten licenses for AppManager for Microsoft SQL Server. If you are managing multiple instances of an application running on a single computer, such as multiple instances of SQL Server, only one license is required for that computer.

This report lists the number of AppManager licenses you have for a particular application (Number of Permanent Licenses) and the number of different computers on which you have discovered that application (Number of Permanent Licenses in Use). You are out of compliance if the number of permanent licenses in use exceeds the number of permanent licenses.

65.12.1 Resource Object

Report agent

65.12.2 Default Schedule

The default schedule is **Run once**.

65.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.

Parameter	How To Set It
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.13 CompVersion

Use this Knowledge Script to generate a report detailing the version number of AppManager components installed on all computers in an AppManager site.

65.13.1 Resource Object

Report agent

65.13.2 Default Schedule

The default schedule is **Run once**.

65.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.14 CurrentDiskSpaceUsage

Use this Knowledge Script to generate a report detailing the used space on logical disks.

This report uses data collected by any Knowledge Script that monitors the available MB or the percentage of used space on a logical disk, such as NT_DiskSpace or UNIX_FileSystemSpace. Ensure you archive data detail when running the Knowledge Scripts to collect data. You must disable the *Do not archive data detail* option in the Advanced tab of the Knowledge Script properties dialog box to allow automatic data archiving.

NOTE: In the *Filter Settings* parameters, if you set the *Filter column* parameter to **Drive** and the *Filter operator* parameter to either **Greater than** or **Less than**, the script will not run but will raise an event indicating you made an invalid configuration of the script. For example, a drive can be equal to/not equal to C:, but not greater than/less than C:.

65.14.1 Resource Object

Report agent

65.14.2 Default Schedule

The default schedule is **Run once**.

65.14.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Select type	Select the method by which report content is ordered. Possible values are: • By computer • By drive • By total space • By space used • By percent used • By space free • By percent free For example, if you select By computer, then data is ordered by computer name. If you select By drive, data is ordered by drive letter.
Sort order	Select whether values are displayed in an ascending or descending order.
Filter Settings	

Parameter	How To Set It
Filter column	Use this parameter to set the first variable of the filtering equation. Use this parameter in conjunction with the *Select type* parameter. Make sure the two parameters have comparable values (for example, if *Select type* is set to *By drive*, set this parameter to *Drive*). If *Select type* is set to *By computer*, set this parameter to *<None>*. Possible values are: • <None> • Drive • Total space • Space used • Percent used • Space free • Percent free
Filter operator	Select an operator for the filtering equation. Possible values are: • Greater than • Less than • Equal to • Not equal to
Filter value	Specify a value for the second variable of the filtering equation. For example, if the first variable is *Drive*, and the operator is *Equal to*, set this parameter to *C:* to return data for all C: drives.
Report settings	
Disk space units	Select whether you would like the values in the report expressed in MB or GB.
Include parameter help card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. A job ID allows you to correlate a specific instance of a Report Script with the corresponding report. The default is unselected.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Select **Yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is Yes.
Event notification	
Event for report success?	Select **Yes** to raise an event when the report is successfully generated. The default is Yes.

Parameter	How To Set It
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.15 DataStream

Use this Knowledge Script to generate a report containing high-level information about datastreams collected by Knowledge Script jobs. High-level information includes the script names, datastream legends, and job IDs.

65.15.1 Resource Object

Report agent

65.15.2 Default Schedule

The default schedule is **Run once**.

65.15.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Select Knowledge Script(s)	Filter the data for your report by Knowledge Script.
Select job(s)	Filter the data for your report by specific Knowledge Script jobs.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID allows you to correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).

Parameter	How To Set It
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.16 DataSummary

Use this Knowledge Script to generate a report containing a statistical summary of selected datastreams.

The data wizard allows you to select any combination of datastreams for a report. Depending on which datastreams you select and which style you select, your report can contain meaningful, easily-understood information, or it can contain information that is of no value.

The following examples of selecting datastreams and report styles show the different types of information reports can contain in each case.

By computer style

If you select different datastreams that use *different* units of measure, the report contains a separate value for each datastream from each computer.

For example, if you select the following datastreams:

- `Ldsk:  D:USED %`
- `Ldsk:  D:AVAIL MB`

the report contains one value for each computer for the percentage of used space on the D: drive, and one value for each computer for the available megabytes on the D: drive.

If you select different datastreams that use the *same* unit of measure, the report contains one value for each computer.

For example, if you select the following datastreams:

- `Ldsk:  D:USED %`
- `MemPhysUsage %`

the report contains a single percentage value for each computer. Each single percentage value is derived from all memory usage and disk usage values taken together. In this case, the values in the report are meaningless.

By legend style

If you select multiple datastreams with the same legend from two different computers, the report contains one value for each different legend.

For example, if you select the following datastreams:

- `Ldsk:  D:USED %`
- `Ldsk:  D:AVAIL MB`

the report contains one value for the percentage of used space on both D: drives, and one value for the available megabytes on both D: drives. This type of report would be useful, for example, if you wanted an overall statistic of disk space availability or memory use for something like a server farm.

If you select multiple datastreams with different legends, the report contains one value for each legend.

For example, if you select the following datastreams:

- `Ldsk:  D:USED %`
- `MemPhysUsage %`

the report contains a single percentage value for each legend. One percentage value is derived from disk usage on both computers, the other from memory usage on both computers. As in the previous example, this type of report is useful for overall statistics.

By computer and legend style

The *by computer and legend* style lets you get individual values for each datastream from each computer.

Using this style, if you select the following datastreams:

- `Ldsk:  D:USED %`
- `Ldsk:  D:AVAIL MB`

the report contains one value for each datastream for each computer.

If you select the following datastreams:

- `MemPhysUsage %`
- `Ldsk:  D:USED %`

the report contains one value for each datastream for each computer.

Regardless of the style you select, the table in the report always shows the average, minimum, maximum, and count values for a datastream. It may show additional values, as well, depending on how you configure the report.

65.16.1 Resource Object

Report agent

65.16.2 Default Schedule

The default schedule is **Run once**.

65.16.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Select peak weekday(s)	Filter the data for your report by days of the week.
Select the style	Select the style for the report: • **By computer** shows values for each computer you selected. • **By legend** shows one value for each different legend. • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Parameter	How To Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the aggregation interval (for example, the average value for 1 Hour) • **Minimum**: The minimum value of data points for the aggregation interval • **Maximum**: The maximum value of data points for the aggregation interval • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the aggregation interval • **Range**: The range of values in the datastream (maximum - minimum = range) • **StandardDeviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the aggregation interval • **Close**: The last value for the aggregation interval • **Change**: The difference between the first and last values for the aggregation interval (close - open = change) • **Count**: The number of data points for the aggregation interval
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to yes, then the data table shows only the top or bottom N or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to yes, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.

Parameter	How To Set It
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to yes to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to yes to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.17 DeletedObjects

Use this Knowledge Script to generate a report about objects that have been permanently deleted from the Navigation pane or the TreeView. These are objects that have been deleted with the **Do not rediscover** option.

65.17.1 Resource Object

Report agent

65.17.2 Default Schedule

The default schedule is **Run once**.

65.17.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.18 DetailData

Use this Knowledge Script to generate a report containing information returned by Knowledge Scripts that prepare data for presentation in an XML format. If the data is not in an XML format, use the PlainDataInfo script.

You can use this report for any script that collects and displays data details in an XML format.

In order to have detail data available for this report, the *Collect data details with data point* option must be set in one of the following ways:

- for each relevant AppManager repository (**File > Preferences > Repository tab > Knowledge Script options > Advanced Properties**)
- on the Advanced properties tab of any individual Knowledge Script for which you want to generate a report.

65.18.1 Resource Object

Report agent

65.18.2 Default Schedule

The default schedule is **Run once**.

65.18.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select Knowledge Script	Filter the data for your report by Knowledge Script. If you have not collected data using a supported Knowledge Scripts, the browser is blank. If you change the name of a Knowledge Script, the new name appears in the browser.
Select computer(s)	Filter the data for your report by computer.
Select time range	Filter the data for your for report by a specific or sliding time range. The default is Sliding.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. The default is n. A job ID helps you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Set miscellaneous report properties as desired.

Parameter	How To Set It
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. The default is n. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.19 DFSSummary

Use this Knowledge Script to generate a report containing details of the Distributed File System (DFS) service on specified computers. Details include the image path and services upon which DFS depends.

65.19.1 Resource Object

Report agent

65.19.2 Default Schedule

The default schedule is **Run once**.

65.19.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data in your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.20 EventArchiveSummary

Use this Knowledge Script to generate a report containing a summary of events per computer. The summary includes event IDs and statuses, Knowledge Scripts that raised the events, and event messages. The data for this report is taken from the ArchiveEvent table in the AppManager repository, which contains any archived event information you saved according to your AppManager repository preferences.

65.20.1 Resource Object

Report agent

65.20.2 Default Schedule

The default schedule is **Run once**.

65.20.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computers	Filter the data for your report by computer.
Select Knowledge Scripts	Filter the data for your report by Knowledge Script. The default is All.
Select jobs	Filter the data for your report by a specific Knowledge Script job. The default is All.
Event status	Filter the data for your report by event status. The default is All.
Select time range for last occurrence	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Report settings	
Limit the size of event detail	Specify the maximum number of characters to display in the event detail message. The default is 200.
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder. The default folder name is ArchivedEventSummary.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired. The default report name is Archived Event Summary.

Parameter	How To Set It
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.21 EventSeveritySummary

Use this Knowledge Script to generate a report containing the number and severity of events raised by Knowledge Script jobs on specified computers.

65.21.1 Resource Object

Report agent

65.21.2 Default Schedule

The default schedule is **Run once**.

65.21.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.22 EventStatisticsSummary

Use this Knowledge Script to generate a report summarizing events per computer. Events are listed by monitored application. The total event count for each application is listed, as well as the count for each event status: open, acknowledged, closed.

65.22.1 Resource Object

Report agent

65.22.2 Default Schedule

The default schedule is **Run once**.

65.22.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.23 EventSummary

Use this Knowledge Script to generate a report containing a summary of events per computer. The summary includes event IDs and statuses, names of the Knowledge Scripts that raised the events, and event messages.

65.23.1 Resource Object

Report agent

65.23.2 Default Schedule

The default schedule is **Run once**.

65.23.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Select Knowledge Script(s)	Filter the data for your report by Knowledge Script.
Select job(s)	Filter the data for your report by specific Knowledge Script jobs.
Event status	Filter the data for your report by event status.
Select time range for last occurrence	Filter the data for your report by a specific or sliding time range. If the last occurrence of the event does not fall within this range, the report will have no data. The default is Sliding.
Report settings	
Limits the size of event detail	Specify the maximum number of characters to display in the event detail message. The default is 200.
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.

Parameter	How To Set It
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.24 FRSSummary

Use this Knowledge Script to generate a report containing details of the File Replication Service (FRS) on specified computers. Details include image path and services upon which FRS depends.

65.24.1 Resource Object

Report agent

65.24.2 Default Schedule

The default schedule is **Run once**.

65.24.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.25 GeneralCounter

Use this Knowledge Script to generate a report containing a chart and table showing the average, maximum or minimum value of each selected datastream.

This report allows you to set the maximum number of data points illustrated in the chart, regardless of the number of data points that have been collected. For example, you may be collecting data every five minutes, but you want to report on the daily maximum value for the last week. Set the time range to 7 days, and set the maximum number of points per chart to 7. The report aggregates the data in increments of one day, and the chart illustrates seven maximum values for each selected datastream. The table in the report mirrors the chart settings: in this case, the table has seven rows of data.

The number of points in the chart do not have to correspond exactly to the time period on which you are reporting. You can illustrate a year's worth of data using 50 or 100 points, and you can illustrate a day's worth of data using 50 or 100 points. This script aggregates the data in the report according to the time range and points per chart settings.

This feature is useful for illustrating any time period in a single chart.

65.25.1 Resource Objects

Report agent

65.25.2 Default Schedule

The default schedule is **Run once**.

65.25.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **By Knowledge Script** provides links to pages showing all datastreams collected by a Knowledge Script (each page shows all datastreams collected from all computers on which the script has run) • **All datastreams on one page** generates a report with all data on a single page

Parameter	How To Set It
Select time range	Filter the data for your report by a specific or sliding time range.
Select peak weekday(s)	Filter the data for your report by days of the week.
Maximum number of points per chart	Specify the maximum number of data points illustrated in the chart. The default is 200. Possible values range from 5 to 1000.
Select average, minimum or maximum	Select the type of value you want in the report.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.26 GeneralMachineDown

Use this Knowledge Script to generate a report about computers that were detected as down during a specified time period.

This report uses data collected by the UNIX_PingMachine and General_MachineDown Knowledge Scripts.

65.26.1 Resource Objects

Report agent

65.26.2 Default Schedule

The default schedule is **Run once**.

65.26.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer. **NOTE:** You must select the computers on which the UNIX_PingMachine or General_MachineDown Knowledge Scripts were run.
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	

Parameter	How To Set It
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.27 GroupPolicySummary

Use this Knowledge Script to summarize Group Policy settings for specified computers.

65.27.1 Resource Object

Report agent

65.27.2 Default Schedule

The default schedule is **Run once**.

65.27.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.28 Inventory

Use this Knowledge Script to generate a report containing details of a specified application on a computer, including version number, root directory and security settings, or all components of a computer, including memory and disk configuration, and details of any applications monitored by AppManager.

This report contains information from a single AppManager repository.

65.28.1 Resource Object

Report agent

65.28.2 Default Schedule

The default schedule is **Run once**.

65.28.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select application	Select the application that is the subject of your report. Select **All Components** to report on all applications on specified computers.
Select computer(s)	Filter the data for your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.

Parameter	How To Set It
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.29 JobInfo

Use this Knowledge Script to generate a report containing the details of Knowledge Script jobs.

The first page of the report lists the specified jobs by computer, and gives the job ID and status of each job. The job IDs are links to pages containing further details about each job. Details include the schedule for each job and the parameter settings.

NOTE: Run this script only on a management server computer.

65.29.1 Resource Object

Report agent

65.29.2 Default Schedule

The default schedule is **Run once**.

65.29.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Select job status	Filter the data for your report by job status.
Select job(s) (optional)	Filter the data for your report by specific Knowledge Script jobs. **NOTE:** If you enable this parameter, do not enable the next parameter. You cannot successfully implement both optional parameters.
Select Knowledge Script(s) (optional)	Filter the data for your report by Knowledge Script. **NOTE:** If you enable this parameter. You cannot successfully implement both optional parameters.
Sort by	Select a sorting method for the contents of the first page of the report: • **Computer** sorts the contents alphabetically by computer name • **Job ID** sorts the information for each computer numerically by job ID • **Knowledge Script Name** sorts the information for each computer alphabetically by Knowledge Script name • **Job Status** sorts the information for each computer alphabetically by job status
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.

Parameter	How To Set It
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.30 JobSummary

Use this Knowledge Script to generate a report about the Knowledge Script jobs, monitoring policies, actions, and events associated with each computer you are monitoring. The report includes all computers in a given AppManager repository.

The first page of the report lists each computer followed by the number of Knowledge Script jobs, monitoring policies, actions, and events associated with that computer. The computer names are links to pages containing further details about each Knowledge Script job on that computer. These details include:

- The job ID
- The Knowledge Script name
- The names of Knowledge Script Groups that include the Knowledge Script
- The names of any Action Knowledge Scripts initiated by the Knowledge Script job
- The number of events raised by the Knowledge Script job

65.30.1 Resource Object

Report agent

65.30.2 Default Schedule

The default schedule is **Run once**.

65.30.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of datastream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of datastream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.

Parameter	How To Set It
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.31 LastDataPoint

Use this Knowledge Script to generate a report about the value of the most recently collected data point in a datastream.

This report is useful for monitoring conditions such as database size or disk space; conditions where the current state of affairs is of most interest.

65.31.1 Resource Object

Report agent

65.31.2 Default Schedule

The default schedule is **Run once**.

65.31.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By Knowledge Script** provides links to pages showing all datastreams collected by a Knowledge Script (each page shows all datastreams collected from all computers on which the script has run) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer)
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.

Parameter	How To Set It
Select output folder	Click the **Browse [...]** button to set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.32 ModuleUsage

Use this Knowledge Script to generate a report about the number of different AppManager modules in use (for example, the number of different SQL Servers on which you are running Knowledge Script jobs). The report contains:

- The module name
- The number of module licenses required
- The number of modules in use

You can use this report in conjunction with the CompLic Knowledge Script to identify differences between the number of module licenses and the number of modules deployed.

65.32.1 Resource Object

Report agent

65.32.2 Default Schedule

The default schedule is **Run once**.

65.32.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.

Parameter	How To Set It
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.33 NetworkInterface

Use this Knowledge Script to generate a report detailing the network interface components on specified computers. Details include the manufacturer, IP address, and subnet mask.

65.33.1 Resource Objects

Report agent

65.33.2 Default Schedule

The default schedule is **Run once**.

65.33.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.34 NTLogicalDisk

Use this Knowledge Script to generate a report detailing the logical disks on specified computers. Details include file systems, and drive sizes (in MB).

65.34.1 Resource Object

Report agent

65.34.2 Default Schedule

The default schedule is **Run once**.

65.34.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.35 NTPhysicalDisk

Use this Knowledge Script to generate a report detailing physical disks on specified computers. Details include disk sizes (in MB), cylinders per disk, and tracks per cylinder.

65.35.1 Resource Object

Report agent

65.35.2 Default Schedule

The default schedule is **Run once**.

65.35.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.36 PerfOverview

Use this Knowledge Script to generate a report containing a single average value for each selected datastream for a specified increment of time, for example, an average value derived from one hour's worth of data or 30 days' worth of data.

If you expect the data sets from which you are deriving values to exceed 1.5 GB, use PerfOverviewLD instead of this script.

A separate chart is generated for each selected datastream.

65.36.1 Resource Object

Report agent

65.36.2 Default Schedule

The default schedule is **Run once**.

65.36.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By Knowledge Script** provides links to pages showing all datastreams collected by a Knowledge Script (each page shows all datastreams collected from all computers on which the script has run)
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Select peak weekday(s)	Filter the data for your report by days of the week.
Aggregation by	Select the method by which data in the report is aggregated. The options are: • Minute • Hour • Day This parameter is used in conjunction with the following parameter. For example, if you choose to aggregate by day, then the following parameter determines how many days' worth of data are aggregated.

Parameter	How To Set It
Aggregation interval	Select the interval at which the data in your report is aggregated. This parameter is used in conjunction with the previous parameter. For example, if the **Aggregation by** parameter is set to **Day**, use this parameter to set the number of days by which data is aggregated (1 gives you a single value for one day's worth of data, 2 gives you a single value for two days' worth of data, and so on).
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.37 PerfOverviewLD

Use this Knowledge Script in place of PerfOverview when the data sets from which you are deriving values exceed the ADO (ActiveX Data Objects) limit of 1.5 GB. When data sets exceed this size limit, the report agent cannot process the data. Use this script to process data on the SQL Server managing the AppManager repository and return the aggregated value to the report agent.

The report contains a single average value for each selected datastream for a specified increment of time, for example, an average value derived from one month's worth of data or one year's worth of data.

A separate chart is generated for each selected datastream.

65.37.1 Resource Object

Report agent

65.37.2 Default Schedule

The default schedule is **Run once**.

65.37.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the datastreams collected from a single computer) • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By Knowledge Script** provides links to pages showing all datastreams collected by a Knowledge Script (each page shows all datastreams collected from all computers on which the script has run)
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Select peak weekday(s)	Filter the data for your report by the days of the week.
Aggregation by	Select the method by which data in the report is aggregated. The options are: • Hour • Day This parameter is used in conjunction with the following parameter. For example, if you choose to aggregate by day, then the following parameter determines how many days' worth of data are aggregated.

Parameter	How To Set It
Aggregation interval	Select the interval at which the data in your report is aggregated. This parameter is used in conjunction with the previous parameter. For example, if the **Aggregation by** parameter is set to **Day**, use this parameter to set the number of days by which data is aggregated (1 gives you a single value for one day's worth of data, 2 gives you a single value for two days' worth of data, and so on).
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.38 PlainDataInfo

Use this Knowledge Script to generate a report listing the details of data points in specified datastreams. Details include the data point value, and the time at which the data point was collected. If the data is presented using an XML format, use the DetailData Knowledge Script.

In order to have detail data available for this report, the *Collect data details with data point* parameter must be set in one of the following ways:

- for each relevant AppManager repository (**File > Preferences > Repository tab > Knowledge Script options > Advanced Properties**)
- on the Advanced properties tab of any individual Knowledge Script for which you want to generate a report.

65.38.1 Resource Objects

Report agent

65.38.2 Default Schedule

The default schedule is **Run once**.

65.38.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select Knowledge Script	Filter the data for your report by Knowledge Script.
Datastream	Specify the legend of the datastreams that you want to include in your report. To return all datastreams, enter `ALL`.
Select computer(s)	Filter the data for your report by computer.
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.

Parameter	How To Set It
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.39 PrinterSummary

Use this Knowledge Script to generate a report detailing the printers and printer drivers installed on specified computers.

65.39.1 Resource Objects

Report agent

65.39.2 Default Schedule

The default schedule is **Run once**.

65.39.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.40 SerLevAvailability

Use this Knowledge Script to generate a report detailing the percentage of time specified services were up or down.

This report uses data collected by the NT_ServiceDown and General_ServiceDown Knowledge Scripts. In order to have accurate data for this report, schedule these Knowledge Scripts to run every five minutes.

If you are using NT_ServiceDown, set the *Collect data?* parameter to **y**, and the *Collect data only on down?* parameter to **n**, so that you are always collecting data, rather than collecting data only when a service is down.

Uptime and downtime are calculated during scheduled maintenance. Ad hoc maintenance is considered as downtime, and is included in all calculations.

NOTE: This script expects a certain number of data points per time period based on the parameter settings of the Knowledge Script collecting data. If any data points are missing, the corresponding times are considered as downtime. For example, if a Knowledge Script is configured to collect 12 data points per hour, but only collects six, then one half hour is considered downtime. Data points may be missing, for example, if the Knowledge Script job was stopped and restarted, or if the agent was not running for that period.

65.40.1 Resource Object

Report agent

65.40.2 Default Schedule

The default schedule is **Run once**.

65.40.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select the style	Select the style for the first page of the report: • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** generates a report with all data on a single page
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Select peak weekday(s)	Filter the data for your report by the days of the week.

Parameter	How To Set It
Aggregation interval	Select the time period by which the data in your report is aggregated: • Hourly • Daily • Weekly
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.41 SQLDBInfo

Use this Knowledge Script to generate a report detailing the databases managed by SQL Servers on specified computers. Details include the database names and owners, and database and log sizes (in MB).

65.41.1 Resource Object

Report agent

65.41.2 Default Schedule

The default schedule is **Run once**.

65.41.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.42 SystemUpTime

Use this Knowledge Script to generate a report detailing the uptime and downtime of monitored computers. Uptime and downtime are illustrated in hours and minutes, as well as the percentage of the monitoring interval during which a computer is running or not. For example, if during a 24-hour monitoring interval, the computer is running for 18 hours and not running for six hours, the uptime and downtimes are represented as:

- Uptime: 18 hours 0 minutes
- Downtime: 6 hours 0 minutes
- Uptime: 75%
- Downtime: 25%

This report uses data collected by the NT_SystemUpTime and UNIX_SystemUpTime Knowledge Scripts. In order to have accurate data for this report, schedule these Knowledge Scripts to run every 5 minutes.

Uptime and downtime are calculated during scheduled maintenance. Ad hoc maintenance is considered as downtime, and is included in all calculations.

65.42.1 Resource Object

Report agent

65.42.2 Default Schedule

The default schedule is **Run once**.

65.42.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Select the style	Select the style for the first page of the report: • **By computer and datastream** provides links to pages showing a single datastream collected from a computer • **All datastreams on one page** generates a report with all data on a single page
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Select peak weekday(s)	Filter the data for your report by the days of the week.
Aggregation interval	Select the time period by which the data in your report is aggregated: • Hourly • Daily • Weekly

Parameter	How To Set It
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.43 SystemUpTimePie

Use this Knowledge Script to generate a report detailing the uptime and downtime of monitored computers. This report illustrates uptime and downtime using a pie chart. You can enter a minimum threshold for uptime. Any values below the threshold are colored red in the table in the report.

Uptime and downtime are illustrated in hours and minutes, as well as the percentage of the monitoring interval during which a computer is running or not. For example, if during a 24-hour monitoring interval, the computer is running for 18 hours and not running for six hours, the uptime and downtime are represented as:

- Uptime: 18 hours 0 minutes
- Downtime: 6 hours 0 minutes
- Uptime: 75%
- Downtime: 25%

This report uses data collected by the NT_SystemUpTime and UNIX_SystemUpTime Knowledge Scripts. In order to have accurate data for this report, schedule these scripts to run every 5 minutes.

Uptime and downtime are calculated during scheduled maintenance. Ad hoc maintenance is considered as downtime, and is included in all calculations.

65.43.1 Resource Object

Report agent

65.43.2 Default Schedule

The default schedule is **Run once**.

65.43.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Select computer(s)	Filter the data for your report by computer.
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Select peak weekday(s)	Filter the data for your report by the days of the week.
Uptime threshold %	Specify a value for the minimum uptime threshold. Any value below this threshold is colored red in the table. Use any value less than 100. You can use decimals.
Report settings	

Parameter	How To Set It
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Chart width	Provide a value for the width in pixels of the pie chart image.
Chart height	Provide a value for the height in pixels of the pie chart image.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

65.44 WatchList

Use this Knowledge Script to generate a report detailing the top or bottom N computers, by number or percent, that generated the selected datastreams.

65.44.1 Resource Object

Report agent

65.44.2 Default Schedule

The default schedule is **Run once**.

65.44.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Data source	
Top or bottom	Select either **Top** or **Bottom** as a filtering criterion.
Number N	Set the value of the *Top or bottom* parameter (for example, top 5 or bottom 5).
Number or percent	Select whether the report defines the top or bottom N by number or percent (for example, top 5 or bottom 5 percent).
Top or bottom by	Select which type of datastream values take precedence in the report: • Average • Minimum • Maximum For example, if you are reporting on the Top 5 computers and you set this parameter to Average, then the top 5 computers with the highest average values for the selected datastreams are included in the report. In this case, the maximum and minimum values are also included, but the average values are listed first in the table, and the average values are by default given a unique graphic style in the chart. The report always includes all three values for the sake of comparison, but the type of value you select for this parameter is given precedence in the report.
Select data wizard	Select the data for your report by Knowledge Script or by datastream.
Select the style	Select the style for the first page of the report: • **By datastream** provides links to pages showing a side-by-side comparison of values for the same datastream collected from different computers (each page shows, for example, the value of the *NT_CpuResource-All Threads(#)* datastream from each computer) • **By Knowledge Script** provides links to pages showing all datastreams collected by a Knowledge Script (each page shows all datastreams collected from all computers on which the script has run)

Parameter	How To Set It
Select time range	Filter the data for your report by a specific or sliding time range. The default is Sliding.
Select peak weekday(s)	Filter the data for your report by the days of the week.
Report settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table/chart/both?	Select the type of datastream values you want to include in the report: • **Table** (table only) • **Chart** (chart only) • **Both** (table and chart)
Select chart style	Define the graphic properties of the charts in your report.
Top/bottom N series style	Select the graphical style of the data series representing the top or bottom N datastreams.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is n.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp contains the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is n.
Event notification	
Event for report success?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

66 SharePoint Knowledge Scripts

AppManager for Microsoft SharePoint Server provides the following Knowledge Scripts for monitoring Microsoft SharePoint resources. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
BytesTransfer	Monitors the total number of bytes transferred per second to and from a Web application.
ConnectionsInterval	Monitors the number of Web application connections.
ContentDatabaseAccessibility	Monitors the accessibility of SharePoint content databases for the Web applications running on the SharePoint server.
ContentManagementEventLog	Monitors the event log for Content Management error events generated by SharePoint.
DBSiteCount	Monitors the number of site collections on each SharePoint content database in the server farm.
DBSpaceUtil	Monitors the amount of space used by the SharePoint content database.
ExtendedWebApplications	Monitors the extended Web applications in the SharePoint server farm.
FASTSearchServerStatus	Monitors the status of the SharePoint FAST Search Server, including availability of the server, the number of queries per minute, and the number of searches per second. (SharePoint Server 2010 only.)
GenericEventLog	Monitors the event log for generic error events generated by SharePoint.
HealthAnalyzer	Monitors the SharePoint Health Analyzer tool, which allows you to schedule automatic checks for configuration, performance, and usage problems in the SharePoint server farm. (SharePoint Server 2010 and later.)
HealthCheck	Monitors the operational status of active SharePoint services and Web applications.
InfoPathEventLog	Monitors the event log for InfoPath Forms error events generated by SharePoint.
IsolatedApps	Monitors isolated applications in a SharePoint 2007 environment. (SharePoint Server 2007 and IIS 6.0 only.)
MailServerStatus	Monitors the mail server status in the SharePoint server farm.

Knowledge Script	What It Does
RecycleBinInfo	Monitors the Recycle Bin usage for all Web applications running on the SharePoint server.
Report_ServerUptime	Generates a report about the number of hours the SharePoint server has been operational since the last reboot.
Report_SiteInfo	Generates a report about the space utilization and date information for each Web application on the SharePoint server.
Report_SiteUsage	Generates a report that contains usage information about each Web application on the SharePoint server.
Report_WebPartInfo	Generates a report about the status and availability of Web Parts used by the SharePoint server.
SearchStatus	Monitors the Search service and crawl status in the SharePoint server farm.
ServerUptime	Monitors the number of hours the SharePoint server has been operational since the last reboot.
SiteCollectionUserCount	Monitors the number of users in a site collection.
SiteEventLog	Monitors the event log for events on the Web application usage.
SiteInfo	Monitors space utilization and date information for each Web application on the SharePoint server.
SiteUsage	Monitors usage information about each Web application on the SharePoint server.
VisualModeSiteCount	Monitors the Visual Mode Site count for each Web application, site collection, and sub-site on a SharePoint server. (SharePoint Server 2010 and later.)
WebApplicationUptime	Monitors the uptime of Web applications on the SharePoint server.
WebPagePerf	Monitors the availability and performance of a Web application's Web pages on the SharePoint server.
WebPartInfo	Monitors the status and availability of Web Parts used by the SharePoint server.

66.1 BytesTransfer

Use this Knowledge Script to monitor the total number of bytes transferred per second to and from a Web application. This script raises an event if the total number of transferred bytes exceeds the threshold you set.

66.1.1 Resource Objects

SharePoint Server: Web Applications

66.1.2 Default Schedule

The default interval for this script is every 30 minutes.

66.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the transferred bytes. The default is 5.
Monitor Byte Transfer	
Event Notification	
Raise event if number of bytes transferred per second exceeds a threshold?	Select **Yes** to raise an event if the number of bytes transferred per second exceeds the threshold you specify. The default is Yes.
Event severity when the number of bytes transferred exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of bytes sent or received exceeds the threshold you set. The default is 10.
Threshold – Maximum bytes received per second	Specify the maximum number of bytes the server can receive before an event is raised. The default is 64000 bytes per second.
Threshold – Maximum bytes sent per second	Specify the maximum number of bytes the server can send before an event is raised. The default is 64000 bytes per second.
Data Collection	
Collect data for current transfer rate (bytes sent, bytes received)?	Select **Yes** to collect byte transfer data for charts and reports. If enabled, data collection returns byte transfer rate (sent and received) data for the server. The default is unselected.

66.2 ConnectionsInterval

Use this Knowledge Script to monitor the number of Web application connections and the total connections for all Web applications from anonymous and user (non-anonymous) accounts during the monitoring interval. This script raises an event if the number of connections exceeds the threshold you set.

NOTE: If anonymous access is not enabled for the Web applications in the SharePoint site collection, this script raises events only for maximum connections to Web applications from user (non-anonymous) accounts that exceed the threshold.

66.2.1 Resource Objects

SharePoint Server: Web Applications

66.2.2 Default Schedule

The default interval for this script is every 30 minutes.

66.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the number of connections. The default is 5.
Monitor Connections Interval	
Event Notification	
Raise event if number of connections exceeds any threshold?	Select **Yes** to raise an event if the number of connections exceeds any of the thresholds you set. The default is Yes.
Event severity when current connections exceed the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of current connections exceeds the threshold. The default is 12.
Threshold – Maximum connections to Web application from anonymous accounts	Specify the maximum number of Web application connections from anonymous accounts that can be open during the monitoring interval. An event is raised if the number of connections exceeds the threshold.The default is 64.
Threshold – Maximum connections to Web application from non-anonymous accounts	Specify the maximum number of Web application connections from non-anonymous (user) accounts that can be open during the monitoring interval. An event is raised if the number of connections exceeds the threshold. The default is 64.

Description	How to Set It
Threshold – Maximum total connections to Web server from anonymous accounts	Specify the maximum total connections to all monitored Web applications from anonymous accounts that can be open during the monitoring interval. An event is raised if the number of connections exceeds the threshold. The default is 64. If you run this Knowledge Script on a child Web Application object, it does not monitor the total connections to a Web server.
Threshold – Maximum total connections to Web server from non-anonymous accounts	Specify the maximum total number of connections to all monitored Web applications from non-anonymous (user) accounts that can be open during the monitoring interval. An event is raised if the number of connections exceeds the threshold. The default is 64. If you run this Knowledge Script on a child Web Application object, it does not monitor the total connections to a Web server.
Data Collection	
Collect data for number of connections?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of Web application connections during the monitoring interval. The default is unselected.

66.3 ContentDatabaseAccessibility

Use this Knowledge Script to monitor the accessibility of SharePoint content databases for the Web applications running on the SharePoint server. This Knowledge Script raises an event if the content databases on the SharePoint server or SQL servers are not accessible.

This script collects data about the availability of the content databases. A value of 0 means that the status of the database is **Offline** for either the SQL servers or the SharePoint server. A value of 100 means that the status of the database is **Online** for the SQL servers and the SharePoint server.

When you run this Knowledge Script on a SharePoint Database in the Navigation pane (for Control Center) or the TreeView (for the Operator Console), this Knowledge Script monitors all content databases under the parent Database object. To monitor only certain content databases, open the **Object** tab and deselect the databases you do not want to monitor.

66.3.1 Configuring Security Manager for ContentDatabaseAccessibility

Before you can run the ContentDatabaseAccessibility Knowledge Script, you need to configure AppManager Security Manager to enable the script to monitor the content databases using SQL authentication.

To configure Security Manager for the ContentDatabaseAccessibility Knowledge Script:

1. In AppManager Security Manager, select the AppManager agent or agents you want to monitor using SQL authorization.
2. On the **Custom** tab, add a custom entry and complete the following fields for the agent or agents you selected in the previous step:

Field	Description
Label	`SharePoint_SQL`
Sub-label	*`ServerName\SharePointInstanceName`* This field can be configured as `default`, which means that the SQL login credentials will be used to connect to any content database. To do this, type `default` in place of *`ServerName\SharePointInstanceName`*
Value 1	Specify the user name for the SQL Server account.
Value 2	Specify the password for the SQL Server account.
Extended application support	Required field. Encrypts the user name and password in Security Manager.

3. Verify that the SQL login account has been granted the `DB_owner` role on the content databases you want to monitor with the ContentDatabaseAccessibility script.

66.3.2 Resource Objects

SharePoint Server: Database

66.3.3 Default Schedule

The default interval for this script is every hour.

66.3.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the accessibility of the SharePoint content databases. The default is 5.
Monitor Content Database Accessibility	
Comma-separated list of content databases to exclude	Specify a list of the content databases to ignore when monitoring. Use commas without spaces to separate multiple content databases.
Event Notification	
Raise event if content databases are inaccessible?	Select **Yes** to raise an event if the content databases are not accessible. The default is Yes.
Event severity when content databases are inaccessible	Set the event severity level, from 1 to 40, to indicate the importance of an event when the content databases are not accessible. The default is 10.
Data Collection	
Collect data for content database accessibility?	Select **Yes** to collect data about the accessibility of the content databases. The default is unselected.

66.4 ContentManagementEventLog

Use this Knowledge Script to monitor the event log for Content Management error events generated by SharePoint.

This Knowledge Script raises events for the following error codes:

- 4958: The content deployment job failed during the publishing process.
- 5322: Content deployment job could not contact the destination server.
- 5323: The connection to the destination server was lost while transporting the deployment package created by the content deployment job.
- 5325: The content deployment job failed on the destination server during the import phase.
- 5326: The content deployment job failed on the source server during the export phase.

66.4.1 Resource Objects

SharePoint Server

66.4.2 Default Schedule

The default interval for this script is every 10 minutes.

66.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to read the Content Management event log. The default is 5.
Additional Settings	
Event Details	
Event detail format	Specify the format of the event details, either as an HTML table or as plain text. The default is HTML Table.
Monitor Content Management Event Log	
Event Notification	
Raise event if SharePoint generates a Content Management error event?	Select **Yes** to raise an AppManager event if SharePoint generates a Content Management error event in the event log. The default is Yes.
Event severity when SharePoint generates a Content Management error event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which SharePoint generates a Content Management error event in the event log. The default is 20.

Description	How to Set It
Data Collection	
Collect data for the Content Management error event?	Select **Yes** to collect data for charts and reports. The default is unselected.
Events in past N hours	Set this parameter to control event checking for the first interval (after which checking is incremental): • **-1** lists all t: he existing entries • **N** lists events for the past n hours, such as 8 for the past 8 hours, or 50 for the past 50 hours • **0** lists only entries from this moment on, without listing any previous entries The default is 0.
Maximum number of entries per event report	Specify the maximum number of entries, from 1 to 100, to be recorded in each event's detail message. If this script finds more entries from the log than it can put into one event message, it will return multiple events to report all the outstanding entries in the log. The default is 30 entries. If this script encounters one or more very large events in the Windows Event log, this script may error out and generate the following event message: `Out of string space.` If this occurs, specify a smaller value for this parameter.

66.5 DBSiteCount

Use this Knowledge Script to monitor the number of site collections on each SharePoint content database in the server farm. This Knowledge Script raises an event when the number of site collections on each content database exceeds the maximum threshold.

66.5.1 Resource Objects

SharePoint Server: Database

66.5.2 Default Schedule

The default interval for this script is every hour.

66.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the number of site collections for each SharePoint content database. The default is 5.
Monitor Site Collection Count for Each Content Database	
Event Notification	
Raise event when site collection count for each content database exceeds the threshold?	Select **Yes** to raise an event if the number of site collections on a content database exceeds the threshold you set. The default is Yes.
Event severity when the site collection count exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of site collections on a content database exceeds the threshold you set. The default is 10.
Threshold – Maximum site collection count for each content database	Specify the maximum number of site collections a content database can contain before an event is raised. The default is 2000.
Data Collection	
Collect data for site collection count for each content database?	Select **Yes** to collect data for the site collection count of each content database. The default is unselected.

66.6 DBSpaceUtil

Use this Knowledge Script to monitor the amount of space used by a SharePoint content database. Space usage is measured in two ways: in megabytes, and as a percentage of the total database space available to the selected content database. The reported size of the content database includes both the content database (MDF file) and the transaction log files (LDF files).

This script raises an event if the size of a content database or the amount of space used by a content database exceeds the threshold you set.

66.6.1 Configuring Security Manager for DBSpaceUtil

Before you can run the DBSpaceUtil Knowledge Script, you need to configure AppManager Security Manager to enable the script to monitor the content databases using SQL authentication.

To configure Security Manager for the DBSpaceUtil Knowledge Script:

1. In AppManager Security Manager, select the AppManager agent or agents you want to monitor using SQL authorization.
2. On the **Custom** tab, add a custom entry and complete the following fields for the agent or agents you selected in the previous step:

Field	Description
Label	`SharePoint_SQL`
Sub-label	*`ServerName\SharePointInstanceName`* This field can be configured as `default`, which means that the SQL login credentials will be used to connect to any content database. To do this, type `default` in place of *`ServerName\SharePointInstanceName`*
Value 1	Specify the user name for the SQL Server account.
Value 2	Specify the password for the SQL Server account.
Extended application support	Required field. Encrypts the user name and password in Security Manager.

3. Verify that the SQL login account has been granted the `DB_owner` role on the content databases you want to monitor with the DBSpaceUtil script.

66.6.2 Resource Objects

SharePoint Server: Database

66.6.3 Default Schedule

The default interval for this script is every 30 minutes.

66.6.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor a SharePoint content database. The default is 5.
Event Notification	
Raise event if the percentage of space used by the content database exceeds threshold?	Select **Yes** to raise an event if the percentage of space used by the content database exceeds the threshold you set. The amount of space used is the total space used by the content database and the transaction log files. The default is Yes.
Event severity when the percentage of space used by the content database exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of space used by the content database exceeds the threshold you set. The default is 10.
Threshold – Maximum amount of space used by the content database (in %)	Specify the maximum percentage of space the content database can use before an event is raised. The default is 75.
Raise event if the content database size exceeds threshold?	Select **Yes** to raise an event if the size of the content database exceeds the threshold you set. The reported size of the content database includes both the content database and the transaction log files. The default is Yes.
Event severity when the content database size exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the size of the content database exceeds the threshold you set. The default is 15.
Threshold – Maximum size of the content database (in MB)	Specify the maximum size of the content database, in megabytes, before an event is raised. The default is 500. The maximum valid value is 204800.
Data Collection	
Collect data for the amount of space used by the content database (in %)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of space utilized by the SharePoint content database, as a percentage. The default is unselected.
Collect data for the size of the content database (in MB)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the size of the SharePoint content database, in megabytes. The default is unselected.

66.7 ExtendedWebApplications

Use this Knowledge Script to monitor the extended Web applications in the SharePoint server farm. For more information about extending Web applications, see the following Microsoft TechNet topics:

- For SharePoint 2013, see http://technet.microsoft.com/en-us/library/gg276325.aspx/
- For SharePoint 2010, see http://technet.microsoft.com/en-us/library/cc261698.aspx/
- For SharePoint 2007, see http://technet.microsoft.com/en-us/library/cc287954.aspx/

This Knowledge Script generates events and collects data for the Web applications that are extended in the server farm, on an Intranet, Internet, Extranet, or Custom site.

66.7.1 Resource Object

SharePoint Server: Web Applications

66.7.2 Default Schedule

The default schedule for this script is Run once.

66.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the extended Web applications in the server farm. The default is 5.
Monitor Extended Web Applications	
Comma-separated list of Web applications to exclude	Specify a list of Web applications to ignore when monitoring. Use commas to separate multiple Web applications.
Event Notification	
Raise event if Web applications are extended?	Select **Yes** to raise an event if the Web applications are extended. The default is Yes.
Event severity when Web applications are extended	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Web applications are extended. The default is 10.
Data Collection	
Collect data for extended Web applications?	Select **Yes** to collect data about Web applications that are extended. The default is unselected.

66.8 FASTSearchServerStatus

Use this Knowledge Script to monitor the status of the FAST Search Server in an environment running Microsoft FAST Search Server 2010 for SharePoint 2010. This script raises an event when the FAST Search Server is unavailable, when the number of queries and failed queries exceed the thresholds you set, and when the average number of searches and time per search exceed the thresholds you set.

66.8.1 Resource Objects

SharePoint Server: FAST Search Server

66.8.2 Default Schedule

The default interval for this script is every 30 minutes.

66.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the status of the FAST Search Server. The default is 5.
Monitor FAST Search Server Status	
Monitor FAST Search Server Availability	
Event Notification	
Raise an event if the FAST Search Server is unavailable during the monitoring interval?	Select **Yes** to raise an event if the FAST Search Server is not available during monitoring. The default is Yes.
Event severity when the FAST Search Server is unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the FAST Search Server is not available. The default is 7.
Monitor FAST Search Server Query Result Server	
Event Notification	
Raise event if the number of failed system queries per second exceeds the threshold?	Select **Yes** to raise an event in which the number of failed system queries per second exceeds the threshold. The default is Yes.
Event severity when the number of failed system queries per second exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of failed system queries per second exceeds the threshold. The default is 12.

Description	How to Set It
Threshold – Maximum number of failed system queries per second	Specify the maximum number of failed system queries per second. The default is 1000.
Raise event if the total number of failed queries per second exceeds the threshold?	Select **Yes** to raise an event in which the total number of failed queries per second exceeds the threshold. The default is Yes.
Event severity when the total number of failed queries per second exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the total number of failed queries per second exceeds the threshold. The default is 14.
Threshold – Maximum total number of failed queries per second	Specify the maximum total number of failed queries per second. The default is 1000.
Raise event if the number of queries per second exceeds the threshold?	Select **Yes** to raise an event in which the number of queries per second exceeds the threshold. The default is Yes.
Event severity when the number of queries per second exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of queries per second exceeds the threshold. The default is 15.
Threshold – Maximum number of queries per second	Specify the maximum total number of queries per second. The default is 1000.
Monitor FAST Search Server Data Set	
Event Notification	
Raise event if the average number of searches per minute exceeds the threshold?	Select **Yes** to raise an event in which the average number of searches per minute exceeds the threshold. The default is Yes.
Event severity when the average number of searches per minute exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average number of searches per minute exceeds the threshold. The default is 8.
Threshold – Maximum average number of searches per minute	Specify the maximum average number of searches per minute. The default is 1000.
Raise event if the average time per search in milliseconds exceeds the threshold?	Select **Yes** to raise an event in which the average time per search in milliseconds exceeds the threshold. The default is Yes.
Event severity when the average time per search in milliseconds exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average time per search in milliseconds exceeds the threshold. The default is 10.
Threshold – Maximum average time per search in milliseconds	Specify the maximum average time per search in milliseconds. The default is 1000.
Data Collection	
Collect data for the availability of the FAST Search Server?	Select **Yes** to collect data about the availability of the FAST Search Server. A value of 0 indicates that the FAST Search Server is not available, and a value of 100 indicates that the server is available. The default is unselected.

Description	How to Set It
Collect data for the number of failed system queries per minute?	Select **Yes** to collect data about the number of failed system queries per minute. The default is unselected.
Collect data for the total number of failed queries per second?	Select **Yes** to collect data about the total number of failed queries per second. The default is unselected.
Collect data for the number of queries per second?	Select **Yes** to collect data about the number of queries per second. The default is unselected.
Collect data for the average number of searches per minute?	Select **Yes** to collect data about the average number of searches per minute. The default is unselected.
Collect data for the average time per search?	Select **Yes** to collect data about the average time per search. The default is unselected.

66.9 GenericEventLog

This Knowledge Script monitors the event log for generic error events created by SharePoint. The SharePoint administrator can configure the event types in the SharePoint Central Administration site.

This script raises events for the following error codes:

- 42: Propagation failed to communicate with a query server.
- 2438: Crawler cannot read from registry.
- 2462: Failed to load word breaker.
- 2483 | 2484: Failed to load protocol handler.
- 3353: Backup failed due to insufficient permissions.
- 4105 | 4106: Master merge error.
- 4127: Failed to load index.
- 4138: Index is corrupt.
- 7035: Backup failed due to timer job failure.
- 10038: Query server removed from rotation.

66.9.1 Resource Objects

SharePoint Server: Web Applications

66.9.2 Default Schedule

The default interval for this script is every 10 minutes.

66.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the GenericEventLog job fails. The default is 5.
Additional Settings	
Event Details	
Event detail format	Specify the format of the event details, either as an HTML table or as plain text. The default is HTML Table.
Monitor Generic Event Log	

Description	How to Set It
Event Notification	
Raise event if SharePoint generates a generic error event?	Select **Yes** to raise an event if SharePoint generates a generic error event in the event log. The default is Yes.
Event severity when SharePoint generates an error event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which SharePoint generates an error event. The default is 20.
Data Collection	
Collect data for the generic error event?	Select **Yes** to collect data for charts and reports. The default is unselected.
Events in past N hours	Set this parameter to control event checking for the first interval (after which checking is incremental): • **-1** lists all the existing entries • **N** lists events for the past n hours, such as 8 for the past 8 hours, or 50 for the past 50 hours • **0** lists only entries from this moment on, without listing any previous entries The default is 0.
Maximum number of entries per event report	Specify the maximum number of entries, from 1 to 100, that you want to be recorded in each event's detail message. If this script finds more entries from the log than it can put into one event message, it will return multiple events to report all the outstanding entries in the log. The default is 30 entries. If this script encounters one or more very large events in the Windows Event log, this script may error out and generate the following event message: `Out of string space.` If this occurs, specify a smaller value for this parameter.

66.10 HealthAnalyzer

Use this Knowledge Script to monitor the SharePoint Health Analyzer tool, a feature in Microsoft SharePoint 2010 and later that allows you to schedule automatic checks for configuration, performance, and usage problems in a SharePoint server farm.

This script raises an event when the SharePoint Health Analyzer tool generates rule execution failure, error, warning, or information events.

66.10.1 Resource Objects

SharePoint Server

66.10.2 Default Schedule

The default interval for this script is every hour.

66.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the HealthAnalyzer job fails. The default is 5.
Additional Settings	
Event Details	
Event detail format	Specify the format of the event details, either as an HTML table or as plain text. The default is HTML Table.
Monitor SharePoint Health Analyzer	
Run Health Analyzer during job?	Select **Yes** to run the SharePoint Health Analyzer tool during the job execution, which allows you to check for configuration, performance, and usage problems in the SharePoint server farm. The default is unselected.
Include or exclude health rules	Specify whether to include or exclude health rules for an event. The default is Include.
Semicolon-separated list of Health Analyzer rules to include or exclude from monitoring	Specify a list of the Health Analyzer rules to include or exclude when monitoring. Use semicolons (;) to separate multiple health rules.
Categories of health rules to include or exclude from monitoring	
Availability	Select **Yes** to monitor health rule entries in the Availability category. The default is Yes.
Configuration	Select **Yes** to monitor health rule entries in the Configuration category. The default is Yes.

Description	How to Set It
Performance	Select **Yes** to monitor health rule entries in the Performance category. The default is Yes.
Security	Select **Yes** to monitor health rule entries in the Security category. The default is Yes.
Custom	Select **Yes** to monitor health rule entries in the Custom category. The default is unselected.
Event Notification	
Monitor Health Rule Execution Failure Events	
Raise event if Health Analyzer generates rule execution failure events?	Select **Yes** to raise an event if the Health Analyzer generates a rule execution failure event. The default is Yes.
Event severity when Health Analyzer generates rule execution failure events	Set the event severity level, from 1 to 40, to indicate the importance of an event in which Health Analyzer generates a rule execution failure event. The default is 7.
Monitor Error Events	
Raise event if Health Analyzer generates error events?	Select **Yes** to raise an event if the Health Analyzer generates an error event. The default is Yes.
Event severity when Health Analyzer generates error events	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Health Analyzer generates an error event. The default is 10.
Monitor Warning Events	
Raise event if Health Analyzer generates warning events?	Select **Yes** to raise an event if the Health Analyzer generates a warning event. The default is Yes.
Event severity when Health Analyzer generates warning events	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Health Analyzer generates a warning event. The default is 15.
Monitor Informational Events	
Raise event if Health Analyzer generates informational events?	Select **Yes** to raise an event if the Health Analyzer generates an informational event. The default is unselected.
Event severity when Health Analyzer generates informational events	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Health Analyzer generates an informational event. The default is 25.

66.11 HealthCheck

Use this Knowledge Script to monitor the operational status of active SharePoint services and Web applications. This script checks the status of all SharePoint services and sites on the SharePoint server, and it can start a stopped service or site. HealthCheck will start services that have a startup type of **Automatic** or **Manual**. This script raises events if a service or site stops, fails to start, or is restarted successfully. This script generates data streams for service or site availability.

The HealthCheck Knowledge Script does not monitor, start, or raise events for disabled SharePoint Windows services.

66.11.1 Resource Objects

SharePoint Server: Services (Windows services), SharePoint Services, and Web Applications

66.11.2 Default Schedule

The default interval for this script is every 5 minutes.

66.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the HealthCheck job fails. The default is 5.
Monitor Services	
Start service or site if it is stopped?	Select **Yes** to automatically start all stopped services or sites on the SharePoint server. The default is Yes. Only activated services can be automatically started. If an administrator has deactivated a service, AppManager cannot start it. This script starts services that have the startup type **Automatic** or **Manual**.
Event Notification	
Raise event if service or site is stopped and should not be started?	Select **Yes** to raise an event if a monitored service or site is stopped but you did not enable the **Start service or site if it is stopped?** parameter. The default is Yes.
Event severity when service or site is stopped and should not be started	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service or site is stopped but you did not enable the **Start service or site if it is stopped?** parameter. The default is 15.
Raise event if service or site fails to start?	Select **Yes** to raise an event if AppManager cannot start a monitored service or site. The default is Yes.
Event severity when service or site fails to start	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot start a monitored service. The default is 5.

Description	How to Set It
Raise event if stopped service or site has been started?	Select **Yes** to raise an event if a service or site has been started since the last time this script ran. The default is Yes.
Event severity when stopped service or site has been started	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service or site has been started since the last time this script ran. The default is 25.
Data Collection	
Collect data for service or site availability?	Select **Yes** to collect data for SharePoint services and site availability. The default is unselected.

66.12 InfoPathEventLog

Use this Knowledge Script to monitor the event log for InfoPath Forms error events generated by SharePoint. This script raises events for the following error codes:

- 5337: InfoPath Forms Services business logic failed.
- 5338: InfoPath Forms Services calculations exceeded the maximum limit.
- 5339: InfoPath Forms Services rules exceeded the maximum limit.
- 5340: InfoPath Forms Services business logic exceeded the maximum limit of operations.
- 5341: InfoPath Forms Services was running business logic when ASP.NET request timed out.
- 5342: A form template's business logic caused an OutOfMemory exception.
- 5343: InfoPath Forms Services business logic exception occurred while loading a form template.
- 5369: InfoPath Forms Services cannot find or load `ifsFileNames.xml`.
- 5374: InfoPath Forms Services postback failure.
- 5733: InfoPath form templates have conflicting business logic assembly identities.
- 5734: InfoPath Forms Services business logic attempted to store a nonserializable object.
- 5736: InfoPath Forms Services DoS postbacks per session.
- 5737: InfoPath Forms Services user has exceeded the maximum number of actions per postback.
- 5757: InfoPath Forms Services found an unexpected session state version.
- 5758: InfoPath Forms Services data adapter security error submit.
- 5759: InfoPath Forms Services solution cache churning.
- 5760: InfoPath Forms Services event counter mismatch.
- 6932: InfoPath Forms Services data adapter security error query.
- 7056: InfoPath Forms Services failed to load a form template.
- 7083: InfoPath Forms Services user has exceeded the maximum session state size.
- 7095: The second stage Recycle bin has reached 90% capacity.
- 7898: InfoPath Forms Services not working due to invalid State Service configuration.

66.12.1 Resource Objects

SharePoint Server

66.12.2 Default Schedule

The default interval for this script is every 10 minutes.

66.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to read the InfoPath event log. The default is 5.
Additional Settings	
Event Details	
Event detail format	Specify the format of the event details, either as an HTML table or as plain text. The default is HTML Table.
Monitor InfoPath Event Log	
Event Notification	
Raise event if SharePoint generates an InfoPath Forms error event?	Select **Yes** to raise an event if SharePoint generates an InfoPath Forms error event in the event log. The default is Yes.
Event severity when SharePoint generates an InfoPath Forms error event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which SharePoint generates an InfoPath Forms error event. The default is 20.
Data Collection	
Collect data for InfoPath Forms error events?	Select **Yes** to collect data to generate charts and reports for InfoPath Forms error events. The default is unselected.
Events in past N hours	Set this parameter to control event checking for the first interval (after which checking is incremental): • **-1** lists all the existing entries • **N** lists events for the past n hours, such as 8 for the past 8 hours, or 50 for the past 50 hours • **0** lists only entries from this moment on, without listing any previous entries The default is 0.
Maximum number of entries per event report	Specify the maximum number of entries, from 1 to 100, that you want to be recorded in each event's detail message. If this script finds more entries from the log than it can put into one event message, it will return multiple events to report all the outstanding entries in the log. The default is 30 entries. If this script encounters one or more very large events in the Windows Event log, this script may error out and generate the following event message: `Out of string space.` If this occurs, specify a smaller value for this parameter.

66.13 IsolatedApps

Use this Knowledge Script to monitor isolated applications in a SharePoint Server 2007 environment. This Knowledge Script works with SharePoint Server 2007 and Internet Information Services (IIS) 6.0 only.

An **isolated application** is a stand-alone application that adds functionality to a SharePoint site, such as a third-party product created for use with SharePoint. An isolated application runs out-of-process, directly from the Web Server. Typically, an isolated application shares its resources with other components in that application.

If several isolated applications run at the same time, SharePoint may not perform optimally. Monitoring the number of isolated applications can improve the performance of SharePoint. This script raises an event if the number of isolated applications exceeds the threshold you set.

66.13.1 Resource Objects

SharePoint Server: Web Applications

66.13.2 Default Schedule

The default interval for this script is every 24 hours.

66.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor an isolated application. The default is 5.
Monitor Isolated Applications	
Event Notification	
Raise event if number of isolated applications exceeds threshold?	Select **Yes** raise an event if the number of isolated applications exceeds the threshold you set. The default is Yes.
Event severity when the number of isolated applications exceeds the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which number of isolated applications exceeds the threshold you set. The default is 8.
Threshold – Maximum isolated applications	Specify the maximum number of isolated applications that are allowed before an event is raised. The default is 10.
Data Collection	
Collect data for number of isolated applications?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of isolated applications. The default is unselected.

66.14 MailServerStatus

Use this Knowledge Script to monitor the mail server status in the server farm. This Knowledge Script raises an event when the SMTP server is not configured in the SharePoint server farm or when the SMTP server is not available.

This script sends test emails for each job iteration. To ensure that these emails do not fill your inbox, NetIQ Corporation recommends the following:

- Schedule the job to run at longer intervals so that the script sends test emails less frequently.
- Create a rule in Microsoft Exchange to periodically delete the test messages.

66.14.1 Resource Objects

SharePoint Server: Web Applications

66.14.2 Default Schedule

The default interval for this script is every 15 minutes.

66.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the status of the mail server. The default is 5.
Monitor Mail Server Status	
Event Notification	
Raise event if SMTP server is not configured?	Select **Yes** to raise an event if the SMTP server is not configured. The default is Yes.
Event severity when SMTP server is not configured	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SMTP server is not configured. The default is 15.
Raise event if SMTP server is not available?	Select **Yes** to raise an event if the SMTP server is not available. The default is Yes.
Event severity when SMTP server is not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SMTP server is not available. The default is 10.
Data Collection	
Collect data for availability of SMTP server?	Select **Yes** to collect data for the availability of the SMTP server. The default is unselected. A value of 0 means that the SMTP server is either not configured or is unavailable. A value of 100 means that the SMTP server is configured and available.

66.15 RecycleBinInfo

Use this Knowledge Script to monitor Recycle Bin usage for all Web applications running on the SharePoint server. This script raises an event if the percentage of the site quota for the Recycle Bin exceeds the specified threshold.

This script monitors two stages of Recycle Bins for site quota usage. By default, SharePoint Server enables the first, or primary, stage of the Recycle Bin. To monitor the secondary stage of the Recycle Bin, enable the secondary Recycle Bin. For more information about enabling the Recycle Bin features, see the Microsoft SharePoint documentation.

For each stage, you can configure this script to raise a warning alert or critical alert when Recycle Bin site quota utilization exceeds a particular threshold. In addition, you can configure this script to empty the Recycle Bin when it reaches a specific threshold, and to raise an event when primary or secondary stage Recycle Bin items have been deleted.

The secondary Recycle Bin utilizes 50% of the site quota value. For example, if the site quota value is 10 MB, by default the secondary recycle bin uses 5 MB. The value of the secondary Recycle Bin can be customized by changing the value of the site quota.

66.15.1 Resource Objects

SharePoint Server: Web Applications

66.15.2 Default Schedule

The default interval for this script is every 24 hours.

66.15.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor a Recycle Bin. The default is 5.
Monitor Recycle Bin Information	
Comma-separated list of Web applications to exclude	Specify a list of Web applications to ignore when monitoring. Use commas to separate multiple Web applications.
File path of a file containing a list of site collection URLs to exclude from monitoring (one per line)	Specify the UNC or file path of a file that contains a list of sites to ignore when monitoring. In the file, list the sites to be excluded, one site per line. The site collection URLs in your list must be in the same format as they appear in event messages. Include the `http://` at the beginning of the URL, and do not include a trailing "/" at the end of the URL (which will cause the job to monitor the site collection you are trying to exclude).

Description	How to Set It
When a quota is not configured for a site, set a value to calculate the site's utilization	Specify a value for a site that does not have a quota configured. This value is used to calculate the utilization percentage of the site. The default is 0, which means that this script will not monitor Recycle Bins for site collections that do not have a quota configured.
Event Notification	
Monitor First Stage Recycle Bin	
Raise warning event if first stage Recycle Bin site quota utilization exceeds threshold?	Select **Yes** to raise a warning event if the first stage Recycle Bin site quota exceeds the threshold you set. The default is Yes. By default, the Knowledge Script job reads the quota configured in the SharePoint site. If the quota is not configured in the site, the job reads the quota configured in this Knowledge Script.
Event severity when first stage Recycle Bin site quota utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the first stage site quota usage threshold is exceeded. The default is 15.
Threshold – Maximum warning threshold for first stage Recycle Bin site quota utilization	Specify the maximum first stage site quota utilization allowed before a warning event is raised. The default is 85%.
Raise critical event if first stage Recycle Bin site quota utilization exceeds threshold?	Select **Yes** to raise a critical event if the first stage Recycle Bin site quota exceeds the threshold you set. The default is Yes. By default, the Knowledge Script job reads the quota configured in the SharePoint site. If the quota is not configured in the site, the job reads the quota configured in this Knowledge Script.
Event severity when first stage Recycle Bin site quota utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the first stage site quota usage threshold is exceeded. The default is 10.
Threshold – Maximum critical threshold for first stage Recycle Bin site quota utilization	Specify the maximum site quota utilization allowed before a critical event is raised. The default is 95%.
Empty first stage Recycle Bin if site quota utilization exceeds critical threshold?	Select **Yes** to empty the first stage Recycle Bin if the site quota utilization exceeds the threshold you set for raising critical events. The default is unselected.
Raise event when all the first stage Recycle Bin items are deleted successfully?	Select **Yes** to raise an event when the first stage Recycle Bin items are deleted. The default is unselected.
Event severity when all the first stage Recycle Bin items are deleted successfully	Set the severity level, from 1 to 40, to indicate the importance of an event in which the first stage Recycle Bin items are deleted. The default is 25.
Monitor Second Stage Recycle Bin	
Raise warning event if second stage Recycle Bin site quota utilization exceeds threshold?	Select **Yes** to raise a warning event if the second stage Recycle Bin site quota exceeds the threshold you set. The default is Yes. By default, the Knowledge Script job reads the quota configured in the SharePoint site. If the quota is not configured in the site, the job reads the quota configured in this Knowledge Script.
Event severity when second stage Recycle Bin site quota utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the second stage site quota usage threshold is exceeded. The default is 15.

Description	How to Set It
Threshold – Maximum warning threshold for second stage Recycle Bin site quota utilization	Specify the maximum second stage site quota utilization allowed before a warning event is raised. The default is 85%.
Raise critical event if second stage Recycle Bin site quota utilization exceeds threshold?	Select **Yes** to raise a critical event if the second stage Recycle Bin site quota exceeds the threshold you set. The default is Yes. By default, the Knowledge Script job reads the quota configured in the SharePoint site. If the quota is not configured in the site, the job reads the quota configured in this Knowledge Script.
Event severity when second stage Recycle Bin site quota utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the second stage site quota usage threshold is exceeded. The default is 10.
Threshold – Maximum critical threshold for second stage Recycle Bin site quota utilization	Specify the maximum site quota utilization allowed before a critical event is raised. The default is 95%.
Empty second stage Recycle Bin if site quota utilization exceeds critical threshold?	Select **Yes** to empty the second stage Recycle Bin if the site quota utilization exceeds the threshold you set for raising critical events. The default is unselected.
Raise event when all the second stage Recycle Bin items are deleted successfully?	Select **Yes** to raise an event when the second stage Recycle Bin items are deleted. The default is unselected.
Event severity when all the second stage Recycle Bin items are deleted successfully	Set the severity level, from 1 to 40, to indicate the importance of an event in which the second stage Recycle Bin items are deleted. The default is 25.
Raise event if a site does not have a quota template configured?	Select **Yes** to raise an event if the site does not have a quota template configured. The default is unselected.
Event severity when a site does not have a quota template configured	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a site does not have a quota template configured. The default is 11.
Data Collection	
Collect data for first stage Recycle Bin site quota utilization?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns data for first stage Recycle Bin site quota use. The default is unselected. The RecycleBinInfo script will not collect data if the quota is set to 0, or if the following parameter is set to 0: **When a quota is not configured for a site, set a value to calculate the site's utilization**, even if you select Yes for that parameter.
Collect data for second stage Recycle Bin site quota utilization?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns data for second stage Recycle Bin site quota use. The default is unselected. The RecycleBinInfo script will not collect data if the quota is set to 0, or if the following parameter is set to 0: **When a quota is not configured for a site, set a value to calculate the site's utilization**, even if you select Yes for that parameter.

66.16 Report_ServerUptime

Use this Knowledge Script to summarize the number of hours the SharePoint server has been operational since the last reboot. This report allows you to make a statistical analysis of the data point values.

This report uses data collected by the ServerUptime Knowledge Script.

66.16.1 Resource Object

Report agent

66.16.2 Default Schedule

The default schedule for this script is Run once.

66.16.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
Select computers	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekdays	Select the day or days of the week to include in your report.
Select the style	Select the style for the report: • **By computer**: Shows one value for each computer you selected. • **By legend**: Shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend**: Shows one value for each unique legend from each computer. The default is By computer and legend.
Data Settings	

Description	How to Set It
Statistics to show	Select the statistical method to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values are dispersed from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report The default is Average.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N*% of selected data • **Top N**: Chart only the top *N* of selected data • **Bottom %**: Chart only the bottom *N*% of data • **Bottom N**: Chart only the bottom *N* of selected data The default is No sort.
Percentage/count for top/bottom	Specify a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If you select **Yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is unselected.
Show totals on the table?	If you select **Yes**, additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is unselected.
Report Settings	
Include parameter help card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include table?	Select **Yes** to include a table of data stream values in the report. The default is Yes.
Include chart?	Select **Yes** to include a chart of data stream values in the report. The default is Yes.

Description	How to Set It
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script and the corresponding report. The default is unselected.
Select properties	Set miscellaneous report properties as needed.
Add time stamp to title?	Select **Yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is unselected.
Event Notification	
Event for report success?	Select **Yes** to raise an event in which the report is successfully generated. The default is Yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is generated successfully. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5.

66.17 Report_SiteInfo

Use this Knowledge Script to summarize information about the Web applications on the SharePoint server, sorted by date and space utilized. This report allows you to make a statistical analysis of the data point values.

This report uses data collected by the SiteInfo Knowledge Script.

66.17.1 Resource Object

Report agent

66.17.2 Default Schedule

The default schedule for this script is Run once.

66.17.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Data Source	
Select computerwizard	Select the computers for your report.
Select the style	Select the style for the report: • **By computer**: Shows one value for each computer you selected. • **By data stream**: Shows one value for each different legend on the report • **By computer and data stream**: Shows one value for each unique legend from each computer. • **By Knowledge Script**: Shows values based on this Knowledge Script. • **All data streams on one page**: Shows values of all data streams on a single page. The default is By computer.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekdays	Select the days of the week to include in your report.
Aggregation by	Select an aggregation method by which to display data in the report: • **Minute**: Average values based on minutes. • **Hour**: Average values based on hours. • **Day**: Average values based on days. The default is Hour.
Aggregation interval	Select an aggregation interval by which to display data in the report. You can select an aggregation interval in the range of 1 through 90. The report displays data based both on the aggregation method and interval. For example, 90 hours, 24 minutes, 7 days.

Parameter	How to Set It
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Count**: Number of data points for the time range of the report • **Sum**: Total value of data points for the time range of the report • **3Sigma:** The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**: Measure of how widely values are dispersed from the mean. • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**: The first value for the aggregation interval. • **Close**: Last value for the time range of the report. The default is Average.
Report Settings	
Include parameter help card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include table?	Select **Yes** to include a table of data stream values in the report. The default is Yes.
Include chart?	Select **Yes** to include a chart of data stream values in the report. The default is Yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script and the corresponding report. The default is unselected.
Select properties	Set miscellaneous report properties as needed.
Add time stamp to title?	Select **Yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is unselected.
Event Notification	
Event for report success?	Select **Yes** to raise an event in which the report is successfully generated. The default is Yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is generated successfully. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5.

66.18 Report_SiteUsage

Use this Knowledge Script to summarize usage information about each Web application on the SharePoint server. This report allows you to make a statistical analysis of the data point values.

This report uses data collected by the SiteUsage Knowledge Script.

66.18.1 Resource Object

Report agent

66.18.2 Default Schedule

The default schedule for this script is Run once.

66.18.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
Select computerwizard	Select the computers for your report.
Select the style	Select the style for the report: • **By computer**: Shows one value for each computer you selected. • **By data stream**: Shows one value for each different legend on the report • **By computer and data stream**: Shows one value for each unique legend from each computer. • **By Knowledge Script**: Shows values based on this Knowledge Script. • **All data streams on one page**: Shows values of all data streams on a single page. The default is By computer.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekdays	Select the days of the week to include in your report.
Aggregation by	Select an aggregation method by which to display data in the report: • **Minute**: Average values based on minutes. • **Hour**: Average values based on hours. • **Day**: Average values based on days. The default is Hour.
Aggregation interval	Select an aggregation interval by which to display data in the report. You can select an aggregation interval in the range of 1 through 90. The report displays data based both on the aggregation method and interval. For example, 90 hours, 24 minutes, 7 days.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report. • **Minimum**: Minimum value of data points for the time range of the report. • **Maximum**: Maximum value of data points for the time range of the report. • **Count**: Number of data points for the time range of the report. • **Sum**: Total value of data points for the time range of the report. • **3Sigma**: The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**: Measure of how widely values are dispersed from the mean. • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**: The first value for the aggregation interval. • **Close**: Last value for the time range of the report. The default is Average.
Report Settings	
Include parameter help card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include table?	Select **Yes** to include a table of data stream values in the report. The default is Yes.
Include chart?	Select **Yes** to include a chart of data stream values in the report. The default is Yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script and the corresponding report. The default is unselected.
Select properties	Set miscellaneous report properties as needed.
Add time stamp to title?	Select **Yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is unselected.
Event Notification	
Event for report success?	Select **Yes** to raise an event in which the report is successfully generated. The default is Yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is generated successfully. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5.

66.19 Report_WebPartInfo

Use this Knowledge Script to summarize the status and availability of Web Parts used by the SharePoint server. This report allows you to make a statistical analysis of the data point values.

This report uses data collected by the WebPartInfo Knowledge Script.

66.19.1 Resource Object

Report agent

66.19.2 Default Schedule

The default schedule for this script is Run once.

66.19.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
Select computer wizard	Select the computers for your report.
Select the style	Select the style for the report: • **By computer**: Shows one value for each computer you selected. • **By data stream**: Shows one value for each different legend on the report • **By computer and data stream**: Shows one value for each unique legend from each computer. • **By Knowledge Script**: Shows values based on this Knowledge Script. • **All data streams on one page**: Shows values of all data streams on a single page. The default is By computer.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekdays	Select the days of the week to include in your report.
Aggregation by	Select an aggregation method by which to display data in the report: • **Minute**: Average values based on minutes. • **Hour**: Average values based on hours. • **Day**: Average values based on days. The default is Hour.
Aggregation interval	Select an aggregation interval by which to display data in the report. You can select an aggregation interval in the range of 1 through 90. The report displays data based both on the aggregation method and interval. For example, 90 hours, 24 minutes, 7 days.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report. • **Minimum**: Minimum value of data points for the time range of the report. • **Maximum**: Maximum value of data points for the time range of the report. • **Count**: Number of data points for the time range of the report. • **Sum**: Total value of data points for the time range of the report. • **3Sigma:** The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**: Measure of how widely values are dispersed from the mean. • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**: The first value for the aggregation interval. • **Close**: Last value for the time range of the report. The default is Average.
Report Settings	
Include parameter help card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include table?	Select **Yes** to include a table of data stream values in the report. The default is Yes.
Include chart?	Select **Yes** to include a chart of data stream values in the report. The default is Yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script and the corresponding report. The default is unselected.
Select properties	Set miscellaneous report properties as needed.
Add time stamp to title?	Select **Yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is unselected.
Event Notification	
Event for report success?	Select **Yes** to raise an event in which the report is successfully generated. The default is Yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is generated successfully. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5.

66.20 SearchStatus

Use this Knowledge Script to monitor the Search service and crawl status in the SharePoint server farm. This script monitors default Search services, and does not monitor custom Search services. This Knowledge Script raises an event when the Search service or the crawl is down.

66.20.1 Resource Objects

SharePoint Server

66.20.2 Default Schedule

The default interval for this script is every hour.

66.20.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the Search service and crawl status in the server farm. The default is 5.
Monitor Search Service Status	
Event Notification	
Raise event when heartbeat of search service is down?	Select **Yes** to raise an event if the heartbeat of the Search service is down. The default is Yes.
Event severity when heartbeat of search service is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the heartbeat of the Search service is down. The default is 10.
Monitor Crawl Status	
Raise event when crawl status is down?	Select **Yes** to raise an event if the crawl is down. The default is Yes.
Event severity when crawl status is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the crawl is down. The default is 15.
Data Collection	
Collect data for search service status?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns data about the status of the Search service. The default is unselected. A value of 0 means that the Search service is down. A value of 100 means that the Search service is up.

Description	How to Set It
Collect data for crawl status?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns data about the status of the crawl. The default is unselected. A value of 0 means that the crawl is down. A value of 100 means that the crawl is up.

66.21 ServerUptime

Use this Knowledge Script to monitor the number of hours the servers hosting the SharePoint server have been operational since the last reboot, giving you real-time data about the availability of the SharePoint server. This script raises an event if servers hosting the SharePoint server are rebooted during the monitoring interval.

66.21.1 Resource Object

SharePoint Server

66.21.2 Default Schedule

The default interval for this script is every 5 minutes.

66.21.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the number of hours the SharePoint server has been operational since the last reboot. The default is 5.
Monitor Server Uptime	
Event Notification	
Raise an event if a system is rebooted during the monitoring interval?	Select **Yes** to raise an event if a computer hosting the SharePoint server is rebooted during the monitoring interval. The default is Yes.
Event severity when system is rebooted	Set the severity level, from 1 to 40, to indicate the importance of the event in which a system is rebooted during the monitoring interval. The default is 25.
Data Collection	
Collect data for SharePoint Server reboot?	Select **Yes** to collect data about SharePoint Server reboot. The default is unselected.

66.22 SiteCollectionUserCount

Use this Knowledge Script to monitor the number of users in a site collection.

This Knowledge Script monitors the three user types that SharePoint sites support: AllUsers, SiteUsers, and Users. The following list describes each type:

- **AllUsers**: Obtains the collection of users that represents all users who are either members of the site, or who have browsed to the site as authenticated members of a domain group in the site.
- **SiteUsers**: Obtains the collection of all users that belong to the site collection.
- **Users**: Obtains the collection of users that are explicitly assigned permissions in the Web site.

For more information about SharePoint user types, see the Microsoft SharePoint documentation.

This Knowledge Script raises an event when the count for AllUsers, SiteUsers, or Users exceeds the threshold.

66.22.1 Resource Objects

SharePoint Server: Web Applications

66.22.2 Default Schedule

The default interval for this script is every hour.

66.22.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the number of users in a site collection. The default is 5.
Monitor Number of Users in a Site Collection	
Event Notification	
Raise event when the All Users count exceeds the threshold?	Select **Yes** to raise an event if the All Users count exceeds the threshold. The default is Yes.
Event severity when the All Users count exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the All Users count exceeds the threshold you set. The default is 10.
Threshold – Maximum count for All Users	Specify the maximum count for All Users before an event is raised. The default is 1000.
Raise event when the Site Users count exceeds the threshold?	Select **Yes** to raise an event if the Site Users count exceeds the threshold. The default is Yes.

Description	How to Set It
Event severity when the Site Users count exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Site Users count exceeds the threshold you set. The default is 15.
Threshold – Maximum count for Site Users	Specify the maximum count for Site Users before an event is raised. The default is 1000.
Raise event when the Users count exceeds the threshold?	Select **Yes** to raise an event if the Users count exceeds the threshold. The default is Yes.
Event severity when the Users count exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Users count exceeds the threshold you set. The default is 25.
Threshold – Maximum count for Users	Specify the maximum count for Users before an event is raised. The default is 1000.
Data Collection	
Collect data for the All Users count?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the All Users count for the site collection. The default is unselected.
Collect data for the Site Users count?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the Site Users count for the site collection. The default is unselected.
Collect data for the Users count?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the Users count for the site collection. The default is unselected.

66.23 SiteEventLog

Use this Knowledge Script to monitor the event log for events related to Web application usage on the SharePoint server.

This script raises events for the following error codes:

- 642: User Account Maintenance.
- 5187: My Web application Creation failure.
- 5550: A Web application move operation has failed–leaving the Web application structure in an unusual state.
- 5551: A Web application copy operation has failed–leaving the Web application structure in an unusual state.
- 5552: A Web application deletion operation has failed–leaving the Web application structure in an unusual state.
- 5553: Web application Synch failed.
- 5555: Content Database Synchronization failed.
- 5707: Profile Import failed.
- 5708: Membership Import failed.

66.23.1 Resource Objects

SharePoint Server

66.23.2 Default Schedule

The default interval for this script is every 10 minutes.

66.23.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SiteEventLog job fails. The default is 5.
Additional Settings	
Event Details	
Event detail format	Specify the format of the event details, either as an HTML table or as plain text. The default is HTML Table.

Description	How to Set It
Monitor Site Event Log	
Event Notification	
Raise event if the Web application raises an error?	Select **Yes** to raise an event if the Web application raises an error event in the event log. The default is Yes.
Event severity when an event is raised	Set the event severity level, from 1 to 40, to indicate the importance of an event raised as a result of an error event in the event log. The default is 20.
Data Collection	
Collect data for site event log?	Select **Yes** to collect data for charts and reports. The default is unselected.
Events in past N hours	Set this parameter to control event checking for the first interval (after which checking is incremental): • **-1** lists all the existing entries • **N** lists events for the past n hours, such as 8 for the past 8 hours, or 50 for the past 50 hours • **0** lists only entries from this moment on, without listing any previous entries The default is 0.
Maximum number of entries per event report	Specify the maximum number of entries, from 1 to 100, that you want to be recorded in each event's detail message. If this script finds more entries from the log than it can put into one event message, it will return multiple events to report all the outstanding entries in the log. The default is 30 entries. If this script encounters one or more very large events in the Windows Event log, this script may error out and generate the following event message: `Out of string space.` If this occurs, specify a smaller value for this parameter.

66.24 SiteInfo

Use this Knowledge Script to monitor space utilization and date information about the Web applications on the SharePoint server. The space information refers to the size of the file, and the date information refers to when the file was last modified.

Space utilization information includes the number of Web applications that have been added recently, along with the number of existing Web applications that have been modified, and Web applications that have been deleted. You can obtain detailed information about SharePoint Web application types such as documents, document libraries, and lists in report format.

This script helps you quickly locate the Web applications that are using more than the maximum amount of allotted space. The script raises an event if date or space utilization exceeds the threshold you set.

Note that the SharePoint module only discovers Web applications with at least one site collection. This script raises an event if the Web application has no site collections or if there is no data available for the Web application.

Web application information is displayed in report format, which you can customize.

66.24.1 Resource Objects

SharePoint Server: Web Applications

66.24.2 Default Schedule

The default interval for this script is every 24 hours.

66.24.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SiteInfo job fails. The default is 5.
Event Notification	
Raise event for date information?	Select **Yes** to raise an event in which the Knowledge Script collects date information for Web applications on the SharePoint server. The default is Yes.
Event severity when site date information is collected successfully	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Web application date information is successfully collected. The default is 25.
Raise event for space utilization?	Select **Yes** to raise an event in which the Knowledge Script collects space utilization information for Web applications on the SharePoint server. The default is Yes.

Description	How to Set It
Event severity when space utilization data is collected successfully	Set the event severity level, from 1 to 40, to indicate the importance of an event in which space utilization information about Web applications is successfully collected. The default is 25.
Raise event if no data is available?	Select **Yes** to raise an event if no date or space utilization information exists for the Web applications on the SharePoint server. The default is unselected.
Event severity when no data is available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no space utilization or date information exists. The default is 11.
Data Collection	
Collect site date information?	Select **Yes** to collect site date information. If enabled, data collection returns information about the date that sites were created and last modified. The default is unselected.
Collect site space utilization data?	Select **Yes** to collect information about the space utilized by each site on the SharePoint server. If enabled, data collection returns information about how much space each site uses. The default is unselected.
Monitoring	
Enter date in the format mm/dd/yyyy	To monitor date information, such as when a file was last modified, specify the date in the following format: `mm/dd/yyyy` If you alter the date format, the report displays an error. The default is blank. If you leave this setting blank, the job uses the current date for filtering the date information.
Select site type:	Select the type of SharePoint Web application that you want to view in the report. This Knowledge Script identifies Web application types using codes. Select: • **0-All**: To view all Web application types in the report • **1-Lists**: To view only the “lists” Web application type in the report • **2-Document Library**: To view only the “document library” Web application type in the report • **3-Document**: To view only the “documents” Web application type in the report. If you do not select a specific Web application type, this script displays all Web application types in the report by default.
Threshold – Maximum KB of space utilized by each site	Specify the maximum amount of space that can be used by Web applications before an event is raised. The default is 0 KB.
Display report in ascending order?	Select **Yes** to view the report items in the ascending order of the items’ last modified date. The space utilization information is ordered by size (in KB). The default is unselected.
The maximum number of records to display	Specify the maximum number of records per site collection that you want to display in your report. • If you set the number of records to 0, the SiteInfo script displays all the records. • If you set the number of records to 5, for example, the SiteInfo script displays the 5 top records for each site collection. So If you have 20 site collections, the report displays 100 records. The default is 50.

66.25 SiteUsage

Use this Knowledge Script to monitor usage information about each Web application on the SharePoint server.

This script collects usage information based on the following parameters:

- URL
- User
- Operating System
- Browser
- Referrer URL

Web application usage information is displayed in report format. You can customize the format in which the report displays the information.

66.25.1 Resource Objects

SharePoint Server: Web Applications

66.25.2 Default Schedule

The default interval for this script is every hour.

66.25.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor usage information about Web applications. The default is 5.
Monitor Site Usage	
Comma-separated list of Web applications to exclude	Specify a list of Web applications to ignore when monitoring. Use commas to separate multiple Web applications.
File path of a file containing a list of site collection URLs to exclude from monitoring (one per line)	Specify the UNC or file path of a file that contains a list of sites to ignore when monitoring. In the file, list the sites to be excluded, one site per line. The site collection URLs in your list must be in the same format as they appear in event messages. Include the `http://` at the beginning of the URL, and do not include a trailing "/" at the end of the URL (which will cause the job to monitor the site collection you are trying to exclude).

Description	How to Set It
Select report type:	Select the report type that you want to view. The report type dictates how data is filtered (included or excluded). This script uses the following codes to identify report types. Select the code to view the report based on that code. The default is 0-URL. • **0-URL**: URLs of pages that are visited, or of pages for lists that are updated. • **1-User**: Names of users who visited the Web application. • **2-OS**: The operating system used on the client computer. All Web application usage data refers specifically to visits from referrer URLs external to the application. • **3-Browser**: The type of Web browser used to visit the SharePoint Web application. All usage data refers specifically to visits from referrer URLs external to the application. • **4-RefURL**: External URLs through which users navigated to the SharePoint application.
Select report format:	Select the format in which you want to view the report. The default is 0-Day-wise. **0-Day-wise**: Displays usage information for each day over the previous 31 days, not including the day the report is generated. **1-Summary**: Summarizes usage information for the previous 31 days, not including the day the report is generated.
The maximum number of records to display	Specify the maximum number of records per site collection that you want to display in your report. • If you set the number of records to 0, the SiteUsage script displays all the records. • If you set the number of records to 5, for example, the SiteUsage script displays the 5 top records for each site collection in the report. The default value is 50.
Data Collection	
Collect site usage data on the SharePoint server?	Select **Yes** to collect usage data for Web applications on your SharePoint Server. The default is unselected.
Include detail report	Select this parameter to display the detail report with data points. The default is unselected.
Event Notification	
Raise event when the site usage report is created?	Select **Yes** to raise an event in which a report for Web application usage is generated. The default is Yes.
Event severity when the site usage report is created	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report for Web application usage is generated. The default is 25.
Raise event when site usage report is unable to be created?	Select **Yes** to raise an event if no usage information exists for the Web applications on the SharePoint server, so no report can be generated. The default is Yes.
Event severity when site usage report is unable to be created	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no usage information exists. The default is 11.

66.26 VisualModeSiteCount

Use this Knowledge Script to monitor the Visual Mode Site count for each Web application, site collection, and sub-site on a Microsoft SharePoint 2010 server or later.

The Visual Upgrade feature in SharePoint 2010 or later is a site-level setting that selects which product version UI to use when displaying the site.

This Knowledge Script raises an event if the number of visual or non-visual sites exceeds the threshold. This script collects usage data for visual and non-visual site counts.

66.26.1 Resource Objects

SharePoint Server: Web Applications

66.26.2 Default Schedule

The default interval for this script is every 15 minutes.

66.26.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the Visual Mode Site count for Web applications. The default is 5.
Monitor Visual Mode Site Counts for all Web Applications	
Event Notification	
Raise event if number of visual site counts exceeds threshold?	Select **Yes** to raise an event if the number of visual site counts exceed the threshold. The default is Yes.
Event severity when visual mode site counts exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of visual site counts exceed the threshold. The default is 10.
Threshold – Maximum number of visual mode site counts	Specify the maximum number of visual mode site counts allowed before an event is raised. The default is 1000.
Raise event if number of non-visual mode site counts exceeds threshold?	Select **Yes** to raise an event if the number of non-visual mode site counts exceeds the threshold. The default is Yes.
Event severity when non-visual mode site counts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of non-visual mode site counts exceeds the threshold. The default is 15.

Description	How to Set It
Threshold – Maximum number of non-visual mode site counts	Specify the maximum number of non-visual mode site counts allowed before an event is raised. The default is 1000.
Data Collection	
Collect data for visual site counts?	Select **Yes** to collect usage data for visual site counts on your SharePoint server. The default is unselected.
Collect data for non-visual site counts?	Select **Yes** to collect usage data for non-visual site counts on your SharePoint server. The default is unselected.

66.27 WebApplicationUptime

Use this Knowledge Script to monitor the uptime of Web applications on your SharePoint server. **Uptime** is the minimum time (threshold) that Web applications on your SharePoint server should run. This script raises an event if uptime for Web applications falls below the threshold you set.

66.27.1 Resource Objects

SharePoint Server: Web Applications

66.27.2 Default Schedule

The default interval for this script is every hour.

66.27.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor usage Web application uptime. The default is 5.
Monitor Web Application Uptime	
Event Notification	
Raise event if Web application uptime falls below threshold?	Select **Yes** to raise an event if the length of time a Web application has been running falls below the threshold you set. The default is Yes.
Event severity when uptime falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of the event if the Web application uptime falls below the threshold you set. The default is 10.
Threshold – Minimum Web application uptime	Specify the minimum uptime that a Web application must maintain to prevent an event from being raised. The default is 10000 seconds.
Data Collection	
Collect data for Web application uptime?	Select **Yes** to collect data about Web application uptime. The default is unselected.

66.28 WebPagePerf

Use this Knowledge Script to monitor the performance of Web pages in a SharePoint Web application.

Performance is measured in terms of the bandwidth you specify. Bandwidth is the number of bytes transferred to and from Web applications. This script raises an event if a log entry exceeds the bandwidth threshold you set. The script will *only* raise events if the number of bytes transferred to and from Web applications is greater than 0 MB.

For SharePoint 2007, this script retrieves performance information by scanning the SharePoint log entries. The script uses the current date's log file to retrieve the performance information. The script uses the Usage Analysis logs found in the following folder:

```
\Program Files\Common Files\Microsoft Shared\Web server
extensions\12\LOGS\guid of Webpp\
```

For SharePoint 2010 or later , this script retrieves performance information by reading from the logging database.

66.28.1 Configuring Security Manager for WebPagePerf

Before you can run the WebPagePerf Knowledge Script, configure AppManager Security Manager for the specific agents from the SharePoint server farm you want to monitor.

To configure Security Manager for the WebPagePerf Knowledge Script:

1. Select the agent or agents you want this script to monitor. These agents should contain information for all sites and Web applications from the farm.
2. On the **Custom** tab in AppManager Security Manager, add a custom entry and complete the following fields for the agent or agents you selected in the previous step:

Field	Description
Label	`SharePoint_SQL`
Sub-label	*`ServerName\SharePointInstanceName`* Because separate SQL instances are created, and the WebPagePerf Knowledge Script gets data from the logging database in a SharePoint instance, you need to provide the database server name, along with the instance name related to SharePoint in SQL.
Value 1	Specify the user name for the SQL Server account.
Value 2	Specify the password for the SQL Server account.
Extended application support	Required field. Encrypts the user name and password in Security Manager.

3. Run the WebPagePerf script on the agent or agents as needed.

66.28.2 Resource Objects

SharePoint Server: Web Applications

66.28.3 Default Schedule

The default interval for this script is every 24 hours.

66.28.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor the performance of Web pages in a SharePoint Web application. The default is 5.
Monitor Web Page Performance	
Event Notification	
Raise event if log entries exceed the bandwidth threshold?	Select **Yes** to raise an event in which log entries exceed the bandwidth threshold you specify. The default is Yes.
Event severity when bandwidth exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the bandwidth exceeds the threshold. The default is 8.
Threshold – maximum bandwidth	Specify the maximum bandwidth allowed before an event is raised. This script supports a maximum bandwidth of 4096 MB. The default is 1 MB.
Raise event if Web page performance information collected successfully?	Select **Yes** to raise an event in which details of Web page performance are collected successfully. The default is unselected.
Event severity when Web page performance information collected successfully	Set the event severity level, from 1 to 40, to indicate the importance of an event in which Web page performance data is collected successfully. The default is 25.
Raise event if no data is available?	Select **Yes** to raise an event if no bandwidth information exists for the Web page on the SharePoint server. The default is unselected.
Event severity when no data is available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no bandwidth information exists. The default is 11.
Data Collection	
Collect data for matching log entries?	Select **Yes** to collect data for charts and reports. The default is unselected.

66.29 WebPartInfo

Use this Knowledge Script to monitor the status and availability of Web Parts used by the SharePoint server.

A **Web Part** is a modular unit of information located within the SharePoint site collection. A typical example of a Web Part is a digital dashboard on your company's SharePoint site collection, which integrates numerous information sources, enterprise applications, and other resources on a single page.

This script raises an event when it collects information about Web Parts and displays it in report format.

66.29.1 Resource Objects

SharePoint Server: Web Applications

66.29.2 Default Schedule

The default interval for this script is every 30 minutes.

66.29.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job fails to monitor Web Parts used by the SharePoint server. The default is 5.
Monitor Web Part Information	
Comma-separated list of Web applications to exclude	Specify a list of Web applications to ignore when monitoring. Use commas without spaces to separate multiple Web applications.
File path of a file containing a list of site collection URLs to exclude from monitoring (one per line)	Specify the UNC or file path of a file that contains a list of sites to ignore when monitoring. In the file, list the sites to be excluded, one site per line. The site collection URLs in your list must be in the same format as they appear in event messages. Include the `http://` at the beginning of the URL, and do not include a trailing "/" at the end of the URL (which will cause the job to monitor the site collection you are trying to exclude).
Event Notification	
Raise event when Web Part details are collected?	Select **Yes** to raise an event in which details of Web Parts used by the SharePoint server are collected. The default is Yes.
Event severity when Web Part detail collection is successful	Set the event severity level, from 1 to 40, to indicate the importance of an event in which Web Part details are successfully collected. The default is 25.
Raise event when Web Part details are unable to be collected?	Select **Yes** to raise an event if no Web Part information exists for the selected object on the SharePoint server. The default is Yes.

Description	How to Set It
Event severity when Web Part details are unable to be collected	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no Web Part information exists. The default is 11.
Data Collection	
Collect data for Web Parts on the SharePoint server?	Select **Yes** to collect data points for all Web Parts on the SharePoint site collection. The default is unselected.

67 Siemens ServerView Knowledge Scripts

The Siemens category provides the following Knowledge Scripts for monitoring Siemens PRIMERGY servers running ServerView. To access more information about any Knowledge Script, select the Knowledge Script and press **F1** in the Knowledge Script view of Control Center. Or in the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
AdaptecLogicalDriveStatus	Monitors the status of logical drives on an Adaptec RAID controller.
AdaptecPhysicalDiskStatus	Monitors the status of physical disks on an Adaptec RAID controller.
AdaptecRAIDControllerStatus	Monitors the status of Adaptec RAID controllers and any attached hard drives.
ArrayLogicalDriveStatus	Monitors the status of a logical drive on a MYLEX RAID controller.
ArrayPhysicalDiskHardErrors	Monitors the number of hardware errors on a disk connected to a MYLEX RAID controller.
ArrayPhysicalDiskMiscErrors	Monitors the number of miscellaneous errors on a disk connected to a MYLEX RAID controller.
ArrayPhysicalDiskParityErrors	Monitors the number of parity errors on a disk connected to a MYLEX RAID controller.
ArrayPhysicalDiskSoftErrors	Monitors the number of software errors on a disk connected to a MYLEX RAID controller.
ArrayPhysicalDiskStatus	Monitors the status of a disk connected to a MYLEX RAID controller.
CPU	Monitors the status of one or more CPUs.
Fan	Monitors the status of individual fans.
HealthCheck	Monitors ServerView-related services.
IDEPhysicalDevice	Monitors discovered IDE physical devices, such as disk or CD-ROM devices.
LSILogicalDriveHealth	Monitors the physical device status, errors, and S.M.A.R.T. (Self-Monitoring, Analysis, and Reporting Technology) status.
LSIPhysicalDeviceHealth	Monitors physical disk status.
	Monitors the status of memory modules on the system board.
NICError	Monitors the network interface card for transmission errors.
NICFail	Checks the status of the network interface card.
OverallCondition	Monitors the overall condition of discovered subsystems, for example, mass storage, system board, power supply, and environment.

Knowledge Script	What It Does
PowerSupply	Monitors the status of one or more internal power supply units.
	Monitors discovered SCSI physical devices, such as disk or CD-ROM devices.
Temperature	Monitors the server's thermal environment and the status of the server's temperature sensors.
Voltage	Monitors the voltage levels found on the system board.

67.1 AdaptecLogicalDriveStatus

Use this Knowledge Script to monitor the status of logical drives on an Adaptec RAID controller. This Knowledge Script raises an event if the logical drive is degraded, building, rebuilding, or has failed.

This Knowledge Script also raises an event if the status of the drive is `other`, which includes invalid, verifying, formatting, formatCertifying, notCreated, verifyingFixing, abortActivity, and reserved.

In addition, the Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.1.1 Resource Objects

Adaptec Logical Drive folder or Adaptec Logical Drive icon.

67.1.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.1.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the logical drive is operating properly • **50** if the logical drive is degraded, building, or rebuilding (this value is also returned to indicate a status of `other`) • **0** if the logical drive has failed The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...logical drive failed**. The default is 5 (red event indicator). • **...logical drive degraded**. The default is 15 (yellow event indicator). • **...logical drive building or rebuilding**. The default is 20 (yellow event indicator). • **...logical drive at other status**. The default is 20 (yellow event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.2 AdaptecPhysicalDiskStatus

Use this Knowledge Script to monitor the status of physical disks on an Adaptec RAID controller. This Knowledge Script raises an event if the disk is building, rebuilding, has issued a warning, or has failed.

The Knowledge Script also raises an event if the status of the disk is `other`, which includes invalid, verifying, formatting, formatCertifying, notCreated, verifyingFixing, abortActivity, and reserved.

In addition, the Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.2.1 Resource Objects

Adaptec Physical Disk folder or Adaptec Physical Disk icon.

67.2.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.2.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the physical disk is operating properly • **50** if the physical disk has issued a warning, is building, or rebuilding (this value is also returned to indicate a status of `other`) • **0** if the physical disk has failed or is missing The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...physical disk failed or missing**. The default is 5 (red event indicator). • **...physical disk degraded or warning**. The default is 15 (yellow event indicator). • **...physical disk building or rebuilding**. The default is 20 (yellow event indicator). • **...physical disk at other status**. The default is 20 (yellow event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.3 AdaptecRAIDControllerStatus

Use this Knowledge Script to monitor the status of Adaptec RAID controllers and any attached hard drives. This Knowledge Script raises an event if the controller or an attached hard drive has failed or issued an error.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.3.1 Resource Objects

Adaptec RAID Controller folder or Adaptec RAID Controller icon.

67.3.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the controller and attached drives are operating properly • **50** if the controller or an attached drive has issued an error • **0** if the controller or an attached drive has failed, is invalid, or is not supported The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...RAID Controller failed**. The default is 5 (red event indicator). • **...RAID Controller error**. The default is 15 (yellow event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.4 ArrayLogicalDriveStatus

Use this Knowledge Script to monitor the status of a logical drive on a MYLEX RAID controller. A *logical drive* is a combination of partitions on physical disks. If the logical drive status is dead or unknown, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.4.1 Resource Objects

Array Logical Drive folder or Array Logical Drive icon.

67.4.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the logical drive is operating properly • **50** if the logical drive status is unknown • **0** if the logical drive is dead The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...logical drive critical**. The default is 5 (red event indicator). • **...logical drive offline or status unknown**. The default is 25 (blue event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.5 ArrayPhysicalDiskHardErrors

Use this Knowledge Script to monitor the status of the physical disks connected to a MYLEX RAID controller. If the number of hardware errors exceeds the threshold, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

If a disk experiences frequent hardware errors, replace the defective disk.

67.5.1 Resource Objects

Array Physical Disk folder or individual Array Physical Disk icon.

67.5.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the number of hardware errors encountered by a physical disk. The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Maximum threshold for hardware errors	Enter a threshold for the maximum number of hardware errors in a monitoring interval. The default is 5.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...threshold exceeded**. The default is 5 (red event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.6 ArrayPhysicalDiskMiscErrors

Use this Knowledge Script to monitor the status of the physical disks connected to a MYLEX RAID controller. If the number of miscellaneous errors exceeds the threshold, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

If a disk experiences frequent miscellaneous errors, replace the defective disk.

67.6.1 Resource Objects

Array Physical Disk folder or individual Array Physical Disk icon.

67.6.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the number of miscellaneous errors encountered by a physical disk. The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Maximum threshold for miscellaneous errors	Enter a threshold for the maximum number of miscellaneous errors in a monitoring interval. The default is 5.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...threshold exceeded**. The default is 5 (red event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.7 ArrayPhysicalDiskParityErrors

Use this Knowledge Script to monitor the status of the physical disks connected to a MYLEX RAID controller. At certain RAID levels, data blocks are protected by redundant data (so-called parity blocks). This Knowledge Script shows a count of the errors detected during this procedure.

If the number of parity errors exceeds the threshold, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

If a disk experiences frequent parity errors, check cabling and termination. This error may be caused by:

- Improper parity generation and checking
- Cable failure
- Improper cable length
- Improper or missing cable termination
- Interference from another device

67.7.1 Resource Objects

Array Physical Disk folder or individual Array Physical Disk icon.

67.7.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the number of parity errors encountered by a physical disk. The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Maximum threshold for parity errors	Specify the maximum number of parity errors that can occur during a monitoring interval before an event is raised. The default is 5.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...threshold exceeded**. The default is 5 (red event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.8 ArrayPhysicalDiskSoftErrors

Use this Knowledge Script to monitor the status of the physical disks connected to a MYLEX RAID controller. If the number of software errors exceeds the threshold, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

If a disk experiences a software error, run Siemens consistency check. If the disk experiences frequent software errors, replace the defective disk.

67.8.1 Resource Objects

Array Physical Disk folder or individual Array Physical Disk icon.

67.8.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the number of software errors encountered by a physical disk. The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Maximum threshold for software errors	Specify the maximum number of software errors that can occur during a monitoring interval before an event is raised. The default is 5.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...threshold exceeded**. The default is 5 (red event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.9 ArrayPhysicalDiskStatus

Use this Knowledge Script to monitor the status of the physical disks connected to a MYLEX RAID controller. If a disk is dead or its status is unknown, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.9.1 Resource Objects

Array Physical Disk folder or individual Array Physical Disk icon.

67.9.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.9.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the physical disk is operating properly • **50** if the physical disk status is rebuilding • **30** if the physical disk status is unknown • **0** if the physical disk is dead The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...physical disk dead** (the disk status is `dead`, the disk does not exist, the disk exists but is not powered on, the disk was deactivated by the controller due to an error). The default is 5 (red event indicator). • **...physical disk rebuilding**. The default is 18 (yellow event indicator). • **...physical disk status unknown**. The default is 25 (yellow event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.10 CPU

Use this Knowledge Script to monitor the status of one or more CPUs. If a CPU fails or its status is unknown, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.10.1 Resource Objects

CPU Folder or individual CPU icons.

67.10.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the CPU status is OK • **30** if the CPU status is unknown • **0** if the CPU is in any other state The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...CPU failed**. The default is 5 (red event indicator). • **...prefailure warnings**. The default is15 (yellow event indicator). • **...CPU status unknown**. The default is 25 (blue event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.11 Fan

Use this Knowledge Script to monitor the status of individual fans. If a fan is not operating properly or if its status is unknown, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.11.1 Resource Objects

Fan Folder or individual Fan icons.

67.11.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the fan status and speed. The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...fan has failed**. The default is 5 (red event indicator). • **...fan failure predicted**. The default is15 (yellow event indicator). • **...redundant fan failed**. The default is 15 (yellow event indicator). • **...fan status is unknown**. The default is 25 (blue event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.12 HealthCheck

Use this Knowledge Script to monitor all ServerView-related services. If a ServerView-related service is not running, this Knowledge Script raises an event, performs the action you specify in the Actions tab of the Knowledge Script, and automatically restarts the service.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

In order for SNMP errors to generate an event, you need to run this Knowledge Script in the TreeView on an object at the Siemens Server level or above.

67.12.1 Resource Objects

Siemens Server or any Siemens Service icon.

67.12.2 Default Schedule

The default interval for this Knowledge Script is **Every 5 minutes**.

67.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Auto-start service?	Set to **y** to automatically restart stopped services. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the status of ServerView-related services. The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...service down; restart failed**. The default is 5 (red event indicator). • **...service down; restart succeeded**. The default is 25 (blue event indicator). • **...service down; don't restart**. The default is 18 (yellow event indicator). • **...SNMP down**. The default is 5 (red event indicator).

67.13 IDEPhysicalDevice

Use this Knowledge Script to monitor discovered IDE physical devices such as, disk or CD-ROM devices. If a device fails, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.13.1 Resource Objects

IDE folder or individual IDE drives.

67.13.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set it
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns 100 if the IDE device is operating properly or 0 if the IDE device is dead. The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...IDE device failure**. The default is 5 (red event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.14 LSILogicalDriveHealth

Use this Knowledge Script to monitor logical drive status on LSI MegaRAID controllers. If the logical drive status is Rebuilding, Failed, Degraded, or Unknown, an event is raised.

67.14.1 Resource Objects

LSI Logical Drive folder or individual Logical Drive icon

67.14.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.14.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set it
General Settings	
Community string	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Job failure event notification	
Event severity for SNMP or ServerView service down	Set the severity level from 1 to 40 to indicate the importance on an event in which the SNMP or ServerView service is down. The default is 10.
Event Notification	
Status Settings	
Raise event when status of logical drive is Failed?	Select Yes to raise an event when the status of the logical drive is Failed. The default is Yes.
Event severity when status of logical drive is Failed	Set the severity level from 1 to 40 to indicate the importance of an event in which the status of the logical drive is Failed. The default is 5.
Raise event when status of logical drive is Degraded or Rebuilding	Select Yes to raise an event when the status of the logical drive is Degraded or Rebuilding. The default is Yes.
Event severity when status of logical drive is Degraded or Rebuilding	Set the severity level from 1 to 40 to indicate the importance of an event in which the status of the logical drive is Degraded or Rebuilding. The default is 18.
Raise event when status of logical drive is Unknown	Select Yes to raise an event when the status of the logical drive is Unknown. The default is unselected.
Event severity when status of logical drive is Unknown	Set the severity level from 1 to 40 to indicate the importance of an event in which the status of the logical drive is Unknown. The default is 35.
Data Collection	

Parameter	How to Set it
Collect data for logical drive status?	Set to **Yes** to collect data for charts and reports. If set to Yes, this Knowledge Script records the operational status of the logical drive at each monitoring interval. The default is unselected.

67.15 LSIPhysicalDeviceHealth

Use this Knowledge Script to monitor physical device status, device errors, and S.M.A.R.T. (Self-Monitoring, Analysis, and Reporting Technology) status on LSI Mega RAID controllers. If the physical device status is Rebuilding, Failed, or Unknown or if the number of errors exceed the threshold you set, an event is raised. An event is also raised if failure is predicted for a physical device or the S.M.A.R.T status is not known.

67.15.1 Resource Objects

Disk Array folder or LSI Physical Disk folder or individual Physical disk icon

67.15.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.15.3 Setting Parameter Values

Set the following parameters as needed

Parameter	How to Set it
General Settings	
community string name	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Job failure event notification	
Event severity for SNMP or ServerView service down	Set the severity level from 1 to 40 to indicate the importance on an event in which SNMP or the ServerView service is down. The default is 10.
Event Notification	
Status Settings	
Raise event when status of physical device is Rebuilding?	Select Yes to raise an event when the status of the physical device is Rebuilding. The default is Yes.
Event severity when status of physical device is Rebuilding	Set the severity level from 1 to 40 to indicate the importance of an event in which the status of the physical device is Rebuilding. The default is 15.
Raise event when status of physical device is Failed?	Select Yes to raise an event when the status of the physical device is Failed. The default is Yes.
Event severity when status of physical device is Failed	Set the severity level from 1 to 40 to indicate the importance of an event in which the status of the physical device is Failed. The default is 5.
Raise event when status of physical device is Unknown	Select Yes to raise an event when the status of the physical device is Unknown. The default is unselected.
Event severity when status of physical device is Unknown	Set the severity level from 1 to 40 to indicate the importance of an event in which the status of the physical device is Unknown. The default is 35.

Parameter	How to Set it
S.M.A.R.T. Status Settings	
Raise event when failure is predicted for physical device?	Select Yes to raise an event when failure is predicted for the physical device. The default is Yes.
Event severity when failure is predicted for physical device	Set the severity level from 1 to 40 to indicate the importance of an event in which failure is predicted for the physical device. The default is 15.
Raise event when S.M.A.R.T. Status of physical device is not available?	Select Yes to raise an event when the S.M.A.R.T. status for the physical device is not available. The default is unselected.
Event severity when S.M.A.R.T. Status of physical device is Not Available.	Set the severity level from 1 to 40 to indicate the importance of an event in which the S.M.A.R.T status of the physical device is Not Available. The default is 5.
Error Settings	
Raise event when physical device errors exceed threshold?	Select Yes to raise an event if the number of physical device errors exceeds the threshold you set. The default is Yes.
Threshold for device errors	Specify the maximum number of errors that can occur for a physical device before an event is raised. The default is 5.
Event severity when device errors exceed threshold	Set the severity level from 1 to 40 to indicate the importance of an event in which physical device errors exceed the threshold you set. The default is 15.
Data Collection	
Collect data for physical device status?	Set to **Yes** to collect data for charts and reports. If set to Yes, this Knowledge Script records the operational status of the device at each monitoring interval. The default is unselected.
Collect data for physical device errors?	Set to **Yes** to collect data for charts and reports. If set to Yes, this Knowledge Script records the number of errors of the device at each monitoring interval. The default is unselected.
Collect data for physical device S.M.A.R.T. status?	Set to **Yes** to collect data for charts and reports. If set to Yes, this Knowledge Script records the S.M.A.R.T. status of the device at each monitoring interval. The default is unselected.

67.16 MemoryModule

Use this Knowledge Script to monitor the status of memory modules on the system board. If a memory module fails or its status is unknown, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

If a memory module experiences frequent errors, locate and replace the defective memory module.

67.16.1 Resource Objects

Memory Module icon.

67.16.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.16.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the memory module is operating properly • **50** if the memory module status is unknown • **0** if the memory module has failed The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...memory module failed**. The default is 5 (red event indicator). • **...status unknown**. The default is 25 (blue event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.17 NICError

Use this Knowledge Script to monitor network interface transmission errors. Both input and output errors are reported and evaluated against the thresholds you specify. If the number of network interface errors per minute exceeds the threshold, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.17.1 Resource Objects

Network Interface Card (NIC) folder or individual NIC icons.

67.17.2 Default Schedule

The default interval for this Knowledge Script is **Every 30 minutes**.

67.17.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the number of input and output errors per minute at each monitoring interval. The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Maximum threshold for input errors per minute	Specify the maximum number of input errors that can occur per minute before an event is raised. The default is 2 errors per minute.
Maximum threshold for output errors per minute	Enter a threshold for the maximum number of output errors per minute. The default is 4 errors per minute.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...SNMP or ServerView service down**. The default is 9 (red event indicator). • **...input error threshold exceeded**. The default is 10 (red event indicator). • **...output error threshold exceeded**. The default is 10 (red event indicator).

67.18 NICFail

Use this Knowledge Script to monitor the status of the network interface. This Knowledge Script checks whether the network interface subsystem is down when the administrator has indicated it should be in the "up" state. If the network interface subsystem is down, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.18.1 Resource Objects

Network Interface Card (NIC) folder or individual NIC icons.

67.18.2 Default Schedule

The default interval for this Knowledge Script is **Every 5 minutes**.

67.18.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the operational status of the network interface subsystem at each monitoring interval. The default is n.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...network interface subsystem is down**. The default is 6 (red event indicator). • **...SNMP or ServerView service down**. The default is 9 (red event indicator).

67.19 OverallCondition

Use this Knowledge Script to monitor the overall condition of the discovered subsystems on the server such as, mass storage, system board, power supply, and environment. If a subsystem is not operating properly, this Knowledge Script raises an event.

NOTE: You cannot customize the parameters to specify what subsystems need to be monitored by this Knowledge Script.

When this Knowledge Script raises an event, the event message does not indicate the subsystem having a problem. It displays a generic message that some of the subsystems are not working properly.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

If the overall condition of a device degrades, use the Siemens-related Knowledge Scripts to identify the source of the problem. To monitor Siemens ServerView services, see HealthCheck.

67.19.1 Resource Objects

Siemens Server.

67.19.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.19.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data. If set to y, this Knowledge Script returns: • **100** if the overall condition is normal • **50** if the overall condition has degraded • **0** if the server encountered an error The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...device error or failed**. The default is 5 (red event indicator). • **...unknown subsystem status**. The default is 10 (red event indicator). • **...device degraded**. The default is 15 (yellow event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.20 PowerSupply

Use this Knowledge Script to monitor the status of one or more internal power supply units. If a power supply unit is not operational or its status is unknown, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.20.1 Resource Objects

Power Supply folder or individual Power Supply icons.

67.20.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.20.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the power supply is operating properly • **30** if the power supply status is unknown • **0** if the power supply has failed The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...power supply failed**. The default is 5 (red event indicator). • **...power supply status unknown**. The default is 25 (blue event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.21 SCSIPhysicalDevice

Use this Knowledge Script to monitor discovered SCSI physical devices such as, disk or CD-ROM devices. If a device fails, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.21.1 Resource Objects

SCSI folder or individual SCSI icons.

67.21.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.21.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns 100 if the SCSI device is operating properly or 0 if the SCSI device has failed. The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for	Set the event severity level, from 1 to 40, to indicate the importance of: • **...SCSI physical device failure**. The default is 5 (red event indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

67.22 Temperature

Use this Knowledge Script to monitor the thermal environment and the status of the thermal sensors of the server. If a sensor is operating out of normal temperature range, or if the thermal status is unknown, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

67.22.1 Resource Objects

Temperature folder or individual Temperature icons.

67.22.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.22.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the temperature (in degrees Celsius) at each monitoring interval. The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...temperature abnormal or sensor failed**. The default is 15 (yellow event indicator). • **...temperature critical**. The default is 5 (red event indicator). • **...temperature status unknown**. The default is 25 (blue indicator). • **...SNMP or Siemens ServerView service down**. The default is 10 (red event indicator).

67.23 Voltage

Use this Knowledge Script to monitor the voltage level for a Siemens server. This Knowledge Script monitors the status of the voltage sensors on the system board. If a sensor detects that the voltage level has dropped below or exceeded the normal operating threshold, or the voltage level is unknown, this Knowledge Script raises an event.

In addition, this Knowledge Script raises an event if SNMP is not operating or there is a problem retrieving a MIB (Management Information Base) variable value.

The server system defines the voltage levels for normal operation internally.

67.23.1 Resource Objects

Voltage folder or individual Voltage icons.

67.23.2 Default Schedule

The default interval for this Knowledge Script is **Every 10 minutes**.

67.23.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the voltage level for each voltage sensor at each monitoring interval. The default is n.
Community	Specify the community string name. If you do not enter a value, the script uses the community string name supplied by Security Manager. If no entry for the community string name exists in Security Manager, the script uses the default value `public`.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...voltage is too high or low**. The default is 5 (red event indicator). • **...voltage status unknown**. The default is 25 (blue indicator). • **...SNMP or ServerView service down**. The default is 10 (red event indicator).

68 SIPServer Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring SIP servers and resources. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
CallQuality	Monitors calls for quality metrics, including jitter, latency, packet loss, Mean Opinion Score (MOS), and R-Value.
CollectCallData	Starts and monitors SIP call data collection.
SetupSupplementalDB	Creates a supplemental database in which to store call detail records, including voice quality reports.
UserAgentQuality	Monitors real-time user agent voice-quality statistics, including jitter, latency, packet loss, Mean Opinion Score (MOS), and R-Value.

68.1 CallQuality

Use this Knowledge Script to monitor SIP packet information stored in the SIP Server supplemental database for call quality statistics. These statistics include jitter, latency (one-way delay), lost data, Mean Opinion Score (MOS), and R-Value. MOS and R-Value are computed only for calls that use one of the following codecs: G.711u, G.711a, or G.729.

This script raises an event if a monitored call quality statistic, such as MOS, crosses a threshold that you specified. The script generates data streams for all monitored call quality statistics.

NOTE: You can trigger NetIQ Vivinet Diagnostics to diagnose the problem indicated by an event in which the percentage lost data threshold is exceeded. For more information, see "Triggering Call and Phone Quality Diagnoses" on page 3932.

The purpose of this script is two-fold:

- **Troubleshooting**. In troubleshooting mode, this script runs once and checks the supplemental database tables for calls that disconnected within the range you select in the *Call disconnect time range* parameter. Select **Run once** on the **Schedule** tab to run this script in troubleshooting mode.
- **Diagnosing**. In diagnostic mode, this script works in conjunction with NetIQ Vivinet Diagnostics to diagnose VoIP quality problems detected during monitoring. If a call quality threshold is exceeded, then, by default, this script launches Action_DiagnoseVoIPQuality, a Knowledge Script that in turn launches Vivinet Diagnostics to generate a diagnosis of the problem.

  To turn off diagnostic mode, click the Actions tab, select **Action_DiagnoseVoIPQuality**, and click **Delete**. Turning diagnostic mode off or on does not affect the events raised by this script.
- **Monitoring**. In monitoring mode, this script checks the supplemental database tables at each specified interval for new records that match your query. You always run the script in monitoring mode unless you select **Run once** on the **Schedule** tab.

68.1.1 Understanding Data Streams and Threshold Events

This script generates data streams for average MOS, R-Value, jitter, latency, and packet loss. These average values are based on data from each phone involved in calls that completed during the script's interval, which is, by default, every 5 minutes. For example, in a given call, party 1's phone jitter was 30 milliseconds and party 2's phone jitter was 75 milliseconds. For this call, the data stream would be a calculated average of the jitter for both phones: 52.5 milliseconds.

This calculated average is below the default threshold value of 60 milliseconds. However, AppManager raises threshold events based on values for each phone in a call, not on the average value. Therefore, for this call, AppManager would raise one event based on the 75 milliseconds of jitter for the called phone.

68.1.2 Prerequisites

- Run SIPServer_SetupSupplementalDB to create the SIP Server supplemental database.
- Because the SIPServer_CallQuality script reports on data stored in the supplemental database by a data collector service, data must exist in the supplemental database before the reporting can be successful. To place data in the supplemental database, run SIPServer_CollectCallData on the SIP Server being monitored before you run the CallQuality script. If the CollectCallData script stops, the data collection also stops, even if the CallQuality script is still running.

68.1.3 Resource Object

SIP Server Call Data folder

68.1.4 Default Schedule

By default, this script runs **every 5 minutes**.

68.1.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CallQuality job. The default is 5.
Raise event if no records found?	Select **Yes** to raise an event if there are no SIP packets to monitor in the SIP Server supplemental database. The script only raises an event when no records exist in the database. The script does not raise an event if it finds records, but those records do not have call quality data. If you select Yes and this script raises this event, check the status of the job run by the SIPServer_CollectCallData Knowledge Script. The default is unselected.
Event severity when no records found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no SIP packets were found. The default is 25.
Call Details	
Include call details?	Select **Yes** to include call details in the events raised by this script. The default is Yes. Leave this parameter unselected to suppress the following call details: • Calling Party • Called Party • Caller and Called Average MOS • Caller and Called Average R-Value • Caller and Called Jitter • Caller and Called Latency • Caller and Called Lost Packets • Caller and Called Codec • Connect Time • Disconnect Time • Duration Calling Party and Called Party details usually contain phone numbers, such as station extensions. If calls are made from named SIP user agents or gateways, rather than phones with numbers assigned, the Agent ID or gateway name might display instead of a called or calling phone extension.

Parameter	How to Set It
Query Filters	Use the following parameters to filter the list of call data records. **Note** Using a quotation mark character (") in a filter parameter causes an error event, unless the character is duplicated. To work around this issue, replace any instance of a quotation mark character with two quotation mark characters. For example, if you want to use `"MyCallerID"` in a filter, write it as `""MyCallerID""`.
Minimum duration	Use this parameter to filter out records whose call duration is less than the value you specify. Accept the default of 0 seconds to ignore the filter for minimum duration.
Maximum table size	Specify the maximum number of detail rows to include in an event message. The default is 50 rows.
Maximum duration	Use this parameter to filter out records whose call duration is greater than or equal to the value you specify. Accept the default of 0 seconds to ignore the filter for maximum duration.
Calling party	Specify the calling party involved in the call that you want to find in the supplemental database. Using an asterisk before and after the search string helps you find a specific numbered extension that may include brackets. For example, specifying `*sip:51006@*` would return the following SIP phone: `<sip:51006@netiqavayasm.ral>`. Leave this parameter blank to search for any call party.
Party connector	Set this parameter only if you specified a party for both the *Calling party* parameter and the *Called party* parameter. Your selection indicates how the script will connect the two parameters: AND or OR. The default is AND.
Called party	Specify the second party involved in the call that you want to find in the supplemental database. Using an asterisk before and after the search string helps you find a specific numbered extension that may include brackets. For example, specifying `*sip:51006@*` would return the following SIP phone: `<sip:51006@netiqavayasm.ral>`. Leave this parameter blank to search for any call party.
Troubleshooting	
Call stop time range	Select a range of time and dates in which the query should search for data in the supplemental database. • Select **Fixed Time** to select specific days and times that the query should begin and end. • Select **Sliding** to select a number of hours, days, months, or years in which to search. The query starts its search at the time the job runs, and goes back through the supplemental database for the number of units you select. The default is Fixed Time. **NOTE:** This parameter is valid only when you select **Run once** on the Schedule tab.
Monitor Average MOS	
Event Notification	
Raise event if average MOS falls below threshold?	Select **Yes** to raise an event if the average MOS value falls below the threshold. The default is Yes.

Parameter	How to Set It
Threshold - Average MOS	Specify the lowest average MOS value, from 1.0 to 5.0, that must occur to prevent an event from being raised. The default is 3.60.
Event severity when average MOS falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average MOS value falls below the threshold. The default is 5.
Data Collection	
Collect data for average MOS?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the average MOS value during the monitoring period. The default is unselected.
Monitor Average R-Value	
Event Notification	
Raise event if average R-Value falls below threshold?	Select **Yes** to raise an event if the average R-Value falls below the threshold. The default is Yes.
Threshold - Average R-Value	Specify the lowest average R-Value, from 0 to 100, that must occur to prevent an event from being raised. The default is 70.
Event severity when average R-Value falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average R-Value falls below the threshold. The default is 5.
Data Collection	
Collect data for average R-Value?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the average R-Value during the monitoring period. The default is unselected.
Monitor Average Jitter	
Event Notification	
Raise event if jitter exceeds threshold?	Select **Yes** to raise an event if the average jitter value exceeds the threshold. The default is Yes.
Threshold - Maximum jitter	Specify the highest average jitter value, in milliseconds, that can occur before an event is raised. The default is 60 milliseconds.
Event severity when jitter exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average jitter value exceeds the threshold. The default is 15.
Data Collection	
Collect data for jitter?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of average jitter that occurred during the monitoring period. The default is unselected.
Monitor Average Latency	
Event Notification	
Raise event if latency exceeds threshold?	Select **Yes** to raise an event if the average latency value exceeds the threshold. The default is Yes.
Threshold - Maximum latency	Specify the highest amount of average latency, in milliseconds, that can occur before an event is raised. The default is 400 milliseconds.
Event severity when latency exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average latency value exceeds the threshold. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for latency?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of latency that occurred during the monitoring period. The default is unselected.
Monitor Average Packet Loss	
Event Notification	
Raise event if packet loss exceeds threshold?	Select **Yes** to raise an event if the average packet loss value exceeds the threshold. The default is Yes.
Threshold - Maximum packet loss	Specify the highest percentage of average packet loss that can occur before an event is raised. The default is 1%.
Event severity when packet loss exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the packet loss value exceeds the threshold. The default is 15.
Data Collection	
Collect data for packet loss?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of packet loss that occurred during the monitoring period. The default is unselected.

68.1.6 Triggering Call and Phone Quality Diagnoses

You can use NetIQ Vivinet Diagnostics to diagnose problems identified by SIPServer Knowledge Scripts.

Using the existing methodology of launching an Action script based on an event, AppManager can launch Action_DiagnoseVoIPQuality to trigger Vivinet Diagnostics to diagnose the problem for events raised by the SIPServer_CallQuality Knowledge Script. SIPServer_CallQuality events trigger Vivinet Diagnostics to diagnose the problem when average MOS, average R-Value, average jitter, average latency, and average packet loss fall below or exceed their thresholds.

The Action script runs by default only if Vivinet Diagnostics 2.3 or later is installed on the computer on which the script is running.

To trigger Vivinet Diagnostics:

1. When setting parameter values for the CallQuality script, click the **Actions** tab. Action_DiagnoseVoIPQuality is selected by default.
2. Click **Properties** and enter values for all parameters for the Action script. For more information about the parameter values, click **Help** on the Properties for Action_DiagnoseVoIPQuality dialog box.

For more information about Vivinet Diagnostics and call quality diagnoses, see the *User Guide for Vivinet Diagnostics* and the Help for the Action_DiagnoseVoIPQuality Knowledge Script.

68.2 CollectCallData

Use this Knowledge Script to monitor the availability of call data for SIP Quality of Server (QoS) sources. This script raises an event when the SIP QoS call data collection is unavailable or available, and it also raises an event when call data collection raises a warning for any reason, including errors that prevent an individual data record from being saved to the database.

68.2.1 Resource Object

SIPServer Call Data folder

68.2.2 Default Schedule

By default, this script runs **every 5 minutes**. You can set the schedule interval in seconds, minutes or hours, or you select the option to run the script once.

68.2.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the CollectCallData job encounters a problem that prevents it from running, such as an invalid parameter, an invalid object detail, or a missing required system resource. The default is 5.
Raise event if call data is unavailable?	Select **Yes** to raise an event when call data is unavailable for any reason, including a failure to start the collection of call data. The default is Yes.The event message lists the reason for the interruption. The reasons include: • The NetIQ Call Data Collector Server Windows service is stopped and cannot be started. • The SIP call data collector cannot start because the UDP port is in use by another application or collector. • The supplemental database does not exist. • The supplemental database exists, but it is down. • The supplemental database exists and is running, but it cannot be accessed. • The supplemental database exists, is running and can be accessed, but writes to the database fail.
Event severity when call data is unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the call data is not available for any reason. The default is 5.
Raise event if call data collection warning?	Select **Yes** to raise an event if call data collection raises a warning for any reason, including errors that prevent an individual data record from being saved to the database. The default is Yes.

Parameter	How to Set It
Event severity when call data collection warning	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the call data collection raises a warning. The default is 15.
Raise event if call data is available?	Select **Yes** to raise an event if call data is available. The default is unselected.
Event severity when call data is available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the call data is available since the last iteration. The default is 25.
Monitor Call Data Availability	
Data Collection	
Collect data for call data availability?	Select **Yes** to collect data for the availability of call data. A 100 indicates that call data was available throughout the monitoring interval, and a 0 indicates otherwise, such as at least one interruption occurred. The default is unselected. If you select the schedule option of run once, the script will not report data, because no “end of interval” point exists. As a result, the script will not report data even if you selected Yes for this parameter.

68.3 SetupSupplementalDB

Use this Knowledge Script to create an SIP Server supplemental database, including the tables and stored procedures needed to store call detail records (CDRs) and voice quality monitoring for a SIP server. In addition, this script creates a SQL Server job that removes old records from the supplemental database.

You can also create the SIP Server supplemental database using the *Set up supplemental database?* parameters in the Discovery_SIPServer Knowledge Script.

For more information, see "Understanding the Supplemental Database" on page 3936.

68.3.1 Resource Object

SIP Server Call Data folder

68.3.2 Default Schedule

By default, this script runs **once**.

68.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the SetupSupplementalDB job. The default is 5.
Raise event if database set up succeeds?	Select **Yes** to raise an event if creation of the SIP Server supplemental database is successful. The default is unselected.
Event severity when database setup succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the success of the creation of the SIP Server supplemental database. The default is 25.

Parameter	How to Set It
Start pruning job on supplemental database?	**For all supported versions of SQL Server, except SQL Server Express versions**: Set to **Yes** to create a SQL job that deletes data from the supplemental database. The SQL job runs every night. The default is Yes. Data is deleted from the supplemental database based on the value you specify in the *Number of days to keep call detail records* parameter. **For SQL Server Express versions**: Set to **No**. The pruning job is not supported for SQL Server Express versions. **To manually delete data from the supplemental database**: 1. Run the following stored procedure from a command line: `osql -E -S <sql server> -n -d <database> -Q "exec dbo.Task_SIPServer_Pruning"` where <*sql server*> is the name of the server that hosts the supplemental database, and where <`database`> is the name of the supplemental database. For example: `osql -E -S SuppDBSIPServer -n -d SIPServer_S8300-Cluster -Q "exec dbo.Task_SIPServer_Pruning"` 2. Configure a Windows Scheduled Task to schedule pruning at an interval of your choosing. The process for configuring a Windows Scheduled Task varies according to your version of Microsoft Windows. Consult your Windows documentation for more information.
Number of days to keep call detail records	Specify the number of days' worth of CDRs you want to keep in the SIP Server supplemental database. Data older than what you specify is discarded. The default is 7 days.
SQL Server Information	
SQL Server instance name	Specify the instance name of the SQL Server where you want to create the new SIP Server supplemental database. Leave this parameter blank to use the default SQL server instance on the proxy agent computer.
SQL database user name	Specify the user name for the SQL Server where you want to create the new SIP Server supplemental database. Leave this parameter blank to use Windows authentication instead of SQL authentication.

68.3.4 Understanding the Supplemental Database

The SIP Server supplemental database is a Microsoft SQL Server database you create for the proxy agent computer. The supplemental database fulfills several functions.

Storage for CDRs and SIP packets

The managed object on the proxy agent computer receives call detail records (CDRs) from SIP servers and SIP packets from phones registered to SIP servers. The SIPServer_CollectCallData

Knowledge Script starts and monitors the complete call data collection on the proxy agent computer, and it saves the CDR and SIP packet data to tables in the SIP Server supplemental database. The SIPServer_CallQuality and SIPServer_UserAgentQuality Knowledge Scripts query the supplemental database for the data they need.

When you start the SIPServer_CallQuality Knowledge Script job, the job starts a collection task in the NetIQ Call Data Collector Server Windows service that begins collecting CDR and SIP data to store in the SIP Server supplemental database.

When you create the supplemental database, you specify how long data is retained before being deleted. AppManager automatically deletes CDRs older than the retention age you specify.

To create and use the supplemental database:

1. **Create the database**. Create one SIP Server supplemental database per SIP Server cluster you are monitoring. Use the Discovery_SIPServer or SIPServer_SetupSupplementalDB Knowledge Script for this purpose.
2. **Monitor the data in the database**. Use the SIPServer_CallQuality or SIPServer_UserAgentQuality scripts to monitor jitter, latency, lost data, R-Value, and MOS data in the database.

68.4 UserAgentQuality

A *SIP user agent* is a logical network endpoint that can send and receive SIP messages. A user agent performs the role of a user agent *client*, which sends SIP requests, and the user agent *server*, which receives the requests and returns a SIP response.

Use this Knowledge Script to continuously monitor SIP packet information stored in the SIP Server supplemental database for quality of service (QOS) statistics for a SIP user agent.

This script monitors jitter, latency, packet loss, Mean Opinion Score (MOS), and RâĂŘValue for a SIP user agent. This script raises an event if a monitored value exceeds or falls below a threshold. MOS and RâĂŘValue are computed only for calls that use one of the following codecs: G.711u, G.711a, or G.729.

NOTE: You can trigger NetIQ Vivinet Diagnostics to diagnose the problem indicated by an event in which the percentage lost data threshold is exceeded. For more information, see "Triggering Call and Phone Quality Diagnoses" on page 3932.

The purpose of this script is two-fold:

- **Troubleshooting**. In troubleshooting mode, this script runs once and checks the supplemental database tables for calls that disconnected within the range you select in the *Call disconnect time range* parameter. Select **Run once** on the **Schedule** tab to run this script in troubleshooting mode.
- **Diagnosing**. In diagnostic mode, this script works in conjunction with NetIQ Vivinet Diagnostics to diagnose VoIP quality problems detected during monitoring. If a call quality threshold is exceeded, then, by default, this script launches Action_DiagnoseVoIPQuality, a Knowledge Script that in turn launches Vivinet Diagnostics to generate a diagnosis of the problem.

  To turn off diagnostic mode, click the Actions tab, select **Action_DiagnoseVoIPQuality**, and click **Delete**. Turning diagnostic mode off or on does not affect the events raised by this script.
- **Monitoring**. In monitoring mode, this script checks the supplemental database tables at each specified interval for new records that match your query. You always run the script in monitoring mode unless you select **Run once** on the **Schedule** tab.

68.4.1 Resource Objects

SIP Server Call Data folder

68.4.2 Prerequisites

- Run SIPServer_SetupSupplementalDB to create the SIP Server supplemental database.
- Because the SIPServer_UserAgentQuality script reports on data stored in the supplemental database by a data collector service, data must exist in the supplemental database before the reporting can be successful. To place data in the supplemental database, run SIPServer_CollectCallData on the SIP Server being monitored before you run the SIPServer_UserAgentQuality script. If the SIPServer_CollectCallData script stops, the data collection also stops, even if the SIPServer_UserAgentQuality script is still running.

68.4.3 Default Schedule

By default, this script runs **every 30 seconds**.

68.4.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the UserAgentQuality job. The default is 5.
Monitor Settings	
User agent to monitor	Specify the name of the user agent you want to monitor, such as `user@domain`. If you do not specify a domain, the script will include any user agent with the correct name that reports RFC6035 statistics.
Troubleshooting	
Call disconnect time range	Select a range of time and dates in which the query should search for data in the supplemental database. This parameter is valid *only* when you select **Run once** on the Schedule tab. • Select **Fixed Time** to select specific days and times for the query to begin and end. • Select **Sliding** to select a number of hours, days, months, or years in which to search. The query starts its search at the time the job runs, and goes back through the supplemental database for the number of units you select. The default is Fixed Time.
Monitor Interval MOS	
Event Notification	
Raise event if interval MOS falls below threshold?	Select **Yes** to raise an event if the interval MOS value falls below the threshold. The default is Yes.
Threshold - Interval MOS	Specify the lowest interval MOS value, from 1.0 to 5.0, that must occur to prevent an event from being raised. The default is 3.60.
Event severity when interval MOS falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the interval MOS value falls below the threshold. The default is 5.
Data Collection	
Collect data for interval MOS?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the interval MOS value during the monitoring period. The default is unselected.
Monitor Interval R-Value	
Event Notification	
Raise event if interval R-Value falls below threshold?	Select **Yes** to raise an event if the interval R-Value falls below the threshold. The default is Yes.
Threshold - Interval R-Value	Specify the lowest interval R-Value, from 0 to 100, that must occur to prevent an event from being raised. The default is 70.
Event severity when interval R-Value falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the interval R-Value falls below the threshold. The default is 5.

Parameter	How to Set It
Data Collection	
Collect data for interval R-Value?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the interval R-Value during the monitoring period. The default is unselected.
Monitor Interval Jitter	
Event Notification	
Raise event if interval jitter exceeds threshold?	Select **Yes** to raise an event if the interval jitter value exceeds the threshold. The default is Yes.
Threshold - Maximum interval jitter	Specify the highest interval jitter value, in milliseconds, that can occur before an event is raised. The default is 60 milliseconds.
Event severity when interval jitter exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the interval jitter value exceeds the threshold. The default is 15.
Data Collection	
Collect data for interval jitter?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of interval jitter that occurred during the monitoring period. The default is unselected.
Monitor Interval Latency	
Event Notification	
Raise event if interval latency exceeds threshold?	Select **Yes** to raise an event if the interval latency value exceeds the threshold. The default is Yes.
Threshold - Maximum interval latency	Specify the highest amount of interval latency, in milliseconds, that can occur before an event is raised. The default is 400 milliseconds.
Event severity when interval latency exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the interval latency value exceeds the threshold. The default is 15.
Data Collection	
Collect data for interval latency?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of latency that occurred during the monitoring period. The default is unselected.
Monitor Interval Packet Loss	
Event Notification	
Raise event if interval packet loss exceeds threshold?	Select **Yes** to raise an event if the interval packet loss value exceeds the threshold. The default is Yes.
Threshold - Maximum interval packet loss	Specify the highest percentage of interval packet loss that can occur before an event is raised. The default is 1%.
Event severity when packet interval loss exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the packet loss value exceeds the threshold. The default is 15.
Data Collection	
Collect data for interval packet loss?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of packet loss that occurred during the monitoring period. The default is unselected.

69 Snmp Knowledge Scripts

The Snmp category provides a set of Knowledge Scripts for monitoring SNMP-enabled devices. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. Or in the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Many Snmp Knowledge Scripts use the terms "ODE" or "OID":

- **ODE**: SNMP Object Description in its readable, named format. For example, "`system.sysDescr.0`" is the ODE for the numeric OID "`.1.3.6.1.2.1.1.0`".
- **OID**: SNMP Object Identifier in its numeric format. For example, "`.1.3.6.1.2.1.1.0`" is the OID for the SNMP attribute "`system.sysDescr.0`".

For more information, see "Customizing Snmp Knowledge Scripts" on page 3942.

The Snmp category includes the following Knowledge Scripts:

Knowledge Script	What It Does
AddMIBs	Copies the specified list of MIB files to the AppManager agent host where you installed AppManager SNMP Toolkit. Reloads the MIB tree for the module so the new MIBs are recognized.
DeviceReboot	Monitors device uptime for an SNMP device and raises an event if the device has restarted since the last monitoring interval.
InterfaceState	Monitors the contents of the Interface MIB from an SNMP device and raises an event when an interface changes state.
RemoveMIBs	Removes the specified list of MIB files from the AppManager agent host where you installed AppManager SNMP Toolkit. Reloads the MIB tree for the module so the removed MIBs are no longer accessible.
SNMPTrap_Async	Checks for incoming SNMP traps forwarded from NetIQ SNMP Trap Receiver.
SyncGet	Attempts an SNMP `Get` or `GetNext` for the specified SNMP attributes. Thresholds can be checked, and mathematical conversions can be performed.
SyncGetTable	Retrieves a specified set of SNMP table columns, and reports results for each row retrieved. Thresholds can be checked, and mathematical conversions can be performed.
SyncPoll	Polls specified SNMP attributes at a prescribed time interval and number of polling attempts. Thresholds can be checked, and mathematical conversions can be performed.
SyncPollTable	Polls a specified set of SNMP table columns at a prescribed time interval and number of polling attempts, and reports summary results for each row polled. Thresholds can be checked, and mathematical conversions can be performed.
SyncSet	Attempts an `SNMP Set` for the specified SNMP attributes of the specified values.

69.1 Customizing Snmp Knowledge Scripts

There are several simple ways to customize Snmp Knowledge Scripts to enhance or add functionality. You can check out an existing script from the `\AppManager\bin\kp\SNMP` folder, perform customizations, and check in the modified script or rename the file to create a new Knowledge Script.

The following list describes how to customize existing Snmp scripts to take advantage of additional functions and features of AppManager SNMP Toolkit.

Enabling SNMP Traffic Tracing

You can enable SNMP Traffic Tracing for all Knowledge Scripts. Turning on Traffic Tracing prints the contents of all SNMP requests or SNMP responses to the `mctrace.log` file on the AppManager agent. This capability can be used as a debugging tool to determine what is actually being sent or received by AppManager SNMP Toolkit.

To enable SNMP Traffic Tracing for a specific Knowledge Script, locate the `Const gintSNMPSectionTraceOn` entry and change the value from "0" to "1". Check out the script, then locate and edit the following block of text accordingly:

```
'#
'# Constants for SNMP Traffic Tracing
'# Set gintSNMPSectionTraceOn to 1 to trace SNMP Traffic.
'# Output goes to the AppManager Agent's mctrace.log file.
'#
Const gintSNMPSectionTraceBit        = 1
Const gintSNMPSectionTraceOn         = 0
```

Changing default locations of community strings

You can change the default locations of community strings (as defined in the **Custom** tab of AppManager Security Manager) for all Knowledge Scripts except for AddMIBs and RemoveMIBs:

- `gstrSNMPSecurityLabels` lists the labels under which the Knowledge Script searches for community strings, in the order they are listed.
- `gstrSNMPDefaultDevice` specifies the **Sub-Label** used to supply the default community string if one has not been configured for a specific device address.

To edit these values, check out the desired Knowledge Script, then locate and edit the following block of text accordingly:

```
'#
'# String(s) to use for finding SNMP Community Strings
'#
Const gstrSNMPSecurityLabels      = "SNMP,NetworkDevice"
Const gstrSNMPDefaultDevice       = "Default"
```

Changing default list separator characters

Many Snmp Knowledge Script parameters are lists: devices, SNMP OIDs, and the like. The characters that serve as list separators can be changed. The defaults are blank and comma.

You can add additional list separator characters, but you cannot delete the comma character.

To edit these values, check out the desired script, then locate and edit the following block of text accordingly:

```
'#
'# Separators for KS Parameters
'#
Const gstrSNMPListSeparators      = " ,"
```

If you change `gstrSNMPListSeparators`, you must also add the `<Delim></Delim>` option to each script parameter's XML definition to specify the same separators defined by `gstrSNMPListSeparators`. If it is not changed in both places, the script will not work correctly.

For the SyncSet script, there is an additional constant: `gstrSNMPStringValueSeparators`. The default is "," (comma). This specifies how SNMP values for this script are delimited. Because setting string values may include strings with spaces, only a comma is allowed as a separator. For example:

```
'#
'# Separators for KS Parameters
'#
Const gstrSNMPListSeparators         = " ,"
Const gstrSNMPStringValueSeparators  = ","
```

Default empty strings in the Discovery_Snmp script

For the Discovery_Snmp Knowledge Script, there are default strings defined to be used if any of the SNMP device details are empty strings. If `sysName.0` is an empty string, "`No Name`" is shown in the TreeView and the object details. All other object details will show "`No Value`" if they did not have a value. For example:

```
'#
'# String(s) to use for SNMP Devices with empty values in System MIB.
'#
Const gstrSNMPNoDeviceName        = "No Name"
Const gstrSNMPNoDeviceValue       = "No Value"
```

Changing default legend prefix and units for the DeviceReboot script

For the DeviceReboot Knowledge Script, the legend prefix and units in which device uptime is reported can be changed. For example, you could change it to Days by editing the text below and changing the divisor value to `86400`.

```
'#
'# Constants for Datastreams
'#
Const DEVICE_UPTIME_LEGEND       = "Device UpTime"
Const DEVICE_UPTIME_AC           = "Device UpTime (Hours)"
Const DEVICE_UPTIME_UNITS        = "Hours"
Const DEVICE_UPTIME_DIVISOR      = 3600
```

Changing default legend prefix for SyncGet and SyncGetTable scripts

For the SyncGet and SyncGetTable Knowledge Scripts, the legend prefix can be changed. Locate and edit the text below:

```
'#
'# Constant for SNMP Generic Scripts Legend Prefix
'#
Const gstrSNMPLegendPrefix        = "SNMP"
```

NOTE: If you rename a customized Knowledge Script, you cannot access Help using the **Help** button in the Knowledge Script Properties dialog box. Refer to the Help for the original script for assistance with parameter configuration.

69.2 AddMIBs

Use this Knowledge Script to install additional MIB files on an SNMP proxy agent computer. The specified files are copied to a default MIBs folder for the AppManager SNMP Toolkit module, and the module reloads the MIB tree so the new MIBs take effect.

This script copies files to and reloads both `AppManager/bin/AMSnmpMIBs` and `AppManager/bin/MIBs` directories. Both managed objects generate events for this script, and the short event messages include the name of the relevant managed object.

Run this script when no other SNMP scripts are active on the target proxy agent computer, because reloading the MIB tree can take place only when no SNMP sessions are active. If this script is unable to reload the MIB tree because of active SNMP sessions, an appropriate event can be raised. If no path or MIB files are supplied, by default this script creates an event containing a list of currently installed MIBs.

This script raises an event if the specified MIB files cannot be found, or an `ASN.1` compilation error occurs while reloading the MIB tree.

SNMP MIBs tend to be organized hierarchically. One MIB is often dependent on another, from which it imports more generic data definitions. Therefore, add a MIB only if all dependent MIBs are already present or are supplied in the same execution of this script.

69.2.1 Resource Object

SNMP Proxy Agent computer

69.2.2 Default Schedule

By default, this script runs once.

69.2.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Full MIB file path	Specify the directory path where the MIB files to be installed are located. This script does not transfer the specified MIB files over the network. The directory path specified for the MIB files must already be locally accessible by the SNMP proxy agent computer.
List of MIB files	Supply a list of filenames for the MIBs you want to install. Do not include the directory path.
Reload MIB tree?	Set to **Yes** to reload the MIB tree after MIB files have been copied. A MIB tree reload is attempted only if all MIB files are installed successfully.
MIB reload timeout	Specify how long this script should wait to try and reload the MIB tree. This can only be performed if no other script has active SNMP sessions. The default is 10 seconds.
Event Notification	

Parameter	How to Set It
Raise event if installation of MIBs succeeds?	Set to **Yes** to raise an event if all MIBs are installed successfully. The details of the event contain the list of installed MIB files.
Event severity when installation of MIBs succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which MIB installation succeeds. The default is 25.
Raise event if installation of MIBs fails?	Set to **Yes** to raise an event if any MIB files fail to install. This can occur if the path of MIB filenames specified is incorrect.
Event severity when installation of MIBs fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which MIB installation fails. The default is 10.
Raise event if reloading of MIB tree succeeds?	Set to **Yes** to raise an event if all MIB files install successfully and the MIB tree is reloaded successfully. This can only occur if the *Reload MIB tree?* parameter is enabled.
Event severity when reloading of MIB tree succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which MIB tree reloading is successful. The default is 25.
Raise event if reload MIB parser warnings received?	Set to **Yes** to raise an event if all MIB files install successfully and reloading the MIB tree reports `ASN.1` parsing errors. This can only occur if the *Reload MIB tree?* parameter is enabled. Details of the parsing errors are in the event.
Event severity when reload MIB parser warnings received	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the MIB reload generates warnings. The default is 15.
Raise event if reloading of MIB tree fails?	Set to **Yes** to raise an event if all MIB files install successfully and reloading the MIB tree fails. This can occur if *Reload MIB tree?* is enabled and the *MIB reload timeout* expires.
Event severity when reloading of MIB tree fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which MIB tree reload fails. The default is 10.

69.3 DeviceReboot

Use this Knowledge Script to monitor whether an SNMP device or its network management component has rebooted between job intervals. This script tracks the uptime value of the host (`hrSystemUptime.0`) or the network management component (`sysUpTime.0`) across job iterations to determine whether devices have rebooted. If the uptime value is less than the last iteration, the device has either rebooted or the uptime counter value has wrapped.

This script attempts to track `sysUpTime.0` on all SNMP devices where the script is run, regardless of whether any previous attempts have failed. If failures do occur, successful retrievals on other devices are not discarded.

This script generates data streams for each monitored SNMP device. The data value saved is the current number of hours the device has been up.

69.3.1 Resource Objects

SNMP Device objects

69.3.2 Default Schedule

By default, this script runs every hour.

69.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
SNMP Parameters	
SNMP port number	Specify the UDP port number on the remote SNMP device to which you want to send SNMP requests. The default is 161.
SNMP retries	Set the number of retries to attempt if a timeout occurs on an SNMP request. The default is 2 retries.
SNMP timeout	Set the number of seconds to wait for a response before timing out an SNMP request. The default is 5 seconds.
Collect data for device uptime?	Set to **Yes** to collect data for use in graphs and reports. If data collection is enabled, returns the device uptime in hours. The default is unchecked.
Monitor host uptime or uptime of the network management portion of the system?	Specify whether you want to monitor the uptime of the SNMP device or its network management component. The default is Host uptime.
Event Notification	
Raise event if device has rebooted?	Set to **Yes** to raise an event if a device reboot is detected. The details of the event contain the retrieved data.
Event severity when device has rebooted	Set the severity level, from 1 to 40, to indicate the importance of an event in which a device reboots. The default is 15.

Description	How to Set It
Raise event if SNMP timeout exceeded?	Set to **Yes** to raise an event if the SNMP `Get` request receives no response from the device, and all retries fail.
Event severity when SNMP timeout exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP timeout threshold is exceeded. The default is 15.
Raise event if SNMP Response error received?	Set to **Yes** to raise an event if an SNMP Response error is received from the device. The type of error is reported in the event details.
Event severity when SNMP Response error received	Set the severity level, from 1 to 40, to indicate the importance of an event in which an SNMP Response error is received. The default is 10.
Raise event if device uptime baseline established?	Set to **Yes** to raise an event when initial data values are retrieved, setting the baseline for comparison on the next retrieval.
Event severity when device uptime baseline established	Set the severity level, from 1 to 40, to indicate the importance of an event in which baseline is established. The default is 25.
Raise event if the host uptime is not available?	Set to Yes to raise an event when the host uptime is not available. The default is Yes.
Event severity when the host uptime is not available.	Set the severity level, from 1 to 40, to indicate the importance of an event in which the host uptime is not available. The default is 15.

69.4 InterfaceState

Use this Knowledge Script to monitor the state of all interfaces in a device. This script tracks the values of `ifAdminStatus` and `ifOperStatus` for each interface across job iterations. If the operational status of an interface changes, an event is raised indicating the time the change occurred. This script also verifies whether `ifAdminStatus` and `ifOperStatus` are in sync.

The script attempts to track interface state on all SNMP devices on which the script is run, regardless of whether any previous attempts failed. If failures do occur, successful retrievals on other devices are not discarded.

This script collects separate data streams for each interface in a device. The data value saved is an integer representing the current operational state of each interface.

69.4.1 Resource Objects

One or more SNMP Device objects

69.4.2 Default Schedule

By default, this script runs every hour.

69.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
SNMP Parameters	
List of interface indices	By default, all interfaces are monitored. However, supplying a list of SNMP interface indices can restrict monitoring to those specific interfaces. Indices must be a single integer value. For example, "`1 4 7`" monitors only interfaces with an SNMP interface index of 1, 4 and 7.
Maximum number of interfaces to monitor	Specify the maximum number of interfaces to monitor. The default is 100.
SNMP port number	Specify the UDP port number on the remote SNMP device to which you want to send SNMP requests. The default is 161.
SNMP retries	Set the number of retries to attempt if a timeout occurs on an SNMP request. The default is 2 retries.
SNMP timeout	Set the number of seconds to wait for a response before timing out an SNMP request. The default is 5 seconds.
Collect data for interface state?	Set to **Yes** to collect data for use in graphs and reports. If enabled, returns a data stream for each interface in the device indicating its state. The default is unchecked.
Event Notification	
Raise event if interface state mismatch detected?	Set to **Yes** to raise an event if an interface has values for `ifAdminStatus` and `ifOperStatus` that are not the same. The details of the event contain the retrieved data.

Parameter	How to Set It
Event severity when interface state mismatch detected	Set the event severity level, from 1 to 40, to indicate the importance of an event in which Interface State Mismatch exists. The default is 10.
Raise event if interface state is up?	Set to **Yes** to raise an event if an interface has transitioned to the Up state since the last Knowledge Script iteration. The details of the event contain the retrieved data.
Event severity when interface state is up	Set the severity level, from 1 to 40, to indicate the importance of an event in which the interface state is Up. The default is 25.
Raise event if interface state is down?	Set to **Yes** to raise an event if an interface has transitioned to the Down state since the last Knowledge Script iteration. The details of the event contain the retrieved data.
Event severity when interface state is down	Set the severity level, from 1 to 40, to indicate the importance of an event in which the interface state is Down. The default is 15.
Raise event if SNMP timeout exceeded?	Set to **Yes** to raise an event if the SNMP `Get` or `GetNext` request receives no response from the device, and all retries fail.
Event severity when SNMP timeout exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP timeout is exceeded. The default is 15.
Raise event if SNMP Response error received?	Set to **Yes** to raise an event if an SNMP Response error is received from the device. The type of error is reported in the event details.
Event severity when SNMP Response error received	Set the severity level, from 1 to 40, to indicate the importance of an event in which an SNMP Response error is received. The default is 10.
Raise event if interface state baseline established?	Set to **Yes** to raise an event when initial data values are retrieved, setting the baseline for comparison on the next retrieval.
Event severity when interface state baseline established	Set the severity level, from 1 to 40, to indicate the importance of an event in which baseline is established. The default severity level is 25.

69.5 RemoveMIBs

Use this Knowledge Script to remove one or more MIB files from an SNMP proxy agent computer. The specified files are deleted from the installation folder, which by default is *installationfolder*\AppManager\bin\AMSnmpMIBs.

Run this script when no other SNMP Knowledge Scripts are active on the target AppManager SNMP Toolkit installation because reloading the MIB tree can only be done when no SNMP sessions are active. If the RemoveMIBs Knowledge Script is unable to reload the MIB tree because of active SNMP sessions, the script can raise an appropriate event.

This script raises an event if the specified MIB files cannot be deleted, or an ASN.1 compilation error occurs while reloading the MIB tree.

SNMP MIBs tend to be hierarchical. That is, one MIB is often dependent on another, from which it imports more generic data definitions. Therefore, delete a MIB only if it has no other dependent MIBs installed.

69.5.1 Resource Object

SNMP Proxy Agent computer

69.5.2 Default Schedule

By default, this script runs once.

69.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
List of MIB files to uninstall	Supply a list of MIB filenames to be deleted.
Reload MIB tree?	Set to **Yes** to reload the MIB tree after MIB files have been deleted. A MIB tree reload is only be attempted if all MIB files are deleted successfully.
MIB reload timeout	Specify how long this script should wait to try and reload the MIB tree. This can only be performed if no other Knowledge Scripts have active SNMP sessions. The default is 10 seconds.
Event Notification	
Raise event if uninstallation of MIBs succeeds?	Set to **Yes** to raise an event if all MIBs are deleted successfully. The details of the event contain the list of installed MIB files.
Event severity when uninstallation of MIBs succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which MIB uninstallation succeeds. The default is 25.
Raise event if uninstallation of MIBs fails?	Set to **Yes** to raise an event if any MIB files fail to delete. This can occur if any specified MIB filenames correspond to files not currently installed.
Event severity when uninstallation of MIBs fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which MIB uninstallation fails. The default is 10.

Parameter	How to Set It
Raise event if reloading of MIB tree succeeds?	Set to **Yes** to raise an event if all MIB files uninstall successfully and the MIB tree is reloaded successfully. This can only occur if the *Reload MIB tree?* parameter is set to Yes.
Event severity when reloading of MIB tree succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which MIB tree reload succeeds. The default is 25.
Raise event if reload MIB parser warnings received?	Set to **Yes** to raise an event if all MIB files uninstall successfully and reloading the MIB tree reports `ASN.1` parsing errors. This can only occur if the *Reload MIB tree?* parameter is set to Yes. Details of the parsing errors are in the event.
Event severity when reload MIB parser warnings received	Set the severity level, from 1 to 40, to indicate the importance of an event in which MIB reload warnings are received. The default is 15.
Raise event if reloading of MIB tree fails?	Set to **Yes** to raise an event if all MIB files uninstall successfully but reloading the MIB tree fails. This can occur if the *Reload MIB tree?* parameter is set to Yes and the *MIB Reload timeout* expires.
Event severity when attempt to reload MIB tree fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which MIB tree reload fails. The default is 10.

69.6 SNMPTrap_Async

Use this Knowledge Script to check for SNMP traps forwarded from NetIQ SNMP Trap Receiver. This script raises an event when an SNMP trap is received and when Trap Receiver is unavailable or subsequently becomes available. In addition, this script generates data streams for Trap Receiver availability.

This script checks for SNMP traps in the MIB tree. You can add MIBs (management information bases) to the MIB tree. For more information, see the AddMIBs Knowledge Script.

In general, a trap receiver is an application that receives traps from SNMP agents. NetIQ SNMP Trap Receiver (Trap Receiver) receives SNMP traps, filters them, and then forwards the traps to AppManager. For more information, see .

69.6.1 Resource Object

SNMP_TrapReceiver

69.6.2 Default Schedule

By default, this script runs on an asynchronous schedule.

69.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Trap Filters	
List of trap OIDs	Type the OIDs (object identifiers) of the traps you want to monitor. You can type one OID or a list of OIDs. Separate multiple OIDs with a comma, for example: `1.3.6.1.2.1.2.2.1.1.1,1.3.6.1.2.1.2.2.1.7.1`
Full path to file with list of trap OIDs	If you have many OIDs to monitor, provide the full path to a file that contains a list of the OIDs. Each OID in the file should be on a separate line, for example: `1.3.6.1.2.1.2.2.1.1.1 1.3.6.1.2.1.2.2.1.7.1` Because the file must be accessible from the AppManager agent, the path must be a local directory on the agent computer or a UNC path. **Important** If you type a UNC path, then the `netiqmc` service must be running as a user that has access to the path.
Event Notification	
Raise trap events?	Set to **Yes** to raise an event when a trap message is received from Trap Receiver. The default is Yes.
Event severity when trap is received	Set the severity level, from 1 and 40, to indicate the importance of an event in which a trap is received. The default is 15.

Parameter	How to Set It
Format trap data according to SNMP version	Select the version of SNMP whose formatting should be used for trap event messages. The data provided by each format is the same; only the layout is different. An event message in SNMP v1 format looks like this:  An event message in SMMP v2 format looks like this: Raise Trap Receiver availability events?	Set to **Yes** to raise an event when Trap Receiver becomes unavailable and when Trap Receiver becomes available once again. The default is Yes.
Event severity when Trap Receiver is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which Trap Receiver becomes unavailable. The default is 5.
Event severity when Trap Receiver becomes available	Set the severity level, from 1 to 40, to indicate the importance of an event in which Trap Receiver becomes available after being unavailable. The default is 25.
Data Collection	
Collect data for Trap Receiver availability?	Set to **Yes** to collect data for charts and reports. If enabled, data collection returns a “1” if Trap Receiver is available and a “0” if Trap Receiver is unavailable. The default is unchecked.
Interval for collecting Trap Receiver availability data	Specify the frequency with which the script collects Trap Receiver availability data. The default is every 5 minutes.

69.7 SyncGet

Use this Knowledge Script to perform an SNMP `Get` or `GetNext` operation for one or more SNMP attributes from one or more SNMP enabled devices. This script raises an event if retrieved values exceed the threshold you set.

The script attempts to get the specified attributes on all supplied SNMP devices, regardless of whether any previous attempts failed. If failures do occur, successful gets on other devices are not discarded.

This script can independently collect separate data streams for each SNMP device/SNMP attribute pairing. Thus, the total number of data streams collected is the number of devices the script has been run on in the TreeView, multiplied by the number of SNMP attributes provided.

NOTE: Supply either all-numeric SNMP attributes or all-string SNMP attributes, because you must choose either a numeric check or string check. SNMP attributes that are octet strings, OIDs, or IP addresses are considered to be string attributes.

If one or more numerical conversions are selected, they are performed in the following order: Multiplication, Division, Delta and Percentage. If Delta and Division are both selected, integer division is performed and any remainder is discarded. If Delta is not selected, real-number division is performed.

Values reported in SNMP Success events show the results of multiplication and division conversions, but not delta and percentage conversions, as these are performed after the Success event has been raised. The final result of all conversions is shown in any threshold events, or in the data points if data is collected.

This script can be run at intervals to periodically poll SNMP attributes. However, if delta calculations are being performed on the retrieved values, the script interval should not be less than one minute, because the accuracy of delta calculations is time dependent and may not produce reliable results at shorter intervals. This is due to many factors including the accuracy of AppManager job scheduling and network traffic delay. The SyncPoll script should be used to accurately poll at intervals of less than one minute.

By default, this script retrieves `sysUpTime.0` from the device, converts the retrieved value to “Days”, and reports the retrieved value in a success event.

69.7.1 Resource Objects

One or more SNMP Device objects

69.7.2 Default Schedule

By default, this script runs once.

69.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Get Parameters	

Parameter	How to Set It
SNMP ODE/OIDs	Supply a list of SNMP Attribute ODEs and/or OIDs. Use ODEs only if the SNMP proxy agent computer has the corresponding MIB available. The default is `sysUpTime.0`.
SNMP port number	Specify the UDP port number on the remote SNMP device to which you want to send SNMP requests. The default is 161.
SNMP retries	Specify the number of retries to attempt if a timeout occurs on an SNMP request. The default is 2 retries.
SNMP timeout	Specify the number of seconds to wait for a response before timing out an SNMP request. The default is 5 seconds.
Perform GetNext instead of Get?	Set to **Yes** to perform an SNMP `GetNext` operation instead of a `Get`. The default is to perform a `Get` operation.
OID Value Check	
Collect data for OID value?	Set to **Yes** to collect data for use in graphs and reports. If enabled, returns a data stream for each SNMP device/SNMP attribute pair. The default is unchecked.
Calculated units	If this script is performing numeric conversions, a name for the resulting units calculated can be entered here. If nothing is supplied for this parameter, the default units are the name of the data type retrieved. The default is “Days”.
Calculate delta for numeric OID value?	Set to **Yes** to specify that the retrieved values are numeric and a delta should be calculated. The difference between the new value and the previous value is calculated. Normally this is used to monitor growth of SNMP counter values between iterations. The default is unchecked. Delta calculations are not normalized. Thus, it is usually necessary to perform a division conversion on delta calculations to convert to the desired time units. For example, if the growth of an SNMP counter is being tracked by doing a delta calculation at a script interval of one minute, it is necessary to divide by 60 to track the growth of the counter on a per-second basis. If set to **Yes**, **integer math** (not **floating point math**) is used; thus, any remainder is discarded. **NOTE:** Do not enable this option if the script is running at intervals of less than one minute. The results may not be reliable.
Use multiplier for numeric OID value?	Set to **Yes** to specify that the retrieved values are numeric and should be multiplied by the value specified for the next parameter. The default is unchecked.
Multiplier value	If the *Use multiplier for numeric OID value?* parameter is enabled, the retrieved SNMP attributes are multiplied by this value before being reported. The default is 1.
Use divisor for numeric OID value?	Set to **Yes** to specify that the retrieved values are numeric and should be divided by the value specified for the next parameter. If you enabled the *Calculate delta for numeric OID value* parameter, integer division is performed and any remainder is discarded. Otherwise, values are converted to real numbers to perform the division and retain the precision of any remainder. The default is Yes.
Divisor value	If the *Use divisor for numeric OID value?* parameter is enabled, the retrieved SNMP attributes are divided by this value before being reported. The default is `8640000`.

Parameter	How to Set It
Calculate percentage of numeric OID value?	Set to **Yes** to specify that the retrieved values are numeric and should be converted to a percentage of the maximum value supplied in the next parameter. Values are converted to real numbers to perform the percentage calculation and retain the precision of any remainder. Calculated values are restricted to a real number between 0% and 100%. The default is unchecked.
Maximum value	If the *Calculate percentage of numeric OID value?* parameter is enabled, the retrieved SNMP attributes are converted to a percentage of the maximum value entered here. The default is 100.
Raise event when maximum threshold exceeded?	Set to **Yes** to specify that the retrieved values should be compared against the maximum threshold value supplied in the next parameter. If enabled, the check is performed after any mathematical conversions that may have been selected above. The default is unchecked.
Threshold – Maximum OID value (post-calculation)	This parameter has no effect unless *Raise event when maximum threshold exceeded?* is enabled. For numeric attributes, specify the maximum threshold value. If this value is exceeded, an event is raised. The threshold value is restricted to whole integer values. The default is 1000.
Raise event when minimum threshold not met?	Set to **Yes** to specify that the retrieved values should be compared against the minimum threshold value supplied in the next parameter. If enabled, the check is performed after any mathematical conversions that may have been selected above. The default is unchecked.
Threshold – Minimum OID value (post-calculation)	This parameter has no effect unless *Raise event if threshold not met?* is enabled. For numeric attributes, specify the minimum threshold value. If this threshold is not met, an event is raised. The threshold value is restricted to whole integer values. The default is 100.
Raise event when returned value equals "Numeric value"?	Set to **Yes** to raise an event when the retrieved numeric values equal the value supplied in the *Numeric value* parameter. If enabled, the check is performed after any mathematical conversions that may have been selected above.
Check for "not equal" instead of "equals"?	Use this parameter to change the function of the previous parameter. To raise an event when the retrieved numeric values do not equal the value supplied in the *Numeric value* parameter, set to **Yes** and ensure that *Raise event when returned value equals "Numeric value"?* is also set to **Yes**.
Numeric value	Use this parameter only if *Raise event when returned value equals "Numeric value"?* is enabled. An event is raised if the retrieved SNMP values equal the value you enter here. If *Check for "not equal" instead of "equals"?* is also enabled, an event is raised if the retrieved SNMP values are not equal to the value you enter here. This threshold is restricted to whole integer values. The default is 0.
Raise event when returned string equals "String value"?	Set to **Yes** to raise an event when the retrieved values equal the value supplied in the *String value* parameter. Use this parameter to retrieve SNMP attributes that are strings, octet strings, OIDs, or IP addresses.
Check for "not equal" instead of "equals"?	Use this parameter to change the function of the previous parameter. To raise an event when the retrieved values do not equal the value supplied in the *String value* parameter, set to **Yes** and ensure *Raise event when returned string equals "String value"?* is also set to **Yes**.

Parameter	How to Set It
Do case-insensitive comparison?	If *Raise event when returned string not equal to value?* is enabled, set to **Yes** to specify that the retrieved values should be compared without regard to character case.
String value	Use this parameter only If *Raise event when returned string equals "String value"?* is enabled. An event is raised if the retrieved string equals the value you enter here. If *Check for "not equal" instead of "equals"?* is also enabled, an event is raised if the retrieved string does not equal the value you enter here. The default is "`String Value`".
Event severity when OID value violates check	Set the severity level, from 1 to 40, to indicate the importance of an event in which a threshold is crossed or an equality/inequality check fails. The default is 5.
Event Notification	
Raise event if SNMP operation succeeds?	Set to **Yes** to raise an event if the SNMP `Get` or `GetNext` operation is successful. The details of the event contain the retrieved data.
Event severity when SNMP operation succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP operation succeeds. The default is 25.
Raise event if SNMP timeout exceeded?	Set to **Yes** to raise an event if the SNMP `Get` or `GetNext` request receives no response from the device, and all retries fail.
Event severity when SNMP timeout exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP timeout period is exceeded. The default is 15.
Raise event if SNMP Response error received?	Set to **Yes** to raise an event if an SNMP Response error is received from the device. The type of error is reported in the event details.
Event severity when SNMP Response error received	Set the severity level, from 1 to 40, to indicate the importance of an event in which an SNMP Response error is received. The default is 10.
Raise event if delta baseline established?	This event can be raised only if the *Calculate delta for numeric OID value?* parameter is enabled. Set to **Yes** to raise an event when the initial value is retrieved, setting the baseline for a difference calculation on the next job iteration.
Event severity when delta baseline established	Set the severity level, from 1 to 40, to indicate the importance of an event in which a delta baseline is established. The default is 25.

69.8 SyncGetTable

Use this Knowledge Script to perform an SNMP table walk along specified columns of an SNMP table. This script raises an event if retrieved values exceed the threshold you set.

NOTE: Because this script walks an SNMP table, do not supply an index value on the ODE/OIDs. Supplying just the attribute name (for example, "ifDescr") is normally sufficient. If only a portion of the table is to be walked, a parameter is available to specify the subset of table indices to walk.

The table walk is performed with iterative `GetNext` operations. As soon as any of the attributes walk beyond the end of the table, or the table indices become out of sync, the table walk terminates. If a table is fully populated, all attributes or table columns walk beyond the end of the table on the same `GetNext` operation. However, if the table has missing values, the table indices become out of sync as soon as a missing value is reached. A table walk is terminated when the first missing value is detected.

This script attempts to walk the specified attributes on all SNMP devices on which this script has been run, regardless of whether any previous attempts failed. If failures do occur, successful walks on other devices are not discarded.

This script individually collects separate data streams for each SNMP device/data OID pairing. Thus, the total number of data streams collected is the number of devices the Knowledge Script is run on multiplied by the number of data OIDs and the number of rows in the table on each device.

NOTE: Supply either all-numeric SNMP attributes or all-string SNMP attributes because you must choose either a numeric check or string check. SNMP attributes that are octet strings, OIDs, or IP addresses are considered to be string attributes.

If one or more numerical conversions are selected, they are performed in the following order: Multiplication, Division, Delta and Percentage. If Delta and Division are both enabled, integer division is performed, and any remainder is discarded. If Delta is not enabled, real-number division is performed.

Values reported in SNMP Success events show the results of multiplication and division conversions, but not delta or percentage conversions, as these are performed after the Success event has been raised. The final result of all conversions is shown in any threshold-crossing events or reflected in the data streams if data is collected.

This script can be run at intervals to periodically poll SNMP tables. However, if delta calculations are being performed on the retrieved values, the script interval should not be less than one minute, because the accuracy of delta calculations is time dependent and may not produce reliable results at shorter intervals. This unreliability is due to many factors including the accuracy of AppManager job scheduling and network traffic delay. The SyncPollTable Knowledge Script should be used to accurately poll at intervals of less than one minute.

By default, this script retrieves the operational status for all interfaces on a device.

69.8.1 Resource Objects

SNMP Device objects

69.8.2 Default Schedule

By default, this script runs once.

69.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Get Table Parameters	
Descriptive ODE/OIDs	Supply a list of SNMP attribute ODEs and/or OIDs. These are descriptive attributes only, which are reported in event and data details for reference purposes. No processing is performed on the retrieved values. The attributes chosen should uniquely identify the retrieved row of an SNMP Table. The default is "`ifIndex, ifDescr`", which identifies the row number and name of a communications interface in the device.
Data ODE/OIDs	Supply a list of SNMP attribute ODEs and/or OIDs. ODEs can only be used if the SNMP proxy agent computer has the corresponding MIB available. The default is `ifOperStatus`.
Optional table indices	By default, the entire SNMP table is walked. However, supplying a list of the table indices to be walked can restrict the walk. Indices can be a single integer value, or multiple integer values separated by dots; just like a numeric OID value but without a leading dot. For example, "1.10.42.1.47" is a valid table index.
Maximum number of table rows to get	Specify the maximum number of table rows to be retrieved. The default is 100.
SNMP port number	Specify the UDP port number on the remote SNMP device to which you want to send SNMP requests. The default is 161.
SNMP retries	Set the number of retries to attempt if a timeout occurs on an SNMP request. The default is 2 retries.
SNMP timeout	Set the number of seconds to wait for a response before timing out an SNMP request. The default is 5 seconds.
OID value check	
Collect data for OID value?	Set to **Yes** to collect data for graphs and reports. The data is stored in the AppManager repository. When enabled, returns a data stream for each SNMP device/SNMP attribute pair. The default is unchecked.
Calculated units	If this script is performing numeric conversions, a name for the resulting units calculated can be entered here. If nothing is supplied for this parameter, the default units are the name of the data type retrieved. The default is blank.
Calculate delta for numeric OID value?	Set to **Yes** to specify that the retrieved values are numeric and the difference between the new value and the previous value should be calculated. Normally this is used to monitor growth of SNMP counter values between iterations. The default is unchecked. Delta calculations are not normalized. Thus, it is usually necessary to perform a division conversion on delta calculations to convert to the desired time units. For example, if the growth of an SNMP counter is being tracked by doing a delta calculation at a script interval of one minute, it is necessary to divide by 60 to track the growth of the counter on a per second basis. If set to **Yes**, **integer math** (not **floating point math**) is used, thus any remainder is discarded. **NOTE:** Do not enable this option if the script is running at intervals of less than one minute. The results may not be reliable.

Parameter	How to Set It
Use multiplier for numeric OID value?	Set to **Yes** to specify that the retrieved values are numeric and should be multiplied by the value in the next parameter. By default, multiplication is not performed on retrieved values.
Multiplier value	If the *Use multiplier for numeric OID value?* parameter is enabled, the retrieved SNMP attributes are multiplied by this value before being reported. The default is 1.
Use divisor for numeric OID value?	Set to **Yes** to specify that the retrieved values are numeric and should be divided by the value in the next parameter. If the *Calculate delta for numeric OID value* parameter has also been enabled, integer division is performed and any remainder is discarded. Otherwise, values are converted to real numbers to perform the division and retain the precision of any remainder. The default is unchecked.
Divisor value	If the *Use divisor for numeric OID value?* parameter is enabled, the retrieved SNMP attributes are divided by this value before being reported. The default is 1.
Calculate percentage of numeric OID value?	Set to **Yes** to specify that the retrieved values are numeric and should be converted to a percentage of the *Maximum value*. Values are converted to real numbers to perform the percentage calculation and retain the precision of any remainder. Calculated values are restricted to a real number between 0% and 100%. The default is unchecked.
Maximum value	If the *Percentage of numeric OID value?* parameter is enabled, the retrieved SNMP attributes are converted to a percentage of the maximum value entered here. The default is 100.
Raise event when maximum threshold exceeded?	Set to **Yes** to specify that the retrieved values should be compared against the maximum threshold value supplied in the next parameter. If enabled, the check is performed after any mathematical conversions that may have been selected above. The default is unchecked.
Threshold – Maximum OID value (post-calculation)	This parameter has no effect unless *Raise event if threshold exceeded?* is enabled. For numeric attributes, specify the maximum threshold value. If this value is exceeded, an event is raised. The threshold value is restricted to whole integer values. The default is 1000.
Raise event when minimum threshold not met?	If *Raise event if threshold not met?* is enabled, set to **Yes** to specify that the retrieved values should be compared against the minimum threshold value supplied in the next parameter. If enabled, the check is performed after any mathematical conversions that may have been selected above. The default is unchecked.
Threshold – Minimum OID value (post-calculation)	If the *Raise event if threshold not met?* parameter is enabled, specify a minimum value for numeric attributes after any calculations have been performed. If this threshold is not met, an event is raised. The threshold value is restricted to whole integer values. The default is 100.
Raise event when returned value equals "Numeric value"?	Set to **Yes** to raise an event when the retrieved numeric values equal the value supplied in the *Numeric value* parameter. If enabled, the check is performed after any mathematical conversions that may have been selected above.
Check for "not equal" instead of "equals"?	Use this parameter to change the function of the previous parameter. To raise an event when the retrieved numeric values do not equal the value supplied in the *Numeric value* parameter, set to **Yes** and ensure that *Raise event when returned value equals "Numeric value"?* is also set to **Yes**.

Parameter	How to Set It
Numeric value	Use this parameter only if *Raise event when returned value equals "Numeric value"?* is enabled. An event is raised if the retrieved SNMP values equal the value you enter here. If *Check for "not equal" instead of "equals"?* is also enabled, an event is raised if the retrieved SNMP values do not equal the value you enter here. This threshold is restricted to whole integer values. The default is 0.
Raise event when returned string equals "String value"?	Set to **Yes** to raise an event when the retrieved values equal the value supplied in the *String value* parameter. Use this parameter to retrieve SNMP attributes that are strings, octet strings, OIDs, or IP addresses.
Check for "not equal" instead of "equals"?	Use this parameter to change the function of the previous parameter. To raise an event when the retrieved values do not equal the value supplied in the *String value* parameter, set to **Yes** and ensure *Raise event when returned string equals "String value"?* is also set to **Yes**.
Do case-insensitive comparison?	If *Raise event when returned string not equal to value?* is enabled, set to **Yes** to specify that the retrieved values should be compared without regard to character case.
String value	Use this parameter only If *Raise event when returned string equals "String value"?* is enabled. An event is raised if the retrieved string equals the value you enter here. If *Check for "not equal" instead of "equals"?* is also enabled, an event is raised if the retrieved string does not equal the value you enter here. The default is "`String Value`".
Event severity when OID value violates check	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is crossed or an equality/inequality check fails. The default is 5.
Event Notification	
Raise event if SNMP operation succeeds?	Set to **Yes** to raise events if the SNMP `Get` or `GetNext` operation is successful. The details of the event contain the retrieved data.
Event severity when SNMP operation succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP operation succeeds. The default is 25.
Raise event if SNMP timeout exceeded?	Set to **Yes** to raise events if the SNMP `Get` or `GetNext` request receives no response from the device, and all retries fail.
Event severity when SNMP timeout exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP timeout period is exceeded. The default is 15.
Raise event if SNMP Response error received?	Set to **Yes** to raise an event if an SNMP Response error is received from the device. The type of error is reported in the event details.
Event severity when SNMP Response error received	Set the severity level, from 1 to 40, to indicate the importance of an event in which an SNMP Response error is received. The default is 10.
Raise event if delta baseline established?	If *Calculate delta for numeric OID value?* has been enabled, set to **Yes** to raise an event when the initial value is retrieved, setting the baseline for a difference calculation on the next retrieval.
Event severity when delta baseline established?	Set the severity level, from 1 to 40, to indicate the importance of an event in which a delta baseline is established. The default is 25.

69.9 SyncPoll

Use this Knowledge Script to poll SNMP attributes on a Device at short time intervals during each Knowledge Script iteration. Only numeric SNMP attributes may be polled. For each set of polled values, this script computes a minimum, maximum, average and standard deviation. This script raises an event if computed values exceed the threshold you set.

When this script is run on multiple devices, they are polled successively, and not simultaneously. To poll devices simultaneously, a different job must be created for each device.

NOTE: The number of Polling attempts multiplied by the Polling interval and then multiplied by the number of devices on which the Knowledge Script is run must not exceed the time interval between Knowledge Script iterations. Attempting to do so causes the script to abort, as the polling would not be able to complete before the next iteration is due to execute.

This script continues polling the SNMP device regardless of whether any previous attempts failed. At least two polling attempts must succeed for any meaningful data to be calculated.

This script individually collects separate data streams for each SNMP attribute. By default, this script calculates the percent bandwidth utilization for the first interface listed in the `ifTable` for the SNMP device, assuming the speed of this interface is standard Ethernet of 100 Megabits per second. If the speed of this interface is different, the values returned by the default settings are not valid.

If one or more numerical conversions are selected, they are performed in the following order: Delta, Multiplication, Division and Percentage.

When polling the growth of SNMP counter values using the Delta option, all values are normalized on a per second basis, regardless of the length of the polling interval. For example, this script can be used to calculate the Kilobytes per second flowing through an interface by polling `ifInOctets` and `ifOutOctets` and dividing the returned values by 1024. The values reported are Kilobytes per second regardless of the length of the polling interval.

69.9.1 Resource Objects

SNMP Device objects

69.9.2 Default Schedule

By default, this script runs once.

69.9.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Polling Parameters	
SNMP ODE/OIDs	Supply a list of SNMP attribute ODEs and/or OIDs. ODEs can only be used if the SNMP proxy agent computer has the corresponding MIB available. The default is: "`ifInOctets.1, ifOutOctets.1`".

Parameter	How to Set It
Polling interval	Specify the time interval between polling attempts during each Knowledge Script iteration. The default is 5 seconds.
Polling attempts	Specify the number of polling attempts to perform during each Knowledge Script iteration. The default is 12. Combined with the default interval of 5 seconds, the script by default polls the SNMP device for 1 minute. The minimum value is 2.
SNMP port number	Specify the UDP port number on the remote SNMP device to which you want to send SNMP requests. The default is 161.
SNMP timeout	Specify the number of seconds to wait for a response before timing out an SNMP request. The default is 5 seconds.
Polled Values Check	
Collect data for polled values?	Set to **Yes** to collect data for use in graphs and reports. The data is stored in the AppManager repository. If enabled, returns a data stream for each SNMP device/SNMP attribute pair. The default is unchecked.
Polling calculation type	For each set of polled values, the Average, Minimum, Maximum and Standard Deviation are calculated. Use this parameter to select which calculated value serves as the data point.
Calculated units	Specify a name to identify the units being polled and calculated by this script. The default is “Percent”.
Calculate delta for polled value?	Set to **Yes** to specify that the retrieved values should be considered a delta from the value retrieved by the previous polling attempt. The difference between the new value and the previous value is calculated. Normally this is used to monitor growth of SNMP counter values between polling attempts. By default, a delta calculation is performed. When set to **Yes**, **integer math** (not **floating point math**) is used; thus, any remainder is discarded. **NOTE:** When this parameter is enabled, the script reports one less polling attempt than was specified for *Polling attempts* because the first polling attempt is used to set a baseline for the delta calculations to follow.
Use multiplier for polled value?	Set to **Yes** to specify that the retrieved values are numeric and should be multiplied by the value in the next parameter. The default is unchecked.
Multiplier value	If the *Use multiplier for numeric OID value?* parameter is enabled, the retrieved SNMP attributes are multiplied by this value before being reported. The default is 1.
Use divisor for polled value?	Set to **Yes** to specify that the retrieved values should be divided by the value in the next parameter. Values are converted to real numbers to perform the division and retain the precision of any remainder. The default is unchecked.
Divisor value	If the *Use divisor for numeric OID value?* parameter is enabled, the retrieved SNMP attributes are divided by this value before being reported. The default is 1.
Calculate percentage of polled value?	Set to **Yes** to specify that the retrieved values should be converted to a percentage of the maximum value supplied in the next parameter. Values are converted to real numbers to perform the percentage calculation and retain the precision of any remainder. Calculated values are restricted to a real number between 0% and 100%. The default is Yes.

Parameter	How to Set It
Maximum value	If the *Percentage of numeric OID value?* parameter is enabled, the retrieved SNMP attributes are converted to a percentage of the maximum value entered here. The default is 12500000 bytes (or 100 Megabits) per second.
Raise event when maximum threshold exceeded?	Set to **Yes** to specify that the retrieved values should be compared against the maximum threshold value supplied in the next parameter. If enabled, the check is performed after any mathematical conversions that may have been selected above. The default is unchecked.
Threshold – Maximum OID value (post-calculation)	This parameter has no effect unless *Raise event when maximum threshold exceeded?* is enabled. For numeric attributes, specify the maximum threshold value. If this value is exceeded by a retrieved value after any selected calculations have been performed, an event is raised. Polling threshold values are real numbers. The default is 90.
Raise event when minimum threshold not met?	Set to **Yes** to specify that the retrieved values should be compared against the minimum threshold value supplied in the next parameter.If enabled, the threshold check is done after any mathematical conversions that may have been selected above. The default is unchecked.
Threshold – Minimum OID value (post-calculation)	This parameter has no effect unless *Raise event when minimum threshold not met?* is enabled. Specify a minimum threshold value. If the retrieved value fails to meet the threshold value after any calculations have been performed, an event is raised. Polling threshold values are real numbers. The default is 0.
Event severity when polled value violates check	Set the severity level, from 1 to 40, to indicate the importance of an event in which a threshold is crossed or an equality/inequality check fails. The default is 5.
Event Notification	
Raise event if SNMP operation succeeds?	Set to **Yes** to raise an event if the SNMP `Get` or `GetNext` operation is successful. The details of the event contain the retrieved data.
Event severity when SNMP operation succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which an SNMP operation succeeds. The default is 25.
Raise event if SNMP timeout exceeded?	Set to **Yes** to raise an event if the SNMP `Get` or `GetNext` request receives no response from the device, and all retries fail.
Event severity when SNMP timeout exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP timeout period is exceeded. The default is 15.
Raise event if SNMP Response error received?	Set to **Yes** to raise an event if an SNMP response error is received from the device. The type of error is reported in the event details.
Event severity when SNMP Response error received	Set the severity level, from 1 to 40, to indicate the importance of an event in which an SNMP Response error is received. The default is 10.

69.10 SyncPollTable

Use this Knowledge Script to perform an SNMP table walk along specified columns of an SNMP table. The retrieved table on the device is then polled at short time intervals at every script iteration. Only numeric attributes are polled. For each table row that is polled, this script computes a minimum, maximum, average and standard deviation. This script raised an event if the computed values exceed the threshold you set.

NOTE: Because this script walks an SNMP table, it is normally not necessary to supply an index value on the ODE/OIDs. Supplying just the attribute name (for example, "ifDescr") is normally sufficient. If only a portion of the table is to be walked, a parameter is available to specify the subset of table indices to walk.

The table walk is performed with iterative `GetNext` operations. As soon as any attribute walks beyond the end of the table, or the table indices become out of sync, the table walk terminates. If a table is fully populated, all attributes (or table columns) walk beyond the end of the table on the same `GetNext` operation. However, if the table has missing values, the table indices become out of sync as soon as a missing value is reached. A table walk is terminated when the first missing value is detected.

When this script is run on multiple devices, they are polled successively, not simultaneously. To poll devices simultaneously, create a different job for each device.

NOTE: The number of Polling attempts multiplied by the Polling interval and then multiplied by the number of devices on which the script is run must not exceed the time interval between script iterations. If this value does exceed the interval, the script job aborts because the polling would not be able to complete before the next Knowledge Script job is due to execute.

The script continues polling, regardless of whether any previous attempts failed. At least two polling attempts must succeed in order to report meaningful data.

This script collects separate data streams for each SNMP table row. Thus, the number of data streams is the number of SNMP data OIDs, multiplied by the number of rows in the table, and multiplied by the number of devices on which the script is run. By default, this script polls how many Kilobytes per second are flowing through each interface listed in the `ifTable` for the SNMP device.

If one or more numerical conversions are selected, they are performed in the following order: Delta, Multiplication, Division and Percentage. When polling growth of SNMP counter values using the Delta option, all values are normalized on a per second basis, regardless of the length of the polling interval. For example, as stated above by default this script calculates the Kilobytes per second flowing through all interfaces in the device. The values reported are Kilobytes per second regardless of the length of the polling interval.

69.10.1 Resource Object

Host System Folder running an AppManager agent

69.10.2 Default Schedule

By default, this script runs once.

69.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Polling Table Parameters	
Descriptive ODE/OIDs	Supply a list of SNMP Attribute ODEs and/or OIDs. These are descriptive attributes only which are reported in event and data details for reference purposes, and no processing is done on the retrieved values. The attributes chosen should uniquely identify the retrieved row of an SNMP table. The default is "`ifIndex, ifDescr`", which identifies the row number and name of a communications interface in the device.
Data ODE/OIDs	Supply a list of SNMP Attribute ODEs and/or OIDs. ODEs can only be used if the SNMP Toolkit module on the proxy agent computer has the corresponding MIB available. The default is "`ifInOctets,IfOutOctets`".
Optional table indices	By default, the entire SNMP table is walked. However, supplying a list of the table indices to be walked can restrict the walk. Indices can be a single integer value, or multiple integer values separated by dots; just like a numeric OID value but without a leading dot. For example, "1.10.42.1.47" is a valid table index.
Maximum number of table rows to poll	Specify the maximum number of table rows to be polled. The default is 100.
Polling interval	Specify the time interval between polling attempts during each Knowledge Script iteration. The default is 5 seconds.
Polling attempts	Specify the number of polling attempts to perform during each Knowledge Script iteration. The default is 12. Combined with the default interval of 5 seconds, the script by default polls the SNMP device for 1 minute. The minimum value is 2.
SNMP port number	Specify the UDP port number on the remote SNMP device to which you want to send SNMP requests. The default is 161.
SNMP timeout	Specify the number of seconds to wait for a response before timing out an SNMP request. The default is 5 seconds.
Polled Values Check	
Collect data for polled values?	Set to **Yes** to collect data for use in graphs and reports. The data is stored in the AppManager repository. When enabled, returns a data stream for each SNMP device/SNMP attribute pair. The default is unchecked.
Polling calculation type	For each set of polled values, the Average, Minimum, Maximum and Standard Deviation are calculated. Use this parameter to select which calculated value serves as the data point for the retrieved values.
Calculated units	Specify a name to identify the units being polled and calculated by this script. The default is "Kbytes/Sec".
Calculate delta for polled value?	Set to **Yes** to specify that the retrieved values should be considered a delta from the value retrieved by the previous polling attempt. The difference between the new value and the previous value is calculated. Normally this is used to monitor growth of SNMP counter values between polling attempts. The default is Yes. When set to **Yes**, **integer math** (not **floating point math**) is used, thus any remainder is discarded. **NOTE:** When you enable this parameter, this script reports one less polling attempt than was specified for *Polling attempts*, because the first polling attempt is used to set a baseline for the delta calculations to follow.
Use multiplier for polled value?	Set to **Yes** to specify that the retrieved values are numeric and should be multiplied by the value in the next parameter. The default is unchecked.

Parameter	How to Set It
Multiplier value	If *Use multiplier for numeric OID value?* is enabled, the retrieved SNMP attributes are multiplied by this value before being reported. The default is 1.
Use divisor for polled value?	Set to **Yes** to specify that the retrieved values are numeric and should be divided by the value in the next parameter. Values are converted to real numbers to perform the division and retain the precision of any remainder. The default is unchecked.
Divisor value	If *Use divisor for numeric OID value?* is enabled, the retrieved SNMP attributes are divided by this value before being reported. The default is 1.
Calculate percentage of polled value?	Set to **Yes** to specify that the retrieved values are numeric and should be converted to a percentage of the maximum value supplied in the next parameter. Values are converted to real numbers to perform the percentage calculation and retain the precision of any remainder. Calculated values are restricted to a real number between 0% and 100%. The default is unchecked.
Maximum value	If *Calculate percentage of numeric OID value?* is enabled, the retrieved SNMP attributes are converted to a percentage of the maximum value entered here. The default is 100.
Raise event when maximum threshold exceeded?	Set to **Yes** to specify that the retrieved values should be compared against the maximum threshold value supplied in the next parameter. If enabled, the check is performed after any mathematical conversions that may have been selected above. The default is unchecked.
Threshold – Maximum OID value (post-calculation)	If *Raise event when maximum threshold exceeded?* is selected, specify a maximum threshold value. If a retrieved value exceeds the threshold, an event is raised. Polling threshold values are real numbers. The default is 1000.
Raise event when minimum threshold not met?	Set to **Yes** to specify that the retrieved values should be compared against the minimum threshold value supplied in the next parameter. If enabled, the check is performed after any mathematical conversions that may have been selected above. The default is unchecked.
Threshold – Minimum OID value (post-calculation)	If *Raise event when minimum threshold not met?* is enabled, specify a minimum threshold value. If a retrieved value fails to meet this threshold, an event is raised. Polling threshold values are real numbers. The default is 100.
Event severity when polled value violates check	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is crossed or an equality/inequality check fails. The default is 5.
Event Notification	
Raise event if SNMP operation succeeds?	Set to **Yes** to raise an event if the SNMP `Get` or `GetNext` is successful. The details of the event contain the retrieved data.
Event severity when SNMP operation succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which an SNMP operation is successful. The default is 25.
Raise event if SNMP timeout exceeded?	Set to **Yes** to raise an event if the SNMP `Get` or `GetNext` request receives no response from the device, and all retries fail.
Event severity when SNMP timeout exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP timeout interval is exceeded. The default is 15.
Raise event if SNMP Response error received?	Set to **Yes** to raise an event if an SNMP Response error is received from the device. The type of error is reported in the event details.

Parameter	How to Set It
Event severity when SNMP Response error received	Set the severity level, from 1 to 40, to indicate the importance of an event in which an SNMP Response error is received. The default is 10.

69.11 SyncSet

Use this Knowledge Script to set one or more SNMP attributes on one or more SNMP-enabled devices to the specified values. The values can be of different types. However, so that the value types can be determined, the SNMP proxy agent computer that executes the script must have the MIB available for the specified attributes even if numeric OIDs are supplied. If the MIB for the specified attributes is not available, an SNMP `Failure` event is raised. Although requiring the MIB to be installed is a restriction, it does allow the flexibility to easily set multiple SNMP attributes of different types from a single script.

This script attempts to set the specified attributes on all supplied SNMP devices, regardless of whether any or all of the attempts fail. If failures do occur, successful sets on other devices cannot be reversed or backed out.

Collected data for this script is a Boolean value that specifies whether the SNMP `Set` operation failed or succeeded.

69.11.1 Resource Objects

SNMP Device objects

69.11.2 Default Schedule

By default, this script runs once.

69.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
SNMP ODE/OIDs	Supply a list of ODEs and/or OIDs. The default is "`sysContact.0`".
SNMP values (comma-separated)	Supply a comma-separated list of SNMP attribute values. As some SNMP values could be text strings, commas must be used as separators rather than spaces. The list must contain the same number of items as the *SNMP ODE/OIDs* parameter, and should be in the order corresponding to their respective attribute. The default is "Your System Administrator".
SNMP port number	Specify the UDP port number on the remote SNMP device to which you want to send SNMP requests. The default is 161.
SNMP retries	Specify the number of retries to attempt if a timeout occurs on an SNMP request. The default is 0 retries.
SNMP timeout	Specify the number of seconds to wait for a response before timing out an SNMP request. The default is 5 seconds.
Set success	
Collect data for Set success?	Set to **Yes** to collect data for use in graphs and reports. The data is stored in the AppManager repository. When enabled, returns a data stream containing a Boolean value representing whether the `Set` request succeeded or failed.

Parameter	How to Set It
Raise event if Set success not equal to threshold?	Set to **Yes** to raise an event if the result of the `Set` request is not equal to the threshold. The default is Yes.
Threshold – Set success	Set this value to one of the following: • 1 – the `Set` request succeeds • 0 – the `Set` request does not succeed. The default is 1 (success).
Event severity when Set success not equal to threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which Set success is not equal to the threshold you set. The default is 15.
Event Notification	
Raise event if SNMP operation succeeds?	Set to **Yes** to raise an event if the SNMP `Set` operation is successful. The details of the event contain the list of attributes you set.
Event severity when SNMP operation succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP `Set` operation succeeds. The default is 25.
Raise event if SNMP timeout exceeded?	Set to **Yes** to raise an event if the SNMP `Set` request receives no response from the device, and all retries fail.
Event severity when SNMP timeout exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP timeout interval is exceeded. The default is 15.
Raise event if SNMP Response error received?	Set to **Yes** to raise an event if an SNMP Response error is received from the device. The type of error is reported in the event details.
Event severity when SNMP Response error received	Set the severity level, from 1 to 40, to indicate the importance of an event in which an SNMP Response error is received. The default is 10.

70 SNMPTraps Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring SNMP Traps resources. From the Knowledge Script view of Control Center, you can access more information about any Knowledge Script by selecting it and clicking **Help**. In the Operator Console, select any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
AddMIB	Adds management information bases (MIBs) for monitoring by the SNMPTraps_TrapMonitor Knowledge Script.
TrapMonitor	Monitors for incoming SNMP traps from devices forwarded by NetIQ Trap Receiver. Raises events when traps are received and for Trap Receiver availability.

70.1 AddMIB

Use this Knowledge Script to add management information base (MIB) files, enabling you to convert trap object identifiers (OIDs) into object descriptive names (ODEs) to make monitored traps more readable with the SNMPTraps_TrapMonitor Knowledge Script. The MIB files should be `ASN.1` text files with a `.txt`, `.my`, or `.mib` file extension, and not compiled MIB files.

Use this script to copy a MIB file from a location you specify to the MIB tree located in the `netiq/AppManager/bin/MIBs` folder. If you select Yes for the *Reload MIB tree?* parameter, you can also reload all MIBs in the tree without restarting the AppManager agent. A restart of the AppManager agent automatically reloads the MIB tree.

In This Scenario	Set These Parameters
You want to add a MIB file to the MIB tree, but do not want the addition to take effect until after the next restart of the AppManager agent.	*Install additional MIB files?*: Select **Yes**. *Full path to MIB files* and *List of MIB files*: Provide location and name of MIB file you want to add. *Reload MIB tree?*: Set to **No** (unselected).
You manually copied a MIB file to the MIB directory and want to reload all MIBs in the directory.	*Install additional MIB files?*: Set to **No** (unselected). *Full path to MIB files* and *List of MIB files*: Leave blank. *Reload MIB tree?*: Select **Yes**. *MIB reload timeout*: Set new timeout value or accept default of 10 seconds.
Due to compiler errors, you edited some MIBs in the MIB directory. Now you want to reload the MIBs to ensure the errors have been fixed.	*Install additional MIB files?*: Set to **No** (unselected). *Full path to MIB files* and *List of MIB files*: Leave blank. *Reload MIB tree?*: Select **Yes**. *MIB reload timeout*: Set new timeout value or accept default of 10 seconds.

70.1.1 Resource Objects

- NT_MachineFolder
- TRAP_SOURCE_DEVICE

70.1.2 Default Schedule

By default, this script runs once.

70.1.3 Setting Parameter Values

Set the **Values** tab parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity if AddMIB job fails unexpectedly	Set the event severity level, from 1 to 40, to reflect the importance when this script fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.
Tracing (for advanced users only)	Use the tracing settings in this section only with the help of NetIQ Technical Support.
Raise event with job execution log?	Select **Yes** to raise an event when the job execution log is created. The default is unselected.
Logging level	Select the logging level you want to monitor. The options are Off, Fatal, Error, Warn, Info, Debug, or All. Use these settings only with the help of Technical Support. The default is Warn.
Derive event severity from most severe event log entry?	Select **Yes** to calculate the event severity for the *Raise event with job execution log* parameter based on the most severe event log entry. The default is Yes.
Event severity (if automatic severity computation not selected above)	If you did not select **Yes** for the *Derive event severity from most severe event log entry* parameter, set the event severity level, from 1 to 40, to reflect the importance of the event raised with the creation of the job execution log. The default is 40.
MIB Load Configuration Settings	
Raise event with the list of currently installed MIBs?	Select **Yes** to raise an informational event that provides a list of all MIBs installed in the MIB tree. The default is Yes.
Event severity for the list of currently installed MIBs	Set the event severity level, from 1 to 40, to reflect the importance of an event that provides a list of all MIBs in the MIB tree. The default is 25.
Install additional MIB files?	Select **Yes** to install additional MIB files. The default is Yes. If you select Yes for this parameter, but do not enter any value for both the *Full path to MIB files* and the *List of MIB files* parameters, the script loads or reloads all MIB files in the `NetIQ\AppManager\bin\MIBs` folder.
Raise event if installation of MIB files succeeds?	Select **Yes** to raise an event if the installation of the MIB files succeeds. The default is Yes.
Event severity when installation of MIB files succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the installation of the MIB files succeeds. The default is 25.
Raise event if installation of MIB files fails?	Select **Yes** to raise an event if the installation of the MIB files fails. The default is Yes.
Event severity when installation of MIB files fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the installation of MIB files fails. The default is 10.
Full path to MIB files	Specify the full path to the folder that contains the MIB files you want to install. Place the file in a location that is accessible by the account under which the `NetIQmc` service is running on the agent. This script supports UNC shares if the agent's parent account has authority to access the share.

Parameter	How to Set It
List of MIB files	Provide a comma-separated list of the MIB files you want to install. The MIB files should not be compiled MIB files. The MIB files you specify must be located in the folder you identified in the *Full path to MIB files* parameter.
Reload MIB tree?	Select **Yes** to update the MIB tree. The default is Yes.
Raise event if reloading of MIB tree succeeds?	Select **Yes** to raise an event if the reloading of the MIB tree succeeds. The default is Yes.
Event severity when reloading of MIB tree succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the reloading of the MIB tree succeeds. The default is 25.
Raise event if reloading of MIB tree fails?	Select **Yes** to raise an event if AppManager fails to reload the specified MIB files. The default is Yes. Failure scenarios include: • MIB reload timeout period expired. • Not all specified MIB files were installed.
Event severity when reloading of MIB tree fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the reloading of the MIB tree fails. The default is 10.
Raise event if reload MIB parser warnings received?	Select **Yes** to raise an event if warning messages are received during the reload process. The default is Yes. A potential warning scenario could be if not all the specified MIB files were loaded to the MIB tree.
Event severity when reload MIB parser warnings received	Set the severity level, from 1 to 40, to indicate the importance of an event in which warning messages are received during the reload process. The default is 15.
MIB reload timeout	Specify the length of time AppManager should attempt to update the MIB tree before timing out and raising a failure event. The default is 10 seconds.

70.2 TrapMonitor

Use this Knowledge Script to monitor v1, v2, and v3 traps sent by remote devices. You can configure the script to generate events for each SNMP trap received. You can also configure this script to raise AppManager events based on the different alarm types used by the monitored SNMP traps.

After you run the Knowledge Script, the SNMPTraps_TrapMonitor job waits for notification of a trap from the NetIQ Trap Receiver server or servers. When the server receives a trap, the TrapMonitor job determines whether the IP address of the source device matches a device that the job is currently monitoring.

You can also use this script to create a new object in the Navigation pane or TreeView, with custom display name format, when a trap is received from a device that is not currently in the Navigation pane or TreeView.

This script also lets you filter the list of devices monitored, with filters based on OID (object identifier) values, ODE (object descriptive name) values, and varbind values, and exclusion filters based on MIB subtrees and trap source devices.

In addition, this script allows you to customize the AppManager event messages that correspond to SNMP traps listed in the `SNMPTraps_AlarmMappings.csv` file that comes with this module. For more information, see "Customizing AppManager Events for Trap Source Devices" on page 3986.

The SNMPTraps_TrapMonitor script also includes vendor-specific formatting for Avaya G3 and Avaya Communication Manager traps to make the AppManager event messages for those traps easier to read. For more information, see the following topics:

- "Formatting Event Message Text for Avaya G3 Traps" on page 3990
- "Formatting Event Message Text for Avaya CM Traps" on page 3991

70.2.1 Prerequisite

Before running the SNMPTraps_TrapMonitor script, configure AppManager Security Manager with the community string and version information for each device you want to monitor. Security Manager entries for SNMP v1 and v2 are optional, but SNMP v3 traps require a Security Manager entry.

If you already use other modules that monitor SNMP traps, such as AppManager for Avaya Communication Manager or AppManager for Network Devices, you can continue to use any existing SNMPTrap Security Manager entries.

The type of Security Manager information you configure varies according to the version of SNMP implemented on the device. AppManager for SNMP Traps supports SNMP versions 1, 2, and 3.command/

70.2.1.1 Configuration for SNMP Versions 1 and 2

To set up Security Manager for SNMP v1 or SNMP v2 traps, complete the following fields on the **Custom** tab in Security Manager:

Field	Description
Label	`SNMPTraps` This script also supports Security Manager entries labeled `SNMPTrap`, which is a label used by other modules that you might have already installed, such as AppManager for Avaya Communication Manager or AppManager for Network Device.
Sub-label	Specify whether the community string is used for a single device or for all devices: • For a single device, list the IP address for the community string. • For all devices, enter `default`.
Value 1	Specify the community string for the device or devices.
Value 2	Leave this field blank.
Value 3	Leave this field blank.

70.2.1.2 Configuration for SNMP Version 3

AppManager for SNMP supports the following modes for SNMP version 3 (SNMP v3):

- No authentication; no privacy
- Authentication; no privacy
- Authentication and privacy

In addition, the module supports the following protocols for SNMP v3:

- MD5 (Message-Digest algorithm 5, an authentication protocol)
- SHA (Secure Hash Algorithm, an authentication protocol)
- DES (Data Encryption Standard, an encryption protocol)

Configure SNMP v3 information for each device monitored by each proxy computer.

If you plan to monitor SNMP v3 traps, install the NetIQ Trap Receiver and the AppManager agent on the *same* computer to prevent malicious users from gaining secure access to the information in these traps. The SNMPTraps_TrapMonitor script notifies you if an SNMP v3 trap source device's corresponding NetIQ Trap Receiver IP address does not match the IP address of the AppManager agent monitoring it.

The SNMPTraps_TrapMonitor script does not fully validate SNMP v3 credentials retrieved from Security Manager for a particular device or set of devices, and the script does not notify you if these credentials do not match. As a result, the SNMPTraps_TrapMonitor script might miss some SNMP v3 traps if you do not enter the Security Manager credentials properly.

For SNMP v3 configuration, complete the following fields in the **Custom** tab of Security Manager for the proxy agent computer.

Field	Description
Label	`SNMPTraps` This script also supports Security Manager entries labeled `SNMPTrap`, which is a label used by other modules that you might have already installed, such as AppManager for Avaya Communication Manager or AppManager for Network Devices.
Sub-label	Specify the IP address, or enter `default` for all devices that do not have a specific IP address entry.
Value 1	Specify the SNMP user name, or *entity*, configured for the device. All SNMP v3 modes require an entry in this field.
Value 2	Specify the name of the context associated with the user name or entity entered in **Value 1**. A *context* is a collection of SNMP information that is accessible by an entity. If possible, enter a context that provides access to all MIBS for a device. If the device does not support context, type an asterisk (*). All SNMP v3 modes require an entry in thisfield.
Value 3	Specify the combination of protocol and password appropriate for the SNMP v3 mode you have implemented. • For *no authentication/no privacy mode*, leave this field blank. • For *authentication/no privacy mode*, enter `md5` or `sha` and the password for the protocol, separating each entry with a comma. For example, enter `md5,abcdef` • For *authentication/privacy mode*, enter `md5` or `sha` and the associated password, and then enter `des` and the associated password, separating each entry with a comma. For example, enter `sha,hijklm,des,nopqrs`

70.2.2 Resource Objects

- NT_MachineFolder
- TRAP_SOURCE_DEVICE

70.2.3 Default Schedule

The default interval for this script is **Asynchronous**.

70.2.4 Setting Parameter Values

Set the **Values** tab parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	

Parameter	How to Set It
Event severity if TrapMonitor job fails unexpectedly	Set the event severity level, from 1 to 40, to reflect the importance when this script fails unexpectedly. The default is 5.
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.

Trap source address format	Select the elements of the trap source address you want to include in AppManager event messages. The default is Both.
	
	If you select **Host ID**, the event message lists the host ID in brackets before the trap details. For example:
	
	`[RALDVAP655]:  Trunk Layer 1 state changed to up`
	
	If you select **Source IP**, the event message lists the IP address for the source in brackets before the trap details. For example:
	
	`[10.22.124.33]:  Trunk Layer 1 state changed to up`
	
	If you select **Both**, the event message lists the name of the host and the IP address in brackets, followed by the trap details. For example:
	
	`[RALDVAP655 (10.22.124.33)]:  Trunk Layer 1 state changed to up`

Format trap data according to SNMP version?	Select the version of SNMP to determine the type of formatting that will be used for trap event messages. The data provided by each format is the same, and only the layout is different. The default is SNMP v2.
Include prefix information to format event messages for Netcool adapter?	Select **Yes** if you are using the NetIQ AppManager Connector for IBM Tivoli Netcool/OMNIbus, and want to format trap events for the connector. If you select Yes, at the start of the resulting AppManager event short message, the script will add four values that are each preceded by tilde characters ( ) that get used by the Netcool connector. The default is unselected.
Varbind display options	**Note** Enabling any of the following varbind display parameters might negatively impact the speed at which traps are processed.
Display ‘friendly’ ODEs in event messages?	Select **Yes** if you want to include spaces in the varbind ODE name in the event detail message. This parameter will add spaces in the varbind ODE name in between characters that differ in case, and it will add spaces between characters and numbers. The default is Yes. For example, the varbind ODE name `v1clogHistFacility` would display as `v1 clog Hist Facility`.
Include varbind OID in event messages?	Select **Yes** to add the OID (object identifier) of the varbind in a separate column in the Varbind table. The default is unselected.
Include varbind MIB name in event messages?	Select **Yes** to add the name of the MIB in front of the varbind ODE in the details of the event message varbinds. For example, the varbind ODE name `v1clogHistFacility` would display as `CISCO-SYSLOG-MIB::v1clogHistFacility`. The default is unselected.

Parameter	How to Set It
Trap Filters	**Note** The SNMPTraps_TrapMonitor script processes the include filters first, and then it processes the exclude filters applied against those results. Also, each filter parameter is processed in the order listed below, so the *List of OIDs and ODEs* parameters are processed before the *List of MIB subtrees* parameters.
Include Filters	
List of OIDs and ODEs to include	Specify the object identifiers (OIDs) of the traps you want to monitor, ignoring all other traps. You can type one OID or a list of OIDs. If you use a list, separate the OIDs with a comma, without any spaces. This parameter also supports the use of ODEs (descriptive names) if the relevant MIBs were loaded into the MIB subtree. If the relevant MIBs are not installed by this module, load them with the SNMPTraps_AddMIB Knowledge Script. The case of the ODEs in your list must match the case of the ODEs as they are defined in the MIBs. This parameter does not support wildcard characters or regular expressions. List the OID or ODE information in the following format: *MIBName*::*TrapName* or NumericalTrapOID Separate multiple trap OIDs or ODEs with commas, without any spaces. For example: EXTREME-DOS-MIB::extremeDosThresholdCleared, 1.3.6.1.4.1.1916.4.14.0.2
File with list of OIDs and ODEs to include	If you have many OID values to monitor, you can specify the full path to a file that contains a list of the OID values you want to include. This parameter also supports the use of ODEs if the relevant MIBs were loaded into the MIB subtree. If the relevant MIBs are not installed by this module, load them with the SNMPTraps_AddMIB Knowledge Script. The case of the ODEs in your list must match the case of the ODEs as they are defined in the MIBs. List each OID or ODE value on a separate line in the file, and format them in the manner described in the previous parameter. Place the file in a location that is accessible by the account under which the NetIQmc service is running on the agent. If you place the file in the NetIQ\AppManager\bin\SNMPTraps folder on the local agent, you do not need to specify a full path to the file. This script supports UNC shares if the agent's parent account has authority to access the share. If you edit the contents of this file after running this job, restart the job to include the updates.
List of MIB subtrees to include	Specify a set of MIB subtrees for which you want to monitor all child traps. The script ignores any traps that are not part of the listed MIB subtrees. You can type one MIB subtree or a list of MIB subtrees. If you type a list, separate the subtrees with a comma, without any spaces. If you add multiple MIB subtrees in this parameter, the script ignores any higher-level subtrees if you also included a lower-level subtree in the list. For example, if you list both 1.3.6.1.4.1.9148 and 1.3.6.1.4.1.9148.1, the script ignores the first, higher-level entry to focus on the second, lower-level entry in the MIB subtree.

Parameter	How to Set It
File with list of MIB subtrees to include	If you have many MIB subtrees to monitor, you can specify the full path to a file that contains a list of the subtrees you want to include. Each MIB subtree in the file should be on a separate line. Place the file in a location that is accessible by the account under which the `NetIQmc` service is running on the agent. If you place the file in the `NetIQ\AppManager\bin\SNMPTraps` folder on the local agent, you do not need to specify a full path to the file.This script supports UNC shares if the `netiqmc` service account has permission to access the share.
Exclude Filters	

List of OIDs, ODEs, and varbind values to exclude	Specify the OIDs, ODEs, and varbind values of the traps you do not want to monitor. You can specify one OID or ODE, or a list of OIDs and ODEs. If you use a list, separate the OIDs and ODEs with a comma, without any spaces.
	
	The case of the ODEs in your list must match the ODEs as they are defined in the MIBs.
	
	List the ODE information in the following format:
	
	`MIB Name``::`*`Trap Name`*
	
	For example:
	
	`CXC-MIB::callHeld,CXC-MIB::callRetrieved`
	
	List the varbind value information in the following format:
	
	`MIBName``::`*`TrapName+MIB Name`*`::`*`Varbind Name=Value`*
	
	For example:
	
	`CXC-MIB::callHeld+CXC-MIB::Varbind1=1`
	
	If you need to use a comma for the *`Value`*, above, use a tilde ( ) character in place of the comma every location where a comma should appear.

File with list of OIDs, ODEs, and varbind values to exclude	If you have many OIDs, ODEs, and varbind values to exclude, you can specify the full path to a file that contains a list of the OIDs, ODEs, and varbind values that you want to exclude. List each value on a separate line in the file, and format them in the manner specified in the previous parameter. The case of the ODEs in your list must match the ODEs as they are defined in the MIBs. Place the file in a location that is accessible by the account under which the `NetIQmc` service is running on the agent. If you place the file in the `NetIQ\AppManager\bin\SNMPTraps` folder on the local agent, you do not need to specify a full path to the file.This script supports UNC shares if the `netiqmc` service account has permission to access the share. If you edit the contents of this file after running this job, restart the job to include the updates.
List of MIB subtrees to exclude	Specify the MIB subtrees of the traps you want to exclude from monitoring so you can focus on a smaller set of traps. You can type one MIB subtree or a list of MIB subtrees. If you use a list, separate the subtrees with a comma, without any spaces.

Parameter	How to Set It
File with list of MIB subtrees to exclude	If you have many MIB subtrees you want to exclude from monitoring, you can specify the full path to a file that contains a list of the subtrees you want to exclude. Each MIB subtree in the file should be on a separate line. Place the file in a location that is accessible by the account under which the `NetIQmc` service is running on the agent. If you place the file in the `NetIQ\AppManager\bin\SNMPTraps` folder on the local agent, you do not need to specify a full path to the file.This script supports UNC shares if the `netiqmc` service account has permission to access the share.
Additional Settings	
Monitor devices not yet discovered?	Select **Yes** to create AppManager events for traps forwarded by devices that are not currently displayed in the Navigation pane or TreeView. The default is unselected.
Discover new devices when traps received?	Select **Yes** to enable the script to discover a new device and create a new object for that device in the Navigation pane or TreeView if a device that has not yet been discovered receives a trap. The default is unselected.
Reverse lookup DNS hostname from an unknown trap source IP address?	Select **Yes** to perform a reverse lookup of the IP address to determine the DNS hostname of the discovered device. The IP address for the device displays as part of the name of the object created for the discovered device in the Navigation pane or TreeView. The default is Yes. This parameter only applies to devices that are not listed in the following parameter, *File containing additional device name/IP address pairs*. Enabling this parameter might negatively impact the performance of this script. If you select Yes for this parameter, you must also select Yes for the *Monitor devices not yet discovered?* parameter to enable the discovery of new devices.

Parameter	How to Set It

File containing additional device name/IP address pairs	Specify the path to a list of mappings that pairs device names to IP addresses.
	
	When a trap is received from an undiscovered device, this parameter determines the object display name in the Navigation pane or TreeView if a match is found. The *Monitor devices not yet discovered?* and the *Discover new devices when traps received?* parameters must both be set to Yes to enable the discovery of new devices.
	
	If you selected No for the *Discover new devices when traps received?*parameter, this parameter formats the short event message of the relevant trap so a device name is specified.
	
	In the file, list just one mapping pair per line, and separate the mappings with a comma, no spaces. Use the following format for the mappings in this file:
	
	`DeviceName,IPAddress`
	
	For example:
	
	`DeviceA,10.41.5.100`
	
	`DeviceB,10.41.5.102`
	
	If the received trap's source IP address does not match the source IP address contained in any monitored Navigation pane or TreeView object, but the IP address *does* match a source IP address provided in the file for this parameter, the script displays the new device in the Navigation pane or TreeView in one of the following three formats:
	
	`Trap Source: DNSHostname [IP Address]`
	
	`Trap Source: CustomDeviceName [IP Address]`
	
	`Trap Source: [IP Address]`
	
	For example:
	
	`Trap Source: DeviceA [10.41.5.101]`
	
	Note You can use IPv6 addresses in your file, and the script will format the alarm event message properly to use the correct custom display name for the object. However, the script will *not* discover a device that uses an IPv6 address if you selected Yes for the *Discover new devices when traps received?* parameter. Traps containing IPv6-formatted source addresses will not have a corresponding object created in the Navigation pane or TreeView.
	
	Place the file in a location that is accessible by the account under which the `NetIQmc` service is running on the agent. This script supports UNC shares if the `netiqmc` service account has permission to access the share. If you place the file in the `NetIQ\AppManager\bin\SNMPTraps` folder on the local agent, you do not need to specify a full path to the file.

Parameter	How to Set It
File with list of IP addresses not yet discovered to exclude	Specify the full path to a file that contains an exclusion list of the IP addresses for devices that have not yet been discovered. This parameter lets you exclude a set of devices that are not relevant and, as a result, are never included as part of the unknown device support in the module. Do not use this parameter to specify a set of already-discovered devices to exclude. Also, this parameter does not exclude already-discovered devices. In the file, list one IPv4 or IPv6 address per line. The script ignores any lines that start with a hash (#) character, and the script also ignores any blank lines. Place the file in a location that is accessible by the account under which the NetIQmc service is running on the agent. If you place the file in the NetIQ\AppManager\bin\SNMPTraps folder on the local agent, you do not need to specify a full path to the file.This script supports UNC shares if the netiqmc service account has permission to access the share. If you edit the contents of this file after running this job, restart the job to include the updates.
List of Trap Receiver IP address/TCP port pairs	Specify a list of mappings that pair IP addresses with the TCP port numbers for any Trap Receiver servers that can receive traps from a device that is not currently discovered in the Navigation pane or TreeView, or Trap Receiver servers that can receive any traps from IPv6 devices. The *IP address* is for the NetIQ Trap Receiver (NTR) server that received the forwarded trap, and the *port* is the TCP port where the SNMPTraps_TrapMonitor job connects to the relevant Trap Receiver server. Use only the IP address, not the host name for a Trap Receiver server. Traps containing IPv6-formatted source addresses will *not* have a corresponding object created in the Navigation pane or TreeView. Format the pairs in the following manner: 10.22.50.100:2735.
Custom message mapping file	Specify the path to the file containing the custom event short message and alarm severity information for individual SNMP trap ODEs. This file also allows you to customize the alarm severity for individual varbind values and substitute text strings for individual varbind values. The default is SNMPTraps_AlarmMappings.csv, located in the NetIQ\AppManager\bin\SNMPTraps folder on the AppManager agent. This file is pre-populated with objMapping, severityMapping, and varbindMapping entries for each trap defined in each MIB installed by the module. If the SNMPTraps_AlarmMappings.csv file does not exist at the target location when you install this module, the installation process will create a new file in the target location. All fields except for the <trap text> are *not* case-sensitive. For more information about the SNMPTraps_AlarmMappings.csv file, see "Customizing AppManager Events for Trap Source Devices" on page 3986.
Tracing (for advanced users only)	
Logging level	Select the logging level you want to monitor. The options are Off, Fatal, Error, Warn, Info, Debug, or All. The default is Warn. Use these tracing settings only with the help of NetIQ Technical Support.
Monitor SNMP Traps	
Event Notification	

Parameter	How to Set It
Raise critical alarm event?	Select **Yes** to raise an AppManager event when the script receives a trap with a trap ODE that matches an objMapping or a severityMapping entry with an AlarmSeverity of *critical* in the file specified in the *Custom message mapping file* parameter. The default is Yes. A *critical* alarm indicates that a condition that impacts service has occurred and an immediate corrective action is required. An example of a critical event is when a total loss of service occurs, and that service must be restored.
Event severity when critical alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which a monitored device receives a trap that maps to a critical alarm. The default is 5.
Raise major alarm event?	Select **Yes** to raise an AppManager event when the script receives a trap with a trap ODE that matches an objMapping entry or a severityMapping entry with an AlarmSeverity of *major* in the file specified in the *Custom message mapping file* parameter. The default is Yes. A *major* alarm indicates that a service-affecting condition has developed and requires an urgent corrective action. An example of a major event is when a severe degradation of service occurs, and the full capability of that service must be restored.
Event severity when major alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the script receives a trap that maps to a major alarm. The default is 10.
Raise minor alarm event?	Select **Yes** to raise an AppManager event when the script receives a trap with a trap ODE that matches an objMapping entry or a severityMapping entry with an AlarmSeverity of *minor* in the file specified in the *Custom message mapping file* parameter. The default is Yes. A *minor* alarm indicates the existence of a fault condition that is not service-affecting, but you should take corrective action to prevent a more serious fault.
Event severity when minor alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the script receives a trap that maps to a minor alarm. The default is 15.
Raise warning alarm event?	Select **Yes** to raise an AppManager event when the script receives a trap with a trap ODE that matches an objMapping or a severityMapping entry with an AlarmSeverity of *warning* in the file specified in the *Custom message mapping file* parameter. The default is Yes. A *warning* alarm indicates the detection of a potential or impending service-affecting fault before any significant effects have occurred. You should take action to further diagnose the problem, if necessary, and then correct the problem to prevent it from becoming a more serious service-affecting fault.
Event severity when warning alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the script receives a trap that maps to a warning alarm. The default is 20.
Raise unmapped alarm event?	Select **Yes** to raise an AppManager event when the script receives a trap with a trap ODE that matches an objMapping or a severityMapping entry with an AlarmSeverity of *unmapped* in the file specified in the *Custom message mapping file* parameter. The default is Yes. An *unmapped* alarm indicates that no mapping exists for a trap that the script does not recognize.
Event severity when unmapped alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the script receives a trap that maps to an unmapped alarm. The default is 15.

Parameter	How to Set It
Raise indeterminate alarm event?	Select **Yes** to raise an AppManager event when the script receives a trap with a trap ODE that matches an objMapping or a severityMapping entry with an AlarmSeverity of *indeterminate* in the file specified in the *Custom message mapping file* parameter. The default is Yes. An *indeterminate* alarm indicates that an entry exists in the `SNMPTraps_AlarmMappings.csv` file, but the severity level cannot be determined due to a missing varbind value, or the entry contains a dynamic value that cannot be specified.
Event severity when indeterminate alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the script receives a trap that maps to an indeterminate alarm. The default is 20.
Raise cleared or resolved alarm event?	Select **Yes** to raise an AppManager event when the script receives a trap with a trap ODE that matches an objMapping or a severityMapping entry with an AlarmSeverity of *cleared* or *resolved* in the file specified in the *Custom message mapping file* parameter. The default is Yes. A *cleared* or *resolved* alarm indicates that one or more previously reported alarms have been cleared.
Event severity when cleared or resolved alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the script receives a trap that maps to a cleared or resolved alarm. The default is 25.
Raise event if Trap Receiver is unavailable?	Select **Yes** to raise an event if a monitored Trap Receiver is not available. The default is Yes.
Event severity when Trap Receiver is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which a monitored Trap Receiver is unavailable. The default is 5.
Raise event if Trap Receiver becomes available?	Select **Yes** to raise an event if a monitored Trap Receiver becomes available. The default is No.
Event severity when Trap Receiver becomes available	Set the severity level, from 1 to 40, to indicate the importance of an event in which a monitored Trap Receiver becomes available. The default is 25.

70.3 Customizing AppManager Events for Trap Source Devices

This module installs a file named `SNMPTraps_AlarmMappings.csv` in the `NetIQ\AppManager\bin\SNMPTraps` folder on the AppManager agent. You can use the contents of this `.csv` file to customize the text of the AppManager events for the trap source devices you are monitoring.

View a brief video demonstration of this feature on the NetIQ YouTube channel:

http://www.youtube.com/watch?v=09jT2CnbjIA

Customizing the AppManager events in this way allows you and other AppManager users to easily identify problems related to SNMP traps in AppManager and quickly address those problems instead of spending time trying to decipher the meaning of the default trap messaging.

This file contains a list of NetIQ-specific mapping entries for the values in the MIBs installed by the module. The mapping entries in the `.csv` file use one of the following formats:

- *objMapping* entries map a trap ODE to an AppManager event short message and an AppManager event severity. For more information, see "Customizing Event Messages and Severities Based on Trap ODE" on page 3986.
- *severityMapping*emphasis/ entries map varbind ODE and varbind value to an AppManager event severity. For more information, see "Customizing Event Severities Based on Varbind Values" on page 3987.
- *varbindMapping* entries map varbind ODE and varbind value to a human-readable string used by the AppManager event, replacing the default values generated by the trap. For more information, see "Customizing Event Message Text Based on Varbind Values" on page 3988.

The SNMPTraps_TrapMonitor Knowledge Script uses these mappings to generate an AppManager event with an event severity or event message based on the parameters you selected in the SNMPTraps_TrapMonitor script.

For example, if you selected **Yes** for the *Raise critical alarm parameter* in the SNMPTraps_TrapMonitor script, and the following events occur:

1. The SNMPTraps_TrapMonitor script receives a trap,
2. The trap's ODE matches an objMapping entry or a varbind ODE in the trap matches a severityMapping entry in the `.csv` file,
3. The entry in the `.csv` file has an AlarmSeverity of *critical*,

then the SNMPTraps_TrapMonitor script generates an AppManager event for that critical trap. You can specify the event severity level of the trap by using the *Event severity when critical alarm received* parameter, or you can use the default AppManager severity level for that parameter, which is 5.

The objMapping, severityMapping, and varbindMapping entry types in the `SNMPTraps_AlarmMappings.csv` file also supports the use of *derived fields*, which are varbind values that the module formats into values that are easier to understand.

If the `SNMPTraps_AlarmMappings.csv` file does not exist at the target location when you install this module, the installation process installs a new file in the target location. If the `SNMPTraps_AlarmMappings.csv` file already exists in the target location when you install this module, the installation process renames the existing file `SNMPTraps_AlarmMappings_OLD.csv` and installs the new `SNMPTraps_AlarmMappings.csv` file in the target location. If you already have a list of alarm mappings, you can specify this file using the *Custom event mapping file* parameter in the SNMPTraps_TrapMonitor script.

Each SNMPTraps_TrapMonitor job uses a unique version of the `SNMPTraps_AlarmMappings.csv` file from the `NetIQ\AppManager\bin\SNMPTraps` folder. Also, the TrapMonitor job reloads the `.csv` file every 24 hours.

70.3.1 Customizing Event Messages and Severities Based on Trap ODE

When the SNMPTraps_TrapMonitor job receives a trap, and the trap ODE matches an objMapping entry in the `SNMPTraps_AlarmMappings.csv` file (or the file you specified in the *Custom message mapping file* parameter), the job creates an AppManager event for that trap. You can customize the AppManager event message and event severity for that trap by editing the entry in the `.csv` file.

The AppManager event message uses the event short message that comes after the fourth tilde ( ) character in the relevant entry in the `.csv` file. The severity for the event corresponds with the event severity parameter for that type of alarm in the trap. Use the parameters in the *Event Notification* section of the SNMPTraps_TrapMonitor script to specify the AppManager alarm settings.

The ODE entries in the `.csv` file are not case-sensitive, and they use the following format:

`objMapping,`*`MIBName`*`::`*`TrapName`*`,`*`AlarmSeverity`*`, `*`NetcoolPrefix1 NetcoolPrefix2  NetcoolPre`

- `objMapping` states that this line contains a mapping of an SNMP trap ODE to an AppManager event short message and alarm severity category.
- *`MIBName`*`::`*`TrapName`* specifies the trap ODE that you are mapping. The ODE contains both the MIB name and the trap name.
- *`AlarmSeverity`* specifies the alarm severity category for this ODE. The following severity category values are supported: *critical, major, minor, warning, indeterminate*, *unmapped*, and *cleared*.
- The final section of the entry is used to format the actual AppManager event short message. This portion is split into four sections, with each section prefixed with a tilde ( ). Each of these four sections can contain normal text or substitution variables. *Substitution variables* represent different varbind values or derived fields (also known as derived varbind values) that you can substitute into an AppManager event message created for a trap. Substitution variables are listed with braces, such as *`{DerivedHostID}`*, and these variables should contain a substituted value at runtime.
  - The three *`NetcoolPrefix`* labels are only for Netcool connector support. The first label signifies an alert group, the second label signifies an alert key, and the third label signifies the source host and address. If you are not using the Netcool connector, leave these entries blank except for the three tildes ( ).
  - *`TrapText`* specifies the event message text that will display for the AppManager event. You can customize this text, and the text is required.

The following is an example of an objMapping entry from the `.csv` file:

```
objMapping,LOAD-BAL-SYSTEM-MIB::loadBalTrapNoMem,major,     MAWS BOOT service
cannot access SES database
```

The SNMPTraps_TrapMonitor script supports the following substitution variables in ODE entries:

- *`{DerivedHostID}`* is the name of the trap-forwarding device, which can be a DNS host name or a custom name provided as input into the SNMPTraps_TrapMonitor script or input as part of a discovered Navigation pane or TreeView object.
- *`{DerivedSourceIP}`* is the IP address of the forwarding device.
- *`{DerivedTrapName}`* is the ODE of the SNMP trap received.

The SNMPTraps_TrapMonitor script also supports varbindMapping substitution variables.

70.3.2 Customizing Event Severities Based on Varbind Values

When the SNMPTraps_TrapMonitor job receives a trap, and the trap varbind value matches a severityMapping entry in the `SNMPTraps_AlarmMappings.csv` file (or the file you specified in the *Custom message mapping file* parameter), the job creates an AppManager event that corresponds to the type of alarm in the SNMP trap. You can customize the AppManager event severity for that trap by editing the corresponding entry in the `SNMPTraps_AlarmMappings.csv` file.

70.3.2.1 Mapping Varbind Values to Alarm Severities

Entries in the `.csv` file can specify a one-to-one mapping of varbind values to a alarm severities.

The severityMapping entries in the file are not case-sensitive, and they use the following format:

`severityMapping,`*`MIBName`*`::`*`VarbindName`*`,`*`VarbindValue`*`,`*`AlarmSeverity`*`replaceable/`

- `severityMapping` states that this line contains a mapping of a varbind value to an AppManager event severity category.
- *`MIBName`*`::`*`VarbindName`* specifies the varbind ODE that you are mapping. The varbind ODE contains both the MIB name and the varbind name.
- `replaceable/`*`VarbindValue`* specifies an alphanumeric string for the varbind being represented.
- *`AlarmSeverity`* specifies the alarm severity category for this varbind ODE. The following severity category values are supported: *critical, major, minor, warning, indeterminate*, and *cleared*.

The following is an example of a severityMapping entry from the `.csv` file:

```
severityMapping,G700-MG-MIB::cmgTrapSeverity,1,cleared
```

70.3.2.2 Mapping Derived Fields to Alarm Severities

An entry in the `.csv` file that maps a derived field to an alarm severity uses the following format:

`severityMapping,`*`DerivedFieldName`*`,`*`DerivedFieldValue`*`,`*`AlarmSeverity`*

- `severityMapping` states that this line contains a mapping of a derived field to an AppManager event severity category.
- *`DerivedFieldName`*`replaceable/` specifies the derived field that you are mapping. This name should be prefixed with the word `Derived`literal/, though it is not required. Also, this name cannot contain any double colon characters (`::`).
- `replaceable/`*`DerivedFieldValue`* specifies an alphanumeric string that could be a possible value for the derived field being represented.
- *`AlarmSeverity`* specifies the alarm severity category for this derived field. The following severity category values are supported: *critical, major, minor, warning, indeterminate*, and *cleared*.

The following is an example of how a severityMapping entry mapped with a derived field value might look:

```
severityMapping,DerivedDefAudFaultMessage,A:1,cleared
```

70.3.3 Customizing Event Message Text Based on Varbind Values

An AppManager event for an SNMP trap can contain a number of values for the various varbinds for that trap, and many times the varbinds do not clearly describe the conditions of the trap. You can replace a varbind value with a string of text that is more relevant and "human-readable" than the original varbind values.

70.3.3.1 Mapping Varbind Values to Event Text

Entries in the `SNMPTraps_AlarmMappings.csv` file (or the file you specified in the *Custom message mapping file* parameter) can specify a one-to-one mapping of varbind values to more readable strings of text.

The varbindMapping entries in the file are not case-sensitive, and they use the following format:

`varbindMapping,`*`MIBName`*`::`*`VarbindName`*`,`*`VarbindValue`*`,`*`HumanReadableString`*`replaceable/`

- `varbindMapping` states that this line contains a mapping of a varbind alphanumeric value to a "human-readable" string.
- *`MIBName`*`::`*`VarbindName`* specifies the varbind ODE that you are mapping. The varbind ODE contains both the MIB name and the varbind name.
- `replaceable/`*`VarbindValue`* specifies an alphanumeric string for the varbind being represented.
- *`HumanReadableString`* specifies any relevant identifying text you want to use to replace the varbind value.

The following is an example of a varbindMapping entry from the `.csv` file:

```
varbindMapping,AVAYA-LOAD-MIB::avGenOpLastFailureIndex,222,ftpResumeNotSupported
```

70.3.3.2 Mapping objMapping Entries to Event Text

In addition to varbindMapping entries, you can apply substitutions to objMapping entries in the `.csv` file. If an objMapping entry contains a substitution variable that matches a varbind ODE defined in the relevant MIB, the resulting AppManager event short messages are updated so that the substitution variable is replaced with the alphanumeric value for that varbind ODE.

If the varbind ODE has a matching varbindMapping entry in the file specified in the *Custom message mapping file* parameter, the corresponding "human-readable" string replaces that alphanumeric value in the event short message.For example, an objMapping entry includes the following event short message:

```
Trunk Layer 2 state changed to {applianXAlarmStatus}
```

This message displays like this if no matching varbindMapping entry exists:

```
Trunk Layer 2 state changed to 1
```

In this instance, the value of the varbind is substituted directly, but the "1" might not mean anything to you. If the file contains a matching varbindMapping entry, the following displays in the event short message:

```
Trunk Layer 2 state changed to up
```

70.3.3.3 Mapping Derived Values to Event Text

Entries in the `SNMPTraps_AlarmMappings.csv` file (or the file you specified in the *Custom message mapping file* parameter) can specify a one-to-one mapping of derived fields to more readable strings of text.

The varbindMapping entries in the `.csv` file are not case-sensitive, and they use the following format:

`varbindMapping,`*`DerivedFieldName`*`,`*`DerivedFieldValue`*`,`*`HumanReadableString`*

- `varbindMapping` states that this line contains a mapping of a derived field value to a "human-readable" string.
- *`DerivedFieldName`* specifies the derived field that you are mapping. This name should be prefixed with the word literal/`Derived`, though it is not required. Also, this name cannot contain any double colon characters (`::`).
- `replaceable/`*`DerivedFieldValue`* specifies an alphanumeric string that could be a possible value for the derived field being represented.
- *`HumanReadableString`* specifies any relevant identifying text you want to use to replace the derived field value.

The following is an example of a varbindMapping entry with a derived field value from the `.csv` file:

```
varbindMapping,DerivedDefAudFaultMessage,0:LINK_PORTS,Check error log
```

70.3.4 Formatting Event Message Text for Avaya G3 Traps

AppManager for SNMP Traps includes vendor-specific formatting for Avaya G3 traps to make the AppManager event messages for those traps easier to read.

If you run an SNMPTraps_TrapMonitor job, and an Avaya G3 trap successfully passes all relevant filters to create an AppManager event for that trap, the SNMPTraps_TrapMonitor script provides vendor-specific formatting for all Avaya G3 traps (which are defined under the 1.3.6.1.4.1.6889.1.8.1.0 MIB subtree).

The detail portion of the event message for Avaya G3 traps includes the following information in the **Trap details** table:

- **CM Hostname**: the script populates this value with the g3clientExternalName varbind, which defines the external name of the G3 client. If this varbind is not populated, the source IP address is set as the value.
- **Maintenance Object**: the script populates this value with the g3alarmsMaintName varbind, which defines the Maintenance Object Name. Known values are populated in the `SNMPTraps_AlarmMappings.csv` file with varbindMapping entries so that a human-readable string is used. If the job does not find a corresponding varbindMapping entry in the `SNMPTraps_AlarmMappings.csv` file, the relevant cell will display just the varbind value.
- **Generation Time**: the script populates this value with the g3alarmsAlarmNumber varbind, and it states the time the alarm was generated.
- **Resolution Time**: the script populates this value with the g3alarmsAlarmNumber varbind, and it states the time that the condition causing the alarm was fixed.
- **New/Modified Alarm**: this value can be *New* for a new alarm condition, or *Modified* for an existing alarm condition that was updated.
- **Derived G3 Alarm Port**: the script populates this value with the g3alarmsPort varbind, which defines the location port in that particular system, such as `cabinet(01-44):carrier(A-E):slot(01-20):port(01-32).`

The following formatting changes occur in the **Derived G3 Alarm Port** column:

- *cmgTrapSubsystem* will be replaced with *SS*.
- *cmgTrapOnBoard* will be replaced with *OB*.
- *cmgTrapLocation* will be replaced with *LOC*.
- *cmgActiveControllerAddress* will be replaced with *ACA*.
- *cmgTrapTypes* will be replaced with *cmgTT*.

If a varbind is empty and cannot be used to display a value in the new **Trap details** table, a value of *N/A* appears in the corresponding cell of the table.

70.3.5 Formatting Event Message Text for Avaya CM Traps

The SNMPTraps_TrapMonitor script includes vendor-specific formatting for Avaya Communication Manager (Avaya CM) traps to make the AppManager event messages for those traps easier to read.

If you run an SNMPTraps_TrapMonitor job, and an Avaya CM trap successfully passes all relevant filters to create an AppManager event for that trap, the SNMPTraps_TrapMonitor script provides vendor-specific formatting for two of the three traps defined in the INADS-MIB definition:

- INADS-MIB::inadssnmpAlarm
- INADS-MIB::inadssnmpAlarmSet

Both of those traps expose the inadssnmpAlarmMessage varbind. The following is an example of the inadssnmpAlarmMessage varbind:

```
inadssmnpAlarmMessage:  1001119999 10/12:24,ACT|<27>May 10 12:23:28 CDOM
snmpd[1425]:  +01:00 2013 426 1 com.avaya.vsp | 0 cannot open /pro/net/snmp6
```

The detail portion of the event message for these two Avaya CM traps includes the following information in the **Trap details** table:

- **DerivedInadsProdID**: the script populates this value with the first 10 characters of the inadssnmpAlarmMessage varbind. In the example above, this value is represented by `1001119999`.
- **DerivedInadsAlarmTime**: the script populates this value with the date and time from the inadssnmpAlarmMessage varbind. In the example above, the script uses the `10/12:24` data and adds the current month in front of it, resulting in the following value: `June 10 12:24`.
- **DerivedInadsAlarmType**: the script populates this value with the three characters following the product ID and the timestamp in the inadssnmpAlarmMessage varbind. In the example above, this value is represented by `ACT`.
- **DerivedInadsAlarmMessage**: the script populates this value with the remaining content in the inadssnmpAlarmMessage varbind. In the example above, this value is represented by `<27>May 10 12:23:28 CDOM snmpd[1425]:  +01:00 2013 426 1 com.avaya.vsp | 0 cannot open /pro/net/snmp6`.

71 SolarisZones Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring Oracle Solaris Zones resources.

From the Knowledge Script view of Control Center, you can access more information about any Knowledge Script by selecting it and clicking **Help**. In the Operator Console, select any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
DaemonState	Monitors the state of the specified daemons and raises an event if any specified daemon is running or not running.
Inventory	Monitors inventory changes in the Solaris Zones module objects. Solaris Zones module objects include: SolarisZonesHost, Zones, Zone processing Unit, Zone Memory, Zone VNIC, and ZFS pools.
VnicIO	Monitors network statistics of VNICs configured with Zones and raises an event if the network statistics exceeds threshold.
ZFSHealth	Monitors ZFS pool health and raises an event if a pool is not online.
ZoneCpuByProcess	Monitors CPU utilization of specified processes and raises an event if CPU utilization exceeds threshold.
ZoneCPUUtil	Monitors CPU utilization of Zones and raises an event if CPU utilization exceeds threshold.
ZoneMemByProcess	Monitors memory utilization of specified processes and raises an event if memory utilization exceeds threshold (in percent and in MB).
ZoneMemoryUtil	Monitors memory utilization of Zones and raises an event if memory utilization exceeds threshold (in percent and in MB).

71.1 DaemonState

Use this Knowledge Script to monitor the state of the specified daemons and raises an event if any specified daemon is running or not running.

71.1.1 Resource Object

SolarisZones_HostFolder

71.1.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

71.1.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if daemons specified in the list are down?	Select **Yes** to raise an event if any of the daemons you specified for monitoring is down. The default is unselected.
Comma-separated list of daemons	Enter one or more daemon names, separated by commas and no spaces. The default is `pools`.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which any of the daemons you specified for monitoring is down. The default is 5.
Raise event if daemons specified in the list are not down?	Select **Yes** to raise an event if any of the daemons that you specified for monitoring is up and running. The default is unselected.
Comma-separated list of daemons	Enter one or more daemon names, separated by commas and no spaces. The default is `pools`.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which any of the daemons you specified for monitoring is down. The default is 5.
Raise event if POOLS daemon is down?	Select **Yes** to raise an event if the POOLS daemon is down. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the POOLS daemon is down. The default is 5.
Raise event if RCAP daemon is down?	Select **Yes** to raise an event if the RCAP daemon is down. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the RCAP daemon is down. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the DaemonState job fails to get the metrics of the specified daemons. The default is Yes.

Parameter	How to Set It
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the DaemonState job fails to get the metrics of the specified daemons. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the DaemonState job fails. The default is 5.

71.2 Inventory

Use this Knowledge Script to monitor changes in the Solaris Zones module objects. SolarisZones module objects include: Host running Solaris Zones, Zones, Zone Processing Unit, Zone Memory, Zone VNIC, and ZFS pools. You can configure this Knowledge Script to raise events when SolarisZones objects are added, removed, or if any object attribute changes.

This Knowledge Script detects inventory changes by comparing snapshots of monitored objects from successive iterations. The first time you run this script, it creates an inventory snapshot. A snapshot reflects the current state of the monitored objects on the SolarisZones host. In the second and subsequent iterations, this Knowledge Script creates a new inventory snapshot, compares it to the previous snapshot, and generates events based on selected options and differences between the snapshots.

Running this Knowledge Script once provides no information, you must run it at least twice for it to detect any inventory changes. NetIQ Corporation recommends you to run this Knowledge Script immediately after discovery, then continue to run it regularly, either periodically or asynchronously, to monitor inventory changes.

71.2.1 Considerations while Running this Script

The following points should be taken in to consideration while running this script:

- You cannot monitor the addition or removal of a Solaris Zones Host, because the AppManager agent runs in the host and if the host goes down, the agent will not be able to communicate with the AppManager server.
- You can only monitor a limited set of attributes for a Solaris Zones Host. If you want to monitor the entire Solaris Zones Host, then run the standard set of AppManager Unix module Knowledge Scripts in the global zone of the Solaris host.
- You can not add or remove the Zone Processing Unit and Zone Memory explicitly. Therefore, you can not monitor the addition or removal of these two objects. When you add or remove a Zone, the event that is triggered as a result of this action includes these objects.
- You can monitor only those Zones that are in *running* state. This script assumes that a Zone is removed if the Zone state is changed to any other state than *running* state.
- You can monitor the addition or removal of a Zone by selecting the *Raise event if Zone state is changed?* parameter. The detailed event message includes the old and new states, other attributes and child object information.

  For example, consider that a zone `zone01` is not present at iteration i. At iteration *i+1*, `zone01` is configured and running. For the *i+1* iteration, the event detailed message displays the current state as *running* and previous state as *not configured*. The *not configured* state is added for this module to indicate that the zone configuration was not present in the system. Such a state is not available in the Oracle Solaris Zones literature.

71.2.2 Object and Attribute Event Options

The Knowledge Script action depends on the combination of event options you select and the inventory object or attribute change that occurs.

The short and detailed event messages both include the following:

- The hierarchy where the change occurred
- The Knowledge Script iteration count where the change was detected

Each snapshot is given an iteration count, beginning with 1. The iteration count is indicated by a # character. For example, if the Knowledge Script detects a Zone attribute change when comparing snapshot six to snapshot five, it adds `[# 6]` to the event short and detailed messages.

For objects added or removed, the short message contains the object name, its position in the object hierarchy, and the iteration number where the change was detected. For object attribute changes, the short message contains the object name and the attribute that has changed.

The detailed message contains the information from the short message, but in natural language and in more detail. For example, if a few attributes have changed for an object, then the short message contains only the attribute names, but the detailed message contains both the old and new attribute values. In case of addition/removal, the short message contains the object name and location which was removed. The detailed message contains the last captured attributes before removal and the first captured attributes after addition, if available.

The changes monitored for each of the objects are listed below:

SolarisZones module object names	Explicit add/remove monitor	Explicit attribute change monitor
SolarisZonesHost	No	Yes
Zones	Yes	Yes
Zone Processing Unit	No	Yes
Zone Memory	No	Yes
Zone VNIC	Yes	Yes
ZFS Pools	Yes	Yes

71.2.2.1 Script Actions when Objects are Added or Removed

The following table summarizes possible script actions when an inventory object is added or removed. **Object** represents the option to raise an event when an inventory object is added or removed. **Attribute** represents the option to raise an event when an inventory object attribute is changed.

	Attribute=No	**Attribute=Yes**
Object=No	No event	Create an attribute change event: • If an object is removed, report that monitored attributes have changed from a finite value to empty • If an object is added, report that monitored attributes have changed from empty to a finite value.
Object=Yes	Create an object added or removed event. Attribute values for the added or removed object are not listed in the event detailed message. For Zones, the child instances are also added or removed and reported in the event detailed message	Create an object added or removed event and list the latest recorded attribute values in the event detailed message. For Zones, the child instances are also added or removed and reported in the event detailed message.

You initially select to monitor a specific attribute change or object addition/removal, and let the script run till iteration *i*. For iteration *i+1*, you change monitoring options by selecting or deselecting some specific option. The script will not create events for the newly changed monitoring objects when it compares snapshot *i+1* to snapshot *i*. The first change comparison related to a specific option will start at iteration *i+1* and *i+2*. If there are any changes, it will be detected and reported in iteration *i+2*.

For example, you first select not to monitor VNIC addition/removal or attribute change till iteration *i*. At iteration *i+1*, you change the options to monitor VNIC addition/removal and attribute change. The script captures the first monitored VNIC change between iterations *i+1* and *i+2*.

When a Zone object is added or removed, the Knowledge Script also adds or removes its child objects, Zone Processing Unit, Zone Memory, and VNIC. In this case, the child objects do not generate individual events. Instead, the top-level event detailed message includes that these child objects have been added or removed.

The event detailed message also lists the latest recorded attributes of the Zone and all the monitored child objects and their attributes. If a child object has its own **Object=No** option selected, it is not included in the top-level event description. Instead, the top-level event includes a message indicating the child object type is not being monitored.

NOTE: If you select not to monitor any of the zone objects (Zone state change, Zone attribute, Zone Process Unit attribute, and Zone memory attribute) and select to monitor only the associated VNIC, and the zone is added or removed, AppManager raises an event only for the VNIC.

If you select to monitor any one of the Zone objects, then AppManager raises an event for the Zone including the VNIC attribute changes.

71.2.2.2 Script Actions when Object Attributes are Changed

The following table summarizes possible script actions when an inventory object attribute is changed. **Object** represents the option to raise an event when an inventory object is added or removed. **Attribute** represents the option to raise an event when an inventory object attribute is changed.

	Attribute=No	**Attribute=Yes**
Object=No	No event	Create an attribute change event with the changes in the detailed message
Object=Yes	No event	Create an attribute change event with the changes in the detailed message

You initially select to monitor a specific attribute change or object addition/removal, and let the script run till iteration *i*. For iteration *i+1*, you change monitoring options by selecting or deselecting some specific option. The script will not create events for the newly selected monitoring objects when it compares snapshot *i+1* to snapshot *i*. The first change comparison related to a specific option will start at iteration *i+1* and *i+2*. If there are any changes, it will be detected and reported in iteration *i+2*.

71.2.2.3 Aggregate Events

This Knowledge Script can create events either separately or in aggregate. Each inventory object includes a parameter to raise separate events and there are three kinds of aggregation:

- Aggregate by host: This option aggregates all the changes that were captured between two iterations as one single event. The detailed message contains all the changes that occurred. If you select this

option, there will be only one event that captures the inventory changes other than the default notifications event and error reporting events.

If you aggregate events based on host, the script generates a single event for the changes to Zone, Host, and VNIC. Selecting this option overrides all the other aggregate options and the severity is based on the host attribute change severity.

- Aggregate by Zone: This option aggregates multiple changes in one Zone as a single event. If you select this option, the maximum events generated between two iterations are equivalent to the number of *running* zones. If you do not select this option, then there will be one event for each object type change in a zone.

  For example, if there are changes in the attribute and processing unit attribute of `zone01` and also changes in the attribute and memory attribute of `zone02`, the script generates two events, one for `zone01` and the other one for `zone02`. The `zone01` event contains the attribute change and processing attribute change. Similarly, the `zone02` event contains both the attribute change and memory attribute change. If you do not select this option, then there will be four events, two per zone, indicating each of the changes.

  The aggregation of events under this option includes changes to a Zone, Zone Processing Unit, Zone Memory, and VNIC. The severity for this event is based on the Zone severity value.

- Aggregate by ZFS: This option is similar to zone aggregation except that the script generates aggregate events for ZFS Pools. If you select this option, this script generate a single event for changes in different ZFS Pools.

You can use this feature to selectively reduce the number of events the Knowledge Script creates and aggregate events by inventory object type.

71.2.3 Snapshot Persistence

This Knowledge Script stores its last snapshot persistently in the UNIX agent. If you restart the agent, the Knowledge Script will continue to work with the snapshot last saved by the agent and the snapshot it creates when it resumes.

You can use snapshot persistence to review cumulative inventory changes that occur when the Knowledge Script is not running. Start the Knowledge Script with a set of options, take a snapshot, and stop the job. When you restart the Knowledge Script at some later time, it compares its first snapshot with the snapshot persistent in the UNIX agent and reports the inventory differences between the time the job stopped and the time it started again.

71.2.4 Snapshot Error Recovery

If there is an error fetching the snapshot or any part of the snapshot, the Knowledge Script does not compare or raise events for objects affected by the error. Instead, it creates an event for the error it encountered and discards the portion of the snapshot with the error, replacing it with the last known valid information. When the Knowledge Script can successfully fetch the part of the snapshot that previously had an error, it compares the part of the current snapshot to the corresponding part from the last valid snapshot.

For example, if the Knowledge Script successfully collects VNIC information through iteration i and fails to collect VNIC information in iteration $i + 1$ because of an error, it replaces the VNIC information in snapshot $i + 1$ with the last valid information from snapshot i. Note that the entire snapshot is not replaced, only the part with the error is replaced. If the VNIC information becomes available at some later iteration $i + k$, the VNIC comparison will resume by comparing snapshot $i + k$ to snapshot $i + k - 1$, which contains the last valid VNIC information from snapshot i.

71.2.5 Resource Objects

SolarisZones_HostFolder

71.2.6 Default Schedule

By default, this script runs daily.

71.2.7 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event when the Inventory job fails to get metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Inventory job fails to get metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Inventory job fails. The default is 5.
Host Monitoring Settings	
Raise event if host system attribute is changed?	Select **Yes** to raise an event when a host system attribute is changed on the SolarisZones server. The default is unselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the host system attribute is changed on the SolarisZones server. The default is 5.
Zone Monitoring Settings	
Raise event if Zone state is changed?	Select **Yes** to raise an event if a Zone state is changed on the SolarisZones server. The default is Yes.
Raise event if Zone attribute is changed?	Select **Yes** to raise an event if a Zone attribute is changed on the SolarisZones server. The default is Yes.
Raise event if Zone CPU attribute is changed?	Select **Yes** to raise an event if a Zone CPU attribute is changed for the SolarisZones server. The default is Yes.
Raise event if Zone memory attribute is changed?	Select **Yes** to raise an event when a Zone memory attribute is changed for the SolarisZones server. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which one of the following changes occur on a Zone on the SolarisZone server: • A Zone state is changed • A Zone attribute is changed • A Zone CPU attribute is changed • A Zone memory is changed The default is 5.
Raise event if VNIC is added or removed?	Select **Yes** to raise an event when a VNIC is added to or removed from the SolarisZones server. The default is Yes.

Parameter	How to Set It
Raise event if Zone VNIC attribute is changed?	Select **Yes** to raise an event when a Zone VNIC attribute is changed for the SolarisZones. The default is Yes.
Event severity	Set the event severity, from 1 to 40, to indicate the importance of an event in which one of the following changes occur on the SolarisZones server: • A VNIC is added to or removed • A Zone VNIC attribute is changed The default is 5.
Aggregate events under host?	Select **Yes** to raise a single aggregate event for all the changes on a SolarisZones host. The default is unselected.
Aggregate events per Zone?	Select **Yes** to raise a single aggregate event for all the changes on a Zone. The default is unselected.
Raise event if ZFS pool is added or removed?	Select **Yes** to raise an event if a ZFS pool is added to or removed from the SolarisZones server. The default is Yes.
Raise event if ZFS pool attribute is changed?	Select **Yes** to raise an event if ZFS pool attribute is changed on the SolarisZones server. The default is Yes.
Aggregate ZFS events?	Select **Yes** to raise a single aggregate event for all the changes on a ZFS pools. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which one of the following ZFS pool changes occur on the Solaris Zones server: • A ZFS pool is added to or removed • A ZFS pool attribute is changed The default is 5.

71.3 VnicIO

Use this Knowledge Script to monitor the network statistics of VNICs configured with Zones. This Knowledge Script raises an event if the network statistics exceeds the threshold, if set. If you have not set the max bandwidth, AppManager raises an event specifying that the max bandwidth for the specific VNIC is not set.

NOTE: VNIC feature is available only on Solaris 11.0 and later. Therefore, this Knowledge Script is supported only on Solaris 11 and later. You cannot run this Knowledge Script on Solaris 10.0.

The runtime data for default VNIC is not present in Solaris 11.0. Therefore, this Knowledge Script does not generate event for the default VNIC.

71.3.1 Resource Object

SolarisZones_VNICObj

71.3.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

71.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if sent bytes exceeds threshold?	Select **Yes** to raise an event if the sent bytes of a VNIC exceeds the threshold you set. The default is Yes.
Threshold value (bytes/sec)	Specify the maximum bytes that a VNIC can send in a second before an event is raised. The default is 8000000 bytes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the VNIC send bytes per second exceeds the threshold you set. The default is 5.
Raise event if received bytes exceeds threshold?	Select **Yes** to raise an event if the received bytes of a VNIC exceeds the threshold you set. The default is Yes.
Threshold value (bytes/sec)	Specify the maximum bytes that a VNIC can receive in a second before an event is raised. The default is 8000000 bytes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the VNIC received bytes per second exceeds the threshold you set. The default is 5.
Raise event if network bandwidth utilization exceeds its max value (if set)?	Select **Yes** to raise an event if the network bandwidth of a VNIC exceeds the maximum value you set. The default is unselected. If you select this parameter and max bandwidth value is not set, AppManager raises an event specifying that the max bandwidth for that specific VNIC has not been set.

Parameter	How to Set It
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the network bandwidth utilization of a VNIC exceeds the maximum value you set. The default is 5.
Raise event if interrupt rate exceeds threshold?	Select **Yes** to raise an event if the interrupts per second of a VNIC exceeds the threshold you set. The default is unselected.
Threshold value (interrupts/sec)	Specify the maximum interrupt rates of a VNIC in a second before an event is raised. The default is 1000000.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the VNIC interrupt rates per second exceed the threshold you set. The default is 5.
Raise event if input packet drops exceed threshold?	Select **Yes** to raise an event if the input packet drops of a VNIC exceed the threshold you set. The default is unselected.
Threshold value (in percent)	Specify the maximum input packet drops (in percent) compared to input packets of a VNIC in a second before an event is raised. The default is 50 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the input packet drops of a VNIC exceed the threshold you set. The default is 5.
Raise event if output packet drops exceed threshold?	Select **Yes** to raise an event if the output packet drops of a VNIC exceed the threshold you set. The default is unselected.
Threshold value (in percent)	Specify the maximum output packet drops (in percent) compared to output packets of a VNIC in a second before an event is raised. The default is 50 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the output packet drops of a VNIC exceed the threshold you set. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the VnicIO job fails to get VNIC metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the VnicIO job fails to get VNIC metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the VnicIO job fails. The default is 5.
Data Collection	
Collect data for bytes sent per second?	Select **Yes** to collect data for the sent bytes per second of VNICs. The default is unselected.
Collect data for bytes received per second?	Select **Yes** to collect data for the received bytes per second of VNICs. The default is unselected.

71.4 ZFSHealth

Use this Knowledge Script to monitor ZFS pool health. If a pool is not online, AppManager raises an event.

71.4.1 Resource Object

SolarisZones_ZFSPoolObj

71.4.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

71.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if ZFS pool is not online?	Select **Yes** to raise an event if a ZFS pool is not online. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZFS pool is not online. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the ZFSHealth job fails to get the ZFS pool metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZFSHealth job fails to get the ZFS pool metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZFSHealth job fails. The default is 5.

71.5 ZoneCpuByProcess

Use this Knowledge Script to monitor the CPU utilization for specified processes in a Zone. If a process is not found, the Knowledge Script assumes that the process is not currently running. If the CPU utilization for any monitored process exceeds the threshold you set, AppManager raises an event.

NOTE: This Knowledge Script does not detect invalid process names or process IDs. If you enter an invalid process name or process ID, the Knowledge Script assumes that the process is not running.

71.5.1 Resource Object

SolarisZones_ZoneObjFolder

71.5.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

71.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Monitoring Options	
Comma-separated list of process names or regular expressions	Enter one or more process names or regular expressions, separated by commas and no spaces. The default is `init`. **NOTE:** You can either specify this parameter or *Comma-separated list of process IDs* parameter to monitor the processes in a Zone.
Comma-separated list of process IDs	Enter one or more process IDs, separated by commas and no spaces. The default is `1`.
Event Settings	
Raise event if CPU utilization compared to pset exceeds threshold?	Select **Yes** to raise an event if the CPU utilization by the specified Zone processes compared to the pset exceeds the threshold you set. The default is Yes.
Threshold value (in percent)	Specify the maximum percent of CPU compared to pset that can be utilized by the specified Zone processes during any interval before an event is raised. The default is 99 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU utilization by the specified Zone processes compared to pset exceeds the threshold you set. The default is 5.
Raise event if any process is not running?	Select **Yes** to raise an event if any of the specified processes in a Zone is not running. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which any process in a Zone is not running. The default is 5.

Parameter	How to Set It
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the ZoneCpuByProcess job fails to get CPU utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneCpuByProcess job fails to get CPU utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneCpuByProcess job fails. The default is 5.
Data Collection	
Collect data for CPU utilization compared to pset?	Select **Yes** to collect data for the CPU utilization of the specified Zone processes compared to pset as a percent value. The default is unselected.

71.6 ZoneCPUUtil

Use this Knowledge Script to monitor the CPU utilization of the zones. This script raises an event if CPU utilization exceeds the threshold you set and also raises an event if CPU utilization exceeds the configured CPU cap that you set for the zone. This script monitors and collects data for the amount of actively used CPU utilization of the zones in percentage.

71.6.1 Resource Object

SolarisZones_ZoneObjFolder

71.6.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

71.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if CPU utilization compared to pset exceeds threshold?	Select **Yes** to raise an event if CPU utilization of the Zones compared to the pset exceeds the threshold you set. The default is Yes.
Threshold value (in percent)	Specify the maximum percent of CPU that can be utilized by the Zones during any interval before an event is raised. The default is 99 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU utilization by the Zones compared to the pset exceeds the threshold you set. The default is 5.
Raise event if CPU utilization compared to host exceeds threshold?	Select **Yes** to raise an event if CPU utilization of the Zones compared to the host exceeds the threshold you set. The default is unselected.
Threshold value (in percent)	Specify the maximum percent of CPU that can be utilized by the Zones during any interval before an event is raised. The default is 99 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU utilization of the Zones compared to the host exceeds the threshold you set. The default is 5.
Raise event if CPU utilization exceeds Zone CPU cap value?	Select **Yes** to raise an event if CPU utilization of a Zone exceeds the CPU cap value set for the Zone. The default is unselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU utilization of a Zone exceeds the CPU cap value set for the Zone. The default is 5.
Raise event if CPU utilization of any process compared to pset exceeds threshold?	Select **Yes** to raise an event if CPU utilization of any process in a Zone compared to pset exceeds the threshold you set. The default is unselected.

Parameter	How to Set It
Threshold value (in percent)	Specify the maximum percent of memory compared to pset that can be utilized by any process in a Zone during any interval before an event is raised. The default is 99 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU utilization of a Zone process compared to the pset exceeds the threshold you set. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the ZoneCPUUtil job fails to get memory utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneCPUUtil job fails to get memory utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneCPUUtil job fails. The default is 5.
Data Collection	
Collect data for CPU utilization compared to pset?	Select **Yes** to collect data for the total CPU utilization compared to the pset. The default is unselected.
Collect data for CPU utilization compared to host?	Select **Yes** to collect data for the total CPU utilization compared to host. The default is unselected.

71.7 ZoneMemByProcess

Use this Knowledge Script to monitor memory usage for specified processes in a Zone. If a process is not found, the Knowledge Script assumes that the process is not currently running. If the memory usage for any monitored process exceeds the threshold you set, AppManager raises an event.

NOTE: This Knowledge Script does not detect invalid process names or process IDs. If you enter an invalid process name or process ID, the Knowledge Script assumes that the process is not running.

71.7.1 Resource Object

SolarisZones_ZoneObjFolder

71.7.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

71.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Monitoring Options	
Comma-separated list of process names or regular expressions	Enter one or more process names or regular expressions, separated by commas and no spaces. The default is `init`. **NOTE:** You can either specify this parameter or *Comma-separated list of process IDs* parameter to monitor the processes in a Zone.
Comma-separated list of process IDs	Enter one or more process IDs, separated by commas and no spaces. The default is `1`.
Event Settings	
Raise event if memory utilization compared to system memory exceeds threshold?	Select **Yes** to raise an event if memory utilization by the specified Zone processes compared to the system memory exceeds the threshold you set. The default is Yes.
Threshold value (in percent)	Specify the maximum percent of memory that can be utilized by the specified Zone processes during any interval before an event is raised. The default is 30 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the memory utilization by the specified Zone processes compared to the system resource exceeds the threshold you set. The default is 5.
Raise event if memory utilization exceeds threshold?	Select **Yes** to raise an event if memory utilization by the specified Zone processes exceeds the threshold you set. The default is unselected.
Threshold value (in MB)	Specify the maximum memory that can be utilized by the specified processes in a Zone during any interval before an event is raised. The default is 50 MB.

Parameter	How to Set It
Event severity	Set the event severity, from 1 to 40, to indicate the importance of an event in which the memory utilization by the Zone processes exceeds the threshold you set. The default is 5.
Raise event if any process is not running?	Select **Yes** to raise an event if any of the specified processes in a Zone is not running. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which any process in a Zone is not running. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the ZoneMemByProcess job fails to get memory utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneMemByProcess job fails to get memory utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneMemByProcess job fails. The default is 5.
Data Collection	
Collect data for memory utilization compared to system memory in percent?	Select **Yes** to collect data for the memory utilization of the specified Zone processes compared to system memory as a percent value. The default is unselected.

71.8 ZoneMemoryUtil

Use this Knowledge Script to monitor the memory utilization of the Zones. This script raises an event if memory utilization exceeds the threshold you set and also raises an event when the Zone memory usage exceeds the configured memory cap set for the Zone. This script monitors and collects data for the amount of actively used Zone memory in MB and also in percentage of total system memory.

71.8.1 Resource Object

SolarisZones_ZoneObjFolder

71.8.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

71.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Settings	
Raise event if memory utilization compared to system memory exceeds threshold?	Select **Yes** to raise an event if memory utilization of the Zones compared to the system memory exceeds the threshold you set. The default is Yes.
Threshold value (in percent)	Specify the maximum percent of memory that can be utilized by the Zones during any interval before an event is raised. The default is 80 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the memory utilization by the Zones compared to the system memory exceeds the threshold you set. The default is 5.
Raise event if memory utilization exceeds Zone memory cap value?	Select **Yes** to raise an event if memory utilization of a Zone exceeds the memory cap value set for the Zone. The default is unselected.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the memory utilization of a Zone exceeds the memory cap value set for the Zone. The default is 10.
Raise event if memory utilization exceeds threshold?	Select **Yes** to raise an event if memory utilization of the Zones exceeds the threshold you set. The default is unselected.
Threshold value (in MB)	Specify the maximum memory that can be utilized by the Zones during any interval before an event is raised. The default is 100 MB.
Event severity	Set the event severity, from 1 to 40, to indicate the importance of an event in which the memory utilization by the Zones exceeds the threshold you set. The default is 5.
Raise event if memory utilization of any process compared to system memory exceeds threshold?	Select **Yes** to raise an event if memory utilization of any process in a Zone compared to the system memory exceeds the threshold you set. The default is unselected.

Parameter	How to Set It
Threshold value (in percent)	Specify the maximum percent of memory compared to system memory that can be utilized by any process in a Zone during any interval before an event is raised. The default is 30 percent.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the memory utilization of a Zone process compared to the system memory exceeds the threshold you set. The default is 5.
Raise event if AppManager fails to get metrics?	Select **Yes** to raise an event if the ZoneMemoryUtil job fails to get memory utilization metrics. The default is Yes.
Event severity	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneMemoryUtil job fails to get memory utilization metrics. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ZoneMemoryUtil job fails. The default is 5.
Data Collection	
Collect data for memory utilization compared to system memory in percent?	Select **Yes** to collect data for the total memory utilization compared to the system memory as a percent value. The default is unselected.
Collect data for memory utilization in MB?	Select **Yes** to collect data for the total memory utilization as a megabyte (MB) value. The default is unselected.

72 SQL Server Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring SQL Server version 2005 and later. The SQLServer category of Knowledge Scripts is supported for SQL Server resources installed in clustered and non-clustered environments.

When deciding which Knowledge Scripts to run and the appropriate threshold values to use, consider how other applications you manage are dependent on SQL Server.

To run these Knowledge Scripts, you must require a minimum of `Public` and `read-only` SQL Server permissions. There are few Knowledge Scripts that require specific SQL Server permission. The following graphic displays the permissions required to run the Knowledge Scripts.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
Accessibility	Monitors SQL Server database accessibility and raises an event if specified database is not accessible.
BlockedProcesses	Monitors the number of SQL Server processes that have been queued for longer than the period of time you specify.
CacheHitRatio	Monitors the percentage at which the requested data page is retrieved from the SQL Server cache without performing physical reads from disk.
Connectivity	Monitors SQL Server connectivity raises an event if the server is not available during the monitoring interval.
DataSpace	Monitors the available data space and the percentage of data space used by each database.
DBLocks	Monitors the number of locks per SQL Server database and raises an event if the number of locks exceeds the threshold you specify.
ErrorLog	Monitors the SQL Server error logs and looks for any error log entries that have appeared since the last monitoring interval. This script also scans the error log entries for any new entries created since the last time it checked.
LogSpace	Monitors the available log space and used log space of a database and raises an event if the available log space falls below the threshold, or if the percentage of log space used exceeds the threshold you specify.
MonitorJobs	Reports on any scheduled jobs that have not completed successfully and raises an event only when new job failures occur since the last monitoring interval.
ServerDown	Monitors the up or down status of SQL Server and also identifies the downtime of the SQL Server since the server was started.

Knowledge Script	What It Does
UserConnections	Monitors the total number of user connections currently connected to SQL Server and raises an event if the total number of user connections exceeds the threshold you specify.

72.1 Accessibility

Use this Knowledge Script to monitor SQL Server database accessibility. This script raises an event if a specified database is not accessible. In addition, this script generates data streams for database accessibility.

You can set a timeout to determine how many times the Knowledge Script attempts to connect to a database.

NOTE: To run this Knowledge Script, you need `public` and `read-only` permission on all the databases that are to be monitored.

Resource Object

SQL Server instance

Default Schedule

The default interval for this script is **Once every hour**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Raise event if job fails unexpectedly?	Select **Yes** to raise an event if the SQLServer_Accessibility job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Raise event if SQL Server login fails?	Select **Yes** to raise an event if login to SQL sever fails. The default is Yes.
Event severity when SQL Server login fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the login to SQL server fails. The default is 15.
Additional Settings	
Event Details	
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Authentication	Select the authentication method that you want to use to access SQL Server. You can either select *Windows Authentication* or *SQL Server Authentication*. The default is Windows Authentication.
User name	Specify the Windows or SQL Server user name that you want to use to access SQL Server. You can specify multiple users separated by a comma. The default is none. For more information on specifying user name, see .

Description	How to Set It
Monitor Server Accessibility	
Timeout	Specify the number of seconds to wait for a response before retrying or determining the database is inaccessible. The default is 30 seconds. When specifying a timeout, the Knowledge Script continues to wait until it receives a response or the timeout is reached. Limit your use of this parameter or keep the timeout period to a minimum for regular monitoring jobs. When running this script to troubleshoot a particular problem and not on a regularly scheduled interval, adjust this parameter to allow a longer timeout period.
Number of retries	Specify the number of times this script should retry connecting to the database before determining the database is inaccessible. The default is 0 (no retry attempts). This Knowledge Script continues waiting until it receives a response or has made the specified number of retry attempts. Limit your use of this parameter or keep retry attempts to a minimum for regular monitoring jobs. When you are running this script to troubleshoot a particular problem and not on a regularly scheduled interval, you might want to adjust this parameter to allow more retry attempts.
Specify list of objects to exclude (comma-separated)	Specify the name of the databases you want to exclude from monitoring, separated by commas. You can use standard pattern-matching characters when specifying database names: • ***** matches zero or more instances of a previous character • **?** matches exactly one instance of a previous character • \d matches any single digit from 0 - 9 • **[ ]** matches exactly one instance of any character between the brackets, including ranges
Specify file path containing list of objects to exclude	Specify the full file path of `.csv` or `.txt` format file that contains the name of the databases that you want to exclude from monitoring. **NOTE:** Enter each database on a separate line. You can use standard pattern-matching characters when specifying database names: • ***** matches zero or more instances of a previous character • **?** matches exactly one instance of a previous character • \d matches any single digit from 0 - 9 • **[ ]** matches exactly one instance of any character between the brackets, including ranges
Include detail report in data points	Select **Yes** to include a detail report in the data points collected for charts and reports. The default is No.
Event Notification	
Raise event if database accessibility is below threshold?	Select **Yes** to raise an event if database accessibility is below the threshold you specify. The default is Yes.
Event severity when database accessibility is below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the database is not accessible. The default is 5.

Description	How to Set It
Threshold - Minimum accessibility	Specify the minimum percentage of database accessibility that should be reached before generating an event. The default is 100 percent. If the percentage of accessibility request falls below the threshold, AppManager raises an event.
Data Collection	
Collect data for database accessibility?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the following: • **100**–all specified databases are accessible • **50**–some of the specified databases are accessible and some are not • **0**–none of the specified databases is accessible. The default is No.
Custom data stream legend	Specify a custom data stream legend to append with the default data legend for the job that is visible in the console. You can specify a maximum of 128 alphanumeric characters in a string, including special characters. The default is none.
Collect data for each database accessibility?	Select **Yes** to collect data for each database for charts and reports. If enabled, data collection returns the data for each database. The default is No.
Custom data stream legend	Specify a custom data stream legend to append with the default data legend for the job that is visible in the console. You can specify a maximum of 128 alphanumeric characters in a string, including special characters. The default is none.

72.2 BlockedProcesses

Use this Knowledge Script to monitor the number of SQL Server processes that are queued for longer than the period of time you specify. You can set a threshold to determine how long a process can be in queue before it is considered blocked. This script raises an event when the number of blocked processes exceeds a threshold you specify.

NOTE: To run this Knowledge Script, you need `public` and `view server state` SQL Server permissions. If you do not have these permissions, the Knowledge Script does not display any error, but the data returned is not complete. To get complete data, you must have these permissions.

Resource Object

SQL Server instance

Default Schedule

The default interval for this script is **Once every hour**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Raise event if job fails unexpectedly?	Select **Yes** to raise an event if the SQLServer_BlockedProcess job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Raise event if SQL Server login fails?	Select **Yes** to raise an event if login to SQL Sever fails. The default is Yes.
Event severity when SQL Server login fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the login to SQL server fails. The default is 15.
Additional Settings	
Event Details	
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Authentication	Select the authentication method that you want to use to access SQL Server. You can either select *Windows Authentication* or *SQL Server Authentication*. The default is Windows Authentication.
User name	Specify the Windows or SQL Server user name that you want to use to access SQL Server. You can specify multiple users separated by a comma. The default is none. For more information on specifying user name, see .

Description	How to Set It
Monitor Blocked Process	
Include detail report in data points?	Select **Yes** to include a detail report in the data points collected for charts and reports. The default is No.
Number of blocked processes to include in report	Specify the number of processes to display in the report pane of the console. The default is 20 blocked processes. Enter 0 to display all blocked processes.
Event Notification	
Raise event if number of blocked processes exceeds threshold?	Select **Yes** to raise an event if the number of blocked processes exceeds the threshold. The default is Yes.
Event severity when number of blocked processes exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of blocked processes exceeds the threshold. The default is 5.
Threshold – Maximum number of blocked processes	Specify the maximum number of processes that can be blocked before an event is raised. The default is 5 blocked processes.
Threshold – Maximum waiting time in queue	Specify the maximum length of time a process can be queued before it is considered a blocked process. The default is 500 milliseconds.
Data Collection	
Collect data for total number of blocked processes?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of blocked processes. The default is No.
Custom data stream legend	Specify a custom data stream legend to append with the default data legend for the job that is visible in the console. You can specify a maximum of 128 alphanumeric characters in a string, including special characters. The default is none.

72.3 CacheHitRatio

Use this Knowledge Script to monitor the percentage at which a requested data page is retrieved from the SQL Server data cache without performing physical reads from disk. This script raises an event if the cache hit ratio falls below the threshold you specify.

Resource Object

SQL Server instance

Default Schedule

The default interval for this script is **Once every hour**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Raise event if job fails unexpectedly?	Select **Yes** to raise an event if the SQLServer_CacheHitRatio job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Monitor Cache Hit Ratio	
Event Notification	
Raise event if cache hit ratio is below threshold?	Select **Yes** to raise an event when the cache hit ratio falls below the threshold. The default is Yes.
Event severity if cache hit ratio is below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the cache hit ratio falls below the threshold. The default is 5.
Threshold – Minimum cache hit ratio	Specify the minimum percentage that requested data pages can be retrieved in the data cache before an event is raised. Ideally this percentage should be set relatively high, because the more frequently SQL Server uses the data cache, the better your database performance. When SQL Server accesses information in the data cache less frequently than the threshold you specify, for example only 50% of the time, an event informs you that database performance has deteriorated. The default is 90%.
Data Collection	

Description	How to Set It
Collect data for cache hit ratio?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the cache hit percentage. The default is No.
Custom data stream legend	Specify a custom data stream legend to append with the default data legend for the job that is visible in the console. You can specify a maximum of 128 alphanumeric characters in a string, including special characters. The default is none.

72.4 Connectivity

Use this Knowledge Script to monitor SQL Server connectivity. You can set a timeout to determine the number of times the script should attempt to contact the server.

This script raises an event if, during any monitoring interval, the number of times the server is not available exceeds the number of retries you specify.

NOTE: To run this Knowledge Script, you need `public` and `read-only` SQL Server permission.

Resource Object

SQL Server instance

Default Schedule

The default interval for this script is **Every five minutes**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Raise event if job fails unexpectedly?	Select **Yes** to raise an event if the SQLServer_Connectivity job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Authentication	Select the authentication method that you want to use to access SQL Server. You can either select *Windows Authentication* or *SQL Server Authentication*. The default is Windows Authentication.
User name	Specify the Windows or SQL Server user name that you want to use to access SQL Server. You can specify multiple users separated by a comma. The default is none. For more information on specifying user name, see .
Monitor Server Connectivity	
Timeout	Specify the maximum number of seconds the Connectivity script should wait for a response from server before retrying. The default is 30 seconds.
Number of retries	Specify the number of times the Connectivity script must retry connecting to the SQL Server before determining that the server is inaccessible. The default is 0.

Description	How to Set It
Event Notification	
Raise event if connection with SQL server fails?	Select **Yes** to raise an event if the connection to a server or an instance fails. The default is Yes.
Event severity when connection with SQL server fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the connection with a server fails. The default is 5.
Data Collection	
Collect data for server connectivity?	Select **Yes** to collect server connectivity data for charts and reports. The default is No.
Custom data stream legend	Specify a custom data stream legend to append with the default data legend for the job that is visible in the console. You can specify a maximum of 128 alphanumeric characters in a string, including special characters. The default is none.

72.5 DataSpace

Use this Knowledge Script to monitor available data space and the percentage of data space used by each database. This script raises an event if the amount of available data space, in MB, is lower than the threshold you specify. This script also raises an event if the percentage of used data space is higher than the threshold you specify.

You can set this script to observe new databases dynamically each time it runs. Observing databases dynamically allows you to monitor data space for newly created SQL Server databases since you ran the Discovery_SQLServer Knowledge Script and prevents you from attempting to monitor databases that have been dropped since discovery.

NOTE:

- Although this script can observe databases each time it runs, the new databases are not reflected in the Operator Console or Control Center.
- To run this Knowledge Script, you need `public` and `read-only` permissions on all the databases that are to be monitored.

Resource Objects

System or User Databases

If you are not observing databases dynamically, you can run this script on a Database folder or individual database objects. Dynamic observation monitors all databases regardless of target resource object.

Default Schedule

The default interval for this script is **Once every hour**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Raise event if job fails unexpectedly?	Select **Yes** to raise an event if the SQLServer_DataSpace job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Raise event if SQL Server login fails?	Select **Yes** to raise an event if login to SQL Sever fails. The default is Yes.
Event severity when SQL Server login fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the login to SQL server fails. The default is 15.
Raise event if database is offline?	Select **Yes** to raise an event if a database is offline. The default is No.

Description	How to Set It
Event severity when database is offline	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when a database is offline. The default is 15.
Raise event if database is deleted?	Select **Yes** to raise an event if a database is deleted. The default is No.
Event severity when database is deleted	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when a database is deleted. The default is 15.
Additional Settings	
Event Details	
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Authentication	Select the authentication method that you want to use to access SQL Server. You can either select *Windows Authentication* or *SQL Server Authentication*. The default is Windows Authentication.
User name	Specify the Windows or SQL Server user name that you want to use to access SQL Server. You can specify multiple users separated by a comma. The default is none. For more information on specifying user name, see .
Monitor Data Space	
Dynamically observe databases at each interval?	Select **Yes** to dynamically observe databases at each monitoring interval. The default is No. **NOTE:** Dynamic observation monitors all databases regardless of target resource object.
Specify list of objects to exclude (comma-separated)	Specify the name of the databases you want to exclude from monitoring, separated by commas. You can use standard pattern-matching characters when specifying database names: • ***** matches zero or more instances of a previous character • **?** matches exactly one instance of a previous character • \d matches any single digit from 0 - 9 • **[ ]** matches exactly one instance of any character between the brackets, including ranges
Specify file path containing list of objects to exclude	Specify the full file path of `.csv` or `.txt` format file that contains the name of the databases that you want to exclude from monitoring. **NOTE:** Enter each database on a separate line. The databases specified in the file are excluded even if dynamic monitoring is not enabled. You can use standard pattern-matching characters when specifying data space names: • ***** matches zero or more instances of a previous character • **?** matches exactly one instance of a previous character • \d matches any single digit from 0 - 9 • **[ ]** matches exactly one instance of any character between the brackets, including ranges
Event Notification	

Description	How to Set It
Raise event if used data space exceeds threshold?	Select **Yes** to raise an event if the percentage of used data space exceeds the threshold you specify. The default is Yes.
Event severity when used data space exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of used data space exceeds the threshold. The default is 5.
Threshold - Maximum percentage of used data space	Specify the maximum percentage of data space that can be in use before an event is raised. The default is 90%.
Raise event if available data space falls below threshold?	Select **Yes** to raise an event if the available data space falls below the threshold you specify. The default is Yes.
Event severity when available data space falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of available data space falls below the threshold. The default is 5.
Threshold - Minimum available data space	Specify the minimum amount of data space that is required to be available before an event is raised. If the amount of available data space falls below this threshold, an event is raised. The default is 0 MB.
Data Collection	
Collect data for used data space?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of data space used for each database. The default is No.
Collect data for available data space?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the available data space (in MB) for each database. The default is No.

72.6 DBLocks

Use this Knowledge Script to monitor the number of locks per SQL Server database. This script raises an event if the number of locks exceeds the threshold. In addition, this script generates data streams for the number of locks, and you can include a report of locks in the events and data for this script. All the databases in the SQL Server are monitored if dynamic observation of databases is enabled, unless you exclude them.

You can set this script to observe new databases dynamically each time it runs. Observing databases dynamically allows you to monitor locks for newly created SQL Server databases since you ran the Discovery_SQLServer Knowledge Script and prevents you from attempting to monitor databases that have been dropped since discovery.

NOTE:

- Although this script can observe databases each time it runs, the new databases are not reflected in the Operator Console or Control Center.
- To run this Knowledge Script, you need `public` and `view server state` SQL Server permissions.

Resource Objects

System or User Databases

If you are not observing databases dynamically, you can run this script on a Database folder or individual database objects. Dynamic observation monitors all databases regardless of target resource object.

Default Schedule

The default interval for this script is **Every 30 minutes**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Raise event if job fails unexpectedly?	Select **Yes** to raise an event if the SQLServer_DBLocks job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Raise event if SQL Server login fails?	Select **Yes** to raise an event if login to SQL server fails. The default is Yes.
Event severity when SQL Server login fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the login to SQL server fails. The default is 15.

Description	How to Set It
Raise event if database is offline?	Select **Yes** to raise an event if a database is offline. The default is No.
Event severity when database is offline	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when a database is offline. The default is 15.
Raise event if database is deleted?	Select **Yes** to raise an event if a database is deleted. The default is No.
Event severity when database is deleted	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when a database is deleted. The default is 15.
Additional Settings	
Event Details	
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Authentication	Select the authentication method that you want to use to access SQL Server. You can either select *Windows Authentication* or *SQL Server Authentication*. The default is Windows Authentication.
User name	Specify the Windows or SQL Server user name that you want to use to access SQL Server. You can specify multiple users separated by a comma. The default is none. For more information on specifying user name, see .
Monitor Database Locks	
Dynamically observe databases at each interval?	Select **Yes** to dynamically observe databases at each monitoring interval. The default is No. **NOTE:** Dynamic observation monitors all databases regardless of target resource object.
Specify list of objects to exclude (comma-separated)	Specify the name of the databases you want to exclude from monitoring, separated by commas. You can use standard pattern-matching characters when specifying database names: • ***** matches zero or more instances of a previous character • **?** matches exactly one instance of a previous character • \d matches any single digit from 0 - 9 • **[ ]** matches exactly one instance of any character between the brackets, including ranges
Specify file path containing list of objects to exclude	Specify the full file path of `.csv` or `.txt` format file that contains the name of the databases that you want to exclude from monitoring. **NOTE:** Enter each database on a separate line. The databases specified in the file are excluded even if dynamic monitoring is not enabled. You can use standard pattern-matching characters when specifying database names: • ***** matches zero or more instances of a previous character • **?** matches exactly one instance of a previous character • \d matches any single digit from 0 - 9 • **[ ]** matches exactly one instance of any character between the brackets, including ranges

Description	How to Set It
Include database locks report in events?	Select to **Yes** to include a report of the number of database locks in the events generated for this script. The default is Yes.
Include database locks report in data?	Select **Yes** to include a report of the number of database locks in the data for charts and reports. The default is Yes.
Maximum locks to report (0 for maximum)	Set the maximum number of locks you want the script to report on for events and data. The default is 0.
Event Notification	
Raise event if locks exceed threshold?	Select **Yes** to raise an event when the number of locks for a database exceeds the threshold. The default is Yes.
Event severity when locks exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of locks held exceeds the threshold. The default is 5.
Threshold – Maximum number of database locks	Specify the maximum number of locks that can be held on a database before an event is raised. The default is 10 locks.
Data Collection	
Collect data for number of database locks?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of locks held on a database, and identifies the application and user holding each lock. The default is No.

72.7 ErrorLog

Use this Knowledge Script to monitor the SQL Server error logs (`Errorlog`, `Errorlog.*` in the SQL Server log folder).

On the first job iteration, this script sets a starting point for next iteration log scanning and does not scan the existing entries in the logs. As a result, it does not return any results on the first iteration. As it continues to run at the interval specified in the Schedule tab, this script looks for any error log entries that have appeared since the last monitoring interval.

This script looks for the matching log text you specified in the *Log text to match* parameter. If you disable the *Literal match?* parameter, log text containing any of the words you specified is considered a match. This script raises an event if the number of entries that match the *Log text to match* criteria exceeds the threshold you specify.

Resource Objects

SQL Server instance

Default Schedule

The default interval for this script is **Once every hour**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Raise event if job fails unexpectedly?	Select **Yes** to raise an event if the SQLServer_LogSpace job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Monitor Error Log	
Log text to match	Specify all or part of the string you want to check for. Separate multiple search strings with commas. The default is `Wait-for graph`. **NOTE:** The text string `Wait-for graph` can be used to catch deadlocks that might occur on the SQL Server instance you are monitoring. However, if this string is used, the SQL Server instance must have additional tracing enabled. For more information, see Microsoft Knowledge Base article 832524.

Description	How to Set It
Literal match?	Select **Yes** if you want to search for the *entire* search string. For example, if you set this parameter to Yes and specify "`foo bar`" as the search string, only lines containing "`foo bar`" are considered a match. The default is Yes. Select **No** to match *any* of the words in the *Log text to match* parameter value. For example, if you set this parameter to **No** and specify "`foo bar`" as the search string, any lines that contain "`foo`," "`bar`," or "`foo bar`" are considered a match.
Case-sensitive?	Select **Yes** to match upper and lower case letters when checking for a match to the search string. The default is No.
Text to exclude	Specify a string or series of strings that you want to exclude from the search results. Use comma to separate multiple strings.
Event Notification	
Raise event if number of new log entries exceed threshold?	Select **Yes** to raise an event if new log entries are found. The default is Yes. **NOTE:** In general, the detail message for the Knowledge Script contains details about the occurrences found. If the message is larger than 32 KB, the data is saved in a file on the managed computer in the `\NetIQ\AppManager\bin` folder, and the detail message contains the truncated data. If you generate these log files, you should periodically remove the files when you are done with them.
Event severity when number of new log entries exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of new log entries exceed the threshold. The default is 5.
Threshold – Maximum number of new log entries	Specify the number of entries that can be logged before an event is raised. The default is 0.
Data Collection	
Collect data for number of new log entries?	Select **Yes** to collect data for the new log entries for charts and reports. If enabled, data collection returns the number of new event log entries.The default is No.

72.8 LogSpace

Use this Knowledge Script to monitor a database's available log space and used log space. This script raises an event if the available log space falls below the threshold you specify, or if the percentage of log space used exceeds the threshold you specify.

You can set this script to observe new databases dynamically each time it runs. Observing databases dynamically allows you to monitor log space for newly created SQL Server databases since you ran the Discovery_SQLServer Knowledge Script and prevents you from attempting to monitor databases that have been dropped since discovery.

NOTE:

- Although this script can observe new databases each time it runs, the new databases are not reflected in the Operator Console or Control Center.
- To run this Knowledge Script, you need `public` and `read-only` permission on all the databases that are to be monitored.

Resource Objects

System or User Databases

If you are not observing databases dynamically, you can run this script on a Database folder or individual database objects. Dynamic observation monitors all databases regardless of target resource object.

Default Schedule

The default interval for this script is **Once every hour**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Raise event if job fails unexpectedly?	Select **Yes** to raise an event if the SQLServer_LogSpace job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Raise event if SQL Server login fails?	Select **Yes** to raise an event if login to SQL Sever fails. The default is Yes.
Event severity when SQL Server login fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the login to SQL server fails. The default is 15.
Raise event if database is offline?	Select **Yes** to raise an event if a database is offline. The default is No.

Description	How to Set It
Event severity when database is offline	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when a database is offline. The default is 15.
Raise event if database is deleted?	Select **Yes** to raise an event if a database is deleted. The default is No.
Event severity when database is deleted	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when a database is deleted. The default is 15.
Additional Settings	
Event Details	
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Authentication	Select the authentication method that you want to use to access SQL Server. You can either select *Windows Authentication* or *SQL Server Authentication*. The default is Windows Authentication.
User name	Specify the Windows or SQL Server user name that you want to use to access SQL Server. You can specify multiple users separated by a comma. The default is none. For more information on specifying user name, see .
Monitor Log Space	
Dynamically observe databases at each interval?	Select **Yes** to dynamically observe databases at each monitoring interval. The default is No. **NOTE:** Dynamic observation monitors all databases regardless of target resource object.
Specify list of objects to exclude (comma-separated)	Specify the name of the databases you want to exclude from monitoring, separated by commas. You can use standard pattern-matching characters when specifying database names: • ***** matches zero or more instances of a previous character • **?** matches exactly one instance of a previous character • \d matches any single digit from 0 - 9 • **[ ]** matches exactly one instance of any character between the brackets, including ranges
Specify file path containing list of objects to exclude	Specify the full file path of `.csv` or `.txt` format file that contains the name of the databases that you want to exclude from monitoring. **NOTE:** Enter each database on a separate line. The databases specified in the file are excluded even if dynamic monitoring is not enabled. You can use standard pattern-matching characters when specifying database names:matches zero • ***** or more instances of a previous character • **?** matches exactly one instance of a previous character • \d matches any single digit from 0 - 9 • **[ ]** matches exactly one instance of any character between the brackets, including ranges
Event Notification	

Description	How to Set It
Raise event if used log space exceeds threshold?	Select **Yes** to raise an event if the used log space value exceeds the threshold you specify. The default is Yes.
Event severity when used log space exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the used log space value exceeds the threshold. The default is 5.
Threshold – Maximum percentage of used log space	Specify the maximum percentage of log space that can be used before an event is raised. The default is 90%.
Raise event if available log space falls below threshold?	Select **Yes** to raise an event if the available log space value falls below the threshold you specify. The default is Yes.
Event severity when available log space falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the available log space value falls below the threshold. The default is 5.
Threshold – Minimum available log space	Specify the minimum disk space in MB that is required for the database's log space. If the amount of disk space falls below this threshold, an event is raised.The default is 0 MB.
Data Collection	
Collect data for used log space?	Select **Yes** to collect data about the used log space for charts and reports. If enabled, data collection, returns the percentage of log space used for each database. The default is No.
Collect data for available log space?	Select **Yes** to collect data about the available log space for charts and reports. If enabled, data collection, returns the available log space in MB. The default is No.

72.9 MonitorJobs

Use this Knowledge Script to monitor SQL Server scheduled jobs that have not successfully completed. You can specify the jobs to monitor. By default, this script raises events only when new job failures occur since the last monitoring interval. In addition, if the number of failed jobs exceeds the threshold you specify, an event is raised.

NOTE: To run this Knowledge Script, you need SQL Server *Select* permission on `sysjobs` and `sysjobservers` tables of msdb database.

Resource Objects

SQL Server instance

Default Schedule

The default interval for this script is **every 10 minutes**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Raise event if job fails unexpectedly?	Select **Yes** to raise an event if the SQLServer_MonitorJobs job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Raise event if SQL Server login fails?	Select **Yes** to raise an event if login to SQL Sever fails. The default is Yes.
Event severity when SQL Server login fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the login to SQL server fails. The default is 15.
Raise event if job is running on SQL Express Server?	Select **Yes** to raise an event if a job is running on SQL Express Server. The default is No. SQL Server jobs are not compatible with SQL Express Server. Therefore, if a database has an instance running SQL Express Server, AppManager raises an event that the job is running on SQL Express Server.
Event severity when job is running on SQL Express Server	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when a database is offline. The default is 15.
Additional Settings	
Event Details	

Description	How to Set It
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Authentication	Select the authentication method that you want to use to access SQL Server. You can either select *Windows Authentication* or *SQL Server Authentication*. The default is Windows Authentication.
User name	Specify the Windows or SQL Server user name that you want to use to access SQL Server. You can specify multiple users separated by a comma. The default is none. For more information on specifying user name, see .
Monitor SQL Jobs	
Specify list of jobs to monitor	Specify the names of jobs to include in monitoring. Separate multiple names with a comma. Only specified job names are included in data collection and have events raised if job failures are detected. By default, all jobs are monitored.
Number of SQL jobs to include in report	Specify the number of SQL jobs that a report can contain. The default is 20. Enter 0 to display all SQL jobs.
Include detail report in data points?	Select **Yes** to include a detail report in the data points collected for charts and reports. The default is No.
Event Notification	
Raise event if number of job failures exceeds threshold?	Select **Yes** to raise an event if the number of job failures exceeds the threshold. The default is Yes.
Event severity when number of job failures exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of failed jobs exceeds the threshold. The default is 5.
Threshold - Maximum number of failed jobs	Specify the maximum number of failed jobs that can be detected before an event is raised. The default is 0 job.
Raise event only when new job failure occurs?	Select **Yes** to raise an event for failed jobs only when failures have occurred since the last monitoring interval. When this option is selected, an event is not raised on previously failed jobs until a new failure is detected. The default is Yes. By default, events are raised if the time of the job error is later than the last monitoring interval.
Data Collection	
Collect data for total number of failed jobs?	Select **Yes** to collect data for the total number of failed jobs for charts and reports. If enabled, data collection returns the number of jobs that have failed, including the job name and the reason for the failure. The default is No.

72.10 ServerDown

Use this Knowledge Script to monitor the up or down status of SQL Server. If the SQL Server or agent services are down, this script raises an event and optionally, attempts to start the services.

This script can also identify the downtime of the SQL Server since the server was started. This information is returned in the event detail message.

Resource Object

SQL Server instance

Default Schedule

The default interval for this script is **Every five minutes**.

Setting Parameter Values

Set the following parameters as needed:

NOTE: The ServiceDown Knowledge Script does not raise any event or collect data for agent service for SQL Server Express Edition, because it does not monitor the agent service for SQL Server Express edition.

Description	How to Set It
General Settings	
Job Failure Notification	
Raise event if job fails unexpectedly?	Select **Yes** to raise an event if the SQLServer_ServerDown job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Monitor Server State	
Restart SQL Server automatically if down?	Select **Yes** to automatically restart SQL Server if it is detected down. The default is Yes.
Event Notification	
Raise event if service restart fails or succeeds?	Select **Yes** to raise an event if a restart service fails or succeeds. The default is Yes.
Event severity when service restart fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the service is down and AppManager for Microsoft SQL Server cannot restart it. The default is 5.

Description	How to Set It
Event severity when service restart succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the service is down and AppManager for Microsoft SQL Server successfully restarted it. The default is 25.
Raise event if service down time exceeds threshold?	Select Yes to raise an event if service down time exceeds the threshold you specify. The default is No.
Event severity when service down time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the service down time exceeds the threshold you set. The default is 5.
Threshold - Maximum service down time	Specify the maximum time in minutes that a service can be down before an event is raised. The default is 5 minutes.
Raise event if SQL Server's server or agent service is disabled?	Select **Yes** to raise an event if the SQL Server's server or agent service is disabled. The default is No.
Event severity when SQL Server's server or agent service is disabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SQL Server's server or agent service is disabled. The default is 15.
Raise event if SQL Server's server or agent service does not exist?	Select **Yes** to raise an event if the SQL Server's server or agent service does not exist. The default is No.
Event severity when SQL Server's server or agent service does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SQL Server's server or agent service does not exist. The default is 25.
Data Collection	
Collect data for server downtime?	Select **Yes** to collect data for the total number of hours the server was down for charts and reports. If enabled, data collection returns the number of hours the server has been down since it was started. The default is No.

72.11 UserConnections

Use this Knowledge Script to monitor the total number of SQL Server user connections. This script raises an event if the total number of SQL Server user connections exceeds the threshold you specify.

NOTE: To run this Knowledge Script, you need `public` and `view server state` SQL Server permissions. If you do not have these permissions, the Knowledge Script does not display any error, but the data returned is not complete. To get complete data, you must have these permissions.

Resource Object

SQL Server instance

Default Schedule

The default interval for this script is **Every 30 minutes**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Raise event if job fails unexpectedly?	Select **Yes** to raise an event if the SQLServer_UserConnections job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Raise event if SQL Server login fails?	Select **Yes** to raise an event if login to SQL Sever fails. The default is Yes.
Event severity when SQL Server login fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the login to SQL server fails. The default is 15.
Additional Settings	
Event Details	
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Authentication	Select the authentication method that you want to use to access SQL Server. You can either select *Windows Authentication* or *SQL Server Authentication*. The default is Windows Authentication.
User name	Specify the Windows or SQL Server user name that you want to use to access SQL Server. You can specify multiple users separated by a comma. The default is none. For more information on specifying user name, see .
Monitor User Connections	

Description	How to Set It
Number of user connections to include in report	Specify the number of user connections to display in the event detail message. Enter 0 to display all connections. The default is 20 user connections.
Event Notification	
Raise event if number of connections exceeds threshold?	Select **Yes** to raise an event if the number of user connections exceeds the threshold. The default is Yes
Event severity when threshold exceeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of user connections exceeds the threshold. The default is 5.
Threshold – Maximum number of user connections	Specify the maximum number of user connections that are allowed before an event is raised. The default is 100 connections.
Data Collection	
Collect data for total number of user connections?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of SQL Server user connections. The default is No.

73 SQL-RT Knowledge Scripts

AppManager ResponseTime for SQL Server provides Knowledge Scripts for monitoring SQL Server response time.

The ADO Knowledge Scripts use Microsoft ActiveX Data Objects (ADO) that are built on the top of Microsoft OLE Database (OLEDB). If you are using ADO or OLEDB on production, you may find it inappropriate to use ODBC to evaluate client/server database performance.

The SQL-RT category of Knowledge Scripts support both ODBC and ADO. You can set ADO parameters to match those in the applications you are testing. You should be able to configure an ADO Knowledge Script in the same way you configure an `ADODB::Connection` on an in-house application.

ADO and ODBC Knowledge Scripts support SQL statements. Be aware that some risk exists in doing continuous `INSERT` and `DELETE` statements on a short schedule.

These Knowledge Scripts support both System and User DSN. Use the appropriate Knowledge Script for the application you are testing.

From within the SQL-RT view of the Operator Console, you can select a Knowledge Script on the **SQL-RT** tab of the Knowledge Script pane.

The following are the Knowledge Scripts in the SQL-RT category:

Knowledge Script	What It Does
ADODSNQuery	Queries a Microsoft SQL Server using ADO and a system DSN.
ADOQuery	Queries a Microsoft SQL Server using ADO.
AdvancedADOQuery	Queries a Microsoft SQL Server using ADO and advanced connection parameters.
ODBCDSNQuery	Queries a Microsoft SQL Server using ODBC DSN.
ODBCQuery	Queries a Microsoft SQL Server using ODBC.
Report_SQL-RT	Summarizes availability and response time for SQL-RT Knowledge Scripts.
Report_SQL-RT_DSN	Summarizes availability and response time for the SQL-RT Knowledge Scripts that use DSN.

73.1 ADODSNQuery

Use this Knowledge Script to query a Microsoft SQL Server using ActiveX Data Objects (ADO) and a system Data Source Name (DSN).

This script generates the following data streams:

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to three response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed.
- **Availability.** This data stream returns one of two values, depending on the data stream format you selected:
  - 1 or 100 = transaction was successful
  - 0 = transaction was not successful

  The Availability data point is an indication of whether the transaction succeeded or failed.

This script raises an event whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The SQL-RT engine cannot be initialized. An initialization error is raised, but neither an Availability nor a Response Time data stream is generated.
- The job transaction does not complete successfully. A transaction error is raised. Only an Availability data stream is generated, with a value of 0.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console.

73.1.1 Resource Object

The SQL response time ADO client

73.1.2 Default Schedule

The default interval for this Knowledge Script is **Every 15 minutes**.

73.1.3 Windows NT Authentication

The ADOQuery and AdvancedADOQuery Knowledge Scripts support both SQL Server authentication and Windows NT authentication; however, the ADODSNQuery Knowledge Script is limited using the security settings in the DSN configuration because ADO cannot overwrite this kind of DSN setting.

Therefore, the job may not use the type of authentication you expected it to use. For example, say you set an invalid SQL username and/or password for the ADODSNQuery parameters, but the job still runs successfully. This can happen when the DSN is set to use Windows authentication, also called "integrated security.". In such a case, if the *Run As Username* parameter has appropriate privileges on the SQL Server database, the OLEDB driver ignores the specific logon user and password supplied in the Knowledge Script parameters. The logon works because the Windows authentication configured in the DSN takes precedence over the SQL Server authentication specified in the Knowledge Script.

73.1.4 Setting Parameter Values

When running this script, use the security model that was set when you defined the DSN.

- When using a DSN configured to use SQL authentication, use the *SQL Logon Username* and *Password* parameters. Or specify a valid Windows account for the *Run As* parameters.
- When using a DSN defined with Windows NT authentication, leave the *SQL Logon Username* and *Password* parameters blank, and specify the valid Windows account for the *Run As* parameters.

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select **Yes** to collect data for graphs and reports. If enabled, data collection returns: • 1 or 100 – Transaction completed successfully • 0 – Transaction did not complete successfully • Time taken to execute the query (in seconds) The default is Yes.
Data stream format	Select a format for the Availability data stream. You can select a 0 ("not available") or 100 ("available") format. The default value is 0-100.
Raise event if transaction fails?	Select **Yes** to raise an event when the server cannot be contacted. The default is Yes.
Event severity when transaction fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the server cannot be contacted. The default is 5.
Response Time	
Collect data for response time?	Select **Yes** to collect response-time data for graphs and reports. The default is Yes. If you enable data collection, you also have the option to see a breakdown in the response times for the component parts of the query, such as the time taken to connect to the SQL Server.
Threshold – Maximum response time (seconds)	Specify the maximum response time in seconds. When response time exceeds this value, an event is raised. The default is 15 seconds.
Raise event if threshold is exceeded?	Select **Yes** to raise an event when the threshold is exceeded. The event message contains a breakdown of the total response time. The default is Yes.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which response time exceeds the threshold. The default is 15.
Response Time Breakdown	

Description	How to Set It
Collect data for connecting to SQL Server?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to establish a connection to the SQL Server. The default is unselected.
Collect data for executing SQL statement?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to execute the SQL statement. The default is unselected.
Collect data for fetching data?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to perform a `fetch` of the query data. The default is unselected.
Target computer	Provide the computer name and instance of the SQL Server. This is an optional field, and is used to enable retrieval of data streams by AppManager Analysis Center v2.0 and later. If specified, it will also be used in place of the DSN in the data stream legend. If you set the *Event on* parameter, the *Target computer* parameter lets you select the server where the event will appear in your console. Enter the name of the server, or click **Browse [...]** to select from a list of available servers. The server you select must already be in the TreeView.
Data source (DSN)	Provide the Data Source DSN used for the connection.
Attributes	Specify the `ADODB::Connection` attributes as follows: • `NONE` (the default). No attributes. • `ABORTRETAINING`: Performs retaining aborts; i.e., calls `RollbackTrans` and automatically starts a new transaction. Not supported by all providers. • `COMMITRETAINING`: Performs retaining commits; i.e., calls `CommitTrans` and automatically starts a new transaction. Not supported by all providers. • `ABORTCOMITRETAINING`: A combination of `ABORTRETAINING` and `COMMITRETAINING`.
Cursor location	Specify the location of the cursor service: • `CLIENT`: Uses client-side cursors supplied by a local cursor library. (Local services may allow many features not allowed by driver-supplied cursors; using this setting may provide some advantage in enabling features.) • `SERVER`: Uses data provider- or driver-supplied cursors. (These cursors may be flexible and allow for additional sensitivity to changes made to the data source by others.) This is the default.
SQL statement	Provide a SQL statement (1024-character maximum) that is compatible with the provider. Calling stored procedures is also supported. The format is `execute stored_procedure`.

Description	How to Set It
Number of rows per fetch	Specify any positive integer or -1. Use an appropriate value according to the size of the result and of a single row. The default value is 1. If the SQL statement is a select, the engine uses the `GetRows()` method to retrieve the data, so you can fetch thousands or records at once. This could mean a huge performance improvement in production. A value of -1 attempts to retrieve all rows on a single fetch. Although this may show interesting results on a small database, it can easily become catastrophic if the result is large and the client machine has limited memory. You should change this value only if the `GetRows ()` method is used in production with a value different than 1.
Event on	Select the TreeView location where events should be displayed. Select either: • **Agent** (the client computer in the response-time tests). This is the default. • **Server** (the AppManager server being tested–see the **Target computer** parameter, above) • **Both.** The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
SQL Logon	
Username	Set this value appropriately based upon your DSN settings.
Password	Set this value appropriately based upon your DSN settings.
Run As	
Username	Provide the username associated with a specific user who has the required permissions to run this application. **Required**. `Interactive User` is a possible value. Leave the Password and Domain parameters blank if you specify "Interactive User". `Interactive User` requires a user to be physically logged into the computer for the test to run. You might want to do this in environments where a firewall is preventing access to an Active Directory domain controller, or where the test computer is part of a workgroup and not part of a domain. With this feature, the user is not validated, so the test can proceed despite the lack of access to the domain.
Password	Specify the password associated with this user that is required to log on to the network and run the application.
Domain	Specify the domain associated with this user that is the domain name you are logging onto. **Required**.
Administrators group on managed client	Provide the name of the Administrators Group on the managed client. Typically, this name is “`Administrators`”, except on some foreign language operating systems. The default is “`Administrators`”.
Timeouts	
Command timeout	Specify the number of seconds to wait while establishing a connection before terminating the event and raising an event. The default is 30 seconds.

Description	How to Set It
Connection timeout	Specify the number of seconds to wait while executing a command before terminating the attempt and raising an event. The default is 15 seconds.

73.2 ADOQuery

Use this Knowledge Script to query a Microsoft SQL Server using ADO.

This script generates the following data streams:

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to three response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 4043 below for more information.
- **Availability**–Returns one of two values:
  - 1 or 100 = transaction was successful
  - 0 = transaction was not successful.

  The Availability data point is an indication of whether the transaction succeeded or failed.

An event is raised whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The SQL-RT engine cannot be initialized. An initialization error is raised, but neither an Availability nor a Response Time data stream is generated.
- The job transaction doesn't complete successfully. A transaction error is raised. Only an Availability data stream is generated, with a value of 0.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console.

73.2.1 Resource Object

The SQL-RT ADO client

73.2.2 Default Schedule

The default interval for this Knowledge Script is **Every 15 minutes**.

73.2.3 Windows NT Authentication

The ADOQuery and AdvancedADOQuery Knowledge Scripts support both SQL Server authentication and Windows NT authentication; however, the ADODSNQuery Knowledge Script is limited to the DSN configuration because ADO cannot override this kind of DSN setting.

Therefore, the job may not use the type of authentication you expected it to use. For example, say you set an invalid SQL username and/or password for ADODSNQuery Knowledge Script parameters. The job may still run successfully if the DSN is set to use Windows authentication. In such a case, if the *Run As Username* parameter has appropriate privileges on the SQL Server database, the OLEDB driver ignores the specific logon username and password. The logon always works because the Windows authentication configured in the DSN takes precedence over the SQL Server authentication set in the Knowledge Script.

73.2.4 Setting Parameter Values

Set the Integrated security option according to the security model you want to use:

- **For SQL authentication**: Clear the **Yes** check box to disable integrated security, then specify the SQL Logon Username and Password parameters. Also, specify the *Run As* parameters to supply a valid account under which to run the Knowledge Script.
- **For Windows NT authentication**: Select the **Yes** check box for integrated security, and leave the *SQL Username* and *Password* parameters blank. Specify the valid account under which to run the Knowledge Script and perform the Windows authentication for the *Run As* parameters.

Set the following parameters as needed.

Description	How to Set It
Availability	
Collect data for availability?	Select **Yes** to collect data for graphs and reports. If enabled, data collection returns: • 1 or 100 – Transaction completed successfully • 0 – Transaction did not complete successfully • Time taken to execute the query (in seconds) The default is Yes.
Data stream format	Select a format for the Availability data stream. You can select a 0 (“not available”) or 100 (“available”) format. The default value is 0-100.
Raise event if transaction fails?	Select **Yes** to raise an event when the server cannot be contacted. The default is yes.
Event severity when transaction fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the server cannot be contacted. The default is 5.
Response Time	
Collect data for response time?	Select **Yes** to collect response-time data for graphs and reports. The default is Yes. If you enable data collection, you also have the option to see a breakdown in the response times for the component parts of the query, such as the time taken to connect to the SQL Server.
Threshold – Maximum response time (seconds)	Specify the maximum response time in seconds. When response time exceeds this value, an event is raised. The default is 15 seconds.
Raise event if threshold is exceeded?	Select **Yes** to raise an event when the threshold is exceeded. The event message contains a breakdown of the total response time. The default is Yes.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which response time exceeds the threshold. The default is 15.
Response Time Breakdown	
Collect data for connecting to SQL Server?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to establish a connection to the SQL Server. The default is unselected.
Collect data for executing SQL statement?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to execute the SQL statement. The default is unselected.

Description	How to Set It
Collect data for fetching data?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to perform a `fetch` of the query data. The default is unselected.
Server and instance name	Provide the names of the server and instance where the transaction will be run. Use the following syntax: `Server/Instance`. If you set the *Event on* parameter, this parameter lets you select the server where the event will appear in your console. The instance name is stripped out. Provide the name of the server and instance, or click **Browse [...]** to select from a list of available servers. The server you select must already be in the TreeView.
Database name	Specify the database name on the SQL Server. This is the "Initial Catalog" part of the Connection Properties collection. If the provider does not support this property, use the default database.
Cursor location	Specify the location of the cursor service: • `CLIENT`: Uses client-side cursors supplied by a local cursor library. (Local services may allow many features not allowed by driver-supplied cursors; using this setting may provide some advantage in enabling features.) • `SERVER`: Uses data provider- or driver-supplied cursors. (These cursors may be flexible and allow for additional sensitivity to changes made to the data source by others.) This is the default.
SQL statement	Provide a SQL statement (128-character maximum) that is compatible with the provider. The format is `execute stored_procedure`.
Number of rows per fetch	Specify any positive integer or -1. Use an appropriate value according to the size of the result and of a single row. The default value is 1. If the SQL statement is a select, the engine uses the `GetRows()` method to retrieve the data, so you can fetch thousands or records at once. This could mean a huge performance improvement in production. A value of -1 attempts to retrieve all rows on a single fetch. Although this may show interesting results on a small database, it can easily become catastrophic if the result is large and the client computer has limited memory. Change this value only if the `GetRows()` method is used in production with a value different than 1.
Integrated security?	Select **Yes** to specify whether the authentication should be done on the Windows integrated security model. The default is unselected.
Event on	Select the TreeView location where events should be displayed. Select either: • **Agent** (the client computer in the response-time tests). This is the default. • **Server** (the AppManager server being tested–see the *Server and instance name* parameter) • **Both.** The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
SQL Logon	
Username	Set this value when you do *not* use integrated security. This is the User ID part of the Connection Properties collection.

Description	How to Set It
Password	Set this value when you do *not* use integrated security. This is the Password part of the Connection Properties collection. Hard encryption is always used.
Run As	
Username	Provide the username associated with a specific user who has the required permissions to run this application. **Required**. `Interactive User` is a possible value. Leave the Password and Domain parameters blank if you specify "Interactive User". `Interactive User` requires a user to be physically logged into the computer for the test to run. You might want to do this in environments where a firewall is preventing access to an Active Directory domain controller, or where the test computer is part of a workgroup and not part of a domain. With this feature, the user is not validated, so the test can proceed despite the lack of access to the domain.
Password	Provide the password associated with this user that is required to log on to the network and run the application.
Domain	Provide the domain associated with this user that is the domain name you are logging onto. **Required**.
Administrators group on managed client	Provide the name of the Administrators Group on the managed client. Typically, this name is "`Administrators`", except on some foreign-language operating systems. The default is "`Administrators`".
Timeouts	
Command timeout	Specify the number of seconds to wait while establishing a connection before terminating the event and generating an error. The default is 30 seconds.
Connection timeout	Specify the number of seconds to wait while executing a command before terminating the attempt and generating an error. The default is 15 seconds.

73.3 AdvancedADOQuery

Use this Knowledge Script to check the ability to query a Microsoft SQL Server using ADO and advanced connection parameters.

This script generates the following data streams:

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to three response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 4043 below for more information.
- **Availability**–Returns one of two values:
  - 1 or 100 = transaction was successful
  - 0 = transaction was not successful.

  The Availability data point is an indication of whether the transaction succeeded or failed.

An event is raised whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The SQL-RT engine cannot be initialized. An initialization error is raised, but neither an Availability nor a Response Time data stream is generated.
- The job transaction does not complete successfully. A transaction error is raised. Only an Availability data stream is generated, with a value of 0.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console.

73.3.1 Resource Object

The SQL response time ADO client

73.3.2 Default Schedule

The default interval for this Knowledge Script is **Every 15 minutes**.

73.3.3 Setting Parameter Values

Be sure to set the *Integrated security?* parameter according to the security model you want to use:

- **For SQL authentication:** Clear the **Yes** check box to disable integrated security, then specify the *SQL Logon Username* and *Password*. Also specify the *Run As* account information to supply a valid account under which to run the Knowledge Script.

- **For Windows NT authentication:** Select the **Yes** check box for integrated security, and leave the *SQL Logon Username* and *Password* parameters blank. Specify a valid user account under which to run the Knowledge Script for the *Run As* Knowledge Script parameters.

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select **Yes** to collect data for graphs and reports. If enabled, data collection returns: • 1 or 100 – Transaction completed successfully • 0 – Transaction did not complete successfully • Time taken to execute the query (in seconds) The default is Yes.
Data stream format	Select the data stream format for the Availability data stream. You can use a 0 (“not available”) or 100 (“available”) format. The default value is 0-100.
Raise event if transaction fails?	Select **Yes** to raise an event when the server cannot be contacted. The default is Yes.
Event severity when transaction fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the server cannot be contacted. The default is 5.
Response Time	
Collect data for response time?	Select **Yes** to collect response-time data for graphs and reports. By default, data is collected. If you enable data collection, you also have the option to see a breakdown in the response times for the component parts of the query, such as the time taken to connect to the SQL Server.
Threshold – Maximum response time (seconds)	Specify the maximum response time in seconds. When response time exceeds this value, an event is raised. The default is 15 seconds.
Raise event if threshold is exceeded?	Select **Yes** to raise an event when the threshold is exceeded. The event message contains a breakdown of the total response time. The default is Yes.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the response time threshold is exceeded. The default is 15.
Response Time Breakdown	
Collect data for connecting to SQL Server?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to establish a connection to the SQL Server. The default is unselected.
Collect data for executing SQL statement?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to execute the SQL statement. The default is unselected.
Collect data for fetching data?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to perform a `fetch` of the query data. The default is unselected.
Server and instance name	Provide the names of the server and instance where the transaction will be run. Use the following syntax: `Server/Instance`. If you set the Event on parameter, this parameter lets you select the server where the event will appear in your console. The instance name is stripped out. Provide the name of the server and instance, or click **Browse [...]** to select from a list of available servers. The server you select must already be in the TreeView.
Database name	Provide the database name on the SQL Server. This is the “Initial Catalog” part of the Connection Properties collection. If the provider does not support this property, use the default database.

Description	How to Set It
Attributes	Specify the `ADODB::Connection` attributes as follows: • `NONE` (the default). No attributes. • `ABORTRETAINING`: Performs retaining aborts; i.e., calls `RollbackTrans` and automatically starts a new transaction. Not supported by all providers. • `COMMITRETAINING`: Performs retaining commits; i.e., calls `CommitTrans` and automatically starts a new transaction. Not supported by all providers. • `ABORTCOMITRETAINING`: A combination of `ABORTRETAINING` and `COMMITRETAINING`.
Cursor location	Specify the location of the cursor service: • `CLIENT`: Uses client-side cursors supplied by a local cursor library. (Local services may allow many features not allowed by driver-supplied cursors; using this setting may provide some advantage in enabling features.) • `SERVER`: Uses data provider- or driver-supplied cursors. (These cursors may be flexible and allow for additional sensitivity to changes made to the data source by others.) This is the default.
Isolation level	Specify the level of transaction isolation for a Connection object as follows: • `UNSPECIFIED`: The provider is using a different isolation level than specified, but that level cannot be determined. • `CHAOS`: You cannot overwrite pending changes from more highly isolated transactions. • `BROWSE`: You can view uncommitted changes in other transactions from one transaction. • `READUNCOMMITTED`: Same as `BROWSE`. • `CURSORSTABILITY`: You can view changes in other transactions from one transaction only after they have been committed. • `READCOMMITTED`: Same as `BROWSE`. This is the default. • `REPEATABLEREAD`: You cannot see changes made in other transactions from one transaction; however, querying again can retrieve new `Recordset` objects. • `ISOLATED`: Transactions are conducted in isolation from other transactions. • `SERIALIZABLE`: Same as `ISOLATED`.
Mode	Set the available permissions for modifying data in a connection, as follows: • `UNKNOWN`: Permissions have either not yet been set or cannot be determined. This is the default. • `READ`: Read-only permissions. • `WRITE`: Write-only permissions. • `READWRITE`: Read/write permissions. • `RECURSIVE`: Not supported at this time. • `SHAREDENYNONE`: Allows others to open a connection with any permission. Neither read nor write access can be denied to others. • `SHAREDENYREAD`: Prevents others from opening a connection with read permissions. • `SHAREDENYWRITE`: Prevents others from opening a connection with write permissions. • `SHAREEXCLUSIVE`: Prevents others from opening a connection.

Description	How to Set It
SQL Statement	Provide a SQL statement (128-character maximum) that is compatible with the provider. The format is `execute stored_procedure`.
Number of rows per fetch	Specify any positive integer or -1. Use an appropriate value according to the size of the result and of a single row. The default value is 1. If the SQL statement is a select, the engine uses the `GetRows()` method to retrieve the data, so you can fetch thousands or records at once. This could mean a huge performance improvement in production. A value of -1 attempts to retrieve all rows on a single fetch. Although this may show interesting results on a small database, it can easily become catastrophic if the result is large and the client machine has limited memory. You should change this value only if the `GetRows()` method is used in production with a value different than 1.
Integrated security?	Select **Yes** to specify whether the authentication should be done on the Windows integrated security model. The default is unselected.
Event on	Select the TreeView location where events should be displayed. Select either: • **Agent** (the client computer in the response-time tests). This is the default. • **Server** (the AppManager server being tested–see the *Server and instance name* parameter) • **Both.** The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
SQL Logon	
Username	Set this value when you do *not* use integrated security. This is the User ID part of the Connection Properties collection.
Password	Set this value when you do *not* use integrated security. This is the Password part of the Connection Properties collection. Hard encryption is always used.
Run As	
Username	Provide the username associated with a specific user who has the required permissions to run this application. **Required**. `Interactive User` is a possible value. Leave the Password and Domain parameters blank if you specify "Interactive User". `Interactive User` requires a user to be physically logged into the computer for the test to run. You might want to do this in environments where a firewall is preventing access to an Active Directory domain controller, or where the test computer is part of a workgroup and not part of a domain. With this feature, the user is not validated, so the test can proceed despite the lack of access to the domain.
Password	Provide the password associated with this user that is required to log on to the network and run the application.
Domain	Provide the domain associated with this user that is the domain name you are logging onto. **Required**.
Administrators group on managed client	Enter the name of the Administrators Group on the managed client. Typically, this name is “`Administrators`”, except on some foreign-language operating systems. The default is “`Administrators`”.

Description	How to Set It
Timeouts	
Command timeout	Specify the number of seconds to wait while establishing a connection before terminating the event and generating an error. The default is 30 seconds.
Connection timeout	Specify the number of seconds to wait while executing a command before terminating the attempt and generating an error. The default is 15 seconds.

73.4 ODBCDSNQuery

Use this Knowledge Script to query a Microsoft SQL Server using Open Database Connectivity (ODBC) and a Data Source Name (DSN).

This script generates the following data streams:

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to three response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 4043 below for more information.
- **Availability**–Returns one of two values:
  - 1 or 100 = transaction was successful
  - 0 = transaction was not successful.

  The Availability data point is an indication of whether the transaction succeeded or failed.

This script raises an event whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The SQL-RT engine can't be initialized. An initialization error is raised, but neither an Availability nor a Response Time data stream is generated.
- The job transaction doesn't complete successfully. A transaction error is raised. Only an Availability data stream is generated, with a value of 0.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console.

73.4.1 Resource Object

The SQL response time ODBC client

73.4.2 Default Schedule

The default interval for this Knowledge Script is **Every 15 minutes**.

73.4.3 About Windows NT Authentication

ODBC Knowledge Scripts do not support Windows authentication (integrated security), but DSN does. Therefore, the job may not use the type of authentication you wanted it to use. For example, if you set an invalid SQL username and/or password in the ODBCDSNQuery Knowledge Script, the job may run successfully if the DSN is set to use Windows authentication.

In such a case, if the value supplied for the *Run As Username* parameter has appropriate privileges on the SQL Server database, the ODBC driver ignores the specific logon username and password you supplied. The logon then succeeds in this case because the Windows authentication in the DSN takes precedence over the authentication method set in the Knowledge Script.

73.4.4 Setting Parameter Values

Depending on what security model was set when you defined the DSN, you should only use that security method when running this Knowledge Script.

- When using a DSN defined with SQL authentication, use the *SQL Logon Username* and *Password* fields only.
- When using a DSN configured to use Windows authentication, leave the *SQL Logon Username* and *Password* fields blank, and specify the valid Windows account for the *Run As* Knowledge Script parameters.

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select **Yes** to collect data for graphs and reports. If enabled, data collection returns: • 1 or 100 – Transaction completed successfully • 0 – Transaction did not complete successfully • Time taken to execute the query (in seconds) The default is yes.
Data stream format	Select the data stream format for the Availability data stream. You can use a 0 ("not available") or 100 ("available") format. The default value is 0-100.
Raise event if transaction fails?	Select **Yes** to raise an event when the server cannot be contacted. The default is Yes.
Event severity when transaction fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the server cannot be contacted. The default is 5.
Response Time	
Collect data for response time?	Select **Yes** to collect response time data for graphs and reports. The default is Yes. If you enable data collection, you also have the option to see a breakdown in the response times for the component parts of the query, such as the time taken to connect to the SQL Server.
Threshold – Maximum response time (seconds)	Specify the maximum response time in seconds. When response time exceeds this value, an event is raised. The default is 15 seconds.
Raise event if threshold is exceeded?	Select **Yes** to raise an event when the threshold is exceeded. The event message contains a breakdown of the total response time. The default is Yes.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which response time exceeds the threshold. The default is 15.
Response Time Breakdown	
Collect data for connecting to SQL Server?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to establish a connection to the SQL Server. The default is unselected.
Collect data for executing SQL statement?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to execute the SQL statement. The default is unselected.
Collect data for fetching data?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to perform a `fetch` of the query data. The default is unselected.

Description	How to Set It
Target computer	Specify the computer name and instance of the SQL Server. This is an optional field, and is used to enable retrieval of data streams by AppManager Analysis Center v2.0 and later. If specified, it is also used in place of the DSN in the data stream legend. If you set the *Event on* parameter, the *Target computer* parameter lets you select the server where the event will appear in your console. Specify the name of the server and instance, or click **Browse [...]** to select from a list of available servers. The server you select must already be in the TreeView.
Data source (DSN)	Provide the system DSN on which the Knowledge Script will be run. **Required**.
SQL Statement	Provide a SQL statement (128-character maximum) that is compatible with the provider. The format is `execute stored_procedure`.
Event on	Select the TreeView location where events should be displayed. Select either: • **Agent** (the client computer in the response-time tests). This is the default. • **Server** (the AppManager server being tested–see the *Target computer* parameter) • **Both.** The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
SQL Logon	
Username	Set this value appropriately based upon your DSN settings.
Password	Set this value appropriately based upon your DSN settings.
Run As	
Username	Provide the username associated with a specific user who has the required permissions to run this application. **Required**. `Interactive User` is a possible value. Leave the Password and Domain parameters blank if you specify "Interactive User". `Interactive User` requires a user to be physically logged into the computer for the test to run. You might want to do this in environments where a firewall is preventing access to an Active Directory domain controller, or where the test computer is part of a workgroup and not part of a domain. With this feature, the user is not validated, so the test can proceed despite the lack of access to the domain.
Password	Provide the password associated with this user that is required to log on to the network and run the application.
Domain	Provide the domain associated with this user that is the domain name you are logging onto. Required.
Administrators group on managed client	Provide the name of the Administrators Group on the managed client. Typically, this name is “`Administrators`”, except on some foreign language operating systems. The default is “`Administrators`”.
Connection timeout	Specify the number of seconds to wait while executing a command before terminating the attempt and generating an error. The default is 15 seconds.

73.5 ODBCQuery

Use this Knowledge Script to query a Microsoft SQL Server using Open Database Connectivity (ODBC) and measure the response time.

This script does not support Windows authentication. Use the ODBCDSNQuery Knowledge Script if you need to use Windows authentication. That script lets you supply a DSN to use. You can then configure the Data Source Name (DSN) file to use Windows authentication.

This script generates the following data streams:

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to three response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 4043 below for more information.
- **Availability**–Returns one of two values:
  - 1 or 100 = transaction was successful
  - 0 = transaction was not successful.

  The Availability data point is an indication of whether the transaction succeeded or failed.

This script raises an event whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The SQL-RT engine cannot be initialized. An initialization error is raised, but neither an Availability nor a Response Time data stream is generated.
- The job transaction does not complete successfully. A transaction error is raised. Only an Availability data stream is generated, with a value of 0.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console.

73.5.1 Resource Object

The SQL response time ODBC client.

73.5.2 Default Schedule

The default interval for this Knowledge Script is **Every 15 minutes**.

73.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select **Yes** to collect data for graphs and reports. If enabled, data collection returns: • 1 or 100 – Transaction completed successfully • 0 – Transaction did not complete successfully • Time taken to execute the query (in seconds) The default is Yes.
Data stream format	Select a format for the Availability data stream. You can use a 0 (“not available”) or 100 (“available”) format. The default value is 0-100.
Raise event if transaction fails?	Select **Yes** to raise an event when the server cannot be contacted. The default is Yes.
Event severity when transaction fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the server cannot be contacted. The default is 5.
Response Time	
Collect data for response time?	Select **Yes** to collect response time data for graphs and reports. The default is Yes. If you enable data collection, you also have the option to see a breakdown in the response times for the component parts of the query, such as the time taken to connect to the SQL Server.
Threshold – Maximum response time (seconds)	Specify the maximum response time in seconds. When response time exceeds this value, an event is raised. The default is 15 seconds.
Raise event if threshold is exceeded?	Select **Yes** to raise an event when the threshold is exceeded. The event message contains a breakdown of the total response time. The default is Yes.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which response time exceeds the threshold. The default is 15.
Response Time Breakdown	
Collect data for connecting to SQL Server?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to establish a connection to the SQL Server. The default is unselected.
Collect data for executing SQL statement?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to execute the SQL statement. The default is unselected.
Collect data for fetching data?	Select **Yes** to collect response-time data showing how much of the overall response time could be attributed to the time taken to perform a `fetch` of the query data. The default is unselected.
Server and instance name	Provide the names of the server and instance where the transaction will be run. Use the following syntax: `Server/Instance`. If you set the *Event on* parameter, this parameter lets you select the server where the event will appear in your console. The instance name is stripped out. Provide the name of the server and instance, or click **Browse [...]** to select from a list of available servers. The server you select must already be in the TreeView.
Database name	Provide the database name on the SQL Server. This is the “Initial Catalog” part of the Connection Properties collection. If the provider does not support this property, use the default database.
SQL statement	Set this value appropriately based on your DSN settings. The format is `execute stored_procedure`.

Description	How to Set It
Event on	Select the TreeView location where events should be displayed. Select either: • **Agent** (the client computer in the response-time tests). This is the default. • **Server** (the AppManager server being tested–see the **Server and instance name** parameter, above) • **Both.** The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
SQL Logon	
Username	Set this value appropriately based on your DSN settings.
Password	Set this value appropriately based on your DSN settings.
Run As	
Username	Provide the username associated with a specific user who has the required permissions to run this application. **Required**. `Interactive User` is a possible value. Leave the Password and Domain parameters blank if you specify "Interactive User". `Interactive User` requires a user to be physically logged into the computer for the test to run. You might want to do this in environments where a firewall is preventing access to an Active Directory domain controller, or where the test computer is part of a workgroup and not part of a domain. With this feature, the user is not validated, so the test can proceed despite the lack of access to the domain.
Password	Provide the password associated with this user that is required to log on to the network and run the application.
Domain	Provide the domain associated with this user that is the domain name you are logging onto. **Required**.
Administrators group on managed client	Provide the name of the Administrators Group on the managed client. Typically, this name is “`Administrators`”, except on some foreign language operating systems. The default is “`Administrators`”.
Connection timeout	Specify the number of seconds to wait while executing a command before terminating the attempt and generating an error. The default is 15 seconds.

73.6 Report_SQL-RT

Use this Report Knowledge Script to generate a report detailing availability and response time for the following SQL-RT Knowledge Scripts:

- ADOQuery
- AdvancedADOQuery
- ODBCQuery

73.6.1 Resource Object

AppManager repository

73.6.2 Default Schedule

The default schedule is **Run once**.

73.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
KS for report	Click **Browse [...]** to select the Knowledge Scripts you want to include in the report.
SQL-RT client(s)	Click **Browse [...]** to select the SQL-RT client computers to include in the report. Your selections are limited to computers or server groups that are visible in the selected views. Select one of the filter options: • **View:** Includes all computers in the views you selected. • **Computer:** Select from individual computers in the views you selected. • **Server Group:** Select from server groups in the views you selected. **NOTE:** Selecting a server group includes all computers in that group.
SQL Server or "All"	Specify the name of the SQL Server or type "All" to designate all computers as SQL Servers. The default is "All".
Select time range	Click **Browse [...]** to set specific start and end report information dates, good for historical or ad hoc reports, or a sliding range that sets the time range of data to include in the report. The sliding range option is the default and is useful for reports running on a regular schedule.
Select peak weekday(s)	Click **Browse [...]** to select a contiguous day range a selection of non-contiguous days.
Aggregation by	Select the time unit by which to aggregate data. The default is Hour. This works in conjunction with the *Aggregation interval* parameter, which determines the number of units for one interval of data aggregation.

Description	How to Set It
Aggregation interval	Select the interval units in which to aggregate data. The default is 1. For example, if you aggregate by the Hour and select 1 here, data is aggregated once every hour.
Report Settings	
Include parameter card?	Select **Yes** to display a table of parameters used in the report. The default is Yes.
Include Availability Detail table?	Select **Yes** to display the Availability Detail table as part of the report. The default is Yes.
Include Availability chart?	Select **Yes** to display the Availability chart as part of the report. The default is Yes.
Availability data stream format	Specify the data stream format. Options are 0-100 or 0-1. • 1 or 100 – Available • 0 – Not available The default format is 0-100.
Threshold on Availability chart	Specify an integer for the percentage threshold. The default is 0 (no threshold is displayed).
Include Response Time Detail table?	Select **Yes** to display the Response Time detail table as part of the report. The default is Yes.
Include Response Time chart?	Select **Yes** to display the Response Time chart as part of the report. The default is Yes.
Units for Response Time report	Select the response time unit, msec or sec. The default is msec.
Threshold on Response Time chart (selected units)	Specify the response time threshold to display on the chart in the report. The default is 0, which suppresses the threshold indicator in the chart.
Select chart style	Click **Browse [...]** to set the appearance of the chart. The same parameters are used in both the Availability and Response Time charts, if both are produced. The default is Ribbon.
Select output folder	Select **Browse [...]** to specify the report filename and the report folder. You can specify a specific folder or have the system generate the folder each time the report runs.
Add job ID to output folder name?	Select **Yes** to add a job ID to the output folder name. Use a job ID to correlate a specific instance of a Report Script with the corresponding report. The default is unselected.
Index-Report Title	Select **Browse [...]** to configure report title settings and custom fields.
Add timestamp to title?	Select **Yes** to add a timestamp to the report title, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is unselected.
Event Notification	
Generate event on success?	Select **Yes** to raise an event when a report is generated. The default is Yes.
Severity level for report success	Set the event severity level to indicate the importance of an event in which the report is generated successfully. The default is 35.
Severity level for report with no data	Set the event severity level to indicate the importance of an event in which the report has no data. The default is 25.

Description	How to Set It
Severity level for report failure	Set the event severity level to indicate the importance of an event in which the report cannot be generated. The default is 5.

73.7 Report_SQL-RT_DSN

Use this Report Knowledge Script to generate a report detailing availability and response time for the following SQL-RT DSN Knowledge Scripts:

- ADODSNQuery
- ODBCDSNQuery

73.7.1 Resource Object

AppManager repository

73.7.2 Default Schedule

The default schedule is **Run once**.

73.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Source	
KS for report	Click **Browse [...]** to select the Knowledge Scripts you want to include in the report.
SQL-RT client(s)	Click **Browse [...]** to select the SQL-RT client computers to include in the report. Your selections are limited to computers or server groups that are visible in the selected views. Select one of the filter options: • **View:** Includes all computers in the views you selected. • **Computer:** Select from individual computers in the views you selected. • **Server Group:** Select from server groups in the views you selected. **NOTE:** Selecting a server group includes all computers in that group.
SQL DSN or “All”	Specify the name of the SQL Server or type “All” to designate all computers as SQL Servers. The default is “All”.
Select time range	Click **Browse [...]** to set specific start and end report information dates, good for historical or ad hoc reports, or a sliding range that sets the time range of data to include in the report. The sliding range option is the default and is useful for reports running on a regular schedule.
Select peak weekday(s))	Click **Browse [...]** to select a contiguous day range a selection of non-contiguous days.
Aggregation by	Select the time unit by which to aggregate data. The default is Hour. This works in conjunction with the next field (Aggregation interval), which determines the number of units for one interval of data aggregation.
Aggregation interval	Select the interval units in which to aggregate data. The default is 1. For example, if you aggregate by the Hour and select 1 here, data is aggregated once every hour.

Description	How to Set It
Report Settings	
Include parameter card?	Select **Yes** to display a table of parameters used in the report. The default is Yes.
Include Availability detail table?	Select **Yes** to display the Availability Detail table as part of the report. The default is Yes.
Include Availability chart?	Select **Yes** to display the Availability chart as part of the report. The default is Yes.
Availability data stream format	Specify the data stream format. Options are 0-100 or 0-1. • 1 or 100 – Available • 0 – Not available The default format is 0-100.
Threshold on Availability chart	Specify an integer for the percentage threshold. The default is 0 (no threshold is displayed).
Include Response Time Detail table?	Select **Yes** to display the Response Time Detail table as part of the report. The default is Yes.
Include Response Time chart?	Select **Yes** to display the Response Time chart as part of the report. The default is Yes.
Units for Response Time report	Select the response time unit, msec or sec. The default is msec.
Threshold on Response Time chart (selected units)	Specify the response time threshold to display on the chart in the report. The default is 0, which suppresses the threshold indicator in the chart.
Select chart style	Click **Browse [...]** to set the appearance of the chart. The same parameters are used in both the Availability and Response Time charts, if both are produced. The default is Ribbon.
Select output folder	Select **Browse [...]** to specify the report filename and the report folder. You can specify a specific folder or have the system generate the folder each time the report runs.
Add job ID to output folder name?	Select **Yes** to add a job ID to the output folder name. Use a job ID to correlate a specific instance of a Report Script with the corresponding report. The default is unselected.
Index-Report Title	Select **Browse [...]** to configure report title settings and custom fields.
Add timestamp to title?	Select **Yes** to add a timestamp to the report title, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is unselected.
Event Notification	
Generate event on success?	Select **Yes** to raise an event when a report is generated. The default is Yes.
Severity level for report success	Set the event severity level to indicate the importance of an event in which the report is generated successfully. The default is 35.
Severity level for report with no data	Set the event severity level to indicate the importance of an event in which the report has no data. The default is 25.
Severity level for report failure	Set the event severity level to indicate the importance of an event in which the report cannot be generated. The default is 5.

74 UNIX Knowledge Scripts

AppManager for UNIX provides the following Knowledge Scripts for monitoring UNIX and Linux computers.

From the Knowledge Script view of console, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help** or **F1**.

Knowledge Script	What It Does
AIXLparUtil	Monitors CPU utilization for Logical Partitions (LPAR) on AIX.
ApplicationProcessMonitor	Monitors the status of processes of an application.
AsciiLog	Monitors an ASCII text file for specific strings and messages logged.
CpuByProcess	Monitors CPU usage for each process and the total CPU usage for all processes.
CpuLoaded	Monitors CPU usage.
CpuResources	Monitors CPU consumption for users, the number of active processes, the number of threads, the number of context switches, and the number of interrupts per second.
CpuUtil	Monitors CPU utilization and queue length.
DNSConnectivity	Checks a DNS client's list of DNS servers to verify each DNS server is reachable and responding to client look-up requests.
DNSHealth	Checks memory and CPU usage for the DNS process and performs a basic `nslookup` test.
DNSReplication	Monitors replication between two name servers in a specified domain.
DynamicFileSystemSpace	Monitors used space and free space on only non-excluded mounted file systems and, optionally, checks for incremental increases in used space.
ExecUtil	Runs a UNIX or Linux command and, optionally generates events based on the program's output or collects data from the output that can be used to generate graphs.
FailedLogon	Monitors failed logon and failed `su` attempts.
FileSystemSpace	Monitors used space and free space on mounted file systems and, optionally, checks for incremental increases in used space.
FileSystemSpaceLC	Uses a configuration file to monitor used space on mounted file systems and, optionally, checks for incremental increases in used space.
GeneralCounter	Monitors any user-specified system performance data.

Knowledge Script	What It Does
HTTPHealth	Sends a status request to a Web server's HTTP port to check server operation.
LargeDir	Checks the disk space used by the directories you specify and the number of files under those directories.
LogicalDiskBusy	Monitors logical disk operation time and the maximum queue length.
LogicalDiskIO	Monitors logical disk IO activity, including disk transfers, reads, and writes per second.
LogicalDiskUtilization	Monitors the utilization and I/O request queue for logical disk devices.
MemByProcess	Monitors the individual memory usage for each specified process and total memory usage for all specified processes.
MemShortage	Monitors the physical memory for a system.
MemUtil	Monitors physical memory, virtual memory, and paging files.
NetInterfacesCollision	Monitors network interface collision.
NetInterfacesConnectivity	Monitors the physical connection between network interface adapters and the network.
NetInterfacesDown	Checks the status of network interfaces.
NetInterfacesErrors	Monitors the percentage of input and output errors for network interfaces.
NetInterfacesIO	Monitors the input, output, and throughput of the network traffic on network interface cards.
PagingHigh	Monitors UNIX paging activity.
PhysicalDiskBusy	Monitors physical disk activity and response time.
PhysicalDiskIO	Monitors physical disk reads and writes in KB per second.
PingMachine	Checks server availability by running a Ping test and returning response time.
PortHealth	Checks whether system ports are working properly.
PrinterQueue	Monitors the printer queue length and the memory size of the documents in the queue.
PrivilegedProcs	Monitors the number of system processes with an effective user ID (euid) of `root`.
ProcessDown	Determines whether specified processes are currently running.
Processes	Monitors the total number of processes.
ProcessUp	Checks whether a specified process is running.
RemoteProcessDown	Monitors applications on remote UNIX computers using a proxy UNIX agent.
Report_CPULoad	Generates a detailed report about CPU usage and queue length.
Report_DiskUsageSummary	Generates a summary report about the percentage of disk space used and the amount of free space.
Report_MemoryUtilization	Generates a detailed report about the use of physical and virtual memory, and paging files.
Report_NetInterfacesIO	Generates a report about the use of bandwidth on network interface cards.

Knowledge Script	What It Does
Report_SystemUpTime	Generates a report detailing the uptime and downtime (by percentage) of monitored computers.
Report_TopMemoryProcs	Generates a report about the total memory used by all processes and the processes that consume the most memory resources.
RunAwayProcs	Detects runaway processes by sampling CPU usage and terminates processes.
RunCommand	Runs a non-interactive UNIX command.
SwapLow	Monitors the availability of swap areas.
Syslog	Monitors the `syslog` file for the search strings you specify.
SystemUpTime	Tracks the number of hours a computer has been operational since it was last rebooted.
TopCpuProcs	Monitors total CPU used by all processes and reports processes that consume the most CPU resources.
TopMemoryProcs	Monitors the total memory used by all processes and reports processes that consume the most memory.
UserSessions	Monitors the number of accounts logged into a computer.
ZombieProcs	Monitors the number of zombie processes.

74.1 Creating Filters with Regular Expressions

The AsciiLog, RemoteProcessDown, NT_UnixRemoteProcessDown, and Syslog Knowledge Scripts enable you to use regular expressions to define include and exclude filters for pattern-matching against the text being evaluated. Where available, include and exclude filters can be used independently or together to give you a great deal of control in looking for and filtering text files. You can also use the regular expression modifiers to further refine your filtering.

For example, if your **include filter** contains `replic.*` and you specify the modifier `i` to make the search case insensitive, the regular expression contains the wildcard (`.`) and repeat (`*`) special characters, indicating you want to find strings that start with `replic` followed by any string of characters. Messages containing either `replication` or `replicated` are matched.

The format is the same for the exclude filter. For example, to find log entries that do not start with the string `success`, the exclude filter might be:

```
^success.*
```

If you are only searching for included strings, you can leave the exclude filter blank. If you want to retrieve all messages in the log in a given interval, you can specify `.*` for the include filter and leave the exclude filter blank.

74.1.1 Special Characters for Regular Expressions

The following special characters can be used in regular expressions:

Character	Purpose
.	Wildcard for any one character
*	Repeat zero or more occurrences
^	Beginning of the line
\$	End of the line
\	Escape the next meta-character
|	Alternate matches
[ ]	Any character in the class set. You can specify individual characters or ranges
( )	Grouping characters. For example, you can specify (a|b|c) to indicate a match with a, or b, or c
+	Quantifier indicating one or more occurrences
?	Quantifier indicating zero or one occurrence
{*n*}	Quantifier indicating exactly *n* occurrence
\w	A word character (alphanumeric plus _)
\s	A white-space character
\d	A digit character

If you use any of these special characters in a literal string, you must "escape" it with a single backslash (\) character. For example, if you run the AsciiLog Knowledge Script, which scans an ASCII text file for

specific strings and messages, and you want to search the log for the string **www.netiq.com**, the string you specify in the Knowledge Script parameter is `www\.netiq\.com`

74.1.2 Modifiers for Regular Expressions

In addition to the special characters you can use to create the regular expression, you can also use modifiers to change how pattern-matching is handled. Valid modifiers include:

Modifier	Description
`c`	Complements the search list
`g`	Matches globally as many times as possible
`i`	Makes the search case insensitive
`m`	Treats the string as multiple lines
`o`	Interpolates variables only once
`s`	Treats the regular expression string as a single long line
`x`	Allows for regular expression extensions

74.2 AIXLparUtil

Use this Knowledge Script to monitor Logical Partitions (LPAR) utilization on AIX computers. LPAR utilization is measured in percentage. This Knowledge Script collects utilization data based on the following parameters:

- Percentage of partition utilized in user mode
- Percentage of partition utilized in system kernel mode
- Percentage of partition utilized for I/O operations
- Percentage of partition in idle mode
- Number of physical processors consumed
- Entitled capacity consumed
- Logical processor utilization

You can set thresholds for each of these parameters. If the partition utilization exceeds any threshold, an event is generated.

74.2.1 Resource Object

CPU icon on AIX

74.2.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Number of seconds between samples	Enter the data collection interval, from 2 to 30, in seconds for the `lparstat` utility. The default value is 5 seconds.
Number of times lparstat should iterate before reporting an average value	Enter the iteration count, from 1 to 100, for the `lparstat` utility. The default value is 3.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.
Data Collection Options	
Collect data for %User CPU state?	Set to **y** to collect data for the percentage of CPU used in user mode. The default is **n**, the data is not collected.

Description	How to Set It
Collect data for %System CPU state?	Set to **y** to collect data for the percentage of CPU used in kernel/system mode. The default is **n**, the data is not collected.
Collect data for %Wait CPU state?	Set to **y** to collect data for the percentage of CPU used in I/O mode. The default is **n**, the data is not collected.
Collect data for %Idle CPU state?	Set to **y** to collect data for the percentage of CPU in the idle mode. The default is **n**, the data is not collected.
Collect data for total CPU utilization?	Set to **y** to collect data for the total percentage of CPU used. This includes utilization data when the CPU is in user and kernel/system modes. The default is **y**, the data is collected.
Collect data for number of physical processors consumed?	Set to **y** to collect data for the number of physical processors consumed by the CPU. The default is **y**, the data is collected.
Collect data for %Entitled capacity consumed?	Set to **y** to collect data for the total percentage of entitled capacity used. The default is **y**, the data is collected.
Collect data for %Logical processors utilization?	Set to **y** to collect data for the total percentage of logical processor used. The default is **y**, the data is collected.
Thresholds and Eventing	
Threshold – Maximum %User CPU state. -1 disables	Enter the threshold value, from 1 to 100, for the maximum percentage of CPU utilization in user mode. AppManager raises an event if the CPU utilization exceeds this threshold. Enter -1 to disable the threshold. The default is 90%.
Threshold – Maximum %System CPU state. -1 disables	Enter the threshold value, from 1 to 100, for the maximum percentage of CPU utilization in the kernel/system mode. AppManager raises an event if the CPU utilization exceeds this threshold. Enter -1 to disable the threshold. The default is 90%.
Threshold – Maximum %Wait CPU state. -1 disables	Enter the threshold value, from 1 to 100, for the maximum percentage of CPU utilization in the I/O wait mode. AppManager raises an event if the CPU utilization exceeds this threshold. Enter -1 to disable the threshold. The default is 90%.
Threshold – Maximum %Idle CPU state. -1 disables	Enter the threshold value, from 1 to 100, for the maximum percentage of CPU in the idle mode. AppManager raises an event if the CPU utilization exceeds this threshold. Enter -1 to disable the threshold. The default is 10%.
Threshold – Maximum total CPU utilization	Enter the threshold value, from 1 to 100, for the maximum percentage of total CPU utilization (in user and kernel/system modes). AppManager raises an event if the CPU utilization exceeds this threshold. The default is 90%.
Threshold – Maximum number of physical processors consumed. -1 disables	Enter the threshold value, from 1 to 100, for the maximum number of physical processors consumed. AppManager raises an event if the number exceeds this threshold. Enter -1 to disable the threshold. The default is -1.
Threshold – Maximum %Entitled capacity consumed. -1 disables	Enter the threshold value, from 1 to 1000, for the maximum percentage of entitled capacity utilization. AppManager raises an event if the capacity exceeds this threshold. Enter -1 to disable the threshold. The default is -1.
Threshold – Maximum %Logical processors utilization. -1 disables	Enter the threshold value, from 1 to 1000, for the maximum percentage of logical processor utilization. AppManager raises an event if the processor utilization exceeds this threshold. Enter -1 to disable the threshold. The default is -1.

74.3 ApplicationProcessMonitor

Use this Knowledge Script to monitor the number of application processes for a particular application.

An application can include multiple application processes. Each application process in turn can have more than one process instance. If the total number of process instances for any of the application processes detected falls below the threshold count you set, AppManager raises an event.

The threshold parameter allows you to set a separate threshold for multiple monitored processes. First, supply a list of processes to monitor for the `Process names` parameter. Separate the process names in the list with commas and no spaces. Then supply a comma-separated list of threshold values that correspond to the processes and are listed in the same order.

You also have the option to restart any process that appears to be down. Anytime the number of process instances for a process reaches 0, this Knowledge Script can invoke a restart command that you supply (see the `Command to restart processes when process count crosses minimum threshold` parameter, below). You can enable events to notify you if the attempt to restart a process with a process count of 0 has succeeded or failed. These events are triggered by the output term corresponding to success in your command script. You need to supply this output term for the `Word(s) in restart command output that indicate success` parameter.

If you enable data collection, this Knowledge Script returns the current process instance count for all the processes in the monitored application(s).

74.3.1 Resource Object

UNIX CPU folder

74.3.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

74.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Application to monitor	Supply the name of the application whose processes you want to monitor. The default is `My Application`.
Process Monitoring	
Process names (comma-separated)	Supply the names of processes to monitor. Separate names of multiple processes with commas and no spaces.
Threshold – Minimum number of processes (comma-separated)	Specify the minimum number of process instances that must be running for each monitored process to prevent an event from being raised. Separate multiple threshold values with commas and no spaces. To ensure that the proper threshold is applied to the intended process, list thresholds in the same order as you listed processes for the `Process names` threshold.

Description	How to Set It
Threshold – Maximum number of processes (comma-separated)	Specify the maximum number of process instances that must be running for each monitored process to prevent an event from being raised. If an application is running more than this number of process instances, an event is raised. Separate multiple threshold values with commas and no spaces. To ensure that the proper threshold is applied to the intended process, list thresholds in the same order as you listed processes for the `Process names` threshold.
Command to restart processes when process count crosses minimum Threshold (comma-separated)	Specify a command to use to restart any process whose process count is higher than the threshold. Separate multiple commands with commas and no spaces. Leave this parameter blank if you do not want to restart processes automatically.
Word(s) in restart command output that indicate success (vertical bar-separated)	Specify a list of the words to be returned by the scripts you supplied to indicate that the scripts succeeded in restarting a process. The presence of these words triggers the success event in AppManager. Use a vertical bar character (|) to separate multiple words, and use a comma to separate the word groups for each process. The default is: `started|success|succeed`
Event Notification	
Raise event if number of processes falls below threshold?	Select **Yes** to raise an event if the process instance count for any monitored process falls below a threshold you set. The default is yes.
Event severity when number of processes falls below threshold	Enter the event severity level, from 10 to 19, to indicate the importance of the event. The default is 10.
Event severity when attempt to restart process fails	Enter the event severity level, from 1 to 9, to indicate the importance of the event. The default is 5.
Event severity when attempt to restart process succeeds	Enter the event severity level, from 20 to 40, to indicate the importance of the event. The values you enter for the `Word(s) in restart command output that indicate success` parameter trigger this event. The default is 25.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.
Data Collection	
Collect data for number of processes?	Select Yes to collect data for charts and reports. If enabled, this script returns the number of process instances detected for each monitored process. The default is yes.

74.4 AsciiLog

Use this Knowledge Script to monitor an ASCII text file for specific strings and messages logged since the last monitoring interval. This Knowledge Script allows you to specify the filename, and a regular expression to identify the string to look for or to exclude. The script scans the ASCII file and reports the matching entries found since the last monitoring period. The script checks for changes to the text file that match the expression you enter; it does not re-scan the entire file at each interval unless it determines that the entire file is new (either because the new file size is smaller or because the cyclic redundancy check indicates there is a new file).

This Knowledge Script reads the entire file to find matching strings the first time it executes. The AsciiLog Knowledge Script tracks the last item read in the file persistently. If the Knowledge Script restarts, it is treated as the first iteration. Because the file it is monitoring has already been read before, the first iteration (that is, after restart), starts reading the file from where the marker stopped before it restarted.

You can configure the script to ignore any ASCII log entries that were generated while the computer was in maintenance mode.

You can also configure the script to perform a cyclic redundancy check (CRC) on the file for the purpose of determining when a file has been replaced rather than appended. If the original has been replaced by a file of the same size or by a larger file, the CRC exposes that change and cause the script to parse the entire new file.

If the file is recreated between intervals and the file size is smaller than the previous version of the file, the script treats it as a new file and searches it from the beginning.

The script raises an event if the number of lines matching your search criteria exceeds the threshold you set, or if the file is missing.

Scanning a large log, bigger than 1 GB for example, might use more operating system resources than you want this script to use. If that happens, reduce the size of the log.

NOTE: To specify the include and exclude patterns, you need to be familiar with Perl regular expressions. Some information is available in the topic "Creating Filters with Regular Expressions" on page 4072.

You can use this script to monitor any text file the UNIX agent has permission to read. If the UNIX agent runs under a specific username rather than `root`, ensure that user account has read permission for the files you want to monitor.

74.4.1 Resource Object

UNIX computer icon

74.4.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event? (y/n)	Select **y** to raise events for the ASCII log. The default is **y**.
Event if log missing? (y/n)	Select **y** to raise an event if the log is missing. The default is **y**.
Event if log file list changed? (y/n)	Select **y** to raise an event if the number of log files changes, for example, if a new file is added. The default is **y**.
Create event for each matching line? (y/n)	Select **y** to raise a new event for each line that meets the event criteria. The default is **n**, no event is created.
Do you want to limit the number of matching lines returned? (y/n)	Select **y** to limit the number of lines from the log file matching the search criteria that is returned from a single job iteration. If you are expecting numerous matches, enable this limit. Console performance might be adversely affected by jobs that return a very large number of matches Use the `Maximum number of matching lines to return` parameter to specify a limit.
Maximum number of matching lines to return	Enter the maximum number of lines, from 0 to 9999, from the log file matching the search criteria to be returned from a single job iteration. This limit avoids a degradation in performance in cases where many lines match the search criteria. To set a limit here, you must enable the `Do you want to limit the number of matching lines returned?` parameter. The default is 500 lines.
Parse the log file the first time? (y/n)	Select **y** to parse the file for the strings you have identified the first time the script runs. Subsequent iterations of the script measure any differences between this version of the file and any subsequent versions. If you select **n**, the first iteration of the script reads the file and inserts a marker at the end. Subsequent iterations of the script then measure differences in the script from this point forward. The default is **n**.
Create events for lines generated during maintenance mode? (y/n)	Select **y** to have AppManager report events for ASCII log entries that were created when the computer was in maintenance mode. If you select **n**, AppManager ignores all ASCII log entries created while the computer is in maintenance mode. The default is **y**.
Collect data? (y/n)	Select **y** to collect data. The script returns the number of lines containing matching strings. The default is no data is collected.
File names to parse (full path, UNIX-like shell pattern matching notation and comma-separated)	Enter the full path to the file you want to monitor or a regular expression representing the file. You can enter multiple files, comma separated without spaces. An event is created when the file is not found, and when files matching the description are added or deleted since the previous job. For example: `/tmp/applog.log,/\/var\/log\/netlog[0-9]/` The UNIX agent must run as an account that has permission to read the file. If you restrict read access on files, you might need to change the account the UNIX agent uses. The default is `/etc/hosts`.
Maximum number of log files to parse (value 0 equals infinite)	Enter the maximum number of log files, from 0 to 100, that you want to monitor. This limit avoids a degradation in performance in environments with numerous large log files. Enter 0 if you want all log files monitored. The default is 0, all log files are monitored.
Regular expression specifying the include filter	Enter a regular expression in Perl, to identify the pattern you want to look for in the text file being monitored. Strings matching the include filter pattern are returned. The default expression, `.+`, matches all strings.

Description	How to Set It
Optional file with regular expressions specifying the include filter	If you do not want to enter a regular expression in the `Regular expression specifying the include filter` parameter, specify the full path to a file containing the regular expression specifying the include filter.
Modifier for the regular expression include filter	Enter any modifier you want to use to change the behavior of the regular expression. For example, specifying `i` for this parameter makes the include filter case-insensitive. For more information about writing Perl regular expressions, see "Creating Filters with Regular Expressions" on page 4072.
Regular expression specifying the exclude filter	Enter a regular expression, in Perl, to identify the pattern you want to exclude from matching in the text file being monitored. Strings with the exclude filter pattern are not returned. Separate multiple commands with commas and no spaces. For information about writing Perl regular expressions, see "Creating Filters with Regular Expressions" on page 4072.
Optional file with regular expressions specifying the exclude filter	If you do not want to enter a regular expression in the `Regular expression specifying the exclude filter` parameter, specify the full path to a file containing the regular expression specifying the exclude filter.
Modifier for the regular expression exclude filter	Enter any modifier you want to use to change the behavior of the regular expression. For example, specifying `i` for this parameter makes the exclude filter case-insensitive. For information about writing Perl regular expressions, see "Creating Filters with Regular Expressions" on page 4072.
Threshold for matching lines	Enter the number of times, from 0 to 99999, to detect a line that matches the search criteria before raising an event. The default is 0, which is the first instance that exceeds the threshold and raises an event.
Validate previously scanned lines with CRC? (y/n)	Select **y** to perform a cyclic redundancy check on the log file. The default is **y**.
Maximum number of log files to keep	Enter the maximum number of log files, from 0 to 9999, to create when the Knowledge Script logs ASCII entries. The default is 10.
Event severity level for threshold crossing	Set the event severity level, from 1 to 40, for crossing the specified threshold. The default is 5.
Event severity level for all other errors	Set the event severity level, from 1 to 40, when an error occurs. The default is 10.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.5 CpuByProcess

Use this Knowledge Script to monitor whether specific processes have exceeded CPU thresholds. The Knowledge Script monitors CPU usage for each named process, as well as the total CPU usage for all named processes.

To determine CPU usage, the Knowledge Script checks the percentage of processor time that the threads for each process used to execute instructions. If a process is not found, the Knowledge Script raises an event and the event detail message indicates which process was not found.

74.5.1 Resource Object

UNIX CPU folder

74.5.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Comma-separated list of process names or regular expressions	Enter one or more process names or regular expressions, separated by commas and no spaces. For example: `qtest.d`. The default is `proc1,proc2`.
Event Settings	
Create event for each specified process?	Set to **y** to raise events for individual processes. The default is **y**.
Create event for the sum of all specified processes?	Set to **y** to raise events for all processes. The default is **y**.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.
Threshold Settings	
Maximum CPU usage (%) for each specified process	Select a threshold for the maximum CPU usage, from 0 to 10000, for each process. You cannot enter negative values. The default is 60.
Maximum CPU usage (%) for all specified processes together	Enter a threshold, from 0 to 10000, for maximum combined CPU usage for all processes you are monitoring. You cannot enter negative values. The default is 95.
Collect Data Settings	
Collect data for each specified process?	Set to **y** to collect data for charts, graphs, and reports for individual processes. The default is **n**, no data is collected for individual processes to generate charts, graphs, or reports.
Collect data on the sum of all specified processes?	Set to **y** to collect data for charts, graphs, and reports for all processes you are monitoring. The default is **n**, no summation data is collected for charts, graphs, or reports.

Description	How to Set It
Event severity level	Enter the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

NOTE: This Knowledge Script does not detect invalid process names. If you enter an invalid process name, the Knowledge Script assumes that the process is not running, and reports zero as the CPU result.

74.6 CpuLoaded

Use this Knowledge Script to monitor average CPU usage and average queue length to determine whether the CPU is overloaded. You can monitor the average usage on each processor or the average usage across all processors in a computer. If both the CPU usage and CPU queue length thresholds are exceeded, the CPU is overloaded and AppManager raises an event.

On some systems the CPU queue length does not rise easily and you might want to ignore the queue length. If you do not want to monitor the CPU queue length, set `Maximum number of processes in the queue threshold` to -1.

74.6.1 Resource Objects

CPU folder or any individual CPU icon (for multiprocessor systems).

74.6.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

74.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if CPU usage and queue are over thresholds? (y/n)	Set to **y** to raise events. The default is **y**.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. When set to y, this script returns the average CPU utilization percentage (%) and the average CPU run queue length. The default is **n**. **Tip** If you only want to collect run queue length data, use the UNIX_GeneralCounter Knowledge Script.
Monitor overall CPU load? (y/n)	Set to **y** to monitor the average load across all processors in a computer. If you are collecting data, setting this option to **y** creates a single data stream for all processors. Set to **n** to monitor the average load for each processor separately. If you are collecting data, setting this option to **n** creates a separate data stream for each processor. The default is **y**. **NOTE:** For a single CPU system, monitoring all CPUs produces the same results as monitoring an individual CPU.
Maximum CPU usage (%) threshold	Type a threshold for maximum CPU utilization (user plus kernel). The default is 90%.
Maximum number of processes in the queue threshold	Type a queue length threshold. CPU queue length indicates how many processes are ready to run. The default is 2. If you do not want to monitor the CPU queue length, set the threshold to -1.

Description	How to Set It
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.6.4 Example of How this Script Is Used

This script monitors both the percentage of CPU used and processor queue length because, by itself, high CPU usage might not indicate a problem. Instead, you need to consider several factors, including:

- Queue length (Load average)
- How you are using the computers monitored
- Your overall strategy for the environment

For example, if you have a **transactional** environment on a computer consistently using 90% of the CPU, the computer is full. However, if the queue length remains low and stable (for example, never more than 2 processes waiting), it might indicate the computer is sized perfectly for maximum efficiency. If the queue length increases and you have processes waiting, it is likely to be a problem you need to address.

In a **batch** environment, consider setting the thresholds differently; for example, during down times when batch jobs are not running you might want an event if CPU usage is over 50% and any process is waiting (queue length at 0) to ensure the computer has enough CPU headroom when the batch jobs are running.

Other factors to consider are long-range plans, such as the number of users you expect to support, for how long, and how much room for growth you need. For example, you might want to set the CPU usage lower to give you an early warning that you need to off-load some processing or order new systems.

74.6.5 Selecting Overall or Individual CPU Load

Monitoring load for each CPU individually provides more specific information about what is happening on a system. For example, if you monitor average load and see CPU usage is 100%, it does not tell you as much about the resource usage as seeing that CPU 0 is running at 90% and CPU 1 is running at 10%.

74.6.6 Handling Spikes

Because CPU and queue length are often subject to temporary spikes, you should set a short interval, such as every 3 to 5 minutes, but raise an event only after thresholds are exceeded in 3 consecutive periods.

74.6.7 Collecting Data

This Knowledge Script is typically used to raise events, but if you collect data, you can use the information to identify usage trends. For example, seeing the CPU usage growing steadily can help you plan for growth. If you want to do this type of analysis, consider running a second job at a less frequent interval.

You can configure this Knowledge Script to collect data on the average CPU utilization percentage (%) and the average CPU run queue length. You can collect data for the average usage on each processor or the average usage across all processors in a computer.

74.6.8 Working with Multi-Processor Systems

On a multi-processor system, the total CPU utilization is the average percentage of time that all the processors on the system are busy executing non-idle threads. For example:

- if all processors are always busy, this is 100%.
- if all processors are 50% busy, this is 50%.
- if 25% of the processors are busy and all processors use a single queue in which threads wait for a processor cycle, this is 25%.

74.7 CpuResources

Use this Knowledge Script to monitor CPU resource consumption for users. This Knowledge Script also monitors the number of active processes, the number of threads, the number of context switches per second, and the number of interrupts per second. If any metric exceeds one of the thresholds you set, AppManager raises an event.

74.7.1 Resource Object

CPU folder

74.7.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event settings	
Event if user CPU time (%) exceeds threshold?	Set to **y** to raise an event if user CPU time usage exceeds the threshold in the interval. The default is **y**.
Event severity when user CPU time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when the user CPU time exceeds the threshold. The default is 5.
Event if number of processes exceeds threshold?	Set to **y** to raise an event if the number of processes exceeds the threshold in the interval. The default is **y**.
Event severity when number of processes exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when the number of processes exceeds the threshold. The default is 5.
Event if number of threads exceeds threshold?	Set to **y** to raise an event if the number of threads exceeds the threshold in the interval. The default is **y**.
Event severity when number of threads exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when the number of threads exceeds the threshold. The default is 5.
Event if context switch rate exceeds threshold?	Set to **y** to raise an event if the context switches per second exceeds the threshold in the interval. The default is **y**.
Event severity when context switch rate exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when the number of context switches per second exceeds the threshold. The default is 5.
Event if interrupt rate exceeds threshold?	Set to **y** to raise an event if the number of interrupts per second exceeds the threshold in the interval. The default is **y**.
Event severity when interrupt rate exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when the number of interrupts per second exceeds the threshold. The default is 5.

Description	How to Set It
Event severity for miscellaneous runtime errors	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when a runtime error occurs. The default is 8.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.
Threshold settings	
Threshold – Maximum CPU usage (%) for user time	Enter a threshold for the maximum CPU usage in user mode. The default is 80%.
Threshold – Maximum number of processes	Enter a threshold for the maximum number of processes that can be running simultaneously. The default is 100 processes.
Threshold – Maximum number of threads	Enter a threshold for the maximum number of threads that can be running simultaneously. The default is 400 threads.
Threshold – Maximum context switch rate	Enter a threshold for the maximum number of context switches per second. The default is 100 switches per second.
Threshold – Maximum interrupt rate	Enter a threshold for the maximum number of interrupts per second. The default is 500 switches per second.
Collect data settings	
Collect data for user CPU time?	Set to **y** to collect the percentage of user CPU time usage during the interval so that the data can be used for graphs and reports. By default, data is not collected.
Collect data for number of processes?	Set to **y** to return the number of active processes for the interval so that the data can be used for graphs and reports. By default, data is not collected.
Collect data for number of threads?	Set to **y** to return the number of threads for the interval so that the data can be used for graphs and reports. By default, data is not collected.
Collect data for context switches per second?	Set to **y** to return the number of context switches per second so that the data can be used for graphs and reports. By default, data is not collected.
Collect data for interrupts per second?	Set to **y** to return the number of interrupts per second so that the data can be used for graphs and reports. By default, data is not collected.

74.8 CpuUtil

Use this Knowledge Script to monitor CPU utilization and queue length. CPU utilization is measured in percentage. This Knowledge Script collects utilization data based on the following parameters:

- User: Percentage of CPU utilized in user mode
- System: Percentage of CPU utilized in kernel mode
- Wait: Percentage of CPU utilized for I/O operations
- Idle: Percentage of CPU in idle mode

You can set thresholds for each of these parameters. If the CPU utilization exceeds any threshold, an event is generated.

If you are using Logical Partitions (LPAR) on AIX, use the AIXLparUtil Knowledge Script.

74.8.1 Resource Object

CPU icon

74.8.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitor overall CPU load? (y/n)	Set to **y** to monitor the total load on the CPU. If you set the value to **n**, only individual CPUs are monitored By default, CPU load is monitored. The default is **y**.
Number of seconds between samples	Enter the data collection interval (in seconds), from 2 to 30, for the `sar` utility. The default value is 5 seconds.
Number of times sar should iterate before reporting an average value	Enter the iteration count, from 1 to 100, for the `sar` utility. The default value is 1.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Data Collection Options	
Collect data for %User CPU state? (y/n)	Set to **y** to collect data for the percentage of CPU utilized in user mode. The default is **n**.
Collect data for %System CPU state? (y/n)	Set to **y** to collect data for the percentage of CPU utilized in kernel/system mode. The default is **n**.
Collect data for %Wait CPU state? (y/n)	Set to **y** to collect data for the percentage of CPU utilized in I/O mode. The default is **n**.

Description	How to Set It
Collect data for %Idle CPU state? (y/n)	Set to **y** to collect data for the percentage of CPU in the idle mode. The default is **n**.
Collect data for Total CPU utilization? (y/n)	Set to **y** to collect data for the total percentage of CPU utilized. This includes utilization data when the CPU is in user and kernel/system modes. The default is **y**.
Collect data on CPU Queue Length? (y/n)	Set to **y** to collect data for the number of processes in the CPU run queue. The default is **n**.
Thresholds and Eventing	
Event if CPU usage exceeds thresholds? (y/n)	Set to **y** to raise an event when the CPU usage exceeds the thresholds you have specified.The default is **y**.
Threshold – Maximum %User CPU state. -1 disables	Enter the threshold value, from 1 to 100, for the maximum percentage of CPU utilization in user mode. AppManager raises an event if the CPU utilization exceeds this threshold. Enter -1 to disable the threshold. The default is 90%.
Threshold – Maximum %System CPU state. -1 disables	Enter the threshold value, from 1 to 100, for the maximum percentage of CPU utilization in the kernel/system mode. AppManager raises an event if the CPU utilization exceeds this threshold. Enter -1 to disable the threshold. The default is 90%.
Threshold – Maximum %Wait CPU state. -1 disables	Enter the threshold value, from 1 to 100, for the maximum percentage of CPU utilization in the I/O wait mode. AppManager raises an event if the CPU utilization exceeds this threshold. Enter -1 to disable the threshold. The default is 90%.
Threshold – Maximum %Idle CPU state. -1 disables	Enter the threshold value, from 1 to 100, for the maximum percentage of CPU in the idle mode. AppManager raises an event if the CPU utilization exceeds this threshold. Enter -1 to disable the threshold. The default is 10%.
Threshold – Maximum Total CPU utilization. -1 disables	Enter the threshold value, from 1 to 100, for the maximum percentage of total CPU utilization (in user and kernel/system modes). AppManager raises an event if the CPU utilization exceeds this threshold. The default is 90%.
Threshold – Maximum number of processes in the queue.	Enter the maximum number of processes that should be allowed to be queued. If the number of processes in queue exceeds the threshold, AppManager raises an event. The default is 10.
Event if queue length is over threshold? (y/n)	Set to **y** to raise an event when the queue length exceeds the threshold you have specified. The default is **n**.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.9 DNSConnectivity

Use this Knowledge Script to check a DNS client's list of name servers. The Knowledge Script identifies the servers to check by scanning the `/etc/resolv.conf` file, then verifies that each server is reachable with a `ping` command and responds to an `nslookup` request. You should run this Knowledge Script on one or more DNS clients to ensure your DNS servers are available and responding to address (`nslookup`) requests. If any server listed in `/etc/resolv.conf` fails to reply to the `ping` command or the `nslookup` request, AppManager raises an event.

You can only use this Knowledge Script on computers that are running a DNS server.

NOTE: If your firewall configuration is set to disable the ping command, you should disable the Attempt to ping servers parameter to avoid unwanted events.

74.9.1 Resource Object

Network folder

74.9.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event? (y/n)	Set to **y** to raise events. The default is **y**.
Attempt to ping servers? (y/n)	Set to **y** to monitor the availability of DNS servers by sending a `ping` command. Set to n if you do not want to verify the server availability using a `ping` command. For example, if your organization or firewall configuration is set to disable the `ping` command, you should set this option to n to avoid unwanted events. The default is **y**.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

74.10 DNSHealth

Use this Knowledge Script to check the health of the DNS server by monitoring memory and CPU usage for the DNS process and attempting a basic address look-up (`nslookup`) request. With this Knowledge Script, you can set separate thresholds for the maximum percentage of CPU and memory the DNS process should be using.

This script raises an event if:

- CPU used by the DNS process exceeds the threshold
- Memory used by the DNS process exceeds the threshold
- The DNS process fails to respond to the look-up request

Because temporary spikes or increases in memory or CPU consumption are typically of less concern than look-up failures, the default event severity level signalling that the memory or CPU threshold has been crossed is a Warning event. For look-up failures, the default severity level indicates that the failure is a Severe event.

You can only use this Knowledge Script on computers that are running a DNS server.

74.10.1 Resource Object

Network folder

74.10.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if CPU usage is over threshold? (y/n)	Set to **y** to raise events for CPU usage over the threshold in the interval. The default is **y**.
Event if memory usage is over threshold? (y/n)	Set to **y** to raise events for memory usage over the threshold in the interval. The default is **y**.
Event if bind not running or nslookup fails? (y/n)	Set to **y** to raise events when the DNS process is down or the look-up request fails in the interval. The default is **y**.
Collect cpu usage data? (y/n)	Set to **y** to collect CPU data for charts and reports. If set to **y**, the script returns the average percentage of CPU used. The default is **n**.
Collect memory usage data? (y/n)	Set to **y** to collect data for charts and reports. If set to **y**, the script returns the average percentage of memory the DNS process used. The default is **n**.
Maximum CPU usage (%) threshold	Enter a threshold for maximum percentage of CPU the DNS process should be allowed to use before raising an event. The default is 90% of available CPU.

Description	How to Set It
Maximum memory usage (%) threshold	Enter a threshold for maximum percentage of memory the DNS process should be allowed to use before raising an event. The default is 50% of available memory.
Site name to look for using nslookup	Enter the name of the site you want the DNS server to look for using `nslookup`.
Event severity when CPU usage (%) over the threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when the percent of CPU usage crosses the threshold. The default is 15.
Event severity when memory usage (%) over the threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when the percent of memory usage crosses the threshold. The default is 15.
Event severity when DNS is down or nslookup fails	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when the DNS is down or when nslookup fails. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.11 DNSReplication

Use this Knowledge Script to monitor replication between primary and backup DNS nameservers. This Knowledge Script queries the Start of Authority (SOA) records for the DNS server on the local computer where you run the job and the remote DNS server you specify to determine the serial number that's currently in the SOA record for each server. This serial number is incremented when there are changes to the DNS zone. If the serial numbers are the same, there is full replication of the primary DNS server's address list. By default, if the serial numbers are not exactly the same in the SOA records (that is, the maximum serial number difference threshold is set to zero), AppManager raises an event.

Although full replication is desirable in most cases, you can specify a threshold for the serial number difference that you deem acceptable for your organization. For example, you might find it acceptable for the serial numbers on backup DNS servers to be out of sync periodically and so might want to adjust the maximum serial number difference threshold to a higher value to allow for this. If the difference between the serial number on the computer where you run the job and the remote DNS server you specify exceeds the acceptable threshold, AppManager raises an event.

You can only use this Knowledge Script on computers that are running a DNS server.

NOTE: Both the DNS server where you run the job and the DNS server you specify in this Knowledge Script should be nameservers responsible for the domain you specify in this Knowledge Script.

74.11.1 Resource Object

Network folder

74.11.2 Default Schedule

The default interval for this script is **Every hour**.

74.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event? (y/n)	Set to **y** to raise events if the difference between the serial numbers in the SOA records is over the threshold. The default is **y**.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. If set to **y**, the script returns the SOA serial number difference between the servers. The default is **n**.
Maximum serial number difference	Enter a threshold for the maximum difference between SOA serial numbers. The default is 0 (identical serial numbers).
Remote DNS server to compare local SOA records against	Enter the name of the DNS server you want to compare SOA records against. The computer you specify should be a backup or secondary DNS server in the same domain as the DNS server where you drop the Knowledge Script job.
Domain name	Enter the name of the domain the local and remote DNS nameservers are responsible for serving.

Description	How to Set It
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity is 25, indicating this is an “informational” event that does not require immediate attention. If DNS replication is critical in your environment, you might want to set the event severity higher, for example 1-10, for greater visibility.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.12 DynamicFileSystemSpace

Use this Knowledge Script to monitor the used space and free space on various types of mounted file systems, including NFS mounted file systems, that are often unmounted then mounted again. You can also check for incremental increases in used space beyond the specified threshold. For example, you can configure this Knowledge Script to **Create a new event for incremental increases** and set the **Threshold for incremental increases** to 5% to create an event when used space exceeds 80%, and create a new event when used space exceeds 85%, 90%, and 95%.

When checking for incremental increases, a single event is created if the specified threshold is met; event collapsing is not applicable. If you want to monitor incremental increases in used space, do NOT enable the event option on the **Advanced** tab to **Generate a new event when original event condition no longer exists**. If you enable this option, the Knowledge Script incorrectly raises an event.

74.12.1 Resource Object

Logical disk or disks

74.12.2 Default Schedule

The default interval for this script is **Every hour**.

74.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if threshold exceeded?	Specify whether you want to raise an event if the amount of file system space used or free exceeds the capacity threshold you specify. The default is **y**.
Threshold – Maximum used space	Type a threshold for the maximum amount of used space (total capacity). If you use this parameter, select the units you want to use. The default is 80.
Threshold – Minimum free space	Type a threshold for the minimum amount of free space available (total capacity) for use. If you use this parameter, select the units you want to use. The default is -1, meaning no minimum.
Units	Select the unit of measure you want to use to determine the threshold for the used space and free space parameters. Available units are percentage, kilobytes, and megabytes. The default is %.
Incremental Event Notification	
Raise new event for incremental increases?	Specify whether you want to continue to raise events if the amount of file system space used exceeds the capacity threshold you specify and continues to increase since the previous event. The default is **n**.
Threshold – Incremental increases	Type the amount that must be exceeded before another event is raised while the initial threshold remains exceeded. The default is 5.
Data Collection	

Description	How to Set It
Collect data for used and available space?	Specify whether you want to collect data for charts, graphs, and reports. When set to **y**, this script returns the percentage of used file system space, the amount of available file system space, the used space, and free space. The default is **n**.
Event severity when used space exceeds threshold	Set the event severity level, from 1 through 40, to indicate the importance of the event. The default is 5.
Filesystem types to exclude	Specify the types of file systems you do not want to monitor. To determine the type of your mounted file system, use the `df` command with the `-T` option. Separate the file system types by a comma without a space. The default is: `subfs,usbfs,proc,iso9660,fd,ctfs,mntfs,objfs,devfs`
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.13 ExecUtil

Use this Knowledge Script to run non-interactive programs from the command line interface on the agent computer and report output of the program. You can use this script to report events based on the output of the program, and you can also use this script to retrieve numeric data points from the program output so you can create charts and graphs of that data.

This script also allows you to run the program in trial mode so you can ensure the parameters are set the way you want before you schedule jobs. If you run the script in trial mode, AppManager generates an event that provide useful information, such as the output of the script or command, in the event details. Trial mode reports the output of the program, but does not evaluate the output. In trial mode, you can verify that you have properly set parameters for the command, the command arguments, environment settings, and data collection without generating extraneous events.

This script does not support running interactive scripts, such as scripts using the \cat command, and does not support incoming data streams during data extraction, for example, STDIN, Terminal, or TTY.

In order for AppManager to properly interpret the output from your script or executable, the output must be in UNIX plain text.

74.13.1 Resource Object

UNIX computer icon

74.13.2 Default Schedule

The default interval for this script is **Run Once**.

74.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
UNIX executable or script name	Specify the command or script name to run on the UNIX or Linux command line. This is the command or script that AppManager will execute on the operating system, not a descriptive name.
Executable or script arguments	Specify the arguments for the command in the format that the command requires.
Application name	Required field. Specify the name you want AppManager to use to identify the program that runs on the UNIX or Linux command line.
Modify environment variable settings?	Set to yes if you want to temporarily add, change a value for, or ignore environment variables when the command or script runs. The default is no.
Environment variables to set (comma separated,Eg. VAR1=VAL1,VAR2=VAL2)	Specify the new environment variables you want to set or the existing environment variables you want to override during the execution of the command or script. Separate the variables with a comma, but no spaces. AppManager does not permanently change the variables that you list in this parameter.

Description	How to Set It
Environment variables to unset (comma separated,Eg. VAR1,VAR2)	Specify the environment variables to ignore during the execution of the command or script. Separate the variables with a comma, but no spaces. AppManager does not permanently remove the variables that you list in this parameter.
Inherit environmental settings for data extraction command?	Set to yes if you want AppManager to use the same environment variable parameter settings to retrieve data from the output of the program as AppManager used to run the program. The default is no.
Trial mode? (reports output without validating)	Set to yes if you want AppManager to run the program and report the output of the program, but not compare the output to the criteria you have set for events. Use this parameter to ensure that you have properly configured the parameters in this Knowledge Script to generate the events and data that you want. The default is yes.
Event Settings	
Raise event with the standard output?	Set to yes if you want AppManager to report an event if the program generates any output. The details of the event contain the output of the program. When you run in Trial Mode, this parameter is ignored. The default is no.
Event severity	Set the event severity level, from 1 through 40, to indicate the importance of the event generated for standard output. The default is 25.
Raise event if execution generates no output?	Set to yes if you want to raise an event if the program does not generate any results. This parameter will create an event if the program fails to execute. When you run in Trial Mode, this parameter is ignored. The default is yes.
Event severity	Set the event severity level, from 1 through 40, to indicate the importance of the event generated if the program does not create output. The default is 5.
Raise event if output contains specific strings?	Set to yes if you want to raise an event if the program generates output that matches a specified character string. Specify the criteria using the **String list** parameter. If you enter multiple character strings, a separate event is raised for each string that matches the output. When you run in Trial Mode, this parameter is ignored. The default is no.
String list (comma separated)	Specify one or more set of UNIX plain text characters to compare to the output of the program. Do not use special characters or rich text. Separate the strings with commas and no spaces. For example, `Incomplete,Data out of bounds,7,error9`
Match case?	Set to yes if you want to distinguish between uppercase and lowercase. The default is `n`.
Event severity	Set the event severity level, from 1 through 40, to indicate the importance of the event generated when the output matches a specified character string. The default is 5.
Raise event if output doesn't contain specific strings?	Set to yes if you want to raise an event if the program generates output that does not include a specified character string. Specify the criteria using the **String list** parameter. If you enter multiple character strings, a separate event is raised for each string that is not included in the output. When you run in Trial Mode, this parameter is ignored. The default is `n`.
String list (comma separated)	Specify one or more sets of characters to compare to the output of the program. Separate the strings with commas and no spaces. For example, `No data available,Data written to file,InfoMessage2`
Match case?	Specify whether you want to distinguish between uppercase and lowercase. The default is `n`.

Description	How to Set It
Event severity	Set the event severity level, from 1 through 40, to indicate the importance of the event generated when the output does not include a specified character string. The default is 5.
Raise event if extracted numeric data exceed thresholds?	Set to yes if you want to raise an event if data over a specified threshold is extracted from the program using the **Data Collection** parameters. Specify the numeric threshold using the **Thresholds for extracted data** parameter. When you run in Trial Mode, this parameter is ignored. The default is `n`.
Event severity	Set the event severity level, from 1 through 40, to indicate the importance of the event generated when the data extracted exceeds the threshold. The default is 5.
Data Collection	
Collect numeric data?	Set to yes if you want AppManager to extract numeric data from the program output that can be used to create charts and graphs or generate events if the number is greater than or less than specified thresholds. You can extract more than one number to use for graphing or to generate events, but the data must be numeric so AppManager can perform the necessary calculations. You can extract negative numbers and decimals, but not numbers that are in scientific notation. The default is no.
Data extraction method? (awk/perl/custom)	Specify how you want AppManager to get numeric data from the output generated by the command or application you specified in the General Settings parameters. If you use AWK or Perl, ensure that the account running the agent can access the utilities. The default is custom command.
Data extraction arguments or expression	Specify the command or expression to extract the numeric data from the program output.
Labels to use for extracted data (comma separated)	Specify the name for AppManager to use to identify the extracted numeric data. If you have multiple numbers, separate the labels for each with a comma and no spaces.
Thresholds for extracted data (comma separated,Eg. MAX1:MIN1,MAX2:MIN2)	Type a set of maximum and minimum thresholds for the extracted data. Separate the maximum and minimum with a colon and no spaces. For example, if you want AppManager to generate an event when the numeric data goes above 75 or below 50, enter `75:50`. If you have multiple numbers, separate the thresholds for each number with a comma and no spaces. For example, `75:50,8600:-2486`.

74.14 FailedLogon

Use this Knowledge Script to monitor the number of failed log-on and switch-user-to-root (`su`) attempts since the last interval. The result is always zero for the first interval so that the Knowledge Script can establish a baseline for subsequent checks. A higher than average number of failed logon or `su` attempts might indicate an attempt to break in to the server or that password guessing programs are being used to try to crack the security on the server.

If the number of failed logon or switch user attempts exceeds the threshold you set, AppManager raises an event.

To run this Knowledge Script as a non-root user on a CentOS computer:

1. Log in using the root account.
2. Run the command `chmod +w /etc/uroot.cfg`.
3. In the uroot configuration file, using for example, `vi /etc/uroot.cfg`, add `/bin/grep` to the end.
4. Save the uroot configuration file.
5. Run the command `chmod -w /etc/uroot.cfg`.

74.14.1 Resource Object

UNIX computer icon

74.14.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event for failed login? (y/n)	Set to **y** to raise an event if the number of failed user login attempts exceeds the threshold in the interval. On Solaris, a failed log-on attempt is only registered after five consecutive failures. The default is **y**.
Event severity level for failed login	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.
Event for failed su? (y/n)	Set to **y** to raise an event if the number of failed attempts to log in as root using the (`su`) command exceeds the threshold in the interval. The default is **y**.
Event severity level for failed su	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

Description	How to Set It
Collect data? (y/n)	Set to **y** to collect data for charts and reports. If set to **y**, the script returns the number of failed login attempts for the interval. The default is **n**.
System log file (leave blank for default)	Type the full path to the location of the log file that records failed attempts to use the `login` command. For more information about how to register logins and record failed attempts to a log file, see your operating system documentation. If you leave this parameter blank, the script checks for the log file in the following default locations: • On Sun Solaris, the default location is `/var/adm/loginlog` • On HP-UX 11.1 and earlier, the default location is `/var/adm/btmp` • On HP-UX 11.2 and later, the default location is `/var/adm/btmps` • On IBM AIX, the default location is `/etc/security/failedlogin` • On Linux, the default location is `/var/log/messages` **NOTE:** On IBM AIX computers, if you configured syslog to log failed login attempts in a file other than the default file, ensure the non-default log file is available by performing the following steps: 1. Create the log file where you want to log failed login attempts. For example, `/var/adm/messages`. For more information, see your IBM AIX documentation. 2. Specify the full path to the log file in the `syslog.conf` system file. 3. Restart `syslog` for the changes to take effect.
System su log file (leave blank for default)	Type the full path to the location of the system log file that records failed attempts to use the `su` command. For more information about how to log failed su attempts to a log file, see your operating system documentation. If you leave this parameter blank, the script checks for the log file in the following default locations: • On Sun Solaris, the default location is `/var/adm/sulog` • On HP-UX, the default location is `/var/adm/sulog` • On IBM AIX, the default location is `/var/adm/sulog` • On Linux, the default location is `/var/log/messages` **NOTE:** On IBM AIX computers, if you configured syslog to log failed attempts to use the `su` command in a file other than the default file, ensure the non-default log file is available by performing the following steps: 1. Create the log file where you want to log failed attempts to use the `su` command. For example, `/var/adm/sulog`. For more information, see your IBM AIX documentation. 2. Specify the full path to the log file in the `syslog.conf` system file. 3. Restart `syslog` for the changes to take effect.
Maximum number of failed login attempts	Enter a threshold for the number of failed logon attempts. The default is 1 failed attempt. **Tip** If you find you are generating too many events from users entering passwords incorrectly, you can determine a typical log on failure pattern (for example 5 per 24 hours) using the Collect data option, then set this parameter based on the typical pattern.
Maximum number of failed su attempts	Enter a threshold for the number of failed `su` attempts. The default is 1 failed attempt.

74.15 FileSystemSpace

Use this Knowledge Script to monitor the used space and free space on mounted file systems and optionally, check for incremental increases in used space beyond the specified threshold.

For example, you can configure this Knowledge Script to **Create a new event for incremental increases** and set the **Threshold for incremental increases** to 5% to create an event when used space exceeds 80%, and create a new event when used space exceeds 85%, 90%, and 95%.

When checking for incremental increases, a single event is created if the specified threshold is met; event collapsing is not applicable. If you want to monitor incremental increases in used space, do NOT enable the event option on the **Advanced** tab to **Generate a new event when original event condition no longer exists**. If you enable this option, the Knowledge Script incorrectly raises an event.

If you want to prevent monitoring of some types of file systems, use the DynamicFileSystemSpace Knowledge Script.

74.15.1 Resource Objects

Any logical disk or disks.

74.15.2 Default Schedule

The default interval for this script is **Every hour**.

74.15.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if threshold exceeded?	Specify whether you want to raise an event if the amount of file system space used or free exceeds the capacity threshold you specify. The default is yes.
Threshold – Maximum used space	Type a threshold for the maximum amount of used space (total capacity). If you use this parameter, also select the units you want to use. The default is 80.
Threshold – Minimum free space	Type a threshold for the minimum amount of free space available (total capacity) for use. If you use this parameter, also select the units you want to use. The default is -1, meaning no minimum.
Units	Select the unit of measure you want to use to determine the threshold for the used space and free space parameters. Available units are percentage, kilobytes, and megabytes. The default is %.
Incremental Event Notification	
Raise new event for incremental increases?	Specify whether you want to continue to raise events if the amount of file system space used exceeds the capacity threshold you specify and continues to increase since the previous event. The default is no.
Threshold – Incremental increases	Type the amount that must be exceeded before another event is raised while the initial threshold remains exceeded. The default is 5.

Description	How to Set It
Data Collection	
Collect data for used and available space?	Specify whether you want to collect data for charts, graphs, and reports. When set to yes, this script returns the amount of used file system space, the amount of available file system space, the used space, and free space. The default is no.
Event severity when used space exceeds threshold	Set the event severity level, from 1 through 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.16 FileSystemSpaceLC

This Knowledge Script uses a configuration file on the managed client computer to monitor the percentage of used space on mounted file systems as reported by the system `df` command and optionally, check for incremental increases in used space beyond the specified threshold. Using the configuration file, you can specify a different threshold for each file system and therefore receive event information for each (for example, when `/usr` is at 95% and `/bin` is at 80%).

When checking for incremental increases, a single event is created if the specified threshold is met; event collapsing is not applicable. If you want to monitor incremental increases in used space, do NOT enable the event option on the **Advanced** Knowledge Script Properties tab to **Generate a new event when original event condition no longer exists**. If you enable this option, the Knowledge Script incorrectly creates an event.

NOTE: You can set thresholds for file systems not in the configuration file but found as the result of a df command. You can enable events and data collection for these file systems. You can also use this Knowledge Script to dynamically monitor file systems without re-running discovery.

74.16.1 Resource Object

Any logical disk folder

74.16.2 Default Schedule

The default interval for this script is **Every hour**.

74.16.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Default Event Thresholds for Mounted File Systems	
Event Notification	
Raise event if threshold exceeded for a mounted file system?	Specify whether you want to raise an event if the percentage of file system space used exceeds the default used threshold you specify for mounted file systems. The default is no.
Threshold – Maximum used space	Type a threshold for the maximum percentage of file system space available (total capacity) that should be in use by mounted file systems. The default is 80.
Incremental Event Notification	
Raise new event for incremental increases?	Specify whether you want to continue to raise events if the percentage of file system space used exceeds the capacity threshold you specify and continues to increase since the previous event. The default is `n`.
Threshold – Incremental increases	Type the percentage that must be exceeded before another event is raised while the initial threshold remains exceeded. The default is 5.
Event severity when used space exceeds threshold	Set the event severity level, from 0 through 40, to indicate the importance of the event. The default is 5.

Description	How to Set It
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.
Default Data Collection Options for Mounted File Systems	
Collect data for space usage on all mounted file systems?	Specify whether you want to collect data for charts, graphs, and reports for mounted file systems. When set to `y`, this script returns the percentage of used file system space, the percentage of available file system space, the used space (MB), and free space (MB). The default is no.
Monitoring	
File system types to exclude	Specify the types of systems you do not want to monitor, separated by commas with no space. The default is `subfs,usbfs,proc,iso9660,fd`.
Monitor mounted NFS shares?	Specify whether you want to monitor mounted Network File Systems. The default is no.

Override configuration file (full path) (optional)	Type the full path to the logical configuration file you created. The default is `/etc/NQfs.conf`.
	
	Use the following format for the configuration file; enter one line per entry:
	
	`"doevent?,dodata?,threshold,mountpoint"`
	`y,n,80,/usr`
	`n,n,75,/var`
	`y,y,90,/tmp`

74.17 GeneralCounter

Use this Knowledge Script to monitor system performance. This script maps elements of UNIX performance data using a format similar to Windows Performance Monitor counters. It uses the Object, Counter, and Instance model, and identifies which of those UNIX "counters" you want to monitor. Information for the objects and counters you specify is returned to the management server. The performance data is then stored in the AppManager repository and available for reporting in AppManager charts and reports.

There are several base objects, such as:

- UX Disk
- UX Virtual Memory
- UX Processor
- UX Block IO
- UX Networking
- UX Paging
- UX Swapping

Each object has multiple counters and can have multiple instances. You can set both high (Over) and low (Under) thresholds for the counter you are monitoring, and can set up the script to raise an event if the value of the counter you select is greater than the **Maximum threshold** value, or is less than the **Minimum threshold** value. You can also specify a consecutive number of times that the over or under threshold value must be crossed before an event is raised.

NOTE: AppManager raises an event only if the counter value is greater than the specified Maximum threshold value or is less than the specified Minimum threshold value. If a counter does not exist on the managed client, the Knowledge Script terminates with an error.

For more information about objects and their counters, see .

74.17.1 Resource Object

UNIX computer icon

74.17.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

74.17.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data for current counter value? (y/n)	Set to `y` to collect data for charts and reports. If set to y, the script returns the current value of the specified counter. The default is `n`.
Raise event if maximum threshold is exceeded? (y/n)	Set to `y` to raise an event if the counter value is greater than the value specified in as the **Maximum threshold** parameter. The default is `y`.
Threshold – Maximum counter value	Enter a greater-than threshold for the counter value. If the counter you are monitoring exceeds this value, AppManager raises an event if the **Raise event if maximum threshold is exceeded?** parameter is enabled. The default is 500. **Tip** Keep in mind that the units this value represents (for example, a number, percentage, or rate) depend on the specific counter you are monitoring.
Raise event if minimum threshold is not met? (y/n)	Set to `y` to raise an event if the counter value is less than the value specified in the **Minimum threshold** parameter. The default is `y`.
Threshold – Minimum counter value	Enter a lower-limit threshold for the counter value. If the counter you are monitoring falls below this value, AppManager raises an event if the **Raise event when minimum threshold not met?** parameter is enabled. The units this value represents depend on the specific counter you are monitoring. The default is 20.

Counter to monitor	Type the object, counter, and instance(s) to monitor.
	
	Use the format *object*|*counter*|*instance*. For example:
	
	`UX Processor|%System Time|_Total`
	
	The names are case-sensitive and the delimiter (|) is required. You can enter up to 5 counters, separated by commas and no spaces.
	
	Some counters require you to specify an instance name as well as the object and counter. In most cases, if a counter requires an instance name, you can specify the specific instance, for example, a specific CPU or device name, or `_Total` for all instances.
	
	Alternatively, you can leave the instance blank to indicate `_Total` instances. For example:
	
	`UX Block IO|Reads/s|,UX Block IO|Writes/s|`
	
	If instances are not applicable for a counter, you can leave the instance blank. For example:
	
	UX Swapping|Swap in KBytes/s|

Consecutive times threshold exceeded	Enter the number of consecutive times, from 0 to 99, the maximum or minimum threshold should be exceeded before an event is raised. The default is 1 time.
Event severity when maximum threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event when the maximum threshold is crossed. The default is 5.
Event severity when minimum threshold not met	Set the event severity level, from 1 to 40, to indicate the importance of the event when the minimum threshold is crossed. The default is 8.
Event severity when no counter/instance found	Set the event severity level, from 1 to 40, to indicate the importance of the event when AppManager cannot find a counter or instance. The default is 15.

Description	How to Set It
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.17.4 Examples of How this Script Is Used

Use this Knowledge Script to yield performance information for the counters you are interested in monitoring. It is particularly useful for monitoring system statistics not already covered with other Knowledge Scripts and customizing the monitoring of your UNIX servers. With AppManager, you can use the counter data to start corrective actions when thresholds are crossed, generate more complex and sophisticated graphs, and provide historical information for reporting, trend analysis, and capacity planning.

When specifying counters, use the format *object*|*counter*|*instance*. For example:

```
UX Processor|%System Time|_Total
```

Object and counter names are case-sensitive and the delimiter (|) is required. For more information about counters, see .

74.18 HTTPHealth

Use this Knowledge Script to check the operation of an HTTP server. This Knowledge Script connects to the Web servers you specify and sends a status request. If the Web server does not respond to the request, AppManager raises an event.

74.18.1 Resource Object

UNIX computer icon

74.18.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.18.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data? (y/n)	Set to `y` to collect data for charts and reports. The default is `n`.
Web server address list (separated by commas and no spaces)	Enter a list of Web server addresses, separated by commas, that you want to check. You can specify the address by hostname, IP address, or fully qualified domain name. For example: `Apache3,64.220.16.1,ajax.com.local`
Web server port (default is port 80)	Enter the port number on which the web servers accept HTTP requests. The default is 80.
Return code list (separated by commas and no spaces)	Enter a list of return codes, separated by commas, to check. Use this parameter to specify any server address that is not in standard URL format. You must have a value in this parameter to use this script. The default is 400.
Event severity level	Set the event notification level, from 1 to 40, to indicate the importance of the event. The default severity level is 8.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.19 LargeDir

Use this Knowledge Script to monitor the directories you specify. The Knowledge Script checks the disk space used by the directories you specify and the number of files under those directories. You can set this Knowledge Script to check directories recursively or to only check in the directories you specify, and to raise an event when disk usage is over the threshold you set or when the number of files in a directory is over the threshold you set.

74.19.1 Resource Object

UNIX computer icon

74.19.2 Default Schedule

The default interval for this script is **Every hour**.

74.19.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if the disk space usage is over the threshold? (y/n)	Set to `y` to raise an event if the disk space used by any monitored directory exceeds the disk space threshold. The default is `y`.
Collect data on disk space usage? (y/n)	Set to `y` to collect data for charts and reports. The default is `n`.
Maximum disk space used threshold (in KB)	Type the maximum amount of disk space, in KB, that should be used for the directory. The default is 1000.
Event if the number of files is over the threshold? (y/n)	Set to `y` to raise an event if the number of files in any monitored directory exceeds the file threshold you set. The default is `y`.
Collect data on the number of files? (y/n)	Set to `y` to collect data for charts and reports. The default is `n`.
Maximum number of files threshold	Type the maximum number of files that should be contained in the directory. The default is 1000.
Event severity level	Set the event notification level, from 1 to 40, to indicate the importance of the event. The default severity level is 15.
Include sub-directories recursively (y/n) ?	Set to `y` to include disk usage and file information for all sub-directories recursively. The default is `y`.
List of directories to search (separated by commas)	Type the directory path you want to monitor. You can specify multiple directories, separated by commas. For example: `/usr/home,/usr/mail`. The default is `/tmp`.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.20 LogicalDiskBusy

Use this Knowledge Script to monitor the logical disk activity on one or multiple disks. You can use this Knowledge Script to set a threshold for maximum disk operation time and the maximum queue length. This Knowledge Script raises an event if either the disk operation time or the queue length exceeds the threshold. This Knowledge Script only provides logical disk metrics that are provided by the operating system kernel.

Do not use this Knowledge Script to monitor queue length for a logical volume on VERITAS or AIX.

On Linux operating systems, this Knowledge Script:

- Does not work on kernel versions 2.6 through 2.6.24
- Requires the optional sysstat package to be installed
- Does not monitor file-based file systems

74.20.1 Resource Objects

Any logical disk or disks on Solaris, Linux, or AIX.

74.20.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.20.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if threshold is exceeded? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data for disk operation time and queue length? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the percentage of logical disk and waiting queue in use. The default is `n`.
Threshold – Maximum disk operation time	Enter a threshold for the maximum amount of time a disk operation should take. The default is 200 milliseconds.
Threshold – Maximum I/O queue length	Enter a threshold for the maximum number of processes that should be in the I/O queue at any time. The default is 1.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.21 LogicalDiskIO

Use this Knowledge Script to monitor the logical disk input/output (I/O) activity. This Knowledge Script monitors the number of logical disk transfers, logical disk reads, and logical disk writes per second. You can set a threshold for each metric. If logical disk I/O exceeds any of the thresholds you set, AppManager raises an event.

74.21.1 Resource Objects

Any logical disk or disks

74.21.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.21.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if threshold is exceeded? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data for transfers per second? (y/n)	Set to `y` to collect data for graphs and reports. If enabled, returns the number of transfers per second for each logical disk. The default is `n`.
Collect data for reads per second? (y/n)	Set to `y` to collect data for graphs and reports. If enabled, returns the number of reads per second for each logical disk. The default is `n`.
Collect data for writes per second? (y/n)	Set to `y` to collect data for graphs and reports. If enabled, returns the number of writes per second for each logical disk. The default is `n`.
Threshold – Maximum transfers per second	Enter the maximum number of transfers per second that can occur before an event is raised. The default is 80.
Threshold – Maximum reads per second	Enter the maximum number of reads per second that can occur before an event is raised. The default is 50.
Threshold – Maximum writes per second	Enter the maximum number of writes per second that can occur before an event is raised. The default is 50.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.22 LogicalDiskUtilization

Use this Knowledge Script to monitor the logical disk activity. This Knowledge Script raises an event if either the percentage of disk utilization or the percentage of time the I/O request queue is not empty exceeds the threshold.

Do not use this Knowledge Script to monitor:

- I/O queue utilization on AIX
- VERITAS logical volumes
- File-based file systems on HP-UX

On Linux operating systems, this Knowledge Script:

- Does not work on kernel versions 2.6 or later
- Requires the optional sysstat package to be installed

74.22.1 Resource Objects

Any logical disk or disks on Solaris, Linux, and AIX.

74.22.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.22.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if threshold is exceeded? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the percentage of logical disk and waiting queue in use. The default is `n`.
Threshold – Maximum disk utilization	Enter a threshold for the maximum percentage of logical disk that should be in use. The default is 95%.
Threshold – Maximum I/O queue utilization (Solaris only)	Enter a threshold for the maximum percentage of time processes should be waiting in the I/O queue. The default is 50%.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.23 MemByProcess

Use this Knowledge Script to monitor memory usage for specified processes. The Knowledge Script monitors individual memory use for each specified process, and the total memory use for all specified processes. If a process is not found, the Knowledge Script assumes that the process is not currently running, and reports zero as the memory result.

If the memory use for any monitored process exceeds the threshold you set, AppManager raises an event.

NOTE: This Knowledge Script does not detect invalid process names. If you enter an invalid process name, the Knowledge Script assumes that the process is not running, and reports zero as the result.

74.23.1 Resource Object

UNIX computer icon

74.23.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.23.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Comma-separated list of process names	Enter one or more process names, separated by commas and no spaces. The default is `dtlogin`.
Create event for each specified process? (y/n)	Set to `y` to raise events when the memory usage is over the threshold for individual processes. The default is `y`.
Collect data for each specified process? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the memory usage for each process. The default is `n`.
Maximum memory usage (KB) for each specified process	Enter a maximum threshold for memory usage for each process. The default is 20000 KB.
Create event for the sum of all specified processes? (y/n)	Set to `y` to raise events when the combined memory usage for all specified processes is over the threshold. The default is `y`.
Collect data on the sum of all specified processes? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the combined memory usage for all specified processes. The default is `n`.
Maximum memory usage (KBs) for all specified processes together	Enter a threshold for combined memory usage for all processes you are monitoring. The default is 32000 KB.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.24 MemShortage

Use this Knowledge Script to monitor the physical memory for a system. This Knowledge Script monitors the swapping scan rate to determine if more physical memory might help system performance. Any non-zero scan rate value can indicate that the current amount of physical memory is causing a performance bottleneck. This Knowledge Script raises an event if the memory (in KB) swapped-in and swapped-out crosses the threshold you specify.

NOTE: For Linux and Solaris versions earlier than 2.8, without the swapping scan rate metric, Update Definition in User Variables. monitors the swapping rate.

74.24.1 Resource Object

Memory folder

74.24.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.24.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if scan rate exceeds threshold? (y/n)	Set to `y` to raise an event if the scan rate exceeds the threshold. The default is `y`.
Collect data? (y/n)	Set to `y` to collect data for charts, graphs, and reports. The default is `n`.
Maximum scan rate (per second)	Type a threshold for the maximum number of pages that should be scanned per second. The default is 0.
Maximum KBytes swapped-in per second threshold	Type a threshold for the maximum amount of memory (in KB) that should be swapped-in per second, for systems without the swapping scan rate metric. The default is 5.
Maximum KBytes swapped-out per second threshold	Type a threshold for the maximum amount of memory (in KB) that should be swapped out per second, for systems without the swapping scan rate metric. The default is 5.
Number of consecutive iterations exceeding threshold before sending an event	Type the number of consecutive times either threshold should be crossed before an event is raised. The default is 2.
Event severity level	Set the event severity level, from 1 through 40, to indicate the importance of the event. The default is 15.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.25 MemUtil

Use this Knowledge Script to monitor physical memory, virtual memory, and paging files. This Knowledge Script raises an event if any usage level crosses the threshold you specify, or if there are any script errors.

74.25.1 Resource Objects

Physical memory object, virtual memory object, paging files folder.

74.25.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.25.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Settings	
Raise event if physical memory crosses threshold?	Specify whether you want to raise an event if physical memory crosses the thresholds you specify for maximum percentage used or minimum MB free. The default is `n`. It is normal for UNIX systems to use almost all physical memory.
Event severity – physical memory	Set the severity level for the event indicating that the maximum physical memory used or minimum physical memory free crosses the threshold. The default is 5.
Raise event if total virtual memory crosses threshold?	Specify whether you want to raise an event if virtual memory crosses the thresholds you specify for maximum percentage used or minimum MB free. The default is `y`.
Event severity – total virtual memory	Set the severity level for the event indicating that the maximum virtual memory used or minimum virtual memory free crosses the threshold. The default is 5.
Raise event if swap space crosses threshold?	Specify whether you want to raise an event if the paging file use crosses the thresholds you specify for maximum percentage used or minimum MB free. The default is `y`.
Event severity – swap space	Set the severity level for the event indicating that the maximum swap space used or minimum swap space free crosses the threshold. The default is 5.
Event severity when Knowledge Script error occurs	Set the severity level for the event indicating that a Knowledge Script error has occurred. For example, if a Knowledge Script aborts before the job starts or during the job. The default is 10.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

Description	How to Set It
Threshold settings	
Threshold – Maximum physical memory used	Type a threshold for the maximum percentage (%) of physical memory that can be in use before an event is raised. It is normal for UNIX systems to use almost all physical memory. The default is 95%.
Threshold – Minimum physical memory free	Type a threshold for the minimum amount (in MB) of physical memory that must be free to prevent an event from being raised. The default is 0.
Threshold – Maximum total virtual memory used	Type a threshold for the maximum percentage (%) of virtual memory that should be in use. The default is 90%.
Threshold – Minimum total virtual memory free	Type a threshold for the minimum amount (in MB) of virtual memory that should be free. The default is 0.
Threshold – Maximum swap space used	Type a threshold for the maximum percentage (%) of swap space that should be in use. The default is 70%.
Threshold – Minimum swap space free	Type a threshold for the minimum amount (in MB) of swap space that should be free. The default is 0.
HP-UX specific settings	
Include reserved value in calculations?	Specify whether you want to include reserved swap space in the calculations. If set to `y`, calculations include space reserved for system deactivation and paging processes. This parameter is only available on computers running the HP-UX operating system. The default is `y`.
HPUX: Include memory pseudo-swap values in calculations?	Specify whether you want to include pseudo-swap space in the calculations. Pseudo-swap space might be up to 3/4 of the available system memory. If set to `y`, calculations include space in the pseudo swap reservation counters. This parameter is only available on computers running the HP-UX operating system. The default is `n`.
Collect data settings	
Collect data for physical memory used?	Specify whether you want to collect data for charts and reports for this information. If set to `y`, this script returns the percentage (%) of physical memory in use. The default is `n`.
Collect data for physical memory free?	Specify whether you want to collect data for charts and reports for this information. If set to `y`, this script returns the amount (in KB) of free physical memory. The default is `n`.
Collect data for total virtual memory used?	Specify whether you want to collect data for charts and reports for this information. If set to `y`, this script returns the percentage (%) of virtual memory in use. The default is `n`.
Collect data for total virtual memory free?	Specify whether you want to collect data for charts and reports for this information. If set to `y`, this script returns the amount (in KB) of free virtual memory. The default is `n`.
Collect data for swap space used?	Specify whether you want to collect data for charts and reports for this information. If set to `y`, this script returns the percentage (%) of the paging file in use. The default is `n`.
Collect data for swap space free?	Specify whether you want to collect data for charts and reports for this information. If set to `y`, this script returns the amount (in KB) of free paging file space. The default is `n`.

Description	How to Set It
Collect data for percentage of computational memory in use?	Specify whether you want to collect data for charts and reports for this information. If set to `y`, this script returns the percent of computational memory being used with the legend `RealMemUsage %`. The default is `n`. **NOTE:** This setting is only available for AIX computers and should be set to `n` for other platforms.

74.26 NetInterfacesCollision

Use this Knowledge Script to monitor network interface collision. The Knowledge Script checks the percentage of network interface collisions in the interval. If the percentage of network interface collisions exceeds the threshold you set, AppManager raises an event.

On AIX, do not use this Knowledge Script to monitor collisions on an Ethernet device. AIX does not provide collision count information for Ethernet devices. If you monitor an Ethernet device on AIX, this Knowledge Script returns a collision count value 0.

This Knowledge Script runs on the Network Interface object. However, it ignores the loopback device.

On Solaris, the UNIX agent must run as root or as a user with root-level authority to retrieve counters associated with the UX Networking performance object. Before running this Knowledge Script, configure the UNIX agent to run as root or as a user that has been given root-level authority using the sudo configuration file.

74.26.1 Resource Objects

Network Interface icon on Solaris, Linux, and HP-UX.

74.26.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.26.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if network interface collision exceeds the threshold? (y/n)	Set to `y` to raise an event if the percentage of network interface collision exceeds the threshold. The default is `y`.
Collect data? (y/n)	Set to `y` to collect data for charts and reports. The default is `n`.
Maximum collision rate (%) threshold	Enter the maximum percentage of network interface collision that should be allowed before raising an event. The default is 80%.
Event severity level	Set the event notification level, from 1 to 40, to indicate the importance of the event. The default severity level is 15.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.27 NetInterfacesConnectivity

Use this Knowledge Script to monitor the physical connection between network interface adapters and the network. If the cable for a network interface card is disconnected from the network, AppManager raises an event.

If the computer where you run this Knowledge Script has only one network interface card and that interface card is unplugged, the event cannot be relayed to the AppManager repository until the network interface card is back in service. Therefore, you should only run this script on computers that have more than one network interface card.

On Solaris computers, the UNIX agent must run as root or as a user with root-level authority to retrieve counters associated with the UX Networking performance object. Before running this Knowledge Script, configure the UNIX agent to run as root or as a user that has been given root-level authority using the sudo configuration file.

74.27.1 Resource Objects

Network Interface icon on Solaris computers (not supported on Linux, HP-UX, or AIX).

74.27.2 Default Schedule

The default interval for this script is **Asynchronous**. Once you start the Knowledge Script job, its runs continuously on the monitored system and reports events or data as they occur.

74.27.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if network interface card is disconnected? (y/n)	Set to `y` to raise an event if the cable for a network interface card is unplugged. The default is `y`.
Event severity when network interface card has lost connectivity	Set the event notification level, from 1 to 40, to indicate the importance of the event. The default severity level is 8.

74.27.4 Example of How this Script Is Used

If you run this Knowledge Script on a computer with multiple network interface cards and at least one of them is available and allows the NetIQ UNIX agent to communicate with the management server, an event is raised if any of the network interface cards is disconnected from the network.

NOTE: This Knowledge Script does not alert you if all network interfaces are disconnected until after network communication is restored. The Knowledge Script job still raises the event, but stores the event in the UNIX agent's local repository until communication with the management server resumes.

74.28 NetInterfacesDown

Use this Knowledge Script to monitor the up and down status of network interfaces. This Knowledge Script uses the `ifconfig` command to determine if any network interface card (NIC) on a computer with multiple network interfaces is down. If a network interface is detected down, AppManager raises an event.

If the computer where you run this Knowledge Script has only one network interface card and that interface card is down or unplugged, the event cannot be relayed to the QDB until the card is back in service. Therefore, only run this script on computers with multiple network interface cards.

On Solaris, the UNIX agent must run as root or as a user with root-level authority to retrieve counters associated with the UX Networking performance object. Before running this Knowledge Script, configure the agent to run as root or as a user with root-level authority through the sudo configuration file.

74.28.1 Resource Object

Network Interface icon

74.28.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.28.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if network interface is down? (y/n)	Set to `y` to raise an event if a network interface is detected down. The default is `y`.
Collect data? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns a value of 100 if the network interface is up and 0 if the network interface is down. The default is `n`.
Event severity level	Set the event notification level, from 1 to 40, to indicate the importance of the event. The default severity level is 20.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.28.4 Example of How this Script Is Used

If you run this Knowledge Script on a computer with multiple network interface cards and at least one of them is available and allows the NetIQ UNIX agent to communicate with the management server, an event is raised if any of the network interface cards goes down. In response to the event, you can configure

this Knowledge script to run a managed client (MC) action to attempt to bring the NIC back online using the `ifconfig` command and the Action_UXCommand Knowledge Script.

You might also want to use this Knowledge Script in conjunction with other Knowledge Scripts, such as NetInterfacesConnectivity and PingMachine to fine-tune your troubleshooting.

NOTE: The NetInterfacesDown Knowledge Script does not alert you if all network interfaces are on computer are down until after network communication is restored. The Knowledge Script job still raises the event, but stores the event in the UNIX agent's local repository until communication with the management server resumes.

74.29 NetInterfacesErrors

Use this Knowledge Script to monitor the input and output errors for network interfaces. If the number of network interface input errors or output errors exceeds the threshold you set, AppManager raises an event.

This Knowledge Script runs on the Network Interface object. However, the NetInterfacesErrors Knowledge Script ignores the loopback device.

On Solaris, the UNIX agent must run as root or as a user with root-level authority to retrieve counters associated with the UX Networking performance object. Before running this Knowledge Script, configure the UNIX agent to run as root or as a user that has been given root-level authority using the sudo configuration file.

74.29.1 Resource Objects

Network Interface icon.

74.29.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.29.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if network interface input errors exceed the threshold? (y/n)	Set to `y` to raise an event if the percentage of network interface input errors exceeds the threshold. The default is `y`.
Collect data on input errors? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the percentage of input errors for the interval. The default is `n`.
Maximum percentage of input errors (%) threshold	Enter the maximum percentage of network interface input errors that should be allowed before raising an event. The default is 80%.
Event if network interface output errors exceed the threshold? (y/n)	Set to `y` to raise an event if the percentage of network interface output errors exceeds the threshold. The default is `y`.
Collect data on output errors? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the percentage of output errors for the interval. The default is `n`.
Maximum percentage of output errors (%) threshold	Enter the maximum percentage of network interface output errors that should be allowed before raising an event. The default is 80%.
Event severity level	Set the event notification level, from 1 to 40, to indicate the importance of the event. The default severity level is 15.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.30 NetInterfacesIO

Use this Knowledge Script to monitor the input and output rate for network interfaces in bytes per second. If the rate of network traffic for input, output, or both exceeds the threshold you set, AppManager raises an event. You cannot use this Knowledge Script in Solaris zones that are not global zones.

This Knowledge Script runs on the Network Interface object. However, the NetInterfacesIO Knowledge Script ignores the loopback device.

74.30.1 Resource Object

Network Interface icon

74.30.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.30.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Settings	
Event?	Set to y to raise events. The default is y.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.
Threshold settings	
Bytes sent and received per second threshold	Enter a threshold for the maximum number of bytes sent and received per second to monitor the throughput rate for the network interface. The default is 8000000 bytes.
Bytes sent per second threshold	Enter a threshold for the maximum number of bytes sent per second. The default is 8000000 bytes.
Bytes received per second threshold	Enter a threshold for the maximum number of bytes received per second. The default is 8000000 bytes.
Maximum network bandwidth utilization (%) threshold	Enter a threshold for the maximum percent of network bandwidth. The default is 10%.
Collect data settings	
Collect data for throughput per second?	Set to y to collect data for charts and reports. If set to y, the script returns the rate of bytes sent and received per second for each interface. The default is n.
Collect data for bytes sent per second?	Set to y to collect data for charts and reports. If set to y, the script returns the rate of bytes sent per second for each interface. The default is n.

Description	How to Set It
Collect data for bytes received per second?	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the rate of bytes received per second for each interface. The default is `n`.
Collect data for network utilization?	For Solaris computers only. Set to `y` to collect data for charts and reports. If set to `y`, the script returns the rate of bytes received per second for each interface. The default is `n`.

74.31 PagingHigh

Use this Knowledge Script to monitor UNIX paging activity. If the size in KB paged-in or paged-out per second exceeds the threshold you set, AppManager raises an event.

74.31.1 Resource Object

UNIX computer on Solaris, Linux, and HP-UX (not supported on AIX).

74.31.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

74.31.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data on page-in KBytes per second? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the average size in KB paged-in per second. The default is `n`.
Collect data on page-out KBytes per second? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the average size in KB paged-out per second. The default is `n`.
Maximum paged-in KBytes per second threshold	Enter a threshold for the maximum size in KB for page-in swaps per second. The default is 200.
Maximum paged-out KBytes per second threshold	Enter a threshold for the maximum size in KB for page-out swaps per second. The default is 200.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.32 PhysicalDiskBusy

Use this Knowledge Script to monitor physical disk activity and average response time. A disk is considered busy if the percentage of time the disk is in operation is high and the average response time is over the threshold. With this Knowledge Script, you can monitor the load for individual disks or the overall load across all physical disks in a computer.

NOTE: If both the total disk activity and average response time thresholds are exceeded, the disk is considered overloaded and AppManager raises an event.

74.32.1 Resource Objects

Physical disk folder or individual physical disks.

74.32.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

74.32.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the percentage of time the disk is busy and the average response time for requests. The default is `n`.
Event if disk activity and response time over threshold? (y/n)	Set to `y` to raise events when both the disk activity and average response are over their respective thresholds. The default is `y`.
Average response time maximum threshold (unavailable on AIX)	Enter a threshold for the maximum response time in milliseconds. The default is 200 milliseconds. Do not use this parameter on computers running an AIX operating system.
Maximum physical disk activity (% busy) threshold	Enter a threshold for the maximum percentage of disk activity before raising an event. The default is 80% busy.
Monitor overall physical disk load? (y/n)	Set to `y` to monitor the overall disk load (for all physical disks on a system). Set to `n` to monitor individual disks separately. The default is `n`.
Event severity level	Set the event severity level, from 0 to 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.33 PhysicalDiskIO

Use this Knowledge Script to monitor the physical disk I/O activity in kilobytes per second. The Knowledge Script monitors the size of physical disk reads and physical disk writes per second.

On Solaris, Linux, and AIX AppManager raises an event if the size of disk reads per second, the size of disk writes per second, or the overall throughput per second exceeds the threshold you set.

On HP-UX, this Knowledge Script only monitors overall throughput and raises an event if the total size of reads and writes per second is over the threshold.

74.33.1 Resource Object

Physical disk object

74.33.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.33.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Event? (y/n)	Set to `y` to raise events. The default is `y`.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.
Threshold settings Collection	
Maximum reads per second (KB) threshold	Enter a threshold for the maximum rate of read operations in KB per second. The default is 50 KB per second.
Maximum writes per second (KB) threshold	Enter a threshold for the maximum rate of write operations in KB per second. The default is 50 KB per second.
Maximum throughput per second (KB) threshold	Enter a threshold for the maximum rate of read and write operations in KB per second. The default is 100 KB per second.
Maximum reads per second threshold	Enter a threshold for the maximum number of read operations per second. The default is 50 operations per second. **NOTE:** This parameter is not supported on Solaris 11 or later versions.
Maximum writes per second threshold	Enter a threshold for the maximum number of write operations per second. The default is 50 operations per second. **NOTE:** This parameter is not supported on Solaris 11 or later versions.

Description	How to Set It
Maximum throughput per second threshold	Enter a threshold for the maximum number of read and write operations per second. The default is 100 operations per second. **NOTE:** This parameter is not supported on Solaris 11 or later versions.
Data Collection	
Collect data for reads per second (KB)?	Set to y to collect data for charts and reports. If set to y, the script returns the rate of disk read operations in KB per second for each disk. The default is n.
Collect data for writes per second (KB)?	Set to y to collect data for charts and reports. If set to y, the script returns the rate of disk write operations in KB per second for each disk. The default is n.
Collect data for throughput per second(KB)?	Set to y to collect data for charts and reports. If set to y, the script returns the rate of disk read and write operations in KB per second for each disk. The default is n.
Collect data for reads per second?	Set to y to collect data for charts and reports. If set to y, the script returns the number of disk read operations per second for each disk. The default is n. **NOTE:** This parameter is not supported on Solaris 11 or later versions.
Collect data for writes per second?	Set to y to collect data for charts and reports. If set to y, the script returns the number of disk write operations per second for each disk. The default is n. **NOTE:** This parameter is not supported on Solaris 11 or later versions.
Collect data for throughput per second?	Set to y to collect data for charts and reports. If set to y, the script returns the number of disk read and write operations per second for each disk. The default is n. **NOTE:** This parameter is not supported on Solaris 11 or later versions.

74.34 PingMachine

Use this Knowledge Script to check the availability of any computers or other devices that reply to ICMP Echo requests. (The ICMP Echo request is commonly used by the `ping` command on UNIX and Windows computers.) With this Knowledge Script, you can check the up/down status of your managed UNIX computers, Windows computers, and other equipment, such as TCP/IP-based printers.

You can specify computers to ping in two ways: by providing comma-separated lists or by naming files containing comma-separated lists. If a computer does not respond to a ping within the response time threshold, the script raises an event.

There are separate lists for UNIX and Windows computers. This separation allows the script to push raised events to computers listed in your TreeView: to do this, the script needs to know whether an event is destined for a UNIX or Windows computer. When an event is pushed to a computer listed in your TreeView, its icon blinks.

This script can raise an event for a computer that is not listed in your TreeView. When this happens, a server group named AppManager Proxy Events is automatically created in the Master TreeView. From this group, you can view, acknowledge, close, and delete all events on the computer. To discover resources and run monitoring jobs on the computer, you must delete the computer from the AppManager Proxy Events server group, then manually add the computer to the TreeView. If necessary, stop any proxy jobs that are monitoring the remote computer so you can add it to the TreeView.

74.34.1 Resource Object

UNIX computer icon

74.34.2 Default Schedule

The default interval for this script is **Every two hours**.

74.34.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
List of UNIX machines to check (by hostname or IP address)	Enter a list of UNIX computer names, separated by commas, that you want to test communication with. The default is `localhost`. For example: `localhost,www.netiq.com`
List of Windows machines to check (by hostname or IP address)	Enter a list of Windows computer names, separated by commas, that you want to test communication with. For example: `us.sandiego01.com,us.portland01.com`

Description	How to Set It

Optional file listing UNIX hosts to ping	Type the full path to the file containing a list of the UNIX computers you want to check. The file should contain the hostname or IP address for each computer in one or more lines. Each line can have multiple computer names, separated by commas. For example, the contents of a file could be:
	`NYC01,NYC02`
	`SALES01,10.15.221.5, SFO01`
	`LABMACH, QATEST`

Optional file listing Windows hosts to ping	Type the full path to the file containing a list of the Windows computers you want to check. The file should contain the hostname or IP address for each computer in one or more lines. Each line can have multiple computer names, separated by commas. For example, the contents of a file could be:
	`NYC01,NYC02`
	`SALES01,10.15.221.5, SFO01`
	`LABMACH, QATEST`

Collect data for response time? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the time it took the server to respond to the `ping` command. The default is `n`.
Collect data for machine up/down? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns: • 100 – Computer tested sent a reply indicating a successful connection, or • 0 – There was no reply. The default is `n`.
Event if response time exceeds the threshold? (y/n)	Set to `y` to raise an event if the response time from the computer whose connection you are testing exceeds the threshold you set. The default is `y`.
Event if the machine is not responding? (y/n)	Set to `y` to raise an event if the computer whose connection you are testing fails to respond to the Ping test. The default is `y`.
Maximum response time (ms) threshold	Enter a threshold for the maximum response time in milliseconds for the reply to take. The default is 500 milliseconds.
Event severity level when response time is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when the response time threshold is crossed. The default severity is 15.
Event severity level when machine is unreachable	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when AppManager cannot communicate with the computer. The default severity is 5.
Number of times to ping target machine per iteration	Enter the number of times that you want to ping the target computer for each iteration. The default is 1.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.35 PortHealth

Use this Knowledge Script to check whether system ports are working properly. This Knowledge Script raises an event if a port is not operating properly.

There are separate lists for UNIX and Windows computers. This separation allows the script to push raised events to computers listed in your TreeView: to do this, the script needs to know whether an event is destined for a UNIX or Windows computer. When an event is pushed to a computer listed in your TreeView, its icon blinks.

This script can raise an event for a computer that is not listed in your TreeView.

NOTE: This Knowledge Script raises an event if a port specified for monitoring cannot be reached from the computer where you dropped the Knowledge Script. In addition to the event, the icon for the computer where you dropped the Knowledge Script blinks.

74.35.1 Resource Object

UNIX computer icon

74.35.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.35.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if port cannot be reached? (y/n)	Set to `y` to raise an event if a specified port is not operating properly. The default is `y`.
Collect data for port status? (y/n)	Set to `y` to collect data for graphs and reports. If enabled, returns: • 100 – the port is operating properly, or • 0 – the port is not operating. The default is `n`.
Windows network addresses in format hostIP:port_number (comma-separated, no spaces)	Type one or more Windows network addresses using the format *host_IP*:*port_number*. Separate multiple addresses by commas and no spaces. The *host_IP* can be a hostname or an IP address. For example: `www.storm.com:8008,21.1.10.1:30`. The default is `www.netiq.com:80`.
UNIX network addresses in format hostIP:port_number (comma-separated, no spaces)	Type one or more UNIX network addresses using the format *host_IP*:*port_number*. Separate multiple addresses by commas and no spaces. The *host_IP* can be a hostname or an IP address. For example: `www.storm.com:8008,21.1.10.1:30`.
Event severity when port cannot be reached	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

Description	How to Set It
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.36 PrinterQueue

Use this Knowledge Script to monitor the health of printers. This Knowledge Script checks the number of jobs in printer queue and the size of the printer queue in KB. If either the number of jobs waiting or the queue size exceeds the threshold you set, AppManager raises an event.

NOTE: General printer status information, such as when the printer is taken off-line or is low on toner, cannot be detected by this Knowledge Script.

74.36.1 Resource Objects

UNIX Printer objects

74.36.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.36.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if printer queue exceeds the threshold? (y/n)	Set to `y` to raise an event if the number of jobs in the printer queue exceeds the threshold. The default is `y`.
Event if printer queue size (KB) exceeds the threshold? (y/n)	Set to `y` to raise an event if the size of the printer queue, in KB, exceeds the threshold. The default is `y`.
Collect printer queue length data?	Set to `y` to collect data for charts and reports. The default is `n`. If you collect data, the Knowledge Script reports the number of print jobs in the queue at each interval.
Collect printer queue size data?	Set to `y` to collect data for charts and reports. If set to `y`, the Knowledge Script reports the size in KB of the printer queue at each interval. The default is `n`.
Maximum number of jobs in the printer queue threshold	Enter a threshold for the maximum number of print jobs waiting in the queue. The default is 100 jobs.
Maximum printer queue size (KB) threshold	Enter a threshold for the maximum size of the printer queue in KB. The default is 4000 KB.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.37 PrivilegedProcs

Use this Knowledge Script to monitor the number of system processes with an effective user ID (`euid`) of `root`. You can specify one or more processes to exclude from the list, if needed. If the number of processes running under `root` is over the threshold you set, AppManager raises an event.

74.37.1 Resource Object

UNIX CPU folder

74.37.2 Default Schedule

The default interval for this script is **Every hour.**

74.37.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if over the threshold? (y/n)	Set to `y` to raise an event if the number of processes running under the root user exceeds the threshold. The default is `y`.
Collect data? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the Knowledge Script reports the number of processes owned by the root user at each interval. The default is `n`.
Maximum number of processes owned by root threshold	Enter a threshold for the maximum number of processes owned by the root user. The default is 30 processes.
Processes to exclude separated by commas	Enter the processes you want to exclude from the list of processes owned by root. Use a comma with no spaces to separate process names.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.38 ProcessDown

Use this Knowledge Script to determine whether specified processes are currently running. AppManager raises an event if a specified process is not running or if the minimum number of processes are not running.

74.38.1 Resource Object

UNIX CPU folder

74.38.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.38.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise an event if the process is not running? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data for processes not running? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns data for each named process. A value of 100 is returned if the process is running; a value of 0 is returned if the process is not running. The default is `n`.
Processes to monitor (comma-separated)	Enter one or more process names, separated by commas and no spaces. For example: `grep,batch`
Minimum number of each process required (comma-separated)	Enter the minimum number of instances that have to go down before you want AppManager to raise an event. If you are monitoring more than one process, list the numbers for each process separated by commas and no spaces. The default is 1. For example, if you do not want to raise an event every time the grep and batch processes goes down, but you do want to raise an event after 10 instances of the process go down, enter: `10,10`
Event severity when process is down	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.39 Processes

Use this Knowledge Script to monitor the number of processes. If the total number of processes detected exceeds the threshold you set, AppManager raises an event.

74.39.1 Resource Object

UNIX CPU folder

74.39.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.39.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if over the threshold? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data? (y/n)	Set to `y` to collect data for charts and reports. If set to y, the script returns the total number of processes running on the system. The default is `n`.
Maximum number of processes threshold	Enter a threshold for the maximum number of processes. The default is 100 processes.
Monitor process count for just specified user	Specify a user account if you want to monitor the number of processes started by that user.
Processes to exclude separated by commas	Enter the names of any processes you want to exclude from the list of processes found. Use a comma with no spaces to separate process names.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.40 ProcessUp

Use this Knowledge Script to check whether a specified process is running. If the specified process is running, AppManager raises an event. You also have the option to automatically terminate the process.

This Knowledge Script requires the UNIX agent to run as the root user account.

74.40.1 Resource Object

UNIX CPU folder

74.40.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.40.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise an event if the process is running? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data for processes running? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns a value of 100 when the number of running processes exceeds the threshold, or a value of 0 when the number of running process does not exceed the threshold. The default is `n`.
Processes for which to look (comma-separated)	Enter one or more process names, separated by commas and no spaces. For example: `grep,batch`
Maximum number of each process required (comma-separated)	Enter the number of instances required to generate an event for each process, separated by commas and no spaces. AppManager reports an event when the number of instances is running for each process. The default is 0,0. For example: `3,4`
Kill the running process? (y/n)	Set to `y` to kill the specified processes if they are detected running. The default is `n`.
Event severity level for process running	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when AppManager identifies the specified process as being up. The default is 10.
Event severity level for failed to kill process	Set the event severity level, from 1 to 40, to indicate the importance of the event reported when AppManager identifies the specified process as being up and but the attempt to kill the process failed. The default is 10.

74.41 RemoteProcessDown

Use this Knowledge Script to monitor processes on a remote UNIX computer where you have not installed the UNIX agent. This Knowledge Script runs on a proxy UNIX agent and monitors processes on a remote UNIX computer.

When you drag this Knowledge Script to a UNIX computer in the TreeView, the Knowledge Script runs on that computer and tries to communicate with a specified list of remote UNIX computers. This Knowledge Script raises an event if any of the named processes are down or any of the computers you specify cannot be reached from the computer where this Knowledge Script is running.

If a monitored process is found to be down, this Knowledge Script can restart it using a script or command you supply. Be sure to read the help for the **Scripts or commands to restart processes** parameter, below, before proceeding.

This Knowledge Script requires the UNIX agent to run as the root user account.

74.41.1 Resource Object

UNIX computer icon (not supported on HP-UX Itanium).

74.41.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

If the script used to restart any process found to be down takes a considerable amount of time, events generated by the job are generated more than 10 minutes apart (by default).

74.41.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if process is down?	Select `y` to raise an event if the monitored process is found to be down. The default is `y`.
Event severity when process is down	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.
Raise event if process is running?	Select `yes` to raise an event if the monitored process is found to be running. The default is `no`.
Event severity when process is running	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Remote Host Connection	
Configure access to the remote managed computers by specifying their root password. All of the remote computers must use the same root password. This Knowledge Script can use SSH with root password authentication or Telnet to communicate with the remote managed computer.	

Description	How to Set It
Password for root user account	If you want to use Secure Shell (SSH) for the connection to the remote computers, make sure SSH with root authentication is enabled on the remote UNIX computers where you want to install the UNIX agent. For this parameter, you must specify the password for the root user to securely access the remote UNIX computers. This Knowledge Script does not support SSH root authentication with an RSA key.

Connection Transport	Select either SSH/SFTP or Telnet/FTP. The default is Telnet/FTP,
	
	This Knowledge Script can use SSH with root password authentication or Telnet to communicate with the remote managed computer.
	
	If you select the Telnet/FTP option the Telnet prompt on the remote computer must end with a space or one of the following characters:`% > # $`
	
	This example shows a supported Telnet prompt:
	
	`user@hostname>`
	
	This example shows an unsupported Telnet prompt:
	
	`<user@hostname:/tmp - 2005-Mar-09>`
	`->`
	
	In the examples above, the last character in the first line of the 2-line prompt is a line feed character, which is not supported.

Telnet non-root user account	If you selected Telnet to connect to the remote UNIX computers, specify a non-root user account to use for the connection. When connecting to a remote UNIX computer using Telnet and FTP, this Knowledge Script switches from the non-root user to the root user.
Telnet non-root user password	If you selected Telnet as the connection transport medium, specify the password for the non-root user account to connect to the remote UNIX computers.
Proxy Monitoring Configuration	
Full path to configuration file for remote monitoring	Supply a full directory path to an XML file to use for monitoring instructions. The configuration file should specify which processes to monitor on the remote UNIX computer and how to restart them. See "Remote Process Monitoring Using a Configuration File" on page 4142 for more information about the configuration file. The default is `/tmp/config.xml`.
Proxy Monitoring without Configuration File	
Hostnames or IP addresses where processes are to be monitored (comma-separated)	Enter a list of hostnames or IP addresses of the UNIX computers where processes are to be monitored. Separate multiple hostnames with commas (,) and no spaces. Supply IP addresses in dotted notation, such as 23.45.678.9. Separate multiple IP addresses with commas and no spaces.
Names of processes to monitor (comma-separated)	Supply the names of the UNIX application processes to monitor. Separate multiple process names with commas and no spaces. You can also enter a Perl regular expression here if you want to exclude and include processes on various platforms through the use of one argument. See "Running this Knowledge Script" on page 4141 for more information.

Description	How to Set It
Scripts or commands to restart processes (comma-separated)	Supply one of the following: • a list of full directory paths to script files to use to restart any processes that are found to be down, or • a list of commands to use to restart these processes. Use this parameter only when you restart the process when it is down. Specify a list of restart commands or shell scripts that contain the restart commands. Do not execute restart commands in the foreground. When executing a restart command in the foreground, this Knowledge Script cannot run at its next scheduled interval until after all of the restart commands have completed. When specifying: • A list of commands to run on the remote computer, run each command in the background by appending an ampersand (&) and separate each command with a comma. If this Knowledge Script is configured to use Telnet/FTP, you can restart a process in the background by appending an ampersand (&) to each command. If this Knowledge Script is configured to use SSH/SFTP, you should use a shell script on the remote computer to restart the processes in the background and ensure that `stdout` and `stderr` are redirected to a log file. When configured to use SSH/SFTP, this Knowledge Script always executes a command to restart a process in the foreground. • A shell script on the remote computer that restarts the processes you want, in the shell script, append an ampersand (&) to each restart command–and ensure that `stdout` and `stderr` are redirected to a log file–to restart a process in the background.
Restart process if down? (y/n for each process, comma-separated)	Provide a list specifying “y” or “n” for each process in the list of processes to monitor. Specify y for a process if you want this Knowledge Script to restart it on the remote computer if it is found to be down. The commands or scripts you specified for the previous parameter are used. Separate each entry in the list with a comma. Do not use spaces.

74.41.4 Running this Knowledge Script

This Knowledge Script requires the proxy UNIX agent to run as the root user account.

It can use either the Secure Shell (SSH) program with root password authentication or Telnet to make a secure connection to the remote UNIX computer(s). By default, Telnet is used, but you can select SSH/SFTP from the **Connection Transport** list to use Secure Shell instead. If you choose to use Telnet, you must supply a non-root user account name and password.

NOTE: Proxy monitoring with this Knowledge Script is possible only if the SSH program is installed on the target computer, or if the Telnet protocol is enabled on it.

A version of this Knowledge Script that runs on a Windows proxy computer to monitor remote UNIX computers is also available. See the NT_UnixRemoteProcessDown Knowledge Script.

You can use this Knowledge Script to monitor the up and down status of the UNIX agent. To do this, specify `nqmagt` in the list of processes you want to monitor. If the `nqmagt` process is detected down, you can specify a restart command, `/etc/init.d/nqmdaemon start`, to restart the agent.

You can specify the process names to be monitored as a parameter, or you can provide a configuration file in XML format to specify processes to monitor and what steps to take to restart them if they are down. See

"Remote Process Monitoring Using a Configuration File" on page 4142 for more information about the configuration file.

You can also supply a Perl regular expression for the **Names of processes to monitor (comma-separated)** parameter if you want to check for a specific string. For example, you can exclude and include processes on various platforms through the use of one argument. For example, assume that a process is running out of the `/usr`, the `/opt`, or the `/var` directory, but you are not sure where. You can enter `(/usr|/opt)/[processname]` for the **Names of processes to monitor** parameter. The Knowledge Script would monitor the process that is running in `/usr` OR in `/opt` but NOT in `/var`. The topic titled "Creating Filters with Regular Expressions" on page 4072 contains more information about regular expressions.

74.41.5 Remote Process Monitoring Using a Configuration File

The RemoteProcessDown Knowledge Script includes an option to use a configuration file in XML format to supply monitoring instructions to the agent. In such a file, you can supply a list of processes to monitor on a given remote UNIX computer, specify how to restart these processes, and indicate whether to restart these processes.

By default, the Knowledge Script looks for the following configuration file:

`/tmp/config.xml`

However, you can supply a different file as the value for the **Full path to configuration file for remote monitoring** parameter.

Following is an example of a valid XML configuration file that instructs the UNIX agent which processes to monitor and what to do if they are not running:

```
<?xml version="1.0" encoding="utf-8" ?>
<SERVERS>
  <SERVER name="uws3">
    <PROCESS name="nqmagt" startupscript="/etc/init.d/nqmdaemon start" restart="y"/>
    <PROCESS name="xntpd"  startupscript="/etc/init.d/xntpd start" restart="n"/>
  </SERVER>
  <SERVER name="uws19">
    <PROCESS name="inetd"  startupscript="/etc/init.d/inetsvc start" restart="n"/>
    <PROCESS name="init"  startupscript="/etc/init.d/init start" restart="n"/>
  </SERVER>
</SERVERS>
```

74.42 Report_CPULoad

Use this Knowledge Script to generate a detailed report about CPU usage. Using this report, you can aggregate the data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the CpuLoaded Knowledge Script.

74.42.1 Resource Objects

Report Agent > AM Repositories > *AppManager repository*.

74.42.2 Default Schedule

The default schedule for this script is **Run once**.

74.42.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (each page shows, for example, the value of the *UNIX_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** provides all the data streams on a single page The default is By computer.
Select time range	Click the **Browse [...]** button to start the time wizard. Use the time wizard to set a specific or sliding time range for data included in your report. The default is 1 day sliding time ending at the current time.
Select peak weekday(s)	Click the **Browse [...]** button to start the day wizard. Use the day wizard to select the days of the week to include in your report. The default is seven days: Sunday through Saturday.
Aggregation by	Specify how you want to aggregate the data in your report. You can specify Minute, Hour, or Day. The default is Hour.

Description	How to Set It
Aggregation interval	Specify the intervals you want to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter help card? (yes/no)	Specify whether you want to include a table in the report that lists parameter settings for the report script. By default, the table is included.
Include table/chart/both?	Select whether you want to include a table, a chart, or both of data stream values in the report. By default, the table is included.
Select chart style	Click the **Browse [...]** button to open the Chart Settings dialog box and select the graphic properties for the charts in your report. The default is Bar.
Select output folder	Click the **Browse [...]** button to open the Publishing Options dialog box and select the parameters for your report's output folder. The default folder prefix is UNIX_CPULoad.
Add job ID to output folder name? (yes/no)	Specify whether you want to add the job ID to the report's output folder name. The default is no. Add the job ID to the output folder name to help make the correlation between a specific instance of a Report Script and the corresponding report easier.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box and select the properties as desired. The default title for your report is UNIX CPU Load.
Add time stamp to title? (yes/no)	Specify whether you want to append a time stamp to the title of your report, making each title unique. The time stamp includes the date and time the report was generated. The default is no. Adding a time stamp is useful in order to run consecutive iterations of the same report without overwriting previous output.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.

Description	How to Set It
Event for report success? (yes/no)	Specify whether you want to raise an event if the report is successfully generated. The default is `y`.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report is successful. The default is 35.
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report has no information in it. The default is 25.
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report fails. The default is 5.

74.43 Report_DiskUsageSummary

Use this Knowledge Script to generate a summary report about the percentage of disk space used and the amount of free space (in MB). Using this report, you can develop a statistical summary of the data you select, for example, the average value of data points over the time period you define for the report.

This report uses data collected by the FileSystemSpace Knowledge Script.

74.43.1 Resource Objects

Report Agent > AM Repositories > *AppManager repository*.

74.43.2 Default Schedule

The default schedule for this script is **Run once**.

74.43.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report.
Select time range	Click the **Browse [...]** button to start the time wizard. Use the time wizard to set a specific or sliding time range for data included in your report. The default is 1 day sliding time ending at the current time.
Select peak weekday(s)	Click the **Browse [...]** button to start the day wizard. Use the day wizard to select the days of the week to include in your report. The default is seven days: Sunday through Saturday.
Select the style	Select the style for the first page of your report: • **By computer** displays one value for each computer you selected. • **By legend** displays one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** displays one value for each unique legend from each computer. The default is `By computer and legend`.
Data settings	Use the following parameters to select the data settings for your report.

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the time range of the report. • **Minimum**. The minimum value of data points for the time range of the report. • **Maximum**. The maximum value of data points for the time range of the report. • **Min**/**Avg**/**Max**. The minimum, average, and maximum values of data points for the time range of the report. • **Range**. The range of values in the data stream (maximum - minimum = range). • **StandardDeviation**. The measure of how widely values are dispersed from the mean. • **Sum**. The total value of data points for the time range of the report. • **Close**. The last value for the time range of the report. • **Change**. The difference between the first and last values for the time range of the report (close - open = change). • **Count**. The number of data points for the time range of the report. The default is `Average`.
Select sorting or display options	Specify whether you want to sort data in your report or how you want to display the data: • **No sort**. Data is not sorted. • **Sort**. Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right). • **Top %**. Chart only the top N % of selected data (sorted by default). • **Top N**. Chart only the top N of selected data (sorted by default). • **Bottom %**. Chart only the bottom N % of data (sorted by default). • **Bottom N**. Chart only the bottom N of selected data (sorted by default). The default is `No sort`.
Percentage (%) or count for top or bottom of chart	Type a number for either the percent or count defined in **Select sorting or display options** (for example, Top 10%, or Top 10). The default is 25.
Truncate top or bottom? (yes/no)	Specify whether you wan to truncate the top or bottom data in your report. If set to `y`., the data table displays only the top or bottom N or % (for example, only the top 10%). If set to no, the table displays all data. The default is `n`.
Show totals on the table? (yes/no)	Specify whether you want to display additional calculations for each column of numbers in a table. If set to yes, the following values are listed at the end of the table: • **Report Average**. An average of all values in a column. • **Report Minimum**. The minimum value in a column. • **Report Maximum**. The maximum value in a column. • **Report Total**: The total of all values in a column. The default is no.
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.

Description	How to Set It
Include parameter help card? (yes/no)	Specify whether you want to include a table in the report that lists parameter settings for the report script. The default is `y`.
Include table/chart/both?	Select whether you want to include a table, a chart, or both of data stream values in the report. The default is `y`.
Select chart style	Click the **Browse [...]** button to open the Chart Settings dialog box and select the graphic properties for the charts in your report. The default is `Bar`.
Select output folder	Click the **Browse [...]** button to open the Publishing Options dialog box and select the parameters for your report's output folder. The default folder prefix is UNIX_LogicalDiskUsageSummary.
Add job ID to output folder name? (yes/no)	Specify whether you want to add the job ID to the report's output folder name. The default is no. Add the job ID to the output folder name to help make the correlation between a specific instance of a Report Script and the corresponding report easier.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box and select the properties as desired. The default title for your report is UNIX Logical Disk Usage Summary.
Add time stamp to title? (yes/no)	Specify whether you want to append a time stamp to the title of your report, making each title unique. The time stamp is made up of the date and time the report was generated. The default is `n`. Adding a time stamp is useful in order to run consecutive iterations of the same report without overwriting previous output.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.
Event for report success? (yes/no)	Specify whether you want to raise an event if the report is successfully generated. The default is `y`.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report is successful. The default is 35.
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report has no information in it. The default is 25.
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report fails. The default is 5.

74.44 Report_MemoryUtilization

Use this Knowledge Script to generate a report about the use of physical and virtual memory, and paging files. Using this report, you can aggregate data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the MemUtil Knowledge Script.

74.44.1 Resource Objects

Report Agent > AM Repositories > *AppManager repository*.

74.44.2 Default Schedule

The default schedule for this script is **Run once**.

74.44.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (each page shows, for example, the value of the *UNIX_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** provides all data streams on a single page The default is By computer.
Select time range	Click the **Browse [...]** button to start the time wizard. Use the time wizard to set a specific or sliding time range for data included in your report. The default is 1 day sliding time ending at the current time.
Select peak weekday(s)	Click the **Browse [...]** button to start the day wizard. Use the day wizard to select the days of the week to include in your report. The default is seven days: Sunday through Saturday.
Aggregation by	Specify how you want to aggregate the data in your report. You can specify Minute, Hour, or Day. The default is `Hour`.

Description	How to Set It
Aggregation interval	Specify the intervals you want to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is `Average`.
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter help card? (yes/no)	Specify whether you want to include a table in the report that lists parameter settings for the report script. The default is `y`.
Include table/chart/both?	Select whether you want to include a table, a chart, or both of data stream values in the report. The default is `y`.
Select chart style	Click the **Browse [...]** button to open the Chart Settings dialog box and select the graphic properties for the charts in your report. The default is Bar.
Select output folder	Click the **Browse [...]** button to open the Publishing Options dialog box and select the parameters for your report's output folder. The default folder prefix is `UNIX_MemoryUtilization`.
Add job ID to output folder name? (yes/no)	Specify whether you want to add the job ID to the report's output folder name. The default is no. Add the job ID to the output folder name to help make the correlation between a specific instance of a Report Script and the corresponding report easier.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box and select the properties as desired. The default is UNIX Memory Utilization.
Add time stamp to title? (yes/no)	Specify whether you want to append a time stamp to the title of your report, making each title unique. The time stamp is made up of the date and time the report was generated. The default is `n`. Adding a time stamp is useful in order to run consecutive iterations of the same report without overwriting previous output.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.
Event for report success? (yes/no)	Specify whether you want to raise an event if the report is successfully generated. The default is `y`.

Description	How to Set It
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report is successful. The default is 35.
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report has no information in it. The default is 25.
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report fails. The default is 5.

74.45 Report_NetInterfacesIO

Use this Knowledge Script to generate a report about the use of bandwidth on network interface cards. Using this report, you can aggregate data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the NetInterfacesIO Knowledge Script.

74.45.1 Resource Objects

Report Agent > AM Repositories > *AppManager repository*.

74.45.2 Default Schedule

The default schedule for this script is **Run once**.

74.45.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report.
Select the style	Select the style for the first page of your report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (each page shows, for example, the value of the *UNIX_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** provides all the data streams on a single page The default is By computer.
Select time range	Click the **Browse [...]** button to start the time wizard. Use the time wizard to set a specific or sliding time range for data included in your report. The default is 1 day sliding time ending at the current time.
Select peak weekday(s)	Click the **Browse [...]** button to start the day wizard. Use the day wizard to select the days of the week to include in your report. The default is seven days: Sunday through Saturday.
Aggregation by	Specify how you want to aggregate the data in your report. You can specify Minute, Hour, or Day. The default is hour.

Description	How to Set It
Aggregation interval	Specify the intervals you want to use to aggregate the data in your report. You can specify 1-5, 7, 8, 10, 12, 14, 15, 24, 28, 30, 60, or 90. The default is 1.
Statistics to show per period	Select a statistical method by which to display data in your report: • **Average**. The average value of data points for the aggregation interval (for example, the average value for 1 Hour). • **Minimum**. The minimum value of data points for the aggregation interval. • **Maximum**. The maximum value of data points for the aggregation interval. • **Count**. The number of data points for the aggregation interval. • **Sum**. The total value of data points for the aggregation interval. • **3Sigma**. The average + (3 * standard deviation) and average - (3 * standard deviation). • **Std**. The standard deviation. The measure of how widely values are dispersed from the mean. • **Box**. Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval. • **Open**. The first value for the aggregation interval. • **Close**. The last value for the aggregation interval. The default is Average.
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter help card? (yes/no)	Specify whether you want to include a table in the report that lists parameter settings for the report script. The default is `y`.
Include table/chart/both?	Select whether you want to include a table, a chart, or both of data stream values in the report. The default is `y`.
Select chart style	Click the **Browse [...]** button to open the Chart Settings dialog box and select the graphic properties for the charts in your report. The default is Bar.
Select output folder	Click the **Browse [...]** button to open the Publishing Options dialog box and select the parameters for your report's output folder. The default folder prefix is `UNIX_NetInterfacesTraffic`.
Add job ID to output folder name? (yes/no)	Specify whether you want to add the job ID to the report's output folder name. The default is no. Add the job ID to the output folder name to help make the correlation between a specific instance of a Report Script and the corresponding report easier.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box and select the properties as desired. The default title for your report is Network Interface Card Traffic.
Add time stamp to title? (yes/no)	Specify whether you want to append a time stamp to the title of your report, making each title unique. The time stamp is made up of the date and time the report was generated. The default is no. Adding a time stamp is useful in order to run consecutive iterations of the same report without overwriting previous output.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.

Description	How to Set It
Event for report success? (yes/no)	Specify whether you want to raise an event if the report is successfully generated. By default, events are enabled.
Event severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report is successful. The default is 35.
Event severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report has no information in it. The default is 25.
Event severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report fails. The default is 5.

74.46 Report_SystemUpTime

Use this UNIX Report Script to generate a report detailing the uptime and downtime of monitored computers. Uptime and downtime are illustrated in hours and minutes, as well as the percentage of the monitoring interval during which a computer is running or not. For example, if during a 24-hour monitoring interval, the computer is running for 18 hours and not running for 6 hours, the uptime and downtimes are represented as:

- Uptime: 18 hours 0 minutes
- Downtime: 6 hours 0 minutes
- Uptime: 75%
- Downtime: 25%

This report uses data collected by the SystemUpTime Knowledge Scripts. In order to have accurate data for this report, these Knowledge Scripts should be scheduled to run every 5 minutes.

Uptime and downtime are calculated during scheduled maintenance. Ad hoc maintenance is considered as downtime, and is included in all calculations.

74.46.1 Resource Objects

Report Agent > AM Repositories > *AppManager repository*.

74.46.2 Default Schedule

The default schedule is **Run once**.

74.46.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report.
Select the style	Select the style for the first page of the report: • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** generates a report with all data on a single page The default is By computer and data stream.
Select time range	Click the **Browse [...]** button to start the time wizard. Use the time wizard to set a specific or sliding time range for data included in your report. The default is 1 day sliding time ending at the current time.

Description	How to Set It
Select peak weekday(s)	Click the **Browse [...]** button to start the day wizard. Use the day wizard to select the days of the week to include in your report. The default is seven days: Sunday through Saturday.
Aggregation interval	Select the time period by which the data in your report is aggregated: • Hourly • Daily • Weekly The default is Hourly.
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter help card? (y/n)	Set to **y** to include a card in the report that lists parameter settings for the report script. The default is to include the card.
Include table/chart/both	Select whether you want to include a table, a chart, or both of data stream values in the report. By default, the table is included.
Select chart style	Click the **Browse [...]** button to open the Chart Settings dialog box. Define the graphic properties of the charts in your report. The default is a line chart.
Select output folder	Click the **Browse [...]** button to set parameters for the output folder. The default output folder prefix is `SystemUpTime`.
Add job ID to output folder name? (y/n)	Set to `y` to append the job ID to the name of the output folder. The default is `n`. This is helpful to make the correlation between a specific instance of a Report Script and the corresponding report.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box. Set the properties parameters as desired. The default report title is SystemUp Time.
Add time stamp to title? (y/n)	Set to **y** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. The default is n. Adding a time stamp is useful in order to run consecutive iterations of the same report without overwriting previous output.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.
Event for report success? (y/n)	Set to `y` to raise an event when the report is successfully generated. The default is `y`.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report is successful. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report has no information in it. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report fails. The default is 5.

74.47 Report_TopMemoryProcs

Use this Knowledge Script to generate a report about the total memory used by all processes and which processes consume the most memory resources.

This report uses data collected by the TopMemoryProcs Knowledge Script.

74.47.1 Resource Objects

Report Agent > AM Repositories > *AppManager repository*.

74.47.2 Default Schedule

The default schedule for this script is **Run once**.

74.47.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report. **NOTE:** For this report, select only one View, and up to 15 computers or server groups. The data wizard allows you to select more, but if you do, the Finish button is disabled. This mechanism prevents you from selecting too much data for the report.
Select time range	Click the **Browse [...]** button to start the time wizard. Use the time wizard to set a specific or sliding time range for data included in your report. The default is 1 day sliding time ending at the current time.
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter help card? (yes/no)	Specify whether you want to include a table in the report that lists parameter settings for the report script. The default is `y`.
Select output folder	Click the **Browse [...]** button to open the Publishing Options dialog box and select the parameters for your report's output folder. The default prefix for the folder name is UNIX_TopMemoryProcs.
Add job ID to output folder name? (yes/no)	Specify whether you want to add the job ID to the report's output folder name. The default is no. Add the job ID to the output folder name to help make the correlation between a specific instance of a Report Script and the corresponding report easier.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box and select the properties as desired. The default title is UNIX Top Memory Utilization by Process.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.

Description	How to Set It
Event for report success? (yes/no)	Specify whether you want to raise an event if the report is successfully generated. The default is `y`.
Severity for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report is successful. The default is 35.
Severity for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report has no information in it. The default is 25.
Severity for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event when the report fails. The default is 5.

74.48 RunAwayProcs

Use this Knowledge Script to detect runaway processes on the specified computer by repeatedly sampling CPU usage for processes. If a process exceeds the CPU threshold in the number of consecutive samples taken (one at each interval), AppManager raises an event.

For example, if this Knowledge Script detects that a process has exceeded the CPU threshold for five consecutive monitoring periods, it might indicate that the process is trapped in an infinite loop or has encountered other problems. In addition to generating an event to notify you of the problem, you can optionally kill any detected runaway processes. The detail message shows the list of processes being sampled.

The UNIX agent must run under a root account for this script to kill runaway processes.

74.48.1 Resource Object

UNIX computer icon

74.48.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.48.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data? (y/n)	Set to `y` to collect data for charts and reports. The default is `n`.
Maximum CPU usage (%) for runaway processes	Enter a threshold for the maximum percentage of CPU any process should be using when sampled. This percentage is used to determine which processes are runaway processes. The default is 90%.
Number of consecutive samples to take	Enter the number of consecutive samples you want taken before raising an event. The default is 3 samples.
Number of runaway processes to show (0 = all)	Specify the number of processes you want displayed in detail event or data message. Enter 0 if you want all processes displayed. The default is 0 for all processes.
Ignore these comma-separated processes	Enter the names of any processes (separated by commas and no spaces) you want to exclude from sampling.
Never kill these comma-separated processes	Enter the names of any processes (separated by commas and no spaces) that should never be killed. The default processes are `sched`, `init`, `pageout`, `fsflush`, `inetd`, `yp`, and `rpc`.
Kill runaway process when detected? (y/n)	Set to `y` to kill any runaway processes found automatically (with the exception of the processes you have specified should never be killed). The default is `n`.

Description	How to Set It
Event severity level for runaway process detected	Set the event severity level, from 1 to 40, to indicate the importance of an event reported when a runaway process is detected. The default is 5.
Event severity level for killed runaway process	Set the event severity level, from 1 to 40, to indicate the importance of an event reported when a runaway process is stopped. The default is 10.
Event severity level for failed to kill runaway process	Set the event severity level, from 1 to 40, to indicate the importance of an event reported when stopping a runaway process fails. The default is 10.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.49 RunCommand

Use this Knowledge Script to run a non-interactive UNIX command. For example, you can use this Knowledge Script to run a batch command that appends a log file or kills a process.

This Knowledge Script raises an event if the results of the command produce output. You can configure this Knowledge Script to not raise an event if the results of the command do not produce any output.

74.49.1 Resource Object

UNIX computer icon

74.49.2 Default Schedule

By default, this script is only run once per computer.

74.49.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event displaying text sent to STDOUT? (y/n)	Specify whether you want to raise an event containing the `STDOUT` of the executed command. The default is `y`.
Include STDERR in event text? (y/n)	Specify whether you want to include the `STDERR` of the command along with the `STDOUT` in the event text. The default is `y`.
Raise event if output is empty? (y/n)	Specify whether you want to raise an event if the results of the command do not produce any output. The default is `y`.
UNIX command with possible arguments	Enter the command to run. Do not enter a command that requires user input. The command you enter should include all necessary arguments and handle any input and output redirection or file management required. Separate multiple processes with semicolons (;) and no spaces.
Event severity level for STDOUT/STDERR event	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 22.

74.50 SwapLow

Use this Knowledge Script to monitor the swap area (files and/or devices) available. You can monitor the overall percentage of space available across all swap areas, or monitor individual swap areas separately. If the percentage of available swap area is below the threshold you set, AppManager raises an event.

74.50.1 Resource Objects

Swap folder or individual swap area objects.

74.50.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.50.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if under the threshold? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data? (y/n)	Set to `y` to collect data for charts and reports. The default is `n`.
Minimum swap space available (%) threshold	Enter a threshold for the minimum percentage of swap space that should be available. The default is 3%.
Monitor overall swap space availability? (y/n)	Set to `y` to monitor all swap areas on a system. Set to `n` to monitor individual swap areas separately (multiple data streams might be created). The default is `n`.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 20.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.51 Syslog

Use this Knowledge Script to monitor the `syslog` file asynchronously for specific messages or search strings. You can enter the search strings to look for using regular expressions and modifiers to define an Include filter and an Exclude filter or you can enter your search criteria in a separate filter file and use this Knowledge Script to specify the location of that file.

You can use the Include filter, the Exclude filter, or both. If you use both filters, messages that contain any included search strings and do not contain any of the excluded search strings are returned.

To specify the include and exclude patterns, you need to be familiar with Perl regular expressions. For more information, see "Creating Filters with Regular Expressions" on page 4072.

On all platforms, the UNIX agent must run as root or as a user with root-level authority to configure and retrieve information from the syslog file. Before running this Knowledge Script, configure the UNIX agent to run as root or as a user that has been given root-level authority using the sudo configuration file. SUSE10 no longer supports syslogd because it has introduced an upgraded syslog named syslogd-ng. However, if you need monitoring support for syslogd, you must install and configure the earlier, bsd-based syslogd.

This Knowledge Script creates a synchronized duplicate of the syslog file in `$AM_HOME/log/`, and uses the duplicate rather than the UNIX syslog file. If this is a security concern, either take measures to protect this file or do not run the script.

74.51.1 Resource Object

UNIX computer icon

74.51.2 Default Schedule

The default interval for this script is **Asynchronous**. After you start the Knowledge Script job, it runs continuously on the monitored system and reports events or data as they occur.

74.51.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Settings	
Raise event if syslog matches filter?	Set to `y` to raise events. The default is `y`.
Event message to display (clearing this setting will display the matched line)	Type the event message you want to display when messages matching the search criteria are found. If you leave this field blank, the entry in the syslog file that matched your search criteria is displayed as the event message. If you specify a custom event message, you can still view the matching entry from the syslog file by displaying the Properties for the child event and clicking the **Message** tab. The default event message is: Syslog match found

Description	How to Set It
Event severity level	Set the event notification level, from 1 to 40, to indicate the importance of the event. By default, the severity level is 8.
Add filter expression string to event message?	Set to **y** if you want AppManager to add the filter to the details of the event message. The default is yes.
Remove timestamp string from event message?	Set to **y** if you do not want to include the syslog timestamp in the event message. The default is no, which means that the syslog timestamp is included in the event message.
Remove process id string from event message?	Set to **y** if you do not want to include the syslog process identifier in the event message. The default is no, which means that the syslog process ID is included in the event message.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.
Filter Settings	
Include Filter	
Base regular expression	Enter a regular expression, in Perl, to identify the pattern you want to look for in the monitored text file. The default expression matches all strings. For information about writing Perl regular expressions, see "Creating Filters with Regular Expressions" on page 4072. Control Center also allows you to override values for parameters. You might want to use that feature instead of, or in conjunction with, this parameter. For more information about setting overrides, see the *Control Center User Guide*.
Special regular expression	Enter an additional regular expression to look for in specific situations. For example, you can have a base regular expression that you use in jobs that run on all computers, then an additional regular expression that you only use in jobs running on some computers. Control Center also allows you to override values for parameters. You might want to use that feature instead of, or in conjunction with, this parameter. For more information about setting overrides, see the *Control Center User Guide*.
Modifier for regular expression	You can use optional modifiers to change the behavior of the regular expression. For example, specifying "i" for this parameter makes the include filter case-insensitive.
Exclude Filter	
Base regular expression	Enter a regular expression, in Perl, to identify the pattern you want to exclude in the monitored text file.
Special regular expression	Enter an additional regular expression to exclude in specific situations. For example, you can have a base regular expression that you use in jobs that run on all computers, then an additional regular expression that you only use in jobs running on some computers. For information about how to selectively run jobs, see the *Control Center User Guide for NetIQ AppManager*.

Description	How to Set It
Modifier for regular expression	You can use optional modifiers to change the behavior of the regular expression. For example, specifying “i” for this parameter makes the include filter case-insensitive. To use the case-insensitive modifier, enter `i`.
Optional file containing additional filters	Enter the full path to a file containing any additional filter items you want to match. You can also use this parameter if you only want to specify matching expressions in an external file.
Collect data?	Set to `y` to collect data for reports and graphs. If set to y, the script returns the number of messages matching the search criteria. The default is `n`.

74.51.4 Example of How this Script Is Used

This Knowledge Script allows you to specify include and exclude expressions as Knowledge Script properties or maintain your search criteria independent of the Knowledge Script parameters in a separate filter file.

In many cases, specifying a filter file provides greater flexibility and makes modifying your search criteria more straightforward because you can add virtually any number of expressions and you do not need to modify the Knowledge Script properties through the Operator Console to pick up your changes.

If you want to use a filter file:

- Identify the strings that you want to find a match for in the syslog file (the entries you want to include in your results).
- Create the file with one regular expression string per line to locate matching strings.
- Make sure the file exists on the target UNIX computer.
- Enter the absolute path to the file on the local UNIX agent in the **Optional file containing additional filters** parameter and start the job.

74.52 SystemUpTime

Use this Knowledge Script to monitor the system up time for a UNIX server. This Knowledge Script tracks the number of hours that the computer has been operational since it was last rebooted. If the computer reboots within the monitoring interval, AppManager raises an event.

This script allows you to specify whether you want AppManager to raise events for reboots when the computer is in maintenance mode.

74.52.1 Resource Object

UNIX computer icon

74.52.2 Default Schedule

The default interval for this script is **Every hour**.

74.52.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event? (y/n)	Set to **y** to raise events. The default is **y**.
Collect data? (y/n)	Set to **y** to collect data for graphs and reports. If set to **y**, the script returns the number of hours the system has been up. The default is **n**.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.
Ignore reboots during maintenance mode? (y/n)	Set to **y** to prevent AppManager from reporting events when the computer reboots while in maintenance mode. The default is **n**.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.53 TopCpuProcs

Use this Knowledge Script to monitor the total CPU resources used by all processes and which processes consume the most CPU resources. If the CPU usage for any of the listed processes exceeds the threshold you set, AppManager raises an event.

74.53.1 Resource Objects

CPU folder

74.53.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.53.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the total CPU usage for the interval and the detail message lists the processes consuming the most CPU resources. The default is `n`.
Maximum CPU usage (%) for all processes threshold	Enter a threshold for the maximum percentage of CPU resources that should be in use for all processes. The default is 90%.
Number of top processes to display (0 means all)	Specify the number of top processes you want displayed in the detail message (event or data). Enter 0 if you want all processes displayed. The default is 5 processes. **NOTE:** Limit the number of processes included in the detail message to the top five to ten processes, rather than reporting on all processes. In most cases, including all processes increases the size of the detail message without providing you with more useful information. Typically, the top few processes are the most significant and the most likely ones you are looking to track down for troubleshooting purposes.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

74.54 TopMemoryProcs

Use this Knowledge Script to monitor the system memory usage to identify which processes are consuming the most memory. This Knowledge Script raises an event if the virtual or physical memory usage for the system crosses the threshold you specify. The top number of processes that are consuming the most physical memory are reported in the event and data detail messages.

74.54.1 Resource Object

Memory folder

74.54.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

74.54.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General settings	
Event?	Specify whether you want to raise an event if the memory usage for all processes crosses the threshold you specify. The default is `y`.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Number of top processes to display (0 means all)	Enter a number indicating how many top processes you want AppManager to display in the detail message (event or data). Type 0 if you want all processes recorded in the detail message. The default is 5. **NOTE:** In most cases, including all processes increases the size of the detail message without providing you with more useful information. Therefore, NetIQ recommends that you limit the number of processes included in the detail message to the top five or ten processes. Typically, the top few processes are the most significant for troubleshooting purposes. Processes that share memory appear to be using more memory than they actually are.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.
Threshold settings	
Maximum virtual memory used (%) threshold	Type a threshold for the maximum percentage (%) of virtual memory that should be in use. The default is 90%.
Maximum physical memory used (%) threshold	Type a threshold for the maximum percentage (%) of physical memory that should be in use for all processes. Physical memory not being used by processes is often used dynamically by the system as cache. The default is 100%.
HP-UX specific settings	

Description	How to Set It
Include reserved value in calculations?	Specify whether you want to include reserved swap space in the calculations. If set to `y`, calculations include space reserved system for deactivation and paging processes. This parameter is only available on computers running the HP-UX operating system. The default is `y`.
Include memory pseudo-swap values in calculations?	Specify whether you want to include pseudo-swap space in the calculations. Pseudo-swap space might be up to 3/4 of the available system memory. If set to `y`, calculations include space in the pseudo swap reservation counters. This parameter is only available on computers running the HP-UX operating system. The default is `n`.
Collect Data settings	
Collect virtual memory data?	Specify whether you want to collect information on virtual memory usage for charts and reports. If set to y, this script returns the virtual memory usage for the interval and the detail message lists the processes consuming the most memory resources. The default is `n`.
Collect physical memory data?	Specify whether you want to collect information on physical memory usage for charts and reports. If set to `y`, this script returns the physical memory usage for the interval and the detail message lists the processes consuming the most memory resources. The default is `n`.

74.55 UserSessions

Use this Knowledge Script to monitor the number of user accounts logged into a computer. This Knowledge Script raises an event if the number of user sessions crosses the threshold you specify. The top number of user sessions are reported in the event and data detail messages.

74.55.1 Resource Object

UNIX computer icon

74.55.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

74.55.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data on user sessions? (y/n)	Specify whether you want to collect information on virtual memory usage for charts and reports. If set to `y`, this script returns the number of current user accounts that are logged into the computer. The default is `n`.
Session Event Options	
Raise event if session thresholds exceeds? (y/n)	Specify whether you want to raise an event if the number of active sessions crosses the threshold you specify. The default is `y`.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of user sessions exceeds the threshold. The default is 25.
Minimum number of users logged in	Type a threshold for the minimum number of active user sessions. The default is 0.
Maximum number of users logged in	Type a threshold for the maximum number of active user sessions. The default is 8.
User Session Options	
Raise event for restricted Users? (y/n)	Specify whether you want to raise an event if restricted user accounts log in. The default is `y`.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of user sessions exceeds the threshold. The default is 40.
Restricted User list (separated by commas and no spaces)	Specify the user accounts that should not log into the computer, separated by commas with no space.

74.56 ZombieProcs

Use this Knowledge Script to detect the number of zombie, or defunct, processes currently left waiting to be cleaned up. If the number of zombie processes exceeds the threshold you set, AppManager raises an event. A large or increasing number of zombie processes can indicate a program you are running is launching child processes but not properly terminating either the parent or child process, or that you might need to exit a running program to eliminate the zombie processes.

74.56.1 Resource Object

CPU folder

74.56.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

74.56.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event if over the threshold? (y/n)	Set to `y` to raise events. The default is `y`.
Collect data? (y/n)	Set to `y` to collect data for charts and reports. If set to `y`, the script returns the number of zombie processes detected for the interval. The default is `n`.
Maximum number of zombie processes threshold	Enter a threshold for the maximum number of zombie processes waiting in the interval. The default is 10 zombie processes.
Event severity level	Set the event notification level, from 1 to 40, to indicate the importance of the event. By default, the severity level is 5.
Event severity for internal failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this job experienced an internal error. The default is 5.

75 VMware vSphere Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring VMware vSphere, vCenter, VMware ESX or ESXi Server hosts, VMware datastores, and VMware virtual machines, also called guests. The scripts can also monitor vCenter alarms, events, and task failures.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
Alarms	Monitors vCenter alert and warning alarms and raises AppManager events when those vCenter alarms get triggered, acknowledged, or cleared.
ClusterCPUUsage	Monitors the CPU usage of the cluster.
ClusterMemUsage	Monitors memory usage, memory swap used, and memory balloon for a cluster.
ClusterStatus	Monitors the configuration status of the cluster.
Configuration	Use this Knowledge Script to generate an inventory of all hosts and virtual machines for the selected vCenter as well as configuration details for each.
ConfigureHostTraffic	Enables an SNMP firewall port for a given host.
DatastoreUsage	Monitors the usage and free space of datastores.
Events	Monitors vCenter error, warning, and informational events, and raises AppManager events when those vCenter events occur.
HostConnected	Monitors changes in the connection status of hosts to vCenter. For example, this script monitors whether the host is visible to vCenter.
HostCPUUsage	Monitors the percentage of host CPU usage and CPU used.
HostDataStoreUsage	Monitors the usage and free space of each datastore connected to a host.
HostDiskIO	Monitors disk reads/writes and total disk I/O for a host.
HostDiskTotalLatency	Monitors the total latency of all disks connected to a host.
HostMemoryUsage	Monitors memory usage, memory swap used, and memory balloon for a host.
HostNetworkIO	Monitors network data received/transmitted for a host.
HostUptime	Monitors time elapsed since last system startup for a host.

Knowledge Script	What It Does
HWCorrectableMemCondition	Monitors the state of the correctable memory condition.
HWFanStatus(CPU)	Monitors the temperature of the CPU fan.
HWFanStatus(System)	Monitors the temperature of the system fan.
HWHPNICLost	For HP ESX hosts only, monitors for SNMP trap messages that indicate the Failed status of a logical adapter.
HWHPNICRestorScripted	For HP ESX hosts only, monitors for SNMP trap messages that indicate the Restored status of a logical adapter.
HWLogicalDiskStatus	Monitors the state of a logical disk.
HWPhysicalDiskStatus	Monitors the state of a physical disk.
HWPowerSupply	Monitors the condition of the power supply in the system.
HWThermalStatus	Monitors the thermal state of the system.
Inventory	Monitors if hosts and virtual machines are added or removed from vCenter, tracks configuration changes to hosts and VMs in vCenter, and monitors hosts and VMs that migrate to different hosts or move to different datastores or resource pools.
ResourcePoolCPUUsage	Monitors the CPU usage of the resource pool.
ResourcePoolMemUsage	Monitors memory usage and memory balloon for the resource pool.
ResourcePoolStatus	Monitors the overall status of the Resource pool.
ServiceHealthCheck	Monitors vCenter Server services.
Tasks	Raises AppManager events when monitored vCenter task failures occur.
VirtualCenterCPUUsage	Monitors the CPU usage of the vCenter process and the CPU usage on the computer hosting vCenter.
VirtualCenterMemoryUsage	Monitors memory usage of the vCenter process and total memory usage on the computer hosting vCenter.
VirtualMachineInventory	Monitors virtual machines that are added, removed, renamed, moved, or migrated within vCenter. NetIQ Corporation recommends you use the Inventory Knowledge Script instead of this script for inventory monitoring.
VmConnected	Monitors changes in the connection status of virtual machines to vCenter.
VmCPUUsage	Monitors CPU usage, CPU ready, CPU wait, and CPU used for a virtual machine.
VmDiskIO	Monitors disk reads/writes for a virtual machine.
VmDiskUsage	Monitors logical disk usage for a virtual machine.
VmMemoryUsage	Monitors over a dozen memory metrics for a virtual machine, including memory active, memory balloon, memory consumed, memory granted, memory overhead, and more.
VmNetworkIO	Monitors network transmits/receives for a virtual machine.
VmOperations	Monitors the number of virtual machine operations that are occurring across clusters and datacenters.
VmPowerStatus	Monitors changes in the power status of virtual machines.

Knowledge Script	What It Does
VmSnapshotUsage	Monitors the number and size of all virtual machine snapshots, as well as the age of virtual machine snapshots and reverted snapshots.
VmToolsStatus	Monitors the VMware Tools status of virtual machines.
VmUptime	Monitors time elapsed since last system startup for a virtual machine.
Recommended Knowledge Script Groups	Performs essential monitoring of your vCenter environment.

75.1 Alarms

Use this Knowledge Script to monitor vCenter *alarms*, which are actions that are triggered when a condition or set of conditions occurs within vCenter. A default set of alarms is defined for vCenter, but vCenter administrators can also define custom alarms.

This script raises an event when monitored vCenter alarms are triggered, acknowledged, and cleared. You can also raise events for currently triggered alarms. You can filter the vCenter alarms by alarm type and alarm name. Use the Objects tab to define the resources you want to monitor.

NOTE: VMware vCenter 4.1 or earlier does not support the ability to generate events when a vCenter alert or warning alarm is acknowledged or cleared.

A list of VirtualCenter_Alarms events with the same short event message will not display individual event details. By default, AppManager collapses event details based on the object and the short event message. If the short event message is the same for a series of events, the list of events will collapse. To view the individual event details, disable event collapsing for that specific Alarms job.

In addition, you can use the VirtualCenter_Alarms Knowledge Script to monitor changes to your ESX and ESXi hardware. For more information, see "Using the Alarms Script to Monitor ESX and ESXi Hardware" on page 4180.

Each event report shows the following information:

- Target
- Category
- Description
- User name
- Time on vCenter when the alarm occurred

NOTE: The first time you run this script, you may experience a short delay before actual monitoring begins. This delay is caused by the various initialization processes that must be carried out by the Alarms script.

75.1.1 Resource Objects

Run the Discovery_VirtualCenter Knowledge Script on the objects you want to monitor before running this Knowledge Script. You can also monitor objects that the Discovery_VirtualCenter Knowledge Script does *not* discover, such as distributed virtual port groups and distributed virtual switches.

You can run this script on the following resource objects:

- vCenter server
- Clusters
- Datacenters
- Datastores
- Hosts
- Resource pools
- Virtual appliances (vApps)

- Virtual machines
- Folders (you can only monitor the folder objects found under the Host & Clusters parent folder in the TreeView pane)
- Distributed virtual port groups (not displayed in the TreeView pane)
- Distributed virtual switches (not displayed in the TreeView pane)
- Network (not displayed in the TreeView pane)
- VMware distributed virtual switch (not displayed in the TreeView pane)

75.1.2 Default Schedule

The default interval for this script is **Asynchronous**. After you start the Knowledge Script, its job status appears as **Running**.

75.1.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when AppManager fails to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot log in to vCenter. The default is 5.
Event severity when Alarms job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Alarms job fails. The default is 5.
Event severity when filter settings contain conflicts	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the filter settings contain conflicts. The default is 15.
Event severity when Alarms job has delayed start	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Alarms job does not start when it is expected to start. The default is 25.
Additional Settings	
Event Details	
Event detail format	Select **HTML Table** or **Plain Text** as the format for the detail in an event message. The default is HTML Table.
Monitor vCenter Alarms	
Event Notification	
Alert Alarms	
Raise event if vCenter alert alarm is triggered?	Set to **Yes** to raise an event if a vCenter alert alarm that matches your criteria is triggered. The default is Yes.
Event severity when vCenter alert alarm is triggered	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a vCenter alert alarm is triggered. The default is 5.
Raise event if vCenter alert alarm is acknowledged?	Set to **Yes** to raise an event if a vCenter alert alarm that matches your criteria is acknowledged. The default is unselected.

Parameter	How to Set It
Event severity when vCenter alert alarm is acknowledged	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a vCenter alert alarm is acknowledged. The default is 25.
Raise event if vCenter alert alarm is cleared?	Set to **Yes** to raise an event if a vCenter alert alarm that matches your criteria is cleared. The default is unselected.
Event severity when vCenter alert alarm is cleared	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a vCenter alert alarm is cleared. The default is 25.
Raise events for currently triggered vCenter alert alarms	Set to **Yes** to raise events for vCenter alert alarms that are in a triggered state when this job first starts. The default is unselected.
Event severity for currently triggered vCenter alert alarms	Set the event severity level, from 1 to 40, to indicate the importance of events for vCenter alert alarms that are in a triggered state when this job first starts. The default is 5.
Alarm name	If you want to raise events on specific alarms, provide the names of the vCenter alarms you want to monitor. AppManager raises an event when an alarm matching your type, name, and status criteria is triggered. If you do not enter an alarm name, AppManager raises events for all alert alarms. The asterisk (*) and (?) are acceptable wildcards. Separate multiple names with a comma, without any spaces. This parameter is not case-sensitive. **NOTE:** You must enter at least a * for this script to run. Do not leave this parameter blank.
Also raise events on unassociated TreeView objects?	Select **Yes** to raise an event for unassociated objects in the TreeView pane. The default is unselected. **NOTE:** To monitor a datastore cluster object, select Yes for this parameter.
Warning Alarms	
Raise event if vCenter warning alarm is triggered?	Set to **Yes** to raise an event if a vCenter warning alarm that matches your criteria is triggered. The default is Yes.
Event severity when vCenter warning alarm is triggered	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a vCenter warning alarm is triggered. The default is 15.
Raise event if vCenter warning alarm is acknowledged?	Set to **Yes** to raise an event if a vCenter warning alarm that matches your criteria is acknowledged. The default is unselected.
Event severity when vCenter warning alarm is acknowledged	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a vCenter warning alarm is acknowledged. The default is 25.
Raise event if vCenter warning alarm is cleared?	Set to **Yes** to raise an event if a vCenter warning alarm that matches your criteria is cleared. The default is unselected.
Event severity when vCenter warning alarm is cleared	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a vCenter warning alarm is cleared. The default is 25.
Raise events for currently triggered vCenter warning alarms	Set to **Yes** to raise events for vCenter warning alarms that are in a triggered state when this job first starts. The default is unselected.
Event severity for currently triggered vCenter warning alarms	Set the event severity level, from 1 to 40, to indicate the importance of events for warning alarms that are in a triggered state when this job first starts. The default is 15.

Parameter	How to Set It
Alarm name	If you want to raise events on specific alarms, provide the names of the vCenter alarms you want to monitor. AppManager raises an event when an alarm matching your type, name, and status criteria is triggered. If you do not enter an alarm name, AppManager raises events for all warning alarms. The asterisk (*) and (?) are acceptable wildcards. Separate multiple names with a comma, without any spaces. This parameter is not case-sensitive. **NOTE:** You must enter at least a * for this script to run. Do not leave this parameter blank.
Also raise events on unassociated TreeView objects?	Select **Yes** to raise an event for unassociated objects in the TreeView pane. The default is unselected. **NOTE:** To monitor a datastore cluster object, select Yes for this parameter.

75.2 Using the Alarms Script to Monitor ESX and ESXi Hardware

You can use the VirtualCenter_Alarms Knowledge Script to monitor state changes in your ESX or ESXi hardware, such as when a fan in a group of fans is close to overheating. Before you can monitor your hardware with the Alarms script, you need to create the hardware alarms in vCenter.

System requirements for monitoring ESX and ESXi hardware:

- At minimum, VMware vSphere 4.0
- At minimum, ESX 3.5, Update 4, or ESXi 4.0

To create a custom alarm in vCenter:

1. In vCenter, locate the ESX or ESXi server you want to monitor in the left pane.
2. On the Hardware Status tab, identify the hardware element you want to monitor, such as a fan group.
3. On the Alarms tab, verify that the **Definitions** view is selected.
4. Right-click anywhere on the Alarms tab and select **New Alarm**.
5. In the Alarm Settings dialog box, type an alarm name, such as `All Fans - Status Yellow`.

   NOTE: Make a note of this name, as you will need to type this name into the VirtualCenter_Alarms Knowledge Script in AppManager when you run the VirtualCenter_Alarms script.

6. Type a short description of the alarm, such as `Alarm triggered when any Host's fan has a status of Yellow.`
7. From the Monitor list, select **Hosts**.
8. Select **Monitor for specific events occurring on this object**.
9. Verify that **Enable this alarm** is checked.
10. On the Triggers tab, click **Add**.
11. From the Event list, select the relevant event type, such as **Hardware Health Changed**.
12. From the Status list, select the relevant alarm status, such as **Alert or Warning**.
13. In the Conditions field, click **Advanced**.
14. In the Trigger Conditions dialog box, specify the different Argument > Operator > Value combinations that must be present to set off the alarm. For example, **newgroup > equal to > Fan** and **newState > equal to > Yellow**.

    NOTE: The newGroup argument represents the sensor being monitored, such as Fan or Voltage. The newState argument represents the current state of the sensor in the newGroup argument.

15. Click **OK** to close the Trigger Conditions dialog box.
16. Click **OK** to close the Alarms Settings dialog box. The custom alarm is now set up in vCenter, and you can start monitoring that alarm with AppManager.

To set up the Alarms script to monitor the new custom alarm in vCenter:

1. In AppManager, run the VirtualCenter_Alarms Knowledge Script on the vCenter object you want to monitor for ESX or ESXi hardware alarms.
2. Click the **Values** tab.
3. ***If you set up a vCenter alert alarm in the previous procedure,*** type the alert alarm name, such as `All Fans - Status Yellow` , into the *Alarm name* parameter under the *Raise event if vCenter alert alarm is triggered?* parameter.
4. ***If you set up a vCenter warning alarm in the previous procedure,*** type the warning alarm name, such as `All Fans - Status Red`, into the *Alarm name* parameter under the *Raise event if vCenter warning alarm is triggered?* parameter.
5. Select **Yes** for the relevant *Raise event* parameter.
6. Set the severity level in the relevant *Event severity* parameter.
7. Click **OK** to run the script.

NOTE: Closing the AppManager Alarms event will not clear the alarm event in vCenter, and closing the vCenter alarm will not clear the AppManager Alarms event.

75.3 ClusterCPUUsage

Use this Knowledge Script to monitor the CPU usage of the cluster. This script raises an event if CPU usage exceeds the threshold you set. In addition, this script generates data streams for CPU usage. This script monitors and collects data for the following performance metrics:

- CPU usage as a percentage: the sum of actively used CPU of all virtual machines in the cluster, as a percentage of the total available CPU.
- CPU usage in MHz: the sum of actively used CPU of all virtual machines in the cluster, in megahertz.

NOTE: The VirtualCenter_ClusterCPUUsage Knowledge Script does not return valid values for VMware vSphere 4.0. When you run the this Knowledge Script, the values returned do not match the values displayed in the Advanced Performance Charts in the vSphere client. This issue does not occur with versions of VMware vSphere later than version 4.0.

75.3.1 Prerequisite

To enable the Knowledge Script to collect accurate CPU usage data, set the following **Statistics Collection Intervals** appropriately in the vCenter Management Server Configuration:

- **Collection Frequency**: The interval duration in vCenter must be less than or equal to the AppManager job interval schedule. For example, if you run the VirtualCenter_ClusterCPUUsage Knowledge Script at 15-minute intervals, the interval duration in vCenter must be less than or equal to 15 minutes.

For more information about setting the Interval Duration and Statistics Level in vCenter, see the VMware Virtual Infrastructure 3 documentation.

75.3.2 Resource Object

vSphere cluster

75.3.3 Default Schedule

By default, this script runs every **15 minutes**.

75.3.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event when percent CPU usage exceeds the threshold?	Select Yes to raise an event if the percentage of CPU usage exceeds the threshold you set. The default is unselected.

Parameter	How to Set It
Event severity when percent CPU usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of the CPU usage exceeds the threshold. The default is 15.
Raise event when CPU usage in MHz exceeds the threshold?	Select Yes to raise an event if CPU usage in MHz exceeds the threshold you set. The default is Yes.
Event severity when CPU usage in MHz exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage in MHz exceeds the threshold. The default is 15.
Raise event when CPU metrics are not available?	Select **Yes** to raise an event if the CPU metrics are not available. The default is Yes.
Event severity when CPU metrics are not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when the ClusterCPUUsage job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ClusterCPUUsage job fails unexpectedly. The default is 5.
Data Collection	
Collect data for percent CPU usage?	Select **Yes** to collect data about the percentage of CPU usage for charts and reports. The default is unselected.
Collect data for CPU usage in MHz?	Select **Yes** to collect CPU usage data in MHz for charts and reports. The default is unselected.
Monitoring	
Maximum threshold for CPU usage	Specify the maximum amount of CPU usage that can occur before an event is raised. The default is 80 percent.
Maximum threshold for CPU usage	Specify the maximum amount of CPU usage that can occur before an event is raised. The default is 800 MHz.

75.4 ClusterMemUsage

Use this Knowledge Script to monitor the memory usage of the cluster. This script raises an event when a monitored value exceeds the threshold you set. This script monitors and collects data for the following performance metrics:

- Memory active: the amount of host machine memory used by all powered-on virtual machines in the cluster. A cluster's consumed memory consists of virtual machine consumed memory and overhead memory. It does not include host-specific overhead memory, such as memory used by the service console or VMkernel.
- Memory balloon: the amount of memory allocated by the virtual machine memory control driver, which is installed with VMware Tools.
- Memory granted: the amount of memory (in kilobytes) that has been allocated to virtual machines running on all hosts in the cluster.
- Memory swap used: the sum of the memory swapped by the powered-on virtual machines on all hosts in the cluster.
- Memory usage: the amount of total configured memory available for use.

75.4.1 Prerequisite

To enable the Knowledge Script to collect accurate memory related data, set the following **Statistics Collection Intervals** appropriately in the vCenter Management Server Configuration:

- **Collection Frequency**: The interval duration in vCenter must be less than or equal to the AppManager job interval schedule. For example, if you run the VirtualCenter_ClusterMemUsage Knowledge Script at 15-minute intervals, the interval duration in vCenter must be less than or equal to 15 minutes.

For more information about setting the Interval Duration and Statistics Level in vCenter, see the VMware Virtual Infrastructure 3 documentation.

75.4.2 Resource Object

vSphere cluster

75.4.3 Default Schedule

By default, this script runs every **15 minutes**.

75.4.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	

Parameter	How to Set It
Raise event when memory active exceeds the threshold?	Select **Yes** to raise an event when memory active exceeds the threshold you set. The default is unselected.
Event severity when memory active exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory active exceeds the threshold. The default is 15.
Raise event when memory balloon used exceeds the threshold?	Select **Yes** to raise an event when memory balloon used exceeds the threshold you set. The default is Yes.
Event severity when memory balloon used exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory balloon used exceeds the threshold. The default is 15.
Raise event when memory granted exceeds the threshold?	Select **Yes** to raise an event when memory granted exceeds the threshold you set. The default is unselected.
Event severity when memory granted exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory granted exceeds the threshold. The default is 15.
Raise event when memory swap used exceeds the threshold?	Select **Yes** to raise an event when memory swap used exceeds the threshold you set. The default is Yes.
Event severity when memory swap used exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory swap used exceeds the threshold. The default is 15.
Raise event when memory usage exceeds the threshold?	Select **Yes** to raise an event when memory usage exceeds the threshold you set. The default is Yes.
Event severity when memory usage exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory usage exceeds the threshold. The default is 15.
Raise event when memory metrics are not available?	Select **Yes** to raise an event if the memory metrics are not available. The default is Yes.
Event severity when memory metrics are not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when ClusterMemUsage job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ClusterMemUsage job fails unexpectedly. The default is 5.
Data Collection	
Collect data for memory active?	Select **Yes** to collect cluster memory usage data for charts and reports. The default is unselected. **NOTE:** Because VMware permits over-allocation of resources, it is possible for data collection to return cluster memory usage data points in excess of 100 percent.

Parameter	How to Set It
Collect data for memory balloon used?	Select **Yes** to collect cluster memory balloon used data for charts and reports. The default is unselected. **NOTE:** Because VMware permits over-allocation of resources, it is possible for data collection to return cluster memory balloon data points in excess of 100 percent.
Collect data for memory granted?	Select **Yes** to collect cluster memory granted data for charts and reports. The default is unselected.
Collect data for memory swap used?	Select **Yes** to collect cluster memory swap data for charts and reports. The default is unselected. **NOTE:** Because VMware permits over-allocation of resources, it is possible for data collection to return cluster memory swap data points in excess of 100 percent.
Collect data for memory usage?	Select **Yes** to collect cluster memory usage data for charts and reports. The default is unselected. **NOTE:** Because VMware permits over-allocation of resources, it is possible for data collection to return cluster memory usage data points in excess of 100 percent.
Monitoring	
Maximum threshold for memory active	Specify the maximum percentage of cluster memory active that can occur before an event is raised. The default is 20 percent.
Maximum threshold for memory usage	Specify the maximum percentage of cluster memory usage that can occur before an event is raised. The default is 80 percent.
Maximum threshold for memory balloon used	Specify the maximum percentage of cluster memory balloon that can occur before an event is raised. The default is 20 percent.
Maximum threshold for memory granted	Specify the maximum percentage of cluster memory granted that can occur before an event is raised. The default is 1024 megabytes.
Maximum threshold for memory swap used	Specify the maximum percentage of cluster memory swap used that can occur before an event is raised. The default is 20 percent.

75.5 ClusterStatus

Use this Knowledge Script to monitor the configuration status of the cluster. This script raises an event if the state of the cluster changes to one of the following states:

- Inconsistent - The number of virtual machines powered on exceeds the requirements of strict failover. The current failover capacity is smaller than the configured failover capacity, and can no longer guarantee failover for the specified number of hosts, but it continues performing failover. If a host fails, VMware first fails over the virtual machines of one host in order of priority, and then fails over the virtual machines of the second host in order of priority, and so on.
- Overcommitted - When capacity is removed from the cluster, such as when a host fails or is removed, and there are no longer enough resources to support all requirements.
- Undercommitted - Available resources can meet all reservations and support all running virtual machines. In addition, at least one host has enough resources to run.

This script generates data streams for undercommitted state, overcommitted state, and inconsistent state.

75.5.1 Resource Object

vSphere cluster

75.5.2 Default Schedule

By default, this script runs every **15 minutes**.

75.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event when cluster state changes?	Select **Yes** to raise an event if the state of the cluster changes. The default is Yes.
Event severity when cluster state is inconsistent	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the cluster state changes to inconsistent. The default is 5.
Event severity when cluster state is overcommitted	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the cluster state changes to overcommitted. The default is 15.
Event severity when cluster state is undercommitted	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the cluster state changes to undercommitted. The default is 25.
Raise event when status information is not available?	Select **Yes** to raise an event if the status information is not available. The default is unselected.
Event severity when status information is not available.	Set the event severity level, from 1 to 40, to indicate the importance of an event in which status information is not available. The default is 15.

Parameter	How to Set It
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when ClusterStatus job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ClusterStatus job fails unexpectedly. The default is 5.
Data Collection	
Collect data for status change?	Select **Yes** to collect data about cluster status for charts and reports. The default is unselected. **NOTE:** If enabled, data collection returns the following data: 100 for undercommitted state, 50 for overcommitted state, and 0 for inconsistent state.

75.6 Configuration

Use this Knowledge Script to generate an inventory of all hosts and virtual machines for the selected vSphere environment as well as configuration details for each host and virtual machine.

NOTE:

- This script may take more than an hour to run on environments with more than 500 virtual machines.
- This script may take significantly longer to run on a proxy agent versus a non-proxy agent.

Each host report shows the following information:

General information

- Type
- Version
- Build
- System manufacturer
- System model
- Number of processors and resources of each (in GHz)
- Processor type
- Total CPU resources (in GHz)
- Memory (in megabytes)
- Number of virtual machines
- If VMotion is enabled or disabled
- Date and time the system was booted
- System date and time
- Uptime

Processor information

- Processor type
- Processor speed
- Number of processor sockets
- Number of cores per socket
- Number of logical processors
- If hyperthreading is enabled or disabled

Memory information

- Total RAM (in megabytes)
- RAM in use by virtual machines
- Service console RAM (in megabytes)

Storage information

- Number of datastores
- Table of device, capacity (in gigabytes), free space (in gigabytes), and type
- Table of adapters, device, host bus adapter, type, and SAN identifier
- Table of physical adapters, device, speed, vSwitch, and WOL support
- Table of virtual switches, configured ports, and available ports

Virtual machine and template information

- Table of virtual machines, state, uptime, CPU count, memory (in megabytes), guest OS, and notes
- Table of templates, CPU count, memory (in megabytes), guest OS, and notes

For each virtual machine, the report shows the following information:

General information

- DNS name
- Guest operating system
- Template
- State
- Uptime
- Host machine
- VMware tools status
- VMware tools version
- Number of snapshots

CPU information

- Number of CPUs
- CPU reservation (in MHz)

Memory information

- Memory (in megabytes)
- Memory reservation (in megabytes)

Disk information

- Table of disks, their type, and their size (in gigabytes)

Network information

- Table of network interface cards, VLAN, emulation, IP address, and MAC address

75.6.1 Resource Object

vCenter

75.6.2 Default Schedule

By default, this script runs **once**.

75.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event when configuration files successfully generated?	Select **Yes** to raise an event if the configuration files were successfully generated. The default is Yes.
Event severity when configuration files successfully generated	Set the event severity level, from 1 to 40, to indicate the importance of an event in which configuration files are generated successfully. The default is 25.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when Configuration job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Configuration job fails unexpectedly. The default is 5.
Knowledge Script Settings	
Full path to output folder for result files	Provide the path to a location on the agent computer in which to save the configuration. The default path is `C:\ProgramFiles\NetIQ\Temp\NetIQ_Debug\VMware`. **NOTE:** This script raises an error event if you use any of the following characters in the path for this parameter: `/ * " < > | ?`
Report file name	Provide a file name for the report. The default name is default.html

75.7 ConfigureHostTraffic

Use this Knowledge Script to enable firewalls on host ESX servers to allow SNMP traffic. This script raises an event if the operation succeeds or fails. This Knowledge Script replaces the VirtualCenter_EnableSNMPTraffic Knowledge Script.

75.7.1 Prerequisite

Enable the **Security Profile and Firewall** permission to run this Knowledge Script.

For more information, see .

75.7.2 Resource Object

vSphere ESX or ESXi host

75.7.3 Default Schedule

By default, this script runs **once**.

75.7.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event when host does not support firewall configuration?	Select **Yes** to raise an event when a host does not support firewall configuration. The default is Yes.
Event severity when host does not support firewall configuration	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a host does not support firewall configuration. The default is 15.
Event severity when host server no longer connected to VirtualCenter	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the selected host server has been removed from vCenter. The default is 35.
Event severity when failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when ConfigureHostTraffic job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ConfigureHostTraffic job fails unexpectedly. The default is 5.
Host inbound traffic settings	

Parameter	How to Set It
Enable SNMP traffic?	Select **Yes** to raise an event when the SNMP inbound traffic is enabled successfully. The default is Yes.
Event severity when SNMP inbound traffic enabled successfully	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SNMP inbound traffic is enabled successfully. The default is 25.
Event severity when SNMP inbound traffic is already enabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which inbound traffic is already enabled. The default is 35.
Event severity when SNMP inbound traffic failed to be enabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SNMP inbound traffic failed to be enabled. The default is 5.

75.8 DatastoreUsage

Use this Knowledge Script to monitor the usage and free space of datastores. This script raises an event if the amount of available free space falls below threshold and percentage of datastore used exceeds the threshold. In addition, this script generates data streams for gigabytes or megabytes of available free space and for the percentage of datastore used.

75.8.1 Resource Object

vSphere datastore

75.8.2 Default Schedule

By default, this script runs every **three hours**.

75.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event when free space falls below the threshold?	Select **Yes** to raise an event if the amount of available datastore free space falls below the threshold you set. The default is Yes.
Event severity when available free space falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of available datastore free space falls below the threshold. The default is 15.
Raise event when datastore percentage used exceeds the threshold?	Select **Yes** to raise an event if the percentage of datastore used exceeds the threshold you set. The default is Yes.
Event severity when percentage used exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance an event in which the percentage of datastore used exceeds the threshold. The default is 15.
Raise event when datastore usage metrics are not available?	Select **Yes** to raise an event when datastore usage metrics are not available. The default is unselected.
Event severity when datastore usage metrics are not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which datastore usage metrics are not available. The default is 15.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve datastore metrics from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when DataStoreUsage job fails unexpectedly	Set the severity level, from 1 to 40, to indicate the importance of an event in which the DataStoreUsage job fails unexpectedly. The default is 5.

Parameter	How to Set It
Data Collection	
Collect data for free space?	Select **Yes** to collect data about the amount of free space for charts and reports. The default is unselected.
Collect data for percentage used?	Select **Yes** to collect data about the percentage of datastore used for charts and reports. The default is unselected.
Monitoring	
Monitor Datastore Free Space	
Minimum threshold for datastore free space	Specify the minimum amount of datastore free space that must be available to prevent an event from being raised. The default is 500. Use the *Select datastore free space unit* parameter to select **GBytes** or **MBytes** as the unit of measure for free space.
Select datastore free space unit	Select whether to measure the amount of datastore free space in **GBytes** or **MBytes**. The default is GBytes.
Maximum threshold for datastore space percentage used	Specify the maximum percentage of datastore that can be used before an event is raised. The default is 90%.

75.9 Events

Use this Knowledge Script to monitor events reported by vCenter Server, such as when a user powers off a virtual machine. You can filter the events by vCenter entity type, user name, and event description.

This Knowledge Script raises an event based on these filters. Use the Objects tab to define the resources you want to monitor. This script monitors all error and warning type events by default.

A list of VirtualCenter_Events events with the same short event message will not display individual event details. By default, AppManager collapses event details based on the object and the short event message. If the short event message is the same for a series of events, the list of events will collapse. To view the individual event details, disable event collapsing for that specific Events job.

WARNING: This Knowledge Script can potentially raise an excessive number of AppManager events, as well as unassociated events for objects not discovered in the AppManager TreeView pane. Use the filtering parameters in this script, such as event description and entity type, to limit the number of events monitored by the script and prevent a flood of irrelevant vCenter events.

Each event report shows the following information:

- Target
- Category
- Description
- User name
- Time on the vCenter Server when the event occurred

NOTE: The first time you run this script, you may experience a short delay before actual monitoring begins. This delay is caused by the various initialization processes that must be carried out by the Events script.

75.9.1 Resource Objects

Run the Discovery_VirtualCenter Knowledge Script on the objects you want to monitor before running this Knowledge Script. You can also monitor objects that the Discovery_VirtualCenter Knowledge Script does *not* discover, such as distributed virtual port groups and distributed virtual switches.

You can run this script on the following resource objects:

- vCenter server
- Clusters
- Datacenters
- Datastores (you cannot monitor folders under the Datastore object)
- Hosts
- Resource pools
- Virtual appliances (vApps)
- Virtual machines
- Folders (you can only monitor the folder objects found under the Host & Clusters parent folder in the TreeView pane)

- Distributed virtual port groups (not displayed in the TreeView pane)
- Distributed virtual switches (not displayed in the TreeView pane)
- Network (not displayed in the TreeView pane)
- VMware distributed virtual switch (not displayed in the TreeView pane)

75.9.2 Default Schedule

The default interval for this script is **Asynchronous**.

75.9.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in. The default is 5.
Event severity when Events job fails unexpectedly	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager fails unexpectedly. The default is 5.
Event severity when filter settings contain conflicts	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the filter settings contain conflicts. The default is 15.
Additional Settings	
Event Details	
Event detail format	Select either **HTML Table** or **Plain Text** as the format for event detail. The default is HTML Table.
Monitor vCenter Events	
Event Notification	
Raise event if vCenter "error" event is detected?	Select **Yes** to raise an event if an "error" event is detected. The default is Yes.
Event severity if vCenter "error" event is detected	Set the severity level, from 1 to 40, to indicate the importance of an event in which a vCenter "error" is detected. The default is 5.
Select vCenter entity type(s)	Click **Browse [...]** to select the vCenter entity types you want to monitor. The default settings include these entity types: Cluster, Datacenter, Datastore, Folder, Host, ResourcePool, vApp, VirtualMachine. **NOTE:** To monitor a datastore cluster object, select vCenter for this parameter.

Parameter	How to Set It
User	If you want to raise events only for a specific user, provide the name of the vCenter user you want to monitor. If you do not enter a user name, AppManager raises events related to all users. This parameter is not case-sensitive. The asterisk (*) and (?) are acceptable wildcards. **NOTE:** You must enter at least a * for this script to run. Use the regular expression \s* to filter only empty values. Do not leave this parameter blank.
Event description	If you want to raise events that include specific text, provide text the event description must contain to be monitored. If you do not provide text, AppManager raises events regardless of text. This parameter is not case-sensitive. The asterisk (*) and (?) are acceptable wildcards. **NOTE:** You must enter at least a * for this script to run. Use the regular expression \s* to filter only empty values. Do not leave this parameter blank.
Raise event if vCenter "warning" event is detected?	Select **Yes** to raise an event if a vCenter "warning" event is detected. The default is Yes.
Event severity when vCenter "warning" event is detected	Set the severity level, from 1 to 40, to indicate the importance of an event in which a vCenter "warning" is detected. The default is 15.
Select vCenter entity type(s)	Click **Browse [...]** to select the vCenter entity types you want to monitor. The default settings include these entity types: Cluster, Datacenter, Datastore, Folder, Host, ResourcePool, vApp, VirtualMachine. **NOTE:** To monitor a datastore cluster object, select vCenter for this parameter.
User	If you want to raise events only for a specific user, provide the name of the vCenter user you want to monitor. If you do not enter a user name, AppManager raises events related to all users. This parameter is not case-sensitive. The asterisk (*) and (?) are acceptable wildcards. **NOTE:** You must enter at least a * for this script to run. Use the regular expression \s* to filter only empty values. Do not leave this parameter blank.
Event description	If you want to raise events only that include specific text, provide text the event description must contain to be monitored. If you do not provide text, AppManager raises events regardless of text. This parameter is not case-sensitive. The asterisk (*) and (?) are acceptable wildcards. **NOTE:** You must enter at least a * for this script to run. Use the regular expression \s* to filter only empty values. Do not leave this parameter blank.
Raise event if vCenter "info" event is detected?	Select **Yes** to raise an event if a vCenter "info" event is detected. The default is unselected.
Event severity when vCenter "info" event is detected	Set the severity level, from 1 to 40, to indicate the importance of an event in which a vCenter "info" event is detected. The default is 25.

Parameter	How to Set It
Select vCenter entity type	Click **Browse [...]** to select the vCenter entity types you want to monitor. The default settings include these entity types: Cluster, Datacenter, Datastore, Folder, Host, ResourcePool, vApp, VirtualMachine. **NOTE:** To monitor a datastore cluster object, select vCenter for this parameter.
User	If you want to raise events only for a specific user, provide the name of the vCenter user you want to monitor. If you do not enter a user name, AppManager raises events related to all users. This parameter is not case-sensitive. The asterisk (*) and (?) are acceptable wildcards. **NOTE:** You must enter at least a `*` for this script to run. Use the regular expression `\s*` to filter only empty values. Do not leave this parameter blank.
Event description	If you want to raise events only that include specific text, provide text the event description must contain to be monitored. If you do not provide text, AppManager raises events regardless of text. This parameter is not case-sensitive. The asterisk (*) and (?) are acceptable wildcards. **NOTE:** You must enter at least a `*` for this script to run. Use the regular expression `\s*` to filter only empty values. Do not leave this parameter blank.
Data Collection	**NOTE:** This script can only collect data for those event categories for which you have selected Yes for the relevant *Raise event for...* parameter. For example, if you want to collect data for error events, you must select **Yes** for the *Raise event if vCenter "error" event is detected?* parameter.
Default time interval to collect data	Specify a default time interval for collecting data for charts and reports. The default is 5 minutes.
Collect data for error events?	Select **Yes** to collect data about error events for charts and reports. The default is Yes.
Collect data for warning events?	Select **Yes** to collect data about warning events for charts and reports. The default is unselected.
Collect data for info events?	Select **Yes** to collect data about informational events for charts and reports. The default is unselected.

75.10 HostConnected

Use this Knowledge Script to monitor changes in the connection status of hosts to vCenter, such as when a host is connected to the vCenter server or when a host goes into maintenance mode from normal mode.

This script raises an event if a host is disconnected or reconnected, or if a host goes into or comes out of maintenance mode. This script will not generate host disconnect or reconnect events while the host is in maintenance mode.

75.10.1 Resource Object

vSphere ESX or ESXi host

75.10.2 Default Schedule

By default, this script runs every **15 minutes**.

75.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Raise event when status information is not available?	Select **Yes** to raise an event when information about the host's connection status is not available. The default is unselected.
Event severity when status information is not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which information about the host's connection status is not available. The default is 15.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when HostConnected job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the HostConnected job fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select either **HTML Table** or **Plain Text** as the format for event detail. The default is HTML Table.
Monitor Connection Status	
Event Notification	

Parameter	How to Set It
Raise event when host enters disconnected state?	Select **Yes** to raise an event when a host enters a disconnected state. The default is Yes. **NOTE:** The script will not generate disconnect events if the host is in maintenance mode.
Event severity when host enters disconnected state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a host enters a disconnected state The default is 15.
Raise event when host is in maintenance mode?	Select **Yes** to raise an event when a connected host goes into maintenance mode. The default is Yes.
Event severity when host in maintenance mode	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a host goes into maintenance mode. The default is 15.
Raise event when host is out of maintenance mode?	Select **Yes** to raise an event when a connected host comes out of maintenance mode. The default is Yes.
Event severity when host out of maintenance mode	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a host comes out of maintenance mode. The default is 15.
Raise event when host enters connected state?	Select **Yes** to raise an event when a host enters a connected state. The default is Yes. **NOTE:** The script will not generate reconnect events if the host is in maintenance mode.
Event severity when host enters connected state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a host enters a connected state. The default is 25.
Data Collection	
Collect data for host availability?	Select **Yes** to collect host availability data for charts and reports. When enabled, data collection returns 100 when a host is available and 0 when a host is unavailable. The default is unselected.
Collect data for host connectivity?	Select **Yes** to collect host connectivity data for charts and reports. When enabled, data collection returns 100 when a host is connected and 0 when a host is not connected. The default is unselected.

75.11 HostCPUUsage

Use this Knowledge Script to monitor host CPU usage and CPU used. This script raises an event if CPU usage exceeds the threshold you set. This script monitors the following metrics:

- CPU reserved capacity - Total CPU capacity reserved by the virtual machines.
- CPU usage - Actively used CPU of the host, as a percentage of the total available CPU reserved by virtual machines running on this host.
- CPU usage in MHz - Total amount of CPU used, in MHz, during the interval.
- CPU used - Sum of the actively used CPU of all powered on virtual machines on a host.

NOTE:

- When a host goes into maintenance mode all VirtualCenter_Host* Knowledge Scripts, except for the VirtualCenter_HostConnected Knowledge Script, suppress events and data.
- In rare situations, queries to the ESX or ESXi host might fail with timeouts because the ESX or ESXi host stops responding. This issue affects all VirtualCenter_Host* Knowledge Scripts. You can work around this issue by restarting the management service on the ESX or ESXi host.

75.11.1 Resource Object

vSphere ESX or ESXi host

75.11.2 Default Schedule

By default, this script runs every **15 minutes**.

75.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Raise event when CPU metrics are not available?	Select **Yes** to raise an event when CPU metrics are not available. The default is Yes.
Event severity when CPU metrics are not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU metrics are not available. The default is 15.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.

Parameter	How to Set It
Event severity when HostCPUUsage job fails unexpectedly	Set the severity level, from 1 to 40, to indicate the importance of an event in which the HostCPUUsage job fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select either **HTML Table** or **Plain Text** as the format for event detail. The default is HTML Table.
Monitor CPU Reserved Capacity	
Event Notification	
Raise event when CPU reserved capacity exceeds the threshold?	Select **Yes** to raise an event when CPU reserved capacity exceeds the threshold you set. The default is unselected.
Threshold – Maximum CPU reserved capacity	Specify the maximum CPU reserved capacity that can occur before an event is raised. The default is 80 percent.
Event severity when CPU reserved capacity exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU reserved capacity exceeds the threshold. The default is 15.
Data Collection	
Collect data for CPU reserved capacity?	Select **Yes** to collect data about CPU reserved capacity for charts and reports. The default is unselected.
Monitor CPU Usage	
Event Notification	
Raise event when CPU usage in MHz exceeds the threshold?	Select **Yes** to raise an event when CPU usage in MHz exceeds the threshold you set. The default is Yes.
Threshold – Maximum CPU usage in MHz	Specify the maximum CPU usage in MHz that can occur before an event is raised. The default is 2000 MHz.
Event severity when CPU usage in MHz exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage in MHz exceeds the threshold. The default is 15.
Raise event when percent CPU usage exceeds the threshold?	Select **Yes** to raise an event when the percentage of CPU usage exceeds the threshold you set. The default is Yes.
Threshold – Maximum percent CPU usage	Specify the maximum percentage of CPU usage that can occur before an event is raised. The default is 80 percent.
Event severity when percent CPU usage exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of CPU usage exceeds the threshold. The default is 15.
Raise event when percent individual CPU usage exceeds the threshold?	Select **Yes** to raise an event when the percentage of individual CPU usage exceeds the threshold you set. The default is Yes.
Threshold – Maximum individual CPU usage	Specify the maximum percentage of individual CPU usage that can occur before an event is raised. The default is 80 percent.
Event severity when individual CPU usage exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of individual CPU usage exceeds the threshold. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for CPU usage in MHz?	Select **Yes** to collect data about CPU usage in MHz for charts and reports. The default is unselected.
Collect data for average CPU usage as percent?	Select **Yes** to collect data about the average CPU usage as a percentage for charts and reports. The default is unselected.
Collect data for individual CPU usage as percent?	Select **Yes** to collect data about usage for individual CPUs as a percentage for charts and reports. The default is unselected.
Monitor CPU Used	
Event Notification	
Raise event when CPU used exceeds the threshold?	Select **Yes** to raise an event when CPU used exceeds the threshold you set. The default is Yes.
Threshold – Maximum CPU used	Specify the maximum CPU used that can occur before an event is raised. The default is 80 percent.
Event severity when CPU used exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU used exceeds the threshold. The default is 15.
Raise event when individual CPU used exceeds the threshold?	Select **Yes** to raise an event when the individual CPU used exceeds the threshold you set. The default is Yes.
Threshold – Maximum individual CPU used	Specify the maximum individual CPU used that can occur before an event is raised. The default is 80 percent.
Event severity when individual CPU used exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the individual CPU used exceeds the threshold. The default is 15.
Data Collection	
Collect data for average CPU used?	Select **Yes** to collect data about average CPU used for charts and reports. The default is unselected.
Collect data for individual CPU used?	Select **Yes** to collect data about individual CPU used for charts and reports. The default is unselected.

75.12 HostDataStoreUsage

Use this Knowledge Script to monitor the datastore usage of all datastores connected to a host. This script raises an event when the percentage of available datastore free space falls below the threshold or when the percentage of used datastore free space exceeds the threshold.

NOTE:

- When a host goes into maintenance mode all VirtualCenter_Host* Knowledge Scripts, except for the VirtualCenter_HostConnected Knowledge Script, suppress events and data.
- In rare situations, queries to the ESX or ESXi host might fail with timeouts because the ESX or ESXi host stops responding. This issue affects all VirtualCenter_Host* Knowledge Scripts. You can work around this issue by restarting the management service on the ESX or ESXi host.

75.12.1 Resource Object

vSphere ESX or ESXi host

75.12.2 Default Schedule

By default, this script runs every **three hours**.

75.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event when available free space falls below the threshold?	Select **Yes** to raise an event if the amount of datastore free space falls below the threshold you set. The default is Yes.
Event severity when available free space falls below the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of available free space falls below the threshold. The default is 15.
Raise event when the percentage of used Datastore exceeds the threshold	Select **Yes** to raise an event if the percentage of used datastore exceeds the threshold you set. The default is Yes.
Event severity when percentage of used Datastore exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of used datastore exceeds the threshold. The default is 15.
Raise event when datastore metrics are not available?	Select **Yes** to raise an event if datastore metrics are not available. The default is unselected.
Event severity when datastore metrics are not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which datastore metrics are not available. The default is 15.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.

Parameter	How to Set It
Event severity when AppManager failed to log in	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when HostDataStoreUsage job fails unexpectedly	Set the severity level, from 1 to 40, to indicate the importance of an event in which the HostDataStoreUsage job fails unexpectedly. The default is 5.
Data Collection	
Collect data for free space?	Select **Yes** to collect data about available datastore free space for charts and reports. The default is unselected.
Collect data for percentage used?	Select **Yes** to collect data about the percentage of used datastore for charts and reports. The default is unselected.
Monitoring	
Minimum threshold for available datastore free space (MB)	Specify the minimum amount of datastore free space that must be available to prevent an event from being raised. The default is 500 megabytes.
Maximum threshold for datastore percentage used (%)	Specify the maximum amount of datastore that can be used before an event is raised. The default is 90%.

75.13 HostDiskIO

Use this Knowledge Script to monitor disk reads/writes for a host. This script raises an event if the amount of reads/writes in megabytes per second exceeds the threshold you set. This script monitors and collects data for the following performance metrics:

- Disk read rate - Rate at which data is read from each LUN (logical unit number) on the host
- Disk write rate - Rate at which data is written to each LUN (logical unit number) on the host
- Total disk I/O

This script generates a pair of data streams for each disk that is configured on a host.

NOTE:

- When a host goes into maintenance mode all VirtualCenter_Host* Knowledge Scripts, except for the VirtualCenter_HostConnected Knowledge Script, suppress events and data.
- In rare situations, queries to the ESX host might fail with timeouts because the ESX host stops responding. This issue affects all VirtualCenter_Host* Knowledge Scripts. You can work around this issue by restarting the management service on the ESX host.

75.13.1 Resource Object

vSphere ESX or ESXi host

75.13.2 Default Schedule

By default, this script runs every **15 minutes**.

75.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event when total disk IO exceeds the threshold?	Select **Yes** to raise an event when total disk IO exceeds the threshold you set. The default is unselected.
Event severity when total disk IO exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which total disk IO exceeds the threshold. The default is 15.
Raise event when disk reads exceed the threshold?	Select **Yes** to raise an event if the amount of disk reads exceeds the threshold you set. The default is Yes.
Event severity when disk reads exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of disk reads exceeds the threshold. The default is 15.
Raise event when disk writes exceed the threshold?	Select **Yes** to raise an event if the amount of disk writes exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Event severity when disk writes exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of disk writes exceeds the threshold. The default is 15.
Raise event when disk IO metrics are not available	Select **Yes** to raise an event if the disk IO metrics are not available. The default is Yes.
Event severity when disk IO metrics are not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the disk IO metrics are not available. The default is 15.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when HostDiskIO job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the HostDiskIO job fails unexpectedly. The default is 5.
Data Collection	
Collect data for total disk IO?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the amount of total disk IO. The default is unselected.
Collect data for disk reads?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the amount of disk reads. The default is unselected.
Collect data for individual disk reads?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the amount of individual disk reads. The default is unselected.
Collect data for disk writes?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the amount of disk writes in megabytes per second. The default is unselected.
Collect data for individual disk writes?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the amount of individual disk writes in megabytes per second. The default is unselected.
Monitoring	
Maximum threshold for total disk IO (MBytes/sec)	Specify the maximum amount of total disk IO that can occur before an event is raised. The default is 20 megabytes per second.
Maximum threshold for disk reads (MBytes/sec)	Specify the maximum amount of disk reads that can occur before an event is raised. The default is 2 megabytes per second.
Maximum threshold for disk writes (MBytes/sec)	Specify the maximum amount of disk writes that can occur before an event is raised. The default is 2 megabytes per second.

75.14 HostDiskTotalLatency

Use this Knowledge Script to monitor the total latency of all disks connected to a host. This script monitors and collects data for the following disk latency performance metrics:

- Disk command latency - Average amount of time taken during the collection interval to process a SCSI (Small Computer System Interface) command.
- Disk read latency - Average amount of time taken during the collection interval to process a SCSI read command.
- Disk write latency - Average amount of time taken during the collection interval to process a SCSI write command.
- Commands - Number of SCSI commands issued during the collection interval.
- Aborted commands - Number of SCSI commands aborted during the collection interval.
- Bus resets - Number of SCSI bus reset commands issued during the collection interval.

NOTE:

- When a host goes into maintenance mode all host scripts, except for the VirtualCenter_HostConnected Knowledge Script, suppress events and data.
- In rare situations, queries to the ESX host might fail with timeouts because the ESX host stops responding. This issue affects all VirtualCenter_Host* Knowledge Scripts. You can work around this issue by restarting the management service on the ESX host.
- If you do any of the following, rescan the host bus adapters (HBAs) to ensure the vCenter inventory is up-to-date:
  - Make changes to storage disks or logical unit numbers (LUNs) available to your ESX system
  - Make changes to storage adapters
  - Create a new datastore or remove an existing one
  - Reconfigure an existing datastore, for example when you add a new extent

  After completing the rescan, restart the HostDiskTotalLatency job or wait 24 hours for it to repopulate its storage adapter cache.

75.14.1 Resource Object

vSphere ESX or ESXi host

75.14.2 Default Schedule

By default, this script runs **Every 15 minutes**.

75.14.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Raise event when latency metrics are not available?	Select **Yes** to raise an event when latency metrics are not available. The default is unselected.
Event severity when latency metrics are not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which latency metrics are not available. The default is 15.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to get metrics. The default is 15.
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in. The default is 5.
Event severity when HostDiskTotalLatency job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the HostDiskTotalLatency job fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select either **HTML Table** or **Plain Text** as the format for event detail. The default is HTML Table.
Monitor Disk Latency	
Event Notification	
Raise event if disk command latency exceeds the threshold?	Select **Yes** to raise an event if disk command latency exceeds the threshold you set. The default is Yes.
Threshold – Maximum disk command latency	Specify the maximum disk command latency that can occur before an event is raised. The default is 10 milliseconds.
Event severity when disk command latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which disk command latency exceeds the threshold. The default is 15.
Raise event if disk read latency exceeds the threshold?	Select **Yes** to raise an event if disk read latency exceeds the threshold you set. The default is Yes.
Threshold – Maximum disk read latency	Specify the maximum disk read latency that can occur before an event is raised. The default is 10 milliseconds.
Event severity when disk read latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which disk read latency exceeds the threshold. The default is 15.
Raise event if disk write latency exceeds the threshold?	Select **Yes** to raise an event if disk write latency exceeds the threshold you set. The default is Yes.
Threshold – Maximum disk write latency	Specify the maximum disk write latency that can occur before an event is raised. The default is 10 milliseconds.
Event severity when disk write latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which disk write latency exceeds the threshold. The default is 15.
Data Collection	
Collect data for disk command latency?	Select **Yes** to collect disk command latency data for charts and reports. The default is unselected.

Parameter	How to Set It
Collect data for disk read latency?	Select **Yes** to collect disk read latency data for charts and reports. The default is unselected.
Collect data for disk write latency?	Select **Yes** to collect disk write latency data for charts and reports. The default is unselected.
Monitor Commands	
Event Notification	
Raise event if commands exceeds the threshold?	Select **Yes** to raise an event if the number of SCSI commands issued during the collection interval exceeds the threshold you set. The default is unselected.
Threshold – Maximum commands	Specify the maximum number of SCSI commands that can occur before an event is raised. The default is 15000.
Event severity when commands exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of SCSI commands exceeds the threshold. The default is 15.
Raise event if aborted commands exceeds the threshold?	Select **Yes** to raise an event if the number SCSI commands aborted during the collection interval exceeds the threshold you set. The default is unselected.
Threshold – Maximum aborted commands	Specify the maximum number of SCSI commands that can be aborted before an event is raised. The default is 10.
Event severity if aborted commands exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of aborted SCSI commands exceeds the threshold. The default is 15.
Data Collection	
Collect data for commands?	Select **Yes** to collect commands data for charts and reports. The default is unselected.
Collect data for aborted commands?	Select **Yes** to collect aborted commands data for charts and reports. The default is unselected.
Monitor Bus Resets	
Event Notification	
Raise event if bus resets exceeds the threshold?	Select **Yes** to raise an event if the number of bus resets exceeds the threshold you set. The default is unselected.
Threshold – Maximum bus resets	Specify the maximum number of bus resets that can occur before an event is raised. The default is 10.
Event severity when bus resets exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which bus resets exceed the threshold. The default is 15.
Data Collection	
Collect data for bus resets?	Select **Yes** to collect data for bus resets for charts and reports. The default is unselected.

75.15 HostMemoryUsage

Use this Knowledge Script to monitor the following memory metrics for a host:

- Memory active - Sum of active memory for all powered-on virtual machines plus vSphere services (such as COS, vpxa) on the host.
- Memory balloon - Sum of memory balloon of all powered-on virtual machines and vSphere services on the host. If the balloon target value is greater than the balloon value, the VMkernel inflates the balloon, causing more virtual machine memory to be reclaimed. If the balloon target value is less than the balloon value, the VMkernel deflates the balloon, which allows the virtual machine to consume additional memory if needed.
- Memory granted - Sum of granted memory for all powered-on virtual machines, plus machine memory for vSphere services on the host.
- Memory overhead - Total of all overhead memory for powered-on virtual machines, plus the overhead of running vSphere services on the host.
- Memory reserved - Amount of memory (in kilobytes) that has been reserved, in particular for resource pools and virtual machines.
- Memory shared - Sum of shared memory for all powered-on virtual machines, plus amount for vSphere services on the host. The host's shared memory may be larger than the amount of machine memory if memory is overcommitted (the aggregate virtual machine configured memory is much greater than machine memory). The value of this statistic reflects how effective transparent page sharing and memory over-commitment are for saving machine memory.
- Memory shared common - Amount of machine memory that is shared by all powered-on virtual machines and vSphere services on the host. Subtract this metric from the shared metric to gauge how much machine memory is saved due to sharing.
- Memory state - Amount of free machine memory on the host. The VMkernel has four free-memory thresholds that affect memory reclamation:
  - 0 (high) Free memory $\geq$ 6% of machine memory minus Service Console memory
  - 1 (soft) 4%
  - 2 (hard) 2%
  - 3 (low) 1%
  - 0 (high) and 1 (soft): Swapping is favored over ballooning
  - 2 (hard) and 3 (low): Ballooning is favored over swapping
- Memory swap in - Sum of swap in values for all powered-on virtual machines on the host.
- Memory swap in rate - Rate at which memory is swapped from disk into active memory.
- Memory swap out - Sum of swap out memory from all powered-on virtual machines on the host.
- Memory swap out rate - Rate at which memory is being swapped from active memory to disk during the current interval. This counter applies to virtual machines and is generally more useful than the swap out counter to determine if the virtual machine is running slow due to swapping, especially when looking at real-time statistics.
- Memory swap used - Sum of the memory swapped by all powered-on virtual machines on the host.

- Memory unreserved - Amount of memory that is unreserved. Memory reservation not used by the Service Console, VMkernel, vSphere services and other powered-on virtual machines user-specified memory reservations and overhead memory. This statistic is no longer relevant to virtual machine admission control, as reservations are now handled through resource pools.
- Memory usage - Percentage of available machine memory usage:
- Memory zero - Sum of zero memory for all powered-on virtual machines, plus vSphere services on the host.

This script raises an event if a monitored metric exceeds the threshold you set.

NOTE:

- When a host goes into maintenance mode all VirtualCenter_Host* Knowledge Scripts, except for the VirtualCenter_HostConnected Knowledge Script, suppress events and data.
- In rare situations, queries to the ESX or ESXi host might fail with timeouts because the ESX or ESXi host stops responding. This issue affects all VirtualCenter_Host* Knowledge Scripts. You can work around this issue by restarting the management service on the ESX or ESXi host.

75.15.1 Resource Object

vSphere ESX or ESXi host

75.15.2 Default Schedule

By default, this script runs every **15 minutes**.

75.15.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Raise event when memory metrics are not available?	Select **Yes** to raise an event when memory metrics are not available. The default is Yes.
Event severity when memory metrics are not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory metrics are not available. The default is 15.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when HostMemoryUsage job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the HostMemoryUsage job fails unexpectedly. The default is 5.

Parameter	How to Set It
Additional Settings	
Event Details	
Event detail format	Select either **HTML Table** or **Plain Text** as the format for event detail. The default is HTML Table.
Monitor Memory Active	
Event Notification	
Raise event when memory active exceeds the threshold?	Select **Yes** to raise an event when the memory active exceeds the threshold you set. The default is unselected.
Threshold – Maximum memory active	Specify the maximum threshold for memory active that can be reached before an event is raised. The default is 20 percent.
Event severity when memory active exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event when the active memory exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory active?	Select **Yes** to collect data about memory active for charts and reports. The default is unselected.
Monitoring Memory Balloon	
Event Notification	
Raise an event when memory balloon exceeds the threshold?	Select **Yes** to raise an event when host memory balloon exceeds the threshold you set. The default is Yes.
Threshold – Maximum memory balloon	Specify the maximum threshold for memory balloon that can be reached before an event is raised. The default is 2 percent.
Event severity when memory balloon exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which host memory balloon exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory balloon?	Select **Yes** to collect data about host memory balloon for charts and reports. The default is unselected.
Monitor Memory Granted	
Event Notification	
Raise event when memory granted exceeds the threshold?	Select **Yes** to raise an event when the amount of memory granted exceeds the threshold you set. The default is unselected.
Threshold – Maximum memory granted	Specify the maximum threshold for memory granted that can be reached before an event is raised. The default is 80 percent.
Event severity when memory granted exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of memory granted exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory granted?	Select **Yes** to collect data about memory granted for charts and reports. The default is unselected.
Monitor Memory Overhead	
Event Notification	

Parameter	How to Set It
Raise event when memory overhead exceeds the threshold?	Select **Yes** to raise an event when the amount of memory overhead exceeds the threshold you set. The default is unselected.
Threshold – Maximum for memory overhead	Specify the maximum threshold for memory overhead that can be reached before an event is raised. The default is 512 megabytes.
Event severity when memory overhead exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of memory overhead exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory overhead?	Select **Yes** to collect data about memory overhead for charts and reports. The default is unselected.
Memory Reserved Capacity	
Event Notification	
Raise event when memory reserved capacity exceeds the threshold?	Select **Yes** to raise an event when memory reserved capacity exceeds the threshold you set. The default is unselected.
Threshold – Maximum for memory reserved capacity	Specify the maximum threshold for memory reserved capacity that can be reached before an event is raised. The default is 80 percent.
Event severity when memory reserved capacity exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which host memory reserved capacity exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory reserved capacity?	Select **Yes** to collect data about memory reserved capacity for charts and reports. The default is unselected.
Monitor Memory Shared	
Event Notification	
Raise event when memory shared falls below the threshold?	Select **Yes** to raise an event when memory shared falls below the threshold you set. The default is unselected.
Threshold – Minimum for memory shared	Specify the minimum threshold for memory shared that can be reached before an event is raised. The default is 512 megabytes.
Event severity when memory shared falls below the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory shared falls below the threshold. The default is 15.
Data Collection	
Collect data for memory shared?	Select **Yes** to collect data about memory shared for charts and reports. The default is unselected.
Monitor Memory Shared Common	
Event Notification	
Raise event when memory shared common falls below the threshold?	Select **Yes** to raise an event when memory shared common falls below the threshold you set. The default is unselected.
Threshold – Minimum for memory shared common	Specify the minimum threshold for memory shared common that can be reached before an event is raised. The default is 256 megabytes.
Event severity when memory shared common falls below the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory shared common falls below the threshold. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for memory shared common?	Select **Yes** to collect data about memory shared common for charts and reports. The default is unselected.
Monitor Memory State	
Event Notification	
Raise event when memory state is hard?	Select **Yes** to raise an event when memory state is hard. The default is unselected.
Event severity when memory state is hard	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the memory state is hard. The default is 10.
Raise event when memory state is high?	Select **Yes** to raise an event when memory state is high. The default is unselected.
Event severity when memory state is high	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the memory state is high. The default is 25.
Raise event when memory state is low?	Select **Yes** to raise an event when memory state is low. The default is unselected.
Event severity when memory state is low	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the memory state is low. The default is 5.
Raise event when memory state is soft?	Select **Yes** to raise an event when memory state is soft. The default is unselected.
Event severity when memory state is soft	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the memory state is soft. The default is 15.
Data Collection	
Collect data for memory state?	Select **Yes** to collect data about memory state for charts and reports. The default is unselected.
Monitor Memory Swap In	
Event Notification	
Raise event when memory swap in exceeds the threshold?	Select **Yes** to raise an event when memory swap in exceeds the threshold you set. The default is unselected.
Threshold – Maximum for memory swap in rate	Specify the maximum threshold for memory swap in rate that can be reached before an event is raised. The default is 512 megabytes.
Event severity when memory swap in exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which host memory swap in exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory swap in?	Select **Yes** to collect data about memory swap in for charts and reports. The default is unselected.
Monitor Memory Swap In Rate	
Event Notification	
Raise event when memory swap in rate exceeds the threshold?	Select **Yes** to raise an event when memory swap rate in exceeds the threshold you set. The default is Yes.
Threshold – Maximum for memory swap in rate	Specify the maximum threshold for memory swap in rate that can be reached before an event is raised. The default is 1 megabyte per second.

Parameter	How to Set It
Event severity when memory swap in rate exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which host memory swap in rate exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory swap in rate?	Select **Yes** to collect data about memory swap in rate for charts and reports. The default is unselected.
Monitor Memory Swap Out	
Event Notification	
Raise event when memory swap out exceeds the threshold?	Select **Yes** to raise an event when memory swap out exceeds the threshold you set. The default is unselected.
Threshold – Maximum for memory swap out	Specify the maximum threshold for memory swap out that can be reached before an event is raised. The default is 256 megabytes.
Event severity when memory swap out exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which host memory swap out exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory swap out?	Select **Yes** to collect data about memory swap out for charts and reports. The default is unselected.
Monitor Memory Swap Out Rate	
Event Notification	
Raise event when memory swap out rate exceeds the threshold?	Select **Yes** to raise an event when memory swap out rate exceeds the threshold you set. The default is Yes.
Threshold – Maximum for memory swap out rate	Specify the maximum threshold for memory swap out rate that can be reached before an event is raised. The default is 1 megabyte per second.
Event severity when memory swap out rate exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory swap out rate exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory swap out rate?	Select **Yes** to collect data about memory swap out rate for charts and reports. The default is unselected.
Monitor Memory Swap Used	
Event Notification	
Raise event when memory swap used exceeds the threshold?	Select **Yes** to raise an event when memory swap used exceeds the threshold you set. The default is Yes.
Threshold – Maximum for memory swap used	Specify the maximum threshold for memory swap used that can be reached before an event is raised. The default is 2.
Event severity when memory swap used exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory swap used exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory swap used?	Select **Yes** to collect data about memory swap used for charts and reports. The default is unselected.
Monitor Memory Unreserved	

Parameter	How to Set It
Event Notification	
Raise event when memory unreserved exceeds the threshold?	Select **Yes** to raise an event when memory unreserved exceeds the threshold you set. The default is unselected.
Threshold – Maximum for memory unreserved	Specify the maximum threshold for memory unreserved that can be reached before an event is raised. The default is 80 percent.
Event severity when memory unreserved exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which host memory unreserved exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory unreserved?	Select **Yes** to collect data about memory unreserved for charts and reports. The default is unselected.
Monitor Memory Usage	
Event Notification	
Raise event when memory usage exceeds the threshold?	Select **Yes** to raise an event when memory usage exceeds the threshold you set. The default is Yes.
Threshold – Maximum for memory usage	Specify the maximum threshold for memory usage that can be reached before an event is raised. The default is 80 percent.
Event severity when memory usage exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which host memory usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory usage?	Select **Yes** to collect data about memory usage for charts and reports. The default is unselected.
Monitor Memory Usage by VMKernel	
Event Notification	
Raise event when memory usage by VMkernel exceeds the threshold?	Select **Yes** to raise an event when memory usage by VMkernel exceeds the threshold you set. The default is unselected.
Threshold – Maximum for memory usage by VMkernel	Specify the maximum threshold for memory usage by VMkernel that can be reached before an event is raised. The default is 256 megabytes.
Event severity when memory usage by VMkernel exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory usage by VMkernel exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory usage by VMkernel?	Select **Yes** to collect data about memory usage for VMkernel for charts and reports. The default is unselected.
Monitor Memory Zero	
Event Notification	
Raise event when memory zero exceeds the threshold?	Select **Yes** to raise an event when memory zero exceeds the threshold you set. The default is unselected.
Threshold - Maximum for memory zero	Specify the maximum threshold for memory zero that can be reached before an event is raised. The default is 20 percent.

Parameter	How to Set It
Event severity when memory zero exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory zero exceeds the threshold. The default is 15.
Data Collection	
Collect data for memory zero?	Select **Yes** to collect data about memory zero for charts and reports. The default is unselected.

75.16 HostNetworkIO

Use this Knowledge Script to monitor network data received/transmitted for a vSphere host. This script raises an event if the rate of network data received/transmitted exceeds the threshold you set.

- Network data received - The rate at which data is received across each physical NIC instance on the host
- Network data transmitted - The rate at which data is written to each LUN (logical unit number) on the host

NOTE:

- When a host goes into maintenance mode all VirtualCenter_Host* Knowledge Scripts, except for the VirtualCenter_HostConnected Knowledge Script, suppress events and data.
- In rare situations, queries to the ESX host might fail with timeouts because the ESX host stops responding. This issue affects all VirtualCenter_Host* Knowledge Scripts. You can work around this issue by restarting the management service on the ESX host.

75.16.1 Resource Object

vSphere ESX or ESXi host

75.16.2 Default Schedule

By default, this script runs every **15 minutes**.

75.16.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event when network data received exceeds the threshold?	Select **Yes** to raise an event if the rate of network data received exceeds the threshold you set. The default is Yes.
Event severity when network data received exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the rate of network data received exceeds the threshold. The default is 15.
Raise event when individual network data received exceeds the threshold?	Select **Yes** to raise an event if the rate of individual network data received exceeds the threshold you set. The default is unselected.
Event severity when individual network data received exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the rate of individual network data received exceeds the threshold. The default is 15.
Raise event when network data transmitted exceeds the threshold?	Select **Yes** to raise an event if the rate of network data transmitted exceeds the threshold you set. The default is Yes.
Event severity when network data transmitted exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the rate of individual network data transmitted exceeds the threshold. The default is 15.

Parameter	How to Set It
Raise event when individual network data transmitted exceeds the threshold?	Select **Yes** to raise an event if the rate of individual network data transmitted exceeds the threshold you set. The default is unselected.
Event severity when individual network data transmitted exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the rate of individual network data transmitted exceeds the threshold. The default is 15.
Raise event when network IO metrics are not available?	Select **Yes** to raise an event if the network IO metrics are not available. The default is Yes.
Event severity when network IO metrics are not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the network IO metrics are not available. The default is 15.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve metrics from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when HostNetworkIO job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the HostNetworkIO job fails unexpectedly. The default is 5.
Data Collection	
Collect data for network data received?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the rate of network data received in megabytes per second. The default is unselected.
Collect data for individual network data received?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the rate of individual network data received in megabytes per second. The default is unselected.
Collect data for network data transmitted?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the rate of network data transmitted in megabytes per second. The default is unselected.
Collect data for individual network data transmitted?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the rate of individual network data transmitted in megabytes per second. The default is unselected.
Monitoring	
Maximum threshold for network data received	Specify the maximum rate of network data received that can occur before an event is raised. The default is 2 megabytes per second.
Maximum threshold for individual network data received	Specify the maximum rate of individual network data received that can occur before an event is raised. The default is 2 megabytes per second.
Maximum threshold for network data transmitted	Specify the maximum rate of network data transmitted that can occur before an event is raised. The default is 2 megabytes per second.
Maximum threshold for individual network data transmitted	Specify the maximum rate of individual network data transmitted that can occur before an event is raised. The default is 2 megabytes per second.

75.17 HostUptime

Use this Knowledge Script to monitor host uptime in days. Host uptime is the time elapsed since the last system startup. This script raises an event when a host is rebooted, and it collects data for host uptime.

NOTE:

- When a host goes into maintenance mode all VirtualCenter_Host* Knowledge Scripts, except for the VirtualCenter_HostConnected Knowledge Script, suppress events and data.
- In rare situations, queries to the ESX or ESXi host might fail with timeouts because the ESX or ESXi host stops responding. This issue affects all VirtualCenter_Host* Knowledge Scripts. You can work around this issue by restarting the management service on the ESX or ESXi host.

75.17.1 Resource Object

vSphere ESX or ESXi host

75.17.2 Default Schedule

By default, this script runs every **5 minutes.**

75.17.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Raise event when uptime metrics are not available?	Select **Yes** to raise an event if uptime metrics are not available. The default is unselected.
Event severity when uptime metrics are not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which uptime metrics are not available. The default is 15.
Event severity when AppManager failed to get metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to retrieve host uptime status from vCenter. The default is 15.
Event severity when AppManager failed to log in	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager failed to log in to vCenter. The default is 5.
Event severity when HostUptime job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the HostUptime job fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select either **HTML Table** or **Plain Text** as the format for event detail. The default is HTML Table.

Parameter	How to Set It
Monitor Uptime	
Event Notification	
Raise event if host server reboots?	Select **Yes** to raise an event if the host server reboots. The default is Yes.
Event severity if host server reboots	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the host server reboots. The default is 15.
Raise event if host reboots while in VMware maintenance mode?	Select **Yes** to raise an event if the host reboots while in VMware maintenance mode. The default is unselected.
Data Collection	
Collect data for uptime?	Select **Yes** to collect data for graphs and reports. When enabled, data collection returns a datastream for the host uptime in days. The default is unselected.

75.18 HWCorrectableMemCondition

Use this Knowledge Script to monitor the state of correctable memory devices. This script uses SNMP to gather the correctable memory condition information.

The text of an event message indicates the state:

- **Failed**, when the correctable memory device is not operating properly.
- **Degraded**, when the memory module's correctable error count has exceeded the threshold.
- **Other**, when the status is unknown or could not be determined.

75.18.1 Prerequisites

- Configure AppManager Security Manager with the information that provides SNMP access to vCenter hosts. For more information, see the "Installing AppManager for VMware vSphere" chapter of the management guide.
- Run the ConfigureHostTraffic Knowledge script to enable an SNMP firewall port for a given host.
- This script queries the SNMP agent on individual ESX or ESXi servers and does not depend on vCenter services. If an SNMP port is not enabled by the firewall, run ConfigureHostTraffic to enable a port.

75.18.2 Resource Objects

vSphere ESX or ESXi host

75.18.3 Default Schedule

By default, this script runs every **15 minutes**.

75.18.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Raise event if hardware not responding?	Select **Yes** to raise an event if correctable memory devices are not responding. The default is Yes.
Event severity when hardware is not responding	Set the event severity level, from 1 to 40, to indicate the importance of an event in which correctable memory devices are not responding. The default is 15.
Raise event if hardware is not supported?	Select **Yes** to raise an event if correctable memory devices are not supported, for example do not have SNMP installed, the host is not HP or Dell hardware, or ports are not enabled. The default is Yes.

Parameter	How to Set It
Event severity when hardware is not supported	Set the event severity level, from 1 to 40, to indicate the importance of an event in which correctable memory devices are not supported. The default is 15.
Event severity when HWCorrectableMemCondition job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the HWCorrectableMemCondition job fails unexpectedly. The default is 5.
SNMP Settings	
SNMP port number	Specify the UDP port number to send the SNMP request at each SNMP device. The default value is 161.
SNMP retries	Set the number of retries to attempt if a timeout occurs on an SNMP request. The default is 2 retries.
SNMP timeout	Set the number of seconds to wait for a response before timing out an SNMP request. The default is 5 seconds.
Monitor Correctable Memory Device Status	
Event Notification	
Raise event if device status is "Ok?"	Select **Yes** to raise an event if the status of a correctable memory device is "Ok". The default is unselected.
Event severity when device status is "Ok"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a correctable memory device is "Ok". The default is 25.
Raise event if device status is "Degraded?"	Select **Yes** to raise an event if the status of a correctable memory device is "Degraded". The default is Yes.
Event severity when device status is "Degraded"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a correctable memory device is "Degraded". The default is 15.
Raise event if device status is "Failed" or Critical?"	Select **Yes** to raise an event if the status of a correctable memory device is "Failed" or "Critical". The default is Yes.
Event severity when device status is "Failed" or "Critical"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a correctable memory device is "Failed" or "Critical". The default is 10.
Raise event if device status is "Unknown?"	Select **Yes** to raise an event if the status of a correctable memory device is "Unknown". The default is Yes.
Event severity when device status is "Unknown"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a correctable memory device is "Unknown". The default is 15.
Raise event if device status is "Other?"	Select **Yes** to raise an event if the status of a correctable memory device is "Other". The default is Yes.
Event severity when device status is "Other"	Set the event severity level, from 1 to 40, to indicate the importance of an event in the status of a correctable memory device is "Other". The default is 15.
Data Collection	
Collect data for device status?	Select **Yes** to collect data for graphs and reports. When enabled, this script returns a data stream for each SNMP device/SNMP attribute pair. The default is Yes.

75.19 HWFanStatus(CPU)

Use this Knowledge Script to monitor the temperature of the CPU fan. This Knowledge Script uses SNMP to find the CPU fan attached to the agent. This script monitors overall fan status, not individual fan status.

This Knowledge Script runs on HP Insight Manager resources only.

The text of an event message indicates the state:

- Failed, when the fan is not operating properly.
- Other, when the system or driver does not support the fan status detection.

75.19.1 Prerequisites

- Configure AppManager Security Manager with the information that provides SNMP access to vCenter hosts. For more information, see the "Installing AppManager for VMware vSphere" chapter of the management guide.
- This script queries the SNMP agent on individual ESX or ESXi servers and does not depend on vCenter services. If an SNMP port is not enabled by the firewall, run ConfigureHostTraffic to enable a port.

75.19.2 Resource Object

vSphere ESX or ESXi host

75.19.3 Default Schedule

By default, this script runs every **15 minutes**.

75.19.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Raise event if hardware not responding?	Select **Yes** to raise an event if CPU fans are not responding. The default is Yes.
Event severity when hardware is not responding	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU fans are not responding. The default is 15.
Raise event if hardware is not supported?	Select **Yes** to raise an event if CPU fans are not supported, for example do not have SNMP installed, the host is not HP or Dell hardware, or ports are not enabled. The default is Yes.
Event severity when hardware is not supported	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU fans are not supported. The default is 15.

Parameter	How to Set It
Event severity when HWFanStatus(CPU) job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the HWFanStatus(CPU) job fails unexpectedly. The default is 5.
SNMP Settings	
SNMP port number	Specify the UDP port number to send the SNMP request at each SNMP device. The default value is 161.
SNMP retries	Set the number of retries to attempt if a timeout occurs on an SNMP request. The default is 2 retries.
SNMP timeout	Set the number of seconds to wait for a response before timing out an SNMP request. The default is 5 seconds.
Monitor Fan Status	
Event Notification	
Raise event if fan status is "Ok?"	Select **Yes** to raise an event if the status of a CPU fan is "Ok". The default is unselected.
Event severity when fan status is "Ok"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a CPU fan is "Ok". The default is 25.
Raise event if fan status is "Failed?"	Select **Yes** to raise an event if the status of a CPU fan is "Failed". The default is Yes.
Event severity when fan status is "Failed"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a CPU fan is "Failed". The default is 10.
Raise event if fan status is "Unknown?"	Select **Yes** to raise an event if the status of a system fan is "Unknown". The default is Yes.
Event severity when fan status is "Unknown"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a system fan is "Unknown". The default is 15.
Raise event if fan status is "Other?"	Select **Yes** to raise an event if the status of a CPU fan is "Other". The default is Yes.
Event severity when fan status is "Other"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a CPU fan is "Other". The default is 15.
Data Collection	
Collect data for fan status?	Select **Yes** to collect data for graphs and reports. When enabled, returns a data stream for each SNMP device/SNMP attribute pair. The default is Yes.

75.20 HWFanStatus(System)

Use this Knowledge Script to monitor the temperature of the system fan. This script uses the UDP port number to find the system fan attached to the agent and monitors its state. This script monitors overall fan status, not individual fan status.

The text of an event message indicates the state:

- Failed, when a required fan is not operating properly.
- Degraded, when a non-required fan is not operating properly.
- Other, when this system or driver does not support the fan status detection.

75.20.1 Prerequisites

- Configure AppManager Security Manager with the information that provides SNMP access to vCenter hosts. For more information, see the "Installing AppManager for VMware vSphere" chapter of the management guide.
- This script queries the SNMP agent on individual ESX or ESXi servers and does not depend on vCenter services. If an SNMP port is not enabled by the firewall, run ConfigureHostTraffic to enable a port.

75.20.2 Resource Object

vSphere ESX or ESXi host

75.20.3 Default Schedule

By default, this script runs every **15 minutes**.

75.20.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Raise event if hardware not responding?	Select **Yes** to raise an event if system fans are not responding. The default is Yes.
Event severity when hardware is not responding	Set the event severity level, from 1 to 40, to indicate the importance of an event in which system fans are not responding. The default is 15.
Raise event if hardware is not supported?	Select **Yes** to raise an event if system fans are not supported, for example do not have SNMP installed, the host is not HP or Dell hardware, or ports are not enabled. The default is Yes.

Parameter	How to Set It
Event severity when hardware is not supported	Set the event severity level, from 1 to 40, to indicate the importance of an event in which system fans are not supported. The default is 15.
Event severity when HWFanStatus(System) job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the HWFanStatus(System) job fails unexpectedly. The default is 5.
SNMP Settings	
SNMP port number	Specify the UDP port number to send the SNMP request at each SNMP device. The default value is 161.
SNMP retries	Set the number of retries to attempt if a timeout occurs on an SNMP request. The default is 2 retries.
SNMP timeout	Set the number of seconds to wait for a response before timing out an SNMP request. The default is 5 seconds.
Monitor System Fan Status	
Event Notification	
Raise event if fan status is "Ok?"	Select **Yes** to raise an event if the status of a system fan is "Ok". The default is unselected.
Event severity when fan status is "Ok"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a system fan is "Ok". The default is 25.
Raise event if fan status is "Degraded?"	Select **Yes** to raise an event if the status of system fan is "Degraded". The default is Yes.
Event severity when fan status is "Degraded"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a system fan is "Degraded". The default is 15.
Raise event if fan status is "Failed?"	Select **Yes** to raise an event if the status of a system fan is "Failed". The default is Yes.
Event severity when fan status is "Failed"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a system fan is "Failed". The default is 10.
Raise event if fan status is "Unknown?"	Select **Yes** to raise an event if the status of a system fan is "Unknown". The default is Yes.
Event severity when fan status is "Unknown"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a system fan is "Unknown". The default is 15.
Raise event if fan status is "Other?"	Select **Yes** to raise an event if the status of a system fan is "Other". The default is Yes.
Event severity when fan status is "Other"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a system fan is "Other". The default is 15.
Data Collection	
Collect data for fan status?	Select **Yes** to collect data for graphs and reports. When enabled, returns a data stream for each SNMP device/SNMP attribute pair. The default is Yes.

75.21 HWHPNICLost

Use this Knowledge Script to monitor the AppManager managed client computer for incoming SNMPv1 trap messages as they are received.

This Knowledge Script runs on HP Insight Manager resources only.

This script monitors HP ESX or ESXi hosts, using specific object identifiers: 18002 or 18006. This script monitors for any time the status of a logical adapter changes to the Failed condition. A Failed condition occurs when the adapter in a single adapter configuration fails, or when the last adapter in a redundant configuration fails. Failure can be caused by loss of link because of a cable being removed. Internal adapter, hub, or switch failures can also cause this condition.

To enable this script to work properly, do **not** enable event collapsing in the **Advanced** tab of the job's Properties dialog box.

Use this script in conjunction with the HWHPNICRestorScripted Knowledge Script to monitor the logical adapter status on your HP ESX or ESXi hosts. To report on the number of times that a logical adapter was down, configure this script to collect data. By default, this script does not collect data.

You can specify search criteria to filter for trap messages from SNMP-enabled applications and devices. This script raises an event when a trap message matches all of the search criteria. All trap messages that match the filtering criteria are returned in the event.

This script requires the Microsoft **SNMP Trap** service to be running on the managed client computer.

This script monitors only new trap messages received by the managed client computer.

75.21.1 Resource Object

vCenter server

75.21.2 Default Schedule

The default interval for this script is **Asynchronous**. After you start the Knowledge Script, its job status appears as **Running**.

75.21.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event?	Select **Yes** to raise an event when a trap message matches all of the search criteria. The event message contains all trap messages that match the filtering criteria. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns data about Failed status conditions. The default is No.

Parameter	How to Set It
Filter by IP source address	Identify the trap message source you want to filter by specifying the Internet Protocol (IP) address of the SNMP source. Specify the IP address using “dot” notation. For example: `10.10.10.10` To filter trap messages from more than one IP address, separate each address with a comma, without any spaces. If you leave this parameter blank, the script does not use the IP address of the SNMP agent that sent the trap message to filter for events. The filter string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
