Raise event if queued OCS user event notifications exceed threshold?	If you are using Microsoft Exchange 2007, 2010, or 2013 without a service pack applied, select **Yes** to raise an event if the number of Office Communications Server notifications in queue exceeds the threshold you set. The default is Yes. This script uses the `Queued OCS User Event Notifications` performance counter, which is the number of notifications that have been created and not yet submitted for delivery. This performance counter is no longer available with Microsoft Exchange 2010 Service Pack 1.
Threshold - Maximum queued OCS user event notifications	Set the maximum number of notifications that can be in queue before an event is raised. The default is 0 notifications.
Event severity when queued OCS user event notifications exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of notifications in queue exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for queued OCS user event notifications?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of notifications in queue for the monitoring period. The default is No.
Monitor Calls Disconnected During Audio Hourglass	
Event Notification	
Raise event if calls disconnected during audio hourglass exceed threshold?	Select **Yes** to raise an event if the number of calls disconnected during the audio hourglass exceeds the threshold you set. The default is Yes. This script uses the `Calls Disconnected by Callers During UM Audio Hourglass` performance counter, which is the number of calls during which the caller disconnected while Unified Messaging was playing the audio hourglass tones. Audio hourglass tones let users know they are still on hold or in queue.
Threshold - Maximum calls disconnected during audio hourglass	Set the maximum number of calls that can be disconnected during the audio hourglass before an event is raised. The default is 0 calls.
Event severity when calls disconnected during audio hourglass exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of disconnected calls exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for calls disconnected during audio hourglass?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls disconnected during audio hourglass for the monitoring period. The default is No.

35.33 Recommended Knowledge Script Group

The following Knowledge Scripts in the AppManager for Exchange2007 module are members of the Exchange2007 recommended Knowledge Script Group (KSG).

- All_BestPracticesAnalyzer
- All_ClockSynchronization
- All_EventLog
- All_ServiceStatus
- CAS_Activity
- CAS_Connectivity
- ETS_ExternalMail
- HTS_Connectivity
- MBS_MailboxAccessibility
- MBS_MailFlow
- Transport_BackPressure
- Transport_QueueStatus
- UMS_Connectivity
- UMS_Failures

You can find the Exchange2007 KSG on the RECOMMENDED tab of the Knowledge Script pane of the Operator Console.

The parameters of all scripts in the KSG are set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab, and then run the Exchange2007 group on an Exchange Server 2007, 2010, or 2013 resource.

The Exchange2007 KSG contains Knowledge Scripts for every server role. When you run the KSG on a particular server role, only the scripts in the KSG associated with that role will run. The All_* Knowledge Scripts in the KSG will run on every role.

The Exchange2007 KSG provides a "best practices" usage of AppManager for monitoring Exchange Server 2007, 2010, or 2013 in your organization. You can use this KSG with AppManager monitoring policies. A monitoring policy, which enables you to efficiently and consistently monitor all the resources in your environment, uses a set of pre-configured Knowledge Scripts to automatically monitor resources as they appear in the TreeView. For more information, see "About Policy-Based Monitoring" in the AppManager Help.

A KSG is composed of a subset of a module's Knowledge Scripts. The script that belongs to a KSG is a different copy of the original script you access from the Exchange2007 tab. If you modify a script that belongs to a KSG, the parameter settings of the original script in the Exchange2007 tab are not affected.

When deployed as part of a KSG, a script's default script parameter settings may differ from when the script is deployed alone. The default settings of a script within a group depend on its monitoring purpose within the larger group, and on the intended monitoring scope of that group.

If you modify or remove a script associated with the Exchange2007 KSG and want to restore it to its original form, you can reinstall AppManager for Exchange Server 2007 on the repository computer or

check in the appropriate script from the `AppManager\qdb\kp\Exchange2007\RECOMMENDED_Exchange2007` directory.

In addition to the Knowledge Scripts in the KSG, NetIQ Corporation recommends using the following scripts for monitoring and managing an Exchange Server 2007, 2010, or 2013 environment. The tables below summarize the scripts that are applicable for the unique elements of an Exchange Server 2007, 2010, or 2013 environment. For more information, see the AppManager Help for each script.

For performing benchmarking and trend analyses before deploying AppManager for Exchange Server, run the following scripts from the NT and AD script categories.

Recommended Knowledge Script	Description
NT_CPUByProcess	Monitors CPU usage for each process and the total CPU usage for all processes.
NT_CPULoaded	Monitors total CPU usage and queue length to determine CPU load.
NT_LogicalDiskBusy	Monitors the logical disk activity on one or more disks.
NT_LogicalDiskIO	Monitors logical disk I/O activity, including disk transfers, and reads and writes per second.
NT_MemUtil	Monitors physical memory, virtual memory, and paging files.
NT_NetworkBusy	Monitors the traffic on the network interface cards on a Windows computer.
AD_Authentications	Monitors the number of Active Directory Kerberos and NT LAN Manager (NTLM) authentications per second.

For monitoring the hardware and operating system of the Exchange Server 2007, 2010, or 2013 server and components, use the following scripts from the **NT** script category and from the categories appropriate for your hardware, such as **CIM** or **Dell**.

Recommended Knowledge Script	Description
[HardwareModule]_ ArrayPhysicalDiskStatus or ArrayPhysicalDrive	Monitors the status of physical drives in an array set.
[HardwareModule]_FanProbe or FanIndividual	Monitors the status of individual fans.
[HardwareModule]_NICError	Monitors network interface transmission errors.
[HardwareModule]_PowerSupply	Monitors the status of the hardware power supplies.
NT_CPULoaded	Monitors total CPU usage and queue length to determine CPU load.
NT_MemUtil	Monitors physical memory, virtual memory, and paging files.
NT_PhysicalDiskQLen	Monitors the number of disk jobs waiting in the queue.
NT_RunAwayProcesses	Detects runaway processes by sampling CPU usage.
NT_SystemUptime	Tracks the number of hours a computer has been operational since it was last rebooted.
NT_DNSConnectivity	Checks connectivity between a managed computer and its DNS server.

For reporting and analysis purposes, use the following script from the **NT** category.

Recommended Knowledge Script	Description
NT_SystemUptime	Tracks the number of hours a computer has been operational since it was last rebooted.

36 Exchange-RT Knowledge Scripts

AppManager ResponseTime for Exchange provides a set of Knowledge Scripts for monitoring the response time of Microsoft Exchange Servers. From within the Exchange-RT view on the Operator Console, you can select a Knowledge Script or report on the EXCHANGE-RT tab of the Knowledge Script pane.

If you choose to collect data, each Knowledge Script generates the following data streams:

- **Availability**

  The Availability data point is always one of the following values:

  – 1 or 100 – the test was successful

  – 0 – the test was not successful

  The Availability data point indicates whether the test succeeded or failed. If, for example, a connection to the Exchange Server was established but the mailbox failed to open, the Availability data point will be 0 (not available, or not successful).

- **Response time**

  You have two options for collecting response-time data:

  – **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.

  – **Response-time Breakdown**. If enabled as separate parameters, you can also collect up to six response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed.

Interactive User

If you select to use the SSL option for a test using RPC over HTTP, you must run the Knowledge Script as "Interactive User" due to the security requirements of SSL. Running as Interactive User requires a user to be physically logged into the computer for the test to run. To run using SSL, type `Interactive User` for the *Exchange Logon and Run As Username* parameter, and leave the *Password* and *Domain* parameters blank.

Security

Most other AppManager ResponseTime Knowledge Scripts require you to enter **Logon** username and password information required to run the application as well as **Run As** information, the credentials

needed to impersonate a network domain user. The Exchange-RT Knowledge Scripts require a single username/password combination, so that the network credentials are used to log onto the Exchange Server. These Knowledge Scripts use Windows authentication to authenticate the user being impersonated.

Use these Knowledge Scripts as templates for tailoring your own Knowledge Scripts:

Knowledge Script	What It Does
CheckAddressBookEntry	Checks an Exchange address book entry and reports the amount of time the operation took.
OpenFolder	Opens an Exchange folder and reports the amount of time the operation took.
OpenFolderAndRead	Opens an Exchange folder and reads the last (most recent) item it contains.
SendAndReceiveMessage	Sends email from and receives it back to a specific email user account.
SendAndTrackMessage	Reports the amount of time taken to deliver an email message and return a receipt for it to the sender.
Report_Exchange-RT	Reports on availability and response time for selected Exchange Servers.

36.1 CheckAddressBookEntry

Use this Knowledge Script to check an Exchange address book entry and report the amount of time the operation took. If the transaction completes successfully, you'll see a positive result for availability, even if the address book entry is not found.

If you select to use the SSL option for a test using RPC over HTTP, you must run the Knowledge Script as "Interactive User ." To run using SSL, type `Interactive User` for the *Exchange Logon and Run As Username* parameter, and leave the *Password* and *Domain* parameters blank.

NOTE: Unlike other AppManager ResponseTime Knowledge Scripts, which require you to enter username and password information required to log into the network domain, the Exchange-RT Knowledge Scripts all use Windows NT authentication (or "integrated security").

36.1.1 Helpful Hints

For the **Address book entry** parameter, even if the server cannot find the particular name you've entered, it still scans the address book and returns a valid response time.

If you are using a mailbox that does not have a unique name, you can do either of the following:

- Use its fully qualified name for the *Mailbox name* parameter.

  For example, say you have the following mailboxes defined on your Exchange Server: `'test'`, `'test 1'`, `'test 2'`, `'system test'`. If you specify the mail account "`test`" when creating a connection in the Microsoft Exchange Server settings dialog box on your Exchange test client, you are prompted for the mailbox to use. The fully qualified name for `'test'` would be in the format: `/o=Your Corporation/ou=Your City/cn=Recipients/cn=test`. Supply this value for the *Mailbox name* parameter (see below).

  To determine the fully qualified mailbox name, click **Check Name** when configuring Exchange Server settings on the test client. A dialog box allows you to specify the account to use. Highlight the desired account and click **Properties**. The value in the **Email address** field is the string to use in the Exchange Service Connection **mailbox** field.

- Enable the *Resolve and use Exchange distinguished name* parameter.

  If the value specified for the *Mailbox name* is ambiguous (say, for example, because the names of multiple mailboxes are very similar), the Exchange Server may not be able to determine which mailbox to use in the response-time test. When you enable the *Resolve and use Exchange distinguished name* parameter, the ResponseTime for Exchange managed object resolves the name in Active Directory to the first match found and uses that value for the transaction.

36.1.2 Collecting Data

If you choose to collect data, this Knowledge Script generates the following data streams:

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.

  - **Response-time Breakdown**. If enabled as separate parameters, up to 6 response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 2127 below for more information.

- **Availability**–Returns one of the following values:
  - 1 or 100 – the transaction was successful
  - 0 – the transaction was not successful

  The Availability data point is an indication of whether the test succeeded or failed. If, for example, a connection to the Exchange Server was established but the mailbox failed to open, the Availability data point will be 0 (not available, or not successful).

An event is raised whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The Exchange-RT engine can't be initialized. An initialization error is generated, but an Availability or Response Time data stream is not generated.
- The transaction doesn't complete successfully. A transaction error is generated. Only an Availability data stream is generated, with a value of 0.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console. See the description of the **Event on** parameter, below.

36.1.3 Resource Objects

Exchange response time clients (Exchange-RT)

36.1.4 Default Schedule

The default interval for this script is **Every 15 minutes**.

36.1.5 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select **Yes** to collect availability data for graphs and reports. By default, data is collected.
Data stream format	Select the data stream format for the Availability data stream. Previous versions of AppManager ResponseTime for Exchange used a 0 ("not available") or 1 ("available") format to indicate availability (that is, test success or failure). You now have the option to use a 0 ("not available") or 100 ("available") format. The default value is 0-100.

Description	How to Set It
Raise event if transaction fails?	Select **Yes** to raise an event when the server cannot be contacted. By default, an event is raised.
Event severity when transaction fails	If events are enabled, set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 5.
Response Time	
Collect data for response time?	Select **Yes** to collect response-time data for graphs and reports. By default, data is collected.
Include time to resolve distinguished name?	Select **Yes** to add extra time to resolve the distinguished name of the account. In some cases, resolving distinguished names could affect performance. If you want to collect this data, enable this parameter and the *Collect data for resolving distinguished name?* parameter. This parameter is disabled by default.
Include time to create profile in response time?	Select **Yes** to include the time taken to create the Exchange profile in the response-time calculation. The default is No. If you want to collect this data, select Yes for this parameter and the *Collect data for creating Exchange profile?* parameter.
Threshold – Maximum response time (seconds)	Specify the maximum response time in seconds. When response time exceeds this value, an event is raised. The event message contains a breakdown of the total response time. The default is 15 seconds.
Raise event if threshold is exceeded?	Select **Yes** to raise an event when the response-time threshold is exceeded. By default, events are raised.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 15.
Response Time Breakdown	
Collect data for resolving distinguished name?	Select **Yes** to collect the results of resolving the distinguished name. By default, this information is not collected.
Collect data for initializing Exchange?	Select **Yes** to collect a separate response-time data stream for the time taken to initialize the connection to the Exchange server. By default, separate response-time data streams are not collected.
Collect data for creating Exchange profile?	Select **Yes** to collect a separate response-time data stream for the time taken to create the Exchange profile. The default is No. To create this data stream, do not enter a value for the *Name of the existing Exchange profile to use* parameter, and select Yes for this parameter and the *Create an Exchange profile during each iteration?* parameter.
Collect data for logon?	Select **Yes** to collect a separate response-time data stream for the time taken to log on to the Exchange server. By default, separate response-time data streams are not collected.
Collect data for opening Exchange database?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Exchange database. By default, separate response-time data streams are not collected.
Collect data for opening address book?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Outlook address book. By default, separate response-time data streams are not collected.
Collect data for resolving entry?	Select **Yes** to collect a separate response-time data stream for the time taken to resolve the Outlook address book entry. By default, separate response-time data streams are not collected.

Description	How to Set It
Address book entry	Enter the address-book entry to check in the response-time test–the name of a person in the Exchange address book. Use the following syntax (for example): `John Doe` If you are setting the *Event on* parameter (see below), the *Address book entry* parameter lets you select the computer where the event will appear in your console. Enter the name of the server, or click the browse button ([**...**]) to select from a list of available servers. The computer you select must already be in the TreeView.
Event on	Select the TreeView location where events should be displayed. Select either: • Agent (the client computer in the response-time tests). This is the default. • Server (the Exchange server being tested–see the *Exchange server name* parameter, below) • Both. The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
Exchange Server Settings	
Create an Exchange profile during each iteration?	Select **Yes** to create an Exchange profile for each iteration, or select **No** to create an Exchange profile on just the first iteration. The default is Yes. If you select No, the following parameters will also be disabled: *Include time to create profile in response time?* and *Collect data for creating Exchange profile*? Also, if you select No, the Exchange profile created during the first iteration persists even after the job is stopped. You should manually delete the Exchange profile to keep Outlook free of unneeded profiles. To avoid NTLM authentication, select No for this parameter, and then set *Profile authentication type* to Kerberos.
Name of the existing Exchange profile to use (optional except for Outlook 2003 to Exchange 2010 or later)	Enter the name of the Exchange profile for which you want to measure response time. The default is blank. The user who owns the email account must manually create the profile in Outlook. The profile must be able to connect with Exchange Server, with this security option selected: *Encrypt data between Microsoft Office Outlook and Microsoft Exchange server*. Also, the server name and mailbox name for the profile should match the *Exchange server name* and *Mailbox name* parameters below. **NOTE:** Use this parameter if you need to measure response time between Outlook 2003 clients and Exchange Server 2010 or later servers. This parameter is optional for other configurations of Outlook and Exchange.
Exchange server name	Enter the name of the Exchange server.
Mailbox name	Enter the name of the mailbox, which is usually a username.

Description	How to Set It
Profile authentication type	Select what kind of authentication you want to use with your Exchange profiles. If you want to let the Exchange server and Outlook communicate to finalize the authentication method (NTLM or Kerberos), use the default value of Negotiate Authentication. To avoid NTLM authentication, select Kerberos for this parameter, and then set the C*reate an Exchange profile during each iteration* parameter to No.
Resolve and use Exchange distinguished name?	Select **Yes** to instruct the ResponseTime for Exchange managed object to resolve the name in Active Directory to the first match found and use that value for the transaction. This option is helpful if the name you supplied for the *Mailbox name* parameter is ambiguous (if, for example, there are mailboxes with names so similar that the Exchange Server cannot determine which one to use for the test). By default, the DN for the mailbox is not used.
Using RPC over HTTP	
Connect to Exchange Server using HTTP?	Select **Yes** to use the hypertext transfer protocol (HTTP) to make the connection to the server that is acting as the RPC proxy for the Exchange server. If enabled, allows you to test Exchange server response time in a proxy situation by using a remote procedure call (RPC) sent over HTTP. By default, HTTP is not used to connect to the Exchange server.
URL to connect to proxy server for Exchange	Enter the URL of the Exchange Server computer that's configured as an RPC proxy server. The RPC proxy server communicates with clients seeking access to the Exchange server. Use the following format (for example): `exchproxy01.netiq.com` Required if RPC over HTTP is used.
SSL Settings	
Connect using SSL only	Select **Yes** to use the Secure Sockets Layer (SSL) security protocol to secure the HTTP connection to the proxy Exchange Server. If you select to use the SSL option for a test using RPC over the HTTP protocol, you must run the Knowledge Script as "Interactive User" due to the security requirements of SSL. See the *Username* parameter below for more information. By default, SSL isn't used for the connection.
Mutually authenticate the session when connecting	Select **Yes** to require the client computer and the Exchange server to perform authentication when the Knowledge Script requests the connection to the Exchange server. By default, authentication is not performed.
Principal name for proxy server	The service principal name of the proxy Exchange server service. This name must be recognized as an entity by the SSL server. The format is `msstd:FQDN` where FQDN is the fully-qualified domain name of the proxy server. Required if the previous parameter (*Mutually authenticate...*) is enabled.

Description	How to Set It
On fast networks, connect using HTTP first, then connect using TCP/IP	Select **Yes** to attempt the connection to the proxy Exchange Server using the HTTP protocol first, and then, if the connection attempt fails, to use TCP/IP for the connection. This setting affects connection response times on fast networks, which Outlook defines as faster than 128 kilobits per second (Kbps). By default, this option is disabled on fast networks.
On slow networks, connect using HTTP first, then connect using TCP/IP	Select **Yes** to attempt the connection to the proxy Exchange Server using the HTTP protocol first, and then, if the connection attempt fails, to use TCP/IP for the connection. This setting affects connection response times on slow networks, which Outlook defines as slower than or equal to 128 kilobits per second (Kbps). By default, this option is enabled on slow networks.
Exchange Logon and Run As	
Username	Enter the name of the person who owns or is authorized to access the mailbox. If you select to use the SSL option for a test using RPC over HTTP, you must run the Knowledge Script as "Interactive User ". Running as "Interactive User" requires that a user be physically logged into the managed client. To run using SSL, type `Interactive User` here. Leave the *Password* and *Domain* parameters blank.
Password	Enter the password associated with this user that is required to log on to the network and run the application. Leave blank to run as Interactive User.
Domain	Enter the domain associated with this user–the domain name you are logging onto. Leave blank to run as Interactive User.
Administrators group on managed client	Enter the name of the Administrators Group on the managed client. Typically, this name is "Administrators". The default is "`Administrators`".
Timeouts	
Job timeout	Set the timeout value, from 1 to 900 seconds, to determine the maximum time allowed to process a job before it's aborted. When an Exchange-RT Knowledge Script job runs, a job timer is started. If the transaction takes longer than the Job timeout, the transaction is stopped and a "Job Timeout" event is raised. The default is 120 seconds.
Queue timeout	Set the timeout value, from 1 to 1200 seconds, to determine how long a job can wait for resources before it's aborted. Multiple simultaneous Exchange-RT Knowledge Script jobs must wait for a token to run. If no token is available for a job you're trying to run, the job is added to the queue and starts a queue timer. When the Queue Timeout for a job expires, the job does not run, a "Queue Timeout" event is raised, and the job is moved to the end of the queue. The default is 300 seconds.

36.2 OpenFolder

Use this Knowledge Script to open a specified Exchange folder and report the amount of time the operation took. The selected folder can be either public or private.

If you select to use the SSL option for a test using RPC over HTTP, you must run the Knowledge Script as "Interactive User ." To run using SSL, type `Interactive User` for the *Exchange Logon and Run As Username* parameter, and leave the *Password* and *Domain* parameters blank.

36.2.1 Helpful Hints

- If you are using a mailbox that does not have a unique name, you should either enable the *Resolve and use Exchange distinguished name?* parameter or supply the fully qualified name for the mailbox. See the "Helpful Hints" section of the CheckAddressBookEntry topic for a full discussion.
- The folder name that you must specify in this Knowledge Script can be for either a private or public folder. The *Folder access* parameter lets you indicate which type you've selected.

36.2.2 Collecting Data

If you choose to collect data, this Knowledge Script generates the following data streams:

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to 5 response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 2133 for more information.
- **Availability**–Returns one of the following values:
  - 1 or 100 – the test was successful
  - 0 – the test was not successful

  The Availability data point is an indication of whether the test succeeded or failed. If, for example, a connection to the Exchange Server was established but the mailbox failed to open, the Availability data point will be 0 (not available, or not successful).

An event is raised whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The Exchange-RT engine can't be initialized. An initialization error is generated, but an Availability or Response Time data stream is not generated.
- The transaction doesn't complete successfully. A transaction error is generated. Only an Availability data stream is generated, with a value of 0.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console. See the description of the *Event on* parameter, below.

36.2.3 Resource Objects

Exchange response time clients (Exchange-RT)

36.2.4 Default Schedule

The default interval for this script is **Every 15 minutes**.

36.2.5 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select **Yes** to collect availability data for graphs and reports. By default, data is collected.
Data stream format	Select the data stream format for the Availability data stream. Previous versions of AppManager ResponseTime for Exchange used a 0 ("not available") or 1 ("available") format to indicate availability (that is, test success or failure). You now have the option to use a 0 ("not available") or 100 ("available") format. The default value is 0-100.
Raise event if transaction fails?	Select **Yes** to raise an event when the server cannot be contacted. By default, an event is raised.
Event severity when transaction fails	If events are enabled, set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 5.
Response Time	
Collect data for response time?	Select **Yes** to collect response-time data for graphs and reports. By default, data is collected.
Include time to resolve distinguished name?	Select **Yes** to add extra time to resolve the distinguished name of the account. In some cases, resolving distinguished names could affect performance. If you want to collect this data, enable this parameter and the *Collect data for resolving distinguished name?* parameter. This parameter is disabled by default.
Include time to create profile in response time?	Select **Yes** to include the time taken to create the Exchange profile in the response-time calculation. The default is No. If you want to collect this data, select Yes for this parameter and the *Collect data for creating Exchange profile?* parameter.
Threshold – Maximum response time (seconds)	Specify the maximum response time in seconds. When response time exceeds this value, an event is raised. The event message contains a breakdown of the total response time. The default is 15 seconds.
Raise event if threshold is exceeded?	Select **Yes** to raise an event when the response-time threshold is exceeded. By default, events are raised.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 15.

Description	How to Set It
Response Time Breakdown	
Collect data for resolving distinguished name?	Select **Yes** to collect the results of resolving the distinguished name. By default, this information is not collected.
Collect data for initializing Exchange?	Select **Yes** to collect a separate response-time data stream for the time taken to initialize the connection to the Exchange server. By default, separate response-time data streams are not collected.
Collect data for creating Exchange profile?	Select **Yes** to collect a separate response-time data stream for the time taken to create the Exchange profile. The default is No. To create this data stream, do not enter a value for the *Name of the existing Exchange profile to use* parameter, and select Yes for this parameter and the *Create an Exchange profile during each iteration?* parameter.
Collect data for logon?	Select **Yes** to collect a separate response-time data stream for the time taken to log on to the Exchange server. By default, separate response-time data streams are not collected.
Collect data for opening Exchange database?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Exchange database. By default, separate response-time data streams are not collected.
Collect data for opening folder?	Select **Yes** to collect a separate response-time data stream for the time taken to open the specified folder. By default, separate response-time data streams are not collected.
Folder name	The name of the Exchange folder to open. The default is `Inbox`. If you are setting the *Event on* parameter (see below), the *Folder name* parameter lets you select the Exchange folder where any events will appear in your console.
Folder access	The security status of the folder. Select either `Private` or `Public`. Default is `Private`.
Event on	Select the TreeView location where events should be displayed. Select either: • Agent (the client computer in the response-time tests; corresponds to the Exchange folder you selected for the *Folder name* parameter, above). This is the default. • Server (the Exchange server being tested–see the *Exchange server name* parameter, below). • Both. The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
Exchange Server Settings	

Description	How to Set It
Create an Exchange profile during each iteration?	Select **Yes** to create an Exchange profile for each iteration, or select **No** to create an Exchange profile on just the first iteration. The default is Yes. If you select No, the following parameters will also be disabled: *Include time to create profile in response time?* and *Collect data for creating Exchange profile*? Also, if you select No, the Exchange profile created during the first iteration persists even after the job is stopped. You should manually delete the Exchange profile to keep Outlook free of unneeded profiles. To avoid NTLM authentication, select No for this parameter, and then set *Profile authentication type* to Kerberos.
Name of the existing Exchange profile to use (optional except for Outlook 2003 to Exchange 2010 or later)	Enter the name of the Exchange profile for which you want to measure response time. The default is blank. The user who owns the email account must manually create the profile in Outlook. The profile must be able to connect with Exchange Server, with this security option selected: *Encrypt data between Microsoft Office Outlook and Microsoft Exchange server*. Also, the server name and mailbox name for the profile should match the *Exchange server name* and *Mailbox name* parameters below. **NOTE:** Use this parameter if you need to measure response time between Outlook 2003 clients and Exchange Server 2010 or later servers. This parameter is optional for other configurations of Outlook and Exchange.
Exchange server name	Enter the name of the Exchange server.
Mailbox name	Enter the name of the mailbox, which is usually a username.
Profile authentication type	Select what kind of authentication you want to use with your Exchange profiles. If you want to let the Exchange server and Outlook communicate to finalize the authentication method (NTLM or Kerberos), use the default value of Negotiate Authentication. To avoid NTLM authentication, select Kerberos for this parameter, and then set the C*reate an Exchange profile during each iteration* parameter to No.
Resolve and use Exchange distinguished name?	Select **Yes** to instruct the ResponseTime for Exchange managed object to resolve the name in Active Directory to the first match found and use that value for the transaction. This option is helpful if the name you supplied for the *Mailbox name* parameter is ambiguous (if, for example, there are mailboxes with names so similar that the Exchange Server cannot determine which one to use for the test). By default, the DN for the mailbox is not used.
Using RPC over HTTP	
Connect to Exchange Server using HTTP?	Select **Yes** to use the hypertext transfer protocol (HTTP) to make the connection to the server that is acting as the RPC proxy for the Exchange server. If enabled, allows you to test Exchange server response time in a proxy situation by using a remote procedure call (RPC) sent over HTTP. By default, HTTP is not used to connect to the Exchange server.

Description	How to Set It
URL to connect to proxy server for Exchange	Enter the URL of the Exchange Server computer that's configured as an RPC proxy server. The RPC proxy server communicates with clients seeking access to the Exchange server. Use the following format (for example): `exchproxy01.netiq.com` Required if RPC over HTTP is used.
SSL Settings	
Connect using SSL only	Select **Yes** to use the Secure Sockets Layer (SSL) security protocol to secure the HTTP connection to the proxy Exchange Server. If you select to use the SSL option for a test using RPC over the HTTP protocol, you must run the Knowledge Script as "Interactive User " due to the security requirements of SSL. See the *Username* parameter below for more information. By default, SSL isn't used for the connection.
Mutually authenticate the session when connecting	Select **Yes** to require the client computer and the Exchange server to perform authentication when the Knowledge Script requests the connection to the Exchange server. By default, authentication is not performed.
Principal name for proxy server	The service principal name of the proxy Exchange server service. This name must be recognized as an entity by the SSL server. The format is `msstd:FQDN` where FQDN is the fully-qualified domain name of the proxy server. Required if the previous parameter (**Mutually authenticate...**) is enabled.
On fast networks, connect using HTTP first, then connect using TCP/IP	Select **Yes** to attempt the connection to the proxy Exchange Server using the HTTP protocol first, and then, if the connection attempt fails, to use TCP/IP for the connection. This setting affects connection response times on fast networks, which Outlook defines as faster than 128 kilobits per second (Kbps). By default, this option is disabled on fast networks.
On slow networks, connect using HTTP first, then connect using TCP/IP	Select **Yes** to attempt the connection to the proxy Exchange Server using the HTTP protocol first, and then, if the connection attempt fails, to use TCP/IP for the connection. This setting affects connection response times on slow networks, which Outlook defines as slower than or equal to 128 kilobits per second (Kbps). By default, this option is enabled on slow networks.
Exchange Logon and Run As	
Username	Enter the name of the person who owns or is authorized to access the mailbox. If you select to use the SSL option for a test using RPC over HTTP, you must run the Knowledge Script as "Interactive User ". Running as "Interactive User" requires that a user be physically logged into the managed client. To run using SSL, type `Interactive User` here. Leave the *Password* and *Domain* parameters blank.
Password	Enter the password associated with this user that is required to log on to the network and run the application. Leave blank to run as Interactive User.
Domain	Enter the domain associated with this user–the domain name you are logging onto. Leave blank to run as Interactive User.

Description	How to Set It
Administrators group on managed client	Enter the name of the Administrators Group on the managed client. Typically, this name is “Administrators”. The default is “`Administrators`”.
Timeouts	
Job timeout	Set the timeout value, from 1 to 900 seconds, to determine the maximum time allowed to process a job before it’s aborted. When an Exchange-RT Knowledge Script job runs, a job timer is started. If the transaction takes longer than the Job timeout, the transaction is stopped and a “Job Timeout" event is raised. The default is 120 seconds.
Queue timeout	Set the timeout value, from 1 to 1200 seconds, to determine how long a job can wait for resources before it’s aborted. Multiple simultaneous Exchange-RT Knowledge Script jobs must wait for a token to run. If no token is available for a job you’re trying to run, the job is added to the queue and starts a queue timer. When the Queue Timeout for a job expires, the job does not run, a "Queue Timeout" event is raised, and the job is moved to the end of the queue. The default is 300 seconds.

36.3 OpenFolderAndRead

Use this Knowledge Script to open an Exchange folder and read the last (most recent) item it contains.

This script won't return an error if the folder is empty, and the job will complete normally.

If you select to use the SSL option for a test using RPC over HTTP, you must run the Knowledge Script as "Interactive User ." To run using SSL, type `Interactive User` for the *Exchange Logon and Run As Username* parameter, and leave the *Password* and *Domain* parameters blank.

36.3.1 Helpful Hints

- If you are using a mailbox that does not have a unique name, you should either enable the *Resolve and use Exchange distinguished name?* parameter or supply the fully qualified name for the mailbox. See the "Helpful Hints" section of the topic CheckAddressBookEntry for a full discussion.
- The folder name that you must specify in this Knowledge Script can be for either a private or public folder. The *Folder access* parameter lets you indicate which type you've selected.

36.3.2 Collecting Data

If you choose to collect data, this Knowledge Script generates the following data streams:

- **Response time**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to 6 response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 2139 below for more information.
- **Availability**–Returns one of the following values:
  - 1 or 100 – the test was successful
  - 0 – the test was not successful

  The Availability data point is an indication of whether the test succeeded or failed. If, for example, a connection to the Exchange Server was established but the mailbox failed to open, the Availability data point will be 0 (not available, or not successful).

An event is raised whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The Exchange-RT engine can't be initialized. An initialization error is generated, but an Availability or Response Time data stream is not generated.
- The transaction doesn't complete successfully. A transaction error is generated. Only an Availability data stream is generated, with a value of 0.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console. See the description of the *Event on* parameter, below.

36.3.3 Resource Objects

Exchange response time clients (Exchange-RT).

36.3.4 Default Schedule

The default interval for this script is **Every 15 minutes**.

36.3.5 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select **Yes** to collect availability data for graphs and reports. By default, data is collected.
Data stream format	Select the data stream format for the Availability data stream. Previous versions of AppManager ResponseTime for Exchange used a 0 ("not available") or 1 ("available") format to indicate availability (that is, test success or failure). You now have the option to use a 0 ("not available") or 100 ("available") format. The default value is 0-100.
Raise event if transaction fails?	Select **Yes** to raise an event when the server cannot be contacted. By default, an event is raised.
Event severity when transaction fails	If events are enabled, set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 5.
Response Time	
Collect data for response time?	Select **Yes** to collect response-time data for graphs and reports. By default, data is collected.
Include time to resolve distinguished name?	Select **Yes** to add extra time to resolve the distinguished name of the account. In some cases, resolving distinguished names could affect performance. If you want to collect this data, enable this parameter and the *Collect data for resolving distinguished name?* parameter. This parameter is disabled by default.
Include time to create profile in response time?	Select **Yes** to include the time taken to create the Exchange profile in the response-time calculation. The default is No.
Threshold – Maximum response time (seconds)	Specify the maximum response time in seconds. When response time exceeds this value, an event is raised. The event message contains a breakdown of the total response time. The default is 15 seconds.
Raise event if threshold is exceeded?	Select **Yes** to raise an event when the response-time threshold is exceeded. By default, events are raised.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 15.
Response Time Breakdown	

Description	How to Set It
Collect data for resolving distinguished name?	Select **Yes** to collect the results of resolving the distinguished name. By default, this information is not collected.
Collect data for initializing Exchange?	Select **Yes** to collect a separate response-time data stream for the time taken to initialize the connection to the Exchange server. By default, separate response-time data streams are not collected.
Collect data for creating Exchange profile?	Select **Yes** to collect a separate response-time data stream for the time taken to create the Exchange profile. The default is No. To create this data stream, do not enter a value for the *Name of the existing Exchange profile to use* parameter, and select Yes for this parameter and the *Create an Exchange profile during each iteration?* parameter.
Collect data for logon?	Select **Yes** to collect a separate response-time data stream for the time taken to log on to the Exchange server. By default, separate response-time data streams are not collected.
Collect data for opening Exchange database?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Exchange database. By default, separate response-time data streams are not collected.
Collect data for opening folder?	Select **Yes** to collect a separate response-time data stream for the time taken to open the folder. By default, separate response-time data streams are not collected.
Collect data for reading the last folder item?	Select **Yes** to collect a separate response-time data stream for the time taken to read the last item received in the folder. By default, separate response-time data streams are not collected.
Folder name	The name of the Exchange folder to open. The default is `Inbox`. If you're setting the *Event on* parameter (see below), the *Folder name* parameter lets you select the Exchange folder where any events will appear in your console.
Folder access	The security status of the folder. Select either `Private` or `Public`. Default is `Private`.
Event on	Select the TreeView location where events should be displayed. Select either: • Agent (the client computer in the response-time tests; corresponds to the Exchange folder you selected for the *Folder name* parameter, above). This is the default. • Server (the Exchange server being tested–see the *Exchange server name* parameter, below). • Both. The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
Exchange Server Settings	

Description	How to Set It
Create an Exchange profile during each iteration?	Select **Yes** to create an Exchange profile for each iteration, or select **No** to create an Exchange profile on just the first iteration. The default is Yes. If you select No, the following parameters will also be disabled: *Include time to create profile in response time?* and *Collect data for creating Exchange profile*? Also, if you select No, the Exchange profile created during the first iteration persists even after the job is stopped. You should manually delete the Exchange profile to keep Outlook free of unneeded profiles. To avoid NTLM authentication, select No for this parameter, and then set *Profile authentication type* to Kerberos.
Name of the existing Exchange profile to use (optional except for Outlook 2003 to Exchange 2010 or later)	Enter the name of the Exchange profile for which you want to measure response time. The default is blank. The user who owns the email account must manually create the profile in Outlook. The profile must be able to connect with Exchange Server, with this security option selected: *Encrypt data between Microsoft Office Outlook and Microsoft Exchange server*. Also, the server name and mailbox name for the profile should match the *Exchange server name* and *Mailbox name* parameters below. **NOTE:** Use this parameter if you need to measure response time between Outlook 2003 clients and Exchange Server 2010 or later servers. This parameter is optional for other configurations of Outlook and Exchange.
Exchange server name	Enter the name of the Exchange server.
Mailbox name	Enter the name of the mailbox, which is usually a username.
Profile authentication type	Select what kind of authentication you want to use with your Exchange profiles. If you want to let the Exchange server and Outlook communicate to finalize the authentication method (NTLM or Kerberos), use the default value of Negotiate Authentication. To avoid NTLM authentication, select Kerberos for this parameter, and then set the C*reate an Exchange profile during each iteration* parameter to No.
Resolve and use Exchange distinguished name?	Select **Yes** to instruct the ResponseTime for Exchange managed object to resolve the name in Active Directory to the first match found and use that value for the transaction. This option is helpful if the name you supplied for the *Mailbox name* parameter is ambiguous (if, for example, there are mailboxes with names so similar that the Exchange Server cannot determine which one to use for the test). By default, the DN for the mailbox is not used.
Using RPC over HTTP	
Connect to Exchange Server using HTTP?	Select **Yes** to use the hypertext transfer protocol (HTTP) to make the connection to the server that is acting as the RPC proxy for the Exchange server. If enabled, allows you to test Exchange server response time in a proxy situation by using a remote procedure call (RPC) sent over HTTP. By default, HTTP is not used to connect to the Exchange server.

Description	How to Set It
URL to connect to proxy server for Exchange	Enter the URL of the Exchange Server computer that's configured as an RPC proxy server. The RPC proxy server communicates with clients seeking access to the Exchange server. Use the following format (for example): `exchproxy01.netiq.com` Required if RPC over HTTP is used.
SSL Settings	
Connect using SSL only	Select **Yes** to use the Secure Sockets Layer (SSL) security protocol to secure the HTTP connection to the proxy Exchange Server. If you select to use the SSL option for a test using RPC over the HTTP protocol, you must run the Knowledge Script as "Interactive User " due to the security requirements of SSL. See the *Username* parameter below for more information. By default, SSL isn't used for the connection.
Mutually authenticate the session when connecting	Select **Yes** to require the client computer and the Exchange server to perform authentication when the Knowledge Script requests the connection to the Exchange server. By default, authentication is not performed.
Principal name for proxy server	The service principal name of the proxy Exchange server service. This name must be recognized as an entity by the SSL server. The format is `msstd:FQDN` where FQDN is the fully-qualified domain name of the proxy server. Required if the previous parameter (*Mutually authenticate...*) is enabled.
On fast networks, connect using HTTP first, then connect using TCP/IP	Select **Yes** to attempt the connection to the proxy Exchange Server using the HTTP protocol first, and then, if the connection attempt fails, to use TCP/IP for the connection. This setting affects connection response times on fast networks, which Outlook defines as faster than 128 kilobits per second (Kbps). By default, this option is disabled on fast networks.
On slow networks, connect using HTTP first, then connect using TCP/IP	Select **Yes** to attempt the connection to the proxy Exchange Server using the HTTP protocol first, and then, if the connection attempt fails, to use TCP/IP for the connection. This setting affects connection response times on slow networks, which Outlook defines as slower than or equal to 128 kilobits per second (Kbps). By default, this option is enabled on slow networks.
Exchange Logon and Run As	
Username	Enter the name of the person who owns or is authorized to access the mailbox. If you select to use the SSL option for a test using RPC over HTTP, you must run the Knowledge Script as "Interactive User ". Running as "Interactive User" requires that a user be physically logged into the managed client. To run using SSL, type `Interactive User` here. Leave the *Password* and *Domain* parameters blank.
Password	Enter the password associated with this user that is required to log on to the network and run the application. Leave blank to run as Interactive User.
Domain	Enter the domain associated with this user–the domain name you are logging onto. Leave blank to run as Interactive User.

Description	How to Set It
Administrators group on managed client	Enter the name of the Administrators Group on the managed client. Typically, this name is “Administrators”. The default is “`Administrators`”.
Timeouts	
Job timeout	Set the timeout value, from 1 to 900 seconds, to determine the maximum time allowed to process a job before it’s aborted. When an Exchange-RT Knowledge Script job runs, a job timer is started. If the transaction takes longer than the Job timeout, the transaction is stopped and a “Job Timeout" event is raised. The default is 120 seconds.
Queue timeout	Set the timeout value, from 1 to 1200 seconds, to determine how long a job can wait for resources before it’s aborted. Multiple simultaneous Exchange-RT Knowledge Script jobs must wait for a token to run. If no token is available for a job you’re trying to run, the job is added to the queue and starts a queue timer. When the Queue Timeout for a job expires, the job does not run, a "Queue Timeout" event is raised, and the job is moved to the end of the queue. The default is 300 seconds.

36.4 SendAndReceiveMessage

Use this Knowledge Script to send email from and receive it back to a specific email user account. (For testing purposes, the server is sending a message to itself.) It reports the operation time.

The incoming message header contains a unique identifier that tracks and identifies the message. If the message is received that matches the sent message within the timeout time, the message is then deleted. If the timeout occurs before the message is received, the message displays in the Outlook Inbox.

If you select to use the SSL option for a test using RPC over HTTP, you must run the Knowledge Script as "Interactive User ." To run using SSL, type `Interactive User` for the *Exchange Logon and Run As Username* parameter, and leave the *Password* and *Domain* parameters blank.

TIP: If you are using a mailbox that does not have a unique name, you should either enable the *Resolve and use Exchange distinguished name?* parameter or supply the fully qualified name for the mailbox. See the "Helpful Hints" section of the topic CheckAddressBookEntryfor a full discussion.

36.4.1 Collecting Data

If you choose to collect data, this Knowledge Script generates the following data streams:

- **Response time.**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to 11 response-time breakdown data streams. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 2145
- **Availability**–Returns one of the following values:
  - 1 or 100 – the test was successful
  - 0 – the test was not successful

  The Availability data point is an indication of whether the test succeeded or failed. If, for example, a connection to the Exchange Server was established but the mailbox failed to open, the Availability data point will be 0 (not available, or not successful).

An event is raised whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The Exchange-RT engine can't be initialized. An initialization error is generated, but an Availability or Response Time data stream is not generated.
- The transaction doesn't complete successfully. A transaction error is generated. Only an Availability data stream is generated, with a value of 0.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console. See the description of the *Event on* parameter, below.

36.4.2 Resource Objects

Exchange response time clients (Exchange-RT)

36.4.3 Default Schedule

The default interval for this script is **Every 15 minutes**.

36.4.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select **Yes** to collect availability data for graphs and reports. By default, data is collected.
Data stream format	Select the data stream format for the Availability data stream. Previous versions of AppManager ResponseTime for Exchange used a 0 ("not available") or 1 ("available") format to indicate availability (that is, test success or failure). You now have the option to use a 0 ("not available") or 100 ("available") format. The default value is 0-100.
Raise event when transaction fails?	Select **Yes** to raise an event when the server cannot be contacted. By default, an event is raised.
Event severity when transaction fails	If events are enabled, set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 5.
Response Time	
Collect data for response time?	Select **Yes** to collect response-time data for graphs and reports. By default, data is collected.
Include time to resolve distinguished name?	Select **Yes** to add extra time to resolve the distinguished name of the account. In some cases, resolving distinguished names could affect performance. If you want to collect this data, enable this parameter and the *Collect data for resolving distinguished name?* parameter. This parameter is disabled by default.
Include time to create profile in response time?	Select **Yes** to include the time taken to create the Exchange profile in the response-time calculation. The default is No.
Threshold – Maximum response time (seconds)	Specify the maximum response time in seconds. When response time exceeds this value, an event is raised. The event message contains a breakdown of the total response time. The default is 15 seconds.
Raise event if threshold is exceeded?	Select **Yes** to raise an event when the response-time threshold is exceeded. By default, events are raised.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 15.
Response Time Breakdown	

Description	How to Set It
Collect data for resolving distinguished name?	Select **Yes** to collect the results of resolving the distinguished name. By default, this information is not collected.
Collect data for initializing Exchange?	Select **Yes** to collect a separate response-time data stream for the time taken to initialize the connection to the Exchange server. By default, separate response-time data streams are not collected.
Collect data for creating Exchange profile?	Select **Yes** to collect a separate response-time data stream for the time taken to create the Exchange profile. The default is No. To create this data stream, do not enter a value for the *Name of the existing Exchange profile to use* parameter, and select Yes for this parameter and the *Create an Exchange profile during each iteration?* parameter.
Collect data for logon?	Select **Yes** to collect a separate response-time data stream for the time taken to log on to the Exchange server. By default, separate response-time data streams are not collected.
Collect data for opening Exchange database?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Exchange database. By default, separate response-time data streams are not collected.
Collect data for opening address book?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Outlook address book. By default, separate response-time data streams are not collected.
Collect data for opening Inbox?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Inbox. By default, separate response-time data streams are not collected.
Collect data for opening Outbox?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Outbox. By default, separate response-time data streams are not collected.
Collect data for creating message?	Select **Yes** to collect a separate response-time data stream for the time taken to create the test email message. By default, separate response-time data streams are not collected.
Collect data for resolving recipient name?	Select **Yes** to collect a separate response-time data stream for the time taken to resolve the name of the recipient of the test email message (see the *Mailbox name* parameter, below). By default, separate response-time data streams are not collected.
Collect data for sending message?	Select **Yes** to collect a separate response-time data stream for the time taken to actually send the test email message. By default, separate response-time data streams are not collected.
Collect data for waiting until message shows up in Inbox?	Select **Yes** to collect a separate response-time data stream for the time taken for the test message to show up in the recipient's mailbox. By default, separate response-time data streams are not collected.
Message size	Enter the size of the message in bytes. Default is 100.

Description	How to Set It
Event on	Select the TreeView location where events should be displayed. Select either: • Agent (the client computer in the response-time tests). This is the default. • Server (the Exchange server being tested–see the *Exchange server name* parameter, below). • Both. The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
Exchange Server Settings	
Create an Exchange profile during each iteration?	Select **Yes** to create an Exchange profile for each iteration, or select **No** to create an Exchange profile on just the first iteration. The default is Yes. If you select No, the following parameters will also be disabled: *Include time to create profile in response time?* and *Collect data for creating Exchange profile*? Also, if you select No, the Exchange profile created during the first iteration persists even after the job is stopped. You should manually delete the Exchange profile to keep Outlook free of unneeded profiles. To avoid NTLM authentication, select No for this parameter, and then set *Profile authentication type* to Kerberos.
Name of the existing Exchange profile to use (optional except for Outlook 2003 to Exchange 2010 or later)	Enter the name of the Exchange profile for which you want to measure response time. The default is blank. The user who owns the email account must manually create the profile in Outlook. The profile must be able to connect with Exchange Server, with this security option selected: *Encrypt data between Microsoft Office Outlook and Microsoft Exchange server*. Also, the server name and mailbox name for the profile should match the *Exchange server name* and *Mailbox name* parameters below. **NOTE:** Use this parameter if you need to measure response time between Outlook 2003 clients and Exchange Server 2010 or later servers. This parameter is optional for other configurations of Outlook and Exchange.
Exchange server name	Enter the name of the Exchange server.
Mailbox name	Enter the name of the mailbox, which is usually a username.
Profile authentication type	Select what kind of authentication you want to use with your Exchange profiles. If you want to let the Exchange server and Outlook communicate to finalize the authentication method (NTLM or Kerberos), use the default value of Negotiate Authentication. To avoid NTLM authentication, select Kerberos for this parameter, and then set the C*reate an Exchange profile during each iteration* parameter to No.

Description	How to Set It
Resolve and use Exchange distinguished name?	Select **Yes** to instruct the ResponseTime for Exchange managed object to resolve the name in Active Directory to the first match found and use that value for the transaction. This option is helpful if the name you supplied for the *Mailbox name* parameter is ambiguous (if, for example, there are mailboxes with names so similar that the Exchange Server cannot determine which one to use for the test). By default, the DN for the mailbox is not used.
Using RPC over HTTP	
Connect to Exchange Server using HTTP?	Select **Yes** to use the hypertext transfer protocol (HTTP) to make the connection to the server that is acting as the RPC proxy for the Exchange server. If enabled, allows you to test Exchange server response time in a proxy situation by using a remote procedure call (RPC) sent over HTTP. By default, HTTP is not used to connect to the Exchange server.
URL to connect to proxy server for Exchange	Enter the URL of the Exchange Server computer that's configured as an RPC proxy server. The RPC proxy server communicates with clients seeking access to the Exchange server. Use the following format (for example): `exchproxy01.netiq.com` Required if RPC over HTTP is used.
SSL Settings	
Connect using SSL only	Select **Yes** to use the Secure Sockets Layer (SSL) security protocol to secure the HTTP connection to the proxy Exchange Server. If you select to use the SSL option for a test using RPC over the HTTP protocol, you must run the Knowledge Script as "Interactive User " due to the security requirements of SSL. See the *Username* parameter below for more information. By default, SSL isn't used for the connection.
Mutually authenticate the session when connecting	Select **Yes** to require the client computer and the Exchange server to perform authentication when the Knowledge Script requests the connection to the Exchange server. By default, authentication is not performed.
Principal name for proxy server	The service principal name of the proxy Exchange server service. This name must be recognized as an entity by the SSL server. The format is `msstd:FQDN` where FQDN is the fully-qualified domain name of the proxy server. Required if the previous parameter (*Mutually authenticate...*) is enabled.
On fast networks, connect using HTTP first, then connect using TCP/IP	Select **Yes** to attempt the connection to the proxy Exchange Server using the HTTP protocol first, and then, if the connection attempt fails, to use TCP/IP for the connection. This setting affects connection response times on fast networks, which Outlook defines as faster than 128 kilobits per second (Kbps). By default, this option is disabled on fast networks.

Description	How to Set It
On slow networks, connect using HTTP first, then connect using TCP/IP	Select **Yes** to attempt the connection to the proxy Exchange Server using the HTTP protocol first, and then, if the connection attempt fails, to use TCP/IP for the connection. This setting affects connection response times on slow networks, which Outlook defines as slower than or equal to 128 kilobits per second (Kbps). By default, this option is enabled on slow networks.
Logon and Run As	
Username	Enter the name of the person who owns or is authorized to access the mailbox. If you select to use the SSL option for a test using RPC over HTTP, you must run the Knowledge Script as "Interactive User ". Running as "Interactive User" requires that a user be physically logged into the managed client. To run using SSL, type `Interactive User` here. Leave the *Password* and *Domain* parameters blank.
Password	Enter the password associated with this user that is required to log on to the network and run the application. Leave blank to run as Interactive User.
Domain	Enter the domain associated with this user–the domain name you are logging onto. Leave blank to run as Interactive User.
Administrators group on managed client	Enter the name of the Administrators Group on the managed client. Typically, this name is "Administrators". The default is "`Administrators`".
Timeouts	
Message delivery timeout	Enter the time, in seconds, for the job to wait for the tracking message to show up in the mailbox before the job is aborted. Enter a value from 1 to 600 seconds. The default is 75 seconds.
Job timeout	Set the timeout value, from 1 to 900 seconds, to determine the maximum time allowed to process a job before it's aborted. When an Exchange-RT Knowledge Script job runs, a job timer is started. If the transaction takes longer than the Job timeout, the transaction is stopped and a "Job Timeout" event is raised. The default is 90 seconds.
Queue timeout	Set the timeout value, from 1 to 1200 seconds, to determine how long a job can wait for resources before it's aborted. Multiple simultaneous Exchange-RT Knowledge Script jobs must wait for a token to run. If no token is available for a job you're trying to run, the job is added to the queue and starts a queue timer. When the Queue Timeout for a job expires, the job does not run, a "Queue Timeout" event is raised, and the job is moved to the end of the queue. The default is 120 seconds.

36.5 SendAndTrackMessage

An Outlook user sending an email message can track the delivery time by requesting a message delivery receipt. Use this Knowledge Script to find out the time required to send an email message and to return a receipt for that email message back to the sender.

NOTE: The recipient email address must reside on an Exchange server. If the server is not an Exchange server, a delivery receipt is not delivered and a timeout occurs.

This Knowledge Script sends the message with a delivery notification flag to a selected mailbox. The message that was sent remains in the Inbox of the recipient. Although this Knowledge Script cannot delete the test messages from the recipient's Inbox, AppManager ResponseTime for Exchange removes the delivery notification that appears in the sender's Inbox if the test message is delivered, and if the notification is received, before the configured **Job timeout** expires. To retrieve the test message, the script looks at the subject for a unique identifier that matches one applied to the sent message.

The receiving user will have test email messages in his or her Inbox that cannot be deleted by this Knowledge Script. We suggest that you create a rule in Microsoft Exchange to delete those test messages periodically.

If you select to use the SSL option for a test using RPC over HTTP, you must run the Knowledge Script as "Interactive User ." To run using SSL, type `Interactive User` for the *Exchange Logon and Run As Username* parameter, and leave the *Password* and *Domain* parameters blank.

TIP: If you are using a mailbox that does not have a unique name, you should either enable the Resolve and use Exchange distinguished name? parameter or supply the fully qualified name for the mailbox. See the "Helpful Hints" section of the topic CheckAddressBookEntryfor a full discussion.

36.5.1 Collecting Data

If you choose to collect data, this Knowledge Script generates the following data streams:

- **Response time.**
  - **Overall response time**. The information returned by this data stream is also saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
  - **Response-time Breakdown**. If enabled as separate parameters, up to 11 response-time breakdown data streams can be collected. These are individual data points for the different parts of the Knowledge Script transaction that are timed. See "Setting Parameter Values" on page 2151 for more information.
- **Availability**–Returns one of two values:
  - 1 – the test was successful
  - 0 – the test was not successful

  The Availability data point is an indication of whether the test succeeded or failed. If, for example, a connection to the Exchange Server was established but the mailbox failed to open, the Availability data point will be 0 (not available, or not successful).

An event is raised whenever one of the following occurs:

- A threshold that you have specified as an event parameter is exceeded.
- The Exchange-RT engine can't be initialized. An initialization error is generated, but an Availability or Response Time data stream is not generated.
- The transaction doesn't complete successfully. A transaction error is generated. Only an Availability data stream is generated, with a value of 0.

You can select where some of the possible events are displayed in the Operator Console TreeView or Control Center Console Server view. This event proxying feature is useful in Control Center Service Map views. It is not supported for jobs that are started in the Operator Web Console. See the description of the *Event on* parameter, below.

36.5.2 Resource Objects

Exchange response time clients (Exchange-RT).

36.5.3 Default Schedule

The default interval for this script is **Every 15 minutes**.

36.5.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Availability	
Collect data for availability?	Select **Yes** to collect availability data for graphs and reports. By default, data is collected.
Data stream format	Select the data stream format for the Availability data stream. Previous versions of AppManager ResponseTime for Exchange used a 0 ("not available") or 1 ("available") format to indicate availability (that is, test success or failure). You now have the option to use a 0 ("not available") or 100 ("available") format. The default value is 0-100.
Raise event if transaction fails?	Select **Yes** to raise an event when the server cannot be contacted. By default, an event is raised.
Event severity when transaction fails	If events are enabled, set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 5.
Response Time	
Collect data for response time?	Select **Yes** to collect response-time data for graphs and reports. By default, data is collected.
Include time to resolve distinguished name?	Select **Yes** to add extra time to resolve the distinguished name of the account. In some cases, resolving distinguished names could affect performance. If you want to collect this data, enable this parameter and the *Collect data for resolving distinguished name?* parameter. This parameter is disabled by default.

Description	How to Set It
Include time to create profile in response time?	Select **Yes** to include the time taken to create the Exchange profile in the response-time calculation. The default is No. If you want to collect this data, select Yes for this parameter and the *Collect data for creating Exchange profile?* parameter.
Threshold – Maximum response time (seconds)	Specify the maximum response time in seconds. When response time exceeds this value, an event is raised. The event message contains a breakdown of the total response time. The default is 15 seconds.
Raise event if threshold is exceeded?	Select **Yes** to raise an event when the response-time threshold is exceeded. By default, events are raised.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. Default is 15.
Response Time Breakdown	
Collect data for resolving distinguished name?	Select **Yes** to collect the results of resolving the distinguished name. By default, this information is not collected.
Collect data for initializing Exchange?	Select **Yes** to collect a separate response-time data stream for the time taken to initialize the connection to the Exchange server. By default, separate response-time data streams are not collected.
Collect data for creating Exchange profile?	Select **Yes** to collect a separate response-time data stream for the time taken to create the Exchange profile. The default is No. To create this data stream, do not enter a value for the *Name of the existing Exchange profile to use* parameter, and select Yes for this parameter and the *Create an Exchange profile during each iteration?* parameter.
Collect data for logon?	Select **Yes** to collect a separate response-time data stream for the time taken to log on to the Exchange server. By default, separate response-time data streams are not collected.
Collect data for opening Exchange database?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Exchange database. By default, separate response-time data streams are not collected.
Collect data for opening address book?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Outlook address book. By default, separate response-time data streams are not collected.
Collect data for opening Inbox?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Inbox. By default, separate response-time data streams are not collected.
Collect data for opening Outbox?	Select **Yes** to collect a separate response-time data stream for the time taken to open the Outbox. By default, separate response-time data streams are not collected.
Collect data for creating message?	Select **Yes** to collect a separate response-time data stream for the time taken to create the test email message. By default, separate response-time data streams are not collected.
Collect data for resolving recipient name?	Select **Yes** to collect a separate response-time data stream for the time taken to resolve the name of the recipient of the test email message (see the *Mailbox name* parameter, below). By default, separate response-time data streams are not collected.
Collect data for sending message?	Select **Yes** to collect a separate response-time data stream for the time taken to actually send the test email message. By default, separate response-time data streams are not collected.

Description	How to Set It
Collect data for waiting until tracking message shows up in Inbox?	Select **Yes** to collect a separate response-time data stream for the time taken for the test message to show up in the recipient's mailbox. By default, separate response-time data streams are not collected.
Email address	Enter the address the message is being sent to on an Exchange server.
Message size	Enter the size of the message in bytes. Default is 100.
Event on	Select the TreeView location where events should be displayed. Select either: • Agent (the client computer in the response-time tests). This is the default. • Server (the Exchange server being tested–see the *Exchange server name* parameter, below). • Both. The event will be shown in two locations in the TreeView. **Notes** This setting does not apply to events related to the Knowledge Script itself, such as Knowledge Script failure or initialization problems. Such events are always displayed on the computer where the job ran. You must select `Agent` when starting jobs in the Operator Web Console. If you select `Server`, no events are generated. If you select `Both`, an event is only shown on the agent.
Exchange Server Settings	
Create an Exchange profile during each iteration?	Select **Yes** to create an Exchange profile for each iteration, or select **No** to create an Exchange profile on just the first iteration. The default is Yes. If you select No, the following parameters will also be disabled: *Include time to create profile in response time?* and *Collect data for creating Exchange profile*? Also, if you select No, the Exchange profile created during the first iteration persists even after the job is stopped. You should manually delete the Exchange profile to keep Outlook free of unneeded profiles. To avoid NTLM authentication, select No for this parameter, and then set *Profile authentication type* to Kerberos.
Name of the existing Exchange profile to use (optional except for Outlook 2003 to Exchange 2010 or later)	Enter the name of the Exchange profile for which you want to measure response time. The default is blank. The user who owns the email account must manually create the profile in Outlook. The profile must be able to connect with Exchange Server, with this security option selected: *Encrypt data between Microsoft Office Outlook and Microsoft Exchange server*. Also, the server name and mailbox name for the profile should match the *Exchange server name* and *Mailbox name* parameters below. **NOTE:** Use this parameter if you need to measure response time between Outlook 2003 clients and Exchange Server 2010 or later servers. This parameter is optional for other configurations of Outlook and Exchange.
Exchange server name	Enter the name of the Exchange server.
Mailbox name	Enter the name of the mailbox, which is usually a username.
Profile authentication type	Select what kind of authentication you want to use with your Exchange profiles. If you want to let the Exchange server and Outlook communicate to finalize the authentication method (NTLM or Kerberos), use the default value of Negotiate Authentication. To avoid NTLM authentication, select Kerberos for this parameter, and then set the C*reate an Exchange profile during each iteration* parameter to No.

Description	How to Set It
Resolve and use Exchange distinguished name?	Select **Yes** to instruct the ResponseTime for Exchange managed object to resolve the name in Active Directory to the first match found and use that value for the transaction. This option is helpful if the name you supplied for the *Mailbox name* parameter is ambiguous (if, for example, there are mailboxes with names so similar that the Exchange Server cannot determine which one to use for the test). By default, the DN for the mailbox is not used.
Using RPC over HTTP	
Connect to Exchange Server using HTTP?	Select **Yes** to use the hypertext transfer protocol (HTTP) to make the connection to the server that is acting as the RPC proxy for the Exchange server. If enabled, allows you to test Exchange server response time in a proxy situation by using a remote procedure call (RPC) sent over HTTP. By default, HTTP is not used to connect to the Exchange server.
URL to connect to proxy server for Exchange	Enter the URL of the Exchange Server computer that's configured as an RPC proxy server. The RPC proxy server communicates with clients seeking access to the Exchange server. Use the following format (for example): `exchproxy01.netiq.com` Required if RPC over HTTP is used.
SSL Settings	
Connect using SSL only	Select **Yes** to use the Secure Sockets Layer (SSL) security protocol to secure the HTTP connection to the proxy Exchange Server. If you select to use the SSL option for a test using RPC over the HTTP protocol, you must run the Knowledge Script as "Interactive User " due to the security requirements of SSL. See the *Username* parameter below for more information. By default, SSL isn't used for the connection.
Mutually authenticate the session when connecting	Select **Yes** to require the client computer and the Exchange server to perform authentication when the Knowledge Script requests the connection to the Exchange server. By default, authentication is not performed.
Principal name for proxy server	The service principal name of the proxy Exchange server service. This name must be recognized as an entity by the SSL server. The format is `msstd:FQDN` where FQDN is the fully-qualified domain name of the proxy server. Required if the previous parameter (*Mutually authenticate...*) is enabled.
On fast networks, connect using HTTP first, then connect using TCP/IP	Select **Yes** to attempt the connection to the proxy Exchange Server using the HTTP protocol first, and then, if the connection attempt fails, to use TCP/IP for the connection. This setting affects connection response times on fast networks, which Outlook defines as faster than 128 kilobits per second (Kbps). By default, this option is disabled on fast networks.

Description	How to Set It
On slow networks, connect using HTTP first, then connect using TCP/IP	Select **Yes** to attempt the connection to the proxy Exchange Server using the HTTP protocol first, and then, if the connection attempt fails, to use TCP/IP for the connection. This setting affects connection response times on slow networks, which Outlook defines as slower than or equal to 128 kilobits per second (Kbps). By default, this option is enabled on slow networks.
Exchange Logon and Run As	
Username	Enter the name of the person who owns or is authorized to access the mailbox. If you select to use the SSL option for a test using RPC over HTTP, you must run the Knowledge Script as "Interactive User ". Running as "Interactive User" requires that a user be physically logged into the managed client. To run using SSL, type `Interactive User` here. Leave the *Password* and *Domain* parameters blank.
Password	Enter the password associated with this user that is required to log on to the network and run the application. Leave blank to run as Interactive User.
Domain	Enter the domain associated with this user–the domain name you are logging onto. Leave blank to run as Interactive User.
Administrators group on managed client	Enter the name of the Administrators Group on the managed client. Typically, this name is "Administrators". The default is "`Administrators`".
Timeouts	
Message delivery timeout	Enter the time, in seconds, for the job to wait for the tracking message to show up in the mailbox before the job is aborted. Enter a value from 1 to 600 seconds. The default is 75 seconds.
Job timeout	Set the timeout value, from 1 to 900 seconds, to determine the maximum time allowed to process a job before it's aborted. When an Exchange-RT Knowledge Script job runs, a job timer is started. If the transaction takes longer than the Job timeout, the transaction is stopped and a "Job Timeout" event is raised. The default is 120 seconds.
Queue timeout	Set the timeout value, from 1 to 1200 seconds, to determine how long a job can wait for resources before it's aborted. Multiple simultaneous Exchange-RT Knowledge Script jobs must wait for a token to run. If no token is available for a job you're trying to run, the job is added to the queue and starts a queue timer. When the Queue Timeout for a job expires, the job does not run, a "Queue Timeout" event is raised, and the job is moved to the end of the queue. The default is 300 seconds.

36.6 Report_Exchange-RT

Use this Report Knowledge Script to generate a report detailing availability and response time for the following Exchange-RT Knowledge Scripts:

- CheckAddressBookEntry
- OpenFolder
- OpenFolderAndRead
- SendAndReceiveMessage
- SendAndTrackMessage

36.6.1 Resource Object

AppManager repository.

36.6.2 Default Schedule

The default schedule is **Run once**

36.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
KS for report	Select the Knowledge Script to report on. Highlight an Exchange-RT script from the **Knowledge Script Name** list and click **Finish** to select it.
Exchange-RT client(s)	Select the Exchange-RT client(s). From the View(s) list, select from one to twenty-five views. Your subsequent selections are limited to computers or server groups that are visible in the selected views. Select one of the Filters options: • **View:** Includes all computers in the views you selected. • **Computer:** Select from individual computers in the views you selected. • **Server Group:** Select from server groups in the views you selected. Selecting a server group includes all computers in that group.
Exchange Server or “All”	Type the name of the Exchange server or type “All” to designate all computers as Exchange servers. Default is “All”.
Select time range	In the Select Date/Time Range dialog box, set specific start and end report information dates (good for historical or ad hoc reports), or a sliding range (the default) that sets the time range of data to include in the report. This option is useful for reports running on a regular schedule and is the default.

Description	How to Set It
Select peak weekday(s)	In the Select Peak Weekday(s) dialog box, press **Shift** to select a contiguous day range, or **Ctrl** to select non-contiguous days.
Aggregation by	Select the time unit by which to aggregate data. The default is Hour. This works in conjunction with the next field (Aggregation interval), which determines the number of units for one interval of data aggregation.
Aggregation interval	Select the interval units in which to aggregate data. The default is 1. For example, if you aggregate by the Hour and select 1 here, data is aggregated once every hour.
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter card?	Specify whether to display a table of parameter settings in the report.
Include Availability detail table?	Specify whether to display the Availability detail table as part of the report. By default, the table is included.
Availability data stream format	Specify the data stream format. Options are 0-100 or 0-1. The default format is 0-100.
Include Availability chart?	Specify whether to display the Availability chart as part of the report. By default, the chart is included.
Threshold on Availability chart	Enter an integer for the percent. Default is 0 (no threshold is displayed).
Include Response Time detail table?	Specify whether to display the Response Time detail table as part of the report. By default, the table is included.
Include Response Time chart?	Specify whether to display the Response Time chart as part of the report. By default, the chart is included.
Units for Response Time report	Select the response time unit of msec (the default) or sec.
Threshold on Response Time chart (selected units)	Enter the units in seconds > 0, or use the default of 0.0. (Zero suppresses the threshold indicator in the chart.)
Select chart style	Options in the Chart Settings dialog box set the appearance of the chart. The same parameters are used in both the availability and response time charts, if both are produced. Default is Ribbon.
Select output folder	In the Specify report folder/filename dialog box, enter an output filename and fill in the remote folder fields.
Add job ID to output folder name?	Specify whether to add a job ID to the output folder name.
Index-Report Title	In the Report Properties dialog box, configure report title settings.
Add time stamp to title	Specify whether to add a time stamp to the report title.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.
Generate event on success?	Specify whether an event is raised when a report is generated. By default, an event is raised.
Severity level for report success	Set the severity level for a successful report. Default is 35.
Severity level for report with no data	Set the severity level for a report with no data. Default is 25.
Severity level for report failure	Set the severity level for a report with no data. Default is 5.

37 General Knowledge Scripts

The General category provides Knowledge Scripts for generalized monitoring tasks that can be applied to almost any application.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
ADAuthentication	Monitors login time and the time required to read a property value of an object on an Active Directory server.
AsciiLog	Monitors ASCII text files for specific strings and messages logged since the last monitoring interval.
AsciiLogRX	Monitors an ASCII text file for specific strings and messages, as defined by regular expressions, logged since the last monitoring interval.
ConfigMachineDown	Loads computer-specific parameters to a local monitored computer so the MachineDownLR script, running on a group, can get the parameters required for each computer where it runs.
Counter	Monitors any System Monitor performance counter.
CounterCorrelate	Monitors thresholds for any pair of System Monitor performance counters.
EventLog	Monitors and filters information in the Windows event logs based on criteria you define.
EventLogRX	Monitors the Windows event logs for new entries matching the filter criteria you define using regular expressions.
MachineDown	Checks whether the target machine you run the script on can communicate with one or more specified Windows computers.
MachineDownLR	Using parameters planted locally by the ConfigMachineDown Knowledge Script, runs on a group of computers to check whether each computer can communicate with one or more specified Windows computers.
MissingEvent	Determines whether a Windows event log does not contain an entry matching your search criteria.
PingMachine	Checks the availability of any computers that reply to ICMP Echo requests (ping command).
Report_MachineAvailability	Generates a report about the availability of computers.
Report_PingMachine	Generates a report about the availability of computers or other machines that reply to ICMP Echo requests.
Report_ServiceChange	Generates a report about changes to the status and start-type of discovered services.

Knowledge Script	What It Does
Report_ServiceDown	Generates a report about the up/down status of discovered services.
Report_ServiceHung	Generates a report about discovered services in the Start-Pending, Stop-Pending, Continue-Pending, or Pause-Pending state.
ServiceChange	Detects any changes to the status and start type of a discovered service.
ServiceDown	Determines whether a discovered service is running.
ServiceHung	Determines whether a discovered service is hung.
ShortEventLog	Monitors and filters information in the Windows event logs based on criteria you specify.
SNMPGet	Monitors SNMP activity and allows you to check SNMP MIB variable values.
WMICounter	Monitors any WMI object property.

37.1 Creating Filters with Regular Expressions

Some Knowledge Scripts enable you to use regular expressions to define include and exclude filters for pattern-matching against the text being evaluated. Depending on the Knowledge Script you are working with, you may be able to use regular expression include and exclude filters when you are setting job properties or you may be able to maintain your search criteria independent of the Knowledge Script parameters in a separate filter file. You may also be able to use regular expression modifiers to further refine your filtering.

For example, if your **include filter** is `replic.*` and you specify the modifier `i` to make the search case-insensitive, the regular expression contains the wildcard (`.`) and repeat (`*`) special characters, indicating you want to find strings that start with `replic` followed by any string of characters. Messages containing either `replication` or `replicated` are captured.

The format is the same for the exclude filter. For example, to find log entries that do not start with the string `success`, the exclude filter might look like this:

```
^success.*
```

If you are only searching for included strings, you can leave the exclude filter blank. If you want to retrieve all messages in the log in a given interval, you can specify `.*` for the include filter and leave the exclude filter blank.

37.1.1 Using Special Characters

The following special characters can be used in regular expressions:

Use This Character	For This Purpose
.	Wildcard for any one character
*	Repeat zero or more occurrences
^	Beginning of the line
\$	End of the line
\	Escape the next meta-character
|	Alternate matches
[ ]	Any character in the class set. You can specify individual characters or ranges.
( )	Grouping characters. For example, you can specify (a|b|c) to indicate a match with a, or b, or c.
+	Quantifier indicating one or more occurrences
?	Quantifier indicating zero or one occurrence
{*n*}	Quantifier indicating exactly *n* occurrence
\w	A word character (alphanumeric plus _)
\s	A white-space character
\d	A digit character

37.1.2 Using Regular Expression Modifiers

In addition to the special characters you can use in creating the regular expression, there are a number of modifiers that can be used to modify how pattern-matching is handled. Valid modifiers include:

Modifier	Description
`c`	Complements the search list
`g`	Matches globally as many times as possible
`i`	Makes the search case-insensitive
`m`	Treats the string as multiple lines
`o`	Interpolates variables only once
`s`	Treats the regular expression string as a single long line
`x`	Allows for regular expression extensions

For additional information about writing regular expressions, see your Perl documentation or other regular expression resources.

37.2 ADAuthentication

Use this Knowledge Script to monitor how long it takes AppManager to log in to an Active Directory domain. You can also use this script to monitor how long it takes (response time) to read a property value of an object on the Domain Controller. This script raises an event if the login time or response read time exceeds the threshold you specify.

You can specify the Domain Controller to which you want to log in. If you do not specify a Domain Controller, then the script uses the nearest one. You must specify the account name and password used to connect to the Domain Controller.

To monitor response time for read operations, specify the LDAP path and the property name of an Active Directory object.

37.2.1 Resource Object

Windows 2000 Server or later

37.2.2 Default Schedule

The default schedule for this script is **Once every 30 minutes**.

37.2.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if login or read response time exceeds threshold?	Select **Yes** to raise an event if the authentication time or response time exceeds the threshold you specify. The default is Yes.
Collect data for login or read response time?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the authentication time (in ms) and the response time (in ms). The default is unselected.
Authenticate against domain controller	Specify the name of the Domain Controller for which you want to authenticate the login. If you do not specify a name, the script uses the nearest Domain Controller. The default is `server.netiq.com`.
User name	Specify the domain and user name for the account you are using to log in. Use the following format for this parameter: *<domain>**<username>*
Account password	Specify the password for the account you are using to log in. The password is stored in an encrypted format. **NOTE:** Maximum allowed password length is 32 characters.
Threshold - Maximum login time	Specify the maximum amount of time it can take to log in to the Domain Controller before an event is raised. The default is 1000 ms.
Monitor read-response time?	Select **Yes** to monitor the time (in ms) required to read the property value of an Active Directory object from a client. The default is unselected.

Parameter	How to Set It
LDAP path to an object on the target AD server	Specify the LDAP path to the Active Directory object for which you want to measure response time. The default is `LDAP://server.netiq.com/RootDSE`.
Specify a property of the AD object	Specify a property of the Active Directory object for which you want to measure response time. The default is `serverName`.
Threshold - Maximum read time	Specify the maximum amount of time it can take to read the specified property before an event is raised. The default is 1000 ms.
Event severity when login or response time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 8 (red event indicator).
Event severity level when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ADAuthentication job fails. The default is 35 (magenta event indicator).

37.3 AsciiLog

Use this Knowledge Script to monitor one or more ASCII text files for specific strings and messages logged since the last monitoring interval. Use this script to specify a pattern or search string to look for in specified ASCII files and report the matching entries found in the monitoring period. The script checks for changes to the text files that match the string you enter; it does not re-scan the entire file at each interval. The script gathers up to 2 MB worth of result matches for each iteration of the job.

In the first interval, the script reads the file and inserts a marker at the end of the file. The script does *not* search for a specified search string during the first interval. In subsequent intervals, the script checks the file for changes that match the search string you specified. The script raises an event if the number of lines matching your search criteria exceeds the threshold you set.

NOTE: The script reports the number of matched lines in each iteration and the detail message contains the text data. If the detail message is larger than 32KB, the data is saved in a file on the managed computer (for example, `C:\program files\netiq\appmanager\bin\log`) and the detail message contains the truncated data. If you generate these log files, periodically remove the files when you are done with them. This script supports files up to 12 GB in size.

37.3.1 Resource Objects

Windows 2000 Server or later

37.3.2 Default Schedule

The default interval for this script is **Once every hour**.

37.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if matches are found?	Select **Yes** to raise events if text strings or messages that match your search criteria are found. The default is Yes.
Event severity when matches are found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which matches to your search criteria are found. The default is 15 (yellow event indicator).
Raise event if no files are found?	Select **Yes** to raise an event if no ASCII files matching your search criteria are found. The default is unselected.
Event severity when no files found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no ASCII files matching your search criteria are found. The default is 10 (red event indicator).
Raise event if no matches are found?	Select **Yes** to raise an event if no text strings or messages that match your search criteria are found in the specified files. The default is unselected.

Parameter	How to Set It
Event severity when no matches found	Set the event severity level, from 1 to 40, to indicate the importance of an event if no matches to your search criteria are found in the specified files. The default is 20 (yellow event indicator).
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the AsciiLog job fails. The default is 5 (red event indicator).
Data Collection	
Collect data for matches to search criteria?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns one or more datastreams for each of your search criteria. The default is unselected. For example, if you search for `logon` and `logoff`, and `logon` is found in `C:\Log01` and `C:\Log02`, but `logoff` is not found, the script will return three datastreams: • Instances of logon in `C:\Log01` • Instances of logon in `C:\Log02` • Instances of logoff Each data point in a datastream contains the number of matches found for that iteration of the script.
Monitoring	
Directory to monitor	Specify the path to the directory in which you want to begin your search, or click **Browse [...]** to navigate to that directory. UNC paths are also supported, such as `\\ENG\appdev`
Include sub-directories?	Select **Yes** to have the script search all sub-directories of the directory you specified in *Directory to monitor*. The default is unselected.
File name (can use wildcards *, ? and %)	Specify the name of the ASCII file in which you want to search. You can use wildcards to specify filenames. The default is logfile*.log. Use the `*` wildcard to match any sequence of zero or more characters. For example, `*.log` instructs the script to search all .log files. Use the `?` wildcard to match any single character. For example, `Log0?` instructs the script to search for any file whose name begins with `Log0` and includes one other character). **NOTE:** You can use multiple instances of the `*` and `?` wildcards to specify filenames; for example: `*log*.log or ??log.log.` Use the % wildcard as a placeholder for the date format specified in *Date selection format*. For example, if you routinely generate a new file of the same name each day and append the filename with a date, you can use this wildcard to tell the script to always search the latest version of the file. Use this wildcard in place of the date added to the filename. For example, if your file is `Log<`*date*`>`, specify the filename in this parameter as `Log%`.
Date selection format	Select the date format. If you are searching files that contain a date as part of the filename, as specified in *File name (can use wildcards *, ? and %)*, you can use this parameter to select the format.

Parameter	How to Set It
Search patterns (separate by comma)	Specify the string for which you want to search. Separate multiple string entries by commas. **NOTE:** The strings you enter cannot contain commas, because commas are used to separate strings from one another.
Threshold - Maximum number of matching lines	Specify the maximum number of matches to your search criteria that can be found before an event is raised. The default is 0.
Enforce case-sensitive match?	Select **Yes** to enforce a case-sensitive match to your search criteria. The default is unselected. For example, if set to Yes, search criteria of `E*.log` would match `Error.log`, but not `error.log`.
Require literal match?	Select **Yes** to enforce a literal match to your search criteria. The default is unselected. For example, if set to Yes, search criteria of `NetIQ AppManager` will find strings that include the entire phrase `NetIQ AppManager`, but not strings that include only `NetIQ` or `AppManager`.
Scan entire file on first iteration?	Select **Yes** to scan entire files on the first iteration of the job. If set to No, the default, the first iteration of the job places a marker at the end of a file and scans from that point on during subsequent iterations.

37.4 AsciiLogRX

Use this Knowledge Script to monitor an ASCII text file for specific strings and messages logged since the last monitoring interval. This script allows you to use regular expressions to specify a pattern or search string to search for in an ASCII file. The script reports the matching entries found in the monitoring period. The script checks for changes to the text file that match the string you enter; it does not re-scan the entire file at each interval. The script gathers up to 2 MB worth of result matches for each iteration of the job.

For more information, see "Creating Filters with Regular Expressions" on page 2161.

In the first interval, the script reads the file and inserts a marker at the end of the file. The script does not search for a specified search string during the first interval. In subsequent intervals, the script checks the file for changes that match the search string you specified. The script raises an event if the number of lines matching your search criteria exceeds the threshold you set.

NOTE: This script reports the number of matched lines in each iteration and the detail message contains the text data. If the detail message is larger than 32 KB, the data is saved in a file on the managed computer (for example, `C:\program files\netiq\appmanager\bin\log`) and the detail message contains the truncated data. If you generate these log files, periodically remove the files when you are done with them.

37.4.1 Resource Objects

Windows 2000 Server or later

37.4.2 Default Schedule

The default interval for this script is **Once every hour**.

37.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if matches are found?	Select **Yes** to raise events if text strings or messages that match your search criteria are found. The default is Yes.
Collect data for matches to search criteria?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns one or more datastreams for each of your search criteria. The default is unselected. For example, if you search for `logon` and `logoff`, and `logon` is found in `C:\Log01` and `C:\Log02`, but `logoff` is not found, the script will return three datastreams: • Instances of logon in `C:\Log01` • Instances of logon in `C:\Log02` • Instances of logoff Each data point in a datastream contains the number of matches found for that iteration of the script.

Parameter	How to Set It
File name (full path)	Specify the full path to the file you want to monitor. For example `C:\temp\backup.log`. UNC names are also supported, such as `\\ENG\appdev\mylog.txt`. **Tip** You can only specify one filename for any job instance. To monitor multiple logs or files, create separate Knowledge Script jobs.
Enforce case-sensitive match?	Select **Yes** to enforce a case-sensitive match to your search criteria. The default is unselected. For example, if set to Yes, search criteria of `E*.log` would match `Error.log`, but not `error.log`.
Find pattern (regular expression)	Specify a regular expression to identify the string you want to find in the specified file. The default is a blank string, which instructs the script to find all new strings entered since the last time the script ran.
Threshold - Maximum number of matching lines	Specify the maximum number of matches to your search criteria that can be found before an event is raised. The default is 0.
Event severity when matches are found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which matches to your search criteria are found. The default is 5.

37.5 ConfigMachineDown

Use this Knowledge Script to set parameter values in the local repository of the computer on which you run it. The values are used by the MachineDownLR Knowledge Script when it runs on that computer. Using this pair of scripts, you can set up individual computers in a group so that when MachineDownLR runs on the group, it can run with different parameter values on each computer. This is particularly useful for enforcing monitoring policies.

37.5.1 Resource Objects

Windows 2000 Server or later

37.5.2 Default Schedule

The default interval for this script is **Run once**.

37.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if parameter values set successfully?	Set to **y** to raise an event if the script successfully sets parameter values in the local repository. The default is y.
List of computers separated by commas (no spaces)	Specify all the computers you want this computer to monitor when MachineDownLR runs on it.
Full path to file with a list of computers (one per line, no commas or spaces)	Specify the path and filename of a text file containing a list of computers for this computer to monitor when MachineDownLR runs on it. The file must be a text file with the name of each computer on a separate line (no spaces).
Event severity when parameter values set successfully	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this script successfully sets parameter values in the local repository. The default is 25 (blue event indicator).

37.6 Counter

Use this Knowledge Script to monitor System Monitor performance counters. You can run this script on any computer or server to monitor any counter available in System Monitor. You can configure the script to raise an event if the value of the counter you select exceeds or falls below the threshold you set. You can also specify a consecutive number of times that a threshold must be exceeded before an event is raised.

Use this Knowledge Script to yield performance information for the counters you want to monitor. When this script collects and graphs data, the results are similar to the results displayed in System Monitor. Use the counter data to start corrective actions when thresholds are exceeded, generate more complex and sophisticated graphs, and provide historical information for reporting, trend analysis, and capacity planning.

37.6.1 Prerequisites

Requirements for Windows Server 2012, Windows 8, Windows 7, Windows 2008 R2, and Windows 2008:

The Log On As account under which the AppManager agent runs for these Windows operating systems must be a domain account and belong to the Administrator local group.

Requirements for Windows Server 2003:

- The Log On As account under which the AppManager agent runs on Windows Server 2003 must belong to the Performance Monitor Users policy.
- If the Operator Console or Control Center is installed on Windows Server 2003, the user account under which the console application runs must belong to the Performance Monitor Users policy.

  To check the local policy:

  1. At a Command Prompt, type `gpedit.msc` and press `Enter`.
  2. In the Group Policy snap-in, double-click **Computer Configuration > Windows Settings > Security Settings > Local Policies > User Rights Assignment**.
  3. In the **Local Setting** column, ensure the appropriate user account belongs to the **Performance Monitor Users** policy.
- If the Operator Console or Control Center is installed on Windows Server 2003, the Remote Registry service on the console computer must be running. If the Remote Registry service is down when you attempt to configure this script by browsing counter information on the remote computer, the console displays an error message that indicates AppManager was unable to connect to the remote computer.

Requirements for Windows Vista:

If the Operator Console or Control Center is installed on Windows Vista, the Remote Registry service on the console computer must be running. If the Remote Registry service is down when you attempt to configure this script by browsing counter information on the remote computer, the console becomes unresponsive.

37.6.2 Resource Object

Windows computer or application server, such as Exchange Server or SQL Server

37.6.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

37.6.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Counter job fails. The default is 5.
Event severity when no counter or instance is found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the counter or instance you specified. The default is 15 (yellow event indicator).
Raise event when counter equals a specific value?	Select **Yes** to raise an event if the counter equals a specific value The default is unselected.
Event severity when counter equals a specific value	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the counter equals a specific value. The default is 15.
Value to match	Specify the number you want the counter to match so an event is generated. The default is 100.
Raise event when counter value exceeds threshold?	Select **Yes** to raise an event if the counter value exceeds the threshold *n* consecutive times. Specify the value of *n* in the *Consecutive times threshold can be crossed before event is raised* parameter. The default is Yes.
Event severity when counter value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a value exceeds the threshold you set. The default is 8 (red event indicator).
Threshold - Maximum counter value	Specify the highest value a counter can attain before an event is raised. The default is 600.
Raise event when counter value falls below threshold?	Select **Yes** to raise an event if the counter value falls below the threshold *n* consecutive times. Specify the value of *n* in the *Consecutive times threshold can be crossed before event is raised* parameter. The default is Yes.
Event severity when counter value falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a value falls below the threshold you set. The default is 8 (red event indicator).
Threshold - Minimum counter value	Specify the lowest value a counter must maintain to prevent an event from being raised. The default is 20.
Monitoring	

Parameter	How to Set It
Name of counter to monitor	Provide the name of the object/counter/instance you want to monitor, or click **Browse [...]** to select the computer and counter you want to monitor. You can also select a counter to monitor by starting System Monitor and clicking **Add** [**+**] in the toolbar. The default is `Objects\Threads\`. If typing the name, use the format `<object>\<counter>\<instance>`. You can enter multiple instances, separated by commas. For example: `Process\% Privileged Time\mapisp32,mqsvc` For more information, see "Examples of Using This Script" on page 2174. **Tips** • If an instance is a parent of multiple instances (for example, if you have a Logical Disk 0 with partitions C: and D:), enter the complete instance name exactly as displayed in System Monitor. For example: `0 ==> C:` • To monitor multiple instances of the same instance name, use one of the following methods: – Indicate the instance index in parentheses to monitor specific instances. For example: `Process\% Privileged Time\netiq,netiq(1),netiq(2)` – Use an asterisk (*) after the instance name to monitor all instances that begin with the string you provide. For example: `Process\% Privileged Time\netiq*` – Use an asterisk (*) before the instance name to monitor all instances that end with the string you provide. For example: `Process\% Privileged Time\*netiq`
Counter unit	Select the unit for the counter you are monitoring: • BYTE • KB • MB • GB The default unit is BYTE. **NOTE:** To monitor a counter whose value is measured in percentage, such as `Process\% Processor Time`, select **BYTE**. The unit in the datastream will indicate the value is a number, although the value is actually a percentage. For example, if the value for the `Process\% Processor Time` counter is 99.96%, the datastream will display a value of 99.96#. The value is correct, only the unit representation is incorrect.
Consecutive times threshold can be crossed before event is raised	Specify the number of consecutive times a counter value can exceed or fall below the threshold before an event is raised. The default is 1 time. **Tip** This parameter provides functionality similar to that of the *Raise event if event condition occurs x times within y job iterations* parameter on the Advanced tab. NetIQ recommends using the *Consecutive times threshold ...* parameter when you run this script. The *Consecutive times threshold ...* parameter is designed to match the event text that is particular to this script, which can vary depending on your entry for the *Name of counter to monitor* parameter. In summary, use the *Consecutive times threshold ...* parameter to raise events. Leave the *Raise event if event condition ...* parameter at the default setting of **1** time within **1** job iteration.
Data Collection	

Parameter	How to Set It
Collect data for counter value?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns values for counters that exceed the threshold. The default is unselected.

37.6.5 Examples of Using This Script

The following are examples of providing information in the *Name of counter to monitor* parameter.

37.6.5.1 Simple Counter with No Instance Name

For example, to monitor the Cache Hit Ratio counter and create one datastream, set the *Name of counter to monitor* parameter as follows:

```
SQLServer\Cache Hit Ratio
```

For this type of counter you can simply leave the instance parameters blank. If selecting this counter through the Counter Browser:

1. Click **Browse [...]** and select the target **Computer**.
2. Select **SQLServer** from the Object list.
3. Select **Cache Hit Ratio** from the Counter list and click **OK**.

37.6.5.2 Counter with Multiple Identical Instance Names

Assume you want to monitor the percentage of processor time used by several `cmd` processes running on a given computer. If you enter `cmd` as the instance name, only the first `cmd` process found is monitored.

To monitor additional `cmd` processes, or to select a specific `cmd` process rather than the "first found," you need to specify the instance index. The simplest way to select multiple instances is through the Counter Browser.

The script will monitor the processor time for these three `cmd` processes and create three datastreams.

If you do not use the Counter Browser and there are multiple instances with the same name, you need to identify which instance to monitor using an instance index, with 0 indicating the first instance, 1 the second, and so on. If you do not enter an index, the first instance found is monitored. If you are typing the information in the *Name of counter to monitor* parameter, use the format `<object>\<counter>\<instance> (<instance_index>)`. For example:

```
Process\% Privileged Time\cmd (0),cmd (1),cmd (3)
```

37.6.5.3 Counter with Parent-Child Instances

In some cases, an instance is a **parent** of multiple **child** instances. For example, if you have a Logical Disk `0` with partitions `C:` and `D:`, the logical disk `0` is the parent of the logical disk `C:` and the logical disk `D:`. In addition, there may be multiple child instances with identical names. For example, two processes called `MSDEV` may each have threads 0, 1, 2, and 3:

```
Instance    ProcessID  ThreadID Instance Index
-------------------------------------------
MSDEV ==> 0    361        495      0
MSDEV ==> 0    291        426      1
MSDEV ==> 1    361        275      0
MSDEV ==> 1    291        181      1
MSDEV ==> 2    361        471      0
MSDEV ==> 2    291        256      1
MSDEV ==> 3    361        376      0
MSDEV ==> 3    291        500      1
```

The simplest way to select these child instances is through the Counter Browser. If you do not use the Counter Browser and there are child instances, you need to identify which instance to monitor using the format `<object>\<counter>\<parent_instance> ==> <child_instance>`. For example:

```
LogicalDisk\% Free Space\0 ==> C:
```

If there are multiple child instances with the same name, you need to identify which child instances to monitor using an instance index, with 0 indicating the first instance, 1 the second, and so on. If you do not enter an index, the first instance found is monitored.

If you are typing the Counter to monitor, use the format: `<object>\<counter>\<parent> ==> <child> (<index>)`. For example:

```
Thread\% Processor Time\MSDEV ==> 0 (0),MSDEV ==> 0 (1)
```

Using the example above, this counter would get `% Processor Time` for threads 495 (`MSDEV` process 361) and 426 (`MSDEV` process 291) and create two datastreams.

```
ID  Job KS Name          Legend
-----------------------------------------------------
7   12  General_Counter  Thread-% Processor Time-MSDEV ==> 0(0)
6   12  General_Counter  Thread-% Processor Time-MSDEV ==> 0(1)
```

37.6.5.4 Format for Entering Counter Names without Browsing

To type counter names rather than use the Counter Browser, enter the complete instance name exactly as it is displayed in the Performance Monitor, including any spaces or spelling conventions.

To manually set the *Name of counter to monitor* parameter (without browsing), use one of the following formats:

Counter Type	General Format to Use and Example
Single counter instance	<object>\<counter>\<instance_name>`Process\% Privileged Time\cmd`
Multiple instances	<object>\<counter>\<instance> (<instance_index>)`Process\% Privileged Time\cmd (1),cmd (4)`
Child instances	<object>\<counter>\<parent_instance> ==> <child_instance>`LogicalDisk\% Free Space\0 ==> C:`
Multiple child instances	<object>\<counter>\<parent> ==> <child> (instance_index)`Thread\% Processor Time\MSDEV ==> 0 (0),MSDEV ==> 0 (1)`

37.7 CounterCorrelate

Use this Knowledge Script to monitor any pair of System Monitor performance counters. You can run this script on any computer or server, and you can monitor any counters available in the System Monitor. You can observe either a maximum or minimum threshold for each counter you are monitoring. You can set the script to raise an event if the value of either counter exceeds or falls below the threshold you set.

To see a list of available counters, click **Browse [...]** in the *Name of counter to monitor* parameter or start the System Monitor and click **Add [+]** in the toolbar.

Use this Knowledge Script to monitor for conditions when the values for any pair of counters indicate a problem. For example, you can raise events when CPU and memory counters both exceed a high threshold, or when a data file size counter exceeds a high threshold and an available disk space counter falls below a low threshold.

37.7.1 Prerequisites

Requirements for Windows Server 2012, Windows 8, Windows 7, Windows 2008 R2, and Windows 2008:

The Log On As account under which the AppManager agent runs for these Windows operating systems must be a domain account and belong to the Administrator local group.

Requirements for Windows Server 2003:

- The Log On As account under which the AppManager agent runs on Windows Server 2003 must belong to the Performance Monitor Users policy.
- If the Operator Console or Control Center is installed on Windows Server 2003, the user account under which the console application runs must belong to the Performance Monitor Users policy.

  To check the local policy:

  1. At a Command Prompt, type `gpedit.msc` and press `Enter`.
  2. In the Group Policy snap-in, double-click **Computer Configuration > Windows Settings > Security Settings > Local Policies > User Rights Assignment**.
  3. In the **Local Setting** column, ensure the appropriate user account belongs to the **Performance Monitor Users** policy.
- If the Operator Console or Control Center is installed on Windows Server 2003, the Remote Registry service on the console computer must be running. If the Remote Registry service is down when you attempt to configure this script by browsing counter information on the remote computer, the console displays an error message that indicates AppManager was unable to connect to the remote computer.

Requirements for Windows Vista:

If the Operator Console or Control Center is installed on Windows Vista, the Remote Registry service on the console computer must be running. If the Remote Registry service is down when you attempt to configure this script by browsing counter information on the remote computer, the console becomes unresponsive.

37.7.2 Resource Objects

Windows computer or application server, such as Exchange Server, SQL Server, IIS server

37.7.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

37.7.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Collect data for counter value?	Set to **y** to collect data for charts and reports. If enabled, data collection returns values for counters that exceed the threshold. The default is n.
Raise event if counter value exceeds or falls below threshold?	Select **yes** to raise an event when a counter value counter exceeds or falls below the threshold you set. The default is yes.
Counter 1 Settings	
Counter value for threshold	Specify the value for the threshold you want to observe. The default is 600.
Use counter value as maximum threshold?	Select **yes** to use the value from the *Counter value for threshold* parameter as a maximum threshold. The script then raises events when the counter value exceeds the threshold. Deselect the yes check box to use the value from the *Counter value for threshold* parameter as a minimum threshold. The script then raises events when the counter value falls below the threshold. The default is yes.
Name of counter to monitor	Specify the object\counter\instance name or click **Browse [...]** to select the object, counter, and instances to monitor. If typing the name, use the format `<object>\<counter>\<instance>`. You can enter multiple instances, separated by commas. For example: `Process\% Privileged Time\mapisp32,mqsvc` If an instance is a parent of multiple instances (for example, if you have a Logical Disk 0 with partitions C: and D:), enter the complete instance name exactly as displayed in Performance Monitor (for example "`0 ==> C:`"). For more information, see "Examples of Using This Script" on page 2174.
Counter 2 Settings	
Counter value for threshold	Specify the value for the threshold you want to observe. The default is 600.
Use counter value as maximum threshold?	Select **yes** to use the value from the *Counter value for threshold* parameter as a maximum threshold. The script then raises events when the counter value exceeds the threshold. Deselect the yes check box to use the value from the *Counter value for threshold* parameter as a minimum threshold. The script then raises events when the counter value falls below the threshold. The default is yes.

Parameter	How to Set It
Name of counter to monitor	Specify the object\counter\instance name or click **Browse [...]** to select the object, counter, and instances to monitor. If typing the name, use the format `<object>\<counter>\<instance>`. You can enter multiple instances, separated by commas. For example: `Process\% Privileged Time\mapisp32,mqsvc` If an instance is a parent of multiple instances (for example, if you have a Logical Disk 0 with partitions C: and D:), enter the complete instance name exactly as displayed in the Performance Monitor (for example "`0 ==> C:`"). See System Monitor for the exact spelling of counter names and details about what each counter represents.
Event severity when counter value exceeds or falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event if a counter value exceeds or falls below the threshold you set. The default is 8 (red event indicator).

37.8 EventLog

Use this Knowledge Script to monitor and filter information in Windows Event Logs. With this script, you can track Windows event log entries that match filtering criteria. This script works on an incremental basis; it does not fully rescan the event log each time it runs. This script returns all event log entries that match the filtering criteria in the event or data point detail message.

On computers where the Security log is updated frequently, such as domain controller computers, consider using the NetIQ Security Manager product to securely and quickly consolidate Security logs with low impact to the server. For more information, visit the NetIQ Web site at www.netiq.com/products/sm/default.asp.

NOTE:

- Only the most recent batch of events can be viewed in the data point detail message. For example, assume you set this script to scan all previous entries in the event log and list ten matching entries in each event detail message. When the job runs, 30 entries are found that match your filtering criteria. In this case, the job creates three child events for the interval, and each child event contains ten entries: the oldest matching entries in one child event batch, the second oldest in Batch 2, and the most recent in Batch 3. If this same job is collecting data and you view the data detail message for the interval, only the entries from the third child event (Batch 3) are displayed.
- When you use text or numeric strings in the *Event [...] filter* parameters, this script searches event logs and matches the text or numeric string to any part of the event entry. The results are not exact matches. For example, if your filter string is "foo," results will include "foobar," "foo," and "food."

37.8.1 Resource Objects

Windows computer or application server, such as Exchange Server or SQL Server

37.8.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

37.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the EventLog job fails. The default is 5.
Event Log Monitoring	

Parameter	How to Set It
Event logs to monitor	Provide a comma-separated list of the event logs you want to monitor. For example: `System,Application,Security` The default is `Application`. **NOTE:** If the event log you specify does not exist on the target computer, the Application log is automatically monitored.
Number of previous hours to scan logs	Set this parameter to control how the script scans the logs at the first interval, after which scanning begins where the previous scan ended. Enter one of the following values: • **-1** – to scan all the existing entries • *N* – to scan entries only for the past *n* hours (8 for the past 8 hours, 50 for the past 50 hours, for example) • **0** – to not scan previous entries; only search from this moment on. The default is 0.
Maximum number of entries per event report	Specify the maximum number of entries to be recorded in each event's detail message. If this script finds more entries from the log than can be put into one event message, it will return multiple events to report all the outstanding entries in the log. The default is 30 entries. If this script encounters one or more very large events in the Windows Event log, this script may error out and generate an event message "`Out of string space`." If this occurs, you can usually work around the problem by adjusting this parameter to a smaller value.
Event Log Filters	
Event Types	
Monitor error events?	Select **Yes** to monitor error event entries. The default is Yes.
Monitor warning events?	Select **Yes** to monitor warning event entries. The default is Yes.
Monitor information events?	Select **Yes** to monitor information event entries. The default is Yes.
Monitor success audits?	Select **Yes** to monitor success audit event entries. Success audits are successful security access attempts that are audited. The default is Yes.
Monitor failure audits?	Select **Yes** to monitor failure audit event entries. Failure audits are failed security access attempts that are audited. The default is Yes.
Monitor unclassified events?	Some events written to Windows event logs do not have event levels or severities set to event types recognized by Windows Server 2008 and later. This Knowledge Script identifies these entries as unclassified. These entries will not be found by the error, warning, information, success audit, or failure audit filter criteria. Select **Yes** to monitor log entries that are unclassified. The default is Yes.

Parameter	How to Set It
Event source filter	Use this parameter to filter for events generated by a particular source, which can be the name of a program, a system component, or a component of a large program. For example, SQLExecutive, SNMP, or the Service Control Manager. Provide a search string. This script will look for matching entries in the Event Log **Source** field. Separate multiple strings with commas. The search string can contain criteria to include entries, exclude entries, or both. Separate include and exclude criteria with a colon (:) using the following format: `include:exclude`. For example, to include all SQL sources and to exclude all SNMP sources, enter the following: `SQL:SNMP` If you specify only include criteria, the colon is not necessary.
Event category filter	Use this parameter to filter for events in a particular category, such as Server or Logon. Provide a search string. This script will look for matching entries in the Event Log **Category** field. Separate multiple strings with commas. The search string can contain criteria to include entries, exclude entries, or both. Separate include and exclude criteria with a colon (:) using the following format: `include:exclude`. For example, to include the Server category and to exclude the Logon category, enter the following: `Server:Logon` If you specify only include criteria, the colon is not necessary.

Event ID filter	Use this parameter to filter for particular event IDs.
	
	Provide a search string or ID range, for example 100-2000). This script will look for matching entries in the Event Log **Event** field. Separate multiple IDs and ranges with commas. For example:
	
	`1,2,10-15,202`
	
	The search string can contain criteria to include entries, exclude entries, or both. Separate include and exclude criteria with a colon (:) using the following format: `include:exclude`. For example, to include event IDs 10 through 15 and to exclude event ID 202, enter the following:
	
	`10-15:202`
	
	If you specify only include criteria, the colon is not necessary.

Event user filter	Use this parameter to filter for events associated with a particular user. Provide a search string, for example, `<domain name>\<user name>`. This script will look for matching entries in the Event Log **User** field. Separate multiple strings with commas. The search string can contain criteria to include entries, exclude entries, or both. Separate include and exclude criteria with a colon (:) using the following format: `include:exclude`. For example, to include events for user Joe and exclude events for user Sam, both of whom are in the `RALQE` domain, enter the following: `RALQE\Joe:RALQE\Sam` If you specify only include criteria, the colon is not necessary.

Parameter	How to Set It
Computer filter	Use this parameter to filter for events generated by a particular computer. Provide a search string. This script will look for matching entries in the Event Log **Computer** field. Separate multiple strings with commas. The search string can contain criteria to include entries, exclude entries, or both. Separate include and exclude criteria with a colon (:) using the following format: `include:exclude`. For example, to include all computers with `SFO` in the hostname and to exclude all computers with `RDU` in the hostname, enter the following: `*SFO*:*RDU*` If you specify only include criteria, the colon is not necessary.
Event description filter	Use this parameter to filter for events with a particular detail description or containing keywords in the description. Provide a search string. This script will look for matching entries in the Event Log **Description** field. Separate multiple strings with commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate include and exclude criteria with a colon (:) using the following format: `include:exclude`. For example, to include the keyword `error` and to exclude the keyword `RSVP`, enter the following: `error:RSVP` If you specify only include criteria, the colon is not necessary.
Event Notification	
Raise event if log entries matching criteria are found?	Select **Yes** to raise an event when log entries match your filtering criteria. The default is Yes.
Event severity when log entries match criteria	Set the event severity level, from 1 to 40, to indicate the importance of an event in which log entries match your search criteria. The default is 15 (red event indicator). **Tip** You can adjust the severity based on which log or type of event you are checking for.
Raise event if log cannot be accessed?	Select **Yes** to raise an event when the log file cannot be read or reached. The default is Yes.
Event severity when a log is inaccessible	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the log file cannot be read or reached.The default is 10.
Data Collection	
Collect data for log entries that match criteria?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns detail about log entries that match your filtering criteria. The default is unselected.
Separate data by log file type?	Select **Yes** to separate event entries from different log files into different datastreams. If unselected, all event entries matching your filtering criteria are placed in the same datastream and the data detail message may include event entries from multiple log sources. For example, if you are monitoring both the System and Application logs, you can enable this parameter so that events in the System log are tracked separately from events in the Application log. The default is unselected.

37.8.4 Examples of How this Script Is Used

You can customize this script in many ways based on your requirements. For example, for general system events, you can set the following options when detecting security failures:

Properties and Parameters	How You Might Set Them
Schedule interval	10 minutes
Raise event if log entries match criteria?	Yes
Log files to filter	Security
Monitor failure audits?	Yes
Event severity when event log entries match criteria	2
Action	MapiMail

With this scenario, on the Schedule tab in the Knowledge Script Properties dialog box, set the interval to **Run every 10 minutes** because you want a short window for checking for this type of problem.

On the Values tab, enable the *Raise event if log entries match criteria?* parameter, indicate you will monitor failure audits in the Security log, and set the event severity to 2, indicating this is a very serious event that should be highly visible. Leave the other filtering options blank.

On the Action tab, indicate that you want an email sent when an event is raised. With these settings, AppManager will regularly check for security failures and will notify you, or whoever you designate, through email if any security failure events are detected.

Another example of how to use this script to detect all problems with your SQL Server could involve setting up the script job like this:

Properties and Parameters	How You Might Set Them
Schedule interval	30 minutes
Raise event if log entries match criteria?	Yes
Log files to filter	Application
Monitor error events?	Yes
Event source filter	MSSQLServer
Event severity when event log entries match criteria	8
Action	MapiMail

Another way you can use this script is to collect data and graph a trend chart from your System event log:

Properties and Parameters	How You Might Set Them
Schedule interval	1 hour
Collect data for log entries that match criteria?	Yes
Log files to filter	System
All other filters	not set
Action	Null

If you choose to collect data, the script returns the number of matched entries as the primary data point to be graphed. The first batch of filtered results can be viewed in the detail data message when you double-click a data point. Additional matching entries may be included in the graph. The peaks and valleys in the graph indicate a large number of events or low event activity.

37.9 EventLogRX

Use this Knowledge Script to scan the Windows logs you specify for entries that match the criteria you specify. You can filter the event log entries by event type and by specifying a combination of include and exclude strings for each event field using regular expressions. This script raises an event if a log entry matches all the filter criteria you specify. All event log entries that match the filtering criteria are returned in the event detail message.

Use the *Filter the [...] field with the regular expression* parameters to control which fields to filter and the filtering criteria to use to find specific information, such as events associated with a specific user or computer name. With this script, you specify the filtering criteria for each field you are interested in using a regular expression or you can specify the name of a file that contains all your filtering criteria.

For more information, see "Creating Filters with Regular Expressions" on page 2161.

You can use the *Events in past N hours* parameter to determine the number of previously recorded event entries, if any, to scan for matches. For example, if you want to check whether any event entries recorded in the last two hours match your filtering criteria, you would set this parameter to 2. To scan the entire log for any previously reported events, set the *Events in past N hours* parameter to -1. After the Knowledge Script job completes its first iteration, only new entries written to the event log that match your criteria are reported. When the *Events in past N hours* parameter is set to 0, the script does not scan the log for any previously reported events.

37.9.1 Prerequisite

This script requires the Async managed object to be installed and the Microsoft EventLog service to be running on the computer you want to monitor.

37.9.2 Resource Objects

Windows computer or application server, such as Exchange Server or SQL Server

37.9.3 Default Schedule

The default interval for this script is **Every 10 minutes**.

37.9.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the EventLogRX job fails. The default is 5.
Event Log Monitoring	

Parameter	How to Set It
Log files to filter	Specify the event log you want to monitor. You can specify multiple event logs, separated by commas. For example: `System,Application,Security`. The default is `Application`. If you do not specify an event log, AppManager monitors all logs. **Notes** • If, in addition to these event logs, you specify a filter file in the *Full path to a file containing filtering criteria* parameter, AppManager ignores the *Filter the [...] field with the regular expression* parameters, but continues to scan the log file you specified. • If the event log you specify does not exist on the target computer, the Application log is automatically monitored.
Number of previous hours to scan logs	Set this parameter to control how the script scans the logs at the first interval, after which scanning begins where the previous scan ended. Enter one of the following values: • **-1** to scan all the existing entries • *N* to scan entries only for the past *n* hours (8 for the past 8 hours, 50 for the past 50 hours, for example) • **0** to not scan previous entries; only search from this moment on. The default is 0.
Enforce case-sensitive filters?	Select **Yes to** make all filter statements for this script case-sensitive. The default is unselected.
Maximum number of entries per event report	Specify the maximum number of entries to be recorded in each event's detail message. If this script finds more entries from the log than can be put into one event message, it will return multiple events to report all the outstanding entries in the log. The default is 30 entries. If this script encounters one or more very large events in the Windows Event log, this script may error out and generate an event message "`Out of string space`." If this occurs, you can usually work around the problem by adjusting this parameter to a smaller value.
Full path to a file containing filtering criteria	Type the full path to a file containing the filtering criteria you want to match if you want to specify matching expressions in an external file. For example: `C:\TEMP\MyFilters.txt`. **NOTE:** If you specify a filter file, AppManager ignores the *Filter the [...] field with the regular expression* parameters, but continues to scan the log file specified in the *Log files to filter (Application, Security, System)* parameter. However, if AppManager cannot process the filter file, the script raises an event (for example, `fail to process filter file C:\general.xml`) and continues to scan the log file using the filtering criteria you specified in the *Filter the [...] field with the regular expression* parameters.
Event Log Filters	

Parameter	How to Set It
Filter the [...] field with a regular expression	Use a regular expression to specify the criteria to look for in each event log field you want to monitor: • **Type**. To filter information based on the type of event (for example, Error, Warning, Information, Audit_Success, Audit_Failure), use a regular expression to identify the type of event entries to include. • **Source**. To filter the entries generated by a particular source (for example `SQLExecutive`, `SNMP`, or `Service Control Manager`), use a regular expression to identify the source of event entries to include. • **Category**. To filter information based on a particular category (for example Server or Logon), use a regular expression to identify the category of event entries to include. • **Event ID**. To filter information based on the event ID, use a regular expression to identify the event IDs to include. • **User**. To filter information based on the user name, use a regular expression to identify the user names to include. • **Computer**. To filter information based on the computer name, use a regular expression to identify the computers to include. • **Description**. To filter information based on the event description, use a regular expression to indicate the description to include. **NOTE:** If you specify a filter file in the *Full path to a file containing filtering criteria* parameter, AppManager ignores the *Filter the [...] field with the regular expression* parameters, but continues to scan the log file specified in the *Log files to filter (Application, Security, System)* parameter.
Event Notification	
Raise event if log entries matching criteria are found?	Select **Yes** raise an event when log entries match your filtering criteria. The default is Yes.
Event severity when log entries match criteria	Set the event severity level, from 1 to 40, to indicate the importance of an event in which log entries match your search criteria. The default is 15 (red event indicator). **Tip** You can adjust the severity based on which log or type of event you are checking for.
Raise event if log cannot be accessed?	Select **Yes** to raise an event when the log file cannot be read or reached. The default is Yes.
Event severity when a log is inaccessible	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the log file cannot be read or reached.The default is 10.
Data Collection	
Collect data for log entries that match criteria?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns detail about log entries that match your filtering criteria. The default is unselected.
Separate data by log file type?	Select **Yes** to separate event entries from different log files into different datastreams. If unselected, all event entries matching your filtering criteria are placed in the same datastream and the data detail message can include event entries from multiple log sources. The default is unselected. For example, if you are monitoring both the System and Application logs, you can enable this parameter to track events in the System log separately from events in the Application log.

37.9.5 Examples of How this Script Is Used

Using this script you can specify regular expressions for each event log field as Knowledge Script properties or maintain your search criteria independent of the script parameters in a separate filter file.

In many cases, specifying an external filter file provides greater flexibility and makes modifying your search criteria more straightforward because you can add almost any number of expressions and you do not need to modify the Knowledge Script properties to pick up your changes.

If you want to use a filter file:

- Identify the strings that you want to find a match for (that is, the entries you want to include in your results).
- Create a text file with one regular expression string per line to locate matching strings. Each line in the file consists of a parameter keyword followed by a colon (:), a tab or blank space, and the regular expression. Or the filter file can be written using XML.
- Make sure the file exists on the target computer.
- Type the absolute path to the file on the local computer in the *Full path to a file containing filtering criteria* parameter and start the job.

37.9.5.1 Formatting the Filter File

There are two valid formats for the filter file: a simple table format to define the strings to include and an XML format that allows you to define more complex include and exclude filtering. For both formats, the parameter name keywords are required, but the field values can be left blank if no filtering is needed.

Select a file format appropriate for the complexity of the filtering you need to do.

37.9.5.2 Table Format

The table format provides a simple way to create the filter file. Each filtering section in the file begins with `EventStart` and ends with `EventEnd`. If an entry in the event log matches all the criteria you have specified within a filtering section, it is considered a match and an AppManager event is raised. If you have more than one filtering section, an entry matching either section raises an event.

For example, the following table format provides two filter sections:

```
EventStart
CaseSensitive:n
Log:System
Type:Error|Warning|Information
Source:^SQL*
Category:*
EventID:1[0-9][0-9][0-9]
User:Sam|Joe|Chris
Computer:SFO*
Description:($Error.*)|(.*error.*occurred.$)
EventEnd
EventStart
CaseSensitive:n
Log:Application
Type:Error|Warning|Information
```

```
Source:^SQL*
Category:*
EventID:1[0-9][0-9][0-9]
User:Sam|Joe|Chris
Computer:SFO*
Description:($Error.*)|(.*error.*occurred.$)
EventEnd
```

NOTE: If you create only one filter section, you do not need to include the `EventStart` and `EventEnd` lines in the file. These lines are only required if you have more than one filtering section.

37.9.5.3 XML Format

The XML format is somewhat more sophisticated and more flexible than the table format. The XML format allows you to set both include and exclude filters using the `<Include>` and `<Exclude>` tags and to combine these filter sets to define the search criteria. Each filtering section in the file begins with the `<Events>` tag. A log entry must match all the criteria you specified within a filtering section for it to be considered a match.

For example:

```
<?xml version = "1.0" standalone = "yes"?>
<EventLogConfig Name = "Event Filter" Type = "EVENT_FILTER_CUSTOM" ID = "76">
<Include>
   <Events>
      <Log>Application</Log>
      <Type>INFORMATION|WARNING|ERROR</Type>
      <Source><Net*]></Source>
      <Category>*</Category>
      <EVENTID>2*</EVENTID>
      <User>*</User>
      <Computer>*</Computer>
      <Description><![CDATA[Event.]]></Description>
      <CaseSensitive>y</CaseSensitive>
   </Events>
   <Events>
      <Log>System</Log>
      <Type>Warning</Type>
      <Source>RSVP</Source>
      <Category>*</Category>
      <EVENTID>*</EVENTID>
      <User>*</User>
      <Computer>SHASTA</Computer>
      <Description>RSVP*</Description>
      <CaseSensitive>y</CaseSensitive>
   </Events>
</Include>
</EventLogConfig>
```

NOTE: If a field contains a regular expression that conflicts with XML syntax or includes special characters, you can use `![CDATA[regular_expression]]` to enclose the expression and prevent parsing problems.

37.10 MachineDown

Use this Knowledge Script to detect whether the computer on which you run the script can communicate with one or more specified Windows computers.

This script does **not** require the AppManager agent to be installed on the remote computers you want to monitor.

To run this script on a Windows Vista computer, the Remote Registry service on the agent computer must be running to connect to the Windows registry on the remote computers you want to monitor. If the Remote Registry Service is down when this script runs, an event is raised to indicate the remote computer was unresponsive and the connection to the Windows registry failed.

You can select computers by browsing the AppManager repository, specifying a list of computers using the *Computers to monitor* parameter, or naming a file that contains a list of computer names or addresses. Browse the AppManager repository to select the remote computers you want and prevent event information from appearing in AppManager while the computer is in maintenance mode.

If you specify a list of computers, instead of browsing the repository for the computers you want, this script displays event information in AppManager even if the remote computer is in maintenance mode.

When typing a list of Windows computers, you can specify computers that are not currently in the Navigation pane or the TreeView pane.

When you run this script on a computer, the script tries to communicate with each of the computers you specified in the *Computers to monitor* parameter.

This script attempts to communicate by:

- Checking name-to-IP-address resolution
- Executing an Internet Control Message Protocol (ICMP) ping
- Connecting to the Windows registry

This script raises an event if any of these attempts fail.

You can also instruct the script to ping specific router IP addresses before attempting to communicate with any of the specified computers. This provides an additional test of the network connection between the computer on which the script is running and the monitored computers. If this test is successful, it eliminates one reason for a lack of communication between computers.

This script does not monitor the computer where the script itself is running. For example, if you run this script on a server named SERVER01 and use the Select computers from the Repository parameter to select the server SERVER01 (either explicitly or as a member of a group or view), the script automatically excludes SERVER01 at run time because it does not make sense to monitor the local computer's availability. If the script is running, the computer must be available. If the script is not running, either the local computer is down or the script or agent has been stopped.

To monitor the local computer, create a second MachineDown job running on a different computer that monitors the local computer in question. In this case, you could have a server SERVER02 running the script and monitoring SERVER01 and server SERVER01 monitoring server SERVER02. If both jobs are collecting data, be careful that the two scripts are not monitoring the same computers, for example, SERVER01 and SERVER02 should not both monitor SERVERA. This would result in two datastreams collecting uptime information for the same server (SERVERA), which can cause the ComputerAvailability report to miscalculate the uptime for SERVERA.

In some cases, this script may not be able to communicate with one or more remote computers because AppManager does not have sufficient privileges to access those remote machines. To avoid this problem,

grant Admin privileges to the AppManager agent's user account or use the PingMachine Knowledge Script to check connectivity.

If you select target computers by browsing the AppManager repository, the logon account for the agent on which the job is running must have sufficient privileges to query the AppManager repository.

If you select to include computers from the AppManager repository by View or Server Group, AppManager automatically includes the new computers on the next iteration. If you select to include computers from the AppManager repository by Computer, AppManager only monitors the computers that were selected. However, if you delete a monitored computer from the AppManager repository, AppManager does not monitor that computer unless you add it back into the AppManager repository. AppManager also reads the server list file on every script iteration. If you remove a computer name from the server list file, starting with the next script iteration, AppManager no longer monitors the computer.

This script can check connections to computers that are across a firewall from the AppManager repository so long as the script is running on a computer on the same side of the firewall as the computers to which it is checking connections. Keep in mind, however, that under these circumstances you cannot select computers by browsing the AppManager repository unless the SQL Server communication ports are open in the firewall and the agent can query the AppManager repository. If you are using an agent across a firewall from the AppManager repository, you are advised to use the *Computers to monitor* or *Filename for computer list* parameter to specify computers.

If the computer that is down has been discovered and is displayed in the Navigation pane or the TreeView, that computer's icon blinks in the Navigation pane or the TreeView. If the computer that is down is not displayed, the computer where you ran the Knowledge Script blinks instead.

For computers running AppManager agents version .x and later where you want to use a monitoring policy, consider using the ConfigMachineDown and MachineDownLR Knowledge Scripts.

When configuring an action for this Knowledge Script, configure the Location to initiate the action on the MS (to run on the management server) or on a Proxy (to run on a particular managed client).

If you instead configure an action to run on the managed client (MC), when a remotely monitored computer is placed into machine maintenance mode (from AppManager) or scheduled maintenance mode (using the AMAdmin_SchedMaint Knowledge Script), any event conditions detected on the remote computer are ignored, but the action is not disabled. In this case, an action runs, but no event information appears on the **Events** tab.

Use the ReportAM_GeneralMachineDown Knowledge Script to generate a report about computers that were detected as down during a specified period.

If you are using the Web Console, the *Select computers from the repository* parameter is not supported. Instead, use the *Computers to monitor* parameter to specify the computers you want to monitor.

37.10.1 Using this Script to Monitor a Subnet

Run this script on a computer in the same subnet as the management server. When completing the *Computers to monitor* parameter, specify a limited number of computers that represent different subnets in your network.

You can then run additional MachineDown jobs on each of the computers specified in the first job to monitor the computers in each of their own subnets. This gives you coverage without stressing network bandwidth. It also ensures that, if a router or subnet is down, you receive only one event for the server being monitored from the agent on the management server's subnet. The other servers in that subnet will not post duplicate "Computer Down" events.

As an example, assume:

- The AppManager management server is installed on the computer TARZAN in subnet 1. Other servers in subnet 1 include TITO and BLUE.
- Subnet 2 includes the servers PAOLO, BONN, and KENO.
- Subnet 3 includes the servers TRISTE, VOILA, and TONTO.

You create a Knowledge Script job that runs on TITO (subnet 1, same as the management server) and set the *Computers to monitor* parameter to PAOLO (subnet 2) and TRISTE (subnet 3).

You then create a job (J-2) on PAOLO with the *Machine list* parameter set to BONN and KENO, and a job (J-3) on TRISTE with the Machine List set to VOILA and TONTO. Also create a job that runs on the management server (for example, TARZAN) that does a reciprocal check with the server in its own subnet (for example, TITO) in its *Computers to monitor* parameter.

TIP: If you want this Knowledge Script to raise an action when a connection is down, enable the *Managed Client Action* parameter in the Knowledge Script Properties dialog box for the job that monitors your subnets.

37.10.2 Resource Objects

Windows 2000 Server or later

37.10.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

Be sure to schedule this job so that you allow enough time for the job to complete during the interval. As a general guideline, allow 20 to 30 seconds for each computer being monitored. This allows enough time for the connection to the registry on each computer.

You can use the following formula to calculate how many minutes are required for the job to complete:

```
(number of computers x 30 seconds)/60 = minutes for job to complete
```

For example:

```
(10 computers x 30 seconds)/60 = 5 minutes
```

37.10.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if a computer is down?	Select **Yes** to raise an event if a connection cannot be established to the target computer. The default is Yes. **NOTE:** For AppManager agents version 6.x and later, events raised for computers in maintenance mode are suppressed.

Parameter	How to Set It
Require Windows Registry connection?	Select **Yes** to require the script to attempt a connection to the registry after it has attempted an ICMP ping. The default is Yes. This test is recommended because Windows can respond to ICMP ping requests even though the computer is in a blue screen state. A connection to the registry is further validation that the target computer is up. If you are using this script to check the status of UNIX machines, you must disable this option. **NOTE:** The account under which the AppManager agent is running must have sufficient privileges to connect to the registry.
Event severity when computer is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a connection cannot be established to the target computer. The default is 5 (red event indicator).
Raise single event for all computers that are down?	Select **Yes** to raise only one event regardless of the number of computers that are down. The default is unselected. If you choose to raise only a single event, the information about specific computers is contained in the event detail message. The same rules for the suppression of events that apply to the *Raise event if a computer is down* parameter also apply here.
Raise event if specified router is down?	Select **Yes** to raise an event if a router specified in the *Router IP addresses* parameter is down. The default is Yes.
Event severity when router is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a specified router is down. The default is 5 (red event indicator).
Raise event if default gateway is down?	Select **Yes** to raise an event when the default gateway is down. The default is Yes. If the default gateway is down, the script might not be able to connect to any of the computers you identified, and false events can be raised,
Event severity when default gateway is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the default gateway is down. The default is 5 (red event indicator).
Raise event if the computer list file is missing?	Select **Yes** to raise an event if the file containing the list of monitored computers cannot be found. The default is Yes.
Event severity when computer list file is missing	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the list of monitored computers cannot be found. The default is 15 (yellow event indicator).
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the MachineDown job fails. The default is 5 (red event indicator).
Data Collection	
Collect data for each monitored server?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the availability, or status, of a specific computer you are monitoring. The default is unselected.
Collect single data point for number of servers down?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of unavailable, or down, computers for the monitored machines. The default is unselected.

Parameter	How to Set It
Collect data for default gateway availability?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the availability, or status, of the default gateway of the computer that is running the job. The default is unselected.
Collect data for router availability?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the availability, or status, of one or more routers that you configured in the *Router IP addresses* parameter. By default, data is not collected.
Monitoring	
Select computers from the repository	Click **Browse [...]** to search the AppManager repository for the computers you want to monitor. You can select computers by view (for example, Master or NT), by server group, or individually. You can use this parameter as the sole selection method, or you can use it in conjunction with the *Computers to monitor* and *Filename for computer list* parameters. **NOTE:** Once you specify a list of computers with this parameter, the script always monitors a list of computers generated by this parameter. You can modify the list, but you cannot delete it. If you want to subsequently specify monitored computers without using this parameter, you need to run a new monitoring job with this script and leave this parameter blank.
Computers to monitor (separate with comma, no space)	Specify a list of computers to monitor. Separate multiple names with commas and no spaces. For example, to check whether the Sales1 server can communicate with the computers `JOE`, `SAM`, and `PAT`, run this script on the `Sales1` computer and enter `JOE,SAM,PAT` in this field. You can use this parameter as the sole selection method, or you can use it in conjunction with the *Select computers from the repository* and *Filename for computer list* parameters.

Filename for computer list	Specify the path to the file that contains a list of computers you want to monitor, or click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	The file should contain the hostname or IP address for each computer in one or more lines. Each line can have multiple computer names, separated by commas and with no spaces.
	
	For example:
	
	`NYC01,NYC02`
	`SALES01,10.15.221.5,SFO01`
	`LABMACH,QATEST`
	
	You can use this parameter as the sole selection method, or you can use it in conjunction with the *Select computers from the repository and Computers to monitor* parameters.

Router IP addresses (separate with comma, no space)	Specify the IP addresses of the routers through which the computer running the script should communicate with the target computers. **NOTE:** If one of the listed routers is down, none of the target computers will be monitored.

Parameter	How to Set It
Number of seconds to wait for ping response	Set the maximum number of seconds to wait for a response from a target computer. The default is 3 seconds.

37.11 MachineDownLR

Use this Knowledge Script to detect whether the computer on which you run the script can communicate with one or more remote Windows computers. This script requires that you first use the ConfigMachineDown Knowledge Script to store a list of remote computers in the local repository on the managed client computer where this script runs.

This script does **not** require the AppManager agent to be installed on the remote computers you want to monitor.

To run this script on a Windows Vista computer, the Remote Registry service on the agent computer must be running to connect to the Windows registry on the remote computers you want to monitor. If the Remote Registry Service is down when this script runs, an event is raised to indicate the remote computer was unresponsive and the connection to the Windows registry failed.

Once you have run ConfigMachineDown on each computer in a group, you can use MachineDownLR in a monitoring policy for the group. On each computer, the script knows what to monitor because ConfigMachineDown previously stored that information in the local repository. The use of MachineDownLR is the same as for MachineDown.

Note that this script displays event information in AppManager even if the remote computer is in maintenance mode.

37.11.1 Example of How this Script Is Used

If you want each computer in your environment to be able to check whether other selected computers are down, run ConfigMachineDown on each computer and specify the particular machine list you want that computer to monitor.

You can then put the MachineDownLR jobs in a monitoring policy that covers all those computers. As the job runs on each computer, it picks up the machine list from the local repository where ConfigMachineDown set it.

In this way, each instance of MachineDownLR can check a different list of computers from each computer where it runs.

37.11.2 Resource Objects

Windows 2000 Server or later

37.11.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

37.11.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Collect data for computer availability?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following: • **100** – target computer is up, • **0** – the target computer is down, or • **50** – communication failed (for example, because a computer's IP address is not found). The default is n.
Event severity when computer is down	Set the severity level, from 1 to 40, to indicate the importance of an event in which the target computer is down. The default is 5 (red event indicator).
Ping router?	Set to **y** to routinely ping the default gateway router. If enabled and the ping fails, the script stops and raises an event. The default is n. When this script runs, it first pings the default gateway router if the Ping Router parameter is enabled. If the ping fails, an event is raised. If the ping is successful or if no ping is requested, this script checks the registry of the destination computer. If that check fails, an event is raised. It also traces the route to the destination if the Trace the route parameter is enabled. If the registry check succeeds, communication with that computer is verified.
Number of seconds to wait for ping response	Specify the maximum number of seconds to wait for the ping to return a positive result. If the *Ping router* parameter is set to n, this threshold parameter is ignored. The default is 3 seconds.
Trace the route to a destination computer	Set to **y** to trace the route to a computer that is down. A traceroute can help you determine where the problem lies. The default is n.
Raise single event for all computers that are down?	Set to **y** to raise a single event regardless of the number of computers that are down. Set to **n** to raise a separate event for each computer that is down. The default is n.

37.12 MissingEvent

Use this Knowledge Script to determine whether a Windows event log does not contain an expected entry. This script raises an event if the Application, Security, or System event log does not contain an entry that matches your filtering criteria. You can use regular expressions or text/numeric strings to specify filtering criteria.

For more information, see "Creating Filters with Regular Expressions" on page 2161.

For example, the SQL backup process normally adds an entry to the event log to indicate databases were successfully backed up. This script can search for log entries that match your filtering criteria and raise an event if the event log does *not* contain an entry for a successful SQL backup.

To determine whether a Windows event log *does* contain an entry matching your filtering criteria, use the EventLog Knowledge Script.

NOTE: If you use text/numeric strings in the *Event [...] filter* parameters, this script searches event logs and matches the filter string to any part of the event entry. The results are not exact matches. For example, if your filter string is "foo," results will include "foobar," "foo," and "food."

Results for regular expression filters are exact matches.

37.12.1 Resource Objects

Windows computer or application server, such as Exchange Server or SQL Server

37.12.2 Default Schedule

By default, this script runs every hour.

37.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MissingEvent job fails. The default is 25.
Event Log Monitoring	
Event logs to monitor	Indicate the name of the event log you want to monitor, separating multiple names with a comma. For example: `System,Application,Security` The default is `Application`. **NOTE:** If the event log you specify does not exist on the target computer, the Application log is automatically monitored.

Parameter	How to Set It
Number of hours to scan logs	Set this parameter to control how the script scans the logs in the first interval, after which scanning begins where the previous scan ended. Enter one of the following values: • **-1** – to scan all the existing entries • *N* – to scan entries only for the past *n* hours (8 for the past 8 hours, 50 for the past 50 hours, for example) • **0** – to not scan previous entries; only search from this moment on The default is 0.
Maximum number of entries per event	Specify the maximum number of entries to be recorded in each event detail message. If this script finds that more entries are missing from the log than can be put into one event message, it will return multiple events to report all the outstanding entries in the log. The default is 10 entries.
Event Log Filters	
Use regular expressions for filter criteria?	Select **Yes** to use a regular expression to specify the criteria to look for in each event log you want to monitor. The default is unselected. You can use regular expressions in the *Event [...] filter* parameters, or you can create an external `.txt` file that contains the regular expressions you want to use as filtering criteria.
Enforce case sensitivity in regular expressions?	Select **Yes** to enforce case-sensitivity in all regular expressions used in the filter parameters or in the external `.txt` file. The default is unselected.
Event type for regular expression filtering	Use a regular expression to identify the type of event entries to search for in the logs: Error, Warning, Information, Audit_Success, Audit_Failure, Unclassified.
Path to file containing regular expression filters	Provide the full path to a file containing the regular expression filtering criteria you want to find in each monitored event log. For example: `C:\TEMP\MyFilters.txt`. Format the contents of the `.txt` file as described in "Using an External Filter File" on page 2201. **NOTE:** If you specify a filter file, AppManager ignores the *Event [...] filter* parameters, even if the filter file is inaccessible for any reason, but continues to scan the log file specified in the *Event logs to monitor* parameter.
Event Types	
Error	Select **Yes** to search for log entries with an event type of Error. The default is Yes.
Warning	Select **Yes** to search for log entries with an event type of Warning. The default is Yes.
Informational	Select **Yes** to search for log entries with an event type of Informational. The default is Yes.
Success Audit	Select **Yes** to search for log entries with an event type of Success Audit. A Success Audit event is an audited security access attempt that succeeds. The default is Yes.
Failure Audit	Select **Yes** to search for log entries with an event type of Failure Audit. A Failure Audit event is an audited security access attempt that fails.The default is Yes.

Parameter	How to Set It
Unclassified	Some events written to Windows event logs do not have event levels or severities set to event types recognized by Windows Server 2008 and later. This Knowledge Script identifies these entries as unclassified. These entries will not be found by the error, warning, informational, success audit, or failure audit filter criteria. Set to **Yes** to monitor log entries that are unclassified. The default is Yes.
Event source filter	To search for log entries generated by a particular source (such as SQLExecutive, SNMP, or the Service Control Manager), enter a search string or a regular expression. This script will look for matching entries in the event log's Source field. Separate multiple strings with commas.
Event category filter	To search for log entries in a particular category (such as Server or Logon), enter a search string or regular expression. This script will look for matching entries in the event log's Category field. Separate multiple strings with commas.
Event ID filter	To search for log entries with particular event IDs, enter a search string, regular expression, or ID range (for example 100-2000). This script will look for matching entries in the event log's Event field. Separate multiple IDs and ranges with commas. For example: `1,2,10-15,202`.
Event user filter	To search for log entries associated with a particular user, enter a regular expression or search string, for example, `<domainname>\<username>`. This script will look for matching entries in the Event log's User field. Separate multiple strings with commas.
Event computer filter	To search for log entries generated by a particular computer, enter a search string or regular expression. This script will look for matching entries in the event log's Computer field. Separate multiple strings with commas.
Event description filter	To search for log entries with a particular detail description or containing keywords in the description, enter a search string or regular expression. This script will look for matching entries in the event log's Description field. Separate multiple strings with commas.
Event Notification	
Raise event if entries are missing from event logs?	Select **Yes** to raise an event if the selected event logs *do not* contain entries matching your filtering criteria. The default is Yes.
Event severity when entries are missing from event logs	Set the severity level, from 1 to 40, to indicate the importance of an event in which the selected logs do not contain entries matching your filtering criteria. The default is 5.
Data Collection	
Collect data for missing log entries?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of log entries found that match the filtering criteria. If no entries match the criteria, data collection returns 0 (zero). The default is unselected.

Parameter	How to Set It
Separate data by log file type	Select **Yes** to separate event entries from different log files into different datastreams. If disabled, all event entries matching your filtering criteria are placed in the same datastream and the data detail message may include event entries from multiple log sources. For example, if you are monitoring both the System and Application logs, you can enable this parameter so that events in the System log are tracked separately from events in the Application log. The default is Yes.

37.12.4 Using an External Filter File

With the MissingEvent script, you can specify regular expressions for each *Event [...] filter* parameter or maintain your search criteria independent of the Knowledge Script parameters in a separate filter file.

In many cases, specifying an external filter file provides greater flexibility and makes modifying your search criteria more straightforward because you can add almost any number of expressions and you do not need to modify the Knowledge Script properties to pick up your changes.

NOTE: If you specify a filter file, AppManager ignores the *Event [...] filter* parameters, even if the filter file is inaccessible for any reason.

If you want to use a filter file:

- Identify the strings that you want to find a match for, that is, the entries you want to include in your results.
- Create a text file with one regular expression string per line to locate matching strings. Each line in the file consists of a parameter keyword followed by a colon (:), a tab or blank space, and the regular expression. Or the filter file can be written using XML.
- Make sure the file exists on the target computer.
- Type the absolute path to the file on the local computer in the *Path to file containing regular expression filters* parameter and start the job.

Two formats are valid for the filter file: a simple table format to define the strings to include and an XML format that allows you to define more complex include and exclude filtering. For both formats, the parameter name keywords are required, but the field values can be left blank if no filtering is needed.

Select a format appropriate for the complexity of your filtering needs.

37.12.4.1 Table Format

The table format provides a simple way to create the filter file. Each filtering section in the file begins with `EventStart` and ends with `EventEnd`. If an entry in the event log matches all the criteria you have specified within a filtering section, it is considered a match; no AppManager event is raised. If you have more than one filtering section, a log entry can match either section. Remember, for the MissingEvent Knowledge Scripts, events are raised only when no log entry matches your criteria.

For example, the following table format file provides two filter sections:

```
EventStart
CaseSensitive:n
Log:System
Type:Error|Warning|Information
Source:^SQL*
Category:*
EventID:1[0-9][0-9][0-9]
User:Sam|Joe|Chris
Computer:SFO*
Description:($Error.*)|(.*error.*occurred.$)
EventEnd
EventStart
CaseSensitive:n
Log:Application
Type:Error|Warning|Information
Source:^SQL*
Category:*
EventID:1[0-9][0-9][0-9]
User:Sam|Joe|Chris
Computer:SFO*
Description:($Error.*)|(.*error.*occurred.$)
EventEnd
```

NOTE: If you are only specifying one filter section, do not include the `EventStart` and `EventEnd` lines in the file.

37.12.4.2 XML Format

The XML format is more sophisticated and more flexible than the table format. The XML format allows you to set both include and exclude filters using the `<Include>` and `<Exclude>` tags and to combine these filter sets to define the search criteria. Each filtering section in the file begins with the `<Events>` tag. A log entry must match all the criteria you specified within a filtering section for it to be considered a match.

For example:

```
<?xml version = "1.0" standalone = "yes"?>
<EventLogConfig Name = "Event Filter" Type = "EVENT_FILTER_CUSTOM" ID = "76">
<Include>
   <Events>
      <Log>Application</Log>
      <Type>INFORMATION|WARNING|ERROR</Type>
      <Source><Net*]></Source>
      <Category>*</Category>
      <EVENTID>2*</EVENTID>
      <User>*</User>
      <Computer>*</Computer>
      <Description><![CDATA[Event.]]></Description>
      <CaseSensitive>y</CaseSensitive>
   </Events>
   <Events>
      <Log>System</Log>
      <Type>Warning</Type>
      <Source>RSVP</Source>
```

```
      <Category>*</Category>
      <EVENTID>*</EVENTID>
      <User>*</User>
      <Computer>SHASTA</Computer>
      <Description>RSVP*</Description>
      <CaseSensitive>y</CaseSensitive>
   </Events>
</Include>
</EventLogConfig>
```

NOTE: If a field contains a regular expression that conflicts with XML syntax or includes special characters, you can use `![CDATA[regular_expression]]` to enclose the expression and prevent parsing problems.

37.13 PingMachine

Use this Knowledge Script to check the availability of computers or other machines that reply to ICMP Echo requests. With this script, you can use your managed client Windows computer to check the up/down status of UNIX computers, other Windows computers, and other equipment, such as TCP/IP-based printers. The ICMP Echo request is commonly used by the ping command on UNIX and Windows computers.

This script automatically raises an event if a computer does not respond to the ping command from the computer where this script is running. Note that this script returns event information even if the remote computer is in maintenance mode. In addition, you can choose to raise an event if the ping attempt fails for any other reason.

When configuring an action for this script, configure the Location to initiate the action on the MS (management server) or on a Proxy (to run on a particular managed client computer).

If you configure an action to run on the managed client (MC), when a remotely monitored computer is placed into machine maintenance mode or scheduled maintenance mode, any event conditions detected on the remote computer are ignored but the action is not disabled; in this case, an action is run but there will be no event information on the **Events** tab.

NOTE: This script does not require the AppManager agent to be installed on the remote computers you want to monitor.

37.13.1 Resource Objects

Any Windows server that recognizes the ping command

37.13.2 Default Schedule

The default interval for this script is **Run once**.

37.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
List of computers to check	Specify a list of the computer names or hostnames, separated by commas, to which you want to test communication. For example, to check connectivity to the NetIQ Corporation Web site, type: `www.netiq.com`. You can specify computers that are not currently in the Navigation pane or the TreeView pane.

Full path to file with list of computers	Provide the full path to the file containing a list of the computers to check. The file should contain the hostname or IP address for each computer in one or more lines. Each line can have multiple computer names, separated by commas and with no spaces. Do not include tabs or any other characters other than commas or computer names in this file.
	For example:
	`NYC01,NYC02`
	`SALES01,10.15.221.5,SFO01`
	`LABMACH,QATEST`

Parameter	How to Set It
Number of seconds to wait for ping response	Specify the maximum number of seconds to wait for a response before timing out. The default is 3 seconds.
Number of echo requests to send	Specify the maximum number of times to send the ping request before raising an event. The default is 2 times.
Threshold - Maximum number of consecutive timeouts	Specify the maximum number of consecutive timeouts to allow before raising an event. The default is 1 timeout.
Raise event for any errors during ping?	Select **Yes** to raise an event if an error other than timing out occurs during the ping attempt. The default is Yes.
Event severity for ping errors	Set the event severity level, from 1 to 40, to indicate the importance of an event in which an error other than timing out occurs during the ping attempt. The default is 5 (red event indicator).
Data Collection	
Collect data for computer availability?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns: • **100** – the target computer responded to the ping • **0** – the target computer did not respond • **50** – either the ping failed or the ping returned no output to the results file The default is y.
Collect data for response time?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the average response time for the computers to which a ping request has been sent. If a computer is unavailable or a ping error occurs, response time data collection returns 0. Ping response times of less than 1 ms are returned as 1 ms.

37.14 Report_MachineAvailability

Use this Knowledge Script to generate a report about the availability of computers. This report uses data collected by the MachineDown Knowledge Script, which tests the connection from a single computer to one or more other computers.

37.14.1 Resource Object

Report agent

37.14.2 Default Schedule

The default schedule for this script is **Run once**.

37.14.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Data source	
Select computers	Select the computers whose data you want to include in your report.
Select time range	Set a specific or sliding time range for data included in your report. The default is a sliding time of 1 day.
Select peak weekdays	Select the days of the week to include in your report. The default is seven days: Sunday through Saturday
Data settings	
Hours or percentage on chart	Select whether to illustrate availability by hours or by percentage. The default is Percentage.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted. This is the default option. • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Enter a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, the data table shows only the top or bottom N or % (for example, only the top 10%). Otherwise, the table shows all data. The default is yes.
Report settings	

Parameter	How to Set It
Include parameter help card?	Select **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Select an option to include datastream values in the report: • **Table: Select this option to include a table of datastream values in the report.** • **Chart:** Select this option to include a chart of datastream values in the report. • **Both:** Select this option to include both table and chart of datastream values in the report.
Select chart style	Define the graphic properties of the charts in your report. The default chart style is Pie.
Select output folder	Set parameters for the output folder. The default folder name is General_MachineAvailability.
Add job ID to output folder name?	Select **yes** to add the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set report properties. The default report name is General Machine Availability.
Add time stamp to title?	Select **yes** to add a time stamp to the title of the report, making each title unique. The time stamp shows the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Select **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the generated report contains no data. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

37.15 Report_PingMachine

Use this Knowledge Script to generate a report about the availability of computers or other machines that reply to ICMP Echo requests. This report uses data collected by the PingMachine Knowledge Script.

37.15.1 Resource Object

Report agent

37.15.2 Default Schedule

The default schedule for this script is **Run once**.

37.15.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select time range	Set a specific or sliding time range for data included in your report. The default is 1 day sliding time ending in 24 hours.
Select peak weekday(s)	Select the days of the week to include in your report. The default is seven days: Sunday through Saturday.
Data settings	
Hours or percentage on chart	Select whether to illustrate availability by hours or by percentage. The default is Percentage.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default) The default is No Sort.
Percentage/count for top/bottom	Specify a value for the percentage or count defined in the *Select sorting/display option* parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or % (for example, only the top 10%). Otherwise, the table shows all data. The default is yes.
Report settings	
Include parameter help card?	Select **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.

Parameter	How to Set It
Include table/chart/both?	Select an option to include datastream values in the report: • **Table: Select this option to include a table of datastream values in the report.** • **Chart:** Select this option to include a chart of datastream values in the report. • **Both:** Select this option to include both table and chart of datastream values in the report.
Select chart style	Define the graphic properties of the charts in your report. The default chart style is Pie.
Select output folder	Set parameters for the output folder. The default folder prefix is General_PingMachine.
Add job ID to output folder name?	Select **yes** to add the job ID to the name of the output folder. By default, the job ID is not included. A job ID helps you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Set report properties. The default title for your report is General Ping Machine Availability.
Add time stamp to title?	Select **yes** to add a time stamp to the title of the report, making each title unique. The time stamp shows the date and time the report was generated. The default is no. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Select **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the generated report contains no data. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

37.16 Report_ServiceChange

Use this Knowledge Script to generate a report about changes to the status and start-type of discovered services. This report uses data collected by the ServiceChange Knowledge Script.

37.16.1 Resource Object

Report agent

37.16.2 Default Schedule

The default schedule for this script is **Run once**.

37.16.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select time range	Set a specific or sliding time range for data included in your report. The default is 1 day sliding time ending in 24 hours.
Select peak weekday(s)	Select the days of the week to include in your report. The default is seven days: Sunday through Saturday.
Data settings	
Hours or percentage on chart	Select whether to illustrate availability by hours or by percentage. The default is Percentage.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default) The default is No Sort.
Percentage/count for top/bottom	Specify a value for the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, the data table shows only the top or bottom N or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Report settings	

Parameter	How to Set It
Include parameter help card?	Select **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Select an option to include datastream values in the report: • **Table: Select this option to include a table of datastream values in the report.** • **Chart:** Select this option to include a chart of datastream values in the report. • **Both:** Select this option to include both table and chart of datastream values in the report. The default is Table.
Select chart style	Define the graphic properties of the charts in your report. The default chart style is Pie.
Select output folder	Set parameters for the output folder. The default report prefix is General_ServiceChange.
Add job ID to output folder name?	Select **yes** to add the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set report properties. The default report title is General Service Change.
Add time stamp to title?	Select **yes** to add a time stamp to the title of the report, making each title unique. The time stamp shows the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Select **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the generated report contains no data. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

37.17 Report_ServiceDown

Use this Knowledge Script to generate a report about the up/down status of discovered services. This report uses data collected by the ServiceDown Knowledge Script.

37.17.1 Resource Object

Report agent

37.17.2 Default Schedule

The default schedule for this script is **Run Once**.

37.17.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select time range	Set a specific or sliding time range for data included in your report. The default is 1 day sliding time ending in 24 hours.
Select peak weekday(s)	Select the days of the week to include in your report. The default is seven days: Sunday through Saturday.
Data settings	
Hours or percentage on chart	Select whether to illustrate availability by **Hours** or by **Percentage**. The default is Percentage.
Select sorting/display option	Select whether data is sorted, and the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Enter a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, the data table shows only the top or bottom N or % (for example, only the top 10%). If set to no, the table shows all data. The default is yes.
Report settings	
Include parameter help card?	Select **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.

Parameter	How to Set It
Include table/chart/both?	Select an option to include datastream values in the report: • **Table: Select this option to include a table of datastream values in the report.** • **Chart:** Select this option to include a chart of datastream values in the report. • **Both:** Select this option to include both table and chart of datastream values in the report.
Select chart style	Define the graphic properties of the charts in your report. The default chart style is Pie.
Select output folder	Set parameters for the output folder. The default report prefix is General_ServiceDown.
Add job ID to output folder name?	Select **yes** to add the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set report properties. The default report title is General Service Down.
Add time stamp to title?	Select **yes** to add a time stamp to the title of the report, making each title unique. The time stamp shows the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Select **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the generated report contains no data. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

37.18 Report_ServiceHung

Use this Knowledge Script to generate a report about discovered services in the Start-Pending, Stop-Pending, Continue-Pending, or Pause-Pending state. If a service is detected in one of these states for a specified number of intervals, it is considered hung. The number of intervals is specified in the Knowledge Script that collects data for this report.

This report uses data collected by the ServiceHung Knowledge Script.

37.18.1 Resource Object

Report agent

37.18.2 Default Schedule

The default schedule for this script is **Run Once**.

37.18.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Data source	
Select computer(s)	Select the computers whose data you want to include in your report.
Select time range	Set a specific or sliding time range for data included in your report. The default is a sliding time of 1 day.
Select peak weekday(s)	Select the days of the week to include in your report. The default is seven days: Sunday through Saturday.
Data settings	
Hours or percentage on chart	Select whether to illustrate availability by **Hours or** by **Percentage**. The default is Percentage.
Select sorting/display option	Select whether data is sorted, and the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Enter a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, the data table shows only the top or bottom N or % (for example, only the top 10%). If set to no, the table shows all data. The default is yes.

Parameter	How to Set It
Report settings	
Include parameter help card?	Select **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table/chart/both?	Select an option to include datastream values in the report: • **Table: Select this option to include a table of datastream values in the report.** • **Chart:** Select this option to include a chart of datastream values in the report. • **Both:** Select this option to include both table and chart of datastream values in the report.
Select chart style	Define the graphic properties of the charts in your report. The default chart style is Pie.
Select output folder	Set parameters for the output folder. The default report prefix is General_ServiceHung.
Add job ID to output folder name?	Select **yes** to add the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set report properties. The default report title is General Service Hung.
Add time stamp to title?	Select **yes** to add a time stamp to the title of the report, making each title unique. The time stamp shows the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Select **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the generated report contains no data. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

37.19 ServiceChange

Use this Knowledge Script to detect any changes to the status and start type of a discovered service. You can run this script for almost any service, including SQL Services, Exchange Services, and IIS Services. This script raises an event if the status (running, stopped, pending, and so on) or startup type (manual, automatic, disabled) of any service has been changed.

37.19.1 Resource Objects

Windows computer or Windows application service

37.19.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

37.19.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Collect data for service changes?	Set to **y** to collect data for charts and reports. If enabled, data collection returns one of the following: • **100** – the service is unchanged • **0** – the service is not running or has been changed. The default is n.
Event severity when service start type changes	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service's start type has changed. The default is 10 (red event indicator).
Event severity when service status changes	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service's status has changed. The default is 5 (red event indicator).
Event severity when information retrieval fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script failed to retrieve service information. The default is 18 (yellow event indicator).

37.20 ServiceDown

Use this Knowledge Script to detect whether a discovered service is running. You can run this script for most services, including SQL Server services, Exchange Server services, and IIS services. Use the NT_ServiceDown Knowledge Script to check other services, such as `WinLogon` or `NetIQms`, which are not included in the Navigation pane or the TreeView.

This script raises an event if any monitored service is not running and can automatically restart the down service.

37.20.1 Resource Objects

Windows computer or Windows application service

37.20.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

37.20.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if service is stopped?	Select **Yes** to raise an event if the status of a monitored service is "stopped." The default is Yes.
Event severity when service is stopped	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a monitored service is "stopped." The default is 18 (yellow event indicator).
Event severity when service cannot be started	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this script is unable to start a stopped service. The default is 5 (red event indicator).
Raise event if service is started?	Select **Yes** to raise an event if this script successfully starts a stopped service. The default is unselected.
Event severity when service is started	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this script successfully starts a stopped service. The default is 25 (blue event indicator).
Raise event if service is missing?	Select **Yes** to raise an event if a service that was found during a previous discover cannot be found. The default is unselected.
Event severity when service is missing	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a discovered service is missing. The default is 8 (red event indicator).
Raise event if service is disabled?	Select **Yes** to raise an event if a service is stopped and is disabled. The default is unselected.

Parameter	How to Set It
Event severity if service is disabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is stopped and is disabled. The default is 12 (yellow event indicator).
Raise event if service is shut down normally?	Select **Yes** to raise an event if a service was stopped as a result of a stop request, such as a stop request issued by a user or as a result of another service being stopped. The default is Yes. This parameter takes effect only when the *Only restart service if shut down normally?* parameter is disabled.
Event severity when service shut down normally	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service was stopped as a result of a stop request. The default is 30 (blue event indicator).
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the ServiceDown job fails. The default is 5 (red event indicator). An event is raised for circumstances under which the script fails to run properly.
Data Collection	
Collect data for service status?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns one datastream for each service you are monitoring, and, for each monitored service, one datastream covering all dependent services. For monitored services, the data detail message includes the service name, the start type, and the status. If a monitored service is up, a value of 100 is returned. If the service is down, a value of 0 is returned. If the service is down and the Knowledge Script successfully restarts the service, a value of 50 is returned. For services depending on the monitored service, the data detail message includes service names, and the start type and status of each service. If all dependent services are up, a value of 100 is returned; if any dependent service is down, a value of 0 is returned. The default is unselected.
Monitoring	
Start stopped services?	Select **Yes** to start a service that is not running. The default is Yes.
Number of seconds to wait for service start	Specify the number of seconds this script should attempt to start a service before timing out. The default is 30 seconds. **NOTE:** If the service fails to start within the timeout period, an event is raised if the *Raise event if service is down?* parameter is set to Yes. The severity of the event is determined by the *Event severity when service cannot be started* parameter.
Start dependent services?	Select **Yes** to start any service that depends on other services started by this script. For example, if this script starts the `MSSQLSERVER` service, it will also start the dependent `SQLSERVERAGENT` service. The default is Yes.
Restart service if shut down normally?	Select **Yes** to restart a service that was stopped as a result of a stop request, such as a stop request issued by a user or as a result of another service being stopped. The default is Yes.

37.21 ServiceHung

Use this Knowledge Script to detect whether a discovered service is hung. You can run this script for most services, including SQL Services, Exchange Services, and IIS Services. A service is considered hung if it is in a Start-Pending, Stop-Pending, Continue-Pending or Pause-Pending state for a specified number of consecutive intervals. This script raises an event if a hung service is detected, and can stop or restart the hung service.

37.21.1 Resource Objects

Any discovered Windows computer or Windows application service

37.21.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

37.21.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Number of consecutive iterations before service is hung	Specify the number of consecutive job iterations a service can be in a Start-Pending, Stop-Pending, Continue-Pending or Pause-Pending state before it is considered hung. The default is 2 consecutive iterations.
Collect data for service status?	Set to **y** to collect data for charts and reports. If enabled, data collection returns one of the following: • **100** – service is up • **0** – service is hung The default is n.
Stop the hung service?	Set to **y** to automatically stop hung services. The default is y.
Start hung service after it is stopped?	Set to **y** to automatically start the service after stopping it. The default is y.
Event severity when start fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this script fails to start a hung service that had been stopped. The default is 5 (red event indicator).
Event severity when start succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this script successfully starts a hung service that had been stopped. The default is 25 (blue event indicator).
Event severity when “start hung service” is disabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the a hung service is detected and the *Start hung service after it is stopped?* parameter is set to n. The default is 18 (yellow event indicator).
Event severity when status retrieval fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this script cannot determine the status of a service. The default is 10 (red event indicator).

Parameter	How to Set It
Event severity when service stop fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this script fails to stop a hung service. The default is 8 (red event indicator).

37.22 ShortEventLog

Use this Knowledge Script to track Windows event log entries that match filtering criteria you specify. This script works on an incremental basis (it does not fully rescan the event log each time it runs), and all event log entries that match the filtering criteria are returned in the event or data point detail message.

This script works in the same fashion as the EventLog Knowledge Script, but removes the header information and returns only the description of the event.

NOTE: Only the most recent batch of events can be viewed in the data point detail message. For example, you might set this script to scan all previous entries in the event log and list ten matching entries in each event detail message. When the job runs, 30 entries are found that match your filtering criteria. In this case, the script creates three child events for the interval. Each child event contains ten entries: the oldest matching entries in one child event batch, the second oldest in Batch 2, and the most recent in Batch 3. If this job is collecting data, and you view the data detail message for the interval, only the entries from the third child event (Batch 3) are displayed.

37.22.1 Resource Objects

Windows computer or application server such as Exchange Server or SQL Server

37.22.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

37.22.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if log entries match criteria?	Set to **y** to raise an event when log entries match your filtering criteria. The default is y.
Collect data for log entries that match criteria?	Set to **y** to collect data for charts and reports. When enabled, data collection returns detail about log entries that match your filtering criteria. The default is n.
Separate data by log file type?	Set to **y** to separate event entries from different log files into different datastreams. If set to n, all event entries matching your filtering criteria are placed in the same datastream and the data detail message may include event entries from multiple log sources. For example, if you are monitoring both the System and Application logs, you can enable this parameter so that events in the System log are tracked separately from events in the Application log. The default is n.
Log files to filter (Application, Security, System)	Specify the event log you want to monitor. You can specify multiple event logs, separated by commas. For example: `System,Application,Security` The default is `Application`.

Parameter	How to Set It
Log scanning for first interval	Set this parameter to control how the script scans the logs at the first interval, after which scanning begins where the previous scan ended. Enter one of the following values: • **-1** – to scan all the existing entries • *N* – to scan entries only for the past *n* hours (8 for the past 8 hours, 50 for the past 50 hours, for example) • **0** – to not scan previous entries; only search from this moment on. The default is 0.
Monitor error events?	Set to **y** to monitor error event entries. The default is y.
Monitor warning events?	Set to **y** to monitor warning event entries. The default is y.
Monitor information events?	Set to **y** to monitor information event entries. The default is y.
Monitor success audits?	Set to **y** to monitor success audit event entries. Success audits are successful security access attempts that are audited. The default is y.
Monitor failure audits?	Set to **y** to monitor failure audit events entries. Failure audits are failed security access attempts that are audited. The default is y.
Event source filter	To filter for events generated by a particular source (such as SQLExecutive, SNMP, or the Service Control Manager), enter a search string. This script will look for matching entries in the Event Log's **Source** field. Separate multiple strings with commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you specify only include criteria, the colon is not necessary
Event category filter	To filter for events in a particular category (such as Server or Logon), enter a search string. This script will look for matching entries in the Event Log's **Category** field. Separate multiple strings with commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you specify only include criteria, the colon is not necessary.
Event ID filter	To filter for particular event IDs, enter a search string or ID range, for example 100-2000. This script will look for matching entries in the Event Log's **Event** field. Separate multiple IDs and ranges with commas. For example: `1,2,10-15,202`. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you specify only include criteria, the colon is not necessary.
Event user filter	To filter for events associated with a particular user, enter a search string, for example, `<domain name>\<user name>`) This script will look for matching entries in the Event Log's **User** field. Separate multiple strings with commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you specify only include criteria, the colon is not necessary

Parameter	How to Set It
Computer filter	To filter for events generated by a particular computer, enter a search string. This script will look for matching entries in the Event Log's **Computer** field. Separate multiple strings with commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you specify only include criteria, the colon is not necessary.
Event description filter	To filter for events with a particular detail description or containing keywords in the description, enter a search string. This script will look for matching entries in the Event Log's **Description** field. Separate multiple strings with commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you specify only include criteria, the colon is not necessary
Maximum number of entries per event report	Specify the maximum number of entries to be recorded in each event's detail message. If this script finds more entries from the log than can be put into one event message, it will return multiple events to report all the outstanding entries in the log. The default is 30 entries. If this script encounters one or more very large events in the Windows Event log, this Knowledge Script may error out and generate an event message "`Out of string space`." If this occurs, you can usually work around the problem by adjusting this parameter to a smaller value.
Event severity when event log entries match criteria	Set the event severity level, from 1 to 40, to indicate the importance of an event in which log entries matched your search criteria. The default is 8 (red event indicator). **Tip** You can adjust the severity based on which log or type of event you are checking for.

37.22.4 Examples of How this Script Is Used

You can customize this script in many ways based on your requirements. For example, for general system events, you can set the following options when detecting security failures:

Properties and Parameters	How You Might Set Them
Schedule interval	10 minutes
Raise event if log entries match criteria?	y
Log files to filter	Security
Monitor failure audits?	y
Event severity when event log entries match criteria	2
Action	MapiMail

With this scenario, on the **Schedule** tab in the Knowledge Script Properties dialog box, set the interval to *Once very 10 minutes* because you want a short window for checking for this type of problem.

On the Values tab, enable the *Raise event if log entries match criteria?* parameter. Set *Log files to filter* to **Security** and set *Monitor failure audits?* to **y**. Set the *Event severity level* parameter to **2**, indicating this is a very serious event that you want to be highly visible. Leave the other filtering options blank.

On the **Action** tab, indicate that you want an e-mail sent if an event is raised. With these settings, AppManager will regularly check for security failures and will notify you, or whoever you designate, through e-mail if any security failure events are detected.

Another example of how to use this script to detect all problems with your SQL Server involves setting up the Knowledge Script job as follows:

Properties and Parameters	How You Might Set Them
Schedule interval	30 minutes
Raise event if log entries match criteria?	y
Log files to filter	Application
Monitor error events?	Error
Event source filter	MSSQLServer
Event severity when event log entries match criteria	8
Action	MapiMail

Another way you can use this Knowledge Script is to collect data and graph a trend chart from your System event log:

Properties and Parameters	How You Might Set Them
Schedule interval	1 hour
Collect data for log entries that match criteria?	y
Log files to filter	System
All other filters	not set
Action	Null

If you select the data collection option, this script returns the number of matched entries as the primary data point to be graphed. The first batch of filtered results can be viewed in the detail data message when you double-click a data point. Additional matching entries may be included in the graph. The peaks and valleys in the graph indicate a large number of events (something unusual) or low event activity (quiet and all "OK").

37.23 SNMPGet

Use this Knowledge Script to monitor SNMP activity for the device or computer you specify. This script performs an SNMP v1 `Get` or `GetNext` against the selected SNMP agent, allowing you to check SNMP MIB (management information base) variable values. The value returned can be compared to the thresholds you set or a text string. This script requires the Microsoft SNMP Service to be running.

NOTE: When setting the parameters for this script, choose whether the jobs should perform a threshold comparison, equality check, or string matching. These operations are mutually exclusive operations.

37.23.1 Resource Objects

Any Windows server or CIM server with an SNMP agent installed and running

37.23.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

37.23.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if MIB variable matches string or numeric value, or exceeds or falls below threshold?	Set to **y** to raise an event if a MIB value falls below or exceeds the threshold, or if a value matches the parameters you set for *Equality check?* or *String match*. The default is y.
Collect data for MIB variable?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the value of the MIB variable for graphing. If the MIB variable you specify is of an octet string type, the value is displayed in the graph data detail message. The default is y.
MIB object identifier	Specify a MIB object identifier in OID notation (for example, `.1.2.3.456.78`) or ODE notation (for example, `system.sysUpTime.0`). The default is `system.sysName.0`. OID notation must include the dot (.) at the beginning of the identifier. ODE notation must be case-sensitive. You can use the ODE if the `mib.bin` file has been compiled on the agent computer in the `%windir%/system32` directory. For information about compiling the `mib.bin`, see the Windows Resource Kit.
SNMP community string	Provide the SNMP community string for the device or computer on which you want to monitor SNMP activity. Leave this parameter blank to use the SNMP community name entered in the AppManager Security Manager. The default is `public`.
SNMP agent	Specify the hostname or IP address of the device or computer on which you want to monitor SNMP activity. If you do not specify an SNMP agent, the local client computer is assumed.

Parameter	How to Set It
Threshold - Maximum MIB variable value	Specify the maximum value the MIB variable can attain before an event is raised. The default is 600000.
Threshold - Minimum MIB variable value	Specify the minimum value the MIB variable must maintain to prevent an event from being raised. The default is 300000.
Check for equality to numeric MIB variable	• Set to **e** to compare the MIB variable's value to a specific value (set in the *Numeric MIB variable value* parameter) and raise an event when the values are equal. • Set to **n** to compare the MIB variable's value to a specific value (set in the *Numeric MIB variable value* parameter) and raise an event when the values are not equal. • Set to **s** to skip testing for equality. This parameter is applicable for numeric MIB variables such as `INTEGER`, `GAUGE`, or `COUNTER`. The default is s.
Numeric MIB variable value	Specify the value that you want to compare with the returned MIB variable value. • If *Check for equality to numeric MIB value?* is set to **e**, an event is raised when the MIB variable equals the value you specify in this parameter. • If *Check for equality to numeric MIB value?* is set to **n**, an event is raised when the values are not equal. The default is 0.
Text string or IP address MIB variable value	Specify the text string or IP address that you want to compare with the returned MIB variable value. This parameter is applicable only when the MIB type is `OCTETSTRING` or `IPADDRESS`. The MIB variable value is compared to this string, and an event is raised if they are equal.
Enforce case-sensitive string match?	Set to **y** to enable this script to match case when checking for a match to the string entered for the *String match* parameter. The default is n.
Event severity when MIB variable matches string or numeric value, or exceeds or falls below threshold?	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a MIB variable value exceeds or falls below the threshold, or if a value matches the parameters you set for *Equality check?* or *String match*. The default is 5 (red event indicator).
Select operation: Get or GetNext	Specify whether to perform SNMP `Get` or `GetNext`. The default is `Get`.
Number of times to perform the operation	Specify the number of times this script should try to perform the `Get` operation before returning an error. The default is 3 times.
Number of seconds to wait for operation to complete	Specify the number of seconds this script should wait for the `Get` or `GetNext` operation to complete before timing out and returning an error. The default is 5 seconds.
Event message text	Provide the text to display in the event detail message. If you do not enter a message, a default message consisting of the MIB variable and value is used.

37.24 WMICounter

Use this Knowledge Script to monitor any Windows Management Instrumentation (WMI) object property. You can run this script on any WMI server and monitor any property available for an object. This script raises an event if the value of the property you select exceeds or falls below the threshold you set. You can also specify a consecutive number of times that the threshold must be exceeded before an event is raised.

Use this script to yield performance information for the WMI properties you are monitoring. Use the property data to start corrective actions when thresholds are exceeded, to generate complex and sophisticated graphs, and to provide historical information for reporting, trend analysis, and capacity planning.

NOTE: An event is raised only if the property value exceeds or falls below the thresholds you set. If a counter does not exist on the monitored computer, the job terminates with an error.

37.24.1 Resource Objects

Windows 2000 Server or later

37.24.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

37.24.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Collect data for WMI object property values?	Set to **y** to collect data for charts and reports. When enabled, data collection returns the object property values that exceeded or fell below the threshold you set. The default is n.
Raise event when object property value exceeds threshold?	Set to **y** to raise an event if the object property value exceeds the maximum threshold you set. The default is y.
Threshold - Maximum value for object property	Specify the maximum value the object property can attain before an event is raised. The default is 100.
Raise event when object property value falls below threshold?	Set to **y** to raise an event if the object property value falls below the minimum threshold you set. The default is y.
Threshold - Minimum value for object property	Specify the minimum value the object property must maintain to prevent an event from being raised. The default is 10.
WMI object property to monitor	Specify the namespace, class, and property to monitor. For more information, see "Selecting a Property to Monitor Using the WMI Browser" on page 2228 and "Entering Property Names Without Browsing" on page 2228. For details about WMI classes and objects, see the WMI Object Browser available with the WMI platform SDK.

Parameter	How to Set It
Number of consecutive times to exceed or fall below threshold	Specify the number of consecutive times a monitored object property value should exceed or fall below the threshold before an event is raised. The default is 1 time.
Raise event if value cannot be retrieved?	Set to **y** to raise an event if this script cannot retrieve the object property value. The default is y.
Event severity when object property value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the object property value exceeds the threshold you set. The default is 8 (red event indicator).
Event severity when object property value falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the object property value falls below the threshold you set. The default is 8 (red event indicator).
Event severity when property/instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the specified property or instance does not exist. The default is 8 (red event indicator).

37.24.4 Selecting a Property to Monitor Using the WMI Browser

To select the property you want to monitor, click **Browse [...]** in the *WMI object property to monitor* parameter to launch the Windows Management Instrumentation Browser dialog box. Specify the target computer, the namespace and class in which the property resides, the instance of the property, such as the name of a service or particular log file, and the name of the specific property you want to monitor. The term "schema" in this dialog box refers to properties.

To select a property to monitor using the WMI browser:

1. Click **Browse [...]** and select the target **Computer**.
2. From the **Classes In** list, specify the namespace that contains the class in which the object and property (schema) are located.
3. Click **Enumerate** to view the classes and objects in the namespace you specified.
4. Select the **Instance** of the class you want to monitor.
5. From the **Schema** list, select the name of the property you want to monitor.
6. Click **OK**.

37.24.5 Entering Property Names Without Browsing

To type property names rather than use the Windows Management Instrumentation Browser, enter the name in the *WMI object's property to monitor* parameter using the following format:

```
<namespace>:<class.instance="unique identifier">:<property>
```

where `instance` is the instance category (such as name or log file), and `"unique identifier"` is the name of the specific instance you want to monitor.

Using the example from the previous section, to monitor the state of the `NetIQmc` service, type this information in the *WMI object's property to monitor* parameter as follows:

```
//./root/cimv2:Win32_Service.Name=""NetIQmc"":State
```

where

- `//./root/cimv2` is the namespace
- `Win32_Service` is the class
- `Name` is the instance
- `"NetIQmc"` is the unique identifier that specifies the specific service you want to monitor
- `State` is the property of the instance that you want to monitor

38 Hardware Knowledge Scripts

The Hardware category provides the following Knowledge Scripts for monitoring Cisco UCS, Dell, HP, and IBM hardware resources. From the Knowledge Script view of Control Center, you can access more information about any Knowledge Script by selecting it and clicking **Help**. In the Operator Console, select any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
BatteryHealth	Monitors the operational status of system batteries.
FanHealth	Monitors the operational status of system fans.
LogicalDriveHealth	Monitors the operational status of system logical drives in an array.
MemoryHealth	Monitors the operational status of system memory.
NICHealth	Monitors the operational status of system network interface controllers (NICs).
PhysicalDriveHealth	Monitors the operational status of system physical drives in an array.
PowerSupplyHealth	Monitors the operational status of system power supplies.
ProcessorHealth	Monitors the operational status of system CPUs.
SmartArrayControllerHealth	Monitors the operational status of Smart Array controllers.
StorageBoxHealth	Monitors the operational status of storage boxes.
TemperatureHealth	Monitors the operational status of system temperature.
VoltageHealth	Monitors voltage levels on the system board.

38.1 Understanding Hardware Resource States

Each Knowledge Script in the Hardware category provides options to raise an event when the monitored hardware resource is in the following states:

- Good
- Miscellaneous
- Degraded
- Undefined
- Error

The following table lists the values that the Knowledge Script job uses to determine the state of a monitored resource:

This value...	Indicates this condition...	Results in this state...	Returns this value if you choose to collect data about device status...
2	OK	Good	0
8	Starting	Miscellaneous	1
11	In service		
13	Lost communication		
15	Dormant		
17	Completed		
3	Degraded	Degraded	2
4	Stressed		
9	Stopping		
0	Unknown	Undefined	3
1	Other		
12	No contact		
5	Predictive failure	Error	4
6	Error		
7	Non-recoverable error		
10	Stopped		
14	Aborted		
16	Supporting entity in error		

38.2 Using Regular Expression Filters

A regular expression is a pattern that describes a specific portion of text. The Hardware Knowledge Scripts enable you to use regular expressions to define inclusion and exclusion filters for pattern-matching against the text being evaluated.

The following table lists some commonly used regular expression types and their usage.

For more information about regular expression syntax, see related Web sites such as www.wikipedia.org/wiki/Regular_expression or www.regular-expressions.info.

Regular Expression Type	Description
Alternate Matches	A pipe character, `|`, indicates alternate possibilities. For example: • The expression `a|b|c` indicates a match with `a`, or `b`, or `c`. • The expression `fan1|fan2|fan3` indicates a match with `fan1`, or `fan2`, or `fan3`.
Anchor	Anchors do not match characters. Instead, they match a position before, after, or between characters. They anchor the regular expression match at a certain point. • A `^` matches a position before the first character in a text string. For example, the expression `^a` applied to the text string `abc` returns `a` because `a` is at the beginning of the text string. The expression `^b` applied to the same text string returns no value, because `b` is not at the beginning of the text string. • A `$` matches a position right after the last character in a text string. For example, the expression `c$` applied to the text string `abc` returns `c` because `c` is at the end of the text string. The expression `a$` applied to the same string returns no value, because `a` is not at the end of the text string.
Escape Metacharacter	A backslash character, `\`, preceded with special characters such as `.`, `@`, `|`, `*`, `?`, `+`, `(`, `)`, `{`, `}`, `[`, `]`, `^`, `$` and `\` forces the special characters to be interpreted as normal characters. For example: • A dot (`.`) is usually used as a wildcard metacharacter, but if preceded by a backslash it represents the dot character itself. For information on wildcard metacharacter, see . • A colon (`:`) when preceded by a backslash excludes or includes all device names that contains `:` in their names. • An equal sign (=) when preceded by a backslash excludes or includes all device names that contains = in their names.
Literal	A literal expression consists of a single character that matches all the occurrences of that character in the text string. For example, if the expression is `a` and the text string is `The gray cat is purring`, then the match is the `a` in `gray` and `a` in `cat`. All characters except for the following are literals: `.`, `|`, `*`, `?`, `+`, `(`, `)`, `{`, `}`, `[`, `]`, `^`, `$` and `\`. These characters are treated as literals when preceded by a `\`.

Regular Expression Type	Description
Matching Characters or Digits	• \d: Matches a digit. • \D: Matches a non-digit. • \s: Matches a whitespace character. • \S: Matches any character except a whitespace. • \w: Matches an alphanumeric character. • \W: Matches an non-alphanumeric character.
Parentheses	Use parentheses, (), to group characters and then apply a repetition operator to the group. For example, the expression (ab)* returns all of the string ababab.
Repeat	A repeat is an expression that is repeated an arbitrary number of times. • A question mark, ?, indicates that the preceding character in the expression is optional. For example, the expression ba? returns b or ba. • An asterisk, *, indicates that the preceding character is to be matched zero or more times. For example, the expression ba* returns all instances of b, ba, baaa, and so on. • A plus sign, +, indicates that the preceding character is to be matched one or more times. The expression ba+ returns all instances of ba or baaaa, for example, but not b. • Curly braces, {}, indicate a specific amount of repetition. For example, the expression a{2} returns the letter a repeated exactly twice. The expression a{2,4} returns the letter a repeated between 2 and 4 times. The expression a{2,} returns the letter a repeated at least twice, with no upper limit. For example, the expression ba{2,4} returns baa, baaa, and baaaa.
Square Brackets	Use square brackets, [], to group characters to specify individual characters or ranges. Examples: • The expression fan[2-5] returns all instances matching fan2, fan3, fan4, and fan5. • The expression fan[1-1] returns all instances matching fan1.
Wildcard	The dot wildcard, .,matches any single character except line break characters. For example, the expression gr.y matches gray, grey, gr%y, and so on.
Word Boundary	• \b: Matches a zero-width word boundary, such as between a letter and a space. For example: er\b matches the er in never but not the er in verb. • \B: Matches a word non-boundary. For example: er\B matches the er in verb but not the er in never.

38.3 BatteryHealth

Use this Knowledge Script to monitor the operational status of system batteries. The script raises an event if a monitored battery is not operating properly. You can also choose to raise events for conditions such as when a battery is in degraded state. You can set severities to indicate the importance of each type of event.

This Knowledge Script does not apply to HP servers.

NOTE: If battery is available on the Cisco UCS server, AppManager discovers it. To monitor the operational status of the battery, run the BatteryHealth Knowledge Script.

38.3.1 Resource Objects

Battery object

38.3.2 Default Schedule

The default interval for this script is **15 minutes**.

38.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain battery metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the battery. The default is Yes.
Event severity when job failed to obtain battery metrics	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the battery. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor battery status. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor battery status. The default is 35.

Description	How to Set It
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.
Event Notification	
Monitor Battery Status	For more information about the various battery states, see "Understanding Hardware Resource States" on page 2232.
Raise event if battery is in Good state?	Select **Yes** to raise an event if the operational status of the battery is Good. The default is unselected.
Event severity when battery is in Good state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the battery is Good. The default is 25.
Raise event if battery is in Error state?	Select **Yes** to raise an event if the operational status of the battery is Error. The default is Yes.
Event severity when battery is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the battery is Error. The default is 5.
Raise event if battery is in Degraded state?	Select **Yes** to raise an event if the operational status of the battery is Degraded. The default is Yes.
Event severity when battery is in Degraded state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the battery is Degraded. The default is 15.
Raise event if battery is in Undefined state?	Select **Yes** to raise an event if the operational status of the battery is Undefined. The default is unselected.
Event severity when battery is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the battery is Undefined. The default is 12.
Raise event if battery is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the battery is Miscellaneous. The default is unselected.
Event severity when battery is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the battery is Miscellaneous. The default is 25.
Data Collection	
Collect data for battery device status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: If you want to monitor the health status of the specified battery devices. • Exclusion: If you do not want to monitor the health status of the specified battery devices.

Description	How to Set It
Include or exclude batteries	Specify a list of battery devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices. For example: `Battery01,Battery02,Battery03` Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring. All regular expressions are supported. For example, if you want to monitor `Battery01`, `Battery02`, and `Battery03`, then specify `Battery0[1-3]`. To monitor the battery devices for a specific server, specify the server name and the device name in the following format: <*server name*>:<*device name*> For example: `Server01:Battery7` `Battery7` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria. Based on the selected criteria, the format `<servername>:*` includes or excludes monitoring of all batteries for the specified server. For example: `Server01:*` includes or excludes monitoring of all batteries for `Server01`. You can also specify a list of servers in the following format: `Server01:*, Server02:*, Server03:*` All the battery devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria. For more information on regular expressions, see "Using Regular Expression Filters" on page 2233.

Full path to file containing list of batteries to include or exclude	Specify the path of the file that lists the battery devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	To list the devices in the file, do one of the following:
	
	• Use commas with no spaces to separate the devices. For example: `Battery01,Battery02,Battery03`
	• List the devices on separate lines. For example:
	
	`Battery01`
	
	`Battery02`
	
	`Battery03`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

38.4 FanHealth

Use this Knowledge Script to monitor the operational status of system fans. The script raises an event if a monitored fan is not operating properly. You can also choose to raise events for other conditions such as when a fan is in a degraded state. You can set severities to indicate the importance of each type of event.

This Knowledge Script does not support monitoring the fan speed on HP servers.

NOTE: In case of Cisco UCS servers, monitoring fans is only applicable to Cisco UCS C-Series Rack Server.

38.4.1 Resource Objects

Fan object

38.4.2 Default Schedule

The default interval for this script is **15 minutes**.

38.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain fan metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the fan. The default is Yes.
Event severity when job failed to obtain fan metrics	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the fan. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor fan status. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor fan status. The default is 35.
Event Details	

Description	How to Set It
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.
Event Notification	
Monitor Fan Status	For more information about the various fan states, see "Understanding Hardware Resource States" on page 2232.
Raise event if fan is in Good state?	Select **Yes** to raise an event if the operational status of the fan is Good. The default is unselected.
Event severity when fan is in Good state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the fan is Good. The default is 25.
Raise event if fan is in Error state?	Select **Yes** to raise an event if the operational status of the fan is Error. The default is Yes.
Event severity when fan is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the fan is Error. The default is 5.
Raise event if fan is in Degraded state?	Select **Yes** to raise an event if the operational status of the fan is Degraded. The default is Yes.
Event severity when fan is in Degraded state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the fan is Degraded. The default is 15.
Raise event if fan is in Undefined state?	Select **Yes** to raise an event if the operational status of the fan is Undefined. The default is unselected.
Event severity when fan is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the fan is Undefined. The default is 12.
Raise event if fan is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the fan is Miscellaneous. The default is unselected.
Event severity when fan is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the fan is Miscellaneous. The default is 25.
Data Collection	
Collect data for fan device status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Collect data for fan device speed?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns the current speed of the monitored resources. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: If you want to monitor the health status of the specified fan devices. • Exclusion: If you do not want to monitor the health status of the specified fan devices.

Description	How to Set It
Include or exclude fans	Specify a list of fan devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices. For example: `Fan01,Fan02,Fan03` Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring. All regular expressions are supported. For example, if you want to monitor `Fan01`, `Fan02`, and `Fan03`, then specify `Fan0[1-3]`. To monitor the fan devices for a specific server, specify the server name and the device name in the following format: <*server name*>:<*device name*> For example: `Server01:Fan1` `Fan1` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria. Based on the selected criteria, the format `<servername>:*` includes or excludes monitoring of all fans for the specified server. For example: `Server01:*` includes or excludes monitoring of all fans for `Server01`. You can also specify a list of servers in the following format: `Server01:*, Server02:*, Server03:*` All the fan devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria. For more information on regular expressions, see "Using Regular Expression Filters" on page 2233.

Full path to file containing list of fans to include or exclude	Specify the path of the file that lists the fan devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	To list the devices in the file, do one of the following:
	
	• Use commas with no spaces to separate the devices. For example: `Fan01,Fan02,Fan03`
	• List the devices on separate lines. For example:
	
	`Fan01`
	
	`Fan02`
	
	`Fan03`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

38.5 LogicalDriveHealth

Use this Knowledge Script to monitor the operational status of system logical drives in an array. The script raises an event if a monitored logical drive is not operating properly. You can also choose to raise events for other conditions such as drive failure and set severities to indicate the importance of each type of event.

38.5.1 Resource Objects

Logical Drive object

38.5.2 Default Schedule

The default interval for this script is **15 minutes**.

38.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain logical drive metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the logical drive. The default is Yes.
Event severity when job failed to obtain logical drive metrics	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the logical drive. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor logical drive status. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor logical drive status. The default is 35.
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.
Event Notification	

Description	How to Set It
Monitor Logical Drive Status	For more information about the various logical drive states, see "Understanding Hardware Resource States" on page 2232.
Raise event if logical drive is in Good state?	Select **Yes** to raise an event if the operational status of the logical drive is Good. The default is unselected.
Event severity when logical drive is in Good state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the logical drive is Good. The default is 25.
Raise event if logical drive is in Error state?	Select **Yes** to raise an event if the operational status of the logical drive is Error. The default is Yes.
Event severity when logical drive is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the logical drive is Error. The default is 5.
Raise event if logical drive is in Degraded state?	Select **Yes** to raise an event if the operational status of the logical drive is Degraded. The default is Yes.
Event severity when logical drive is in Degraded state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the logical drive is Degraded. The default is 15.
Raise event if logical drive is in Undefined state?	Select **Yes** to raise an event if the operational status of the logical drive is Undefined. The default is unselected.
Event severity when logical drive is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the logical drive is Undefined. The default is 12.
Raise event if logical drive is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the logical drive is Miscellaneous. The default is unselected.
Event severity when logical drive is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the logical drive is Miscellaneous. The default is 25.
Data Collection	
Collect data for logical drive device status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: If you want to monitor the health status of the specified logical drive devices. • Exclusion: If you do not want to monitor the health status of the specified logical drive devices.

Description	How to Set It
Include or exclude array logical disks	Specify a list of logical drive devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices. For example: `LogicalDrive01,LogicalDrive02,LogicalDrive03` Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring. All regular expressions are supported. For example, if you want to monitor `LogicalDrive01`, `LogicalDrive02`, and `LogicalDrive03`, then specify `LogicalDrive0[1-3]`. To monitor the devices for a specific server, specify the server name and the device name in the following format: *<server name>*:*<device name>* For example: `Server01:LogicalDrive1` `LogicalDrive1` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria. Based on the selected criteria, the format *<servername>*`:*` includes or excludes monitoring of all logical drive devices for the specified server. For example: `Server01:*` includes or excludes monitoring of all logical drive devices for `Server01`. You can also specify a list of servers in the following format: `Server01:*, Server02:*, Server03:*` All the logical drive devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria. For more information on regular expressions, see "Using Regular Expression Filters" on page 2233.

Full path to file containing list of array logical disks to include or exclude	Specify the path of the file that lists the logical drive devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\`*<path to file>* rather than `\\`*<server>*`\D$\`*<path to file>*.
	
	To list the devices in the file, do one of the following:
	• Use commas with no spaces to separate the devices. For example: `LogicalDrive1,LogicalDrive2,LogicalDrive3`
	• List the devices on separate lines. For example:
	
	`LogicalDrive1`
	
	`LogicalDrive2`
	
	`LogicalDrive3`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

38.6 MemoryHealth

Use this Knowledge Script to monitor the operational status of system memory. The script raises an event if the system memory is not operating properly. You can also choose to raise events for other conditions and set severities to indicate the importance of each type of event.

38.6.1 Resource Objects

Memory card object

38.6.2 Default Schedule

The default interval for this script is **15 minutes**.

38.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain memory device metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the system memory. The default is Yes.
Event severity when job failed to obtain memory device metrics	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the system memory. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor system memory. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor system memory. The default is 35.
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.

Description	How to Set It
Event Notification	
Monitor Memory Status	For more information about the various memory states, see "Understanding Hardware Resource States" on page 2232.
Raise event if memory device is in Good state?	Select **Yes** to raise an event if the operational status of the system memory is Good. The default is unselected.
Event severity when memory device is in Good state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the system memory is Good. The default is 25.
Raise event if memory device is in Error state?	Select **Yes** to raise an event if the operational status of the system memory is Error. The default is Yes.
Event severity when memory device is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the system memory is Error. The default is 5.
Raise event if memory device is in Undefined state?	Select **Yes** to raise an event if the operational status of the system memory is Undefined. The default is unselected.
Event severity when memory device is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the system memory is Undefined. The default is 12.
Raise event if memory device is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the system memory is Miscellaneous. The default is unselected.
Event severity when memory device is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the system memory is Miscellaneous. The default is 25.
Data Collection	
Collect data for memory device status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: If you want to monitor the health status of the specified memory devices. • Exclusion: If you do not want to monitor the health status of the specified memory devices.

Description	How to Set It
Include or exclude global memory units	Specify a list of memory devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices. For example: `Memory01,Memory02,Memory03` Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring. All regular expressions are supported. For example, if you want to monitor `Memory01`, `Memory02`, and `Memory03`, then specify `Memory0[1-3]`. To monitor the devices for a specific server, specify the server name and the device name in the following format: <*server name*>:<*device name*> For example: `Server01:Memory1` `Memory1` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria. Based on the selected criteria, the format `<servername>:*` includes or excludes monitoring of all memory devices for the specified server. For example: `Server01:*` includes or excludes monitoring of all memory devices for `Server01`. You can also specify a list of servers in the following format: `Server01:*, Server02:*, Server03:*` All the memory devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria. For more information on regular expressions, see "Using Regular Expression Filters" on page 2233.

Full path to file containing list of global memory units to include or exclude	Specify the path of the file that lists the memory devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	To list the devices in the file, do one of the following:
	• Use commas with no spaces to separate the devices. For example: `Memory01,Memory02,Memory03`
	• List the devices on separate lines. For example:
	
	`Memory01`
	
	`Memory02`
	
	`Memory03`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

38.7 NICHealth

Use this Knowledge Script to monitor the operational status of system network interface controllers (NICs). The script raises an event if a monitored NIC is down or not operating properly. You can also choose to raise events for other conditions and set severities to indicate the importance of each type of event.

38.7.1 Resource Objects

Network interface controller object

38.7.2 Default Schedule

The default interval for this script is **15 minutes**.

38.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain NIC metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the NIC. The default is Yes.
Event severity when job failed to obtain NIC metrics	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the NIC. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor NIC status. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor NIC status. The default is 35.
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.

Description	How to Set It
Event Notification	
Monitor NIC Status	For more information about the various NIC states, see "Understanding Hardware Resource States" on page 2232.
Raise event if NIC is in Up state?	Select **Yes** to raise an event if the NIC is operating. The default is unselected.
Event severity when NIC is in Up state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the NIC is operating. The default is 25.
Raise event if NIC is in Down state?	Select **Yes** to raise an event if the NIC is not operating. The default is Yes.
Event severity when NIC is in Down state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the NIC is not operating. The default is 5.
Raise event if NIC is in Error state?	Select **Yes** to raise an event if the operational status of the NIC is Error. The default is Yes.
Event severity when NIC is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the NIC is Error. The default is 5.
Raise event if NIC is in Undefined state?	Select **Yes** to raise an event if the operational status of the NIC is Undefined. The default is unselected.
Event severity when NIC is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the NIC is Undefined. The default is 12.
Raise event if NIC is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the NIC is Miscellaneous. The default is unselected.
Event severity when NIC is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the NIC is Miscellaneous. The default is 25.
Data Collection	
Collect data for NIC device status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: If you want to monitor the health status of the specified NIC devices. • Exclusion: If you do not want to monitor the health status of the specified NIC devices.

Description	How to Set It

Include or exclude Network Interface Controllers (NICs)	Specify a list of NIC devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices.
	
	For example: `NIC01,NIC02,NIC03`
	
	Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring.
	
	All regular expressions are supported. For example, if you want to monitor `NIC01`, `NIC02`, and `NIC03`, then specify `NIC0[1-3]`.
	
	To monitor the devices for a specific server, specify the server name and the device name in the following format:
	
	`<server name>:<device name>`
	
	For example: `Server01:NIC1`
	
	`NIC1` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria.
	
	Based on the selected criteria, the format `<servername>:*` includes or excludes monitoring of all NIC devices for the specified server. For example: `Server01:*` includes or excludes monitoring of all NIC devices for `Server01`.
	
	You can also specify a list of servers in the following format:
	
	`Server01:*, Server02:*, Server03:*`
	
	All the NIC devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria.
	
	For more information on regular expressions, see “Using Regular Expression Filters” on page 2233.

Full path to file containing list of Network Interface Controllers (NICs) to include or exclude	Specify the path of the file that lists the NIC devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	To list the devices in the file, do one of the following:
	• Use commas with no spaces to separate the devices. For example: `NIC01,NIC02,NIC03`
	• List the devices on separate lines. For example:
	
	`NIC01`
	
	`NIC02`
	
	`NIC03`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

38.8 PhysicalDriveHealth

Use this Knowledge Script to monitor the operational status of system physical drives in an array. The script raises an event if a monitored physical drive is not operating properly. You can also choose to raise events for other conditions and set severities to indicate the importance of each type of event.

38.8.1 Resource Objects

Logical drive object

38.8.2 Default Schedule

The default interval for this script is **15 minutes**.

38.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain physical drive metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the physical drive. The default is Yes.
Event severity when job failed to obtain physical drive metrics	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the physical drive. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor physical drive status. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor physical drive status. The default is 35.
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.
Event Notification	

Description	How to Set It
Monitor Physical Drive Status	For more information about the various physical drive states, see "Understanding Hardware Resource States" on page 2232.
Raise event if Physical Drive is in Good state?	Select **Yes** to raise an event if the operational status of the physical drive is Good. The default is unselected.
Event severity when Physical Drive is in Good state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the physical drive is Good. The default is 25.
Raise event if Physical Drive is in Error state?	Select **Yes** to raise an event if the operational status of the physical drive is Error. The default is Yes.
Event severity when Physical Drive is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the physical drive is Error. The default is 5.
Raise event if Physical Drive is in Degraded state?	Select **Yes** to raise an event if the operational status of the physical drive is Degraded. The default is Yes.
Event severity when Physical Drive is in Degraded state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the physical drive is Degraded. The default is 15.
Raise event if Physical Drive is in Undefined state?	Select **Yes** to raise an event if the operational status of the physical drive is Undefined. The default is unselected.
Event severity when Physical Drive is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the physical drive is Undefined. The default is 12.
Raise event if Physical Drive is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the physical drive is Miscellaneous. The default is unselected.
Event severity when Physical Drive is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the physical drive is Miscellaneous. The default is 25.
Data Collection	
Collect data for physical drive device status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: If you want to monitor the health status of the specified physical drive devices. • Exclusion: If you do not want to monitor the health status of the specified physical drive devices.

Description	How to Set It

Include or exclude array physical disks	Specify a list of physical drive devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices.
	
	For example:
	`PhysicalDrive01,PhysicalDrive02,PhysicalDrive03`
	
	Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring.
	
	All regular expressions are supported. For example, if you want to monitor `PhysicalDrive01`, `PhysicalDrive02`, and `PhysicalDrive03`, then specify `PhysicalDrive0[1-3]`.
	
	To monitor the devices for a specific server, specify the server name and the device name in the following format:
	
	<*server name*>:<*device name*>
	
	For example: `Server01:PhysicalDrive1`
	
	`PhysicalDrive1` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria.
	
	Based on the selected criteria, the format `<servername>:*` includes or excludes monitoring of all physical drive devices for the specified server. For example: `Server01:*` includes or excludes monitoring of all physical drive devices for `Server01`.
	
	You can also specify a list of servers in the following format:
	
	`Server01:*, Server02:*, Server03:*`
	
	All the physical drive devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria.
	
	For more information on regular expressions, see "Using Regular Expression Filters" on page 2233.

Full path to file containing list of array physical disks to include or exclude	Specify the path of the file that lists the physical drive devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	To list the devices in the file, do one of the following:
	• Use commas with no spaces to separate the devices. For example: `PhysicalDrive01,PhysicalDrive02,PhysicalDrive03`
	• List the devices on separate lines. For example:
	
	`PhysicalDrive01`
	
	`PhysicalDrive02`
	
	`PhysicalDrive03`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

38.9 PowerSupplyHealth

Use this Knowledge Script to monitor the operational status of system power supplies. The script raises an event if a monitored power supply is not operating properly. You can also choose to raise events for other conditions and set severities to indicate the importance of each type of event.

NOTE: In case of Cisco UCS servers, monitoring power supplies is only applicable to Cisco UCS C-Series Rack Server.

38.9.1 Resource Objects

Power supply object

38.9.2 Default Schedule

The default interval for this script is **15 minutes**.

38.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain power supply metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the power supply. The default is Yes.
Event severity when job failed to obtain power supply metrics	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the power supply. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor power supply status. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor power supply status. The default is 35.
Event Details	

Description	How to Set It
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.
Event Notification	
Monitor Power Supply Status	For more information about the various power supply states, see "Understanding Hardware Resource States" on page 2232.
Raise event if power supply is in Good state?	Select **Yes** to raise an event if the operational status of the power supply is Good. The default is unselected.
Event severity when power supply is in Good state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the power supply is Good. The default is 25.
Raise event if power supply is in Error state?	Select **Yes** to raise an event if the operational status of the power supply is Error. The default is Yes.
Event severity when power supply is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the power supply is Error. The default is 5.
Raise event if power supply is in Degraded state?	Select **Yes** to raise an event if the operational status of the power supply is Degraded. The default is Yes.
Event severity when power supply is in Degraded state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the power supply is Degraded. The default is 15.
Raise event if power supply is in Undefined state?	Select **Yes** to raise an event if the operational status of the power supply is Undefined. The default is unselected.
Event severity when power supply is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the power supply is Undefined. The default is 12.
Raise event if power supply is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the power supply is Miscellaneous. The default is unselected.
Event severity when power supply is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the power supply is Miscellaneous. The default is 25.
Data Collection	
Collect data for power supply device status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: If you want to monitor the health status of the specified power supply devices. • Exclusion: If you do not want to monitor the health status of the specified power supply devices.

Description	How to Set It
Include or exclude power supplies	Specify a list of power supply devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices. For example: `PS01,PS02,PS03` Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring. All regular expressions are supported. For example, if you want to monitor `PS01`, `PS02`, and `PS03`, then specify `PS0[1-3]`. To monitor the devices for a specific server, specify the server name and the device name in the following format: <*server name*>:<*device name*> For example: `Server01:PS3` `PS3` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria. Based on the selected criteria, the format `<servername>:*` includes or excludes monitoring of all power supply devices for the specified server. For example: `Server01:*` includes or excludes monitoring of all power supply devices for `Server01`. You can also specify a list of servers in the following format: `Server01:*, Server02:*, Server03:*` All the power supply devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria. For more information on regular expressions, see "Using Regular Expression Filters" on page 2233.

Full path to file containing list of power supplies to include or exclude	Specify the path of the file that lists the power supply devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	To list the devices in the file, do one of the following:
	
	• Use commas with no spaces to separate the devices. For example: `PS01,PS02,PS03`
	• List the devices on separate lines. For example:
	
	`PS01`
	
	`PS02`
	
	`PS03`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

38.10 ProcessorHealth

Use this Knowledge Script to monitor the operational status of system CPUs. The script raises an event if a monitored CPU is not operating properly. You can also choose to raise events for other conditions and set severities to indicate the importance of each type of event.

38.10.1 Resource Objects

CPU object

38.10.2 Default Schedule

The default interval for this script is **15 minutes**.

38.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain CPU metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the CPU. The default is Yes.
Event severity when job failed to obtain **CPU** metrics	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the CPU. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor processor status. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor processor status. The default is 35.
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.
Event Notification	

Description	How to Set It
Monitor CPU Status	For more information about the various CPU states, see "Understanding Hardware Resource States" on page 2232.
Raise event if CPU is in Good state?	Select **Yes** to raise an event if the operational status of the CPU is Good. The default is unselected.
Event severity when CPU is in Good state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the CPU is Good. The default is 25.
Raise event if CPU is in Error state?	Select **Yes** to raise an event if the operational status of the CPU is Error. The default is Yes.
Event severity when CPU is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the CPU is Error. The default is 5.
Raise event if CPU is in Degraded state?	Select **Yes** to raise an event if the operational status of the CPU is Degraded. The default is Yes.
Event severity when CPU is in Degraded state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the CPU is Degraded. The default is 15.
Raise event if CPU is in Undefined state?	Select **Yes** to raise an event if the operational status of the CPU is Undefined. The default is unselected.
Event severity when CPU is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the CPU is Undefined. The default is 12.
Raise event if CPU is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the CPU is Miscellaneous. The default is unselected.
Event severity when CPU is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the CPU is Miscellaneous. The default is 25.
Data Collection	
Collect data for CPU device status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Collect data for CPU device clockspeed?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns the current speed of the monitored resources. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: If you want to monitor the health status of the specified processor devices. • Exclusion: If you do not want to monitor the health status of the specified processor devices.

Description	How to Set It
Include or exclude processors	Specify a list of processor devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices. For example: `CPU01,CPU02,CPU03` Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring. All regular expressions are supported. For example, if you want to monitor `CPU01`, `CPU02`, and `CPU03`, then specify `CPU0[1-3]`. To monitor the devices for a specific server, specify the server name and the device name in the following format: <*server name*>:<*device name*> For example: `Server01:CPU7` `CPU7` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria. Based on the selected criteria, the format `<servername>:*` includes or excludes monitoring of all processor devices for the specified server. For example: `Server01:*` includes or excludes monitoring of all processor devices for `Server01`. You can also specify a list of servers in the following format: `Server01:*, Server02:*, Server03:*` All the processor devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria. For more information on regular expressions, see "Using Regular Expression Filters" on page 2233.

Full path to file containing list of processors to include or exclude	Specify the path of the file that lists the processor devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	To list the devices in the file, do one of the following:
	
	• Use commas with no spaces to separate the devices. For example: `CPU01,CPU02,CPU03`
	• List the devices on separate lines. For example:
	
	`CPU01`
	
	`CPU02`
	
	`CPU03`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

38.11 SmartArrayControllerHealth

Use this Knowledge Script to monitor the operational status of Smart Array controllers. The script raises an event if a monitored controller is not operating properly. You can also choose to raise events for other conditions and set severities to indicate the importance of each type of event.

38.11.1 Resource Objects

Smart Array controller object

38.11.2 Default Schedule

The default interval for this script is **15 minutes**.

38.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain Smart Array controller metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the controller. The default is Yes.
Event severity when job failed to obtain **Smart Array controller** metrics	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the controller. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor Smart Array controller status. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor Smart Array controller status. The default is 35.
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.

Description	How to Set It
Event Notification	
Monitor Smart Array Controller Status	For more information about the various Smart Array controller states, see "Understanding Hardware Resource States" on page 2232.
Raise event if Smart Array controller is in Good state?	Select **Yes** to raise an event if the operational status of the controller is Good. The default is unselected.
Event severity when Smart Array controller is in Good state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the controller is Good. The default is 25.
Raise event if Smart Array controller is in Error state?	Select **Yes** to raise an event if the operational status of the controller is Error. The default is Yes.
Event severity when Smart Array controller is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the controller is Error. The default is 5.
Raise event if Smart Array controller is in Degraded state?	Select **Yes** to raise an event if the operational status of the controller is Degraded. The default is Yes.
Event severity when Smart Array controller is in Degraded state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the controller is Degraded. The default is 15.
Raise event if Smart Array controller is in Undefined state?	Select **Yes** to raise an event if the operational status of the Smart Array controller is Undefined. The default is unselected.
Event severity when Smart Array controller is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the controller is Undefined. The default is 12.
Raise event if Smart Array controller is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the controller is Miscellaneous. The default is unselected.
Event severity when Smart Array controller is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the controller is Miscellaneous. The default is 25.
Data Collection	
Collect data for Smart Array controller device status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: If you want to monitor the health status of the specified Smart Array controller devices. • Exclusion: If you do not want to monitor the health status of the specified Smart Array controller devices.

Description	How to Set It
Include or exclude Smart Array controllers	Specify a list of Smart Array controller devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices. For example: `SmartArray01,SmartArray02,SmartArray03` Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring. All regular expressions are supported. For example, if you want to monitor `SmartArray01`, `SmartArray02`, and `SmartArray03`, then specify `SmartArray0[1-3]`. To monitor the devices for a specific server, specify the server name and the device name in the following format: <*server name*>:<*device name*> For example: `Server01:SmartArray5` `SmartArray5` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria. Based on the selected criteria, the format `<servername>:*` includes or excludes monitoring of all Smart Array controller devices for the specified server. For example: `Server01:*` includes or excludes monitoring of all Smart Array controller devices for `Server01`. You can also specify a list of servers in the following format: `Server01:*, Server02:*, Server03:*` All the Smart Array controller devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria. For more information on regular expressions, see "Using Regular Expression Filters" on page 2233.

Full path to file containing list of Smart Array controllers to include or exclude	Specify the path of the file that lists the Smart Array controller devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	To list the devices in the file, do one of the following:
	
	• Use commas with no spaces to separate the devices. For example: `SmartArray01,SmartArray02,SmartArray03`
	• List the devices on separate lines. For example:
	
	`SmartArray01`
	
	`SmartArray02`
	
	`SmartArray03`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

38.12 StorageBoxHealth

Use this Knowledge Script to monitor the operational status of storage boxes on HP servers. The script raises an event if a monitored storage box is not operating properly. You can also choose to raise events for other conditions and set severities to indicate the importance of each type of event.

This Knowledge Script does not apply to Cisco UCS, Dell, and IBM servers.

38.12.1 Resource Objects

Storage box object for HP servers

38.12.2 Default Schedule

The default interval for this script is **15 minutes**.

38.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain storage box device metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the storage box. The default is Yes.
Event severity when job failed to obtain storage box device metrics	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the storage box. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor storage box status. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor storage box status. The default is 35.
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.

Description	How to Set It
Event Notification	
Monitor Storage Box Status	For more information about the various storage box states, see "Understanding Hardware Resource States" on page 2232.
Raise event if storage box device is in Good state?	Select **Yes** to raise an event if the operational status of the storage box is Good. The default is unselected.
Event severity when storage box device is in Good State	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the storage box is Good. The default is 25.
Raise event if storage box device is in Error state?	Select **Yes** to raise an event if the operational status of the storage box is Error. The default is Yes.
Event severity when storage box device is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the storage box is Error. The default is 5.
Raise event if storage box device is in Undefined state?	Select **Yes** to raise an event if the operational status of the storage box is Undefined. The default is unselected.
Event severity when storage box device is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the storage box is Undefined. The default is 12.
Raise event if storage box device is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the storage box is Miscellaneous. The default is unselected.
Event severity when storage box device is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the storage box is Miscellaneous. The default is 25.
Data Collection	
Collect data for storage box device status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: If you want to monitor the health status of the specified storage box devices. • Exclusion: If you do not want to monitor the health status of the specified storage box devices.

Description	How to Set It
Include or exclude storage boxes	Specify a list of storage box devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices. For example: `Box01,Box02,Box03` Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring. All regular expressions are supported. For example, if you want to monitor `Box01`, `Box02`, and `Box03`, then specify `Box0[1-3]`. To monitor the devices for a specific server, specify the server name and the device name in the following format: <*server name*>:<*device name*> For example: `Server01:Box3` `Box3` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria. Based on the selected criteria, the format `<servername>:*` includes or excludes monitoring of all storage box devices for the specified server. For example: `Server01:*` includes or excludes monitoring of all storage box devices for `Server01`. You can also specify a list of servers in the following format: `Server01:*, Server02:*, Server03:*` All the storage box devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria. For more information on regular expressions, see "Using Regular Expression Filters" on page 2233.

Full path to file containing list of storage boxes to include or exclude	Specify the path of the file that lists the storage box devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	To list the devices in the file, do one of the following:
	
	• Use commas with no spaces to separate the devices. For example: `Box01,Box02,Box03`
	• List the devices on separate lines. For example:
	
	`Box01`
	
	`Box02`
	
	`Box03`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

38.13 TemperatureHealth

Use this Knowledge Script to monitor the operational status of the system temperature. The script raises an event if there is a temperature-related issue. You can also choose to raise events for other conditions and set severities to indicate the importance of each type of event.

38.13.1 Resource Objects

Thermometer object

38.13.2 Default Schedule

The default interval for this script is **15 minutes**.

38.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain temperature sensor metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the temperature sensor. The default is Yes.
Event severity when job failed to obtain temperature sensor metrics	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the temperature sensor. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor temperature sensor status. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor temperature sensor status. The default is 35.
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.

Description	How to Set It
Event Notification	
Monitor Temperature Sensor Status	For more information about the various temperature sensor states, see "Understanding Hardware Resource States" on page 2232.
Raise event if temperature sensor is in Good state?	Select **Yes** to raise an event if the operational status of the temperature sensor is Good. The default is unselected.
Event severity when temperature sensor is in Good state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the temperature sensor is Good. The default is 25.
Raise event if temperature sensor is in Error state?	Select **Yes** to raise an event if the operational status of the temperature sensor is Error. The default is Yes.
Event severity when temperature sensor is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the temperature sensor is Error. The default is 5.
Raise event if temperature sensor is in Degraded state?	Select **Yes** to raise an event if the operational status of the temperature sensor is Degraded. The default is Yes.
Event severity when temperature sensor is in Degraded state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the temperature sensor is Degraded. The default is 15.
Raise event if temperature sensor is in Undefined state?	Select **Yes** to raise an event if the operational status of the temperature sensor is Undefined. The default is unselected.
Event severity when temperature sensor is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the temperature sensor is Undefined. The default is 12.
Raise event if temperature sensor is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the temperature sensor is Miscellaneous. The default is unselected.
Event severity when temperature sensor is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the temperature sensor is Miscellaneous. The default is 25.
Data Collection	
Collect data for temperature sensor status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Collect data for temperature sensor reading?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns the current temperature sensor reading for the monitored resources. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: If you want to monitor the health status of the specified temperature sensor devices. • Exclusion: If you do not want to monitor the health status of the specified temperature sensor devices.

Description	How to Set It

Include or exclude temperature devices	Specify a list of temperature sensor devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices.
	
	For example: `Temp01,Temp02,Temp03`
	
	Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring.
	
	All regular expressions are supported. For example, if you want to monitor `Temp01`, `Temp02`, and `Temp03`, then specify `Temp0[1-3]`.
	
	To monitor the devices for a specific server, specify the server name and the device name in the following format:
	
	`<server name>:<device name>`
	
	For example: `Server01:Temp4`
	
	`Temp4` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria.
	
	Based on the selected criteria, the format `<servername>:*` includes or excludes monitoring of all temperature sensor devices for the specified server. For example: `Server01:*` includes or excludes monitoring of all temperature sensor devices for `Server01`.
	
	You can also specify a list of servers in the following format:
	
	`Server01:*, Server02:*, Server03:*`
	
	All the temperature sensor devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria.
	
	For more information on regular expressions, see "Using Regular Expression Filters" on page 2233.

Full path to file containing list of temperature devices to include or exclude	Specify the path of the file that lists the temperature sensor devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	To list the devices in the file, do one of the following:
	• Use commas with no spaces to separate the devices. For example: `Temp01,Temp02,Temp03`
	• List the devices on separate lines. For example:
	
	`Temp01`
	
	`Temp02`
	
	`Temp03`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

38.14 VoltageHealth

Use this Knowledge Script to monitor voltage levels on a system board. The script raises an event if there is a voltage-related issue. You can also choose to raise events for other conditions and set severities to indicate the importance of each type of event.

This Knowledge Script is not applicable for HP servers.

38.14.1 Resource Objects

Voltage object

38.14.2 Default Schedule

The default interval for this script is **15 minutes**.

38.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	**How to Set It**
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 5.
Raise event if job failed to obtain voltage device metrics?	Select **Yes** to raise an event if the Knowledge Script job is not able to obtain data about the operational status of the voltage sensor. The default is Yes.
Event severity when job failed to obtain voltage device metrics	Set the event severity, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to obtain data about the operational status of the voltage sensor. The default is 15.
Raise event if XML is modified?	Select **Yes** to raise an event if the XML for this Knowledge Script is modified. The default is Yes.
Event severity when XML is modified	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the XML for this Knowledge Script is modified. The default is 22.
Raise event if full path to file containing filters does not exist?	Select **Yes** to raise an event if the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor voltage sensor status. The default is unselected.
Event severity when full path to file containing filters does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job is not able to locate the file that specifies the list of computers for which you do not want to monitor voltage sensor status. The default is 35.
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.

Description	How to Set It
Event Notification	
Monitor Voltage Device Status	For more information about the various voltage device states, see "Understanding Hardware Resource States" on page 2232.
Raise event if voltage device is in Good state?	Select **Yes** to raise an event if the operational status of the voltage sensor is Good. The default is unselected.
Event severity when voltage device is in Good state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the voltage sensor is Good. The default is 25.
Raise event if voltage device is in Error state?	Select **Yes** to raise an event if the operational status of the voltage sensor is Error. The default is Yes.
Event severity when voltage device is in Error state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the voltage sensor is Error. The default is 5.
Raise event if voltage device is in Undefined state?	Select **Yes** to raise an event if the operational status of the voltage sensor is Undefined. The default is unselected.
Event severity when voltage device is in Undefined state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the voltage sensor is Undefined. The default is 12.
Raise event if voltage device is in Miscellaneous state?	Select **Yes** to raise an event if the operational status of the voltage sensor is Miscellaneous. The default is unselected.
Event severity when voltage device is in Miscellaneous state	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the operational status of the voltage sensor is Miscellaneous. The default is 25.
Data Collection	
Collect data for voltage device status?	Select **Yes** to collect data for charts and reports. If you select **Yes**, this Knowledge Script returns a value that indicates the status of the monitored resources. For more information about the possible values, see "Understanding Hardware Resource States" on page 2232. The default is unselected.
Inclusion or Exclusion Filter	
Inclusion or exclusion criteria	Select one of the following criteria: • Inclusion: Select **Inclusion** if you want to monitor the health status of the specified voltage devices. • Exclusion: Select **Exclusion** if you do not want to monitor the health status of the specified voltage devices.

Description	**How to Set It**
Include or exclude voltage devices	Specify a list of voltage devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. Use commas with no spaces to separate the devices. For example: `Voltage01,Voltage02,Voltage03` Based on the selected criteria, the specified devices of all the monitored servers are included or excluded from monitoring. All regular expressions are supported. For example, if you want to monitor `Voltage01`, `Voltage02`, and `Voltage03`, then specify `Voltage0[1-3]`. To monitor the devices for a specific server, specify the server name and the device name in the following format: <*server name*>:<*device name*> For example: `Server01:Voltage3` `Voltage3` is included in the monitoring of `Server01` only if you have selected the **Inclusion** criteria. Based on the selected criteria, the format `<servername>:*` includes or excludes monitoring of all voltage devices for the specified server. For example: `Server01:*` includes or excludes monitoring of all voltage devices for `Server01`. You can also specify a list of servers in the following format: `Server01:*, Server02:*, Server03:*` All the voltage devices of `Server01`, `Server02`, and `Server03` are included in the monitoring only if you have selected the **Inclusion** criteria. For more information on regular expressions, see "Using Regular Expression Filters" on page 2233.

Full path to file containing list of voltage device to include or exclude	Specify the path of the file that lists the voltage devices that you want to include or exclude from monitoring based on your selection in the **Inclusion or exclusion criteria** parameter. You can also click **Browse [...]** and navigate to the file.
	
	Use the local path to the file rather than the UNC path. For example, use `D:\<path to file>` rather than `\\<server>\D$\<path to file>`.
	
	To list the devices in the file, do one of the following:
	
	• Use commas with no spaces to separate the devices. For example: `Voltage01,Voltage02,Voltage03`
	• List the devices on separate lines. For example:
	
	`Voltage01`
	
	`Voltage02`
	
	`Voltage03`
	
	All regular expressions are supported. For examples, see .

Case-sensitive inclusion or exclusion	Select **Yes** to use case-sensitive pattern matching to include or exclude resources from monitoring based on the selected criteria. The default is unselected.

39 HP SIM Knowledge Scripts

AppManager (HP SIM) provides a set of Knowledge Scripts for monitoring servers running HP SIM. It also includes Knowledge Scripts to generate reports about the performance of your HP SIM implementation.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
ArrayLogicalDriveCondition	Monitors the overall condition of logical drives in an array set.
ArrayLogicalDriveStatus	Monitors the status of logical drives in an array set.
ArrayPhysicalDiskStatus	Monitors the status of physical drives in an array set.
ASRHealth	Monitors Automatic Server Recovery (ASR) status and the number of ASR-initiated reboots.
ASRStatus	Monitors changes to the Automatic Server Recovery (ASR) status, and the status of the Pager, DialIn, and DialOut functions.
CorrectableMem	Monitors the condition of correctable memory and the number of new correctable memory errors.
CriticalErrorLog	Monitors the Critical Error Log for uncorrected critical error entries.
EventLog	Monitors NT event log entries created by SIM (entries with Insight Agents as the source).
FanIndividual	Checks the status of individual fans.
FanSummary	Monitors the status of System and CPU fans.
FCAExternalControllerFail	Monitors the operational status of Fibre Channel Array (FCA) external controllers.
FCAFail	Monitors the status of FCA controllers.
FCAHostControllerFail	Monitors the operational status of FCA host controllers.
FCAHostFail	Monitors the status of FCA host controllers.
FCAOverallCondition	Monitors the overall condition of the FCA system.
FLTPWRIndividualCondition	Monitors the status of fault tolerant power supplies.
FLTPWROverallCondition	Monitors the overall condition of the Fault Tolerant Power Supply sub-system.
HealthCheck	Monitors all SIM services and automatically restarts any service that is not running.

Knowledge Script	What It Does
IDAFail	Monitors IDA controllers and IDA drives.
IDEFail	Monitors IDE controllers and IDE drives.
IntegratedLog	Monitors the Integrated Management Log.
NICError	Monitors network interface transmission errors.
NICFail	Checks whether the network interface subsystem is down.
Report_ASRHealth-RebootCount	Generates a report about ASR status, and the number of ASR-initiated reboots.
Report_CIMResource_CPU_MemoryUsage	Generates a report about CPU and memory usage by SIM processes.
Report_CIMSCSI-Status	Generates a report about the number of hard resets, soft resets, and command timeouts for the SCSI controller.
Report_CorrectableMemoryErrors	Generates a report about the condition of correctable memory, and the number of new correctable memory errors.
Report_NewEventLogEntries	Generates a report about Windows event log entries with the SIM Insight Agent as the source.
Report_NICErrorRate	Generates a report about network interface input and output errors.
ResourceHigh	Monitors the CPU and memory used by the SIM process.
RIBBatteryRechargeLevel	Monitors the battery recharge level of the Remote Insight Board battery.
RIBBatteryStatus	Monitors the status of the Remote Insight Board battery.
RIBBatteryRechargeLevel	Monitors the status of the Remote Insight Board cable connections, including the keyboard, mouse and external power cable.
RIBCondition	Monitors the overall condition of the Remote Insight Board.
RIBInterfaceStatus	Monitors the interface status of the Remote Insight Board.
RIBVirtualPowerCable	Monitors the virtual power cable connection of the Remote Insight Board.
SCSIFail	Monitors discovered SCSI drives.
SCSITimeout	Monitors the number of hard resets, soft resets, and command timeouts for the SCSI controller during the monitoring interval.
TeamedNICCondition	Monitors the condition of Teamed NIC.The job raises an event when Teamed NIC is degraded or fails.
TempIndividual	Monitors the status of SIM temperature sensors.
ThermalStatus	Monitors the computer's thermal environment and the status of the computer's temperature sensors.
UPSBatteryLow	Monitors the UPS battery life.
UPSLineStatus	Checks the status of the UPS AC power line.

39.1 ArrayLogicalDriveCondition

Use this Knowledge Script to monitor the overall condition of logical drives in an array set. The job raises an event if a monitored logical drive is not operating properly.

39.1.1 Resource Object

Array Logical Drive object

39.1.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

39.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Logical drive failed	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set failed. The default is 5.
Severity - Logical drive degraded	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set is in a degraded condition. The default is 12.
Severity - Unknown condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set is in an unknown condition. The default is 15.
Severity - Unexpected Knowledge Script error	Set the event severity level from 1 to 40, to indicate the importance of an event in which the ArrayLogicalDriveCondition Knowledge Script fails unexpectedly. The default is 35.

39.2 ArrayLogicalDriveStatus

Use this Knowledge Script to monitor the status of logical drives in an array set. The job raises an event if the status of a monitored logical drive is anything but normal.

39.2.1 Resource Object

Array Logical Drive object

39.2.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

39.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Event severity level for SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Event severity level for logical drive failed	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set failed. The default is 5.
Event severity level for logical drive not configured	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set is not configured. The default is 25.
Event severity level for logical drive recovering	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set is recovering. The default is 15.
Event severity level for logical drive ready for rebuild	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set is ready for rebuild. The default is 25.
Event severity level for logical drive rebuilding	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set is being rebuilt. The default is 15.
Event severity level for wrong physical disk replaced	Set the event severity level from 1 to 40, to indicate the importance of an event in which the wrong physical drive in an array set is replaced. The default is 12.
Event severity level for physical disk not responding	Set the event severity level from 1 to 40, to indicate the importance of an event in which a physical disk in an array set is not responding. The default is 12.
Event severity level for array enclosure overheating	Set the event severity level from 1 to 40, to indicate the importance of an event in which an array enclosure is overheating. The default is 12.

Description	How to Set It
Event severity level for logical drive no longer functioning	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set is no longer functioning. The default is 5.
Event severity level for logical drive doing data expansion	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set is doing data expansion. The default is 15.
Event severity level for logical drive ready for data expansion	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set is ready for data expansion. The default is 25.
Event severity level for logical drive unavailable	Set the event severity level from 1 to 40, to indicate the importance of an event in which a logical drive in an array set is unavailable. The default is 25.
Event severity level for unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of a logical drive in an array set is unknown. The default is 15.
Event severity level for unexpected Knowledge Script error	Set the event severity level from 1 to 40, to indicate the importance of an event in which the ArrayLogicalDriveStatus job fails unexpectedly. The default is 35.

39.3 ArrayPhysicalDiskStatus

Use this Knowledge Script to monitor the status of physical drives in an array set. This Knowledge Script raises an event if any physical drive is not operating or if any operation of the physical drive has degraded.

39.3.1 Resource Object

Array Physical Disk object

39.3.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

39.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is n.
Event severity level for SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Event severity level for disk failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which a a physical drive in an array set fails. The default is 5.
Event severity level for disk degraded	Set the event severity level from 1 to 40, to indicate the importance of an event in which a physical drive in an array set is in a degraded condition. The default is 12.
Event severity level for unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of a physical drive in an array set is unknown. The default is 15.
Event severity level for unexpected Knowledge Script error	Set the event severity level from 1 to 40, to indicate the importance of an event in which the ArrayPhysicalDiskStatus job fails unexpectedly. The default is 35.

39.4 ASRHealth

Use this Knowledge Script to monitor Automatic Server Recovery (ASR) status. This Knowledge Script checks the overall condition of the ASR. The job raises an event if problems are detected. Event severity is specific to the failed condition.

This Knowledge Script also checks the number of ASR-initiated reboots that have occurred on a server during the monitoring interval. The job raises an event if the reboot count exceeds the threshold you set.

39.4.1 Resource Object

ASR object

39.4.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Collect Data? (y/n)	Set to **y** to collect data for charts and reports. If set to **y**, the script returns the number of times ASR rebooted the system. The default is **n**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Reboot maximum threshold	Specify a threshold for the maximum number of server reboots before the job raises an event. The default is 3.
Event severity level for SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Event severity level for overall condition critical	Set the event severity level from 1 to 40, to indicate the importance of an event in which the overall condition of the ASR is critical. The default is 2.
Event severity level for overall condition degraded	Set the event severity level from 1 to 40, to indicate the importance of an event in which the overall condition of the ASR is degraded. The default is 8.
Event severity level for number of reboots exceeded threshold	Set the event severity level from 1 to 40, to indicate the importance of an event in which the number of ASR-initiated reboots exceeded the threshold. The default is 5.

39.5 ASRStatus

Use this Knowledge Script to monitor changes to the Automatic Server Recovery (ASR) status. By default, the Knowledge Script checks the overall status of the ASR and the status of the Pager, DialIn, and DialOut functions. The job raises an event if the status of any monitored function changes during the monitoring interval.

NOTE: You can also raise an event when any ASR function is disabled. To have the Knowledge Script perform this check, set the Event severity level for ASR disabled parameter to a positive number.

39.5.1 Resource Object

ASR object

39.5.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Check pager? (y/n)	Set to **y** to check Pager status. The default is **y**.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Check DialIn? (y/n	Set to **y** to check DialIn status The default is **y**.
Check DialOut? (y/n)	Set to **y** to check DialOut status. The default is **y**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Event severity level for SNMP or CIM failure	Set the event severity level from 1 to 40 to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Event severity level for ASR disabled	Set the event severity level from 1 to 40 to indicate the importance of an event in which the ASR is disabled, or set to -1 if you do not want events to occur when the ASR is disabled. The default is -1.
Event severity level for ASR status change	Set the event severity level from 1 to 40, to indicate the importance of an event in which the ASR has a status change. The default is 8.

39.6 CorrectableMem

Use this Knowledge Script to monitor the condition of the correctable memory and the number of new correctable memory errors. The job raises an event if the number of correctable memory errors exceeds the threshold you set.

39.6.1 Resource Object

Correctable Memory object

39.6.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Collect data?	Set to **y** to collect data for charts and reports. If set to **y**, the script returns the number of correctable memory errors. The default is **n**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Correctable memory errors maximum threshold	Specify a threshold for the maximum number of correctable memory errors. If you specify -1, the Knowledge Script uses the threshold value from a MIB variable inside SIM. **NOTE:** Because the number of errors reported is a delta value for the interval, it is always 0 for the first interval.
Event severity level for SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Event severity level for overall condition critical	Set the event severity level from 1 to 40, to indicate the importance of an event in which the correctable memory has an overall condition of critical. The default is 2.
Event severity level for overall condition degraded	Set the event severity level from 1 to 40, to indicate the importance of an event in which the correctable memory has an overall condition of degraded. The default is 8.
Event severity level if correctable memory errors exceeded threshold	Set the event severity level from 1 to 40, to indicate the importance of an event in which the number of correctable memory errors exceeded the threshold. The default is 8.

39.7 CriticalErrorLog

Use this Knowledge Script to monitor the Critical Error Log for uncorrected critical error entries:

- A critical event indicates a failure entry in the Critical Error log.
- A degraded condition event indicates that an uncorrected error or degraded operation error has been recorded in the log.

NOTE: For more information about the raised events, check the entries using the Insight Manager Console.

39.7.1 Resource Object

Critical Error Log object

39.7.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Failure entry	Set the event severity level from 1 to 40, to indicate the importance of an event in which a failure entry is recorded in the log. The default is 5.
Severity - Degraded condition entry	Set the event severity level from 1 to 40, to indicate the importance of an event in which an uncorrected error or degraded operation error has been recorded in the log. The default is 12.
Severity - Unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which a status of unknown is recorded in the log. The default is 15.

39.8 EventLog

Use this Knowledge Script to monitor the NT event log entries created by AppManager for HP SIM. These entries are in the System log. Insight Agents are listed as the source. You can define other parameters for filtering the event log, such as event category, event ID, user, server name, and description.

39.8.1 Resource Objects

SIM server objects

39.8.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Collect data?	Set to **y** to collect data for charts and reports. The default is **n**.
Start with events in past N hours	Set this parameter to determine which events are searched the first time you run the job. The following entries are valid: • **-1** to search all existing log entries during the first interval • **n** to search entries for the past *n* hours (8 for the past 8 hours, 50 for the past 50 hours, etc.) • **0** to search no previous entries (search from the current time forward) The default is 0.
Monitor for events of type: Error?	Set to **y** if you want to monitor Error events. The default is **y**.
Monitor for events of type: Warning?	Set to **y** if you want to monitor Warning events. The default is **y**.
Monitor for events of type: Information?	Set to **y** if you want to monitor Information events. The default is **n**.
Filter the Event Category field for	If you are interested in events in a particular category (for example 9 or 4), specify an appropriate search string. The Knowledge Script looks for matching entries in the Event Log's Category field. You can specify multiple strings separated by commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Filter the Event ID field for	If you are interested in particular event IDs, specify an appropriate search string. The Knowledge Script looks for matching entries in the Event Log's Event field. You can specify multiple IDs separated by commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.

Description	How to Set It
Filter the Event User field for	If you are interested in events associated with a particular user, specify an appropriate search string. The Knowledge Script looks for matching entries in the Event Log's User field. You can specify multiple strings separated by commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Filter the Event Computer field for	If you are interested in events generated by a particular computer, specify an appropriate search string. The Knowledge Script looks for matching entries in the Event Log's Computer field. You can specify multiple strings separated by commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Filter the Event Description field for	If you are interested in events with a particular detail description or containing keywords in the description, specify an appropriate search string. The Knowledge Script looks for matching entries in the Event Log's Description field. You can specify multiple strings separated by commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Maximum number of log entries per event report	Specify the maximum number of log entries to be included in each event's detail message.The script returns multiple events if it finds more entries in the log than the maximum limit you specify. The default is 30 entries.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

39.9 FanIndividual

Use this Knowledge Script to monitor the status of individual fans. For each fan being monitored, this Knowledge Script raises an event if the fan is not operating properly or the status is unknown.

39.9.1 Resource Object

Fan object

39.9.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Event severity level for SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Event severity level for critical condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which an individual fan is in critical condition. The default is 8.
Event severity level for unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of an individual fan is unknown. The default is 15.

39.10 FanSummary

Use this Knowledge Script to monitor the status of System and CPU fans. When a required fan fails, this Knowledge Script raises an event indicating a critical condition. When a fan that is not required fails, this Knowledge Script raises an event indicating a degraded condition.

39.10.1 Resource Object

Fan object

39.10.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **y**.
Raise event if fan summary not supported (y/n)?	Set to **y** to raise an event if fan summary is not supported. The default is **n**.
Event severity level for SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Event severity level for critical failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which a required fan fails. The default is 8.
Event severity level for degraded condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which a fan that is not required fails. The default is 15.
Event severity level if fan summary not supported	Set the event severity level from 1 to 40, to indicate the importance of an event in which a fan summary is not supported. The default is 20.

39.11 FCAExternalControllerFail

Use this Knowledge Script to monitor the operational status of Fibre Channel Array external controllers.

The Knowledge Script raises:

- A critical event if the controller fails, making drives on the controller inaccessible.
- A degraded condition event if any of the controller's logical or physical drives is not operating properly.
- A warning if the status is not known.

39.11.1 Resource Object

FCA object

39.11.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - Critical failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which a controller fails. The default is 5.
Severity - Degraded condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which any of the controller's logical or physical drives is not operating properly. The default is 12.
Severity - Unknown condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of a controller is unknown. The default is 15.

39.12 FCAFail

Use this Knowledge Script to monitor the status of Fibre Channel Array (FCA) controllers.

The Knowledge Script raises:

- A critical event if the controller fails, making drives on the controller inaccessible.
- A degraded condition event if any of the controller's logical or physical drives is not operating properly.
- A warning if the status is not known.

39.12.1 Resource Object

FCA object

39.12.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Critical failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which the controller fails. The default is 5.
Severity - Degraded condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which any of the controller's logical or physical drives is not operating properly. The default is 12.
Severity - Unknown condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which the condition of the controller is unknown. The default is 9.

39.13 FCAHostControllerFail

Use this Knowledge Script to monitor the operational status of Fibre Channel host controllers.

The Knowledge Script raises:

- A critical event if the controller fails, making drives on the controller inaccessible.
- A degraded condition event if any of the controller's logical or physical drives is not operating properly.
- A warning if the status is not known.

39.13.1 Resource Object

FCA object

39.13.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Critical failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which the controller fails, making drives on the controller inaccessible. The default is 5.
Severity - Degraded condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which any of the controller's logical or physical drives is not operating properly. The default is 12.
Severity - Unknown condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which the condition of the controller is unknown. The default is 15.

39.14 FCAHostFail

Use this Knowledge Script to monitor the status of Fibre Channel Array (FCA) host controllers.

The Knowledge Script raises:

- A critical event if the controller fails, making drives on the controller inaccessible.
- A degraded condition event if any of the controller's logical or physical drives is not operating properly.
- A warning if the status is not known.

39.14.1 Resource Object

FCA object

39.14.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Controller failed	Set the event severity level from 1 to 40, to indicate the importance of an event in which the controller failed. The default is 5.
Severity - Degraded drive	Set the event severity level from 1 to 40, to indicate the importance of an event in which any of the controller's logical or physical drives is not operating properly. The default is 12.
Severity - Unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of the controller is unknown. The default is 15.

39.15 FCAOverallCondition

Use this Knowledge Script to monitor the overall condition of the FCA system.

The Knowledge Script raises:

- A critical event if the controller fails, making drives on the controller inaccessible.
- A degraded condition event if any of the host controller's logical or physical drives is not operating properly.
- A warning if the status is not known.

39.15.1 Resource Object

FCA object

39.15.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.15.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Controller failed	Set the event severity level from 1 to 40, to indicate the importance of an event in which the controller fails. The default is 5.
Severity - Degraded drive	Set the event severity level from 1 to 40, to indicate the importance of an event in which any of the host controller's logical or physical drives is not operating properly. The default is 12.
Severity - Unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of a controller is unknown. The default is 15.

39.16 FLTPWRIndividualCondition

Use this Knowledge Script to monitor the status of fault tolerant power supplies. The job raises a critical or degraded operation event when the fault tolerant power supply is not operating properly.

39.16.1 Resource Object

Fault Tolerant Power Supply object

39.16.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.16.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Power supply failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which a fault tower power supply fails. The default is 5.
Severity - Degraded operation	Set the event severity level from 1 to 40, to indicate the importance of an event in which an operation for a fault tolerant power supply is in a degraded condition. The default is 12.
Severity - Unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status if a fault tolerant power supply is unknown. The default is 15.

39.17 FLTPWROverallCondition

Use this Knowledge Script to monitor the overall condition of the fault tolerant power supply sub-system. The job raises a critical or degraded event when the sub-system is not operating properly.

39.17.1 Resource Object

Fault Tolerant Power Supply object

39.17.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.17.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Power supply failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which the fault tolerant power supply sub-system fails. The default is 5.
Severity - Degraded operation	Set the event severity level from 1 to 40, to indicate the importance of an event in which an operation for a fault tolerant power supply sub-system is a degraded condition. The default is 12.
Severity - Unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of a fault tolerant power supply sub-system is unknown. The default is 15.
Severity - Unexpected Knowledge Script error	Set the event severity level from 1 to 40, to indicate the importance of and event in which the FLTPWROverallCondition Knowledge Script fails unexpectedly. The default is 35.

39.18 HealthCheck

Use this Knowledge Script to monitor all SIM services. The job raises an event if any service is not running and automatically re-starts the service. In addition, the `SNMP Get` function is explicitly exercised to ensure its proper operation. This Knowledge Script raises an event if the SNMP cannot get a SIM `MIB` variable.

39.18.1 Resource Object

SIM server services objects

39.18.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

39.18.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Auto-start service?	Set to **y** to automatically restart services that are down. The default is **y**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Severity - Service down; restart failed	Set the event severity level from 1 to 40, to indicate the importance of an event in which a SIM service is down and restart failed. The default is 5.
Severity - Service down; restart succeeded	Set the event severity level from 1 to 40, to indicate the importance of an event in which a SIM service was down and restart succeeded. The default is 25.
Severity - Service down; do not restart	Set the event severity level from 1 to 40, to indicate the importance of an event in which a SIM service is down and will not be restarted. The default is 18.
Severity - SNMP service down or cannot get MIB value.	Set the event severity level from 1 to 40, to indicate the importance of an event in which a SIM service is down or cannot get the MIB value. The default is 5.

39.19 IDAFail

Use this Knowledge Script to monitor IDA controllers.

The Knowledge Script raises:

- A critical event if an IDA drive fails.
- A degraded condition event if any IDA drive is not operating properly.
- A warning if the status is not known.

39.19.1 Resource Object

IDA

39.19.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.19.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the community name. The default is either the community name specified in the Security Manager or *public* if no community name has been specified.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Failed drive	Set the event severity level from 1 to 40, to indicate the importance of an event in which an IDA drive fails. The default is 5.
Severity - Degraded drive	Set the event severity level from 1 to 40, to indicate the importance of an event in which an IDA drive is not operating properly. The default is 12.
Severity - Unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of an IDA drive is unknown. The default is 15.

39.20 IDEFail

Use this Knowledge Script to monitor IDE controllers.

The Knowledge Script raises:

- A critical event if an IDE drive fails.
- A degraded condition event if any IDE drive is not operating properly.
- A warning if the status is not known.

39.20.1 Resource Object

IDE

39.20.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.20.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the community name. The default is either the community name specified in the Security Manager or *public* if no community name has been specified.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Failed drive	Set the event severity level from 1 to 40, to indicate the importance of an event in which an IDE drive fails. The default is 5.
Severity - Degraded drive	Set the event severity level from 1 to 40, to indicate the importance of an event in which an IDE drive is not operating properly. The default is 12.
Severity - Unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of an IDE drive is unknown. The default is 15.

39.21 IntegratedLog

Use this Knowledge Script to monitor the current status of the SIM log. The job raises an event if it is not able to scan the SIM log or if it finds unsupported Knowledge Scripts running on the SIM agent.

If this Knowledge Script cannot scan the SIM log, it returns, `"Failed to scan Integrated Management Log:  errcode = "`. If an unsupported Knowledge Script is run on the SIM agent, it returns, `"This Knowledge Script is not supported on this Compaq server."`

39.21.1 Resource Object

Integrated management log

39.21.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.21.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event? (y/n)	Set to **y** to raise events. The default is **y**.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Community	Specify the community name. The default is either the community name specified in the Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Component failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which a component fails. The default is 8.
Severity - Non-fatal error	Set the event severity level from 1 to 40, to indicate the importance of an event in which a non-fatal error occurs. The default is 15.
Severity - Informational but with LCD alert message	Set the event severity level from 1 to 40, to indicate the importance of an informational but with LCD alert message. The default is 20.
Ignore log entries without date and time?	Set to **y** to allow the IntegratedLog Knowledge Script job to ignore log entries for which there is no date or time. If set to n, the IntegratedLog Knowledge Script job monitors log entries for which there is no date or time. However, because the job cannot determine whether these entries are old or new, the job might return results for them more than once.

39.22 NICError

Use this Knowledge Script to monitor network interface transmission errors. Both input and output errors are reported and compared to respective thresholds. The job raises an event when the number of network interface errors per minute exceeds the threshold you set.

39.22.1 Resource Object

NIC object

39.22.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

39.22.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Collect data?	Set to **y** to collect data for charts and reports. The default is **n**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Input errors per minute maximum threshold	Specify a threshold for the maximum number of input errors per minute. The default is 2 errors per minute.
Output errors per minute maximum threshold	Specify a threshold for the maximum number of output errors per minute. The default is 4 errors per minute.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Input errors per minute exceeded threshold	Set the event severity level from 1 to 40, to indicate the importance of an event in which input errors per minute exceeded the threshold you set. The default is 10.
Severity - Output errors per minute exceeded threshold	Set the event severity level from 1 to 40, to indicate the importance of an event in which output errors per minute exceeded the threshold you set. The default is 10.

39.23 NICFail

Use this Knowledge Script to monitor the status of the network interface. This Knowledge Script checks whether the network interface subsystem is down when the administrator has indicated it should be in the "up" state. The event details message includes the time when the interface was discovered as down.

39.23.1 Resource Object

NIC object

39.23.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

39.23.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Interface down	Set the event severity level from 1 to 40, to indicate the importance of an event in which the network interface subsystem is down. The default is 6.

39.24 Report_ASRHealth-RebootCount

Use this CIM_Report script to generate a report about Automatic Server Recovery (ASR) status, and the number of ASR-initiated reboots. This report allows you to make a statistical analysis of the data point values over the time range you define for the report.

This report uses data collected by the ASRHealth Knowledge Script.

39.24.1 Resource Object

Report agent

39.24.2 Default Schedule

The default schedule for this script is **Run once**.

39.24.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Filter the data in your report by computer name.
Select time range	Filter the data in your report by a specific or sliding time range.
Select peak weekday(s)	Filter the data in your report by the days of the week.
Data settings	
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report • **Minimum**: The minimum value of data points for the time range of the report • **Maximum**: The maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report • **Range**: The range of values in the datastreams (maximum - minimum = range) • **StandardDeviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time range of the report • **Close**: The last value for the time range of the report • **Change**: The difference between the first and last values for the time range of the report (close - open = change) • **Count**: The number of data points for the time range of the report

Description	How to Set It
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N% of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N% of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or percent (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is **yes**.
Include table?	Set to **yes** to include a table of datastream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of datastream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. The default is no. A job ID helps you correlate a specific instance of a Report Script with the corresponding report.
Select properties	Set miscellaneous report properties as required.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. The default is no. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is **yes**.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).

Description	How to Set It
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

39.25 Report_CIMResource_CPU_MemoryUsage

Use this CIM_Report script to generate a report about CPU and memory usage by SIM processes. This report allows you to make a statistical analysis of the data point values over the time range you define for the report.

This report uses data collected by the ResourceHigh Knowledge Script.

39.25.1 Resource Object

Report agent

39.25.2 Default Schedule

The default schedule for this script is **Run once**.

39.25.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Filter the data in your report by computer name.
Select time range	Filter the data in your report by a specific or sliding time range.
Select peak weekday(s)	Filter the data in your report by the days of the week.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the datastream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report • **Minimum**: The minimum value of data points for the time range of the report • **Maximum**: The maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report • **Range**: The range of values in the datastream (maximum - minimum = range) • **StandardDeviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time range of the report • **Close**: The last value for the time range of the report • **Change**: The difference between the first and last values for the time range of the report (close - open = change) • **Count**: The number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N% of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N% of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or percent (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of datastream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of datastream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.

Description	How to Set It
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as needed.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

39.26 Report_CIMSCSI-Status

Use this CIM_Report script to generate a report about the number of hard resets, soft resets, and command timeouts for the SCSI controller. This report allows you to make a statistical analysis of the data point values over the time range you define for the report.

This report uses data collected by the SCSITimeout Knowledge Script.

39.26.1 Resource Object

Report agent

39.26.2 Default Schedule

The default schedule for this script is **Run once**.

39.26.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Filter the data in your report by computer name.
Select time range	Filter the data in your report by a specific or sliding time range.
Select peak weekday(s)	Filter the data in your report by the days of the week.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the datastream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report • **Minimum**: The minimum value of data points for the time range of the report • **Maximum**: The maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report • **Range**: The range of values in the datastream (maximum - minimum = range) • **StandardDeviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time range of the report • **Close**: The last value for the time range of the report • **Change**: The difference between the first and last values for the time range of the report (close - open = change) • **Count**: The number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N% of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N% of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or percent (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of datastream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of datastream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.

Description	How to Set It
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

39.27 Report_CorrectableMemoryErrors

Use this CIM_Report script to generate a report about the condition of correctable memory and the number of new correctable memory errors. This report allows you to make a statistical analysis of the data point values over the time range you define for the report.

This report uses data collected by the CorrectableMem Knowledge Script.

39.27.1 Resource Object

Report agent

39.27.2 Default Schedule

The default schedule for this script is **Run once**.

39.27.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Filter the data in your report by computer name.
Select time range	Filter the data in your report by a specific or sliding time range.
Select peak weekday(s)	Filter the data in your report by the days of the week.
Data settings	
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report • **Minimum**: The minimum value of data points for the time range of the report • **Maximum**: The maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report • **Range**: The range of values in the datastream (maximum - minimum = range) • **StandardDeviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time range of the report • **Close**: The last value for the time range of the report • **Change**: The difference between the first and last values for the time range of the report (close - open = change) • **Count**: The number of data points for the time range of the report

Description	How to Set It
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N% of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N% of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or percent (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of datastream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of datastream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as needed.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).

Description	How to Set It
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

39.28 Report_NewEventLogEntries

Use this CIM_Report script to generate a report about Windows event log entries with the SIM Insight Agent as the source. This report allows you to make a statistical analysis of the data point values over the time range you define for the report.

This report uses data collected by the EventLog Knowledge Script.

39.28.1 Resource Object

Report agent

39.28.2 Default Schedule

The default schedule for this script is **Run once**.

39.28.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Filter the data in your report by computer name.
Select time range	Filter the data in your report by a specific or sliding time range.
Select peak weekday(s)	Filter the data in your report by the days of the week.
Data settings	
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report • **Minimum**: The minimum value of data points for the time range of the report • **Maximum**: The maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report • **Range**: The range of values in the datastream (maximum - minimum = range) • **StandardDeviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time range of the report • **Close**: The last value for the time range of the report • **Change**: The difference between the first and last values for the time range of the report (close - open = change) • **Count**: The number of data points for the time range of the report

Description	How to Set It
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N% of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N% of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or percent (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of datastream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of datastream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as needed.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).

Description	How to Set It
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

39.29 Report_NICErrorRate

Use this CIM_Report script to generate a report about network interface input and output errors. This report allows you to make a statistical analysis of the data point values over the time period you define for the report.

This report uses data collected by the NICError Knowledge Script.

39.29.1 Resource Object

Report agent

39.29.2 Default Schedule

The default schedule for this script is **Run once**.

39.29.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Filter the data in your report by computer name.
Select time range	Filter the data in your report by a specific or sliding time range.
Select peak weekday(s)	Filter the data in your report by the days of the week.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the datastream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report • **Minimum**: The minimum value of data points for the time range of the report • **Maximum**: The maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report • **Range**: The range of values in the datastream (maximum - minimum = range) • **StandardDeviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time range of the report • **Close**: The last value for the time range of the report • **Change**: The difference between the first and last values for the time range of the report (close - open = change) • **Count**: The number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N% of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N% of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or percent (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of datastream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of datastream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set parameters for the output folder.

Description	How to Set It
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

39.30 ResourceHigh

Use this Knowledge Script to monitor the CPU and memory used by the SIM process. The job raises an event if the CPU or memory usage exceeds the threshold you set.

39.30.1 Resource Object

SIM server object

39.30.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.30.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Collect data?	Set to **y** to collect data for charts and reports. The default is **n**.
%CPU usage maximum threshold	Specify a threshold for the maximum percentage of the CPU the SIM process should use. The default is 60%.
Memory usage maximum threshold	Specify a threshold for the maximum memory (in MB) the SIM process should use. The default is 6MB.
Event severity level	You can set the event severity level, from 1 to 40, to indicate the importance of this event. The default is 8.

39.31 RIBBatteryRechargeLevel

Use this Knowledge Script to monitor the battery recharge level of the Remote Insight Board. The job raises an event if the battery recharge level is below the threshold you set.

39.31.1 Resource Object

Remote Insight Board object

39.31.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.31.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Collect data?	Set to **y** to collect data for charts and reports. The default is **n**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Recharge level minimum threshold	Specify a threshold for the minimum percentage to which the battery is recharged. The default is 75%.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Recharge level below threshold	Set the event severity level from 1 to 40, to indicate the importance of an event in which the battery recharge level of the Remote Insight Board is below the threshold you set. The default is 5.

39.32 RIBBatteryStatus

Use this Knowledge Script to monitor the status of the Remote Insight Board battery. The job raises an event if the battery has failed or is disconnected.

39.32.1 Resource Object

Remote Insight Board object

39.32.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.32.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Collect data?	Set to **y** to collect data for charts and reports. The default is **n**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Battery failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which the Remote Insight Board battery fails. The default is 5.
Severity - Battery disconnected	Set the event severity level from 1 to 40, to indicate the importance of an event in which the Remote Insight Board battery **is disconnected**. The default is 15.
Severity - Unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of the Remote Insight Battery is unknown. The default is 15.

39.33 RIBCableConnections

Use this Knowledge Script to monitor the status of the Remote Insight board cable connections, including the keyboard, mouse, and external power cable. The job raises an event if any cable is disconnected.

39.33.1 Resource Object

Remote Insight Board object

39.33.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.33.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Collect data? (y/n)	Set to **y** to collect data for charts and reports. The default is **n**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Cable disconnected	Set the event severity level from 1 to 40, to indicate the importance of an event in which a Remote Insight Board cable is disconnected. The default is 5.
Severity - Unknown connection status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of a Remote Insight Board connection is unknown. The default is 15.

39.34 RIBCondition

Use this Knowledge Script to monitor the overall condition of the Remote Insight Board. The job raises a failed or degraded event if the board is not operating properly.

39.34.1 Resource Object

Remote Insight Board object

39.34.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.34.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Collect data?	Set to **y** to collect data for charts and reports. The default is **n**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Failed board	Set the event severity level from 1 to 40, to indicate the importance of an event in which the Remote Insight Board fails. The default is 5.
Severity - Degraded board	Set the event severity level from 1 to 40, to indicate the importance of an event in which the Remote Insight Board is not operating properly. The default is 8.
Severity - Unknown condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which the condition of the Remote Insight Board is unknown. The default is 15.

39.35 RIBInterfaceStatus

Use this Knowledge Script to monitor the interface status of the Remote Insight board. The job raises an event if the firmware of the board is not responding to commands.

39.35.1 Resource Object

Remote Insight Board object

39.35.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.35.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Collect data?	Set to **y** to collect data for charts and reports. The default is **n**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Not responding	Set the event severity level from 1 to 40, to indicate the importance of an event in which the firmware of the Remote Insight Board is not responding to commands. The default is 5.
Severity - Unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of the interface is unknown. The default is 15.

39.36 RIBVirtualPowerCable

Use this Knowledge Script to monitor the virtual power cable connection of the Remote Insight board. The job raises an event if the cable is disconnected.

39.36.1 Resource Object

Remote Insight Board object

39.36.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.36.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Collect data?	Set to **y** to collect data for charts and reports. The default is **n**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Cable disconnected	Set the event severity level from 1 to 40, to indicate the importance of an event in which the virtual power cable of the Remote Insight Board battery **is disconnected**. The default is 5.
Severity - Unknown connection status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of the virtual power cable connection of the Remote Insight Board battery **is unknown**. The default is 15.

39.37 SCSIFail

Use this Knowledge Script to monitor Small Computer System Interface (SCSI) drives.

This Knowledge Script raises:

- A critical event if a SCSI drive fails.
- A degraded condition event if any SCSI drive is not operating properly.
- A warning if the status is not known.

39.37.1 Resource Object

SCSI object

39.37.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.37.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Failed drive	Set the event severity level from 1 to 40, to indicate the importance of an event in which an SCSI drive fails. The default is 5.
Severity - Degraded drive	Set the event severity level from 1 to 40, to indicate the importance of an event in which the SCSI drive is not operating properly. The default is 12.
Severity - Unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of the SCSI drive is unknown. The default is 15.

39.38 SCSITimeout

Use this Knowledge Script to monitor the number of hard resets, soft resets, and command timeouts for the Small Computer System Interface (SCSI) controller during the monitoring interval. The job raises an event if any threshold is exceeded.

39.38.1 Resource Object

SCSI object

39.38.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

39.38.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Event?	Set to **y** to raise events. The default is **y**.
Collect data?	Set to **y** to collect data for charts and reports. If set to **y**, the script returns the number of hard resets, soft resets, and command timeouts in the interval. The default is **n**.
Hard reset maximum threshold	Specify a threshold for the maximum number of hard resets. The default is 0 hard resets.
Soft reset maximum threshold	Specify a threshold for the maximum number of soft resets. The default is 2 soft resets.
Command timeout maximum threshold	Specify a threshold for the maximum number of command timeouts. The default is 10 timeouts.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Hard reset threshold exceeded	Set the event severity level from 1 to 40, to indicate the importance of an event in which the hard reset threshold for the SCSI controller is exceeded. The default is 5.
Severity - Soft reset threshold exceeded	Set the event severity level from 1 to 40, to indicate the importance of an event in which the soft reset threshold for the SCSI controller is exceeded. The default is 8.
Severity - Timeout threshold exceed	Set the event severity level from 1 to 40, to indicate the importance of an event in which the timeout threshold for the SCSI controller is exceeded. The default is 12.

39.39 TeamedNICCondition

Use this Knowledge Script to monitor the condition of Teamed Network Interface Cards (NIC). Teamed NICs run in parallel to increase link speed. The job raises an event when Teamed NIC is degraded or fails.

39.39.1 Resource Object

Teamed NIC object

39.39.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.39.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise events. The default is **y**.
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or HP NIC Agent failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which the Teamed NIC fails. The default is 9
Severity - Degraded condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which the Teamed NIC is in a degraded condition. The default is 12.
Severity - Critical condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which the Teamed NIC is in critical condition. The default is 8.
Severity - Unknown condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which the condition of the Teamed NIC is unknown. The default is 15.

39.40 TempIndividual

Use this Knowledge Script to monitor the status of SIM temperature sensors. If the temperature sensors are operating out of normal range, this Knowledge Script raises a degraded condition event. If the temperature sensors indicate a critical condition, this Knowledge Script raises a critical condition event.

39.40.1 Resource Object

SIM temperature sensor object

39.40.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.40.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Event?	Set to **y** to raise events. The default is **y**.
Collect data?	Set to **y** to collect data for charts and reports. If set to **y**, the script returns the number of hard resets, soft resets, and command timeouts in the interval. The default is **n**.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Critical condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which the SIM temperature sensors are in critical condition. The default is 3.
Degraded condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which the SIM temperature sensors are in a degraded condition. The default is 8.
Severity - Unknown status	Set the event severity level from 1 to 40, to indicate the importance of an event in which the status of the SIM temperature sensors is unknown. The default is 15.
Severity - Unexpected Knowledge Script error	Set the event severity level from 1 to 40, to indicate the importance of and event in which the TempIndividual Knowledge Script fails unexpectedly. The default is 35.

39.41 ThermalStatus

Use this Knowledge Script to monitor the system's thermal environment and the status of the system's temperature sensors. If the overall condition of the system's thermal environment is abnormal or the temperature sensors are operating out of normal range, this Knowledge Script raises a degraded condition event. If the thermal environment or temperature sensors indicate a critical condition, this Knowledge Script raises a critical condition event.

39.41.1 Resource Object

Temperature objects

39.41.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

39.41.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Collect data?	Set to **y** to collect data for charts and reports. The default is **n**.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - Critical condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which the system's thermal environment or temperature sensors are in critical condition. The default is 3.
Severity - Degraded condition	Set the event severity level from 1 to 40, to indicate the importance of an event in which the system's thermal environment or temperature sensors are in a degraded condition. The default is 8.

39.42 UPSBatteryLow

Use this Knowledge Script to monitor the UPS battery life. The job raises an event when the battery life is below the threshold you set. Only run this Knowledge Script when the computer is not using AC power if you want to check the UPS battery.

39.42.1 Resource Object

UPS object

39.42.2 Default Schedule

The default interval for this script is **Every 3 minutes**.

39.42.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Battery life minimum threshold	Specify a threshold for the minimum number of minutes of remaining battery life. The default is 3 minutes.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - AC power is on	Set the event severity level from 1 to 40, to indicate the importance of an event in which the AC power is on. The default is 25.
Severity - Battery is low	Set the event severity level from 1 to 40, to indicate the importance of an event in which the UPS battery life is below the threshold you set. The default is 2.

39.43 UPSLineStatus

Use this Knowledge Script to monitor the UPS AC power line. The job raises a critical event if the AC power line is down.

39.43.1 Resource Object

UPS object

39.43.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

39.43.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Community	Specify the SNMP community string. The default is either the community name specified in AppManager Security Manager or *public* if no community name has been specified.
Severity - SNMP or CIM failure	Set the event severity level from 1 to 40, to indicate the importance of an event in which SNMP or HP SIM fails. The default is 9.
Severity - AC power line down	Set the event severity level from 1 to 40, to indicate the importance of an event in which the UPS AC power line is down. The default is 2.

40 IBM Systems Director Knowledge Scripts

AppManager for IBM Systems Director provides the following Knowledge Scripts: for monitoring IBM Systems Director resources. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. Or in the Operator Console, click any Knowledge Script in the Knowledge Script pane and press F1.

Knowledge Script	What It Does
EventLog	Scans the Application log for IBM Systems Director entries.
FanSpeed	Monitors the speed of some or all fans on an IBM Systems Director server.
HealthCheckHW	Monitors the overall health of IBM Systems Director hardware components.
HealthCheckMgmtSrv	Monitors IBM Systems Director-related services.
MemoryErrors	Monitors the memory bank errors on an IBM Systems Director system.
NICError	Monitors the network interface controllers on an IBM Systems Director server for transmission errors.
ServeRAIDControllerStat	Monitors the operational status of ServeRAID controllers.
ServeRAIDLogicalDriveStat	Monitors the operational status of ServeRAID logical drives.
ServeRAIDPhysicalDrivePFA	Monitors for predicted failures of RAID physical drives.
ServeRAIDPhysicalDriveStat	Monitors the operational status of ServeRAID physical drives.
Temperature	Monitors the temperature on a IBM Systems Director server.
Voltage	Monitors the voltage levels on a IBM Systems Director server.

40.1 EventLog

Use this Knowledge Script to scan the Application log for entries created by IBM Systems Director server.

In the first interval, the value you specify for the *Start with events in past N hours* option determines how far back in the log to check for matching entries. As the script continues to run at subsequent intervals, it checks for any new entries since the last log check.

You can further restrict the types of log entries that generate an event in two ways:

- Use the *Monitor for events of type* options to search only certain types of events, such as Warning events.
- Use the *Filter the [...] field for* options to search only for specific information, such as events with a specific ID.

Each time this script runs, it checks the Application log for entries matching your selection criteria and raises an event if matching entries are found. The event detail message returns the text of the log entries found. When this script is set to collect data, it returns the number of log entries found, and the data point detail message returns the text of the log entries.

40.1.1 Resource Object

Netfinity Director

40.1.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

40.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when the event log contains entries that match the criteria you specify. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this script returns the number of new event log entries matching your selection criteria. The detail message returns the text of the log entries. The default is n.
Start with events in past N hours	Set this option to determine which existing entries in the System log are scanned when the script starts to run: • **-1** scan all existing entries • **0** do not scan existing entries • **N** scan entries created in the past *N* hours (for example, 8 for the past 8 hours) The default is 0.
Monitor for Error events?	Set to **y** to monitor the event log for Error events. The default is y.

Description	How to Set It
Monitor for Warning events?	Set to **y** to monitor the event log for Warning events. The default is y.
Monitor for Information events?	Set to **y** to monitor the event log for Information events. The default is y.
Filter the Event ID field for	To monitor for particular Event IDs, enter an appropriate search string. The script looks for matching entries in the Event Log's Event field. Multiple IDs and ranges can be entered separated by commas. For example: 1,2,10-15,202. The search string can contain criteria used to include entries, exclude entries, or both. Separate include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Filter the Event Description field for	To monitor for events with a particular detail description or containing keywords in the description, enter an appropriate search string. The looks for matching entries in the Event Log's Description field. Multiple strings can be entered separated by commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Maximum number of entries per event message	Specify the maximum number of entries to be recorded into each event's detail message. If the script finds more matching entries in the log than can be put into a single event message, it raises multiple events to return all the log entries. The default is 30 entries.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the event log contains entries that match your selection criteria. The default is 8.

40.2 FanSpeed

Use this Knowledge Script to monitor the speed of a particular fan or all fans on an IBM Systems Director server. This script is useful for collecting data on all fans on an IBM Systems Director server. To raise events on the overall health of an IBM Systems Director system, including fan speed-related events, use the HealthCheckHW Knowledge Script.

IBM Systems Director defines the upper and lower operating thresholds for fan speed. Use the IBM Systems Director-specified threshold values to monitor all fans or a particular fan and raise a Warning event when the fan speed is less than the upper threshold and a Critical event when the fan speed is less than the lower threshold. You can also set a parameter to raise an event if the fan speed is normal.

Alternatively, this script allows you to specify custom values for upper and lower thresholds. Check your IBM Systems Director documentation to determine the minimum speed for a fan and set the custom thresholds in this Knowledge Script accordingly. When using this script to raise events based on a custom threshold, to avoid raising false events on fans that run normally at different speeds, run the script on a particular fan sensor.

40.2.1 Resource Objects

Fan folder or a fan icon on a Netfinity Director server

40.2.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

40.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when fan speed exceeds the threshold you specify. The default is y.
Raise event when fan speed is normal?	Set to **y** to raise an event when fan speed is normal. The default is n.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, data collection records fan speed information for each fan you are monitoring. The default is n.
Threshold option (0 for standard, 1 for custom)	Specify a threshold option for raising events. Enter: • **0** to use the IBM Systems Director-specified threshold values for normal operation. Based on these threshold values, this Knowledge Script can raise a Warning event when the fan speed is below the upper threshold and a Critical event when the fan speed is below the lower threshold. • **1** to specify custom threshold values for the fan speed thresholds. The default is 0.

Description	How to Set It
Custom threshold for a Warning event	Specify an upper threshold, in revolutions per minute, for raising a Warning event. For example, to raise a Warning event when the fan speed is less than 1,300 RPM, specify `1300`. The default is 750 RPM. To use this option, the *Threshold option* must be configured to raise an event based on custom thresholds (option 1).
Custom threshold for a Critical event	Specify a lower threshold, in revolutions per minute, for raising a Critical event. For example, to raise a Critical event when the fan speed is less than 1,100 RPM, specify `1100`. The default is 500 RPM. To use this option, the *Threshold option* must be configured to raise an event based on custom thresholds (option 1).
Event severity levels...	Set the event severity level, from 1 to 40, to indicate the importance of the following events: • **...Normal event**. Fan speed is normal. The default is 30. • **...Warning event**. Fan speed is lower than the upper threshold. The default is 15. • **...Critical event.** Fan speed is lower than the lower threshold. The default is 5. • **...Threshold information is not available.** This can occur when the IBM Systems Director threshold or a custom threshold is 0. The default is 25.

40.3 HealthCheckHW

Use this Knowledge Script to monitor the current health information and predictive health information of IBM Systems Director hardware components, including voltage level, temperature, fan speed, and logical disk errors. This script raises an event when the status of a server component is considered by IBM Systems Director to be in a Warning or Critical state.

IBM Systems Director defines the operating thresholds for these components. You can use the default event severity levels for Warning and Critical events or set your own.

This script is useful for monitoring all of the voltage, temperature and fan sensors, and logical disks on an IBM Systems Director server.

40.3.1 Resource Object

Netfinity Director server

40.3.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

40.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when a server component is in Warning or Critical state. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, data collection records the overall status of voltage levels, temperature, fan speed, and logical disk errors. The default is n.
Event severity levels...	Set the event severity level, from 1 to 40, to indicate the importance of the following events: • **...Warning event.** The default is 15. • **...Critical event.** The default is 5.

40.4 HealthCheckMgmtSrv

Use this Knowledge Script to monitor the up and down status of IBM Systems Director-related services. If a service is not running, an event is raised and the service can be automatically restarted.

This script is useful for monitoring some or all of the IBM Systems Director-related services on an IBM Systems Director server.

40.4.1 Resource Object

Netfinity Director server

40.4.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

40.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Auto-start a service?	Set to **y** to automatically restart down services. The default is y.
Collect data?	Set to **y** to collect data for service status. If set to y, data collection records the service availability. The default is n.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...Failed to restart**. The default is 5. • **...Successful restart**. The default is 25. • **...Do not restart**. The default is 18.

40.5 MemoryErrors

Use this Knowledge Script to monitor the memory errors of an IBM Systems Director server. You can monitor the errors of an individual memory bank or all the memory banks of an IBM Systems Director system. An event is raised if the number of bits of memory errors exceeds the threshold.

40.5.1 Resource Objects

Physical Memory or a DIMM icon on a Netfinity Director server

40.5.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

40.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for memory bank errors. If set to y, data collection records the memory bank errors with the details of the memory slot. The default is n.
Threshold level	Specify the maximum amount of memory errors that can occur before an event is raised. The default is 1 bit.
Event severity levels...	Set the event severity level, from 1 to 40, to indicate the importance of the following events: • **...Critical event.** The default is 5. • **...Severity normal.** The default is 25.

40.6 NICError

Use this Knowledge Script to monitor the number of network interface controller (NIC) transmission errors on an IBM Systems Director server. Both input and output errors are reported and compared to respective thresholds. By default, if the number of NIC errors per minute exceeds the threshold you set, an event is raised.

This script is useful for collecting data and raising events on some or all NICs on an IBM Systems Director server.

40.6.1 Resource Objects

NIC folder NIC icon on a Netfinity Director server

40.6.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

40.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, data collection records the number of input and output errors per minute at each monitoring interval. The default is n.
Maximum threshold for input errors	Specify the maximum number of input errors that can occur per minuted before an event is raised. The default is 2 errors per minute.
Maximum threshold for output errors	Specify the maximum number of output errors that can occur per minute before an event is raised. The default is 4 errors per minute.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...input errors per minute exceed the threshold**. The default is 10. • **...output errors per minute exceed the threshold**. The default is 10.

40.7 ServeRAIDControllerStat

Use this Knowledge Script to monitor the operational status of ServeRAID controllers. If the RAID controller has failed or its status cannot be determined, an event is raised.

NOTE: This Knowledge Script attempts to query the metrics using SNMP, and if that fails, it uses WMI. An event is raised if both attempts fail.

40.7.1 Resource Object

RAID controller

40.7.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

40.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the RAID controller has failed or its status cannot be determined. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the RAID controller is functioning properly • **0** if the RAID controller has failed or the state cannot be determined The default is n.
Community	Provide the SNMP community name of the RAID device. The default is either the community name entered in AppManager Security Manager or *public* if no community name has been entered.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...SNMP and WMI, or IBM Director Agent failure**. The default is 9. • **...critical condition**. The default is 8. • **...unknown status**. The default is 15.

40.8 ServeRAIDLogicalDriveStat

Use this Knowledge Script to monitor the operational status of ServeRAID logical drives. If the RAID logical drive is offline, migrating, free, or in critical condition or unknown state, an event is raised.

NOTE: This Knowledge Script attempts to query the metrics using SNMP, and if it fails, it uses the WMI. An event is raised if both attempts fail.

40.8.1 Resource Objects

RAID logical drives

40.8.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

40.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the RAID logical drive is offline, migrating, free, or in a critical or unknown state. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the RAID logical drive is functioning properly • **50** if the RAID logical drive is offline, migrating, free, or degraded • **0** if the RAID logical drive is in critical condition or the state cannot be determined The default is n.
Community	Provide the SNMP community name of the RAID device. The default is either the community name entered in AppManager Security Manager or *public* if no community name has been entered.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...SNMP and WMI, or IBM Director Agent failure**. The default is 9. • **...critical condition**. The default is 8. • **...drive offline, migrating, or free**. The default is 18. • **...unknown status**. The default is 15.

40.9 ServeRAIDPhysicalDrivePFA

Use this Knowledge Script to monitor for predicted failures of RAID physical drives. If a failure is predicted, an event is raised.

NOTE: This Knowledge Script attempts to query the metrics using SNMP, and if that fails, it uses WMI. An event is raised if both attempts fail.

40.9.1 Resource Objects

RAID disk drives

40.9.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

40.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a failure is predicted for the RAID physical drive. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the RAID physical drive is functioning properly • **0** if a failure is predicted for the RAID physical drive The default is n.
Community	Provide the SNMP community name of the RAID device. The default is either the community name entered in AppManager Security Manager or *public* if no community name has been entered.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...SNMP and WMI, or IBM Director Agent failure**. The default is 9. • **...failure predicted**. The default is 8.

40.10 ServeRAIDPhysicalDriveStat

Use this Knowledge Script to monitor the operational status of ServeRAID physical drives. If the RAID physical drive is ready, on standby, being rebuilt, not present, or in an unknown state, an event is raised.

NOTE: This Knowledge Script attempts to query the metrics using SNMP, and if that fails, it uses WMI. An event is raised if both attempts fail.

40.10.1 Resource Objects

RAID disk drives

40.10.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

40.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a RAID physical drive is ready, on standby, being rebuilt, not present, or in an unknown state. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the RAID physical drive is online, or is a spare drive • **50** if the RAID physical drive is ready, on standby, or being rebuilt • **0** if the RAID physical drive is down, not present, or the state cannot be determined The default is n.
Community	Provide the SNMP community name of the RAID device. The default is either the community name entered in AppManager Security Manager or *public* if no community name has been entered.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of: • **...SNMP and WMI, or IBM Director Agent failure**. The default is 9. • **...drive is down**. The default is 8. • **...drive on standby, being rebuilt, or ready**. The default is 18. • **...unknown status**. The default is 15.

40.11 Temperature

Use this Knowledge Script to monitor a particular temperature sensor or all temperature sensors on an IBM Systems Director server. This script is useful for collecting data on all temperature sensors on an IBM Systems Director server. To raise events on the overall health of an IBM Systems Director system, including temperature-related events, use the HealthCheckHW Knowledge Script.

IBM Systems Director defines the lower and upper operating thresholds for temperature. Use the IBM Systems Director-specified threshold values to monitor all temperature sensors or a particular temperature sensor and raise a Warning event when the temperature is higher than the lower threshold and a Critical event when the temperature is higher than the upper threshold.

Alternatively, this script allows you to specify custom values for lower and upper thresholds. Check your IBM Systems Director documentation to determine an acceptable lower and upper threshold for temperature and set the custom thresholds in this script accordingly. When using this script to raise events based on a custom threshold, to avoid raising false events on temperature sensors that run normally at different temperatures, run the script on a particular temperature sensor.

40.11.1 Resource Objects

Temperature folder or a temperature icon on a Netfinity Director server

40.11.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

40.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a value exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the temperature detected by the sensor in Celsius. The default is n.
Threshold option (0 for standard, 1 for custom)	Specify a threshold for raising events. Enter: • **0** to use the IBM Systems Director-specified threshold values for normal operation. Based on these thresholds, this Knowledge Script can raise a Warning event when the temperature is above the lower threshold and a Critical event when the temperature is above the upper threshold. • **1** to specify custom threshold values for lower and upper temperature thresholds. The default is 0.
Custom threshold for a Warning event	Specify a lower threshold, in Celsius, for raising a Warning event. For example, to raise a Warning event when the operating temperature is higher than 60Âř Celsius, specify `60`. The default is 65Âř Celsius. To use this option, the *Threshold option* must be configured to raise an event based on custom thresholds (option 1).

Description	How to Set It
Custom threshold for a Critical event	Specify an upper threshold, in Celsius, for raising a Critical event. For example, to raise a Critical event when the operating temperature is higher than 85Âř Celsius, specify `85`. The default is 80Âř Celsius. To use this option, the *Threshold option* must be configured to raise an event based on custom thresholds (option 1).
Event severity levels...	Set the event severity level, from 1 to 40, to indicate the importance of the following events: • **...Warning event.** Temperature is above the lower threshold. The default is 15. • **...Critical event**. Temperature is above the upper threshold. The default is 5. • **...Threshold information is not available**. This can occur when the IBM Systems Director threshold or a custom threshold is 0. The default is 25.

40.12 Voltage

Use this Knowledge Script to monitor the voltage levels for a particular voltage sensor or all voltage sensors on an IBM Systems Director server. To raise events on the overall health of an IBM Systems Director system, including voltage-related events, use the HealthCheckHW Knowledge Script.

IBM Systems Director defines the operating range for voltage sensors. Use this script to monitor all voltage sensors or a particular voltage sensor and raise an event when the voltage level is above the upper threshold or below the lower threshold specified by IBM Systems Director. You can also set a parameter to raise an event when the voltage level is normal.

40.12.1 Resource Objects

Voltage folder or a voltage icon on a Netfinity Director server

40.12.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

40.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a value exceeds or falls below the threshold. The default is y.
Raise an event when the voltage level is normal?	Set to **y** to raise an event when the voltage level is normal. The default is n.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the voltage level detected by each sensor you monitor. The default is n.
Event severity levels...	Set the event severity level, from 1 to 40, to indicate the importance of the following events: • **...Voltage level is normal**. Voltage level is normal. The default is 30. • **...Low level threshold**. Voltage level is below the lower threshold. The default is 5. • **...High level threshold**. Voltage level is above the upper threshold. The default is 5. • **...Threshold information is not available**. This can occur when the IBM Systems Director threshold is 0. The default is 25.

41 IIS Knowledge Scripts

In addition to Knowledge Scripts for monitoring IIS performance and availability, AppManager for IIS also provides many IIS-specific Knowledge Scripts to generate reports for IIS information.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
ApplicationPools	Monitors application pools.
ASPCommFailure	Monitors the number of communication failures during an interval.
ASPEventLog	Monitors and filters ASP and ASP.NET information in the Windows Application Event Log.
ASPNETApplicationRestarted	Monitors the number of ASP.NET application restarts during a monitoring interval.
ASPNETApplicationRunning	Monitors the number of running ASP.NET applications during a monitoring interval.
ASPNETErrors	Monitors the total number of ASP.NET errors during the monitoring interval.
ASPNETPipelineInstances	Monitors the number of ASP.NET pipeline instances during a monitoring interval.
ASPNETReqStat	Monitors: • Number of current ASP.NET requests • Number of ASP.NET requests disconnected • Time taken to execute ASP.NET requests • Number of queued ASP.NET requests • ASP.NET request processing rate • Number of ASP.NET requests rejected • Wait time before processing the most recent ASP.NET request
ASPNETRequestCurrent	Monitors the number of current ASP.NET requests.
ASPNETRequestDisconnected	Monitors the number of ASP.NET requests from clients that disconnected during a monitoring interval.
ASPNETRequestExecuteTime	Monitors the time the most recent ASP.NET request required to execute.
ASPNETRequestQueued	Monitors the number of ASP.NET requests that are queued to be serviced.

Knowledge Script	What It Does
ASPNETRequestRate	Monitors the ASP.NET request processing rate.
ASPNETRequestRejected	Monitors the number of ASP.NET requests that were rejected during a monitoring interval.
ASPNETRequestWaitTime	Monitors the time the most recent ASP.NET request waited to be serviced.
ASPNETWorkerProcessCPU	Monitors the CPU usage of the ASP.NET worker processes during a monitoring interval.
ASPNETWorkerProcessExcepRate	Monitors the current exception rate for the common language runtime (CLR) in all ASP.NET worker processes.
ASPNETWorkerProcessExceptions	Monitors the number of CLR exceptions thrown in all ASP.NET worker processes during a monitoring interval.
ASPNETWorkerProcessMemory	Monitors the nonshared memory (private) usage of the ASP.NET worker processes during a monitoring interval.
ASPNETWorkerProcessRestarted	Monitors the number of ASP.NET worker process restarts during a monitoring interval.
ASPNETWorkerProcessRunning	Monitors the number of running ASP.NET worker processes during a monitoring interval.
ASPQueueBusy	Monitors the number of ASP requests currently in the queue.
ASPRegistryChange	Monitors changes to registry keys or values.
ASPReqStat	Monitors: • Number of ASP request errors • Different types of ASP request failures • ASP sessions that timed out.
ASPRequestError	Monitors the number of ASP request errors per second.
ASPRequestFailed	Monitors the number of different types of ASP request failures during an interval.
ASPSessionTimeout	Monitors the number of ASP sessions that timed out during an interval.
ASPThroughput	Monitors the throughput rate for ASP requests.
CacheHitRatio	Monitors the cache hit ratio for cache requests during the monitoring interval.
CentralizedBinaryLogging	Extracts information from the IIS centralized binary logging file.
CGIRequests	Monitors the CGI requests for a Web site during the monitoring interval.
CpuHigh	Monitors the CPU usage of specified IIS application processes.
FTPBytes	Monitors the rate of bytes transferred per second to and from the FTP server.
FTPConnections	Monitors the current number of connections to FTP sites.
FTPConnectionsInterval	Monitors the number of FTP site connections from anonymous and user accounts over the monitoring interval.
FTPConnectionUtil	Monitors the percentage of FTP connections being utilized.

Knowledge Script	What It Does
FTPFiles	Monitors the total number of files sent to and received from the FTP server.
FTPStatistics	Monitors: • Current number of connections to FTP sites • Number of FTP site connections • Percentage of FTP connections being utilized.
FTPTransStat	Monitors the rate of bytes transferred per second and the total number of files sent to and received from the FTP server.
HealthCheck	Checks whether any IIS services or Web sites are down and tracks queue length for blocked I/O requests.
HTTPBytes	Monitors the total number of bytes transferred per second to and from a Web site.
HTTPBytesInterval	Monitors the total number of bytes transferred to and from Web sites during a monitoring interval.
HTTPConnectionsInterval	Monitors the number of HTTP connections during a monitoring interval.
HTTPConnectionUtil	Monitors the percentage of Web site connections being utilized.
HTTPFiles	Reports the total number of files sent to and received from the Web server during a monitoring interval.
HTTPNotFound	Reports the number of requested pages that could not be found by the Web server during a monitoring interval.
HTTPRequests	Monitors the total number of HTTP method requests.
HTTPStatistics	Monitors: • Current number of HTTP connections to a Web site • Number of HTTP connections • Percentage of Web server connections being utilized.
HTTPTransStat	Monitors the total number of bytes transferred per second and the number of bytes transferred to and from Web sites, during a monitoring interval.
IsolatedApps	Monitors the number of isolated applications within a Web site.
KillTopCPUProcs	Monitors the CPU usage for IIS processes (`w3wp` for IIS 6.0).
Log	Monitors and filters information in the IIS Web site logs.
MemoryHigh	Monitors the memory usage of specified IIS application processes.
NNTPArticles	Monitors the number of articles processed by the NNTP server.
NNTPBytes	Monitors the number of bytes processed by the NNTP server.
NNTPClientCommands	Monitors the number of client requests processed by the NNTP server.
NNTPClientFailures	Monitors the number of client security request failures processed by the NNTP server.
NNTPConnections	Monitors the current number of connections to the NNTP server.
NNTPConnectionsInterval	Monitors the of inbound and outbound connections to the NNTP server during a monitoring interval.

Knowledge Script	What It Does
NNTPConnectionUtil	Monitors the percentage of NNTP server connections being utilized.
NNTPEventLog	Monitors and filters information in the Event Log.
NNTPServerFailures	Monitors the number of NNTP server failures that occurred in the specified interval.
NNTPSpaceLow	Monitors used and free disk space on each drive serving as an NNTP virtual root.
NNTPStatistics	Monitors: • Current number of connections to NNTP server • Inbound and outbound connections to the NNTP server • Percentage of NNTP connections being utilized.
Report_ASPCommunicationFailure	Generates a report about the number of ASP communication failures.
Report_ASPNETApplicationRestarted	Generates a report about the number of ASP.NET application restarts.
Report_ASPNETApplicationRunning	Generates a report about the number of ASP.NET applications running.
Report_ASPNETErrors	Generates a report about the number of ASP.NET application errors.
Report_ASPNETPipelineInstances	Generates a report about the number of ASP.NET pipeline instances.
Report_ASPNETReqStat	Generates a report about the number of: • ASP.NET current requests • Disconnected ASP.NET requests • ASP.NET request execution time • Queued ASP.NET requests • ASP.NET requests processed per second • Rejected ASP.NET requests • Wait time of ASP.NET requests.
Report_ASPNETRequestCurrent	Generates a report about the number of ASP.NET current requests.
Report_ASPNETRequestDisconnected	Generates a report about the number of ASP.NET requests from clients that disconnected.
Report_ASPNETRequestExecuteTime	Generates a report about the execution time for ASP.NET requests.
Report_ASPNETRequestQueued	Generates a report about the number of ASP.NET requests queued.
Report_ASPNETRequestRate	Generates a report about the ASP.NET request rate.
Report_ASPNETRequestRejected	Generates a report about the number of ASP.NET requests rejected.
Report_ASPNETRequestWaitTime	Generates a report about the average ASP.NET request wait time.
Report_ASPNETWorkerProcessCPU	Generates a report about the CPU utilization of ASP.NET worker processes.

Knowledge Script	What It Does
Report_ASPNETWorkerProcessExcepRate	Generates a report about the number of CLR exceptions thrown per second in all ASP.NET worker processes.
Report_ASPNETWorkerProcessExceptions	Generates a report about the number of CLR exceptions thrown in all ASP.NET worker processes.
Report_ASPNETWorkerProcessMemory	Generates a report about ASP.NET memory usage.
Report_ASPNETWorkerProcessRestarted	Generates a report about the number of ASP.NET worker processes that were restarted.
Report_ASPNETWorkerProcessRunning	Generates a report about the number of ASP.NET worker processes that were running.
Report_ASPNewEventLogEntries	Generates a report about the number of ASP events.
Report_ASPQueueBusy	Generates a report about the number of ASP requests currently in the queue.
Report_ASPRegistryChange	Generates a report about the number of changes to ASP registry keys.
Report_ASPReqStat	Generates a report about the number of: • ASP request errors • Different types of ASP request failures • ASP sessions that timed out
Report_ASPRequestError	Generates a report about the number of ASP request errors per second.
Report_ASPRequestFailed	Generates a report about the number of ASP request failures by error type.
Report_ASPSessionTimeout	Generates a report about the number of ASP sessions that timed out during an interval.
Report_ASPThroughput	Generates a report about the number of ASP requests processed per second.
Report_CpuUsage	Generates a report about the CPU usage of IIS application processes.
Report_FTPBytesRate	Generates a report about the total number of bytes transferred per second to and from an FTP site.
Report_FTPConnections	Generates a report about the current number of connections from anonymous and user accounts to an FTP site.
Report_FTPFilesTransferRate	Generates a report about the total number of files sent to and received from an FTP server during the monitoring interval.
Report_FTPTransStat	Generates a report about the total number of bytes transferred and the total number of files sent to and received from the FTP server.
Report_HTTPC21WebTransferRate	Generates a report about the total number of bytes transferred per second to and from a Web server.
Report_HTTPNotFoundError	Generates a report about the number of requested pages that could not be found by the Web server per monitoring interval.
Report_MemoryUsage	Generates a report about the number of bytes of memory being used by the specified IIS process.

Knowledge Script	What It Does
Report_NNTPArticlesTransferRate	Generates a report about the current number of articles processed by the NNTP server.
Report_NNTPBytesTransferRate	Generates a report about the current number of bytes processed by the NNTP server.
Report_NNTPClientCommands	Generates a report about the number of client commands processed by the NNTP server.
Report_NNTPClientFailures	Generates a report about the number of client security request failures processed by the NNTP server.
Report_NNTPCurrentConnections	Generates a report about the total number of connections to the NNTP server.
Report_NNTPTransStat	Generates a report about the number of articles and bytes processed by the NNTP server.
Report_NNTPVirtualRootDiskSpace	Generates a report about the used and free disk space for each drive that is used as an NNTP virtual root.
RestartServer	Restarts an IIS server.
ServiceUptime	Monitors the uptime for Web sites and services, and FTP sites and services.
SMTPBytesInterval	Monitors the total number of bytes transferred to and from SMTP sites during a monitoring interval.
SMTPConnections	Monitors the number of current inbound and outbound connections on an SMTP site, and outbound connection attempts refused by remote sites.
SMTPConnectionsInterval	Monitors the number of inbound and outbound connections to and from SMTP sites during the monitoring interval.
SMTPConnectionUtil	Monitors the percentage of SMTP site connections being utilized.
SMTPMsgs	Monitors SMTP messages for the total number of bytes sent and received, messages delivered, inbound messages received, and outbound messages sent during a monitoring interval.
SMTPQueue	Monitors the number of messages in the local, remote, local retry, and remote retry queues.
SMTPStatistics	Monitors: • Number of current connections on an SMTP site • Inbound and outbound connections to and from the SMTP site • Percentage of SMTP connections being utilized
SSLCertMon	Identifies and monitors the status of SSL certificates on the Web server.
UDDIConnections	Monitors Web servers running the UDDI services database and UDDI directory.
UnloadApps	Unloads applications from a Web server.
WebServiceExtensions	Extracts the IIS Web service extensions and their status.

41.1 ApplicationPools

Use this Knowledge Script to monitor the health, performance, and recycling properties of application pools. An application pool is a set of isolated Web applications hosted on a common server. Each application pool is allocated a set of server resources.

For example, if a Web site with a memory leak is in an independent application pool, it does not affect any other Web site because each application pool has its own server resources (including memory). If the application pool data collection fails or succeeds, AppManager raises an event.

41.1.1 Versions of IIS Supported

6.0 and later.

41.1.2 Resource Objects

Web servers

41.1.3 Default Schedule

The default interval for this script is **Run once**.

41.1.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Start application pools if stopped?	Select Yes to start the application pools. The default is No.
Collect data of application pool health properties?	Select Yes to collect data for charts and reports. By default, data is collected.
Event severity when application pool fails to start or data collection fails	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity when application pool starts or data collection succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.

41.2 ASPCommFailure

Use this Knowledge Script to monitor the number of ASP communication failures during a monitoring interval. This Knowledge Script considers requests disconnected as communication failures. If the number of ASP communication failures exceeds the threshold you set, AppManager raises an event.

41.2.1 Versions of IIS Supported

6.0 and later.

41.2.2 Resource Objects

Web servers

41.2.3 Default Schedule

The default interval for this script is Every 5 minutes.

NOTE: If the schedule is set to Run Once, the value returned is the current total, not the total for the monitoring interval.

41.2.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of failures exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for ASP communication failures?	Set to **y** to collect data for charts and reports. If set to y, the script returns both the number of failures and the failure rate. The default is n.
Threshold – Maximum number of ASP communication failures	Specify the maximum number of communication failures allowed before AppManager raises an event. The default is 25 failures.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.3 ASPEventLog

Use this Knowledge Script to monitor the Windows Application Event Log for entries in the Application Event Log that have Active Server Pages as their Source and ASP.NET events.

During the first monitoring interval, the value you specify for the **Starting point for log search (past N hours)** parameter determines how far back in the log to check for matching entries. As the script continues to run at subsequent intervals, it checks for any new entries created since the last time the log was checked.

You can further restrict the types of log entries that generate an event in two ways:

- Use the **Event type [...]** parameters to search only certain types of events, such as Warning events.
- Use the **Filter [...]** parameters to search only for specific information, such as events associated with a specific user or computer name.

Each time this Knowledge Script runs, it checks the Event Log for entries matching your selection criteria and raises an event if matching entries are found. The event detail message returns the text of the log entries found. When this Knowledge Script is set to collect data, it returns the number of log entries found, and the data point detail message returns the text of the log entries.

When you search for ASP or ASP.NET events, the script populates the event log with matching data. This includes the search result along with the version number. For example, if you select ASP.NET as the search criterion, the result displays ASP.NET v1.1.4322, where "v1.1.4322" is the version number of ASP.NET.

41.3.1 Versions of IIS Supported

6.0 and later.

41.3.2 Resource Objects

Web servers

41.3.3 Default Schedule

The default interval for this script is Every 10 minutes.

41.3.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if log entries match search criteria?	Set to **y** to raise an event if the log entries match the search criteria. The default is y.
Filters the event log for counter:	Select to filter the event log. The default is Active Server Pages.
Collect data for matching log entries?	Set to **y** to collect data for charts and reports. If set to y, returns the number of matching Event Log entries, and the detailed message lists the log entries. The default is n.

Description	How to Set It
Starting point for log search (past *N* hours)	Set this parameter to determine which events to search for the first time the Knowledge Script is run. Subsequent searches begin where the last search finished. The following values are valid: • -1: Search all Event Log events that occurred before and during the first monitoring interval. • 0: Search only for events that occurred during the monitoring interval; previous events are not searched. • *N*: The number of hours to go back in the Event Log to search for matching events. For example, specify `8` to search the last 8 hours of the Event Log for matching entries. The default is 0.
Event type: Error	Set to **y** to monitor error events. The default is y. If you set the event type to n, an error Event Log entry does not raise an event, is not returned in an event detail message, and is not collected as data if the **Collect data...** parameter is set to y.
Event type: Warning	Set to **y** to monitor warning events. The default is y. If you set the event type to n, a warning Event Log entry does not raise an event, is not returned in an event detail message, and is not collected as data if the **Collect data...** parameter is set to y.
Event type: Information	Set to **y** to monitor information events. The default is y. If you set the event type to n, an informational Event Log entry does not raise an event, is not returned in an event detail message, and is not collected as data if the **Collect data...** parameter is set to y.
Filter: Event ID	Specify a search string that filters the following fields in the Event log: • **Event Category**. Specify one or more text strings to look for in the Category field; separate multiple strings with commas. • **Description**. Specify a detail description or keywords in the description. A string can contain spaces, underscores, and periods; separate multiple entries with commas. For example: `no domain,critical error from the Active Directory`. The search string can contain criteria used to include and exclude entries. The following syntax rules apply: • Separate include and exclude criteria with a colon (:). Strings to the left of the colon are included; strings to the right of the colon are excluded. For example, `zones,caching:primary or secondary`. • Separate multiple include or exclude entries with commas. For example, `finance,sales:corp00,HQ`. • If you are specifying only include criteria, the colon is not necessary. For example, `primary DNS domain`. • If you are specifying only exclude criteria, start the search string with a colon. For example, `:online help`.

Description	How to Set It
Filter: Event Description	Specify a search string that filters the following fields in the Event log: • **Event Category**. Specify one or more text strings to look for in the Category field; separate multiple strings with commas. • **Description**. Specify a detail description or keywords in the description. A string can contain spaces, underscores, and periods; separate multiple entries with commas. For example: `no domain,critical error from the Active Directory`. The same search rules as the *Filter: Event ID* parameter apply.
Maximum number of log entries per event message	Set the maximum number of Event Log entries that can be returned in each event report. For example, if this value is set to 30 and 67 Event Log entries are found, three event reports are raised: two reports containing 30 events and one report containing 7 events. The Message column on the **Events** tab in the Operator Console displays the number of events in each event report, the type of log where the events were found, and the event report batch number (the sequential number of the event report). Batch numbers start at 1 for each Knowledge Script iteration. The default is 30 entries per event message.
Event severity when search criteria met	Set the event severity level, from 1 to 40, to indicate the importance of the event when the search criteria is met. The default is 15.
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the event when the job fails with an internal error. The default is 5.

41.4 ASPNETApplicationRestarted

Use this Knowledge Script to track the number of ASP.NET application restarts during the monitoring interval. AppManager raises an event if the number of ASP.NET applications restarted exceeds the threshold you set.

This Knowledge Script can be set to raise an event when it detects unexpected ASP.NET application restarts.

41.4.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.4.2 Resource Objects

Web servers

41.4.3 Default Schedule

The default interval for this script is Every 5 minutes.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.4.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if number of restarts exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for ASP.NET application restarts?	Set to **y** to collect data for reports and graphs. If data is collected, the number of ASP.NET application restarts is returned. The default is n.
Threshold – Maximum applications restarted	Specify the maximum number of ASP.NET application restarts allowed before AppManager raises an event. The default is 1 restart.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.5 ASPNETApplicationRunning

Use this Knowledge Script to monitor the current number of ASP.NET applications running.

This Knowledge Script can be used to track the ASP.NET load on an IIS server. You can set a threshold to determine the number of running applications that raise an event.

41.5.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.5.2 Resource Object

Web servers

41.5.3 Default Schedule

The default interval for this script is Every 5 minutes.

41.5.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if number of ASP.NET applications running exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for number of ASP.NET applications running?	Set to **y** to collect data for reports and graphs. If data is collected, the current number of ASP.NET applications running is returned. The default is n.
Threshold – Maximum ASP.NET applications running	Specify the maximum number of running ASP.NET applications allowed before AppManager raises an event. The default is 1 application running.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.6 ASPNETErrors

Use this Knowledge Script to monitor the total number of parser, compilation, and runtime errors associated with ASP.NET applications during the monitoring interval.

Use this script to raise an event if errors are occurring. You can set a threshold to determine the number of errors that must occur during the monitoring interval before AppManager raises an event.

41.6.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.6.2 Resource Objects

Web servers

41.6.3 Default Schedule

The default interval for this script is Every 5 minutes.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.6.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if number of ASP.NET errors exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for number of ASP.NET errors?	Set to **y** to collect data for reports and graphs. If data is collected, returns the total number of ASP.NET parser, compilation, and runtime errors that occurred during the monitoring interval. The default is n.
Threshold–Maximum ASP.NET errors	Specify the maximum number of ASP.NET errors allowed before AppManager raises an event. The default is 0 errors.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.7 ASPNETPipelineInstances

Use this Knowledge Script to monitor the current number of ASP.NET pipeline instances.

This Knowledge Script monitors the overall performance of ASP.NET applications. In most circumstances, it is better for the number of pipeline instances to be low when the server is busy because a low number indicates that the CPU is being used efficiently. Set a threshold to determine the number of pipeline instances that raises an event.

41.7.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.7.2 Resource Objects

Web servers

41.7.3 Default Schedule

The default interval for this script is Every 5 minutes.

41.7.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if number of ASP.NET pipeline instances exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for number of ASP.NET pipeline instances?	Set to **y** to collect data for reports and graphs. If data is collected, returns the current number of ASP.NET pipeline instances. The default is n.
Threshold – Maximum pipeline instances	Specify the maximum number of ASP.NET pipeline instances allowed before AppManager raises an event. The default is 1 pipeline instance.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.8 ASPNETReqStat

Use this Knowledge Script to monitor the following:

- Number of current ASP.NET requests
- Number of ASP.NET requests from clients that disconnected during a monitoring interval
- Time taken to execute the most recent ASP.NET request
- ASP.NET requests that are in queue
- ASP.NET request processing rate
- Number of ASP.NET requests that were rejected during a monitoring interval
- Wait time before processing the most recent ASP.NET request

This Knowledge Script consolidates functionality that is also available in seven separate IIS Knowledge Scripts:

- ASPNETRequestCurrent
- ASPNETRequestDisconnected
- ASPNETRequestExecuteTime
- ASPNETRequestQueued
- ASPNETRequestRate:
- ASPNETRequestRejected
- ASPNETRequestWaitTime

41.8.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.8.2 Resource Objects

Web servers

41.8.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

41.8.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
ASPNETRequestCurrent	Select Yes to check for current ASP.NET requests. The default is Yes.
Raise event if number of current ASP.NET requests exceeds threshold?	Select Yes to raise an event if the number of ASP.NET requests exceeds the threshold. The default is Yes.
Collect data for number of current ASP.NET requests?	Select Yes to collect data for charts and reports. If data is collected, it returns the current number of ASP.NET requests. The default is No.
Threshold – Maximum current ASP.NET requests	Specify the maximum number of ASP.NET current requests allowed before AppManager raises an event. The default is 1 request.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.
ASPNETRequestDisconnected	Select Yes to check for disconnected ASP.NET requests. The default is Yes.
Raise event if number of disconnected ASP.NET requests exceeds threshold?	Select Yes to raise an event if the number of disconnected ASP.NET requests exceeds the threshold. The default is Yes.
Collect data for disconnected ASP.NET requests?	Select Yes to collect data for charts and reports. If data is collected, it returns the number of ASP.NET requests disconnected because of a communication failure. The default is No.
Threshold – Maximum disconnected ASP.NET requests	Specify the maximum number of disconnected ASP.NET requests allowed before AppManager raises an event. The default is 0 (no disconnected requests).
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.
ASPNETRequestExecuteTime	Select Yes to check the time taken to execute ASP.NET requests. The default is Yes.
Raise event if time required to execute last ASP.NET request exceeds threshold?	Select Yes to raise an event if time to execute the last ASP.NET request exceeds the threshold. The default is Yes.
Collect data for time required to execute ASP.NET requests?	Select Yes to collect data for charts and reports. If data is collected, it returns the execution time of the last ASP.NET request. The default is No.
Threshold – Maximum execution time	Specify the maximum ASP.NET request execution time allowed before AppManager raises an event. The default is 100 ms.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.
ASPNETRequestQueued	Select Yes to check for queued ASP.NET requests. The default is Yes.
Raise event if number of queued ASP.NET requests exceeds threshold?	Select Yes to raise an event if the number of queued ASP.NET request exceeds the threshold. The default is Yes.
Collect data for number of queued ASP.NET requests?	Select Yes to collect data for charts and reports. If data is collected, it returns the number of ASP.NET requests currently in all queues. The default is No.

Description	How to Set It
Threshold – Maximum queued requests	Specify the maximum number of queued requests allowed before AppManager raises an event. The default is 10 requests.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.
ASPNETRequestRate	Select Yes to check the ASP.NET request processing rate. The default is Yes.
Raise event if number of ASP.NET requests per second exceeds threshold?	Select Yes to raise an event if the processing rate for ASP.NET requests fails to meet the threshold. The default is Yes.
Collect data for ASP.NET processing rate?	Select Yes to collect data for charts and reports. If data is collected, returns the number of ASP.NET requests processed per second. The default is No.
Threshold – Minimum processing rate	Specify the minimum processing rate allowed before AppManager raises an event. The default is 10 requests per second.
Threshold – Minimum requests	Specify the minimum number of ASP.NET requests processed during the interval for the request processing rate to be calculated. No event is raised if the number of requests processed is less than this value. The default is 300 requests.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.
ASPNETRequestRejected	Select Yes to check for rejected ASP.NET requests. The default is Yes.
Raise event if number of rejected ASP.NET requests exceeds threshold?	Select Yes to raise an event if the number of rejected ASP.NET requests exceeds the threshold. The default is Yes.
Collect data for number of rejected ASP.NET requests?	Select Yes to collect data for charts and reports. If data is collected, it returns the number of ASP.NET requests that were rejected because a queue limit was exceeded. The default is No.
Threshold – Maximum requests rejected	Specify the maximum number of rejected requests allowed before AppManager raises an event. The default is 0 rejected requests.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.
ASPNETRequestWaitTime	Select Yes to check the wait time before processing the most recent ASP.NET request. The default is Yes.
Raise event if wait time for the last ASP.NET request exceeds threshold?	Select Yes to raise an event if elapsed time in queue for ASP.NET requests exceed the threshold. The default is Yes.
Collect data for ASP.NET request wait time?	Select Yes to collect data for charts and reports. If data is collected, it returns the time (in milliseconds) the last ASP.NET request waited in queue before being processed. The default is No.
Threshold – Maximum ASP.NET request wait time	Specify the maximum wait time of the last ASP.NET request allowed before AppManager raises an event. The default is 1000 ms (1 sec).

Description	How to Set It
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.
Other settings	
Event severity for unexpected error	Set the event severity level, from 1 to 40, to indicate the importance of an event in which an unexpected error occurred. The default is 35.

41.9 ASPNETRequestCurrent

Use this Knowledge Script to monitor the number of requests currently being handled by the ASP.NET Internet Server application programming interface (ISAPI). This script reports the number of requests in the application request queue.

This Knowledge Script can raise an event if ASP.NET is close to rejecting requests because of request volume.

41.9.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.9.2 Resource Objects

Web servers

41.9.3 Default Schedule

The default interval for this script is Every 5 minutes.

41.9.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if number of current ASP.NET requests exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for number of current ASP.NET requests?	Set to **y** to collect data for reports and graphs. If data is collected, returns the current number of ASP.NET requests. The default is n.
Threshold – Maximum current ASP.NET requests	Specify the maximum number of ASP.NET current requests allowed before AppManager raises an event. The default is 900.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.10 ASPNETRequestDisconnected

Use this Knowledge Script to monitor the number of ASP.NET requests that have been disconnected because of a communication problem during the monitoring interval.

This script can raise an event if requests are being disconnected because of communication problems.

41.10.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.10.2 Resource Objects

Web servers

41.10.3 Default Schedule

The default interval for this script is Every 5 minutes.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.10.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if number of disconnected ASP.NET requests exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for disconnected ASP.NET requests?	Set to **y** to collect data for reports and graphs. If data is collected, returns the number of ASP.NET requests disconnected because of a communication failure. The default is n.
Threshold – Maximum disconnected ASP.NET requests	Specify the maximum number of disconnected ASP.NET requests allowed before AppManager raises an event. The default is 0 (no disconnected requests).
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.11 ASPNETRequestExecuteTime

Use this Knowledge Script to monitor the time required to execute the last ASP.NET request.

This script raises an event if requests are taking an unexpectedly long time to execute.

41.11.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.11.2 Resource Objects

Web servers

41.11.3 Default Schedule

The default interval for this script is Every 5 minutes.

41.11.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if time required to execute last ASP.NET request exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for time required to execute request?	Set to **y** to collect data for reports and graphs. If data is collected, returns the execution time of the last ASP.NET request. The default is n.
Threshold – Maximum execution time	Specify the maximum ASP.NET request execution time allowed before AppManager raises an event. The default is 100 ms.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.12 ASPNETRequestQueued

Use this Knowledge Script to monitor the number of ASP.NET requests currently in all queues.

NOTE: This script raises an event if too many requests are being queued.

41.12.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.12.2 Resource Objects

Web servers

41.12.3 Default Schedule

The default interval for this script is Every 5 minutes.

41.12.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if number of queued ASP.NET requests exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for number of queued ASP.NET requests?	Set to **y** to collect data for reports and graphs. If data is collected, returns the number of ASP.NET requests currently in all queues. The default is n.
Threshold – Maximum queued requests	Specify the maximum number of queued requests allowed before AppManager raises an event. The default is 10 requests.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.13 ASPNETRequestRate

Use this Knowledge Script to monitor the number of ASP.NET requests processed per second. Two thresholds can be set. The request rate is not calculated unless a minimum number of ASP.NET requests are processed during the monitoring interval. The request rate is then calculated and compared with the minimum number of ASP.NET requests processed per second threshold. If the request rate falls below the minimum, AppManager raises an event.

Use this script to monitor the overall performance of ASP.NET applications.

41.13.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.13.2 Resource Objects

Web servers

41.13.3 Default Schedule

The default interval for this script is Every 5 minutes.

41.13.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if processing rate for ASP.NET requests fails to meet threshold?	Set to **y** to raise events. The default is y.
Collect data for processing rate?	Set to **y** to collect data for reports and graphs. If data is collected, returns the number of ASP.NET requests processed per second. The default is n.
Threshold – Minimum processing rate	Specify the minimum processing rate allowed before AppManager raises an event. The default is 10 requests per second.
Threshold – Minimum requests	Specify the minimum number of ASP.NET requests processed during the interval for the request processing rate to be calculated. No event is raised if the number of requests processed is less than this value. The default is 300 requests.
Event severity when processing rate threshold not met	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.14 ASPNETRequestRejected

Use this Knowledge Script to monitor the number of ASP.NET requests that were rejected during the monitoring interval.

This script raises an event if the number of rejected ASP.NET requests exceeds the threshold you set, indicating that insufficient server resources were available to process them.

41.14.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.14.2 Resource Objects

Web servers

41.14.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.14.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if number of rejected ASP.NET requests exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for number of rejected ASP.NET requests?	Set to **y** to collect data for reports and graphs. If data is collected, the number of ASP.NET requests that were rejected because a queue limit was exceeded is returned. The default is n.
Threshold – Maximum requests rejected	Specify the maximum number of rejected requests allowed before AppManager raises an event. The default is 0 rejected requests.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.15 ASPNETRequestWaitTime

Use this Knowledge Script to monitor the time in milliseconds that the last ASP.NET request waited in a queue before being processed.

This script raises an event if the length of time that requests are in queue exceeds the threshold you set.

41.15.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.15.2 Resource Objects

Web servers

41.15.3 Default Schedule

The default interval for this script is Every 5 minutes.

41.15.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if elapsed time in queue exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for ASP.NET request wait time?	Set to **y** to collect data for reports and graphs. If data is collected, the time (in milliseconds) the last ASP.NET request waited in queue before being processed is returned. The default is n.
Threshold – Maximum ASP.NET request wait time	Specify the maximum wait time of the last ASP.NET request allowed before AppManager raises an event. The default is 1000 ms (1 sec).
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.16 ASPNETWorkerProcessCPU

Use this Knowledge Script to monitor the CPU utilization of the ASP.NET worker processes: `w3wp` or `aspnet_wp`.

This script raises an event if the percentage of CPU time being used by the ASP.NET worker processes exceeds the threshold you set.

41.16.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.16.2 Resource Objects

Web servers

41.16.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

41.16.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if ASP.NET worker process CPU utilization exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for ASP.NET worker process CPU utilization?	Set to **y** to collect data for reports and graphs. The default is n. If data is collected, the percentage of CPU time used by the ASP.NET worker processes is returned.
Threshold – ASP.NET worker process CPU utilization	Specify the maximum CPU percentage used by the ASP.NET worker processes that is allowed before AppManager raises an event. The default is 70%.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.17 ASPNETWorkerProcessExcepRate

Use this Knowledge Script to monitor the current exception rate for the common language runtime (CLR) in ASP.NET worker processes: `w3wp` or `aspnet_wp`.

AppManager raises an event if CLR exceptions are thrown in ASP.NET worker processes at an unexpectedly high rate.

41.17.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.17.2 Resource Objects

Web servers

41.17.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

41.17.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event when rate of ASP.NET CLR exceptions exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for ASP.NET CLR exceptions rate?	Set to **y** to collect data for reports and graphs. The default is n. If data is collected, the number of CLR exceptions thrown per second by ASP.NET worker processes is returned.
Threshold – Maximum ASP.NET CLR exception rate	Specify the maximum number of CLR exceptions thrown per second by ASP.NET worker processes that is allowed before AppManager raises an event. The default is 0.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.18 ASPNETWorkerProcessExceptions

Use this Knowledge Script to monitor the current total number of exceptions thrown by the common language runtime (CLR) in ASP.NET worker processes: `w3wp` or `aspnet_wp`.

This script raises an event if an unusually large number of CLR exceptions are thrown in ASP.NET worker processes.

41.18.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.18.2 Resource Objects

Web servers

41.18.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

41.18.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event when number of ASP.NET CLR exceptions exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for ASP.NET CLR exceptions?	Set to **y** to collect data for reports and graphs.The default is n. If data is collected, returns the current total number of CLR exceptions thrown by ASP.NET worker processes.
Threshold – Maximum ASP.NET CLR exceptions	Specify the maximum number of CLR exceptions thrown by ASP.NET worker processes that is allowed before AppManager raises an event. The default is 0.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.19 ASPNETWorkerProcessMemory

Use this Knowledge Script to monitor the nonshared, or "private," memory usage of the ASP.NET worker processes: `w3wp` or `aspnet_wp`.

This script raises an event if ASP.NET worker processes use an unusually large amount of nonshared memory.

41.19.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.19.2 Resource Objects

Web servers

41.19.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

41.19.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if private memory utilization exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for total private memory utilization?	Set to **y** to collect data for reports and graphs. If data is collected, returns the number of bytes of private memory used by both ASP.NET worker processes during the monitoring interval. The default is n.
Threshold – Maximum private memory utilized	Specify the maximum number of bytes of private memory used by the ASP.NET worker processes that is allowed before AppManager raises an event. The default is 25,000 KB.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.20 ASPNETWorkerProcessRestarted

Use this Knowledge Script to monitor the number of times an ASP.NET worker process, `w3wp` or `aspnet_wp`, was restarted during the monitoring interval

This script raises an event if worker processes are unexpectedly restarting.

41.20.1 Versions of IIS Supported

6.0 and later, with the .NET Framework installed.

41.20.2 Resource Objects

Web servers

41.20.3 Default Schedule

The default interval for this script is Every 5 minutes.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.20.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if number of times ASP.NET worker processes were restarted exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for number of ASP.NET worker process restarts?	Set to **y** to collect data for reports and graphs. If data is collected, returns the number of ASP.NET worker process restarts. The default is n.
Threshold – Maximum ASP.NET worker process restarts	Specify the maximum number of ASP.NET worker processes that can be restarted during the monitoring interval before AppManager raises an event. The default is 1.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.21 ASPNETWorkerProcessRunning

Use this Knowledge Script to monitor the number of running ASP.NET worker process: `aspnet_wp`.

This script raises an event if more ASP.NET worker processes are running than expected.

41.21.1 Versions of IIS Supported

6.0 and later

41.21.2 Resource Objects

Web servers

41.21.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

41.21.4 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Raise event if number of running ASP.NET worker processes exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for currently running ASP.NET worker processes?	Set to **y** to collect data for reports and graphs. If data is collected, the number of ASP.NET worker processes running during the monitoring interval is returned. The default is n.
Threshold – Maximum number of ASP.NET worker processes currently running	Specify the maximum number of ASP.NET worker processes that can be running before AppManager raises an event. The default is 2.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.22 ASPQueueBusy

Use this Knowledge Script to monitor the number of ASP requests currently in the queue. If the number of queued requests exceeds the threshold for a specified number of monitoring intervals, AppManager raises an event.

41.22.1 Versions of IIS Supported

6.0 and later.

41.22.2 Resource Objects

Web servers

41.22.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

41.22.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of ASP queued requests exceeds threshold for *N* consecutive intervals?	Set to **y** to raise events. The default is y.
Collect data for ASP queued requests?	Set to **y** to collect data for charts and reports. If set to y, this script returns the number of ASP requests in the queue. The default is n.
Threshold – Maximum ASP queue length	Specify the maximum number of ASP requests allowed in the queue before AppManager raises an event. The default is 3 requests.
Threshold – Maximum number of consecutive intervals where queue length exceeds threshold	Specify the maximum number of consecutive intervals the queue length can exceed the threshold before AppManager raises an event. The default is 3 intervals.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.23 ASPRegistryChange

Use this Knowledge Script to monitor changes to Windows Registry parameters. Valid keys include HKEY_LOCAL_MACHINE, HKEY_CLASSES_ROOT, HKEY_CURRENT_USER, and HKEY_USERS. If a registry key or value is added, changed, or deleted, AppManager raises an event.

41.23.1 Versions of IIS Supported

6.0 and later.

41.23.2 Resource Objects

Web servers

41.23.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

41.23.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if changes to registry keys detected?	Set to **y** to raise events. The default is y.
Collect data for changes to registry keys?	Set to **y** to collect data for charts and reports. If set to y, returns the number of changes to the Windows Registry since the previous job ran. The default is n.
Root registry key to monitor	Specify the root registry key to monitor. Valid root options are: • HKEY_LOCAL_MACHINE • HKEY_CLASSES_ROOT • HKEY_CURRENT_USER • HKEY_USERS The default is HKEY_LOCAL_MACHINE.
Pathname	Specify the full path to the registry key. The default path is SYSTEM\CurrentControlSet\Services\W3SVC.
Sub-level	Specify the number of descending key levels below the path name to monitor. The default is 2 levels deep.
Sub-keys to exclude (separated by commas)	Specify any sub-keys to exclude from monitoring. Separate sub-keys using commas; do not add spaces between sub-key entries. For example, to exclude "Beep" and "Afd" under the CurrentControlSet sub-key, specify the following: SYSTEM\CurrentControlSet\Services\Beep, SYSTEM\CurrentControlSet\Services\Afd

Description	How to Set It
Event severity when change detected	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the changed is detected. The default is 8.
Event severity for errors accessing the registry	Set the event severity level, from 1 and 40, to indicate the importance of the event. The default is 35.

41.24 ASPReqStat

Use this Knowledge Script to monitor the number of ASP request errors per second, different types of ASP request failures during an interval, and ASP sessions that timed out during an interval.

This Knowledge Script consolidates the functionality that is also available in three separate IIS Knowledge Scripts:

- ASPRequestError
- ASPRequestFailed
- ASPSessionTimeout

41.24.1 Versions of IIS Supported

6.0 and later.

41.24.2 Resource Objects

Web servers

41.24.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

41.24.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
ASPRequestError	Select Yes to check for ASP request errors. The default is Yes.
Raise an event if ASP request error rate exceeds threshold?	Select Yes to raise an event if the ASP request error rate exceeds the threshold. The default is Yes.
Collect data for current ASP request errors?	Select Yes to collect data for charts and reports. The default is No.
Threshold – Maximum current ASP request error rate	Specify the maximum number of errors per second allowed before AppManager raises an event. The default is 1 error per second.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 5.
ASPRequestFailed	Select Yes to check for ASP request failures. The default is Yes.
Raise event if number of errors exceeds any threshold?	Select Yes to raise an event if the number of errors exceeds any threshold. The default is Yes.
Collect data for number of ASP request failures?	Select Yes to collect data for charts and reports. If enabled, this script returns the number of failure, rejection, and timeout errors during an interval. The default is No.

Description	How to Set It
Threshold – Maximum number of failure errors	Specify the maximum number of failure errors allowed before AppManager raises an event. The default is 25 errors.
Threshold – Maximum number of rejected errors	Specify the maximum number of rejection errors allowed before AppManager raises an event. The default is 25 errors.
Threshold – Maximum number of timeout errors	Specify the maximum number of timeout errors allowed before AppManager raises an event. The default is 25 errors.
Event severity when any threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 5.
ASPRequestTimeout	Select Yes to check for ASP sessions that timed out during a monitoring interval. The default is Yes.
Raise event if number of timed-out ASP sessions exceeds threshold?	Select Yes to raise an event if the number of ASP sessions exceeds the threshold. The default is Yes.
Collect data for number of timed-out ASP sessions?	Select Yes to collect data for charts and reports. If selected, this script returns the number of sessions that timed out during a monitoring interval. The default is No.
Threshold – Maximum number of timed-out sessions	Specify the maximum number of sessions that can time out during an interval before AppManager raises an event. The default is 25 sessions.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Other settings	
Event severity for unexpected error	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.

41.25 ASPRequestError

Use this Knowledge Script to monitor the number of ASP request errors per second. Errors that can occur in response to an ASP request include connection errors, compile errors, and runtime errors. If the number of errors per second exceeds the threshold you set, AppManager raises an event.

41.25.1 Versions of IIS Supported

6.0 and later.

41.25.2 Resource Objects

Web servers

41.25.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

41.25.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if ASP request error rate exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for current ASP request errors?	Set to **y** to collect data for charts and reports. If set to y, this script returns the current number of ASP request errors per second. The default is n.
Threshold – Maximum current ASP request error rate	Specify the maximum number of errors per second allowed before AppManager raises an event. The default is 1 error per second.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 8.

41.26 ASPRequestFailed

Use this Knowledge Script to monitor the number of ASP request failures during the monitoring interval, by error type. ASP requests can fail for the following reasons:

- Failures
- Rejection because of insufficient resources available to queue the request
- Timeout before the request can be completed

If the number of failure errors, rejected errors, or timeout errors exceeds the thresholds you set, AppManager raises an event.

41.26.1 Versions of IIS Supported

6.0 and later.

41.26.2 Resource Objects

Web servers

41.26.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.26.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of errors exceeds any threshold?	Set to **y** to raise events if any of the thresholds is exceeded. The default is y.
Collect data for number of ASP request errors?	Set to **y** to collect data for charts and reports. If set to y, returns the number of failure, rejection, and timeout errors during an interval. The default is n.
Threshold – Maximum number of failure errors	Specify the maximum number of failure errors allowed before AppManager raises an event. The default is 25 errors.
Threshold – Maximum number of rejected errors	Specify the maximum number of rejection errors allowed before AppManager raises an event. The default is 25 errors.
Threshold – Maximum number of timeout errors	Specify the maximum number of timeout errors allowed before AppManager raises an event. The default is 25 errors.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.27 ASPSessionTimeout

Use this Knowledge Script to monitor the number of ASP sessions that timed out during a monitoring interval. If the number of ASP sessions that timed out exceeds the threshold you set, AppManager raises an event.

41.27.1 Versions of IIS Supported

6.0 and later.

41.27.2 Resource Objects

Web servers

41.27.3 Default Schedule

The default interval for this script is **Every 5 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.27.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of timed-out ASP sessions exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for number of timed-out ASP sessions?	Set to **y** to collect data for charts and reports. If set to y, this script returns the number of sessions that timed out during a monitoring interval. The default is n.
Threshold – Maximum number of timed-out sessions	Specify the maximum number of sessions that can time out during an interval before AppManager raises an event. The default is 25 sessions.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.28 ASPThroughput

Use this Knowledge Script to monitor the current number of ASP requests processed per second. If the current ASP request rate exceeds the threshold you set, AppManager raises an event.

41.28.1 Versions of IIS Supported

6.0 and later.

41.28.2 Resource Objects

Web servers

41.28.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

41.28.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of ASP requests processed per second exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for average number of ASP requests processed per second?	Set to **y** to collect data for charts and reports. If set to y, returns the average number of ASP requests processed per second. The default is n.
Threshold – Maximum number of ASP requests processed per second	Specify the maximum number of ASP requests per second allowed before AppManager raises an event. The default is 100 requests per second.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.29 CacheHitRatio

Use this Knowledge Script to monitor the cache hit ratio for cache requests: the total number of cache hits and misses, and the cache hit ratio.

The cache hit ratio is the percentage of time information is found in the cache. A low cache hit ratio might indicate that the information most commonly requested is not stored in the cache and that the contents of the cache need to be reexamined. If the cache hit ratio falls below the minimum threshold you set, AppManager raises an event.

41.29.1 Versions of IIS Supported

6.0 and later.

41.29.2 Resource Objects

IIS servers

41.29.3 Default Schedule

The default interval for this script is **Once every hour**.

41.29.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if cache hit ratio fails to meet threshold?	Set to **y** to raise events. The default is y.
Collect data for cache hits, cache misses, and cache hit ratio?	Set to **y** to collect data for charts and reports. If set to y, the script returns the cache hit ratio. The default is n.
Threshold – Minimum cache hit ratio	Specify the minimum number of cache hits required during any interval before AppManager raises an event. The default is 50%.
Event severity when threshold not met	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.30 CentralizedBinaryLogging

Use this Knowledge Script to scan the IIS centralized binary logging file for information by choosing from a list of filter criteria.

IIS used two types of logging:

- Normal: Creates one log file per Web site. Depending on the number of Web sites, the corresponding folders (`w3svc*`) are created under the log file directory at `C:\WINDOWS\system32\LogFiles`.
- Binary: Creates one folder under the log files directory at `C:\WINDOWS\system32\LogFiles\W3SVC`.

Usually an IIS server hosts many Web sites. In such a situation, creating many log files and writing all the log data to a disk consumes CPU and memory resources. This creates performance and scalability issues. Centralized binary logging is a process where multiple Web sites send binary, unformatted log data to a single log file. Centralized binary logging minimizes the amount of system resources used for logging, while providing detailed log data, which is useful in troubleshooting applications.

This Knowledge Script converts the binary file into text format. The corresponding folders are created according to the Web site information in the binary file. These folders do not interfere with the functioning of the log files. Manually deleting the folders does not have any effect on the functioning of the binary log.

If log entries matching the filter criteria are found, AppManager raises an event.

NOTE: File Transfer Protocol (FTP), Network News Transfer Protocol (NNTP), and Simple Mail Transfer Protocol (SMTP) do not support Centralized Binary Logging.

41.30.1 Prerequisite

To enable the Knowledge Script to read the binary logging file, install Microsoft Log Parser.

For more information, see http://www.microsoft.com/downloads/details.aspx?FamilyID=890cd06b-abf8-4c25-91b2-f8d975cf8c07&displaylang=en.

41.30.2 Version Compatibility

6.0 and later.

41.30.3 Resource Objects

Web servers

41.30.4 Default Schedule

The default schedule of this script is **Once daily**.

41.30.5 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if log entries match search criteria?	Select Yes to raise an event if log entries match search criteria. The default is Yes
Collect data for matching log entries?	Select Yes to collect data for matching log entries for charts and graphs. The default is No.
Filter: Bytes received greater than	Specify the number of bytes received that you want to search for in the centralized binary logging file. Numbers in this field are “greater than” values. For example, if you specify `200`, this script searches the Bytes Received column for values greater than 200. The default is 200 bytes received.
Filter: Bytes sent greater than	Specify the number of bytes sent that you want to search for in the centralized binary logging file. Numbers in this field are “greater than” values. For example, if you specify `200`, this script searches the Bytes Sent column for values greater than 200. The default is 200 bytes sent.
Filter: Client IP	Specify the Web address or IP address to search for in the IIS Web site log.
Filter: Operation type	Specify the operation type to search for. For example, type `get` or `post`. Specify one type.
Filter: Protocol status	Specify the HTTP protocol status code to search for. For example, `200`.
Filter: Protocol version	Specify the protocol version number to search for. For example, HTTP 1.0.
Filter: URI Stem	Specify the Uniform Resource Identifier (URI) Stem of the server to search for. URI is the addressing technology for identifying resources on the Internet or private Intranet.
Filter: Server IP	Specify the IP address of the server to search for.
Filter: Server name	Specify the name of the server to search for.
Filter: Time taken greater than	Specify the length of time an HTTP action (for example, `get` or `post`) takes to complete. Numbers in this field are “greater than” values. For example, if you type `200`, this script searches the Time Taken column for values greater than 200. The default is 200 milliseconds (ms).
Filter: Windows status	Specify the Windows status code to search for. For example, `200`.
Event severity when search criteria met	Set the event severity level, from 1 to 40, to indicate the importance of the event. Adjust the severity depending on which types of events you check for. The default is 8.

41.31 CGIRequests

Use this Knowledge Script to monitor the CGI requests for a Web site. A CGI (Common Gateway Interface) request serves as an interface between an HTTP request and the execution of a program on the Web server. If the number of CGI requests exceeds the threshold you set, AppManager raises an event.

41.31.1 Versions of IIS Supported

6.0 and later.

41.31.2 Resource Objects

Discovered Web sites

41.31.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

41.31.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if current number of CGI requests exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for current number of CGI requests?	Set to **y** to collect data for charts and reports. If set to y, returns the number of CGI requests completed. The default is n.
Threshold – Maximum number of CGI requests	Specify the maximum number of CGI requests that are allowed before AppManager raises an event. The default is 200 requests.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.32 CpuHigh

Use this Knowledge Script to monitor the CPU utilization of IIS application processes. If the amount of CPU time used by any IIS process exceeds the threshold you set, AppManager raises an event.

You can select which processes to monitor. The processes to monitor depend on the version of IIS you are running.

IIS 6.0:

- When running in IIS 5.0 compatibility mode, `inetinfo.exe`, for in-process applications, or `dllhost.exe`, for out-of-process applications. One `dllhost.exe` process is for the pooled applications, and one is for each isolated out-of-process application. If you have the .NET Framework installed on IIS 6.0, you can also monitor `aspnet_wp` for any ASP.NET applications.
- When running in worker process isolation mode, `w3wp.exe` for multiple processes.

IIS 7.0 and IIS 7.5:

- `inetinfo` with IIS 6.0 compatibility option enabled
- `w3wp`

41.32.1 Versions of IIS Supported

6.0 and later.

41.32.2 Resource Objects

IIS servers

41.32.3 Default Schedule

The default interval is **Every 5 minutes**.

41.32.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if CPU utilization of any process exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for CPU utilization by process?	Set to **y** to collect data for charts and reports. If set to y, this script returns the CPU utilization of the named application process. The default is n.
Process names to monitor (separated by commas)	Specify the names of the application processes to monitor. Separate multiple entries with commas. For example: `inetinfo,dllhost`.
Threshold – Maximum CPU utilization for any process	Specify the maximum percentage of CPU resources the selected processes can use before AppManager raises an event. The default is 60%.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.33 FTPBytes

Use this Knowledge Script to monitor the total number of bytes transferred per second to and from an FTP site. If the byte transfer rate exceeds the threshold you set, AppManager raises an event.

41.33.1 Versions of IIS Supported

6.0 and later.

41.33.2 Resource Objects

FTP sites

41.33.3 Default Schedule

The default interval is **Every 30 minutes**.

41.33.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of bytes transferred per second exceeds a threshold?	Set to **y** to raise events. The default is n.
Collect data for current transfer rate (bytes sent, bytes received)?	Set to **y** to collect data for charts and reports. If set to y, returns the number of bytes transferred per second. The default is n.
Threshold – Maximum bytes received per second	Specify the maximum bytes per second that can be received by the FTP site before AppManager raises an event. The default is 64000 bytes per second.
Threshold – Maximum bytes sent per second	Specify the maximum bytes per second that can be sent by the FTP site before AppManager raises an event. The default is 64000 bytes per second.
Event severity when either threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.

41.34 FTPConnections

Use this Knowledge Script to monitor the current number of connections from anonymous and non-anonymous (user) accounts to an FTP site. If the number of FTP site connections exceeds the threshold you set, AppManager raises an event.

41.34.1 Versions of IIS Supported

6.0 and later.

41.34.2 Resource Objects

FTP sites

41.34.3 Default Schedule

The default interval is **Every 30 minutes**.

41.34.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if current number of connections exceeds either threshold?	Set to **y** to raise events. The default is n.
Collect data for current FTP connections (from anonymous or non-anonymous accounts)?	Set to **y** to collect data for charts and reports. If set to y, this script returns the number of connections from anonymous and user accounts to the FTP site. By default, data is collected.
Threshold – Maximum connections from anonymous accounts	Specify the maximum number of connections allowed from anonymous accounts to the FTP site before AppManager raises an event. The default is 64 connections.
Threshold – Maximum connections from non-anonymous (user) accounts	Specify the maximum number of connections allowed from non-anonymous (user) accounts to the FTP site before AppManager raises an event. The default is 64 connections.
Event severity when either threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 12.

41.35 FTPConnectionsInterval

Use this Knowledge Script to monitor the number of connections to an FTP site, and totals for all monitored sites, from anonymous and user accounts during the monitoring interval. If the number of FTP connections exceeds the threshold, AppManager raises an event.

41.35.1 Versions of IIS Supported

6.0 and later.

41.35.2 Resource Objects

FTP sites

41.35.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.35.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of connections exceeds any threshold?	Set to **y** to raise events. The default is y.
Collect data for number of connections per site, and total for all sites?	Set to **y** to collect data for charts and reports. If set to y, returns the number of FTP connections during the monitoring interval. The default is n.
Threshold – Maximum connections to FTP site from anonymous accounts	Specify the maximum number of FTP site connections that can come from anonymous accounts before AppManager raises an event. The default is 64 connections.
Threshold – Maximum connections to FTP site from non-anonymous accounts	Specify the maximum number of FTP site connections that can come from non-anonymous (user) accounts before AppManager raises an event. The default is 64 connections.
Threshold – Maximum total connections to all FTP sites from anonymous accounts	Specify the maximum total number of connections to all FTP sites that can come from anonymous accounts before AppManager raises an event. The default is 64 connections.
Threshold – Maximum total connections to all FTP sites from non-anonymous accounts	Specify the maximum total number of connections to all FTP sites that can come from non-anonymous (user) accounts before AppManager raises an event. The default is 64 connections.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 12.

41.36 FTPConnectionUtil

Use this Knowledge Script to monitor the percentage of connections to an FTP site that are being utilized. If the percentage of FTP connections exceeds the threshold you set, AppManager raises an event.

If you receive an event stating that the "maximum number of connections" value cannot be retrieved, specify the maximum number of connections allowed on the FTP site on which you are running the Knowledge Script for the **Maximum connections allowed** parameter. Information about the maximum number of connections allowed on an FTP server can be found in the IIS Manager.

If your FTP connections are unlimited, either use the default value or refer to the IIS documentation for information about how to calculate the total number available connections.

No data point is collected for utilization percentage when the Maximum Connections, taken either from IIS itself or from the **Maximum connections allowed** parameter, is 0.

41.36.1 Versions of IIS Supported

6.0 and later.

41.36.2 Resource Objects

FTP sites

41.36.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

41.36.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if connection utilization exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for current connections and connection utilization?	Set to **y** to collect data for charts and reports. If set to y, returns the number of FTP connections and connection utilization (%). No data point is collected for the percentage of utilization when the Maximum Connections is 0. The default is n.
Threshold – Maximum connection utilization	Specify the maximum percentage of available FTP connections that can be used before AppManager raises an event. The default is 90%.
Maximum connections allowed on this site	If the "maximum number of connections" value cannot be retrieved from the site, specify the maximum number of connections allowed on the FTP site where this script is being run. The default is 5000 FTP connections.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 12.

41.37 FTPFiles

Use this Knowledge Script to monitor the total number of files sent to and received from an FTP site during the monitoring interval. If the number of transferred files exceeds the threshold you set, AppManager raises an event.

41.37.1 Versions of IIS Supported

6.0 and higher.

41.37.2 Resource Objects

FTP sites

41.37.3 Default Schedule

The default interval is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.37.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of files sent or received exceeds threshold?	Set to **y** to raise events. The default is n.
Collect data for files sent or files received?	Set to **y** to collect data for charts and reports. If set to y, returns the number of files being sent and received by the FTP site during an interval. By default, data is collected.
Threshold – Maximum files received	Specify the maximum number of files that can be received by the FTP site during an interval before AppManager raises an event. The default is 640 files.
Threshold – Maximum files sent	Specify the maximum number of files that can be sent by the FTP site during an interval before AppManager raises an event. The default is 640 files.
Event severity when either threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.

41.38 FTPStatistics

Use this Knowledge Script to monitor the current number of connections to FTP sites, number of FTP site connections, and percentage of FTP connections being utilized.

This Knowledge Script consolidates functionality that is also available in three separate IIS Knowledge Scripts:

- FTPConnections
- FTPConnectionsInterval
- FTPConnectionUtil

If you receive an event stating that the "maximum number of connections" value cannot be retrieved, specify the maximum number of connections allowed on the FTP site on which you are running the Knowledge Script for the **Maximum connections allowed on this site** parameter. Information about the maximum number of connections allowed on an FTP server can be found in the IIS Manager.

If your FTP connections are unlimited, either use the default value or refer to the IIS documentation for information on calculating the total number available connections.

No data point is collected for utilization percentage when the Maximum Connections, taken either from IIS itself or from the **Maximum connections allowed on this site** parameter, is 0.

41.38.1 Versions of IIS Supported

6.0 and later.

41.38.2 Resource Objects

FTP sites

41.38.3 Default Schedule

The default interval is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.38.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
FTPConnections	Select Yes to check for the current number of connections to FTP sites. The default is Yes.
Raise event if current number of connections exceeds either threshold?	Select Yes to raise events. The default is Yes.

Description	How to Set It
Collect data for current FTP connections (from anonymous or non-anonymous accounts)?	Select Yes to collect data for charts and reports. If set to Yes, this script returns the number of connections from anonymous and user accounts to the FTP site. The default is No.
Threshold – Maximum connections from anonymous accounts	Specify the maximum number of connections allowed from anonymous accounts to the FTP site before AppManager raises an event. The default is 64 connections.
Threshold – Maximum connections from non-anonymous (user) accounts	Specify the maximum number of connections allowed from non-anonymous (user) accounts to the FTP site before AppManager raises an event. The default is 64 connections.
Event severity when either threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 12.
FTPConnectionsInterval	Select Yes to check for the number of connections to FTP sites. The default is Yes.
Raise event if number of connections exceeds either threshold?	Select Yes to raise events. The default is Yes.
Collect data for number of connections per site and total for all sites?	Select Yes to collect data for charts and reports. If set to Yes, returns the number of FTP connections during the monitoring interval. The default is No.
Threshold – Maximum connections to FTP site from anonymous accounts	Specify the maximum number of FTP site connections from anonymous accounts before AppManager raises an event. The default is 64 connections.
Threshold – Maximum connections to FTP site from non-anonymous (user) accounts	Specify the maximum number of FTP site connections from non-anonymous accounts before AppManager raises an event. The default is 64 connections.
Threshold – Maximum total connections to all FTP sites from anonymous accounts	Specify the maximum total number of connections to all FTP sites from anonymous accounts before AppManager raises an event. The default is 64 connections.
Threshold – Maximum total connections to all FTP sites from non-anonymous (user) accounts	Specify the maximum total number of connections to all FTP sites from non-anonymous accounts before AppManager raises an event. The default is 64 connections.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 12.
FTPConnectionUtil	Select Yes to check for the percentage of connections to an FTP site that are being utilized. The default is No.
Raise event if connection utilization exceeds threshold?	Select Yes to raise events. The default is Yes.
Collect data for current connections and connection utilization?	Select Yes to collect data for charts and reports. If set to Yes, returns the number of FTP connections and connection utilization (%). No data point is collected for the percentage of utilization when the **Maximum Connections** is 0. The default is No.
Threshold – Maximum connection utilization	Specify the maximum percentage of available FTP connections before AppManager raises an event. The default is 90%.
Maximum connections allowed on this site	If the “maximum number of connections” value cannot be retrieved from the site, specify the maximum number of connections allowed on the FTP site where this script is being run. The default is 5000 FTP connections.

Description	How to Set It
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 12.
Other settings	
Event severity for unexpected error	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.

41.39 FTPTransStat

Use this Knowledge Script to monitor the rate of bytes transferred per second and the total number of files sent to and received from the FTP server.

This Knowledge Script consolidates functionality that is also available in two separate IIS Knowledge Scripts:

- FTPBytes
- FTPFiles

41.39.1 Versions of IIS Supported

6.0 and later.

41.39.2 Resource Objects

FTP sites

41.39.3 Default Schedule

The default interval is **Every 30 minutes**.

41.39.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
FTPBytes	Select **Yes** to check the total number of bytes transferred per second to and from an FTP site. The default is Yes.
Raise event if number of bytes transferred per second exceeds threshold?	Select **Yes** to raise events. The default is Yes.
Collect data for current transfer rate (bytes sent, bytes received)?	Select **Yes** to collect data for charts and reports. If set to Yes, returns the number of bytes transferred per second. The default is No.
Threshold – Maximum bytes received per second	Specify the maximum bytes per second that can be received by the FTP site before AppManager raises an event. The default is 64000 bytes per second.
Threshold – Maximum bytes sent per second	Specify the maximum bytes per second that can be sent by the FTP site before AppManager raises an event. The default is 64000 bytes per second.
Event severity when either threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
FTPFiles	Select **Yes** to check the total number of files sent to and received from an FTP site during the monitoring interval. The default is Yes.

Description	How to Set It
Raise event if number of files sent or received exceeds threshold?	Select **Yes** to raise events. The default is Yes.
Collect data for files sent or files received?	Select **Yes** to collect data for charts and reports. If set to Yes, returns the number of files sent and received by the FTP site during an interval. The default is No.
Threshold – Maximum files received	Specify the maximum number of files that can be received by the FTP site during an interval before AppManager raises an event. The default is 640 files.
Threshold – Maximum files sent	Specify the maximum number of files that are sent by the FTP site during an interval before AppManager raises an event. The default is 640 files.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Other settings	
Event severity for unexpected error	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.

41.40 HealthCheck

Use this Knowledge Script to check the status of IIS services and Web sites. If any IIS service, such as `W3svc`, or Web site is not running, AppManager raises an event. Optionally, the IIS service or Web site can automatically be re-started.

41.40.1 Versions of IIS Supported

6.0 and later.

41.40.2 Resource Objects

IIS services and Web sites

41.40.3 Default Schedule

The default interval is **Every 5 minutes**.

41.40.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Auto-start service or Web site?	Set to **y** to automatically restart down services or Web sites. The default value is **y**.
Event severity: Auto-start...	Set the event severity level, from 1 to 40, to indicate the importance when auto-start: • **... fails**. Specify a value that indicates the service or site is down and AppManager for IIS cannot restart it. The default is 5. • **... succeeds**. Specify a value that indicates the service or site was down and AppManager for IIS successfully restarted it. The default is 25. • **...Site or service is down and auto-start not enabled**. Specify a value to indicate the service or site is down and AppManager for IIS has been set not to restart. The default is 18.
Collect data for site or service status?	Set to **y** to collect data for charts and reports. The default is n.

41.41 HTTPBytes

Use this Knowledge Script to monitor the total number of bytes transferred per second to and from a Web site. If the total number of transferred bytes exceeds the thresholds you set, AppManager raises an event.

This script supports "dynamic observation" of Web sites. Dynamically observed Web sites are new sites that AppManager for IIS has observed while monitoring your IIS servers. These sites are included in jobs, but they cannot be monitored until you discover them by running the Discovery_IIS Knowledge Script again.

If you select a subset of Web sites for the job but leave the **Dynamically observe sites at each interval?** parameter enabled, this script will still do dynamic observation, and results will be returned for all Web sites, not just the subset selected. To limit results, disable the **Dynamically observe...** parameter.

41.41.1 Versions of IIS Supported

6.0 and later.

41.41.2 Resource Objects

Web sites

41.41.3 Default Schedule

The default interval is **Every 30 minutes**.

41.41.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Dynamically observe Web sites at each interval?	Set to **y** to dynamically observe new Web sites at each monitoring interval. The default is y.
Exclude Web sites (separate names with commas)	Specify the name of any site you want to exclude. You can exclude multiple sites, separated by commas with no spaces. For example: `site1,site2`. **NOTE:** If you are not dynamically observing sites, this parameter is ignored.
Raise event if number of bytes transferred per second exceeds a threshold?	Set to **y** to raise events. The default is y.
Collect data for current transfer rate (bytes sent, bytes received)?	Set to **y** to collect data for charts and reports. If set to y, returns the byte transfer rate for the HTTP server. By default, data is collected.
Threshold – Maximum bytes received per second	Specify the maximum bytes per second that can be received by the HTTP server before AppManager raises an event. The default is 64000 bytes per second.

Description	How to Set It
Threshold – Maximum bytes sent per second	Specify the maximum bytes per second that can be sent by the HTTP server before AppManager raises an event. The default is 64000 bytes per second.
Event severity when either threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.

41.42 HTTPBytesInterval

Use this Knowledge Script to monitor the number of bytes transferred to and from Web sites, and totals for all monitored sites, during the monitoring interval. If the number of transferred bytes exceeds any of the thresholds you set, AppManager raises an event.

This script supports "dynamic observation" of Web sites. Dynamically observed Web sites are new sites that AppManager for IIS has observed while monitoring your IIS servers. These sites are included in jobs, but they cannot be monitored until you discover them by running the Discovery_IIS Knowledge Script again.

If you select a subset of Web sites for the job but leave the **Dynamically observe sites at each interval?** parameter set to y, this script will still do dynamic observation, and results will be returned for all Web sites, not just the subset selected. To limit results, set the **Dynamically observe...** parameter to n. You can disable monitoring of totals for all sites by typing "_Total" for the **Exclude Web sites** parameter.

41.42.1 Versions of IIS Supported

6.0 and later.

41.42.2 Resource Objects

Web sites

41.42.3 Default Schedule

The default interval is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.42.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Dynamically observe Web sites at each interval?	Set to **y** to dynamically observe new Web sites at each monitoring interval. The default is y.
Exclude Web sites	Specify the name of any site you want to exclude. You can exclude multiple sites, separated by commas with no spaces. For example: `site1,site2`. Specify "_Total" to disable monitoring of totals. **NOTE:** If you are not dynamically observing sites, this parameter is ignored.
Raise event if number of bytes transferred exceeds any threshold?	Set to **y** to raise events. The default is y.

Description	How to Set It
Collect data for transfer rate (bytes sent, bytes received)?	Set to **y** to collect data for charts and reports. If set to y, returns the number of bytes transferred to and from the HTTP server during the monitoring interval. The default is n.
Threshold – Maximum bytes received by Web site	Specify the maximum number of bytes that can be received by a Web site during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Threshold – Maximum bytes sent by Web site	Specify the maximum number of bytes that can be sent by a Web site during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Threshold – Maximum total bytes received by all Web sites	Specify the maximum number of bytes that can be received by all monitored Web sites during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Threshold – Maximum total bytes sent by all Web sites	Specify the maximum total number of bytes that can be sent by all monitored Web sites during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.

41.43 HTTPConnectionsInterval

Use this Knowledge Script to monitor the number of Web site connections, and totals for all Web sites, from anonymous and non-anonymous (or user) accounts during the monitoring interval. This Knowledge Script monitors the number of connections established after the previous iteration. If the number of Web site connections exceeds any threshold, AppManager raises an event.

This script supports "dynamic observation" of Web sites. Dynamically observed Web sites are new sites that AppManager for IIS has observed while monitoring your IIS servers. These sites are included in jobs, but they cannot be monitored until you discover them by running the Discovery_IIS Knowledge Script again.

If you select a subset of Web sites for the job but leave the **Dynamically observe sites at each interval?** parameter set to y, this script will still do dynamic observation, and results will be returned for all Web sites, not just the subset selected. To limit results, set the **Dynamically observe...** parameter to n. You can disable monitoring of totals for all sites by typing "_Total" for the **Exclude Web sites** parameter.

41.43.1 Versions of IIS Supported

6.0 and later.

41.43.2 Resource Objects

Discovered Web sites

41.43.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.43.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Dynamically observe Web sites at each interval?	Set to **y** to dynamically observe new Web sites at each monitoring interval. The default is y.
Exclude Web sites (separate names with commas)	Specify the name of any request you want to exclude. You can exclude multiple sites, separated by commas with no spaces. For example: `site1,site2`. Specify "_Total" to disable monitoring of totals for all sites. **NOTE:** If you are not dynamically observing sites, this parameter is ignored.
Raise event if number of connections exceeds a threshold?	Set to **y** to raise events. The default is y.

Description	How to Set It
Collect data for number of connections?	Set to **y** to collect data for charts and reports. If set to y, returns the number of Web server connections during the monitoring interval. The default is n.
Threshold – Maximum connections to Web site from anonymous accounts	Specify the maximum number of Web site connections from anonymous accounts that can be open during the monitoring interval. The default is 64
Threshold – Maximum connections to Web site from non-anonymous (user) accounts	Specify the maximum number of Web site connections from non-anonymous (user) accounts that can be open during the monitoring interval. The default is 64
Threshold – Maximum total connections to all Web sites from anonymous accounts	Specify the maximum total number of connections to all monitored Web sites from anonymous accounts that can be open during the monitoring interval. The default is 64
Threshold – Maximum total connections to all Web sites from non-anonymous (user) accounts	Specify the maximum total number of connections to all monitored Web sites from non-anonymous (user) accounts that can be open during the monitoring interval. The default is 64
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.44 HTTPConnectionUtil

Use this Knowledge Script to monitor the percentage of Web site connections being utilized. If the percentage of Web site connections being used exceeds the threshold you set, AppManager raises an event.

If you receive an event stating that the "maximum number of connections" value cannot be retrieved, specify the maximum number of connections allowed for the **Maximum connections allowed** parameter. Information about the maximum number of connections allowed on a Web site can be found in the IIS Manager.

If your Web site connections are unlimited, either use the default value or refer to the IIS documentation for information about how to calculate the total number of available connections.

If the percentage of Web site connections being used exceeds the threshold you set, AppManager raises an event. No data point is collected for utilization percentage when the Maximum Connections, taken either from IIS itself or from the **Maximum connections allowed** parameter, is 0.

41.44.1 Versions of IIS Supported

6.0 and later.

41.44.2 Resource Objects

Web sites

41.44.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

41.44.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if connection utilization exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for current connections and connection utilization?	Set to **y** to collect data for charts and reports. If set to y, the script returns the number of Web site connections being used and the utilization (%). No data point is collected for the percentage of utilization when the Maximum Connections is 0. The default is n.
Threshold – Maximum connection utilization	Specify the maximum percentage of Web site connections that can be used before AppManager raises an event. The default is 90%
Maximum connections allowed on this site	If the "maximum number of connections" value cannot be retrieved from the server, specify the maximum number of connections allowed on the Web site where this script is being run. The default is 5000 connections.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.45 HTTPFiles

Use this Knowledge Script to report the total number of files sent to and received from a Web site during the monitoring interval. If the number of files sent to and received from the Web site exceeds either threshold you set, AppManager raises an event.

This script supports "dynamic observation" of Web sites. Dynamically observed Web sites are new sites that AppManager for IIS has observed while monitoring your IIS servers. These sites are included in jobs, but they cannot be monitored until you discover them by running the Discovery_IIS Knowledge Script again.

If you select a subset of Web sites for the job but leave the **Dynamically observe sites at each interval?** parameter set to y, this script will still do dynamic observation, and results will be returned for all Web sites, not just the subset selected. To limit results, set the **Dynamically observe...** parameter to n.

41.45.1 Versions of IIS Supported

6.0 and later.

41.45.2 Resource Objects

Web sites

41.45.3 Default Schedule

The default interval is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.45.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Dynamically observe Web sites at each interval?	Set to **y** to dynamically observe Web sites at each monitoring interval. The default is y.
Exclude Web sites (separate names with commas)	Specify the name of any site you want to exclude. You can exclude multiple sites, separated by commas with no spaces. For example: `site1,site2`. **NOTE:** If you are not dynamically observing sites, this parameter is ignored. Also, if you run the Knowledge Script on an individual site, dynamic observation is deselected and the exclusion list is ignored.
Raise event if number of files transferred exceeds a threshold?	Set to **y** to raise events. The default is y.
Collect data for files sent and files received?	Set to **y** to collect data for charts and reports. If set to y, returns the number of files sent and received by the Web site during an interval. The default is n.

Description	How to Set It
Threshold – Maximum files received	Specify the maximum number of files that can be received by the Web site during an interval before AppManager raises an event. The default is 640 files.
Threshold – Maximum files sent	Specify the maximum number of files that can be sent by the Web site during an interval before AppManager raises an event. The default is 640 files.
Event severity when either threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.

41.46 HTTPNotFound

Use this Knowledge Script to monitor the number of requested pages that could not be found by the Web site during the monitoring interval. When a page cannot be found, the request generally returns an `HTTP 404` error code to the client. If the number of pages not found by the Web site exceeds the threshold you set, AppManager raises an event.

This script supports "dynamic observation" of Web sites. Dynamically observed Web sites are new sites that AppManager for IIS has observed while monitoring your IIS servers. These sites are included in jobs, but they cannot be monitored until you discover them by running the Discovery_IIS Knowledge Script again.

If you select a subset of Web sites for the job but leave the **Dynamically observe sites at each interval?** parameter set to y, this script will still do dynamic observation, and results will be returned for all Web sites, not just the subset selected. To limit results, set the **Dynamically observe...** parameter to n.

41.46.1 Versions of IIS Supported

6.0 and later.

41.46.2 Resource Objects

Web sites

41.46.3 Default Schedule

The default interval is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.46.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Dynamically observe Web sites at each interval?	Set to **y** to dynamically observe Web sites at each monitoring interval. The default is y.
Exclude Web sites (separate names with commas)	Specify the name of any sites you want to exclude. You can exclude multiple sites, separated by commas with no spaces. For example: `site1,site2`. **NOTE:** If you are not dynamically observing sites, this parameter is ignored.
Raise event if number of "Page not Found" errors exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for number of "Page not Found" errors?	Set to **y** to collect data for charts and reports. If set to y, this script returns the number of `Page not Found` errors. The default is n.
Threshold – Maximum number of "Page not Found" errors	Specify the maximum number of `Page not Found` errors allowed per interval before AppManager raises an event. The default is 200 errors.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.47 HTTPRequests

Use this Knowledge Script to monitor the total number of HTTP method requests during the monitoring interval. The following requests can be monitored: `COPY`, `DELETE`, `GET`, `HEAD`, `LOCK`, `MKCOL`, `MOVE`, `OPTIONS`, `POST`, `PROPFIND`, `PROPPATCH`, `PUT`, `SEARCH`, `TRACE`, and `UNLOCK`.

If the number of HTTP method requests exceeds the threshold you set, AppManager raises an event.

This script supports "dynamic observation" of Web sites. Dynamically observed Web sites are sites that AppManager for IIS has observed while monitoring your IIS servers. These sites are included in jobs, but they cannot be monitored until you discover them by running the Discovery_IIS Knowledge Script again.

If you select a subset of Web sites for the job but leave the **Dynamically observe sites at each interval?** parameter set to y, this script will still do dynamic observation, and results will be returned for all Web sites, not just the subset selected. To limit results, set the **Dynamically observe**... parameter to n.

41.47.1 Versions of IIS Supported

6.0 and later.

41.47.2 Resource Objects

Web sites

41.47.3 Default Schedule

The default interval for this script is **Every hour**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.47.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Dynamically observe Web sites at each interval?	Set to **y** to dynamically observe Web sites at each monitoring interval. If set to n, only the Web sites you discovered are monitored. The default is y.
Exclude Web sites (separate names with commas)	Specify the names of any Web sites you want to exclude if you are dynamically observing Web sites. You can exclude multiple Web sites, separated by commas with no spaces. For example: `Default Web Sites,Administration Web Sites` **NOTE:** If you are not dynamically observing Web sites, this parameter is ignored.
Raise event if number of HTTP method requests exceeds a threshold?	Set to **y** to raise events. The default is y.

Description	How to Set It
Collect data for number of HTTP method requests?	Set to **y** to collect data for charts and reports. If set to y, the script returns the total number of HTTP method requests. The default is n.
Threshold: Total... ...Copy requests ...Delete requests ...Get requests ...Head requests ...Lock requests ...Mkcol requests ...Move requests ...Options requests ...Post requests ...Propfind requests ...Proppatch requests ...Put requests ...Search requests ...Trace requests ...Unlock requests	Specify the maximum number of method requests of each type allowed before AppManager raises an event. The default is 100 requests.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.48 HTTPStatistics

Use this Knowledge Script to monitor the current number of connections from anonymous and non-anonymous (or user) accounts to a Web site, number of Web site connections, and percentage of Web site connections being utilized.

This Knowledge Script consolidates functionality that is also available in two separate IIS Knowledge Scripts:

- HTTPConnectionsInterval
- HTTPConnectionUtil

41.48.1 Versions of IIS Supported

6.0 and later.

41.48.2 Resource Objects

Web sites

41.48.3 Default Schedule

The default interval is **Every 30 minutes**.

41.48.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
HTTPConnectionsInterval	Select Yes to check for the number of Web site connections made during the monitoring interval. The default is Yes.
Dynamically observe Web sites at each interval?	Select Yes to dynamically observe new Web sites at each monitoring interval. The default is Yes.
Exclude Web sites (separate names with commas)	Specify the name of any request you want to exclude. You can exclude multiple sites, separated by commas with no spaces. For example: `site1,site2`. Specify "_Total" to disable monitoring of totals for all sites. **NOTE:** If you are not dynamically observing sites, you can ignore this parameter.
Raise event if number of connections exceeds any threshold?	Select Yes to raise events.The default is Yes.
Collect data for number of connections per site and total per server?	Select Yes to collect data for charts and reports. If set to Yes, returns the number of Web server connections during the monitoring interval. The default is No.

Description	How to Set It
Threshold – Maximum connections to Web site from anonymous accounts	Specify the maximum number of Web site connections from anonymous accounts open during the monitoring interval. The default is 64.
Threshold – Maximum connections to Web site from non-anonymous (user) accounts	Specify the maximum number of Web site connections from non-anonymous (user) accounts open during the monitoring interval. The default is 64.
Threshold – Maximum total connections to all Web sites from anonymous accounts	Specify the maximum total number of connections to all monitored Web sites from anonymous accounts open during the monitoring interval. The default is 64.
Threshold – Maximum total connections to all Web sites from non-anonymous (user) accounts	Specify the maximum total number of connections to all monitored Web sites from non-anonymous (user) accounts open during the monitoring interval. The default is 64.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 12.
HTTPConnectionUtil	Select Yes to check for the percentage of Web site connections being utilized. The default is Yes.
Raise event if connection utilization exceeds threshold?	Select Yes to raise events. The default is Yes.
Collect data for current connections and connection utilization?	Select Yes to collect data for charts and reports. If set to Yes, the script returns the number of Web site connections being used and the utilization (%). No data point is collected for the percentage of utilization when the Maximum Connections is 0. The default is No.
Threshold – Maximum connection utilization	Specify the maximum percentage of Web site connections that can be used before AppManager raises an event. The default is 90%
Maximum connections allowed on this site	If the “maximum number of connections” value cannot be retrieved from the server, specify the maximum number of connections allowed on the Web site where this script is being run. The default is 5000 connections.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 12.
Other settings	
Event severity for unexpected error	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.

41.49 HTTPTransStat

Use this Knowledge Script to monitor the total number of bytes transferred per second and the number of bytes transferred to and from Web sites during the monitoring interval.

This Knowledge Script consolidates functionality that is also available in two separate IIS Knowledge Scripts:

- HTTPBytes
- HTTPBytesInterval

NOTE: Although each of these Knowledge Scripts are available individually, it is recommended that you use the HTTPTransStat Knowledge Script.

41.49.1 Versions of IIS Supported

6.0 and later.

41.49.2 Resource Objects

Web sites

41.49.3 Default Schedule

The default interval is **Every 30 minutes**.

41.49.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
HTTPBytes	Select **Yes** to monitor the total number of bytes transferred per second to and from a Web site. The default is Yes.
Dynamically observe Web sites at each interval?	Select **Yes** to dynamically observe new Web sites at each monitoring interval. The default is Yes.
Exclude Web sites (separate names with commas)	Specify the name of any site you want to exclude. You can exclude multiple sites, separated by commas with no spaces. For example: `site1,site2`. **NOTE:** If you are not dynamically observing sites, you can ignore this parameter.
Raise event if number of bytes transferred per second exceeds threshold?	Select **Yes** to raise events. The default is Yes.
Collect data for current transfer rate of bytes sent and received?	Select **Yes** to collect data for charts and reports. If set to Yes, returns the byte transfer rate for the HTTP server. The default is No.

Description	How to Set It
Threshold – Maximum bytes received per second	Specify the maximum bytes per second received by the HTTP server before AppManager raises an event. The default is 64000 bytes per second.
Threshold – Maximum bytes sent per second	Specify the maximum bytes per second sent by the HTTP server before AppManager raises an event. The default is 64000 bytes per second.
Event severity when either threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.
HTTPBytesInterval	Select **Yes** to check the total number of files sent to and received from a Web site during the monitoring interval. The default is Yes.
Dynamically observe Web sites at each interval?	Select **Yes** to dynamically observe new Web sites at each monitoring interval. The default is Yes
Exclude Web sites (separate names with commas)	Specify the name of any site you want to exclude. You can exclude multiple sites, separated by commas with no spaces. For example: `site1,site2`. Specify "_Total" to disable monitoring of totals. **NOTE:** If you are not dynamically observing sites, this parameter is ignored.
Raise event if number of bytes transferred exceeds any threshold?	Select **Yes** to raise events. The default is y.
Collect data for number of bytes sent and received per site and total for all sites?	Select **Yes** to collect data for charts and reports. If set to y, returns the number of bytes transferred to and from the HTTP server during the monitoring interval. The default is No.
Threshold – Maximum bytes received by Web site	Specify the maximum number of bytes that can be received by a Web site during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Threshold – Maximum bytes sent by Web site	Specify the maximum number of bytes that can be sent by a Web site during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Threshold – Maximum total bytes received by all Web sites	Specify the maximum number of bytes that can be received by all monitored Web sites during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Threshold – Maximum total bytes sent by all Web sites	Specify the maximum total number of bytes that can be sent by all monitored Web sites during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.
Other settings	
Event severity for unexpected error	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.

41.50 IsolatedApps

This Knowledge Script monitors the number of isolated applications defined within a Web site. An "isolated" application is an application that runs out-of-process, or in a separate memory space, from the Web server. If the number of isolated applications exceeds the threshold you set, AppManager raises an event.

In IIS 6.0, IIS 5.0 isolation mode is available to support IIS 5.0 applications on IIS 6.0. However, IIS 7.0 and IIS 7.5 do not have an IIS 5.0 isolation mode, so the AppIsolated property is deprecated. All applications will run from the application pool.

NOTE: In IIS 6.0, by default all the applications are worker process isolation (Pooled-process). Applications will only run in in-process mode if a list of ISAPI filters and extensions for those applications are specified in the InProcessISapiApps Metabase Property. For more information, see the following Microsoft TechNet article: http://www.microsoft.com/technet/prodtechnol/WindowsServer2003/Library/IIS/0b8cb780-ed85-44fa-9e4f-8dc9ee2b3382.mspx?mfr=true

---

The following table summarizes the data streams generated and how the data is derived, depending on the IIS version:

IIS versions	Number of in-process applications data stream	Number of pooled-process applications data stream	Number of out-of-process applications data stream
IIS 6.0 in IIS 5.0 compatibility mode	Application protection = IIS process (Low). Runs under `inetinfo` process.	Application protection = pooled (Medium). Runs under a pooled `dllhost` or `aspnet_wp` process.	Application protection = High (isolated). Runs under individual `dllhost` or `aspnet_wp` processes.
IIS 6.0	The `InProcessIsapiApps Metabase Property` specifies a list of ISAPI filters and extensions that will run in-process.	Application pools: Each application pool runs under `w3wp` process.	Supports out-of-process applications for IIS 5.0 backward compatibility.

41.50.1 Versions of IIS Supported

6.0

41.50.2 Resource Objects

Web sites

41.50.3 Default Schedule

The default interval for this script is **Once every hour**.

41.50.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of isolated applications exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for number of isolated applications?	Set to **y** to collect data for charts and reports. If set to y, the script returns the number of isolated applications. By default, data is collected.
Threshold – Maximum Isolated applications	Specify the maximum number of isolated applications allowed before AppManager raises an event. The default is 0 applications.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.51 KillTopCPUProcs

Use this Knowledge Script to monitor the CPU utilization levels of the IIS process `w3wp`. If the process exceeds the CPU utilization threshold you set, AppManager raises an event. You can also set this Knowledge Script to automatically stop a process if it exceeds the CPU utilization threshold. If events are enabled, AppManager raises an event if a process is stopped and restarted.

41.51.1 Versions of IIS Supported

6.0 and later.

41.51.2 Resource Objects

IIS servers

41.51.3 Default Schedule

The default interval for this script is **Regular intervals**, every three minutes.

41.51.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if threshold exceeded or if process killed and restarted?	Set to **y** to raise events. The default is y.
Kill CPU-intensive processes?	Set to **y** to automatically stop any process that exceeds the threshold. The default is y.
Threshold – Maximum% CPU utilization	Specify the maximum percentage of CPU utilization allowed by any IIS process before AppManager raises an event. The default is 90%.
Event severity when CPU utilization threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 10.
Event severity: kill...	You can set the event severity level, from 1 to 40, to indicate the importance when attempt to stop process: • **... fails**. Specify a value that indicates a process is exceeding the threshold and AppManager for IIS cannot stop the process. The default is 10. • **... succeeds**. Specify a value that indicates a process is exceeding the threshold and AppManager for IIS has successfully stopped the process. The default is 20.

41.52 Log

Use this Knowledge Script to monitor and filter information in the IIS Web site logs. If any entries in the currently active log are found that match your filter criteria, AppManager raises an event.

The specific types of information posted to the IIS Web site logs depend on how the IIS log is configured.

This script can be resource-intensive if the IIS log size is large.

The following log formats are supported:

- Microsoft's IIS Log format
- W3C Extended Log file format
- NCSA Common Log file format

All logs must use the Daily log schedule.

NOTE:

- The search and filter parameters only work if the log fields you select are available in the log. Make sure you select those fields for inclusion in the log being searched.
- If you are using the Log Knowledge Script with centralized binary logging enabled in IIS, then IIS will not update the individual log files of each Web site. Instead, IIS will update the centralized log file. In that case, the Log Knowledge Script does not raise events properly, and AppManager will raise an event about this situation. For best results, disable centralized binary logging in IIS.

To disable centralized binary logging for all Web sites on a server running IIS:

1. From the Start menu, click Run.
2. In the Open field, type the following: `<SystemDrive>\Windows\System32\cscript.exe <SystemDrive>\inetpub\AdminScripts\adsutil.vbs SET W3SVC/CentralBinaryLoggingEnabled false`
3. Click OK.
4. From the command prompt, type `net stop W3SVC` and press Enter to stop the World Wide Web Publishing Service (WWW service).
5. The WWW service must be stopped and restarted for changes to take effect.

41.52.1 Versions of IIS Supported

6.0 and later.

41.52.2 Resource Objects

Web sites

41.52.3 Default Schedule

The default interval for this script is **Once daily**.

41.52.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if log entries match search criteria?	Set to **y** to raise events. The default is y.
Event severity when search criteria met	Set the event severity level, from 1 to 40, to indicate the importance of the event. Adjust the severity depending on which types of events you are checking for. The default is 8.
Raise event if IIS centralized logging is enabled?	Set to **y** to raise an event if centralized logging is enabled. If you use this script with centralized logging enabled, then IIS will not update the individual log files of each Web site. The default is n.
Event severity when centralized logging is enabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which centralized logging enabled. The default is 15.
Collect data for matching log entries?	Set to **y** to collect data for charts and reports. If set to y, returns the number of matched entries during the interval. The default is n.
Filter: Bytes received greater than	Specify the number of bytes received that you want to search for in the IIS log file. Numbers in these fields are “greater than” values. For example, if you specify `200` for “bytes received”, this script searches the Bytes Received column for values greater than 200. The default is 200 bytes received.
Filter: Bytes sent greater than	Specify the number of bytes sent that you want to search for in the IIS log file. Numbers in these fields are “greater than” values.
Filter: Client IP	Specify the Web address or IP address to search for in the IIS Web site log.
Filter: Client cookie	Specify the name of the client cookie to search for.
Filter: Operation type	Specify the operation type to search for. For example, type `get` or `post`. Specify one type.
Filter: Protocol status	Specify the HTTP protocol status code to search for. For example, `200`.
Filter: Protocol version	Specify the protocol version number to search for. For example, HTTP 1.0.
Filter: Referrer page	Specify the name of the referrer site to search for. The referrer site is the Web site last visited by a user.
Filter: Server IP	Specify the IP address of the server to search for.
Filter: Server name	Specify the name of the server to search for.
Filter: Time taken greater than	Specify the length of time an HTTP action (for example, `get` or `post`) took to complete. Numbers in this field are “greater than” values. For example, if you specify `200`, this script searches the Time Taken column for values greater than 200. The default is 200 milliseconds (ms).
Filter: Username	Specify the name of the user to search for.
Filter: Win32 status	Specify the Windows status code to search for. For example, `200`.

41.53 MemoryHigh

Use this Knowledge Script to detect whether an IIS application process is using too much memory. This script monitors the memory utilization and the paged and nonpaged memory pool sizes of IIS application processes.

AppManager raises an event if an instance of an application process exceeds the memory utilization threshold or either of the memory pool size thresholds.

You can select which processes to monitor. The processes to monitor depend on the version of IIS you are running.

IIS 6.0:

- `inetinfo`
- `w3wp`

IIS 7.0 and IIS 7.5:

- `inetinfo` (with IIS 6.0 compatibility option enabled)
- `w3wp`

41.53.1 Versions of IIS Supported

6.0 and later.

41.53.2 Resource Objects

IIS servers

41.53.3 Default Schedule

The default interval is **Every 5 minutes**.

41.53.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if any threshold exceeded?	Set to **y** to raise events. The default is y.
Collect data for memory utilization or memory pool size?	Set to **y** to collect data for charts and reports. If set to y, returns the memory utilization and memory pool sizes of the named IIS application process (in bytes). The default is n.
Process names (separated by commas)	Specify the names of the application processes to monitor. Separate multiple entries with a comma. Do not use spaces. For example: `inetinfo,dllhost`.

Description	How to Set It
Threshold – Working set size	Specify the maximum amount of memory that any instance of the selected process can use before AppManager raises an event. The default is 10,000,000 bytes.
Threshold – Paged memory pool size	Specify the maximum size the paged memory pool that any instance of the selected process can reach before AppManager raises an event. The default is 5,000,000 bytes.
Threshold – Non-paged memory pool size	Specify the maximum size the non-paged memory pool that any instance of the selected process can reach before AppManager raises an event. The default is 5,000,000 bytes.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.54 NNTPArticles

Use this Knowledge Script to monitor the number of articles processed by an NNTP (Network News Transfer Protocol) site during the monitoring interval. If the number of articles sent and received exceeds the threshold you set, AppManager raises an event.

NOTE: The IIS 7.0 and 7.5 environments do not support this Knowledge Script.

41.54.1 Versions of IIS Supported

6.0.

41.54.2 Resource Objects

NNTP sites

41.54.3 Default Schedule

The default interval is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.54.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of articles transferred exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for articles received and articles sent?	Set to **y** to collect data for charts and reports. If set to y, this script returns the number of articles processed by the NNTP site. The default is n.
Threshold – Articles received	Specify the maximum number of articles that can be received during an interval before AppManager raises an event. The default is 100 articles.
Threshold – Articles sent	Specify the maximum number of articles that can be sent during an interval before AppManager raises an event. The default is 100 articles.
Event severity when either threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.55 NNTPBytes

Use this Knowledge Script to monitor the current number of bytes processed by the NNTP site. If the number of bytes processed exceeds the threshold you set, AppManager raises an event.

NOTE: The IIS 7.0 and 7.5 environments do not support this Knowledge Script.

41.55.1 Versions of IIS Supported

6.0.

41.55.2 Resource Objects

NNTP sites

41.55.3 Default Schedule

The default interval is **Every 30 minutes**.

41.55.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if current byte transfer rate exceeds a threshold?	Set to **y** to raise events. The default is y.
Collect data for bytes received and bytes sent per second?	Set to **y** to collect data for charts and reports. If set to y, this script returns the number of bytes processed by the NNTP site. The default is n.
Threshold – Maximum bytes received	Specify the maximum bytes per second that can be received by the NNTP site before AppManager raises an event. The default is 20 bytes.
Threshold – Maximum bytes sent	Specify the maximum bytes per second that can be sent by an NNTP site before AppManager raises an event. The default is 20 bytes.
Event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.56 NNTPClientCommands

Use this Knowledge Script to monitor the number of client commands processed per second by an NNTP site. You can specify the types of commands you are interested in monitoring. For example, you may want to ignore Help requests. If the number of commands of any type exceeds the threshold you set, AppManager raises an event.

NOTE: The IIS 7.0 and 7.5 environments do not support this Knowledge Script.

41.56.1 Versions of IIS Supported

6.0.

41.56.2 Resource Objects

NNTP sites

41.56.3 Default Schedule

The default interval is **Every 30 minutes**.

41.56.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if threshold exceeded?	Set to **y** to raise events. The default is y.
Collect data for number of client commands processed/second?	Set to **y** to collect data for charts and reports. If set to y, returns the number of client commands processed by the NNTP site per second. The default is n.
Threshold – Maximum client commands	Specify the maximum number of client commands per second that can be processed by an NNTP site before AppManager raises an event. This threshold applies to all of the commands monitored by this script. The default is 20 commands/sec.

Description	How to Set It
Monitor: ...Article commands? ...Group commands? ...Help commands? ...IHave commands? ...Newgroups commands? ...Newnews commands? ...Next commands? ...Post commands? ...Quit commands? ...Stat commands? ...Last commands? ...List commands?	Set to **y** to monitor the commands issued per second. The threshold you specified applies to all commands monitored. The default is n for `Group`, `Help`, `IHave`, `Newgroups`, `Newnews`, `Quit`, `Stat`, `Last`, and `List` commands. The default is y for `Article`, `Next`, and `Post` commands.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 16.

41.57 NNTPClientFailures

Use this Knowledge Script to monitor the number of logon failures processed per second by an NNTP site during the monitoring interval. If the number of logon failures processed per second by the NNTP site exceeds the threshold you set, AppManager raises an event.

NOTE: The IIS 7.0 and 7.5 environments do not support this Knowledge Script.

41.57.1 Versions of IIS Supported

6.0.

41.57.2 Resource Objects

NNTP sites

41.57.3 Default Schedule

The default interval is **Every 30 minutes**.

41.57.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of logon failures exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for number of logon failures?	Set to **y** to collect data for charts and reports. If set to y, returns the number of logon failures processed by the NNTP site during the monitoring interval. The default is n.
Threshold – Maximum number of logon failures	Specify the maximum number of logon failures that can be processed by an NNTP site before AppManager raises an event. The default is 2 failures per second.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.58 NNTPConnections

Use this Knowledge Script to monitor the current number of connections to an NNTP site. Both inbound connections, connections to the NNTP site, and outbound connections, those initiated by the NNTP site, are monitored.

If the number of connections to the NNTP site exceeds either of the thresholds you set, AppManager raises an event.

NOTE: The IIS 7.0 and 7.5 environments do not support this Knowledge Script.

41.58.1 Versions of IIS Supported

6.0.

41.58.2 Resource Objects

NNTP sites

41.58.3 Default Schedule

The default interval is **Every 30 minutes**.

41.58.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of current connections exceeds either threshold?	Set to **y** to raise events. The default is y.
Collect data for current inbound or outbound connections?	Set to **y** to collect data for charts and reports. If set to y, this script returns the total number of current connections and current outbound connections to the NNTP site. The default is n.
Threshold – Maximum current inbound connections	Specify the maximum number of inbound NNTP connections that are allowed before AppManager raises an event. The default is 50 connections.
Threshold – Maximum current outbound connections	Specify the maximum number of outbound NNTP connections that are allowed before AppManager raises an event. The default is 50 connections.
Event severity when either threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.59 NNTPConnectionsInterval

Use this Knowledge Script to monitor the number of inbound and outbound connections on an NNTP site, and the total number of inbound and outbound connections for all monitored NNTP sites, during the monitoring interval. If the number of inbound or outbound connections exceeds the threshold, AppManager raises an event.

NOTE: The IIS 7.0 and 7.5 environments do not support this Knowledge Script.

41.59.1 Versions of IIS Supported

6.0.

41.59.2 Resource Objects

NNTP sites

41.59.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.59.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of inbound or outbound connections exceeds a threshold?	Set to **y** to raise events. The default is y.
Collect data for inbound or outbound connections per site, and total per server?	Set to **y** to collect data for charts and reports. If set to y, returns the number of inbound and outbound NNTP site connections. The default is n.
Threshold – Maximum inbound connections per site	Specify the maximum number of inbound NNTP site connections. The default is 50.
Threshold – Maximum outbound connections per site	Specify the maximum number of outbound NNTP site connections. The default is 50.
Threshold – Maximum total inbound connections for all sites	Specify the maximum total number of inbound connections to all NNTP sites during the monitoring interval. The default is 50.
Threshold – Maximum total outbound connections for all sites	Specify the maximum total number of outbound connections from all NNTP sites during the monitoring interval. The default is 50.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.60 NNTPConnectionUtil

Use this Knowledge Script to monitor the percentage of NNTP site connections being utilized. If the percentage of NNTP connections exceeds the threshold you set, AppManager raises an event.

The percentage of connections being used is calculated from the total number of connections allowed on the NNTP site. If you receive an event stating that the "maximum number of connections" value cannot be retrieved, specify the maximum number of connections allowed for the NNTP site where you are running the Knowledge Script for the **Maximum connections allowed** parameter. Information about the maximum number of connections allowed on an NNTP site can be found in the IIS Manager.

If your NNTP site connections are unlimited, either use the default value or refer to the IIS documentation for information about how to calculate the total number of available connections.

No data point is collected for utilization percentage when the Maximum Connections, taken either from IIS itself or from the **Maximum connections allowed** parameter, is 0.

NOTE: The IIS 7.0 and 7.5 environments do not support this Knowledge Script.

41.60.1 Versions of IIS Supported

6.0.

41.60.2 Resource Objects

NNTP sites

41.60.3 Default Schedule

The default interval for this script is Every 30 minutes.

41.60.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if connection utilization exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for current connections and connection utilization?	Set to **y** to collect data for charts and reports. If set to y, returns the number of NNTP site connections. No data point is collected for the percentage of utilization when the Maximum Connections is 0. The default is n.
Threshold – Maximum connection utilization	Specify the maximum percentage of NNTP site connections that can be used before AppManager raises an event. The default is 90%
Maximum connections allowed on this site	Specify the maximum number of connections allowed on the NNTP site where this script is being run. The default is 5000 NNTP connections.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.61 NNTPEventLog

Use this Knowledge Script to scan the Windows System Event Log for NNTP server events matching the criteria you specify.

During the first monitoring interval, the value you specify for the **Starting point for log search...** parameter determines how far back in the log to check for matching entries. As the script continues to run at subsequent intervals, it checks for any new entries created since the last time the log was checked.

You can further restrict the types of log entries that generate an event in two ways:

- Select only certain types of events to search for, such as Warning events.
- Use the **Filter: [...]** parameters to search only for specific information, such as events associated with a specific user or computer name.

Each time this Knowledge Script runs, it checks the System Event Log for entries matching your selection criteria and raises an event if matching entries are found. The event detail message returns the text of the log entries found.

When this Knowledge Script is set to collect data, it returns the number of log entries found, and the data point detail message returns the text of the log entries.

NOTE: The IIS 7.0 and 7.5 environments do not support this Knowledge Script.

41.61.1 Versions of IIS Supported

6.0.

41.61.2 Resource Objects

NNTP servers

41.61.3 Default Schedule

The default interval for this script is **Every 10 minutes**.

41.61.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if log entries match search criteria?	Set to **y** to raise events. The default is y.
Collect data for matching log entries?	Set to **y** to collect data for charts and reports. If set to y, this script returns the new Event Log entries that match the search criteria. The default is n.

Description	How to Set It
Starting point for log search (past *N* hours)	Set this parameter to determine which events to search for the first time the Knowledge Script is run. Subsequent searches begin where the last search finished. The following values are valid: • -1: Search all Event Log events in the entire log. During subsequent monitoring intervals, only events that occur during the interval are searched. • 0: Search only for events that occurred during the monitoring interval; previous events are not searched. • *N*: The number of hours to go back in the Event Log to scan for matching events. For example, type `8` to scan the last 8 hours of the Event Log for matching entries. The default is 0.
NNTP event type: Error	Set to **y** to monitor error events. The default is y. If you set the event type to n, an error Event Log entry does not raise an event, is not returned in an event detail message, and is not collected as data if the **Collect data...** parameter is set to y.
NNTP event type: Warning	Set to **y** to monitor warning events. The default is y. If you set the event type to n, a warning Event Log entry does not raise an event, is not returned in an event detail message, and is not collected as data if the **Collect data...** parameter is set to y.
NNTP event type: Information	Set to **y** to monitor information events. The default is y. If you set the event type to n, an informational Event Log entry does not raise an event, is not returned in an event detail message, and is not collected as data if the **Collect data...** parameter is set to y.
Filter: NNTP...	Specify a search string that filters the following fields in the Event Log: • **...event ID**. Specify a single event ID or a range of event IDs; separate multiple entries with commas. For example: `414,1028-3531,4015`. • **...description**. Specify a detail description or keywords in the description. A string can contain spaces, underscores, and periods; separate multiple entries with commas. The following is an example: `no domain,critical error from the Active Directory`. The search string can contain criteria used to include and exclude entries. The following syntax rules apply: • Separate include and exclude criteria with a colon (:). Strings to the left of the colon are included; strings to the right of the colon are excluded. For example, `zones,caching:primary or secondary`. • Separate multiple include or exclude entries with commas. For example, `finance,sales:corp00,HQ`. • If you are specifying only include criteria, the colon is not necessary. For example, `primary DNS domain`. • If you are specifying only exclude criteria, start the search string with a colon. For example, `:online help`.

Description	How to Set It
Maximum number of log entries per event message	Set the maximum number of Event Log entries that can be returned in each event report. For example, if this value is set to 30 and 67 Event Log events are found, three event reports are raised, two reports containing 30 events and one report containing 7 events. The Message column on the **Events** tab in the Operator Console displays the number of events in each event report, the type of log the events are from, and the event report batch number (the sequential number of the event report). Batch numbers start at 1 for each Knowledge Script iteration. The default is 30 entries per event message.
Event severity when search criteria met	Set the event severity level, from 1 to 40, to indicate the importance of the event. Adjust the severity depending on the types of events you are checking for. The default is 8.

41.62 NNTPServerFailures

Use this Knowledge Script to monitor the number of NNTP site failures that occurred during a monitoring interval. Site failures include failures of control messages, outbound logons, moderated postings, and total outbound connections. You can set thresholds for any or all of these failure types. If the number of NNTP site failures exceeds any threshold you set, AppManager raises an event.

NOTE: The IIS 7.0 and 7.5 environments do not support this Knowledge Script.

41.62.1 Versions of IIS Supported

6.0.

41.62.2 Resource Objects

NNTP sites

41.62.3 Default Schedule

The default interval is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.62.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of NNTP site failures exceeds any threshold?	Set to **y** to raise events. The default is y.
Collect data for each of the failure types?	Set to **y** to collect data for charts and reports. If set to y, returns the number of each type of site failures that occurred during an interval. The default is n.
Threshold – Maximum failed... ...control messages ...outbound logons ...moderated postings ...total outbound connections	Specify the maximum number of NNTP site failures of each type that can occur before AppManager raises an event. The default is 1 failure.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.63 NNTPSpaceLow

Use this Knowledge Script to monitor used and free disk space for each logical disk drive that is used as a virtual root for an NNTP site. AppManager raises an event if any drive exceeds the maximum threshold for used disk space, or fails to meet the minimum threshold for free disk space.

NOTE: The IIS 7.0 and 7.5 environments do not support this Knowledge Script.

41.63.1 Versions of IIS Supported

6.0.

41.63.2 Resource Objects

NNTP sites

41.63.3 Default Schedule

The default interval is **Once every 24 hours**.

41.63.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if threshold is crossed?	Set to **y** to raise events. The default is y.
Collect data for free disk space and percent used disk space?	Set to **y** to collect data for charts and reports. If set to y, this script returns the amount of used and free disk space. The default is n.
Threshold – Maximum disk utilization	Specify the maximum percentage of disk space that can be used before AppManager raises an event. The default is 95%.
Threshold – Minimum free disk space	Specify the minimum amount of free disk space required. If the free disk space falls below this threshold, AppManager raises an event. The default is 10 MB.
Event severity when threshold crossed	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.64 NNTPStatistics

Use this Knowledge Script to monitor the current number of connections to NNTP server, inbound and outbound connections to the NNTP server during a monitoring interval, and percentage of NNTP connections being utilized.

This Knowledge Script consolidates functionality that is also available in three separate IIS Knowledge Scripts:

- NNTPConnections
- NNTPConnectionsInterval
- NNTPConnectionUtil

NOTE: The IIS 7.0 and 7.5 environments do not support this Knowledge Script.

41.64.1 Versions of IIS Supported

6.0.

41.64.2 Resource Objects

NNTP sites

41.64.3 Default Schedule

The default interval is **Every 30 minutes**.

41.64.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
NNTPConnections	Select **Yes** to check for the current number of connections to an NNTP site. The default is Yes.
Raise event if number of current connections exceeds either threshold?	Select **Yes** to raise events.
Collect data for current inbound or outbound connections?	Select **Yes** to collect data for charts and reports. If set to Yes, this script returns the total number of current connections and current outbound connections to the NNTP site. By default, data is collected.
Threshold – Maximum current inbound connections	Specify the maximum number of inbound NNTP connections that are allowed before AppManager raises an event. The default is 50 connections.
Threshold – Maximum current outbound connections	Specify the maximum number of outbound NNTP connections that are allowed before AppManager raises an event. The default is 50 connections.

Description	How to Set It
Event severity when either threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.
NNTPConnectionsInterval	Select **Yes** to check for the number of inbound and outbound connections on an NNTP site and the total number of inbound and outbound connections for all monitored NNTP sites. The default is Yes.
Raise event if number of inbound or outbound connections exceeds threshold?	Select **Yes** to raise events. The default is Yes.
Collect data for inbound or outbound connections per site and total per server?	Select **Yes** to collect data for charts and reports. If set to y, returns the number of inbound and outbound NNTP site connections. The default is No.
Threshold – Maximum inbound connections per site	Specify the maximum number of inbound NNTP site connections. The default is 50.
Threshold – Maximum outbound connections per site	Specify the maximum number of outbound NNTP site connections. The default is 50.
Threshold – Maximum total inbound connections for all sites	Specify the maximum total number of inbound connections to all NNTP sites during the monitoring interval. The default is 50.
Threshold – Maximum total outbound connections for all sites	Specify the maximum total number of outbound connections from all NNTP sites during the monitoring interval. The default is 50.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
NNTPConnectionUtil	Select **Yes** to check the percentage of NNTP site connections being utilized. The default is Yes.
Raise event if connection utilization exceeds threshold?	Select **Yes** to raise events. The default is Yes.
Collect data for current connections and connection utilization?	Select **Yes** to collect data for charts and reports. If set to Yes, returns the number of NNTP site connections. No data point is collected for the percentage of utilization when the Maximum Connections is 0. The default is No.
Threshold – Maximum connection utilization	Specify the maximum percentage of NNTP site connections before AppManager raises an event. The default is 90%.
Maximum connections allowed on this site	Specify the maximum number of connections allowed on the NNTP site where this script is being run. The default is 5000 NNTP connections.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 12.
Other settings	
Event severity for unexpected error	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.

41.65 Report_ASPCommunicationFailure

Use this Knowledge Script to generate a report about the number of ASP communication failures. This report allows you to make a statistical analysis of the data point values, such as the average over a time period.

This report uses data collected by the ASPCommFailure Knowledge Script.

41.65.1 Resource Objects

Report agent

41.65.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.65.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values are deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to yes, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to yes, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.66 Report_ASPNETApplicationRestarted

Use this Knowledge Script to generate a report about the number of ASP.NET application restarts.

This report uses data collected by the ASPNETApplicationRestarted Knowledge Script.

41.66.1 Resource Objects

Report agent

41.66.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.66.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values are deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.67 Report_ASPNETApplicationRunning

Use this Knowledge Script to generate a report about the number of running ASP.NET applications.

This report uses data collected by the ASPNETApplicationRunning Knowledge Script.

41.67.1 Resource Objects

Report agent

41.67.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.67.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values are deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.68 Report_ASPNETErrors

Use this Knowledge Script to generate a report about the total number of parser, compilation, and run-time errors associated with ASP.NET applications.

This report uses data collected by the ASPNETErrors Knowledge Script.

41.68.1 Resource Objects

Report agent

41.68.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.68.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values are deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.69 Report_ASPNETPipelineInstances

Use this Knowledge Script to generate a report about the total number of pipeline instances. This report gives you a sense for the overall performance of ASP.NET applications.

This report uses data collected by the ASPNETPipelineInstances Knowledge Script.

41.69.1 Resource Objects

Report agent

41.69.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.69.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values are deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.70 Report_ASPNETReqStat

Use this Knowledge Script to generate a report on the following:

- Number of current ASP.NET requests
- Number ASP.NET disconnected because of a communication problem
- Time taken to execute ASP.NET requests
- ASP.NET requests that are in a queue
- Number of ASP.NET requests processed per second
- Number of ASP.NET requests rejected because the queue limits were exceeded
- Wait time (in milliseconds) that an ASP.NET request waited in a queue, before processing

This report uses data collected by the ASPNETReqStat Knowledge Script.

The Report_ASPNETReqStat script consolidates functionality that is also available in seven separate IIS Knowledge Scripts:

- Report_ASPNETRequestCurrent
- Report_ASPNETRequestDisconnected
- Report_ASPNETRequestExecuteTime
- Report_ASPNETRequestQueued
- Report_ASPNETRequestRate
- Report_ASPNETRequestRejected
- Report_ASPNETRequestWaitTime

41.70.1 Resource Objects

Report agent

41.70.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.70.3 Setting Parameter Values

Set the following parameters, as needed:

Description	How to Set It
Select which reports to run	Select **Yes** to run specific Knowledge Scripts. By default, the check boxes are selected.
Run report for Current Requests?	Select **Yes** to check for current ASP.NET requests. The default is Yes.
Run report for Disconnected Requests?	Select **Yes** to check for disconnected ASP.NET requests. The default is Yes.
Run report for Request Execute Time?	Select **Yes** to check the time taken to execute ASP.NET requests. The default is Yes.
Run report for Queued Requests?	Select **Yes** to check for queued ASP.NET requests. The default is Yes.
Run report for Requests Processed Per Second?	Select **Yes** to check the ASP.NET request processing rate per second. The default is Yes.
Run report for Requests Rejected?	Select **Yes** to check for rejected ASP.NET requests. The default is Yes.
Run report for Request Wait Time?	Select **Yes** to check the wait time (in milliseconds) that an ASP.NET request waited in a queue before processing The default is Yes.
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** to select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report

Description	How to Set It
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom? (yes/no)	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table? (yes/no)	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card? (yes/no)	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table? (yes/no)	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart? (yes/no)	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click Browse and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click Browse and set parameters for the output folder.
Add job ID to output folder name? (yes/no)	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click Browse and open the Report Properties dialog box. Set the properties parameters as needed.

Description	How to Set It
Add time stamp to title? (yes/no)	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success? (yes/no)	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.71 Report_ASPNETRequestCurrent

Use this Knowledge Script to generate a report about the number of requests currently being handled by the ASP.NET Internet Server application programming interface (ISAPI). This includes those that are queued, executing, or waiting to be written to the client.

This report uses data collected by the ASPNETRequestCurrent Knowledge Script.

41.71.1 Resource Objects

Report agent

41.71.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.71.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.72 Report_ASPNETRequestDisconnected

Use this Knowledge Script to generate a report about the number of ASP.NET requests that have been disconnected because of a communication problem.

This report uses data collected by the ASPNETRequestDisconnected Knowledge Script.

41.72.1 Resource Objects

Report agent

41.72.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.72.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.73 Report_ASPNETRequestExecuteTime

Use this Knowledge Script to generate a report about the time required to execute ASP.NET requests.

This report uses data collected by the ASPNETRequestExecuteTime Knowledge Script.

Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.74 Report_ASPNETRequestQueued

Use this Knowledge Script to generate a report about the number of ASP.NET requests currently in all queues.

This report uses data collected by the ASPNETRequestQueued Knowledge Script.

41.74.1 Resource Objects

Report agent

41.74.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.74.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.75 Report_ASPNETRequestRate

Use this Knowledge Script to generate a report about the number of ASP.NET requests processed per second.

This report uses data collected by the ASPNETRequestRate Knowledge Script.

41.75.1 Resource Objects

Report agent

41.75.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.75.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.76 Report_ASPNETRequestRejected

Use this Knowledge Script to generate a report about the number of ASP.NET requests that were rejected because one of the queue limits was exceeded.

This report uses data collected by the ASPNETRequestRejected Knowledge Script.

41.76.1 Resource Objects

Report agent

41.76.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.76.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.77 Report_ASPNETRequestWaitTime

Use this Knowledge Script to generate a report about the time (in milliseconds) that an ASP.NET request waited in a queue before being processed.

This report uses data collected by the ASPNETRequestWaitTime Knowledge Script.

41.77.1 Resource Objects

Report agent

41.77.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.77.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.

Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.80 Report_ASPNETWorkerProcessExceptions

Use this Knowledge Script to generate a report about the total number of exceptions thrown by the common language runtime (CLR) in all ASP.NET worker processes.

This report uses data collected by the ASPNETWorkerProcessExceptions Knowledge Script.

41.80.1 Resource Objects

Report agent

41.80.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.80.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.81 Report_ASPNETWorkerProcessMemory

Use this Knowledge Script to generate a report about the memory usage of the ASP.NET worker processes. The memory usage reported on is nonshared or "private" memory.

This report uses data collected by the ASPNETWorkerProcessMemory Knowledge Script.

41.81.1 Resource Objects

Report agent

41.81.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.81.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.82 Report_ASPNETWorkerProcessRestarted

Use this Knowledge Script to generate a report about the number of ASP.NET worker process restarts.

This report uses data collected by the ASPNETWorkerProcessRestarted Knowledge Script.

41.82.1 Resource Objects

Report agent

41.82.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.82.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.83 Report_ASPNETWorkerProcessRunning

Use this Knowledge Script to generate a report about the number of running ASP.NET worker processes.

This report uses data collected by the ASPNETWorkerProcessRunning Knowledge Script.

41.83.1 Resource Objects

Report agent

41.83.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.83.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.84 Report_ASPNewEventLogEntries

Use this Knowledge Script to generate a report about the number of ASP events (entries that have Active Server Pages as their Source in the Application log).

This report uses data collected by the ASPEventLog Knowledge Script.

41.84.1 Resource Objects

Report agent

41.84.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.84.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.85 Report_ASPQueueBusy

Use this Knowledge Script to generate a report about the number of ASP requests currently in the queue. This report allows you to make a statistical analysis of the data point values, such as the average or maximum value over a time period.

This report uses data collected by the ASPQueueBusy Knowledge Script.

41.85.1 Resource Objects

Report agent

41.85.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.85.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.

If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.86 Report_ASPRegistryChange

Use this Knowledge Script to generate a report about the number of changes to ASP registry keys. This report allows you to make a statistical analysis of the data point values, such as the average or maximum value over a time period.

This report uses data collected by the ASPRegistryChange Knowledge Script.

41.86.1 Resource Objects

Report agent

41.86.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.86.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.87 Report_ASPReqStat

Use this Knowledge Script to generate a report about the number of ASP request errors per second, different types of ASP request failures during an interval, and ASP sessions that timed out during an interval. This report uses data collected by the ASPReqStat Knowledge Script.

The Report_ASPReqStat Knowledge Script consolidates functionality that is also available in three separate IIS Knowledge Scripts:

Report_ASPRequestError

Report_ASPRequestFailed

Report_ASPSessionTimeout

41.87.1 Resource Objects

Report agent

41.87.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.87.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Select which reports to run	Select **Yes** to run specific Knowledge Scripts. By default, the check boxes are selected.
Run report for ASP Request Error?	Select **Yes** to generate a report for ASP request errors. The default is Yes.
Run report for ASP Request Failed?	Select **Yes** to generate a report for failed ASP requests. The default is Yes.
Run report for ASP Session Timeout?	Select **Yes** to generate a report for ASP.NET requests that timed out. The default is Yes.
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.

Description	How to Set It
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom? (yes/no)	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.

Description	How to Set It
Show totals on the table? (yes/no)	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card? (yes/no)	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table? (yes/no)	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart? (yes/no)	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	.
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.88 Report_ASPRequestError

Use this Knowledge Script to generate a report about the number of ASP request errors per second. This report allows you to make a statistical analysis of the data point values, such as the average or maximum value over a time period.

This report uses data collected by the ASPRequestError Knowledge Script.

41.88.1 Resource Objects

Report agent

41.88.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.88.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** to select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.89 Report_ASPRequestFailed

Use this Knowledge Script to generate a report about the number of ASP request failures by error type. This report allows you to make a statistical analysis of the data point values, such as the average or maximum value over a time period.

This report uses data collected by the ASPRequestFailed Knowledge Script.

41.89.1 Resource Objects

41.93.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.94 Report_FTPConnections

Use this Knowledge Script to generate a report about the current number of connections from anonymous and user accounts to the FTP server. This report allows you to make a statistical analysis of the data point values, such as the average or maximum value over a time period.

This report uses data collected by the FTPConnections Knowledge Script.

41.94.1 Resource Objects

Report agent

41.94.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.94.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Generate report for selected KS:	Select the Knowledge Script from the drop-down list to generate the report. You can generate the report for the individual Knowledge Script IIS_FTPConnections or the consolidated Knowledge Script IIS_FTPStatistics. By default, **IIS_FTPConnections** is selected.
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.95 Report_FTPFilesTransferRate

Use this Knowledge Script to generate a report about the total number of files sent to and received from the FTP server.

This report uses data collected by the FTPFiles Knowledge Script.

41.95.1 Resource Objects

Report agent

41.95.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.95.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.96 Report_FTPTransStat

Use this Knowledge Script to generate a report about the total number of bytes transferred per second and the total number of files sent to and received from the FTP server. This report uses data collected by the FTPTransStat Knowledge Script.

This Knowledge Script consolidates functionality that is also available in two separate IIS Knowledge Scripts:

- Report_FTPBytesRate
- Report_FTPFilesTransferRate

NOTE: Although each of these Knowledge Scripts are available individually, you should run the Report_FTPTransStat report.

41.96.1 Resource Objects

Report agent

41.96.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.96.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Select which reports to run	Select **Yes** to run specific Knowledge Scripts. By default, the check boxes are selected.
Run report for FTP Bytes Rate?	Select **Yes** to generate a report for the total number of bytes transferred per second to and from the FTP server. The default is Yes.
Run report for FTP Files Transfer Rate?	Select **Yes** to generate a report for the total number of files sent to and received from the FTP server. The default is Yes.
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.

Description	How to Set It
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom? (yes/no)	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.

Description	How to Set It
Show totals on the table? (yes/no)	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card? (yes/no)	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table? (yes/no)	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart? (yes/no)	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name? (yes/no)	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title? (yes/no)	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success? (yes/no)	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.97 Report_HTTPC21WebTransferRate

Use this Knowledge Script to generate a report about the total number of bytes transferred per second to and from the Web server. This report allows you to make a statistical analysis of the data point values, such as the average or maximum value over a time period.

This report uses data collected by the HTTPBytes Knowledge Script.

41.97.1 Resource Objects

Report agent

41.97.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.97.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Generate report for selected KS:	Select the Knowledge Script from the drop-down list to generate the report. You can generate the report for the individual Knowledge Script IIS_HTTPBytes or the consolidated Knowledge Script, IIS_HTTPTransStat. By default, **IIS_HTTPBytes** is selected.
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings

Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.99 Report_MemoryUsage

Use this Knowledge Script to generate a report about the number of bytes of memory being used by the specified IIS process. This report allows you to make a statistical analysis of the data point values, such as the average or maximum value over a time period.

This report uses data collected by the MemoryHigh Knowledge Script.

41.99.1 Resource Objects

Report agent

41.99.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.99.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.100 Report_NNTPArticlesTransferRate

Use this Knowledge Script to generate a report about the current number of articles processed by the NNTP server. This report allows you to make a statistical analysis of the data point values, such as the average or maximum value over a time period.

This report uses data collected by the NNTPArticles Knowledge Script.

NOTE: The IIS 7.0 environment does not support this Knowledge Script.

41.100.1 Resource Objects

Report agent

41.100.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.100.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.101 Report_NNTPBytesTransferRate

Use this Knowledge Script to generate a report about the current number of bytes processed by the NNTP server. This report allows you to make a statistical analysis of the data point values, such as the average or maximum value over a time period.

This report uses data collected by the NNTPBytes Knowledge Script.

NOTE: The IIS 7.0 environment does not support this Knowledge Script.

Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.105 Report_NNTPTransStat

Use this Knowledge Script to generate a report about the current number of articles and bytes processed by the NNTP server. This report uses data collected by the NNTPStatistics Knowledge Script.

This Knowledge Script consolidates functionality that is also available in two separate IIS Knowledge Scripts:

- Report_NNTPArticlesTransferRate
- Report_NNTPBytesTransferRate

NOTE: The IIS 7.0 environment does not support this Knowledge Script.

41.105.1 Resource Objects

Report agent

41.105.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.105.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Select which reports to run	Select **Yes** to run specific Report Knowledge Scripts. By default, the check boxes are selected.
Run report for Article Transfer Rate?	Select **Yes** to generate a report about the current number of articles processed by the NNTP server. The default is Yes.
Run report for Bytes Transfer Rate?	Select **Yes** to generate a report about the current number of bytes processed by the NNTP server. The default is Yes.
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** and select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.

Description	How to Set It
Data settings	
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom? (yes/no)	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table? (yes/no)	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.

Description	How to Set It
Report settings	
Include parameter help card? (yes/no)	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table? (yes/no)	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart? (yes/no)	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** to open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name? (yes/no)	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success? (yes/no)	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.106 Report_NNTPVirtualRootDiskSpace

Use this Knowledge Script to generate a report about the used and free disk space for each drive that is used as an NNTP virtual root. This report allows you to make a statistical analysis of the data point values, such as the average or maximum value over a time period.

This report uses data collected by the NNTPSpaceLow Knowledge Script.

NOTE: The IIS 7.0 environment does not support this Knowledge Script.

41.106.1 Resource Objects

Report agent

41.106.2 Default Schedule

The default schedule is **Run once**.

NOTE: Run this script every 30 minutes for optimal report generation.

41.106.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse** to select the computers for your report.
Select time range	Click **Browse** to select a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse** to select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: Average value of data points for the time range of the report • **Minimum**: Minimum value of data points for the time range of the report • **Maximum**: Maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: Minimum, average, and maximum values of data points for the time range of the report • **Range**: Range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: Measure of how widely values are deviate from the mean • **Sum**: Total value of data points for the time range of the report • **Close**: Last value for the time range of the report • **Change**: Difference between the first and last values for the time range of the report (close - open = change) • **Count**: Number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top *N* % of selected data (sorted by default) • **Top N**: Chart only the top *N* of selected data (sorted by default) • **Bottom %**: Chart only the bottom *N* % of data (sorted by default) • **Bottom N**: Chart only the bottom *N* of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom *N* or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: Average of all values in a column • **Report Minimum**: Minimum value in a column • **Report Maximum**: Maximum value in a column • **Report Total**: Total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the Knowledge Script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How to Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse** and open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click **Browse** and set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to correlate a specific instance of a Knowledge Script and the corresponding report. The default is no.
Select properties	Click **Browse** and open the Report Properties dialog box. Set the properties parameters as needed.
Add time stamp to title?	Set to **yes** to append a timestamp to the title of the report, making each title unique. The timestamp is composed of the date and time the report was generated. A timestamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.107 RestartServer

Use this Knowledge Script to stop and then restart an IIS server. Events are raised if the attempt to stop or restart a service fails or succeeds. Any services that are stopped when the job runs can also be detected and started.

41.107.1 Versions of IIS Supported

6.0 and later.

41.107.2 Resource Objects

IIS servers

41.107.3 Default Schedule

The default schedule is **Run once**.

41.107.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if attempt to restart fails or succeeds?	Set to **y** to raise events. The default is y.
Restart server?	Set to **y** to automatically restart the IIS server after it is stopped. Set to n to stop but not restart the server. The default is y.
Start all stopped services?	Set to **y** to automatically restart any IIS service that is stopped when the job runs. The default is n.
Event severity when attempt to restart...	Set the event severity level, from 1 to 40, to indicate the importance when auto-restart: • **... fails**. Specify a value that indicates when AppManager for IIS cannot restart the server. The default is 10. • **... succeeds**. Specify a value that indicates that AppManager for IIS has successfully restarted the server. The default is 20.

41.108 ServiceUptime

Use this Knowledge Script to monitor the uptime of Web and FTP sites or services. If the amount of time a site has been running fails to meet the minimum threshold you set, AppManager raises an event.

41.108.1 Versions of IIS Supported

6.0 and later.

41.108.2 Resource Objects

Web sites and FTP sites

41.108.3 Default Schedule

The default interval is **Once every hour**.

41.108.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if uptime fails to meet threshold?	Set to **y** to raise events. The default is y.
Collect data for Web and FTP site or service uptime?	Set to **y** to collect data for charts and reports. If set to y, returns length of time a site has been running. The default is n.
Threshold – Minimum uptime	Specify the minimum amount of time (in seconds) that discovered Web and FTP sites must have been up to prevent an event from being raised. The default is 10000 seconds.
Event severity when threshold not met	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.109 SMTPBytesInterval

Use this Knowledge Script to monitor the number of bytes transferred to and from SMTP sites, and the total for all monitored SMTP sites, during a monitoring interval. If the total number of bytes received or bytes sent by a site exceeds a threshold you set, AppManager raises an event.

41.109.1 Versions of IIS Supported

6.0 and later.

41.109.2 Resource Objects

SMTP sites

41.109.3 Default Schedule

The default interval is **Once every hour**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.109.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of bytes transferred exceeds any threshold?	Set to **y** to raise events. The default is y.
Collect data for number of bytes sent or received by site, and total for all sites?	Set to **y** to collect data for charts and reports. If set to y, returns the number of bytes transferred to and from the SMTP site or all monitored sites during the monitoring interval. The default is n.
Threshold – Maximum bytes received per SMTP site	Specify the maximum number of bytes that can be received from an SMTP site during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Threshold – Maximum bytes sent per SMTP site	Specify the maximum number of bytes that can be sent by an SMTP site during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Threshold – Maximum bytes received for all SMTP sites	Specify the maximum number of bytes that can be received from all SMTP sites during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Threshold – Maximum bytes sent for all SMTP sites	Specify the maximum number of bytes that can be sent by all SMTP sites during a monitoring interval before AppManager raises an event. The default is 64000 bytes.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.

41.110 SMTPConnections

Use this Knowledge Script to monitor the current number of inbound and outbound connections on an SMTP site, and the outbound connection attempts refused by remote sites. If the current number of inbound, outbound, or refused outbound connection attempts exceeds the threshold you set, AppManager raises an event.

41.110.1 Versions of IIS Supported

6.0 and later.

41.110.2 Resource Objects

SMTP sites

41.110.3 Default Schedule

The default interval is **Once every hour**.

41.110.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if any threshold exceeded?	Set to **y** to raise events. The default is y.
Collect data for current number of inbound, outbound, or refused connections to an SMTP site?	Set to **y** to collect data for charts and reports. If set to y, returns the number of inbound and outbound connections and refused outbound connections. The default is n.
Threshold – Maximum current inbound connections	Specify the maximum number of inbound connections allowed before AppManager raises an event. The default is 50 connections.
Threshold – Maximum current outbound connections	Specify the maximum number of outbound connections allowed before AppManager raises an event. The default is 50 connections.
Threshold – Maximum refused outbound connections	Specify the maximum number of refused outbound connections allowed before AppManager raises an event. The default is 50 connections.
Event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.111 SMTPConnectionsInterval

Use this Knowledge Script to monitor the number of inbound and outbound connections to and from SMTP sites, and totals for all sites, during the monitoring interval. This script returns data for individual SMTP sites and totals for all sites. If the number of connections exceeds any threshold, AppManager raises an event.

41.111.1 Versions of IIS Supported

6.0 and later.

41.111.2 Resource Objects

SMTP sites

41.111.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.111.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if number of inbound or outbound connections exceeds a threshold?	Set to **y** to raise events. The default is y.
Collect data for inbound or outbound connections per site and total for all sites?	Set to **y** to collect data for charts and reports. If set to y, returns the number of connections per SMTP site and totals for all monitored SMTP sites. The default is n.
Threshold – Maximum inbound connections per site	Specify the maximum number of inbound SMTP site connections that can be open before AppManager raises an event. The default is 50.
Threshold – Maximum outbound connections per site	Specify the maximum number of outbound SMTP site connections that can be open before AppManager raises an event. The default is 50.
Threshold – Maximum total inbound connections for all sites	Specify the total number of inbound connections to all SMTP sites during the monitoring interval before AppManager raises an event. The default is 50.
Threshold – Maximum total outbound connections for all sites	Specify the total number of outbound connections from all SMTP sites during the monitoring interval before AppManager raises an event. The default is 50.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.112 SMTPConnectionUtil

Use this Knowledge Script to monitor the percentage of SMTP server connections being utilized. If the percentage of SMTP connections exceeds the threshold you set, AppManager raises an event.

The utilization percentage is calculated from the total number of connections allowed on the SMTP site being monitored. If you receive an event stating that the "maximum number of connections" value cannot be retrieved, enter the maximum number of connections allowed on the SMTP server where you are running the Knowledge Script for the **Maximum connections allowed** parameter. Information about the maximum number of connections allowed on an SMTP server can be found in the IIS Manager.

If your SMTP server connections are unlimited, either use the default value or refer to the IIS documentation for information about how to calculate the total number of available connections.

No data point is collected for utilization percentage when the Maximum Connections, taken either from IIS itself or from the **Maximum connections allowed** parameter, is 0.

41.112.1 Versions of IIS Supported

6.0 and later.

41.112.2 Resource Objects

SMTP sites

41.112.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

41.112.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if connection utilization exceeds threshold?	Set to **y** to raise events. The default is y.
Collect data for current connections and connection utilization?	Set to **y** to collect data for charts and reports. If set to y, returns the number of SMTP site connections and connection utilization (%). No data point is collected for the percentage of utilization when the Maximum Connections is 0. The default is n.
Threshold – Maximum connection utilization	Specify the maximum percentage of SMTP site connections that can be used before AppManager raises an event. The default is 90%
Maximum connections allowed on this site	If the "maximum number of connections" value cannot be retrieved from the site, enter the maximum number of connections allowed on the SMTP site. The default is 5000 SMTP connections.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

41.113 SMTPMsgs

Use this Knowledge Script to monitor SMTP messages for the monitoring interval:

- Number of bytes sent and received
- Number of messages delivered to local mailboxes
- Number of inbound messages received, and
- Number of outbound messages sent

This script raises an event if a monitored value exceeds the threshold you set.

41.113.1 Versions of IIS Supported

6.0 and later.

41.113.2 Resource Objects

SMTP sites

41.113.3 Default Schedule

The default interval is **Once every hour**.

NOTE: If the schedule is set to Run Once, the value returned is the current total.

41.113.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if any threshold exceeded?	Set to **y** to raise events. The default is y.
Collect data for total bytes sent or received, messages received, sent, or delivered?	Set to **y** to collect data for charts and reports. If set to y, the script returns: • total number of bytes sent or received in messages • total number of inbound messages received • total number of outbound messages sent • total number of messages delivered to local mailboxes The default is n.
Threshold – Maximum number of message bytes received	Specify the maximum number of message bytes to be received before AppManager raises an event. The default is 50,000,000 (50 million) bytes.
Threshold – Maximum number of message bytes sent	Specify the maximum number of message bytes to be sent before AppManager raises an event. The default is 50,000,000 (50 million) bytes.

Description	How to Set It
Threshold – Maximum number of messages delivered	Specify the maximum number of messages to be delivered before AppManager raises an event. The default is 1000 messages.
Threshold – Maximum number of messages received	Specify the maximum number of inbound messages to be received before AppManager raises an event. The default is 1000 messages.
Threshold – Maximum number of messages sent	Specify the maximum number of outbound messages to be delivered, received, and sent before AppManager raises an event. The default is 1000 messages.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.114 SMTPQueue

Use this Knowledge Script to monitor the current number of SMTP messages in local, remote, local retry, and remote retry queues. If the number of messages in any queue exceeds the threshold you set, AppManager raises an event.

41.114.1 Versions of IIS Supported

6.0 and later.

41.114.2 Resource Objects

SMTP sites

41.114.3 Default Schedule

The default interval is **Once every hour**.

41.114.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if any threshold exceeded?	Set to **y** to raise events. The default is y.
Collect data for SMTP messages in local, remote, local retry, and remote retry queues?	Set to **y** to collect data for charts and reports. If set to y, returns the number of messages in each type of SMTP queue. The default is n.
Threshold: Maximum... ...SMTP local queue length ...SMTP local retry queue length ...SMTP remote queue length ...SMTP remote retry queue length	Specify the maximum number of messages any monitored queue can have before AppManager raises an event. The default is 50 messages.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

41.115 SMTPStatistics

Use this Knowledge Script to monitor the number of current inbound and outbound connections on an SMTP site, and outbound connection attempts refused by remote sites, inbound and outbound connections to and from the SMTP site during a monitoring interval, and percentage of SMTP connections being utilized.

This Knowledge Script consolidates functionality that is also available in three separate IIS Knowledge Scripts:

- SMTPConnections
- SMTPConnectionsInterval
- SMTPConnectionUtil

41.115.1 Versions of IIS Supported

6.0 and later.

41.115.2 Resource Objects

SMTP sites

41.115.3 Default Schedule

The default interval is **Once every hour**.

41.115.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
SMTPConnections	Select Yes to check the current number of inbound and outbound connections on an SMTP site. The default is Yes.
Raise event if any threshold exceeded?	Select Yes to raise events. The default is Yes.
Collect data for current number of inbound, outbound, or refused connections to an SMTP site?	Select Yes to collect data for charts and reports. If set to Yes, returns the number of inbound and outbound connections and refused outbound connections. The default is No.
Threshold – Maximum current inbound connections	Specify the maximum number of inbound connections allowed before AppManager raises an event. The default is 50 connections.
Threshold – Maximum current outbound connections	Specify the maximum number of outbound connections allowed before AppManager raises an event. The default is 50 connections.

Description	How to Set It
Threshold – Maximum refused outbound connections	Specify the maximum number of refused outbound connections allowed before AppManager raises an event. The default is 50 connections.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
SMTPConnectionsInterval	Select Yes to check for the number of inbound and outbound connections to and from SMTP sites, and totals for all sites, during the monitoring interval. The default is Yes.
Raise event if number of inbound or outbound connections exceeds threshold?	Select Yes to raise events. The default is Yes.
Collect data for inbound or outbound connections per site and total for all sites?	Select Yes to collect data for charts and reports. If set to Yes, returns the number of connections per SMTP site and totals for all monitored SMTP sites. The default is No.
Threshold – Maximum inbound connections per site	Specify the maximum number of inbound SMTP site connections that can be open before AppManager raises an event. The default is 50.
Threshold – Maximum outbound connections per site	Specify the maximum number of outbound SMTP site connections that can be open before AppManager raises an event. The default is 50.
Threshold – Maximum total inbound connections for all sites	Specify the total number of inbound connections to all SMTP sites during the monitoring interval before AppManager raises an event. The default is 50.
Threshold – Maximum total outbound connections for all sites	Specify the total number of outbound connections from all SMTP sites during the monitoring interval before AppManager raises an event. The default is 50.
Event severity when any threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
SMTPConnectionUtil	Select Yes to check the percentage of SMTP server connections being utilized. The default is Yes.
Raise event if connection utilization exceeds threshold?	Select Yes to raise events. The default is Yes.
Collect data for current connections and connection utilization?	Select Yes to collect data for charts and reports. If set to Yes, returns the number of SMTP site connections and connection utilization (%). No data point is collected for the percentage of utilization when the Maximum Connections is 0. The default is No.
Threshold – Maximum connection utilization	Specify the maximum percentage of SMTP site connections that can be used before AppManager raises an event. The default is 90%.
Maximum connections allowed on this site	If the “maximum number of connections” value cannot be retrieved from the site, enter the maximum number of connections allowed on the SMTP site. The default is 5000 SMTP connections.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 12.
Other settings	

Description	How to Set It
Event severity for unexpected error	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35.

41.116 SSLCertMon

Use this Knowledge Script to identify and monitor expiration dates of valid SSL certificates running on Web servers. AppManager raises an event if any valid SSL certificate is found. AppManager also raises an event if no SSL certification is available.

41.116.1 Versions of IIS Supported

6.0 and later.

41.116.2 Resource Objects

Web servers

41.116.3 Default Schedule

The default interval is **Every 30 minutes**.

41.116.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise an event if any valid SSL certificate is found?	Select Yes to enable events. The default is Yes.
Raise an event if no valid SSL certificate is available?	Select Yes to raise an event if no valid SSL certificate is available. The default is Yes.
Collect data for valid SSL certificates of IIS server?	Select Yes to collect data for charts and reports. The default is No.
Event severity when valid SSL certificates are found	Set the event severity for valid SSL certificates found, from 1 to 40, to indicate the importance of the event. The default is 25.
Enter the number of days for SSL certificate expiration	Specify the number of days pending before expiration of the SSL certificate, from 0 to 100. This value will show only those SSL certificates whose expiration is within the number of days specified. The default value 0 will show all the valid SSL certificates on a machine.

41.117 UDDIConnections

Use this Knowledge Script to monitor the UDDI (Universal Description, Discovery, and Integration) database connection. If the collection of data from a UDDI database fails, AppManager raises an event.

41.117.1 Versions of IIS Supported

- 6.0 (on 32-bit computers only)
- 7.0 (on 32-bit and 64-bit computers)
- 7.5 (on 32-bit and 64-bit computers)

41.117.2 Resource Objects

UDDI Server

41.117.3 Default Schedule

The default interval is **Run Once**.

41.117.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if collection of data fails?	Select Yes to raise events. If data is collected, it returns the name and description of the UDDI server. The default is Yes.
Raise event if connection to the UDDI database server fails?	Select Yes to enable events. The default is Yes.
Event severity when UDDI database data collection/connection fails	Set the event severity level for data collection failure, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity when UDDI database data collection/connection succeeds	Set the event severity level for data collection success, from 1 to 40, to indicate the importance of the event. The default is 25.

41.118 UnloadApps

Use this Knowledge Script to unload one or more IIS Web applications from memory. Instead of restarting IIS, you can run this script to unload a select group of Web applications from memory. This script does not restart the IIS service or refresh the cache. However, property changes to unloaded applications can take effect after you reload the applications.

AppManager raises an event if an application cannot be unloaded, or if an application is successfully unloaded.

41.118.1 Versions of IIS Supported

6.0.

41.118.2 Resource Objects

Web servers

41.118.3 Default Schedule

By default, this script **Runs once**.

41.118.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if unload operation succeeds or fails?	Set to y to raise an event if an application cannot be unloaded, or if an application is successfully unloaded. The default is y.
Collect data for number of applications unloaded?	Set to **y** to collect data for charts and reports. If set to y, returns the number of applications unloaded. Returns 1 if "`root`" operation completed successfully, indicating that all applications (not just one) were successfully unloaded. The default is n.
Web sites (use semicolons as separators)	Specify the names of the sites with applications that you want to unload. Use semicolons to separate multiple entries. For example: `FINANCE;SALES;HR`
Applications to unload (separate applications with commas, sites with semicolons)	Specify the names of the applications to unload. Use commas to separate multiple entries and semicolons to map applications to the sites named in the **Web sites** field. For example, to remove the following applications from the servers used as an example above: • `AcctsPay` from the Web server `FINANCE` • `COMMForce` and `CRMSuite` from the Web server `SALES` • `Talent4Hire` from the Web server `HR` specify the following: `AcctsPay;COMMForce,CRMSuite;Talent4Hire`

Description	How to Set It
Event severity when unload operation fails	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.

41.119 WebServiceExtensions

Use this Knowledge Script to extract the Web service extensions listed on the IIS servers and their status. If extracting the Web service extensions and their status is successful or unsuccessful, AppManager raises an event. AppManager also raises an event if the IIS server is older than version 6.0.

41.119.1 Version Compatibility

6.0 and later.

41.119.2 Resource Objects

Web servers

41.119.3 Default Schedule

The default schedule of this script is **Run Once**.

41.119.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if version incorrect?	Select Yes to raise an event if the IIS server version is below 6.0.
Event severity if operation fails	Set the event severity level, from 1 to 40, to indicate the event severity if the operation fails. The default severity level is 5.
Raise event if operation succeeds?	Set the event severity level, from 1 to 40, to indicate the event severity if the operation succeeds. The default severity level is 25.

42 Lync Knowledge Scripts

Microsoft Lync combines enterprise-ready instant messaging, presence capabilities, conferencing, unified communications, and administrative controls in a single offering. Lync adds real-time conferencing hosted on servers inside the corporate firewall to existing features such as federation and public instant-messaging connectivity.

AppManager for Microsoft Lync provides the following Knowledge Scripts for monitoring Microsoft Lync resources. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
ArchivedVoIPCallActivity	Monitors the various VoIP call metrics contained in the Monitoring (CDR) database.
CallQuality	Monitors call quality metrics such as MOS, round trip, jitter, and packet loss.
CollectCallData	Polls Lync Quality of Experience (QoE) metrics databases for call quality metrics and saves the data to the Lync supplemental database.
ConferenceCallActivity	Monitors the number of active conferences and the number of users in those conferences.
EdgeServerCallActivity	Monitors current call activity metrics of an Edge server.
EdgeServerCallFailures	Monitors current call failure metrics of an Edge server.
ExtendedSyntheticTransaction	Monitors the health of the Lync deployment by executing extended Lync synthetic transaction test against the Lync Front End pools. Reports the test result and latency, which helps in understanding the end-user experience.
HealthCheck	Monitors the active status of Lync server services.
MCUStatus	Monitors the health and draining state of a Multipoint Control Unit (MCU).
MediationServerCallActivity	Monitors the current inbound and outbound calls of a Mediation server.
MediationServerCallFailures	Monitors the session failure metrics of a Mediation server.
MediationServerHealth	Monitors the server health metrics of a Mediation server.
MediationServerUsage	Monitors the server resource usage of a Mediation server.
SessionCallActivity	Monitors the session initiation rate of a Lync server.
SessionCallFailures	Monitors session failure metrics of a Lync server.
SetupSupplementalDB	Creates a Lync supplemental database to store call quality metrics (audio, video, and application sharing).
SyntheticTransaction	Monitors the health of the Lync deployment by executing Lync synthetic transaction test against the Lync Front End pools. Reports the test result and latency, which helps in understanding the end-user experience.

Knowledge Script	What It Does
SystemUptime	Monitors the length of time a system has been up and running since a reboot.
SystemUsage	Monitors the total CPU and memory usage of a Lync server.

42.1 ArchivedVoIPCallActivity

Use this Knowledge Script to monitor the various Voice over IP (VoIP) call metrics contained in the Monitoring database. This script monitors the number of total VoIP calls made, the types of calls made, the average duration of calls, the number of redirected calls, and the number of calls per gateway.

A gateway is third-party hardware that connects Microsoft Lync with a public switched telephone network (PSTN), private branch exchange (PBX), or other phone system.

42.1.1 Resource Objects

Lync_ArchivingandCDRFolder

Lync_CDRObject

42.1.2 Default Schedule

The default interval for this script is 15 minutes.

42.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the ArchivedVoIPCallActivity job fails. The default is 5.
Monitor Total Number of VoIP Calls	
Event Notification	
Raise event if total number of VoIP calls exceeds the threshold?	Select **Yes** to raise an event if the number of VoIP calls exceeds the threshold. The default is Yes.
Threshold - Maximum total number of VoIP calls	Specify the maximum number of VoIP calls that can be active before an event is raised. The default is 20.
Event severity when total number of VoIP calls exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of VoIP calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for total number of VoIP calls?	Select **Yes** to collect data about the number of VoIP calls. The default is Yes.
Monitor Total Number of UC to PSTN Calls	
Event Notification	

Description	How to Set It
Raise event if total number of UC to PSTN calls exceeds threshold?	Select **Yes** to raise an event if the number of unified communications (UC) calls to public switched telephone network (PSTN) calls exceeds the threshold. The default is Yes.
Threshold - Maximum total number of UC to PSTN calls	Specify the maximum number of UC to PSTN calls that can be active before an event is raised. The default is 20.
Event severity when total number of UC to PSTN calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for total number of UC to PSTN calls?	Select **Yes** to collect data about the number of UC to PSTN calls. The default is Yes.
Monitor Total Number of PSTN to UC Calls	
Event Notification	
Raise event if total number of PSTN to UC calls exceeds threshold?	Select **Yes** to raise an event if the number of PSTN to UC calls exceeds the threshold. The default is Yes.
Threshold - Maximum total number of PSTN to UC calls	Specify the maximum number of PSTN to UC calls that can be active before an event is raised. The default is 20.
Event severity when total number of PSTN to UC calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for total number of PSTN to UC calls?	Select **Yes** to collect data about the number of PSTN to UC calls. The default is Yes.
Monitor Average Duration of Calls	
Event Notification	
Raise event if average duration of calls exceeds threshold?	Select **Yes** to raise an event if the average duration of calls exceeds the threshold. The default is Yes.
Threshold - Maximum average duration of calls	Specify the maximum average call duration that can occur before an event is raised. The default is 20.
Event severity when the average duration of calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the average duration of calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for average duration of calls?	Select **Yes** to collect data about the average duration of calls. The default is Yes.
Monitor Number of Redirected Calls	
Event Notification	
Raise event if total number of redirected calls exceeds threshold?	Select **Yes** to raise an event if the number of redirected, or transferred, calls exceeds the threshold. The default is Yes.
Threshold - Maximum total number of redirected calls	Specify the maximum number of calls that can be redirected before an event is raised. The default is 20.

Description	How to Set It
Event severity when total number of redirected calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of redirected calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of redirected calls?	Select **Yes** to collect data about the number of redirected calls. The default is Yes.
Monitor Number of Calls per Gateway	
Event Notification	
Raise event if total number of calls per gateway exceeds threshold?	Set to **Yes** to raise an event if the number of calls per gateway exceeds the threshold. The default is Yes.
Threshold - Maximum total number of calls per gateway	Specify the maximum number of calls that the gateway can handle before an event is raised. The default is 20.
Event severity when total number of calls per gateway exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of calls per gateway?	Select **Yes** to collect data about the number of calls per gateway. The default is Yes.

42.2 CallQuality

Use this Knowledge Script to monitor Lync call quality information stored in the Lync supplemental database for call quality statistics for audio, video, and application sharing calls. The statistics include round trip, jitter, packet loss, and Mean Opinion Score (MOS). The script raises an event if a monitored call quality statistic falls below or exceeds a threshold. The script generates data streams for all monitored call quality statistics of audio, video and application sharing calls.

This script checks the supplemental database tables at each specified interval for new records that match your query.

42.2.1 Understanding Data Streams and Threshold Events

This script generates data streams for average round trip, jitter, and packet loss for audio, video, and application sharing calls. This script also generates data streams for average MOS for audio calls. These average values are based on data from each call that passes through the Lync Server during the script's interval, which is, by default, every 5 minutes. For example, in an audio call, if the jitter of any audio stream (incoming/outgoing) is greater that 60 milliseconds, AppManager raises an event for that audio call.

42.2.2 Prerequisites

- Run Lync SetupSupplementalDB to create the Lync Server supplemental database.
- Because the Lync_CallQuality script reports on data stored in the supplemental database by a data collector service, data must exist in the supplemental database before the reporting can be successful. To place data in the supplemental database, run Lync_CollectCallData on the Lync Server being monitored before you run the CallQuality script. If the CollectCallData script stops, the data collection also stops, even if the CallQuality script is still running.

42.2.3 Resource Object

Lync_MonitoringFolder

42.2.4 Default Schedule

By default, this script runs **every 5 minutes**.

NOTE: Ensure that Lync_CollectCallData Knowledge Script runs at a faster interval than this script.

42.2.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CallQuality job. The default is 5.
Raise event if no records found?	Select **Yes** to raise an event if there are no records in the Lync supplemental database or when no records exist in the database that matches the filter criteria. If you select Yes and this script raises this event, check the status of the job run by the Lync_CollectCallData Knowledge Script. The default is unselected.
Event severity when no records found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no Lync packets were found. The default is 25.
Call Details	
Include call details?	Select **Yes** to include call details in the events raised by this script. The default is Yes. Leave this parameter unselected to suppress the following call details: • Calling Party • Called Party • Caller and Called Average MOS • Caller and Called Average Round Trip • Caller and Called Jitter • Caller and Called Lost Packets • Start Time • End Time • Duration Calling Party and Called Party details usually contain SIP address, such as sip:example@example.com.
Query Filters	
Minimum duration	Use this parameter to filter out records whose call duration is less than the value you specify. Accept the default of 0 seconds to ignore the filter for minimum duration.
Maximum table size	Specify the maximum number of detail rows to include in an event message. The default is 50 rows.
Maximum duration	Use this parameter to filter out records whose call duration is greater than or equal to the value you specify. Accept the default of 0 seconds to ignore the filter for maximum duration.
Calling party	Specify the calling party SIP address that you want to find in the supplemental database. You can use a percentage (%) as a wildcard character. For example, if you specify `%@netiq.corp`, the script will search for all reported calling parties within the netiq.corp domain. Leave this parameter blank to search for any calling party.
Party connector	Set this parameter only if you specified a party for both the *Calling party* parameter and the *Called party* parameter. Your selection indicates how the script will connect the two parameters: AND or OR. The default is AND.

Parameter	How to Set It
Called party	Specify the called party SIP address that you want to find in the supplemental database. You can use an percentage (%) as a wildcard character. For example, if you specify `%@netiq.corp`, the script will search for all reported called parties within the netiq.corp domain. Leave this parameter blank to search for any called party.
Monitor Audio Call	
Monitor Average MOS	
Event Notification	
Raise event if average MOS falls below threshold?	Select **Yes** to raise an event if the average MOS value falls below the threshold. The default is Yes.
Threshold - Average MOS	Specify the lowest average MOS value, from 0.0 to 5.0, that must occur to prevent an event from being raised. The default is 3.60.
Event severity when average MOS falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average MOS value falls below the threshold. The default is 5.
Data Collection	
Collect data for average MOS?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the average MOS value during the monitoring period. The default is unselected.
Monitor Average Round Trip	
Event Notification	
Raise event if average round trip exceeds threshold?	Select **Yes** to raise an event if the average round trip value exceeds the threshold. The default is Yes.
Threshold - Average round Trip	Specify the highest average round trip value, in milliseconds, that can occur before an event is raised. The default is 50 milliseconds.
Event severity when average round trip exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average round trip value exceeds the threshold. The default is 15.
Data Collection	
Collect data for average round trip?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of average round trip that occurred during the monitoring period. The default is unselected.
Monitor Average Jitter	
Event Notification	
Raise event if jitter exceeds threshold?	Select **Yes** to raise an event if the average jitter value exceeds the threshold. The default is Yes.
Threshold - Maximum jitter	Specify the highest average jitter value, in milliseconds, that can occur before an event is raised. The default is 60 milliseconds.
Event severity when jitter exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average jitter value exceeds the threshold. The default is 15.
Data Collection	
Collect data for jitter?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of average jitter that occurred during the monitoring period. The default is unselected.

Parameter	How to Set It
Monitor Average Packet Loss	
Event Notification	
Raise event if packet loss exceeds threshold?	Select **Yes** to raise an event if the average packet loss value exceeds the threshold. The default is Yes.
Threshold - Maximum packet loss	Specify the highest percentage of average packet loss that can occur before an event is raised. The default is 1%.
Event severity when packet loss exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the packet loss value exceeds the threshold. The default is 15.
Data Collection	
Collect data for packet loss?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of packet loss that occurred during the monitoring period. The default is unselected.
Monitor Video Call	
Monitor Average Round Trip	
Event Notification	
Raise event if average round trip exceeds threshold?	Select **Yes** to raise an event if the average round trip value exceeds the threshold. The default is Yes.
Threshold - Average round trip	Specify the highest average round trip value, in milliseconds, that can occur before an event is raised. The default is 50 milliseconds.
Event severity when average round trip exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average round trip value exceeds the threshold. The default is 15.
Data Collection	
Collect data for average round trip?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of average round trip that occurred during the monitoring period. The default is unselected.
Monitor Average Jitter	
Event Notification	
Raise event if jitter exceeds threshold?	Select **Yes** to raise an event if the average jitter value exceeds the threshold. The default is Yes.
Threshold - Maximum jitter	Specify the highest average jitter value, in milliseconds, that can occur before an event is raised. The default is 30 milliseconds.
Event severity when jitter exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average jitter value exceeds the threshold. The default is 15.
Data Collection	
Collect data for jitter?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of average jitter that occurred during the monitoring period. The default is unselected.
Monitor Average Packet Loss	
Event Notification	
Raise event if packet loss exceeds threshold?	Select **Yes** to raise an event if the average packet loss value exceeds the threshold. The default is Yes.

Parameter	How to Set It
Threshold - Maximum packet loss	Specify the highest percentage of average packet loss that can occur before an event is raised. The default is 1%.
Event severity when packet loss exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the packet loss value exceeds the threshold. The default is 15.
Data Collection	
Collect data for packet loss?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of packet loss that occurred during the monitoring period. The default is unselected.
Monitor Application Sharing Call	
Monitor Average Round Trip	
Event Notification	
Raise event if average round trip exceeds threshold?	Select **Yes** to raise an event if the average round trip value exceeds the threshold. The default is Yes.
Threshold - Average round trip	Specify the highest average round trip value, in milliseconds, that can occur before an event is raised. The default is 50 milliseconds.
Event severity when average round trip exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average round trip value exceeds the threshold. The default is 15.
Data Collection	
Collect data for average round trip?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of average round trip that occurred during the monitoring period. The default is unselected.
Monitor Average Jitter	
Event Notification	
Raise event if jitter exceeds threshold?	Select **Yes** to raise an event if the average jitter value exceeds the threshold. The default is Yes.
Threshold - Maximum jitter	Specify the highest average jitter value, in milliseconds, that can occur before an event is raised. The default is 100 milliseconds.
Event severity when jitter exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average jitter value exceeds the threshold. The default is 15.
Data Collection	
Collect data for jitter?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of average jitter that occurred during the monitoring period. The default is unselected.

42.3 CollectCallData

Use this Knowledge Script to poll Lync Quality of Experience (QoE) metrics databases for call quality metrics to store the data in Lync supplemental database. This Knowledge Script raises an event when the Knowledge Script fails or when the Lync call quality metrics data collection fails.

42.3.1 Prerequisite

Run SetupSupplementalDB to create the Lync supplemental database.

42.3.2 Resource Object

Lync_QoEObject

42.3.3 Default Schedule

By default, this script runs every 1 minute.

42.3.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to set it
General Settings	
Job Failure Notification	
Event Severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Call Data Collection	
Call Data Collection Failure Notification	
Event severity when Call Data Collection fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when call data collection fails. The default is 5.
Raise event when Call Data Collection succeeds	Select **Yes** to raise an event if the job is successful. The default is Yes.
Event severity when Call Data Collection succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when call data collection is successful. The default is 25.

42.4 ConferenceCallActivity

Use this Knowledge Script to monitor the number of active conferences, and the number of users involved in those conferences, on a Lync server. The conference type can be instant message (IM), telephony, A/V, or Web.

42.4.1 Resource Object

Lync_ConferenceObject

42.4.2 Default Schedule

The default interval for this script is five minutes.

42.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor IM Conferences	
Event Notification	
Raise event if number of IM conferences exceeds threshold?	Select **Yes** to raise an event if the number of instant message conferences exceeds the threshold. The default is Yes.
Threshold - Maximum number of IM conferences	Specify the maximum number of IM conferences that can be active before an event is raised. The default is 25.
Event severity when number of IM conferences exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of IM conferences exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of IM conferences?	Select **Yes** to collect data about the number of IM conferences. The default is unchecked.
Monitor A/V Conferences	
Event Notification	
Raise event if number of A/V conferences exceeds threshold?	Select **Yes** to raise an event if the number of A/V conferences exceeds the threshold. The default is Yes.
Threshold - Maximum number of A/V conferences	Specify the maximum number of A/V conferences that can be active before an event is raised. The default is 25.

Description	How to Set It
Event severity when number of A/V conferences exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of A/V conferences exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of A/V conferences?	Select **Yes** to collect data about the number of A/V conferences. The default is unchecked.
Monitor Telephony Conferences	
Event Notification	
Raise event if number of telephony conferences exceeds threshold?	Select **Yes** to raise an event if the number of telephony conferences exceeds the threshold. The default is Yes.
Threshold - Maximum number of telephony conferences	Specify the maximum number of telephony conferences that can be active before an event is raised. The default is 25.
Event severity when number of telephony conferences exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of telephony conferences exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of telephony conferences?	Select **Yes** to collect data about the number of telephony conferences. The default is Yes.
Monitor Web Conferences	
Event Notification	
Raise event if number of Web conferences exceeds threshold?	Select **Yes** to raise an event if the number of Web conferences exceeds the threshold. The default is Yes.
Threshold - Maximum number of Web conferences	Specify the maximum number of Web conferences that can be active before an event is raised. The default is 25.
Event severity when number of Web conferences exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of Web conferences exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of Web conferences?	Select **Yes** to collect data about the number of Web conferences. The default is Yes.
Monitor IM Conference Users	
Event Notification	
Raise event if number of IM conference users exceeds threshold?	Select **Yes** to raise an event if the number of IM conference users exceeds the threshold. The default is Yes.
Threshold - Maximum number of IM conference users	Specify the maximum number of IM conference users that can be active before an event is raised. The default is 10.
Event severity when number of IM conference users exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of IM conference users exceeds the threshold. The default is 15.
Data Collection	

Description	How to Set It
Collect data for number of IM conference users?	Select **Yes** to collect data about the number of IM conference users. The default is Yes.
Monitor A/V Conference Users	
Event Notification	
Raise event if number of A/V conference users exceeds threshold?	Select **Yes** to raise an event if the number of A/V conference users exceeds the threshold. The default is Yes.
Threshold - Maximum number of A/V conference users	Specify the maximum number of A/V conference users that can be active before an event is raised. The default is 10.
Event severity when number of A/V conference users exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of A/V conference users exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of A/V conference users?	Select **Yes** to collect data about the number of A/V conference users. The default is Yes.
Monitor Telephony Conference Users	
Event Notification	
Raise event if number of telephony conference users exceeds threshold?	Select **Yes** to raise an event if the number of telephony conference users exceeds the threshold. The default is Yes.
Threshold - Maximum number of telephony conference users	Specify the maximum number of telephony conference users that can be active before an event is raised. The default is 10.
Event severity when number of telephony conference users exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of telephony conference users exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of telephony conference users?	Select **Yes** to collect data about the number of telephony conference users. The default is Yes.
Monitor Web Conference Users	
Event Notification	
Raise event if number of Web conference users exceeds threshold?	Select **Yes** to raise an event if the number of Web conference users exceeds the threshold. The default is Yes.
Threshold - Maximum number of Web conference users	Specify the maximum number of Web conference users that can be active before an event is raised. The default is 10.
Event severity when number of Web conference users exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of Web conference users exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of Web conference users?	Select **Yes** to collect data about the number of Web conference users. The default is Yes.

42.5 EdgeServerCallActivity

Use this Knowledge Script to monitor call activity metrics of an Edge Server, including the number of active server connections. This script also monitors the number of connections that are slow because they are overloaded, also known as throttling. In addition, this script monitors the number of disconnected server connections.

42.5.1 Resource Object

Lync_EdgeServerFolder

42.5.2 Default Schedule

The default interval for this script is five minutes.

42.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Active Server Connections	
Event Notification	
Raise event if the number of active server connections exceeds threshold?	Select **Yes** to raise an event if the number of active server connections exceeds the threshold. The default is Yes.
Threshold - Maximum active server connections	Specify the maximum number of active server connections that can occur before an event is raised. The default is 100.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of active server connections exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of active server connections?	Select **Yes** to collect data about the active server connections. The default is Yes.
Monitor Throttled Connections	
Event Notification	
Raise event if number of throttled connections exceeds threshold?	Select **Yes** to raise an event if the number of throttled connections exceeds the threshold. Throttled connections are when connections are slow as a result of being overloaded. The default is Yes.

Description	How to Set It
Threshold - Maximum number of throttled connections	Specify the maximum number of throttled connections that can occur before an event is raised. The default is 15.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of throttled connections exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of throttled server connections?	Select **Yes** to collect data about the number of throttled server connections. The default is Yes.
Monitor Disconnected Server Connections	
Event Notification	
Raise event if number of disconnected server connections exceeds threshold?	Select **Yes** to raise an event if the number of disconnected server connections exceeds the threshold. The default is Yes.
Threshold - Maximum disconnected server connections	Specify the maximum number of disconnected server connections that can occur before an event is raised. The default is 25.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of disconnected server connections exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of server connections disconnected due to throttling?	Select **Yes** to collect data about the number of server connections disconnected because of throttling. The default is Yes.

42.6 EdgeServerCallFailures

Use this Knowledge Script to monitor current call failure metrics of an Edge server. This script generates a data stream for the number of connection failures and raises an event if the number of connection failures exceeds the specified threshold.

42.6.1 Resource Object

Lync_EdgeServerFolder

42.6.2 Default Schedule

The default interval for this script is five minutes.

42.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Connection Failures	
Event Notification	
Raise event if the number of connection failures exceeds threshold?	Select **Yes** to raise an event if the number of connection failures exceeds the threshold. The default is Yes.
Threshold - Maximum connection failures	Specify the maximum number of connections that can fail before an event is raised. The default is 15.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of connection failures exceeds the threshold. The default is 15.
Data Collection	
Collect data for the number of connection failures?	Select **Yes** to collect data about the number of connection failures. The default is Yes.

42.7 ExtendedSyntheticTransaction

Use this Knowledge Script to monitor the health of a Lync deployment by executing the Lync extended synthetic transaction test on the Lync Front End pool. This Knowledge Script reports the result and latency of the Lync extended synthetic transaction test, which helps in understanding the end-user experience. This script generates relevant data streams for the test latency.

42.7.1 Resource Objects

Lync_PoolFolder

Lync_PoolObject

42.7.2 Default Schedule

The default interval for this script is 1 hour.

42.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the ExtendedSyntheticTransaction job fails. The default is 5.
Extended Lync Test	
Test Peer-To-Peer PSTN Call	Select **Yes** to run the test for Peer-To-Peer PSTN Call against your Lync Pool.
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Peer-To-Peer PSTN Call test fails. The default is 5.
Peer-To-Peer PSTN Call Latency	
Raise event if latency exceeds the threshold	Select this option to raise an event when the peer-to-peer PSTN call latency exceeds the threshold. This option is selected by default.
Latency threshold	Specify the threshold in milliseconds for the latency of the Peer-To-Peer PSTN Call test. The default is 1000.
Event severity when Latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the latency of Peer-To-Peer PSTN call exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the Peer-To-Peer PSTN Call latency.
Test Conference Join Launcher	Select **Yes** to run the test for Conference Join Launcher against your Lync Pool. **NOTE:** This test is not supported for Lync 2010.
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Conference Join Launcher test fails. The default is 5.
Conference Join Launcher Latency	

Parameter	How to Set It
Raise event if latency exceeds the threshold	Select this option to raise an event when the Conference Join Launcher latency exceeds the threshold. This option is selected by default.
Latency threshold	Specify the threshold in milliseconds for the latency of the Conference Join Launcher test. The default is 1000.
Event severity when Latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the latency of the Conference Join Launcher exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the Conference Join Launcher latency.
Test Audio Conferencing Provider	Select **Yes** to run the test for Audio Conferencing Provider against your Lync Pool. **NOTE:** This test is not supported for Lync 2010.
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event when the Audio Conferencing Provider test fails. The default is 5.
Audio Conferencing Provider Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of Audio Conferencing Provider exceeds the threshold. This option is selected by default.
Latency threshold (milliseconds)	Specify the threshold in milliseconds for the latency of the Audio Conferencing Provider test. The default is 1000.
Event severity when Latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Audio Conferencing Provider latency exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the Audio Conferencing Provider latency.
Test Audio/Video Edge Connectivity	Select **Yes** to run the test for Audio/Video Edge Connectivity against your Lync Pool. **NOTE:** This test is not supported for Lync 2010.
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Audio/Video Edge Connectivity test fails. The default is 5.
Audio/Video Edge Connectivity Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of Audio/Video Edge Connectivity exceeds the threshold. This option is selected by default.
Latency threshold (milliseconds)	Specify the threshold in milliseconds for the latency of Audio/Video Edge Connectivity test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Audio/Video Edge Connectivity latency exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the Audio/Video Edge Connectivity latency.
Test Data Conference	Select **Yes** to run the test for Data Conference against your Lync Pool. **NOTE:** This test is not supported for Lync 2010.
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Data Conference test fails. The default is 5.
Data Conference Latency	

Parameter	How to Set It
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of Data Conference exceeds the threshold. This option is selected by default.
Latency threshold	Specify the threshold in milliseconds for the latency of Data Conference test. The default is 1000.
Event severity when Latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Data Conference latency exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the Data Conference latency.
Test Exchange Unified Messaging Connectivity	Select **Yes** to run the test for Exchange Unified Messaging Connectivity against your Lync Pool. **NOTE:** This test is not supported for Lync 2010.
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Exchange Unified Messaging Connectivity test fails. The default is 5.
Exchange Unified Messaging Connectivity Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of Exchange Unified Messaging connectivity exceeds the threshold. This option is selected by default.
Latency threshold	Specify the threshold in milliseconds for the latency of Exchange Unified Messaging Connectivity test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Exchange Unified Messaging Connectivity latency exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the Exchange Unified Messaging Connectivity latency.
Test Persistent Chat	Select **Yes** to run the test for Persistent Chat against your Lync Pool. **NOTE:** This test is not supported on Lync 2010.
Test failure event severity	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Persistent Chat test fails. The default is 5.
Persistent Chat Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of Persistent Chat exceeds the threshold. This option is selected by default.
Latency threshold	Specify the threshold in milliseconds for the latency of the Persistent Chat test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Persistent Chat latency exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the Persistent Chat latency.
Test Unified Contact Store Access	Select **Yes** to run the test for Unified Contact Store Access against your Lync Pool. **NOTE:** This test is not supported on Lync 2010.
Test failure event severity	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Unified Contact Store Access test fails. The default is 5.
Unified Contact Store Access Latency	

Parameter	How to Set It
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of Unified Contact Store Access exceeds the threshold. This option is selected by default.
Latency threshold	Specify threshold in milliseconds for the latency of the Unified Contact Store Access test. The default is 1000.
Event severity when Latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Unified Contact Store Access latency exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the Unified Contact Store Access latency.
Test Mobile IM	Select **Yes** to run the test for Mobile IM against your Lync Pool. **NOTE:** This test is not supported for Lync 2010.
Sender's SIP address	Specify the Sender's SIP address in the following format: *SIP:username@domain.extension*. For example, *SIP:testuser@testdomain.com*
Receiver's SIP address	Specify the Receiver's SIP address in the following format: *SIP:username@domain.extension* For example, *SIP:testuser@testdomain.com*
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Mobile IM test fails. The default is 5.
Mobile IM Latency	
Raise event if the latency exceeds the threshold	Select **Yes** to raise an event when the latency of Mobile IM exceeds the threshold. This option is selected by default.
Latency threshold	Specify the threshold in milliseconds for the latency of the Mobile IM test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Mobile IM latency exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the Mobile IM latency.
Test XMPP IM	Select **Yes** to run the test for XMPP IM against your Lync Pool to determine that the instant message can be sent over Extensible Messaging and Presence Protocol gateway. **NOTE:** This test is not supported for Lync 2010.
Receiver's address	Specify the address of the receiver on which the test for XMPP IM is to be sent in the following format: *username@domain.extension*. For example, *testuser@testdomain.com*
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the XMPP IM test fails. The default is 5.
XMPP IM Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of XMPP IM exceeds the threshold. This option is selected by default.

Parameter	How to Set It
Latency threshold	Specify the threshold milliseconds for the latency of the XMPP IM test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the XMPP IM latency exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the XMPP IM latency.

42.8 HealthCheck

Use this Knowledge Script to monitor the active status of Lync server services. You can run this script on a Front-end server, a Mediation server, or an Edge server to monitor the services on that server. This script raises an event if a service fails to start, stops and then starts again, or is disabled. This script generates a data stream for service availability.

42.8.1 Resource Object

Lync_ServicesObject

42.8.2 Default Schedule

The default interval for this script is one minute.

42.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Services	
Start a service if it is stopped?	Select **Yes** if you want to start a stopped service. The default is Yes.
Data Collection	
Collect data for service availability?	Select **Yes** to collect data about service availability. The default is Yes.
Raise event if a service fails to start?	Select **Yes** to raise an event if the service fails to start. The default is Yes.
Event severity when service fails to start	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service fails to start. The default is 5.
Raise event if a stopped service has been started?	Select **Yes** to raise an event if the service has been started. The default is Yes.
Event severity when a stopped service has been started	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when a stopped service has been started again. The default is 25.
Raise event if service is disabled?	Select **Yes** to raise an event if the service is disabled. The default is unchecked.
Event severity when service is disabled	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service is disabled. The default is 15.

42.9 MCUStatus

Use this Knowledge Script to monitor the health and draining state of a Multipoint Control Unit, or MCU. For example, IMMCU is an IM Conferencing server that runs as an IM service, and this script monitors the load for that server.

The different health states display the level of use as well as the number of users on the server.

42.9.1 Resource Object

Lync_MCUObject

42.9.2 Default Schedule

The default interval for this script is five minutes.

42.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor MCU Health State	
Raise event if health state is Loaded?	Select **Yes** to raise an event if the health state is Loaded. The default is unchecked.
Event severity when health state is Loaded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the health state is Loaded. The default is 20.
Raise event if health state is Full?	Select **Yes** to raise an event if the health state is Full. The default is Yes.
Event severity when health state is Full	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the health state is Full. The default is 15.
Monitor MCU Draining State	
Raise event if draining state is Requesting to Drain?	Select **Yes** to raise an event if the draining state is Requesting to Drain, or attempting to close MCU services to reduce the load. The default is Yes.
Event severity when draining state is Requesting to Drain	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the draining state is Requesting to Drain. The default is 15.
Raise event if draining state is Draining?	Select **Yes** to raise an event if the draining state is set to Draining, the process of closing MCU services to reduce the load. The default is Yes.
Event severity when draining state is Draining	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the draining state is set to Draining. The default is 10.

42.10 MediationServerCallActivity

Use this Knowledge Script to monitor inbound and outbound calls of a Mediation server, an optional component that connects Lync to a phone system, such as a PSTN, POTS, PBX, or some other legacy system.

42.10.1 Resource Object

Lync_MediationFolder

42.10.2 Default Schedule

The default interval for this script is five minutes.

42.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Inbound Calls	
Event Notification	
Raise event if number of inbound calls exceeds threshold?	Select **Yes** to raise an event if the number of inbound calls exceeds the threshold. The default is Yes.
Threshold - Maximum number of inbound calls	Specify the maximum number of inbound calls that can occur before an event is raised. The default is 25.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of inbound calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of current inbound calls?	Select **Yes** to collect data about the number of current inbound calls. The default is Yes.
Monitor Outbound Calls	
Event Notification	
Raise event if number of outbound calls exceeds threshold?	Select **Yes** to raise an event if the number of outbound calls exceeds the threshold. The default is Yes.
Threshold - Maximum number of outbound calls	Specify the maximum number of outbound calls that can occur before an event is raised. The default is 25.

Description	How to Set It
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of outbound calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of current outbound calls?	Select **Yes** to collect data about the number of current outbound calls. The default is Yes.
Monitor Rejected Inbound Calls	
Event Notification	
Raise event if number of rejected inbound calls exceeds threshold?	Select **Yes** to raise an event if the number of rejected inbound calls exceeds the threshold. Calls can be rejected if the Mediation server or the third-party gateway is over capacity. The default is Yes.
Threshold - Maximum number of rejected inbound calls	Specify the maximum number of rejected inbound calls that can occur before an event is raised. The default is 25.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of rejected inbound calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of rejected inbound calls?	Select **Yes** to collect data about the number of rejected inbound calls. The default is Yes.
Monitor Rejected Outbound Calls	
Event Notification	
Raise event if number of rejected outbound calls exceeds threshold?	Select **Yes** to raise an event if the number of rejected outbound calls exceeds the threshold. Calls can be rejected if the Mediation server or the third-party gateway is over capacity. The default is Yes.
Threshold - Maximum number of rejected outbound calls	Specify the maximum number of rejected outbound calls that can occur before an event is raised. The default is 25.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of rejected outbound calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of rejected outbound calls?	Select **Yes** to collect data about the number of current rejected outbound calls. The default is Yes.

42.11 MediationServerCallFailures

Use this Knowledge Script to monitor current call failure metrics of a Mediation server, an optional component that connects Lync to a phone system, such as a PSTN, POTS, PBX, or some other legacy system.

42.11.1 Resource Object

Lync_MediationObject

42.11.2 Default Schedule

The default interval for this script is five minutes.

42.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Call Failures	
Event Notification	
Raise event if number of call failures exceeds threshold?	Select **Yes** to raise an event if the number of call failures exceeds the threshold. The default is Yes.
Threshold - Maximum call failures	Specify the maximum number of calls that can fail before an event is raised. The default is 10 percent.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of call failures exceeds the threshold. The default is 10.
Data Collection	
Collect data for number of call failures?	Select **Yes** to collect data about the number of call failures. The default is Yes.

42.12 MediationServerHealth

Use this Knowledge Script to track the global health of a Mediation server, an optional component that connects Lync to a phone system, such as a PSTN, POTS, PBX, or some other legacy system. Health statuses include Disabled, Normal, Light Load, Heavy Load, and Overload. This script also monitors total packet drops and TCP disconnects because the received packet is out of sync.

42.12.1 Resource Object

Lync_MediationFolder

42.12.2 Default Schedule

The default interval for this script is five minutes.

42.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Health State	
Raise event if global health status is Heavy Load?	Select **Yes** to raise an event if the global health status is heavy load. A health status of Heavy Load occurs when attempts to initiate new calls through the Mediation server fail. The default is Yes.
Event severity when global health status is Heavy Load	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of conferences exceeds the threshold. The default is 15.
Raise event if global health status is Overloaded?	Select **Yes** to raise an event if the global health status is Overloaded. The default is Yes.
Event severity when global health status is Overloaded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of conferences exceeds the threshold. The default is 10.
Monitor Dropped RTP Packets	
Event Notification	
Raise event if number of dropped RTP packets exceeds threshold?	Select **Yes** to raise an event if the number of dropped RTP packets exceeds the threshold. The default is Yes.
Threshold - Maximum dropped RTP packets	Specify the number of dropped RTP packets that can occur before an event is raised. The default is 5.

Description	How to Set It
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the threshold is exceeded. The default is 15.
Data Collection	
Collect data for number of dropped RTP packets per second?	Select **Yes** to collect data about dropped RTP packets per second. The default is Yes.
Monitor TCP Disconnects	
Event Notification	
Raise event if number of TCP disconnects exceeds threshold?	Select **Yes** to raise an event if the number of TCP disconnects exceeds the threshold. The default is Yes.
Threshold - Maximum number of TCP disconnects	Specify the number of TCP disconnects that can occur before an event is raised. The default is 10.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the threshold is exceeded. The default is 15.
Data Collection	
Collect data for number of TCP disconnects?	Select **Yes** to collect data about number of TCP disconnects. The default is Yes.

42.13 MediationServerUsage

Use this Knowledge Script to monitor the overall resource usage of a Mediation server, an optional component that connects Lync to a phone system, such as a PSTN, POTS, PBX, or some other legacy system. Server usage data includes the number of overloaded conferences and the average time for processing audio packets.

42.13.1 Resource Object

Lync_MediationObject

42.13.2 Default Schedule

The default interval for this script is five minutes.

42.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Overloaded Conferences	
Event Notification	
Raise event if the number of overloaded conferences exceeds threshold?	Select **Yes** to raise an event if the number of overloaded conferences exceeds the threshold. The default is Yes.
Threshold - Maximum overloaded conferences	Specify the maximum number of overloaded conferences that can occur before an event is raised. The default is 50.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of overloaded conferences exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of overloaded conferences?	Select **Yes** to collect data about the number of overloaded conferences. The default is Yes.
Monitor Average Audio Packet Processing Time	
Event Notification	
Raise event if the average processing time exceeds threshold?	Select **Yes** to raise an event if the average audio packet processing time exceeds the threshold. The default is Yes.
Threshold - Maximum average time	Specify the highest average processing time that can occur before an event is raised. The default is one second.

Description	How to Set It
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the average time exceeds the threshold. The default is 10.
Data Collection	
Collect data for average time to process audio packets?	Select **Yes** to collect data about the average processing time. The default is Yes.

42.14 SessionCallActivity

Use this Knowledge Script to monitor the session initiation rate of a Lync server. These sessions can include the following types: instant message (IM), file transfer, remote assistance, application sharing, audio, video, or telephony sessions.

This script gets session initiation data from the SessionDetails and Media Tables of the `LcsCDR` back-end database of the Lync Monitoring server. This script reports the number of sessions initiated per minute between two consecutive job iterations.

NOTE: In Lync, sessions have two users, and conferences contain three or more users.

42.14.1 Resource Object

Lync_ArchivingAndCDRObject

Lync_CDRObject

42.14.2 Default Schedule

The default interval for this script is five minutes.

42.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor IM Sessions	
Event Notification	
Raise event if number of IM sessions exceeds threshold?	Select **Yes** to raise an event if the number of IM sessions exceeds the threshold. The default is Yes.
Threshold - Maximum number of IM sessions	Specify the maximum number of IM sessions that can occur before an event is raised. The default is 25.
Event severity when number of IM sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of IM sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of IM sessions?	Select **Yes** to collect data about the number of IM sessions. The default is unchecked.
Monitor File Transfer Sessions	

Description	How to Set It
Event Notification	
Raise event if number of file transfer sessions exceeds threshold?	Select **Yes** to raise an event if the number of file transfer sessions exceeds the threshold. The default is Yes.
Threshold - Maximum number of file transfer sessions	Specify the maximum number of file transfer sessions that can occur before an event is raised. The default is 25.
Event severity when number of file transfer sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of file transfer sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of file transfer sessions?	Select **Yes** to collect data about the number of file transfer sessions. The default is unchecked.
Monitor Remote Assistance Sessions	
Event Notification	
Raise event if number of remote assistance sessions exceeds threshold?	Select **Yes** to raise an event if the number of remote assistance sessions exceeds the threshold. The default is Yes.
Threshold - Maximum number of remote assistance sessions	Specify the maximum number of remote assistance sessions that can occur before an event is raised. The default is 25.
Event severity when number of remote assistance sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of remote assistance sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of remote assistance sessions?	Select **Yes** to collect data about the number of remote assistance sessions. The default is Yes.
Monitor Application Sharing Sessions	
Event Notification	
Raise event if number of application sharing sessions exceeds threshold?	Select **Yes** to raise an event if the number of application sharing sessions exceeds the threshold. The default is Yes.
Threshold - Maximum number of application sharing sessions	Specify the maximum number of application sharing sessions that can occur before an event is raised. The default is 25.
Event severity when number of application sharing sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of application sharing sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of application sharing sessions?	Select **Yes** to collect data about the number of application sharing sessions. The default is unchecked.
Monitor Audio Sessions	
Event Notification	
Raise event if number of audio sessions exceeds threshold?	Select **Yes** to raise an event if the number of audio sessions exceeds the threshold. The default is Yes.
Threshold - Maximum number of audio sessions	Specify the maximum number of audio sessions that can occur before an event is raised. The default is 25.

Description	How to Set It
Event severity when number of audio sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of audio sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of audio sessions?	Select **Yes** to collect data about the number of audio sessions. The default is unchecked.
Monitor Video Sessions	
Event Notification	
Raise event if number of video sessions exceeds threshold?	Select **Yes** to raise an event if the number of video sessions exceeds the threshold. The default is Yes.
Threshold - Maximum number of video sessions	Specify the maximum number of video sessions that can occur before an event is raised. The default is 25.
Event severity when number of video sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of video sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of video sessions?	Select **Yes** to collect data about the number of video sessions. The default is Yes.
Monitor Telephony Sessions	
Event Notification	
Raise event if number of telephony sessions exceeds threshold?	Select **Yes** to raise an event if the number of telephony sessions exceeds the threshold. The default is Yes.
Threshold - Maximum telephony sessions	Specify the maximum number of telephony sessions that can occur before an event is raised. The default is 15.
Event severity when number of telephony sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of telephony sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of telephony sessions?	Select **Yes** to collect data about the number of telephony sessions. The default is Yes.
Monitor Meeting Sessions	
Event Notification	
Raise event if number of meeting sessions exceeds threshold?	Select **Yes** to raise an event if the number of meeting sessions exceeds the threshold. The default is Yes.
Threshold - Maximum number of meeting sessions	Specify the maximum number of meeting sessions that can occur before an event is raised. The default is 15.
Event severity when number of meeting sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of meeting sessions exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of meeting sessions?	Select **Yes** to collect data about the number of meeting sessions. The default is Yes.

42.15 SessionCallFailures

Use this Knowledge Script to monitor the session failure metrics of a Lync server. This script queries the Call Detail Record server to find any known session failures. These sessions can include the following types: instant message (IM), file transfer, remote assistance, application sharing, audio, video, or telephony sessions.

NOTE: In Lync, sessions have two users, and conferences contain three or more users.

This script calculates failed sessions from the SessionDetails and Media Tables of the `LcsCDR` back-end database of the Lync Monitoring server. This script reports the number of session failures per minute between two consecutive job iterations.

The SessionCallFailures script considers sessions with the following SIP Status codes as failed:

400, 401, 402, 403, 405, 406, 407, 408, 410, 413, 414, 415, 416, 420, 421, 423, 481, 482, 483, 485, 488, 493, 500, 501, 502, 503, 504, 505, 513, 600, 606

For more information about SIP status codes, see http://tools.ietf.org/html/rfc3261#page-182.

42.15.1 Resource Object

Lync_ArchivingAndCDRObject

Lync_CDRObject

42.15.2 Default Schedule

The default interval for this script is five minutes.

42.15.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Session Failures	
Event Notification	
Raise event if number of session failures exceeds threshold?	Select **Yes** to raise an event if the number of session failures exceeds the threshold. The default is Yes.
Threshold - Maximum session failures	Specify the maximum number of session failures that can occur before an event is raised. The default is 5.

Description	How to Set It
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the number of session failures exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of session failures?	Select **Yes** to collect data about the number of session failures. The default is unchecked.

42.16 SetupSupplementalDB

Use this Knowledge Script to create a Lync supplemental database, including the tables and stored procedures needed to store call quality detail records (CDRs). In addition, this script creates a SQL Server job that removes old records from the supplemental database.

You can also create the Lync supplemental database using the *Set up supplemental database?* parameter in the Discovery_Lync Knowledge Script.

For more information, see .

42.16.1 Resource Object

Lync_MonitoringFolder

42.16.2 Default Schedule

The default interval for this script is three hours.

42.16.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the SetupSupplementalDB job fails. The default is 5.
Raise event if database setup fails?	Select **Yes** to raise an event if creation of the Lync supplemental database fails. The default is unselected.
Event severity when database setup fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Lync supplemental database is not created. The default is 15. It is possible that the supplemental database was not created because of one of the following reasons: • The Discovery job was run with the *Set up supplemental database* parameter selected on a computer other than a front-end pool server • The Discovery job was run on a computer with the *Set up supplemental database* parameter selected on which SQL Server is not installed • The Discovery job was run on a computer with the *Set up supplemental database* parameter selected where Lync supplemental database was already created

Description	How to Set It
Raise event if database setup succeeds?	Select **Yes** to raise an event if creation of the Lync supplemental database is successful. The default is unselected.
Event severity when database setup succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Lync supplemental database is created successfully. The default is 25.
Start pruning job on supplemental database?	Select **Yes** to create a SQL job that deletes data from the supplemental database. The SQL job runs every night. The default is Yes. Data is deleted from the supplemental database based on the value you specify in the *Number of days to keep call detail records* parameter.
Number of days to keep call detail records	Specify the number of days' days' worth of call detail records to keep in the Lync supplemental database. Data older than what you specify is discarded. The default is 7 days. You can specify a maximum of 30 days.
SQL Server Information	
SQL Server \instance name	Specify the SQL Server name where you want to create the new Lync Server supplemental database along with the instance if any. If you specify both the SQL Server instance name for this parameter and the SQL Server database user name in the following parameter, these values must match the values you specified in . If this field is left blank, then the script uses the default SQL server on the agent computer to create the supplemental database in the Lync agent where you run the discovery or the Lync_SetupSupplementalDB script. If the SQL database is not present on the Lync agent, then the script fails to create the database. If you do not specify the instance name, the script creates the database in the default instance.
SQL database user name	Specify the user name for the SQL Server where you want to create the new Lync Server supplemental database. Leave this parameter blank to use Windows authentication instead of SQL authentication.

42.17 SyntheticTransaction

Use this Knowledge Script to monitor the health of the Lync deployment. Each Lync synthetic transaction test is executed on the Lync Front End pool. Lync_SyntheticTransaction reports the test result and latency of the Lync synthetic transaction test, which helps in predicting the end user experience. Before running Lync_SyntheticTansaction, you need to set up and configure the Lync trusted application server. For more information about configuring a trusted application server, see .

To run this Knowledge Script, you should first discover the Lync trusted application server and every Lync FrontEnd pool within the server.

42.17.1 Resource Objects

Lync_PoolFolder

Lync_PoolObject

42.17.2 Default Schedule

The default interval for this script is 1 hour.

42.17.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the SyntheticTransaction job fails. The default is 5.
Lync Test	
Test Instant Messaging	Select **Yes** to run the test for Instant Messaging against the Lync FrontEnd Pool.
Test failure event severity	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Instant Messaging test fails. The default is 5.
Instant Messaging Latency	
Raise event when latency exceeds the threshold	Select **Yes** to raise an event when the latency of Instant Messaging exceeds the threshold. This option is selected by default.
Latency threshold	Specify the threshold in milliseconds for the latency of Instant Messaging. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the latency of Instant Messaging exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for Instant Messaging latency.
Test Group Instant Messaging	Select **Yes** to run the test for Group Instant Messaging against your Lync Pool.

Description	How to Set It
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the test for Group Instant Messaging fails. The default is 5.
Group Instant Messaging Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of Group Instant Messaging exceeds the threshold. This option is selected by default.
Latency threshold	Specify the threshold in milliseconds for the latency of Group Instant Messaging test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Group Instant Messaging latency exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the latency of Group Instant Messaging.
Test Peer-To-Peer Audio/Video	Select **Yes** to run the test for Peer-To-Peer Audio/Video against your Lync Pool.
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Peer-To-Peer Audio/Video test fails. The default is 5.
Peer-To-Peer Audio/Video Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the Peer-To-Peer Audio/Video latency exceeds the threshold. This option is selected by default.
Latency threshold	Specify the threshold in milliseconds for the latency of Peer-To-Peer Audio/Video test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Peer-To-Peer Audio/Video latency exceeds the threshold. The default is 10.
Collect data for latency	Select this option to collect the data stream for the latency of Peer-To-Peer Audio/Video.
Test Audio Video Conference	Select **Yes** to run the test for Audio/Video Conference against your Lync Pool.
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Audio Video Conference test fails. The default is 5.
Audio/Video Conference Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of audio/video conference call exceeds the threshold. This option is selected by default.
Latency threshold	Specify the threshold in milliseconds for the latency of the Audio/Video Conference test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when latency of audio/video conference call exceeds the threshold.
Collect data for latency	Select **Yes** to collect the data stream for the latency of audio/video conference call.
Test Presence	Select **Yes** to run the test for Presence against your Lync Pool.
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the test for Presence fails. The default is 5.

Description	How to Set It
Presence Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of Presence exceeds the threshold. This option is selected by default.
Latency threshold	Specify threshold in milliseconds for the latency of Presence test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Presence latency exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the Presence latency.
Test Registration	Select **Yes** to run the test for Registration against your Lync Pool.
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Registration test fails. The default is 5.
Registration Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of Registration exceeds the threshold. This option is selected by default
Latency threshold	Specify the threshold in milliseconds for the latency of Registration test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the latency of Registration exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the Registration latency.
Test Address Book Service	Select **Yes** to run the test for the Address Book service against your Lync Pool.
Test failure event severity	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the test for Address Book service fails. The default is 5.
Address Book Service Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of Address Book service exceeds the threshold. This option is selected by default.
Latency threshold	Specify the threshold in milliseconds for the latency of the Address Book Service test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the latency of Address Book service exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the latency of the Address Book service.
Test Address Book Web Query	Select **Yes** to run the test for Address Book Web Query against your Lync Pool.
Event severity when test fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the Address Book Web Query test fails. The default is 5.
Address Book Web Query Latency	
Raise event if latency exceeds the threshold	Select **Yes** to raise an event when the latency of Address Book Web Query exceeds the threshold. This option is selected by default.

Description	How to Set It
Latency threshold	Specify threshold in milliseconds for the latency of Address Book Web Query test. The default is 1000.
Event severity when latency exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the latency of Address Book Web Query exceeds the threshold. The default is 10.
Collect data for latency	Select **Yes** to collect the data stream for the latency of Address Book Web Query.

42.18 SystemUptime

Use this Knowledge Script to monitor the length of time a server has been up and running since a reboot. This script generates a data stream for system uptime (hours) and raises an event if the Lync server is rebooted.

42.18.1 Resource Object

Lync

42.18.2 Default Schedule

The default interval for this script is five minutes.

42.18.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Raise event if system reboot detected?	Select **Yes** to raise an event if the system has rebooted. The default is Yes.
Event severity when system reboot detected	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the system has rebooted. The default is 10.
Monitor System Uptime	
Data Collection	
Collect data for system uptime?	Select **Yes** to collect data about system uptime, in hours. The default is Yes.

42.19 SystemUsage

Use this Knowledge Script to monitor the total CPU and memory usage of a Lync server, and to monitor the contributions of each Lync service to this usage. This script generates data streams for total CPU and memory usage for a Lync server (%) and for total CPU and memory usage by a service (%). It raises an event if a threshold set for these values is exceeded.

42.19.1 Resource Object

Lync_ServicesObject

Lync_ServicesFolder

42.19.2 Default Schedule

The default interval for this script is five minutes.

42.19.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 5.
Monitor Service CPU Usage	
Event Notification	
Raise event if total CPU usage for a service exceeds threshold?	Select **Yes** to raise an event if the percentage of total CPU usage for the service exceeds the threshold. The default is Yes.
Threshold - Maximum service CPU usage	Specify the maximum percentage of the CPU that can be used by the service before an event is raised. The default is 65%.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the maximum CPU usage for the service exceeds the threshold. The default is 15.
Data Collection	
Collect data for service CPU usage?	Select **Yes** to collect data about CPU usage for the service. The default is Yes.
Monitor Total CPU Usage	
Event Notification	
Raise event if total CPU usage exceeds threshold?	Select **Yes** to raise an event if the percentage of total CPU usage exceeds the threshold. The default is unchecked.

Description	How to Set It
Threshold - Maximum total CPU usage	Specify the maximum percentage of the total CPU that can be used before an event is raised. The default is 80%.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the maximum CPU usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for total CPU usage?	Select **Yes** to collect data about total CPU usage. The default is unchecked.
Monitor Service Memory Usage	
Event Notification	
Raise event if total memory usage by a service exceeds threshold?	Select **Yes** to raise an event if the percentage of total memory usage by the service exceeds the threshold. The default is Yes.
Threshold - Maximum service memory usage	Specify the maximum percentage of memory used by the service that can be used before an event is raised. The default is 65%.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the maximum memory used by a the service exceeds the threshold. The default is 15.
Data Collection	
Collect data for service memory usage?	Select **Yes** to collect data about total memory usage for the service. The default is Yes.
Monitor Total Memory Usage	
Event Notification	
Raise event if total memory usage exceeds threshold?	Select **Yes** to raise an event if the percentage of total memory usage exceeds the threshold. The default is Yes.
Threshold - Maximum total memory usage	Specify the maximum percentage of the total memory that can be used before an event is raised. The default is 80%.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the maximum total memory usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for total memory usage?	Select **Yes** to collect data about total memory usage. The default is Yes.

43 Module Builder Knowledge Scripts

As the AppManager expert, you work with the custom AppManager Knowledge Scripts created by the subject matter expert with the Module Builder Editor. These scripts allow you to monitor the processes, services, performance counters, event log events, and log files that are critical to the performance of the managed application.

Before you can run the Knowledge Scripts for your new module, install the Module Builder managed object, and then generate the custom Knowledge Scripts. For more information, see "Generating Knowledge Scripts for a New Module" on page 2634.

A separate Module Builder Knowledge Script group exists for each module you generated with the Module Builder Editor. For more information, see "Working with Module Builder Knowledge Scripts" on page 2636.

Depending on the settings you and the subject matter expert specified in the Module Builder Editor, Module Builder creates one or more of the following Knowledge Scripts:

Knowledge Script	What It Does
EventLogCheck	Monitors a set of event log events for the application.
LogFileCheck	Monitors a set of log files for the application.
PerformanceMetrics	Monitors the status of the performance counters selected for the application.
ProcessHealthCheck	Monitors the health and status of processes selected for the application.
ServiceHealthCheck	Monitors the health and status of services related to the application.

NOTE: To view generic Help for Module Builder Knowledge Scripts, click **Help > Help Topics**, and then go to the Knowledge Script Reference folder on the Contents tab and select the **Module Builder Knowledge Scripts** folder.

43.1 Generating Knowledge Scripts for a New Module

As the AppManager expert, your responsibilities begin when you receive the `.mob` file created with the Module Builder Editor by the subject matter expert. Install the ModuleBuilder managed object files on each agent, console, and repository computer.

After reviewing the `.mob` file in the Module Builder Editor and making any changes needed to the settings and conditions, use the `.mob` file to generate the new module and its Knowledge Scripts.

The generation process also creates an application monitoring contract, a PDF file that describes the Windows components and settings specified by the subject matter expert in the Module Builder Editor. The Knowledge Scripts and the contract can only be generated if all the relevant settings are complete, with no required settings left as *I don't know* and no required severity levels left undefined.

You need Adobe Acrobat Reader or another PDF reader application to read the PDF file, which uses the following naming convention: `ModuleBuilder-[ApplicationName]_Agreement.pdf`.

NOTE:

- You do not need to open the `.mob` file on the same computer used by the subject matter expert when the `.mob` file was created.
- Data gathered on the subject matter expert's computer is displayed in the Module Builder Editor, but no data is gathered from your computer while you are in AppManager Expert mode.

To generate scripts for a new module:

1. Double-click the `.mob` file to open the Module Builder Editor.
2. If the Module Builder Editor does not open in AppManager Expert mode, click **Show AppManager Expert Mode**.
3. Review the contents of the `.mob` file by clicking **Configure** for each component on the Review Results and Add Details pane of the Interview Summary window.
4. Where needed, update the `.mob` file if information is incorrect or missing, including places where the subject matter expert left an option set to *I don't know*. Send the file back to the subject matter expert for more information, if needed.
5. In the Generate AppManager Module pane of the Interview Summary window, click **Generate**.
6. ***If you want to change the default severity settings for all generated Knowledge Scripts***, edit the four severity levels as needed. The smaller the number, the higher the importance in AppManager.
7. ***If you want to view a list of changes made to this file***, click **View Change History**. Edits made by the subject matter expert are listed under the *changes by SME* section of the `.txt` file, while edits by the AppManager expert are listed under *changes by AME*.
8. Click **Generate Module** and select the folder where you want to place the generated scripts and the monitoring contract.

   NOTE: If you are generating a module for an application you previously used with the Module Builder Editor, the Module Builder Editor will overwrite any existing Knowledge Scripts in the default folder. If you do not want to overwrite existing scripts, navigate to a different folder or click **Make New Folder.**

9. Click **OK** to close the Module Generation Complete dialog box.

   TIP: If the generation process generated any errors and you want to copy the error information into another application, press **Ctrl** while you select the errors, and then press **Ctrl+C**.

10. Click **Finish**.
11. Copy the folder containing the newly generated scripts from the `\Module Builder Projects\` folder onto a shared drive or a removable drive, or email the folder and its contents to the console computer where AppManager is installed. If you are running the Module Builder Editor and AppManager on the same computer, you can skip this step.
12. On the console computer where AppManager is installed, paste the new Module Builder folder and its contents into the `\NetIQ\AppManager\qdb\kp` folder.
13. In AppManager, check in the Knowledge Scripts. For more information about checking in scripts, see the user guides for Operator Console or Control Center.
14. At this point, the Module Builder custom module functions just like any other AppManager module. You can add computers to monitor and run the discovery process as needed.

NOTE: If the subject matter expert makes any changes to the module settings in the ModuleBuilder Editor, launch the Module Builder Editor and generate the scripts again using the above process. Check in the new or updated Knowledge Scripts, run the discovery process again, and update any existing jobs as well.

43.2 Working with Module Builder Knowledge Scripts

The `Discovery_ModuleBuilder-[`*ApplicationName*`]` appears in the Discovery Knowledge Script group, where `[`*ApplicationName*`]` is the application name given by the subject matter expert in the Select Application process of the Module Builder Editor.

The names for custom Knowledge Scripts created with the Module Builder Editor are structured like this: `ModuleBuilder-[`*ApplicationName*`]_[`*ScriptName*`]`, where `[`*ScriptName*`]` is the name of the specific Knowledge Script.

The name for a Module Builder Discovery Knowledge Script is structured like this: `Discovery_ModuleBuilder-[`*ApplicationName*`].`

The names of the objects in the TreeView are structured like this: `ModuleBuilder-[ApplicationName]:[`*ComputerName*`]`, where `[`*ComputerName*`]` is the name of the computer on which the Module Builder Editor was run.

NOTE:

- When deploying a Module Builder Knowledge Script on one or more computers that have more than one unique Module Builder application, the script automatically associates all Module Builder application objects, not just the objects based on the script. When deploying a Module Builder script in this scenario, use the Objects tab to unselect Module Builder applications that are not applicable.
- For monitoring policies, AppManager automatically creates jobs without control over the object matching, which could lead to failure events, such as job type mismatches.
- For rule-based management groups, you cannot use the Compare Object with Name object rule because of the way in which Module Builder objects are named. The unique portion of the object name will be to the right of the colon. As a result, you must instead use a rule-based management group, such as Match Detail.

43.3 Revising an Existing Module Builder Custom Module

As the AppManager expert, you can revise the settings or Windows components selected in the Module Builder Editor if those settings are not sufficient or accurate. You can also revise the custom module when you upgrade to a newer release of the managed application.

When a subject matter expert or an AppManager expert updates a module and the AppManager expert regenerates the resulting Knowledge Scripts, the new scripts must be checked in, a new discovery must occur, and any existing jobs should be updated.

To revise an existing module:

1. Decide if you want to create a new Module Builder custom module with its own set of Knowledge Scripts and object tree in the TreeView, or if you want to use the existing application and preserve currently running jobs and existing data streams.
2. ***If you want to create a new custom module with its own set of Knowledge Scripts***, complete the following steps:
   (a) Use the Module Builder Editor to specify the application and the application components to monitor.
   (b) Generate the new Knowledge Scripts.
   (c) In AppManager, stop and existing jobs running with the old version of the module.
   (d) Check in the new scripts.
   (e) Run discovery and deploy new jobs.
3. ***If you want to use the existing Knowledge Scripts***, complete the following steps:
   (a) Use the Module Builder Editor to update the existing `.mob` file or simply create a new `.mob` file with the same application name as the old version.
   (b) Generate the new Knowledge Scripts.
   (c) In AppManager, check in the new scripts.

   NOTE: When you revise an existing .mob file, if you change the Application name field on the Discover Application Properties dialog box for the Select Application to Manage process, you get a new object tree and a new set of Knowledge Scripts.
4. For jobs that are currently running with the previous version of the module, you need to propagate the updated Knowledge Scripts. For more information, see the "Running Monitoring Jobs" chapter of the *AppManager Operator Console User Guide*.

43.4 Using the Browse Button to Set Parameters

Some Knowledge Script parameters can only be set by clicking the **Browse (...)** button in the Value column. Clicking **Browse (...)** launches a dialog box that lists each item individually. The dialog box allows you to edit the parameter-specific settings for each item or items to be monitored. This option is also called the Knowledge Script parameter extension.

If you want to override the settings created by the subject matter expert with the Module Builder Editor, you can change the values in the Browse dialog box as needed.

Depending on the Knowledge Script parameter, you will encounter one of the following sets of options in the resulting dialog box:

- If you want to raise an event if a certain condition is met, select **Yes** in the Raise Event? column for each item in the list you want to update. Select **No** if you do not want to raise an event.
- If you want to change the default severity level, type a new severity level number in the Severity column for each item in the list you want to update.
- If you want to edit the threshold amounts or units for a process, type a new number in the Threshold column or select an option from the Unit column for each item in the list you want to update.
- If you want to edit the threshold amounts for a performance counter, specify the new amounts for each item in the list you want to update. The Unit and Scale values are listed in the dialog box, but you cannot edit these parameters.

TIP: When relevant, click **Apply default to All** to change all parameters to the value set in the Default row. The default setting for each object is determined by the settings selected by the subject matter expert in the Module Builder Editor.

43.5 EventLogCheck

This automatically generated Knowledge Script monitors a set of event log events for the application, based on the criteria set up in the Module Builder Editor. With this Knowledge Script you can track Windows event log entries that match a filtering criterion.

You can set AppManager to send an event or alert if the specified text or conditions appear in an event log, and then collect data on those events.

NOTE:

- The EventLogCheck script uses the local repository on the agent computer to store the last scanned information. As a result, locally stored data for a job persists unless you remove it from the agent. If you stop an existing EventLogCheck job and then restart it later, you might not receive an event, and your data stream value might be set to zero. EventLogCheck only looks for new entries based on the last time the log file was analyzed. Because the job was an existing job, the last scan time was saved on the agent computer being monitored. When the job was restarted, the last scan time was used as the starting point.
- If you change the Scan back parameter for an active running EventLogCheck job, you might not get an event and your data stream value could be set to zero. By default EventLogCheck will only look for new entries based upon the last time the event log was analyzed. Because the job was an existing job, the last scan time was saved on the agent computer being monitored. When the job was restarted, the last scan time was used as the starting point.

43.5.1 Resource Object

Event Log object

43.5.2 Default Schedule

The default interval for this script is every 30 minutes.

43.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Log	
Scan back event log N hours on first iteration	Set this parameter to control checking for the first interval (after which checking is incremental): • **-1** for all the existing entries • **N** for the past n hours (8 for the past 8 hours, 50 for the past 50 hours, etc.) • **0** for no previous entries (only search from this moment on) The default is 0. **NOTE:** This parameter value is only used on the first iteration of the job. If you stop the job and then start it again, this parameter will not be considered.

Description	How to Set It
Threshold: Maximum number of matching entries	Click **Browse (...)** and specify the threshold for the number of matching entries for each event log. The default is 1.
Maximum number of entries per event report	Specify the maximum number of entries to be recorded in each event's detail message. If the Knowledge Script finds more entries from the log than can be put into one event message, it will return multiple events to report all the outstanding entries in the log. The default is 30 entries.
Data Collection	
Collect data for event log?	Click **Browse (...)** and select **Yes** for each event for which you want to collect data. If enabled, data collection returns the number of matches found during the monitoring period.The default is No.
Maximum number of entries in data detail	Specify the maximum number of event log entries you want to list in the data detail. The data stream value will have the total count, but this parameter will limit the number of matches that are listed in the data detail. The default is 100 entries.
Event log data stream legend	Edit the name of the legend for the event log data stream. The default text is: "Event [EVENT_DESCRIPTION]". [EVENT_DESCRIPTION] will be substituted with the event filter description specified in the Module Builder Editor.
Event Notification	
Event Found in Event Log	
Raise event if entry is found in event log?	Click **Browse (...)** and select **Yes** for each event for which you want to raise an AppManager event when an event condition is met. The default is based on the options selected in the Module Builder Editor.
Event severity when entry is found in event log	Click **Browse (...)** and specify the event severity for each event in which an entry is found in the event log. The default severity level is based on the options selected in the Module Builder Editor.
Event message when entry is found in event log	Edit the event message text used when an entry is found in the event log. The default text is: "Event [EVENT_DESCRIPTION] was found in the [EVENT_LOG] event log". [EVENT_DESCRIPTION] will be substituted with the event filter description specified in the Module Builder Editor, and [EVENT_LOG] will be substituted with the Windows Event Log associated with the event filter (such as Application, System, or Security).
Additional Settings	
Event Details	
Event detail format	Specify how you want the event detail information formatted. Your options include: • **HTML Table**: Displays the information in an HTML-formatted table. • **Plain Text**: Displays the information in a table that uses plain text. The default is HTML Table.
Job Timeout	
Elapsed time for job timeout	Specify the length of system inactivity that designates a job timeout. The default is 30 minutes.
Event severity when job timeout occurs	Specify the event severity, between 1 and 40, to indicate the importance of an event raised when a job timeout occurs. The default is 10.

Description	How to Set It
Event message when job timeout occurs	Edit the text of the job timeout message. The default text is: “Job timeout”.
Job Failure Event Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 10.

43.6 LogFileCheck

This automatically generated Knowledge Script monitors a set of text log files for the application, based on the criteria set up in the Module Builder Editor.

You can use this Knowledge Script to raise AppManager events or notifications for the following situations:

- If a log file is found
- If a log file is not found
- If a specified string is found in a log file

LogFileCheck can also collect data for a specified log file after the log file has been found.

NOTE:

- The LogFileCheck script uses the local repository on the agent computer to store the last scanned information. As a result, locally stored data for a job persists unless you remove the data from the agent. If you stop the LogFileCheck job, and then start it again later, the monitoring continues from where it left off.
- If you stop a LogFileCheck job and then restart it later, you might not receive an event, and your data stream value might be set to zero. LogFileCheck only looks for new entries based on the last time the log file was analyzed. Because the job was an existing job, the last scan time was saved on the agent computer being monitored. When the job was restarted, the last scan time was used at the starting point.

43.6.1 Resource Object

Log Files object

43.6.2 Default Schedule

The default interval for this script is every hour.

43.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Log File Found	
Data Collection	
Collect data for log file found?	Click **Browse (...)** and select **Yes** for all log files for which you want to collect data. If enabled, data collection returns the following: • 0 - the log file is not found • 100 - the log file is found. The default is No.

Description	How to Set It
Log file found data stream legend	Edit the name of the legend for the log file found data stream. The default text is: “Log File [OBJECT]”. [OBJECT] will be substituted with the name of the log file.
Event Notification	
Log File Found	
Raise event if log file found?	Click **Browse (...)** and select **Yes** for the log files for which you want to raise an event if the log file is found. The default is based on the options selected in the Module Builder Editor.
Event severity when log file is found	Click **Browse (...)** and set the event severity for when a log file is found. The default severity level is based on the options selected in the Module Builder Editor.
Event message when log file is found	Edit the event message text used when a log file is found. The default text is: “Log File [OBJECT] was found”. [OBJECT] will be substituted with the name of the log file.
Log File Not Found	
Raise event if log file is not found?	Click **Browse (...)** and select **Yes** for all the log files for which you want to raise an event if the log file is not found. The default is based on the options selected in the Module Builder Editor.
Event severity when log file is not found	Click **Browse (...)** and set the event severity for when a log file is not found. The default severity level is based on the options selected in the Module Builder Editor.
Event message when log file is not found	Edit the event message text used when a log file is not found. The default text is: “Log File [OBJECT] was not found” [OBJECT] will be substituted with the name of the log file.
String Found in Log File	
Scan entire file or files on first iteration?	Click **Browse (...)** and select **Yes** for all the log files you want Module Builder to completely scan the first time you run the this Knowledge Script. If you have a large number of log files to scan, you might want to select No to avoid any potential performance issues on the first iteration. The default is No.
Rescan updated files?	Click **Browse (...)** and select **Yes** for the log files you want to completely rescan. When set to No, each monitored log file that changes during the monitoring interval will be scanned for new entries from the last scan position. When set to Yes, the *entire* file will be rescanned for matching entries when the file changes. The default is No.
Display additional log file text with data and event?	Click **Browse (...)** and select **Yes** for all the log files for which you want to display additional log file text with data and event. The additional log file text could be the entire line of log file data that includes the search string, the rest of the line, or the surrounding characters. This option is specified in the Module Builder Editor.
Data Collection	
Collect data for string found in log file?	Click **Browse (...)** and select **Yes** for all the log files for which you want to collect data for when Module Builder finds that log file. The default is No.

Description	How to Set It
Maximum number of entries in data detail	Specify the maximum number of log files you want to list in the data detail. The data stream value will have the total count, but this parameter will limit the number of matches that are listed in the data detail. The default is 100.
String found in log file data stream legend	Edit the name of the legend for the data stream created when Module Builder finds a log file with the specified text string. The default text for the legend is: "String [SEARCH_STRING] [CASE_SENSITIVE] [REGULAR_EXPRESSION] in log file [OBJECT]". [SEARCH_STRING] will be substituted by the search word or words specified in the Module Builder Editor. If the *Match Case* option in the Module Builder Editor was checked, [CASE_SENSITIVE] will be replaced by "Case Sensitive" in the legend. If the *Use Regular Expression* option in Module Builder is checked, [REGULAR_EXPRESSION] will be replaced by "Uses Regular Expression" in the legend. [OBJECT] will be substituted with the name of the log file.
Event Notification	
Raise event if string is found?	Click **Browse (...)** and select **Yes** for all the log files for which you want to raise an event if the search string is found. The default setting is based on the options selected in the Module Builder Editor.
Maximum number of entries in event detail	Specify the maximum number of log files you want to list in the event detail. The data stream value will have the total count, but this parameter will limit the number of matches that are listed in the event detail. The default is 100. **NOTE:** The matches are listed from newest to oldest.
Event message when string is found	Edit the event message text used when the search string is found. The default text for the legend is: "New [SEARCH_STRING] [CASE_SENSITIVE] [REGULAR_EXPRESSION] entry was found in log file [OBJECT]". [SEARCH_STRING] will be substituted by the search word or words specified in the Module Builder Editor. If the *Match Case* option in the Module Builder Editor was checked, [CASE_SENSITIVE] will be replaced by "Case Sensitive" in the legend. If the *Use Regular Expression* option in Module Builder is checked, [REGULAR_EXPRESSION] will be replaced by "Uses Regular Expression" in the legend. [OBJECT] will be substituted with the name of the log file.
Additional Settings	
Event Details	
Event detail format	Specify how you want the event detail information formatted. Your options are: • **HTML Table**: Displays the information in an HTML-formatted table. • **Plain Text**: Displays the information in a table that uses plain text. The default is HTML Table.
Job Timeout	
Elapsed time for job timeout	Specify the length of system inactivity that designates a job timeout. The default is 30 minutes.
Event severity when job timeout occurs	Specify the event severity for when a job timeout occurs. The default is 10.
Event message when job timeout occurs	Edit the text of the job timeout message. The default text is: "Job timeout".
Job Failure Event Notification	

Description	How to Set It
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 10.

43.7 PerformanceMetrics

This automatically generated Knowledge Script monitors a set of performance counters for the application, based on the criteria set up in the Module Builder Editor.

You can use this Knowledge Script to raise AppManager events for the following situations:

- If the specified counter exceeds a threshold
- If the specified counter falls below a threshold

PerformanceMetrics can also collect data for the specified performance counter.

TIP: To create a dynamic view based on the name of a performance counter that has special characters such as \ or % in its name, use the wildcard symbol * in place of the special character.

43.7.1 Resource Object

Performance Counters object

43.7.2 Default Schedule

The default interval for this script is five minutes.

43.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Performance Counter	
Data Collection	
Collect data for performance counter?	Click **Browse (...)** and select **Yes** for the performance counters for which you want to collect counter value data, modified by the Scale value selected in the Module Builder Editor, where relevant. The default is No.
Performance counter data stream legend	Edit the name of the legend for the performance counter data stream. The default text is: “Performance counter [PERFORMANCE_COUNTER]”. [PERFORMANCE_COUNTER] will be substituted with the name of the performance counter.
Event Notification	
Counter Exceeds Threshold	
Raise event if counter exceeds threshold?	Click **Browse (...)** and select **Yes** for all the performance counters for which you want to raise an event if the threshold is exceeded. The default setting is based on the options selected in the Module Builder Editor.
Threshold: Maximum performance counter value	Click **Browse (...)** and edit the threshold amount for the selected performance counters. The default threshold is based on the options selected in the Module Builder Editor.

Description	How to Set It
Event severity when counter exceeds threshold	Click **Browse (...)** and edit the severity level for when a selected performance counter exceeds the threshold. The default severity level is based on the options selected in the Module Builder Editor.
Event message when counter exceeds threshold	Edit the name of the legend for the performance counter data stream for when the counter exceeds the threshold. The default text is: “Performance Counter [PERFORMANCE_COUNTER] exceeds threshold”. [PERFORMANCE_COUNTER] will be substituted with the name of the performance counter.
Counter Below Threshold	
Raise event if counter falls below threshold?	Click **Browse (...)** and select **Yes** for all the performance counters for which you want to raise an event if the counter falls below the threshold. The default setting is based on the options selected in the Module Builder Editor.
Threshold: Minimum performance counter value	Click **Browse (...)** and edit the threshold amount as needed for the selected performance counters. The default threshold is based on the options selected in the Module Builder Editor.
Event severity when counter falls below threshold	Click **Browse (...)** and edit the severity level for when a selected performance counter falls below the threshold. The default severity level is based on the options selected in the Module Builder Editor.
Event message when counter falls below threshold	Edit the name of the legend for the performance counter data stream for when the counter falls below the lower threshold. The default text is: “Performance Counter [PERFORMANCE_COUNTER] falls below threshold”. [PERFORMANCE_COUNTER] will be substituted with the name of the performance counter.
Additional Settings	
Event Details	
Event detail format	Specify how you want the event detail information formatted. Your options include: • **HTML Table**: Displays the information in an HTML-formatted table. • **Plain Text**: Displays the information in a table that uses plain text. The default is HTML Table.
Job Timeout	
Elapsed time for job timeout	Specify the length of system inactivity that designates a job timeout. The default is 5 minutes.
Event severity when job timeout occurs	Specify the event severity for when a job timeout occurs. The default is 10.
Event message when job timeout occurs	Edit the text of the job timeout message. The default text is: “Job timeout”.
Job Failure Event Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 10.

43.8 ProcessHealthCheck

This automatically generated Knowledge Script monitors the status, memory usage, and CPU usage of selected processes for your application, based on the type of information gathered in the Module Builder Editor.

You can use this Knowledge Script to raise AppManager events for the following situations:

- If the process is running, not running, no longer running, or recently started
- If the process exceeds a certain level of physical memory usage
- If the process exceeds a certain level of CPU usage

ProcessHealthCheck can also collect data for the process state, for CPU usage for the process, and for memory utilization for the process.

43.8.1 Resource Object

Processes object or Processes folder

43.8.2 Default Schedule

The default interval for this script is every five minutes.

43.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Process State	
Data Collection	
Collect data for the state of the process?	Click **Browse (...)** and select **Yes** for each process for which you want to gather process state data. The default is No.
Process state data stream legend	Edit the name of the legend for the process state data stream. The default text is: “Process [OBJECT]”. [OBJECT] will be substituted with the name of the process.
Event Notification	
Process Not Running	
Raise event if process not running?	Click **Browse (...)** and select **Yes** for each process for which you want to raise an event if that process is not running. The default setting is based on the options selected in the Module Builder Editor.
Event severity when process is not running	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised if a process is not running. The default severity level is based on the options selected in the Module Builder Editor.

Description	How to Set It
Event message when process is not running	Edit the existing message that displays when the job times out. The default text is: “Process [OBJECT] is not running”. [OBJECT] will be substituted with the name of the process.
Process Running	
Raise event if process is running?	Click **Browse (...)** and select **Yes** for each process for which you want to raise an event if that process is running. The default setting is based on the options selected in the Module Builder Editor.
Event severity when process is running	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the process is running. The default severity level is based on the options selected in the Module Builder Editor.
Event message when process is running	Edit the event message text that displays when the process is running. The default text is: “Process [OBJECT] is running”. [OBJECT] will be substituted with the name of the process.
Process No Longer Running	
Raise event if process is no longer running?	Click **Browse (...)** and select **Yes** for each process for which you want to raise an event if that process has stopped running since the last script iteration. The default setting is based on the options selected in the Module Builder Editor.
Event severity when process is no longer running	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the process is no longer running. The default severity level is based on the options selected in the Module Builder Editor.
Event message when process is no longer running	Edit the event message text that displays when the process is no longer running. The default text is: “Process [OBJECT] is no longer running”. [OBJECT] will be substituted with the name of the process.
Process Recently Started	
Raise event if process was recently started?	Click **Browse (...)** and select **Yes** for each process for which you want to raise an event if that process was started since the last iteration of this script. The default setting is based on the options selected in the Module Builder Editor.
Event severity when process was recently started	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the process was recently started. The default severity level is based on the options selected in the Module Builder Editor.
Event message when process was recently started	Edit the event message text that displays when the process has recently started. The default text is: “Process [OBJECT] was recently started”. [OBJECT] will be substituted with the name of the process.
Monitor CPU Usage?	Select **Yes** to monitor the amount of CPU the process uses. The default is based on the options selected in the Module Builder Editor.
CPU usage threshold	Click **Browse (...)** and specify the level of CPU usage for each process that will raise an event. The default threshold setting is based on the options selected in the Module Builder Editor.
Data Collection	
Collect data for CPU usage?	Click **Browse (...)** and select **Yes** for each process for which you want to gather CPU usage data. The default is No.

Description	How to Set It
CPU usage data stream legend	Edit the name of the legend for the CPU usage data stream. The default text is: “Process [OBJECT] CPU usage”. [OBJECT] will be substituted with the name of the process.
Data Collection for Additional Process Instances	
Collect data for all instances of this process, or for each individual instance?	Select the instances for which you want to collect data: • **All**: Combined; collect data on all processes and generate a single data stream for each process, regardless of how many instances of that process are running. Each instance will be listed in the detail. • **Individual**: Collect data on all instances of a process individually and display data in individual data streams. • **Both**: Collect data on all instances of a process as well as each process, and generate data streams for each instance, each process, and all instances in each process combined. The default is All.
Data stream legend for CPU usage for individual instances of a process	Edit the name of the legend for the CPU usage data stream for individual instances of a process. The default text is: “Process [OBJECT]-[PID] CPU usage”. [OBJECT] will be substituted with the name of the process, and [PID] stands for the Process ID for each instance.
Event Notification	
Raise event if CPU usage exceeds threshold?	Click **Browse (...)** and select **Yes** for each process for which you want to raise an event if the CPU usage exceeds threshold. The default setting is based on the options selected in the Module Builder Editor.
Event severity when CPU usage exceeds threshold	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the CPU usage exceeds the threshold. The default severity level is based on the options selected in the Module Builder Editor.
Event message when CPU usage exceeds threshold	Edit the event message text that displays when the CPU usage exceeds the stated threshold. The default text is: “Process [OBJECT] CPU usage above threshold”. [OBJECT] will be substituted with the name of the process, and [PID] stands for the Process ID for each instance.
Notification for Additional Process Instances	
Raise events on individual instances of a process or all at once?	Select the instances for which you want to raise events: • **All**: Single event including all instances if any instance exceeds the threshold. • **Individual**: Individual events for each instance that exceeds the threshold. The default is All.
CPU usage data stream legend for individual instances of a process	Edit the name of the data stream legend for when CPU usage exceeds the threshold for individual instances of a process. The default text is: “Process [OBJECT]-[PID] CPU usage above threshold”. [OBJECT] will be substituted with the name of the process, and [PID] stands for the Process ID for each instance.
Monitor Memory Usage?	Select **Yes** to raise an event if memory usage exceeds the threshold. The default is based on the options selected in the Module Builder Editor

Description	How to Set It
Memory usage threshold	Click **Browse (...)** and specify the level of memory usage for each process that will raise an event. The default is based on the options selected in the Module Builder Editor.
Data Collection	
Collect data for memory usage?	Click **Browse (...)** and select **Yes** for each process for which you want to gather memory usage data. The default is No.
Memory usage data stream legend	Edit the name of the legend for the memory usage data stream. The default text is: “Process [OBJECT] memory usage”. [OBJECT] will be substituted with the name of the process.
Data Collection for Additional Process Instances	
Collect data for all instances of this process, or for each individual instance?	Select the instances for which you want to collect data: • **All**: Collect data on all processes and generate a single data stream for each process, regardless of how many instances of that process are running. Each instance will be listed in the detail. • **Individual**: Collect data on all instances of a process individually and display data in individual data streams. • **Both**: Collect data on all instances of a process as well as each process, and generate data streams for each instance, each process, and all instances in each process combined. The default is All.
Data stream legend for memory usage for individual instances of a process	Edit the name of the legend for the memory usage data stream for individual instances of a process. The default text is:” Process [OBJECT]-[PID] memory usage”. [OBJECT] will be substituted with the name of the process, and [PID] stands for the Process ID for each instance.
Event Notification	
Raise event if memory usage exceeds threshold?	Click **Browse (...)** and select **Yes** for each process for which you want to raise an event if the memory usage exceeds threshold. The default setting is based on the options selected in the Module Builder Editor.
Event severity when memory usage exceeds threshold	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the memory usage exceeds the threshold. The default severity level is based on the options selected in the Module Builder Editor.
Event message when memory usage exceeds threshold	Edit the event message text that displays when memory usage exceeds the threshold. The default text is: “Process [OBJECT] memory usage above threshold”. [OBJECT] will be substituted with the name of the process.
Notification for Additional Process Instances	
Raise events on individual instances of a process or all at once?	Select the instances for which you want to raise events: • **All**: Single event including all instances if any instance exceeds the threshold. • **Individual**: Individual events for each instance that exceeds the threshold. The default is All.

Description	How to Set It
Memory usage data stream legend for each individual instance of a process	Edit the name of the data stream legend for when memory usage exceeds the threshold for individual instances of a process. The default text is: “Process [OBJECT]-[PID] memory usage above threshold”. [OBJECT] will be substituted with the name of the process, and [PID] stands for the Process ID for each instance.
Additional Settings	
Event Details	
Event detail format	Specify how you want the event detail information formatted. Your options include: • **HTML Table**: Displays the information in an HTML-formatted table. • **Plain Text**: Displays the information in a table that uses plain text. The default is HTML Table.
Job Timeout	
Elapsed time for job timeout	Specify the length of system inactivity that designates a job timeout. The default is 5 minutes.
Event severity when job timeout occurs	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job times out. The default is 10.
Event message when job timeout occurs	Edit the existing message that displays when the job times out. The default text is: “Job timeout”.
Job Failure Event Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 10.

43.9 ServiceHealthCheck

This automatically generated Knowledge Script monitors the status of Windows services related to the application, based on the type of information gathered in the Module Builder Editor.

You can use this Knowledge Script to raise AppManager events for the following situations:

- If the service is started
- If the service is disabled or paused
- If the service was not found
- If the service is not running
- If the service is unresponsive or hung
- If the service shut down normally

For some of the above situations, this script can take automated actions on the service, including:

- Starting a service that is not running or that has been shut down normally
- Stopping a service that was started
- Terminating and restarting a service that is hung

ServiceHealthCheck can also collect data for the service status.

43.9.1 Resource Object

Services object

43.9.2 Default Schedule

The default interval for this script is every five minutes.

43.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Service State	
Data Collection	
Collect data for the state of the service?	Click **Browse (...)** and select Yes for each service for which you want to gather service state data. The default is No.
Collect data for dependent services?	Select **Yes** to gather service data for any other services that are affected by a change in the status of the selected service. The default is unselected.
Service state data stream legend	Edit the name of the legend for the service data stream. The default text is "Service [OBJECT]". [OBJECT] will be substituted with the name of the service.

Description	How to Set It
Event Notification	
Service Monitor Settings	
Service Started	
Raise event if service is started?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if that service is started. The default setting is based on the options selected in the Module Builder Editor.
Event severity when service is started	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service is started. The default severity level is based on the options selected in the Module Builder Editor.
Event message when service is started	Edit the event message text that displays when the service is started. The default text is “[OBJECT] Service is started”. [OBJECT] will be substituted with the name of the service.
Service Disabled	
Raise event if service is disabled?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if that service is disabled. The default setting is based on the options selected in the Module Builder Editor.
Event severity when service is disabled	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service is disabled. The default severity level is based on the options selected in the Module Builder Editor.
Event message when service is disabled	Edit the event message text that displays when the service is disabled. The default text is “[OBJECT] Service is disabled”. [OBJECT] will be substituted with the name of the service.
Service Paused	
Raise event if service is paused?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if that service is paused. The default setting is based on the options selected in the Module Builder Editor.
Event severity when service is paused	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service is paused. The default severity level is based on the options selected in the Module Builder Editor.
Event message when service is paused	Edit the event message text that displays when the service is paused. The default text is “[OBJECT] Service is paused”. [OBJECT] will be substituted with the name of the service.
Service Not Found	
Raise event if service is not found?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if that service is not found. The default setting is based on the options selected in the Module Builder Editor.
Event severity when service is not found	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service is not found. The default severity level is based on the options selected in the Module Builder Editor.
Event message when service is not found	Edit the event message text that displays when the service is not found. The default text is “[OBJECT] Service is not found”. [OBJECT] will be substituted with the name of the service.
Service Not Running	

Description	How to Set It
Raise event if service is not running?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if that service is not running. The default setting is based on the options selected in the Module Builder Editor.
Event severity when service is not running	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service is not running. The default severity level is based on the options selected in the Module Builder Editor.
Event message when service is not running	Edit the event message text that displays when the service is not running. The default text is "[OBJECT] Service is not running". [OBJECT] will be substituted with the name of the service.
Service Unresponsive	
Raise event if service is unresponsive or hung?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if that service is unresponsive or hung. The default setting is based on the options selected in the Module Builder Editor.
Number of iterations before considering service is unresponsive	Specify the number of times the script should run without getting a response from the service before the script should consider the service to be unresponsive. The default is two iterations.
Event severity when service is unresponsive	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service is unresponsive. The default severity level is based on the options selected in the Module Builder Editor.
Event message when service is unresponsive	Edit the event message text that displays when the service is unresponsive. The default text is "[OBJECT] Service is unresponsive or hung". [OBJECT] will be substituted with the name of the service.
Service Shut Down Normally	
Raise event if service was shut down normally?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if that service was shut down normally. The default setting is based on the options selected in the Module Builder Editor.
Event severity when service was shut down normally	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service was shut down normally. The default severity level is based on the options selected in the Module Builder Editor.
Event message when service was shut down normally	Edit the event message text that displays when the service was shut down normally. The default text is "[OBJECT] Service was shut down normally". [OBJECT] will be substituted with the name of the service.
Service Action Options	
Service Auto-start	
Auto-start the service if found stopped?	Click **Browse (...)** and select **Yes** for each service you want to start if that service was stopped due to an error.
Auto-start the service if shut down normally?	Click **Browse (...)** and select **Yes** for each service you want to start if that service is shut down normally.
Auto-start dependent services?	Select **Yes** if you want to start any services that are affected by a change in the status of the selected service. The default is unselected.
Auto-start timeout for services?	Specify the length of the time to wait for the service to start before the auto-start option is considered timed out. The default is 30 seconds.

Description	How to Set It
Raise event if auto-start successful?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if that service is started successfully.
Event severity when auto-start successful	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event when a service is started successfully.
Event message when auto-start successful	Edit the event message text that displays when the service is started correctly. The default text is "[OBJECT] Service auto-started successfully". [OBJECT] will be substituted with the name of the service.
Raise event if auto-start failed?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if AppManager could not start the service.
Event severity when auto-start failed	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager could not start the service.
Event message when auto-start failed	Edit the event message text that displays when AppManager could not start the service. The default text is "[OBJECT] Service auto-start failed". [OBJECT] will be substituted with the name of the service.
Raise Event if Auto-start Disabled and Service is Down?	Select **Yes** if you want to raise an event if a service has auto-start disabled and the service is not running, so as a result, the service cannot be restarted. The default is Yes.
Event severity when auto-start disabled and service is stopped	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when a service has auto-start disabled and the service is not running.
Event message when auto-start disabled and service is stopped	Edit the event message text that displays when a service has auto-start disabled and the service is not running. The default text is "[OBJECT] Service stopped and auto-start disabled".
Service Stop	
Stop the service if found started?	Click **Browse (...)** and select **Yes** for each service you want to stop if AppManager finds that the service has started. The default severity level is based on the options selected in the Module Builder Editor.
Stop dependent services?	Select **Yes** to stop any services that are dependent on the service that AppManager found that was started. The default is unselected.
Raise event if stop successful?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if that running service is stopped successfully.
Event severity when stop successful	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the service is stopped successfully.
Event message when stop successful	Edit the event message text that displays when the service is stopped successfully. The default text is "[OBJECT] Service stopped successfully". [OBJECT] will be substituted with the name of the service.
Raise event if stop failed?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if AppManager cannot stop the service. The default is Yes.
Event severity when stop failed	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when AppManager cannot stop the service.
Event message when stop failed	Edit the event message text that displays when AppManager cannot stop the service. The default text is "[OBJECT] Service stop failed". [OBJECT] will be substituted with the name of the service.
Terminate Service	

Description	How to Set It
Terminate if service is unresponsive?	Click **Browse (...)** and select **Yes** for each service you want to stop if AppManager considers the service to be unresponsive. The default setting is based on the options selected in the Module Builder Editor.
Terminate the dependents if service is unresponsive?	Select **Yes** if you want to stop any services that are dependent on the selected service that AppManager considers to be unresponsive. The default is Yes.
Raise event if terminated successfully?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if AppManager stops the unresponsive service.
Event severity when terminate is successful	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when AppManager stops the unresponsive service.
Event message when terminate is successful	Edit the event message text that displays when AppManager stops the unresponsive service. The default text is "[OBJECT] Service terminated successfully". [OBJECT] will be substituted with the name of the service.
Raise event if terminate failed?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if the attempt to terminate that service failed. The default is Yes.
Event severity when terminate failed	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when AppManager cannot stop the service.
Event message when terminate failed	Edit the event message text that displays when AppManager cannot stop the service. The default text is "[OBJECT] Service termination failed". [OBJECT] will be substituted with the name of the service.
Restart Terminated Service?	
Restart the dependents?	Select **Yes** if you want to restart any services dependent on the selected service that AppManager previously terminated. The default is Yes.
Restart timeout for services?	Specify the length of the restart timeout. The default is 30 seconds.
Raise event if service restarted successfully?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if AppManager successfully restarted that service.
Event severity when service restarted successfully	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when AppManager successfully restarted that service.
Event message when service restarted successfully	Edit the event message text that displays when AppManager successfully restarted that service. The default text is "[OBJECT] Service restarted successfully". [OBJECT] will be substituted with the name of the service.
Raise event if service restart failed?	Click **Browse (...)** and select **Yes** for each service for which you want to raise an event if AppManager failed to restart that service. The default is Yes.
Event severity when restart failed	Click **Browse (...)** and set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when AppManager failed to restart that service.
Event message when restart failed	Edit the event message text that displays when AppManager failed to restart that service. The default text is "[OBJECT] Service failed to restart". [OBJECT] will be substituted with the name of the service.
Additional Settings	
Event Details	

Description	How to Set It
Event detail format	Specify how you want the event detail information formatted. Your options include: • **HTML Table**: Displays the information in an HTML-formatted table. • **Plain Text**: Displays the information in a table that uses plain text. The default is HTML Table.
Job Timeout	
Elapsed time for job timeout	Specify the length of system inactivity that designates a job timeout. The default is 5 minutes.
Event severity when job timeout occurs	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job times out. The default is 10.
Event message when job timeout occurs	Edit the existing message that displays when the job times out. The default text is “Job timeout”.
Job Failure Event Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails. The default is 10.

44 MSCS Knowledge Scripts

AppManager provides Knowledge Scripts for monitoring Microsoft Cluster Server. These scripts can monitor shared drives and other shared resources from active nodes.

The Knowledge Scripts in the MSCS category are designed to run on clustered servers. They use the Cluster Administrator API, which enables them to track shared resources better.

Run the MSCS Knowledge Scripts on a server group representing all the nodes in the Microsoft Cluster Server, or on at least two different nodes. By running them on multiple nodes, you covered in case of a failure on one node, such as a computer that disconnects from the network or has a system failure. If you ran all your MSCS Knowledge Scripts on that node, you would receive no events from them.

The ability to monitor resources from active nodes applies to all the Knowledge Scripts in the MSCS category.

AppManager provides the following Knowledge Scripts for monitoring MSCS resources. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
EventLog	Monitors Windows Event Log entries created by the Microsoft Cluster Server (entries that have ClusSvc as their Source in the System Log).
GroupDown	Detects when a cluster resource group is not online. Can attempt to bring that cluster group online automatically.
GroupOwnerChange	Detects whether the owner of a cluster group has changed.
HealthCheck	Checks whether a node, network, resource, group, or a network interface is down. Also checks whether the ownership of a group has changed.
NetInterfaceDown	Checks whether a cluster network interface is down.
NetworkDown	Checks whether a cluster network is down.
NodeDown	Checks whether a cluster node is down.
ResourceDown	Detects when a cluster resource is not online; attempts to bring that cluster resource online automatically.
ResourceOwnerChange	Detects whether the owner of a cluster resource has changed.

44.1 EventLog

Use this Knowledge Script to monitor and filter Microsoft Windows Event Log entries created by the Microsoft Cluster Server (entries that have **ClusSvc** as their Source in the System Log). This script tracks Windows event log entries that match a set of filtering criteria and notifies you when a log entry that meets the filtering criteria is generated during the monitoring interval.

This script works on an incremental basis, meaning it does not fully rescan the event log each time it runs, and all log entries that match the filtering criteria are returned in the event or data point detail message.

44.1.1 Resource Object

Microsoft Cluster Server

In Windows Server 2003 environments, run this script on only one node to avoid duplication of events. Running this script on multiple nodes results in multiple scannings of the same Event Log, which in turn results in duplicate events for the same Event Log entries.

44.1.2 Default Schedule

By default, this script runs every 30 minutes.

44.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if log entries match your search criteria. The default is y. **NOTE:** The format for Event log entries in Windows Server 2008 differs slightly from the format of Event log entries in Windows Server 2003. This difference can affect the information displayed in an event message for events raised on failover clusters. Specifically, for Windows Server 2003, the Description in the event message is an alphabetic value derived from the ResourceName and ResourceGroup fields in the Event log. In Windows Server 2008, the Description may be a numeric value or may be blank, depending on the contents of the ResourceName and ResourceGroup fields.
Collect data?	Set to **y** to collect data for charts and reports. The default is n. If enabled, data collection returns the number of new event log entries, and the detailed message lists the log entries.
Events in past N hours	Set this parameter to control checking for the first interval (after which checking is incremental): • **-1** for all the existing entries • **n** for the past N hours (8 for the past 8 hours, 50 for the past 50 hours, etc.) • **0** for no previous entries (only search from this moment onward)

Description	How to Set It
Monitor for error events?	Set to **y** to monitor the Event Log for error events. The default is y.
Monitor for warning events?	Set to **y** to monitor the Event Log for warning events. The default is y.
Monitor for information events?	Set to **y** to monitor the Event Log for information events. The default is y.
Monitor for success audit events?	Set to **y** to monitor the Event Log for success audit events. The default is y.
Monitor for failure audit events?	Set to **y** to monitor the Event Log for failure audit events. The default is y.
Filter the Event Category field for	To monitor for events in a particular category (for example Server or Logon), enter an appropriate search string. This script looks for matching entries in the Event Log Category field. Multiple strings can be entered separated by commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Filter the Event ID field for	To monitor for particular event IDs, enter an appropriate search string. This script looks for matching entries in the Event Log Event field. Multiple IDs and ranges can be entered separated by commas. For example: 1,2,10-15,202. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Filter the Event User field for	To monitor for events associated with a particular user, enter an appropriate search string. This script looks for matching entries in the Event Log's User field. Multiple strings can be entered separated by commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Filter the Event Computer field for	To monitor for events generated by a particular computer, enter an appropriate search string. This script looks for matching entries in the Event Log Computer field. Multiple strings can be entered separated by commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Filter the Event Description field for	To monitor for events with a particular detail description or containing keywords in the description, enter an appropriate search string. This script looks for matching entries in the Event Log Description field. Multiple strings can be entered separated by commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Maximum number of entries per event report	Specify the maximum number of entries that can be recorded into each event's detail message before an event is raised. If this script finds more entries from the log than can be put into one event report, it raises multiple events to report all the outstanding entries in the log. The default is 30 entries.
Event severity level when log entries match search criteria	Set the event severity level, from 1 to 40, to indicate the importance of an event in which log entries match your search criteria. The default is 8 (red event indicator). You can adjust the severity depending on the log or type of event you are checking.

Description	How to Set It
Event severity level when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the EventLog job fails unexpectedly. The default is 35 (magenta event indicator).

44.2 GroupDown

Use this Knowledge Script to detect whether a cluster resource group is online. This script raises an event if the cluster group is offline. You can set this script to automatically bring the cluster group online.

44.2.1 Resource Object

Microsoft cluster group

44.2.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

44.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if a cluster group is not online or if a cluster-related API failure occurs. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. The default is n. If enabled, data collection returns a value of: • **100** if the cluster resource group is online. • **50** if the group is partially online. • **0** if the cluster group is off-line. • **-1** if the cluster group cannot be found.
Auto-start cluster resource group?	Set to **y** to automatically start the cluster resource group. The default is y.
Event severity level when cluster group offline and auto-start fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster group is offline and auto-start fails. The default is 5 (red event indicator).
Event severity level when cluster group offline and auto-start succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster group is offline and auto-start succeeds. The default is 25 (blue event indicator).
Event severity level when cluster group offline and auto-start is set to n	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster group is offline and you set the Auto-start cluster resource group? parameter to n. The default is 18 (yellow event indicator).
Event severity level when cluster-related API failure occurs	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster-related API failure occurs. The default is 15 (yellow event indicator).

44.3 GroupOwnerChange

Use this Knowledge Script to detect whether the owner of a cluster group has changed. Changes in the ownership of a cluster group typically indicate a failover or failback operation has taken place. This script raises an event if the owner of the cluster group changes or if a cluster-related API failure occurs.

Both the event and data detail message indicate the previous cluster group owner and the new group owner.

44.3.1 Resource Object

Microsoft cluster group

44.3.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

44.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event when cluster group ownership changes or if a cluster-related API failure occurs. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. The default is n. If enabled, data collection returns a value of 0 if the cluster group owner has changed in the interval, or a value of 100 if the cluster group owner has stayed the same. The detail message indicates the previous group owner and the new group owner.
Event severity level when cluster group owner changes	Set the event severity level, from 1 to 40, to indicate the importance of an event in which cluster group ownership has changed. The default is 5 (red event indicator).
Event severity level when cluster-related API failure occurs	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster-related API failure occurs. The default is 15 (yellow event indicator).

44.4 HealthCheck

Use this Knowledge Script to determine whether a Microsoft Windows cluster node, network, resource, group, or network interface is down. This script can also determine whether the ownership of a cluster group has changed.

44.4.1 Resource Objects

Microsoft cluster node, network, resource, group, and network interface object

44.4.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

44.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data Collection	
Collect data?	Select **Yes** to collect data for graphs and charts. The default is Yes.
Monitoring	
Auto-start cluster resource?	Select **Yes** to automatically start a cluster resource that is down. The default is Yes.
Auto-start cluster group?	Select **Yes** to automatically start a cluster group that is down. The default is Yes.
Event Notification	
Raise event if changes occur in a network, resource, or group?	Select **Yes** to raise separate events, one for each component, for changes that occur in Cluster Server components: network, resource, or group. The default is Yes.
Raise a single event?	Select **Yes** to raise one event that summarizes all changes that have occurred in all Cluster Server components: network, resource and group. The default is Yes.
Event severity level when cluster-related API failure occurs	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster-related API failure occurs. The default is 15.
Event severity level when a node is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a node is down. The default is 8.
Network	
Event severity level when network is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the network is down. The default is 8.
Event severity level when network is partitioned	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the network is partitioned. The default is 9.
Event severity level when cluster network interface is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the cluster network interface is down. The default is 8.

Description	How to Set It
Cluster Resources	
Event severity level when cluster resource is off-line and auto-start fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster resource is offline and auto-start fails. The default is 5.
Event severity level when cluster resource is off-line and auto-start is set to 'No'	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster resource is offline and you deselected the Auto-start cluster resource? parameter. The default is 18.
Event severity level when cluster resource is off-line and auto-start is successful	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster resource is offline and auto-start succeeds. The default is 25.
Cluster Group	
Event severity level when cluster group owner changes	Set the event severity level, from 1 to 40, to indicate the importance of an event in which cluster group ownership has changed. The default is 5.
Event severity level when cluster group is off-line and auto-start fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster group is offline and auto-start fails. The default is 5 (red event indicator).
Event severity level when cluster group is off-line and auto-start is set to 'No'	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster group is offline and you deselected the Auto-start cluster group? parameter. The default is 18 (yellow event indicator).
Event severity level when cluster group is off-line and auto-start is successful	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster group is offline and auto-start succeeds. The default is 2 (blue event indicator).

44.5 NetInterfaceDown

Use this Knowledge Script to detect whether a cluster network interface is down. This script raises an event if the network interface is down or a cluster-related API failure occurs.

44.5.1 Resource Object

Microsoft cluster net interface object

44.5.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

44.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if a cluster network interface is down or when a cluster-related API failure occurs. The default is y.
Collect data?	Set to **y** to collect data for charts and reports.The default is n. If enabled, data collection returns a value of 100 if the interface is up and a value of 0 if the interface is down.
Event severity level when cluster network interface down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster network interface is down. The default is 8 (red event indicator).
Event severity level when cluster-related API failure occurs	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster-related API failure occurs. The default is 15 (yellow event indicator).

44.6 NetworkDown

Use this Knowledge Script to detect whether a cluster network is down. This script raises an event if the network is down or if a cluster-related API failure occurs.

44.6.1 Resource Object

Microsoft cluster network folder

44.6.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

44.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if the network is down, if the network has been partitioned, or when a cluster-related API failure occurs. The default is y.
Collect data?	Set to **y** to collect data for charts and reports.The default is n. If enabled, data collection returns a value of 100 if the cluster network is up and a value of 0 if the cluster network is down.
Event severity level when network down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the network is down. The default is 8 (red event indicator).
Event severity level when network has been partitioned	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the network has been partitioned. The default is 9 (red event indicator).
Event severity level when cluster-related API failure occurs	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster-related API failure occurs. The default is 15 (yellow event indicator).

44.7 NodeDown

Use this Knowledge Script to detect whether a cluster node is down. This script raises an event if the node is down or when a cluster-related API failure occurs.

44.7.1 Resource Object

Microsoft cluster node

44.7.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

44.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if a node is down or if a cluster-related API failure occurs. The default is y.
Collect data?	Set to **y** to collect data for charts and reports.The default is n. If enabled, data collection returns a value of 100 if the cluster node is up and a value of 0 if the cluster node is down.
Event severity level when node down	Set the event severity level, from 1 to 40, to indicate the importance o an event in which a node is down. The default is 8 (red event indicator).
Event severity level when cluster-related API failure occurs	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster-related API failure occurs. The default is 15 (yellow event indicator).

44.8 ResourceDown

Use this Knowledge Script to detect if a cluster resource is online. This script raises an event if the resource if offline or if a cluster-related API failure occurs. You can set this script to attempt to bring the cluster resource online automatically.

44.8.1 Resource Object

Microsoft cluster resource

44.8.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

44.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event if a cluster group is offline or if a cluster-related API failure occurs. The default is y.
Collect data?	Set to **y** to collect data for charts and reports.The default is n. If enabled, data collection returns a value of 100 if the cluster resource is online and a value of 0 if the cluster resource is off-line.
Auto-start cluster resource?	Set to **y** to automatically start the cluster resource. The default is y.
Event severity level when cluster group off-line and auto-start fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster group is offline and auto-start fails. The default is 5 (red event indicator).
Event severity level when cluster group off-line and auto-start succeeds	Set the event severity level, from 1 to 40, to indicate the importance o an event in which a cluster group is offline and auto-start succeeds. The default is 25 (blue event indicator).
Event severity level when cluster group off-line and auto-start set to no	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster group is offline and you have set the Auto-start cluster resource? parameter to n. The default is 18 (yellow event indicator).
Event severity level when cluster-related API failure occurs	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a cluster-related API failure occurs. The default is 15 (yellow event indicator).

44.9 ResourceOwnerChange

Use this Knowledge Script to detect whether the owner of a cluster resource has changed. Changes in the ownership of a resource typically indicate a failover or failback operation has taken place. This script raises an event if the owner of the cluster resource changes or if a cluster-related API failure occurs.

Both the event and data detail message indicate the previous cluster resource owner and the new resource owner.

44.9.1 Resource Object

Microsoft cluster resource

44.9.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

44.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event?	Set to **y** to raise an event is cluster resource ownership changes or when a cluster-related API failure occurs. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. The default is n. If enabled, data collection returns a value of 0 if the cluster resource owner has changed in the interval, or a value of 100 if the resource owner has stayed the same. The detail message indicates the previous resource owner and the new owner.
Event severity level when cluster resource owner changes	Set the event severity level, from 1 to 40, to indicate the importance of an event in which cluster resource ownership has changed. The default is 5 (red event indicator).
Event severity level for cluster-related API failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which cluster-related API failure occurs. The default is 15 (yellow event indicator).

45 NetBackupUNIX Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring NetBackup resources.

From the Knowledge Script view of the Control Center Console, you can access more information about any Knowledge Script by selecting it and pressing **F1**.

Knowledge Script	What It Does
Clients	Monitors the number of clients managed by the NetBackup server.
DBDirSize	Monitors the size in MB of the NetBackup database directory on the NetBackup server.
DeviceStatus	Monitors the NetBackup device status and optionally resets.
ErrorLog	Checks for errors, generates an error log, warning, and critical entries made since the last time the script was run.
FailedJobs	Monitors the number of backup jobs that failed during the specified interval.
IncompleteJobs	Monitors the number of incomplete backup jobs during the specified interval.
LogDirSize	Monitors the size in MB of the NetBackup `log` directory.
PendingRequest	Monitors the number of pending device requests on the NetBackup server.
ResourceHigh	Monitors the CPU and memory usage of NetBackup daemons.
StorageUnitsChanged	Monitors whether changes are made to the storage units configured on the NetBackup Server.
SuccessfulJobs	Monitors the number of successfully completed backup jobs during the specified interval.

45.1 Clients

Use this Knowledge Script to monitor the number of NetBackup clients managed by the NetBackup server. This Knowledge Script raises an event if the number of managed clients exceeds the threshold you set.

45.1.1 Resource Object

NetBackup server

45.1.2 Default Schedule

The default interval for this Knowledge Script is **Every 24 hours**.

45.1.3 Setting Parameter Values

Set the following parameters as needed.

Description	How to Set It
Raise event when the managed backup clients threshold is exceeded?	Set to y to raise events. The default is y.
Collect data for number of clients being managed?	Set to y to collect data for charts and reports. If set to y, this script returns the number of clients managed by the NetBackup server. The default is n.
Threshold – Maximum number of clients being managed	Enter a threshold for the maximum number of clients, from 0 to 9999, NetBackup sever can manage before raising an event. The default is 10 clients.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

45.2 DBDirSize

Use this Knowledge Script to monitor the size in MB of the NetBackup database directory in the NetBackup server. This Knowledge Script raises an event and executes the specified action if the size of the database directory exceeds the threshold you set.

45.2.1 Resource Object

NetBackup server

45.2.2 Default Schedule

The default interval for this Knowledge Script is **Every 24 hours**.

45.2.3 Setting Parameter Values

Set the following parameters as needed.

Description	How to Set It
Raise event when the database directory size threshold is exceeded?	Set to y to raise events. The default is y.
Collect data for database directory size?	Set to y to collect data for charts and reports. If set to y, this script returns the size in MB of the database directory. The default is n.
Threshold – maximum size of database directory	Type a threshold for the maximum size in MB, from 0 to 9999, of the NetBackup database directory. The default is 200 MB.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.

45.3 DeviceStatus

Use this Knowledge Script to detect the status of a NetBackup device. If the device status is Not Connected, you can change the status to Connected. A NetBackup device is the medium used to store archived information, such as a tape drive.

This Knowledge Script raises an event when the auto-reset feature succeeds in resetting a device from the Not Connected status to the Connected status, and when the auto-reset feature fails.

45.3.1 Resource Object

NetBackup device

45.3.2 Default Schedule

The default interval for this Knowledge Script is **Every 24 hours**.

45.3.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Collect data for device status?	Set to y to collect data for charts and reports. If set to y, this script returns 0 if the device is down or 100 if the device is up. The default is n.
Automatically reset device if device is down?	Set to y to automatically reset a device that is detected as down. The default is y.
Event severity level when auto-reset fails	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Event severity level when auto-reset succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.

45.4 ErrorLog

Use this Knowledge Script to generate a log of problems on the NetBackup server, and then scan the log for Error, Warning, and Critical entries.

An iteration is the schedule you set for running the Knowledge Script. For example, **Every hour**. During the first iteration, this Knowledge Script sets a starting point to check for log entries but does not generate any events. During subsequent iterations, this Knowledge Script generates events if the server creates log entries.

45.4.1 Resource Object

NetBackup server

45.4.2 Default Schedule

The default interval for this Knowledge Script is **Every hour**.

45.4.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Raise event if a log entry is found?	Set to y to raise events. During the first iteration of the job, all log entries are evaluated. On subsequent iterations, existing entries are ignore, and only log entries written since the last iteration will raise an event. The default is y.
Collect data for the number of log entries found?	Set to y to collect charts for graphs and reports. If set to y, this script returns the total number of entries in the error log during the interval. The default is n.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.

45.5 FailedJobs

Use this Knowledge Script to monitor the number of failed backup jobs. This Knowledge Script raises an event if the number of failed jobs during the interval exceeds the set threshold.

An iteration is the schedule you set for running the Knowledge Script. For example, **Every 24 hours**. During the first iteration, this Knowledge Script sets a starting point to check for failed backup jobs but does not generate any events. During subsequent iterations, this Knowledge Script generates events if the server generates failed backup jobs.

NOTE: The first iteration of this Knowledge Script may list a job multiple times. In subsequent iterations, the Knowledge Script lists the jobs only once.

45.5.1 Resource Object

NetBackup server

45.5.2 Default Schedule

The default interval for this Knowledge Script is **Every 24 hours**.

45.5.3 Setting Parameter Values

Set the following parameters as needed.

Description	How to Set It
Raise event when threshold is exceeded?	Set to y to raise events. The default is y.
Collect data for number of failed backup jobs?	Set to y to collect data for charts and reports. If set to y, this script returns the number of failed jobs since the last script iteration. The default is n.
Threshold – Maximum number of failed backup jobs	Type a threshold for the maximum number of failed jobs, from 0 to 9999, that can be detected before an event is raised. The default is 10.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

45.6 IncompleteJobs

Use this Knowledge Script to monitor the number of incomplete backup jobs. This Knowledge Script raises an event if the number of incomplete jobs during the interval exceeds the set the threshold.

An iteration is the schedule you set for running the Knowledge Script. For example, **Every 24 hours**. During the first iteration, this Knowledge Script sets a starting point to check for incomplete backup jobs but does not generate any events. During subsequent iterations, this Knowledge Script generates events if the server generates incomplete backup jobs.

45.6.1 Resource Object

NetBackup server

45.6.2 Default Schedule

The default interval for this Knowledge Script is **Every 24 hours**.

45.6.3 Setting Parameter Values

Set the following parameters as needed.

Description	How to Set It
Raise event when the incomplete jobs threshold is exceeded?	Set to y to raise events. The default is y.
Collect data for number of incomplete jobs?	Set to y to collect data for charts and reports. If set to y, this script returns the number of jobs submitted and the number of incomplete jobs since the last script iteration. The default is n.
Threshold – Maximum number of incomplete backup jobs	Type a maximum threshold for the number of incomplete jobs, from 0 to 9999, since the last script iteration. The default is 10.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.

45.7 LogDirSize

Use this Knowledge Script to monitor the size (in MB) of the NetBackup `log` directory. This Knowledge Script raises an event if the size of this directory exceeds the threshold you set.

45.7.1 Resource Object

NetBackup server

45.7.2 Default Schedule

The default interval for this Knowledge Script is **Every 24 hours**.

45.7.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Raise event when the log directory size threshold is exceeded?	Set to y to raise events. The default is y.
Collect data for log directory size?	Set to y to collect data for charts and reports. If set to y, this script returns the size (in MB) of the NetBackup `log` directory. The default is n.
Threshold – Maximum size of `log` directory	Type a threshold for the maximum size in MB, from 0 to 9999, of the NetBackup `log` directory. The default is 200 MB.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.

45.8 PendingRequest

Use this Knowledge Script to monitor the current number of pending device requests on the NetBackup server. This Knowledge Script raises an event if the current number of pending device requests exceeds the threshold you set.

45.8.1 Resource Object

NetBackup server

45.8.2 Default Schedule

The default interval for this Knowledge Script is **Every hour**.

45.8.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Raise event when the current number of pending device requests threshold is exceeded?	Set to y to raise events. The default is y.
Collect data for number of pending device requests?	Set to y to collect data for charts and reports. If set to y, this script returns the current number of pending device requests. The default is n.
Threshold – Maximum number of pending device requests	Type a threshold for the maximum current number of pending device requests, from 0 to 9999, that can be detected before an event is raised. The default is 5 requests.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 8.

45.9 ResourceHigh

Use this Knowledge Script to monitor the CPU and memory usage of NetBackup daemons. This Knowledge Script raises an event if the CPU or memory usage exceeds the threshold you set.

45.9.1 Resource Objects

NetBackup daemons

45.9.2 Default Schedule

The default interval for this Knowledge Script is **Every 5 minutes**.

45.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event when either threshold is exceeded?	Set to y to raise events. The default is y.
Collect data for CPU and memory utilization? (y/n)	Set to y to collect data for charts and reports. If set to y, returns the CPU utilization (%) and the memory utilization (MB) of the NetBackup daemons. The default is n.
Threshold – Maximum CPU utilization	Enter a threshold for the maximum CPU utilization, as a percentage of total CPU time, of the NetBackup daemons that can be detected before an event is raised. The default is 60%.
Threshold – Maximum memory utilization	Type a threshold for the maximum number of MB, from 0 to 5000, of memory utilization that can be detected before an event is raised. The default is 6 MB.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.

45.10 StorageUnitsChanged

Use this Knowledge Script to detect whether modifications have been made to storage units configured on the NetBackup server. This Knowledge Script raises an event if you add a new storage unit or delete a storage unit.

45.10.1 Resource Object

NetBackup storage unit folder

45.10.2 Default Schedule

The default interval for this Knowledge Script is **Every 24 hours**.

45.10.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Raise event if modification to storage units is detected?	Set to y to raise events. The default is y.
Collect data for number of modified storage units?	Set to y to collect data for charts and reports. If set to y, this script returns the number of added and deleted storage units. The default is n.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.

45.11 SuccessfulJobs

Use this Knowledge Script to monitor the number of successfully completed backup jobs. This Knowledge Script raises an event if the number of successfully completed jobs during the interval falls below the set threshold.

An iteration is the schedule you set for running the Knowledge Script. For example, **Every 24 hours**. During the first iteration, this Knowledge Script sets a starting point to check for successful backup jobs but does not generate any events. During subsequent iterations, this Knowledge Script generates events if the server generates successful backup jobs.

45.11.1 Resource Object

NetBackup server

45.11.2 Default Schedule

The default interval for this Knowledge Script is **Every 24 hours**.

45.11.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Raise event when threshold not met?	Set to y to raise events. The default is y.
Collect data for number of successfully completed backup jobs?	Set to y to collect data for charts and reports. If set to y, this script returns the number of successfully completed backup jobs since the last script iteration. The default is n.
Threshold – Minimum number of successfully completed backup jobs	Type a minimum threshold for the number of successfully completed backup jobs, from 0 to 9999, since the last script iteration. The default is 10 jobs.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

45.11.4 Example of How this Script is Used

Assume that you run three backup jobs every morning at 2 A.M. and expect all the jobs to be complete by 7 A.M. You can run this script once each day at 8 A.M. with the **Number of successfully completed jobs minimum threshold** set to **3**. This script raises an event and alerts you to possible problems if any of the scheduled backup jobs fails to complete by 8 A.M.

46 NetBackup Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring the operations of Symantec NetBackup on Windows computers.

From the Knowledge Script view of Control Center, you can access more information about any Knowledge Script by selecting it and clicking **Help**. Or in the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What it Does
Clients	Monitors the number of clients managed by the NetBackup server.
DBDirSize	Monitors the size in MB of the NetBackup database (DB) directory.
DeviceStatus	Detects when a NetBackup device is down, and optionally resets it.
ErrorLog	Scans the NetBackup error log file for Error, Warning, and Critical entries during the monitoring interval.
EventLog	Monitors the Windows Application log for entries created by NetBackup.
FailedJobs	Monitors the number of backup jobs that failed during the monitoring interval.
IncompleteJobs	Monitors the number of backup jobs that partially completed during the monitoring interval.
LogDirSize	Monitors the size in MB of the NetBackup log directory.
PendingRequest	Monitors the number of pending device requests on the NetBackup server.
ResourceHigh	Monitors the CPU and memory usage of NetBackup services.
ServiceDown	Monitors discovered NetBackup services to determine if any service is down, and optionally restarts the service.
StorageUnitsChanged	Monitors whether storage units configured on the NetBackup server have been added or deleted during the monitoring interval.
SuccessfulJobs	Monitors the number of backup jobs that completed successfully during the monitoring interval.

46.1 Clients

Use this Knowledge Script to monitor the number of backup clients managed by the NetBackup server. This script raises an event if the number of clients being managed exceeds the threshold you set.

46.1.1 Resource Object

NetBackup server

46.1.2 Default Schedule

The default interval for this script is every 24 hours.

46.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if threshold exceeded?	Select **Yes** to raise an event if number of clients exceeds the threshold you set. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of clients managed by the NetBackup server. The default is unselected.
Threshold – Maximum number of clients	Specify the maximum number of clients that can be managed by the server before an event is raised. The default is 10 clients.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of clients exceeds the threshold you set. The default is 15.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.2 DBDirSize

Use this Knowledge Script to monitor the size (in MB) of the NetBackup database (DB) directory. This script raises an event if the size of this directory exceeds the threshold you set.

46.2.1 Resource Object

NetBackup server

46.2.2 Default Schedule

The default interval for this script is every 24 hours.

46.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if threshold exceeded?	Select **Yes** to raise an event if the size of the DB directory exceeds the threshold you set. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the size (in MB) of the NetBackup DB directory. The default is unselected.
Threshold – Maximum size of `DB` directory	Specify the maximum size that the NetBackup DB directory can attain before an event is raised. The default is 20 MB.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the size of the NetBackup DB directory exceeds the threshold you set. The default is 15.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.3 DeviceStatus

Use this Knowledge Script to detect when a NetBackup tape device is DOWN, and optionally set it to an UP state. This script raises an event when the reset feature succeeds in resetting a device from the DOWN state to the UP state, and when the reset feature fails.

46.3.1 Resource Object

NetBackup device

46.3.2 Default Schedule

The default interval for this script is every 24 hours.

46.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if device is down?	Select **Yes** to raise an event if the device is down. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns 0 if the device is down, or 100 if the device is up. The default is unselected.
Reset device?	Select **Yes** to automatically reset a device that is detected as down. The default is unselected.
Event severity when reset fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager fails to reset a device. The default is 10.
Event severity when reset succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager succeeds in resetting a device. The default is 25.
Event severity when device is down and reset is not enabled	Set the event severity level, from 1 to 40, to indicate the importance of the event when the device is down and the *Reset device?* parameter is disabled. The default severity level is 20.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.4 ErrorLog

Use this Knowledge Script to generate a log of problems on the NetBackup server, and then scan that log for Error, Warning, and Critical entries. The first iteration of the script collects entries from all available data, regardless of the interval specified. Subsequent iterations of the script collect entries made since the previous iteration. For example, if this script is set to run **Every 8 Hours**, then for the first iteration it checks for all entries, and for subsequent iterations it checks for entries made during the previous eight hours. This script raises an event if the number of entries exceeds the threshold you set.

NOTE: When running this script on a media server, AppManager filters log entries and only collects entries originating from that media server. No filtering is applied when running this script on a master server, so AppManager returns log entries originating from both the master server and any associated media servers.

46.4.1 Resource Object

NetBackup server

46.4.2 Default Schedule

The default interval for this script is every hour.

46.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if threshold exceeded?	Select **Yes** to raise an event if the number of error entries exceeds the threshold you set. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of entries in the error log during the monitoring interval. The default is unselected.
Threshold–Maximum number of error entries	Specify the maximum number of entries that can be found during the monitoring interval before an event is raised. The default is 0.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of error entries exceeds the threshold you set. The default is 15.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.5 EventLog

Use this Knowledge Script to monitor event log entries created by NetBackup. These entries are under the Windows Application Log. You can define other categories for filtering Application Log entries, such as Event ID and Event Description.

The first iteration of the script collects entries from all available data, regardless of the interval specified. Subsequent iterations of the script collect entries made since the previous iteration. For example, if this script is set to run **Every 8 Hours**, then for the first iteration it checks for all entries, and for subsequent iterations it checks for entries made during the previous eight hours. This script raises an event if the number of entries exceeds the threshold you set.

46.5.1 Resource Object

NetBackup server

46.5.2 Default Schedule

The default interval for this script is every 24 hours.

46.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of log entries that match the search criteria. The default is unselected.
Start collecting events from past N hours	Use this parameter to determine which events are searched the first time you run the Knowledge Script job. Subsequent searches begin where the previous one finished. The following entries are valid: • **-1** to search all existing log entries during the first interval • *N* to search entries for the past *N* hours (8 for the past 8 hours, 50 for the past 50 hours, and so on) • **0** to search no previous entries (search from the current time forward) The default is 0.
Maximum number of entries per event report	Specify the maximum number of new log entries that can be found during the monitoring interval before an event is raised. The default is 30.
Event Notification	
Raise event if log entries matching criteria are found?	Select **Yes** to raise an event if log entries are found that match the criteria set in this Knowledge Script. The default is Yes.
Event severity when log entries match criteria	Set the event severity level, from 1 to 40, to indicate the importance of an event when log entries match the event log criteria. The default is 15.
Log Entry Selection	

Description	How to Set It
Count ERROR entries	Select **Yes** to monitor error event entries. The default is Yes.
Count WARNING entries	Select **Yes** to monitor warning event entries. The default is Yes.
Count INFO entries	Select **Yes** to monitor information event entries. The default is No.
Count SUCCESSAUDIT entries	Select **Yes** to monitor success audit event entries. Success audits are successful security access attempts that are audited. The default is No.
Count FAILUREAUDIT entries	Select **Yes** to monitor failure audit event entries. Failure audits are failed security access attempts that are audited. The default is No.
Count UNCLASSIFIED entries	Some events written to Windows event logs do not have event levels or severities set to event types recognized by Windows Server 2008 and later. This Knowledge Script identifies these entries as unclassified. These entries will not be found by the error, warning, information, success audit, or failure audit filter criteria. Select Yes to monitor log entries that are unclassified. The default is No.
Text filter for the Event ID field	Provide an appropriate search string to find matching entries in the Event field of the Event Log. Separate multiple IDs with commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Text filter for the Event Description field	Provide an appropriate search string to find matching entries in the Description field of the Event Log. Separate multiple strings with commas. The search string can contain criteria used to include entries, exclude entries, or both. Separate the include and exclude criteria with a colon (:). If you are specifying only include criteria, the colon is not necessary.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.6 FailedJobs

Use this Knowledge Script to monitor the number of failed backup jobs. This script raises an event if the number of failed jobs during the interval exceeds the threshold you set. A failed job is one that returns an `Exit` status code of `>1` in the NetBackup log.

During the first iteration, this Knowledge Script checks for failed backup jobs from all available data, regardless of the interval specified. During subsequent iterations, this script checks for failed backup jobs during the scheduled interval. For example, if this script is set to run **Every 8 Hours**, then for the first iteration it checks for all failed jobs, and for subsequent iterations it checks for failed jobs during the previous eight hours.

NOTE: When running this script on a media server, AppManager filters log entries and only collects entries originating from that media server. No filtering is applied when running this script on a master server, so AppManager returns log entries originating from both the master server and any associated media servers.

46.6.1 Resource Object

NetBackup server

46.6.2 Default Schedule

The default interval for this script is every 24 hours.

46.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if threshold exceeded?	Select **Yes** to raise an event if the number of failed jobs exceeds the threshold you set. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of failed jobs during the interval you specify. The default is unselected.
Threshold – Maximum number of failed jobs	Specify the maximum number of failed jobs allowed during the monitoring interval before an event is raised. The default is 0.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of failed jobs exceeds the threshold you set. The default is 15.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.7 IncompleteJobs

Use this Knowledge Script to monitor the number of incomplete backup jobs. If the number of incomplete jobs during the interval exceeds the threshold you set, an event is raised. An incomplete job is one that returns an `Exit` status code of `=1` in the NetBackup log.

During the first iteration, this Knowledge Script checks for incomplete backup jobs from all available data, regardless of the interval specified. During subsequent iterations, this script checks for incomplete backup jobs during the scheduled interval. For example, if this script is set to run **Every 8 Hours**, then for the first iteration it checks for all incomplete jobs, and for subsequent iterations it checks for incomplete jobs during the previous eight hours.

NOTE: When running this script on a media server, AppManager filters log entries and only collects entries originating from that media server. No filtering is applied when running this script on a master server, so AppManager returns log entries originating from both the master server and/or any associated media servers.

46.7.1 Resource Object

NetBackup server

46.7.2 Default Schedule

The default interval for this script is every 24 hours.

46.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if threshold exceeded?	Select **Yes** to raise an event if the number of incomplete jobs exceeds the threshold you set. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of jobs submitted and the number of incomplete jobs during the interval you specify. The default is unselected.
Threshold – Maximum number of incomplete jobs	Specify the maximum number of incomplete jobs allowed during the monitoring interval before an event is raised. The default is 10.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of incomplete jobs exceeds the threshold you set. The default is 15.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.8 LogDirSize

Use this Knowledge Script to monitor the size (in MB) of the NetBackup log directory. This script raises an event if the size of this directory exceeds the threshold you set.

46.8.1 Resource Object

NetBackup server

46.8.2 Default Schedule

The default interval for this script is every 24 hours.

46.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if threshold exceeded?	Select **Yes** to raise an event if the size of the log directory exceeds the threshold you set. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the size (in MB) of the NetBackup log directory. The default is unselected.
Threshold – Maximum size of log directory	Specify the maximum size the NetBackup log directory can attain before an event is raised. The default is 20 MB.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the size of the log directory exceeds the threshold you set. The default is 15.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.9 PendingRequest

Use this Knowledge Script to monitor the number of pending device requests on the NetBackup server. This script raises an event if the number of pending requests exceeds the threshold you set.

46.9.1 Resource Object

NetBackup server

46.9.2 Default Schedule

The default interval for this script is every hour.

46.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if threshold exceeded?	Select **Yes** to raise an event if the number of pending requests exceeds the threshold you set. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of pending device requests. The default is unselected.
Threshold – Maximum number of pending device requests	Specify the maximum number of device requests that can be pending before an event is raised. The default is 10 requests.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of pending requests exceeds the threshold you set. The default is 15.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.10 ResourceHigh

Use this Knowledge Script to monitor the CPU and memory usage of NetBackup services. This script raises an event if CPU or memory usage exceeds the thresholds you set.

46.10.1 Resource Object

NetBackup service

46.10.2 Default Schedule

The default interval for this script is every 10 minutes.

46.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if threshold exceeded?	Select **Yes** to raise an event if CPU usage or memory utilization exceeds the threshold you set. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of CPU usage and the number of MB of memory usage for a service. The default is unselected.
Threshold – Maximum percent CPU usage	Specify the maximum amount of CPU usage allowed before an event is raised. The default is 60%.
Threshold – Maximum memory usage	Specify the maximum memory usage allowed before an event is raised. The default is 6 MB.
Event severity when CPU or memory threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage or memory utilization exceeds the threshold you set. The default is 15.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.11 ServiceDown

Use this Knowledge Script to monitor discovered NetBackup services to see if any service is down. This script raises an event if a service is not running. This script can automatically restart any service that is down.

46.11.1 Resource Object

NetBackup service

46.11.2 Default Schedule

The default interval for this script is every 24 hours.

46.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if service is down?	Select **Yes** to raise an event if a service is down. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns: • 100–monitored service is running • 0–monitored service is not running. The default is unselected.
Restart service?	Select **Yes** to automatically restart any service that is down. The default is unselected.
Event severity when restart fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which an attempt is made to restart a service that is down, and restart fails. The default is 10.
Event severity when restart succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which an attempt is made to restart a service that is down, and restart succeeds. The default is 25.
Event severity when service is down and restart is not enabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which an attempt is made to restart a service that is down and the *Restart service?* parameter is disabled. The default is 20.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.12 StorageUnitsChanged

Use this Knowledge Script to monitor storage units configured on the NetBackup server during the monitoring interval. This script raises an event if a storage unit is deleted or a new one is added.

46.12.1 Resource Object

NetBackup storage unit folder

46.12.2 Default Schedule

The default interval for this script is every 24 hours.

46.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if storage units are changed?	Select **Yes** to raise an event if a storage unit has been added or deleted. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of added and deleted storage units. The default is unselected.
Event severity when a storage unit is changed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a storage unit has been modified. The default is 15.
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

46.13 SuccessfulJobs

Use this Knowledge Script to monitor the number of successfully completed backup jobs. This script raises an event if the number of successfully completed jobs during the interval falls below the threshold you set. A successful job is one that returns an `Exit` status code of `=0` in the NetBackup log.

During the first iteration, this Knowledge Script checks for successful backup jobs from all available data, regardless of the interval specified. During subsequent iterations, this script checks for successful backup jobs during the scheduled interval. For example, if this script is set to run **Every 8 Hours**, then for the first iteration it checks for all successful jobs, and for subsequent iterations it checks for successful jobs during the previous eight hours.

The following is an example of how you can use this Knowledge Script. Assume you run three backup jobs every morning at 2:00 AM, and you expect all of the jobs to be complete by 7:00 AM. You can run this script once a day at 8:00 AM with the *Threshold – Minimum number of successfully completed jobs* parameter set to 3. If any of the scheduled backup jobs fails to complete by 8:00 AM, an event is raised, alerting you to possible problems.

NOTE: When running this script on a media server, AppManager filters log entries and only collects entries originating from that media server. No filtering is applied when running this script on a master server, so AppManager returns log entries originating from both the master server and/or any associated media servers.

46.13.1 Resource Object

NetBackup server

46.13.2 Default Schedule

The default interval for this script is every 24 hours.

46.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Monitoring Parameters	
Raise event if threshold not met?	Select **Yes** to raise an event if the number of successfully completed jobs falls below the threshold you set. The default is Yes.
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of successfully completed backup jobs during the interval you specify. The default is unselected.
Threshold – Minimum number of successfully completed jobs	Specify the minimum number of backup jobs that must be successfully completed to prevent an event from being raised. The default is 10 jobs.
Event severity when threshold is not met	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of successfully completed jobs falls below the threshold you set. The default is 15.

Description	How to Set It
Success and Failure Events	
Raise event on script success?	Select **Yes** to raise an event if the Knowledge Script job succeeds. The default is unselected.
Severity of success event	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job succeeds. The default is 35.
Severity of event raised when script fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Knowledge Script job fails. The default is 10.

47 NetServices Knowledge Scripts

The NetServices category provides Knowledge Scripts for monitoring network services with AppManager, such as monitoring the availability and use of the Windows Internet Name Service (WINS) server. This Knowledge Script category is added when you discover Windows.

NOTE: You can use the NetServices category to monitor Windows Server 2008 (or later) services.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
DHCPHealthCheck	Checks the availability and SNMP MIB counter of the DHCP server.
DHCPLeases	Monitors the percentage of DHCP address leases that are being used.
DNSHealthCheck	Monitors availability, CPU usage, memory usage, and name resolution of the DNS service.
DNSSync	Checks connectivity between two DNS servers.
RASConnections	Monitors the average number of connections to the remote access server (RAS).
RASErrors	Monitors the total number of remote access server (RAS) errors in an interval.
RASHealthCheck	Checks the availability and CPU usage of the RAS server.
RASStat	Monitors the throughput of the RAS server.
WINSConflict	Monitors conflict activity on the WINS server.
WINSFailure	Reports the number of failures per second on the WINS server.
WINSHealthCheck	Checks availability and CPU usage of the WINS server.
WINSQueries	Monitors query activity on the WINS server.
WINSReplication	Monitors replication activity on the WINS server.
WINSStat	Monitors the total registrations, renewals, and releases on the WINS server.

47.1 DHCPHealthCheck

Use this Knowledge Script to check the status of the Dynamic Host Configuration Protocol (DHCP) service and the SNMP MIB variable value for a DHCP object identifier (OID). If the DHCP service is not running or a valve cannot be retrieved for the DHCP OID, an event is raised. If the DHCP service is not running, it can be automatically restarted.

47.1.1 Prerequisite

This script requires the Microsoft SNMP service to be running.

47.1.2 Resource Object

DHCP service object

47.1.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

47.1.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event when DHCP service is down or MIB counter can't be retrieved?	Set to **y** to raise an event when the DHCP service is down or the MIB counter cannot be retrieved. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • **100** – the DHCP service is running, or • **0** – the service is not running. The default is n.
Auto-start service?	Set to **y** to automatically restart the DHCP service. The default is y.
Event severity level for service down; restart failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the DHCP service is down and AppManager cannot restart the service. The default is 5 (red event indicator).
Event severity level for service down; restart successful	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the DHCP service is down and AppManager successfully restarted the service. The default is 25 (blue event indicator).
Event severity level for service down; don't restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the DHCP service is down and the *Auto-start service?* parameter is set to n. The default is 18 (yellow event indicator).
Event severity level for SNMP failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which an SNMP failure has occurred. The default is 18 (yellow event indicator).

Parameter	How to Set It
OID of any DHCP MIB counter	Provide the object identifier of any DHCP MIB counter you want checked. The default is .1.3.6.1.4.1.311.1.3.1.2.0.
Community	Specify the SNMP community string. The default is either the community string entered in AppManager Security Manager or *public* if no community string has been entered. The default is *public*.

47.2 DHCPLeases

Use this Knowledge Script to monitor the percentage of DHCP address leases that are being used. This script raises an event if the percentage of addresses used exceeds the threshold you set or the number of available addresses falls below the threshold you set. This script can monitor addresses for each DHCP scope individually or for the entire DHCP server.

The concept of a DHCP address lease is one in which a client computer does not retain a permanent DHCP address. With a DHCP lease, a client computer communicates with a DHCP server on reboot to begin or confirm the lease of an address.

47.2.1 Prerequisite

This script requires the Microsoft SNMP service to be running.

47.2.2 Resource Object

DHCP service object

47.2.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

47.2.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for total address usage?	Set to **y** to raise events when the percentage of addresses used or the number of available addresses exceeds the threshold for the entire DHCP server. The default is y.
Event for scope address usage?	Set to **y** to raise events when the percentage of addresses used or the number of available addresses exceeds the appropriate threshold for any DHCP scope. The default is y.
Collect data for total address usage?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total number of addresses in use. The default is n.
Collect data for scope address usage?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of addresses in use in a DHCP scope. The default is n.
Maximum threshold for the percentage of total addresses in use	Specify the maximum percentage of addresses that can be in use at one time for the entire DHCP server (total addresses available) before an event is raised. The default is 95%.
Maximum threshold for percentage of addresses in use in a scope	Specify the maximum percentage of addresses that can be in use in a DHCP scope before an event is raised. The default is 80%. A DHCP scope is the range of IP addresses that the DHCP server can assign to clients that are on one subnet.

Parameter	How to Set It
Minimum threshold for total number of addresses available	Specify the minimum number of addresses that must be available for the DHCP server to prevent an event from being raised. The default is 10.
Minimum threshold for number of addresses available in a scope	Specify the minimum number of addresses that must be available in a DHCP scope to prevent an event from being raised. The default is 5.
Event severity level for total usage high or availability low	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of addresses in use exceeds the threshold or the number of available addresses falls below the threshold. The default is 10 (red event indicator).
Event severity level for scope usage high or availability low	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of addresses in use in a scope exceeds the threshold or the number of available addresses in a scope falls below the threshold. The default is 15 (yellow event indicator).
Community	Specify the SNMP community string. The default is either the community name entered in AppManager Security Manager or *public* if no community name has been entered. The default is public.

47.3 DNSHealthCheck

Use this Knowledge Script to monitor the availability, CPU usage, memory usage, and name resolution of the Domain Name System (DNS) service. By default, this script attempts to restart the DNS service if the service is not running.

47.3.1 Resource Object

DNS service object

47.3.2 Default Schedule

The default interval for this script is **Every five minutes**.

47.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event when DNS service is down?	Set to **y** to raise an event when the DNS service is down. The default is y.
Event when DNS name resolution fails?	Set to **y** to raise an event when name resolution fails. If set to y, the script attempts to resolve the specified hostname to the specified IP address. If the name resolution fails, an event is raised. If set to n, the script does not perform a name resolution lookup, and the *Hostname for name resolution* and *Host IP address that should be returned* parameters are ignored. The default is y.
Event when DNS CPU usage is over threshold?	Set to **y** to raise an event when the percentage of CPU consumed by the DNS service exceeds the threshold. The default is y.
Event when DNS memory usage is over threshold?	Set to **y** to raise an event when the amount of memory consumed by the DNS service exceeds the threshold. The default is y.
Collect data for DNS service up/down?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • **100** – the DNS service is running, or • **0** – the service is not running. The default is n.
Collect data for DNS CPU usage?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the percentage of CPU consumed by the DNS service. The default is n.
Collect data for DNS memory usage?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the amount of memory, in kilobytes (KB), consumed by the DNS service. The default is n.
Auto-start service?	Set to **y** to automatically restart the DNS service if it is down. The default is y.

Parameter	How to Set It
Event severity level for service down; restart failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the DNS service is down and the script cannot restart the service. The default is 5 (red event indicator).
Event severity level for service down; restart succeeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the DNS service is down and the script successfully restarted the service. The default is 25 (blue event indicator).
Event severity level for service down; don't restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the DNS service is down and the *Auto-start service?* parameter is set to n. The default is 18 (yellow event indicator).
Event severity level for NS lookup failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the DNS name resolution function fails. The default is 8 (red event indicator).
Event severity level for CPU usage exceeded threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. The default is 8 (red event indicator).
Event severity level for memory usage exceeded threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory usage exceeds the threshold. The default is 8 (red event indicator).
Event severity level for external command failed to execute	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a system error prevents the execution of the DNS service. The default is 8 (red event indicator).
DNS process % CPU maximum threshold	Specify the maximum percentage of CPU resources that can be consumed by the DNS process before an event is raised. The default is 10%.
DNS process memory usage maximum threshold	Specify the maximum amount of memory resources that can be consumed by the DNS process before an event is raised. The default is 1024 KB.
Hostname for name resolution	Specify the name of the host to look up if you are using this script to test the hostname-to-IP address resolution. Default is localhost.
Host IP address that should be returned	Specify the correct IP address that should be returned by the DNS service if you are using this script to test the hostname-to-IP address resolution. The default is 127.0.0.1.

47.4 DNSSync

Use this Knowledge Script to check connectivity between two DNS servers. This script compares the DNS time stamp serial number for the current site with the time stamp serial number for the DNS site you specify. Both the remote site hostname and DNS domain name are required. This script raises an event if the serial numbers of the DNS servers are out of sync by more than the threshold value.

47.4.1 Resource Object

DNS service object

47.4.2 Default Schedule

The default interval for this script is **Every hour**.

47.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise an event if the serial numbers of the DNS servers are out of sync by more than the threshold value. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • **100** – the servers are in sync, or • **0** – the servers are out of sync by more than the threshold value. In either case, the difference between the local and remote serial numbers is recorded in the detail message. The default is n.
DNS serial number difference maximum threshold	Specify the maximum difference that can occur between the local and remote DNS serial numbers before an event is raised. The default is 10.
Remote DNS host name	Specify the name of the DNS host computer. The default is `eclipse.netiq.com`.
DNS domain name	Specify the name of the DNS domain on the remote server. The default is netiq.com.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the serial numbers of the DNS servers are out of sync by more than the threshold value. The default is 8 (red event indicator).

47.5 RASConnections

Use this Knowledge Script to monitor the average number of connections to the Remote Access Server (RAS). This script raises an event if the total number of connections per minute exceeds the threshold you set.

47.5.1 Resource Object

RAS service object

47.5.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

47.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise an event if the total number of connections to the RAS per minute exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the average number of connections to the RAS per minute during the monitoring interval. The default is n.
Connections per minute maximum threshold	Specify the maximum number of connections to the server that can occur per minute before an event is raised. The default is 50 connections per minute.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of connections per minute exceeds the threshold. The default is 8 (red event indicator).

47.6 RASErrors

Use this Knowledge Script to monitor the total number of Remote Access Server (RAS) errors in an interval. Remote access server errors can include CRC errors, alignment errors, and timeout errors, for example. This script raises an event if the total number of errors exceeds the threshold.

47.6.1 Resource Object

RAS service object

47.6.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

47.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise an event if the total number of errors exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the difference between the number of RAS errors during the last monitoring interval and the number of RAS errors during the current monitoring interval. The default is n.
Total number of errors maximum threshold	Specify the maximum number of errors that can occur before an event is raised. The default is 50 errors.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of errors exceeds the threshold. The default is 8 (red event indicator).

47.7 RASHealthCheck

Use this Knowledge Script to check the availability of the Remote Access Server (RAS) service. This script raises an event if the RAS service is not running and attempts to restart the service if the service is not running.

47.7.1 Resource Object

RAS service object

47.7.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

47.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event when RAS service is down?	Set to **y** to raise an event when the RAS service is down. The default is y.
Collect data for RAS service up/down?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • **100** – the RAS service is running, or • **0** – the RAS service is not running. The default is n.
Auto-start service?	Set to **y** to automatically restart down services. The default is y.
Check RasMan?	Set to **y** to check whether the Remote Access Connection Manager (`RasMan`) service is running. The default is n.
Event severity level for service down; restart failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the RAS service is down and this script could not restart the service. The default is 5 (red event indicator).
Event severity level for service down; restart succeeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the RAS service is down and this script successfully restarted the service. The default is 25 (blue event indicator).
Event severity level for service down; don't restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the RAS service is down and the *Auto-start service?* parameter is set to n. The default is 18 (yellow event indicator).

47.8 RASStat

Use this Knowledge Script to monitor the traffic on the Remote Access Server (RAS) server. This script raises an event if the total number of bytes transferred (transmitted and received) exceeds the threshold you set.

47.8.1 Resource Object

RAS service object

47.8.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

47.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise an event if the total number of bytes transferred per second by the RAS server since the script was last run exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of bytes transferred by the RAS server since the script was last run. The default is n.
Total bytes per second maximum threshold	Specify the maximum total number of bytes that can be transferred per second before an event is raised. The default is 500 bytes per second.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the total number of transferred bytes exceeds the threshold. The default is 8 (red event indicator).

47.9 WINSConflict

Use this Knowledge Script to monitor conflict activity on the Windows Internet Name Service (WINS) server. This script raises an event if the number of group and unique conflicts per second exceeds the threshold you set.

Group conflicts per second is the rate at which group registrations received by the WINS server resulted in conflicts with records in the database. *Unique conflicts* per second is the rate at which unique registrations and renewals received by the WINS server resulted in conflicts with records in the database

47.9.1 Resource Object

WINS service object

47.9.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

47.9.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise an event when the number of conflicts per second exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of unique conflicts and group conflicts per second. The default is n.
Total conflicts per second maximum threshold	Specify the maximum number of group and unique conflicts that can occur per second before an event is raised. The default is 4 conflicts per second.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of group and unique conflicts exceeds the threshold. The default is 8 (red event indicator).

47.10 WINSFailure

Use this Knowledge Script to report the number of failures per second on the Windows Internet Name Service (WINS) server. This script raises an event if the total failure rate for queries and releases exceeds the threshold you set.

47.10.1 Resource Object

WINS service object

47.10.2 Default Schedule

The default interval for this script is **Every 10 minutes**.

47.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise an event if the total failure rate for queries and releases on the WINS server exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of failed queries and failed releases per second. The default is n.
Total failures per second maximum threshold	Specify the maximum number of failures that can occur per second before an event is raised. The default is 2 failures per second.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of failures exceeds the threshold. The default is 8 (red event indicator).

47.11 WINSHealthCheck

Use this Knowledge Script to check the availability and CPU usage of the Windows Internet Name Service (WINS) service. This script raises an event if the WINS service is not running or if CPU usage exceeds the threshold you set. In addition, this script attempts to restart the WINS service if the service is not running.

47.11.1 Resource Object

WINS service object

47.11.2 Default Schedule

The default interval for this script is **Every 5 minutes**.

47.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event when WINS service is down?	Set to **y** to raise an event if the WINS service is not running. The default is y.
Event when WINS CPU usage is over threshold?	Set to **y** to raise an event if the percentage of CPU consumed by the WINS service exceeds the threshold. The default is y.
Collect data for WINS service up/down?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • **100** – the WINS service is running, or • **0** – the service is not running. The default is n.
Collect data for WINS CPU usage?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the percentage of CPU used by the WINS service. The default is n.
Auto-start service?	Set to **y** to automatically restart down services. The default is y.
Event severity level for service down; restart failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the WINS service is down and this script cannot restart it. The default is 5 (red event indicator).
Event severity level for service down; restart succeeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the WINS service is down and this script successfully restarted the service. The default is 25 (blue event indicator).
Event severity level for service down; don't restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the WINS service is down and the *Auto-start service?* parameter is set to n. The default is 18 (yellow event indicator).
Event severity level for CPU usage exceeded threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold you set. The default is 8 (red event indicator).
WINS process %CPU maximum threshold	Specify the maximum percentage of CPU that the WINS process can consume before an event is raised. The default is 60%.

47.12 WINSQueries

Use this Knowledge Script to monitor query activity on the Windows Internet Name Service (WINS) server. This script raises an event when query failure rate or the total number of queries exceeds the threshold you set.

47.12.1 Resource Object

WINS service object

47.12.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

47.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise an event when the total number of queries per second or the number of failed queries per second exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of failed and successful queries per second. The default is n.
Failed query maximum threshold	Specify the maximum number of failed queries that can occur per second before an event is raised. The default is 2 query failures per second.
Total query maximum threshold	Specify the maximum number of queries that can occur per second before an event is raised. The default is 50 queries.
Event severity level for failed queries exceeded threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of failed queries exceeds the threshold you set. The default is 8 (red event indicator).
Event severity level for total queries exceeded threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the total number of queries exceeds the threshold you set. The default is 25 (blue event indicator).

47.13 WINSReplication

Use this Knowledge Script to monitor replication activity on the Windows Internet Name Service (WINS) server. This script raises an event if either a planned or network-triggered replication does not occur within the specified period.

47.13.1 Prerequisite

This script requires the Microsoft SNMP service to be running.

47.13.2 Resource Object

WINS service object

47.13.3 Default Schedule

The default interval for this script is **Every 30 minutes**.

47.13.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Community	Provide the SNMP community string. The default is either the community name entered in AppManager Security Manager or *public* if no community name has been entered.
Event if planned replication failed?	Set to **y** to raise events when planned replications fail. The default is y.
Event if network-triggered replication failed	Set to **y** to raise events when network-triggered replications fail. The default is y.
Number of minutes without planned replication maximum threshold	Specify the maximum number of minutes to wait for a planned replication. If replication does not occur within the elapsed time, this script assumes that the planned replication failed. The default is 60 minutes.
Number of minutes without network replication maximum threshold	Specify the maximum number of minutes to wait for a network-triggered replication. If replication does not occur within the elapsed time, this script assumes that the network replication failed. The default is 60 minutes.
Event severity level for planned replication failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a planned replication fails. The default is 8 (red event indicator).
Event severity level for network-triggered replication failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a network-triggered replication fails. The default is 15 (yellow event indicator).
Event severity level for SNMP failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which an SNMP failure occurs. The default is 18 (yellow event indicator).

47.14 WINSStat

Use this Knowledge Script to monitor the total registrations, renewals, and releases on the Windows Internet Name Service (WINS) server. This script raises an event when the number of registrations, renewals, or releases per second exceeds the threshold you set.

47.14.1 Resource Object

WINS service object

47.14.2 Default Schedule

The default interval for this script is **Every 30 minutes**.

47.14.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event?	Set to **y** to raise events when the total number of registrations, renewals, or releases per second on the WINS server exceeds the thresholds you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total numbers of registrations, renewals, and releases per second on the WINS server. The default is n.
Registrations per second maximum threshold	Specify the maximum number of registration requests that can occur per second before an event is raised. The default is 20 requests per second.
Renewals per second maximum threshold	Specify the maximum number of renewal requests that can occur per second before an event is raised. The default is 20 requests per second.
Releases per second maximum threshold	Specify the maximum number of release requests that can occur per second before an event is raised. The default is 20 requests per second.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 15 (yellow event indicator).

48 NetworkDevice Knowledge Scripts

AppManager for Network Devices provides the following Knowledge Scripts for monitoring network devices such as routers, switches, and voice gateways by means of SNMP polling of Management Information Bases (MIBs). Using SNMP `GET` commands, NetworkDevice scripts monitor the basic subsystems that are common to all devices, such as CPU, memory, and the chassis.

AppManager for Network Devices supports SNMP versions 1, 2, and 3.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. Or in the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
ATMLink_QoS	Monitors QoS on ATM links on a Cisco IOS device for traffic class usage, dropped packet rate, and queue depth.
ATMLink_Util	Monitors the usage of the parent resource of the ATM links on a network device.
Chassis_Usage	Monitors the physical chassis of a network device, including CPU, RAM, flash memory, backplane, temperature sensors, voltage sensors, and fan sensors.
Device_Ping	Checks the availability of network devices that respond to ICMP Echo requests.
Device_Syslog	Listens for UDP traffic on port 514.
Device_Uptime	Monitors the number of hours that a network device or its network management component has been operational since its last reboot.
FrameRelayLink_QoS	Monitors QoS on frame relay links on a Cisco IOS device for traffic class usage, dropped packet rate, and queue depth.
FrameRelayLink_Util	Monitors the usage of a parent resource for the frame relay links on a network device.
FXOPort_Health	Monitors signal errors on an FXO port on a network device.
FXOPort_Util	Monitors FXO port usage on a network device.
FXSPort_Health	Monitors signal errors on an FXS port on a network device.
FXSPort_Util	Monitors FXS port usage on a network device.
Host_CPULoaded	Accesses the Host Resource MIB to monitor CPU usage on a device.
Host_DeviceStatus	Accesses the Host Resource MIB to monitor the status and error count for a device.
Host_MemoryUsage	Accesses the Host Resource MIB to monitor memory usage on a device.

Knowledge Script	What It Does
Host_ProcessDown	Accesses the Host Resource MIB to determine whether a specified process is not running on a device.
Host_ProcessUp	Accesses the Host Resource MIB to determine whether a specified process is running on a device.
Host_StorageUsage	Accesses the Host Resource MIB to monitor storage usage on a device.
Interface_Health	Monitors the parent resource for the interfaces on a network device.
IPSubsystem_Util	Monitors the IP subsystem of a network device.
ISDNChannel_CallVolume	Measures the number of incoming calls, the number of outgoing calls, and the percentage of call failures (dropped calls) on a device.
ISDNChannel_Health	Monitors the operational status of ISDN bearer channels and the up-or-down status of signaling channels.
ISDNChannel_Util	Measures the usage of ISDN channels on a device.
LANLink_QoS	Monitors QoS on LAN links on a Cisco IOS device for traffic class usage, dropped packet rate, and queue depth.
LANLink_Util	Monitors the parent resource for the LAN links on a network device.
Report_ChassisUsage	Summarizes the Good-Acceptable-Poor (GAP) and average usage for CPU, memory pool, and backplane for a network device.
Report_DeviceAvailability	Summarizes the availability of selected network devices.
Report_ISDNCallVolume	Summarizes the average ISDN channel call volume for the links on selected devices.
Report_ISDNTimeDetail	Summarizes the average ISDN statistics on selected trunks.
Report_ISDNUtilization	Summarizes the average ISDN channel call volume for the trunks on selected devices.
Report_LinkUtilization	Summarizes average link usage.
Report_QoSUtilization	Summarizes average traffic class statistics for the links on selected devices.
Report_QoSVolume	Summarizes average traffic class statistics for the links on selected devices.
Report_TotalVolume	Summarizes total volume for selected devices.
SingleATMLink_Util	Monitors the usage of the ATM links on a single network device.
SingleFrameRelayLink_Util	Monitors the usage of frame relay links on a single network device.
SingleInterface_Health	Monitors the health of interfaces on a single network device.
SingleLANLink_Util	Monitors the usage of the LAN links on a single network device.
SingleWANLink_Util	Monitors the usage of the serial, T1, or T3 links on a single network device.
SNMPTrap_AddMIB	Add management information bases for monitoring by the SNMPTrap_Async Knowledge Script.
SNMPTrap_Async	Checks for incoming SNMP traps forwarded from NetIQ SNMP Trap Receiver.
WANLink_QoS	Monitors QoS on WAN links on a Cisco IOS device for traffic class usage, dropped packet rate, and queue depth.
WANLink_Util	Monitors the parent resource for the serial, T1, or T3 links on a network device.

Knowledge Script	What It Does
Recommended Knowledge Scripts	Identifies the scripts recommended for optimal monitoring of network devices.

48.1 ATMLink_QoS

Use this Knowledge Script to monitor Quality of Service (QoS) on ATM links on a Cisco IOS device. This script monitors traffic class usage, dropped packet rate, and queue depth. In addition, this script raises an event if a monitored item exceeds the threshold that you set and generates datastreams for all monitored items.

Traffic class

A particular category of traffic on an interface. For example, voice and data can be classified as individual traffic classes.

Queue

The virtual buffer associated with a particular traffic class.

Dropped packet rate

The rate at which packets are dropped because of factors such as queuing, policing, early detection, or traffic shaping.

Queue depth

The number of packets in a queue.

Policy

The action that QoS takes within a traffic class upon the traffic that enters the class, such as dropping packets. Pre-policy traffic is the traffic that flows into a traffic class, before QoS applies a policy. Post-policy is the traffic that leaves a traffic class after a policy has been applied.

48.1.1 Resource Object

NetworkDevice ATM Link Folder

48.1.2 Default Schedule

By default, this script runs every 5 minutes.

48.1.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the ATMLink_QoS job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	

Parameter	How to Set It
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Link name filter	Using regular expression, specify the names of the ATM links you want to monitor or do not want to monitor. Use this parameter in conjunction with the *Include or exclude link name filter* parameter. **Examples** • To monitor all ATM links, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude interface name filter.* • To monitor all ATM links, enter "*" and select **Include** in *Include or exclude link name filter*. • To monitor nothing, enter "*" and select **Exclude** in *Include or exclude link name filter.*
Include or exclude link name filter	Select **Include** to monitor only the ATM links you specified in *Link name filter*. Select **Exclude** to monitor all ATM links except those you specified in *Link name filter.*
Class name filter	Using regular expression, specify the names of the traffic classes you want to monitor. Leave this parameter blank to monitor all traffic classes.
Traffic Class Utilization	
Monitor traffic class utilization?	Select **Yes** to monitor traffic class usage and to activate the parameters in this section. The default is Yes.
Collect data for traffic class utilization?	Select **Yes** to collect data for charts and graphs. The default is No. This script generates datastreams for the pre-policy and post-policy bandwidth used by each configured traffic class.
Threshold - Maximum traffic class utilization	Specify the highest percentage of traffic class usage that can occur before an event is raised. The default is 25%.
Event severity when traffic class utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of traffic class usage exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Collect data for traffic class pre/post policy bytes?	Select **Yes** to collect data for charts and graphs. The default is No. This script creates datastreams for the number of pre- and post-policy bytes per second.
Select unit for traffic class pre/post policy bytes	Select the unit for collecting data for the pre/post policy bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Queue Depth	
Monitor queue depth?	Select **Yes** to monitor queue depth and to activate the parameters in this section. The default is Yes.
Collect data for queue depth?	Select **Yes** to collect data for charts and graphs. The default is No. This script generates datastreams for queue depth (number of packets) by class name.

Parameter	How to Set It
Threshold - Maximum priority queue depth	Specify the maximum number of packets that a priority queue can contain before an event is raised. The default is 0 packets.
Threshold - Maximum non-priority queue depth	Specify the highest number of packets that a non-priority queue can contain before an event is raised. The default is 10 packets.
Event severity when queue depth exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the queue depth exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Dropped Packets	
Monitor dropped packet rate?	Select **Yes** to monitor the rate at which packets are dropped from the traffic class and to activate the parameters in this section. The default is Yes.
Collect data for dropped packet rate?	Select **Yes** to collect data for charts and graphs. the default is No. This script generates datastreams for the percentage of dropped packets, and for the number of packets dropped per second.
Threshold - Maximum dropped packet rate	Specify the maximum rate at which packets can be dropped from the traffic class before an event is raised. The default is 1%.
Event severity when dropped packet rate exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the dropped packet rate exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.2 ATMLink_Util

Use this Knowledge Script to monitor the usage of the parent resource of the Asynchronous Transfer Mode (ATM) links on a network device. This script raises an event if a monitored value exceeds the threshold that you set. In addition, this script generates datastreams for bandwidth usage, packet rate, and packet error rate.

NOTE: ATMLink_Util differs from SingleATMLink_Util in that it lets you monitor all links for all devices of any parent resource. SingleATMLink_Util allows you to monitor selected links for only one device.

You should understand your network's normal behavior so that you know when to examine usage levels more closely.

Determine usage levels on your current network: ethernet, Fiber Distributed Data Interface (FDDI), token ring, and Asynchronous Transfer Mode (ATM). On most networks, usage gradually increases as users begin using more network resources, such as email, network printing, and file sharing. Be concerned with usage peaks that *do not* follow this pattern.

Examine your network's typical usage over time and note whether your network has experienced a gradual or sudden increase in usage.

- A sharp increase in usage indicates an abnormal condition. Search the area of the network where the increase occurred. For example, a device may be causing "broadcast storms."
- A sustained high or low level of usage indicates an increasing or decreasing load on your network. If necessary, redistribute network traffic by segmenting your LAN with a bridge, router, or switch.

48.2.1 Resource Object

NetworkDevice ATM Link Folder

48.2.2 Default Schedule

By default, this script runs every 5 minutes.

48.2.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the ATMLink_Util job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.

Parameter	How to Set It
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Link name filter	Using regular expression, specify the names of the ATM links you want to monitor or do not want to monitor. Use this parameter in conjunction with the *Include or exclude link name filter* parameter. **Examples** • To monitor all ATM links, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude link name filter.* • To monitor all ATM links, enter "*" and select **Include** in *Include or exclude link name filter.* • To monitor nothing, enter "*" and select **Exclude** in *Include or exclude link name filter.*
Include or exclude link name filter	Select **Include** to monitor only the ATM links you specified in *Link name filter*. Select **Exclude** to monitor all ATM links except those you specified in *Link name filter.*
Link Utilization	
Monitor link utilization?	Select **Yes** to monitor link usage and to activate the parameters in this section. The default is Yes.
Collect data for bandwidth utilization?	Select **Yes** to collect data about bandwidth usage for charts and graphs. The default is Yes.
Threshold - Maximum bandwidth utilization	Specify the maximum percentage of bandwidth usage that can occur before an event is raised. The default is 50%.
Event severity when bandwidth utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the bandwidth usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Collect data for bytes sent/received?	Select **Yes** to collect data about sent and received bytes for charts and graphs. The default is Yes.
Select unit for bytes sent/received	Select the unit for collecting data for the sent/received bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Collect data for inbound/outbound bandwidth utilization?	Select **Yes** to collect data for inbound/outbound bandwidth utilization. The data value is the maximum of the bandwidth inbound value or the bandwidth outbound value, whichever value is larger. The default is No.
Link Errors	
Monitor link errors?	Select **Yes** to monitor link errors and to activate the parameters in this section. The default is Yes.
Collect data for link errors?	Select **Yes** to collect data about link errors for charts and graphs. The default is No.
Threshold - Maximum packet errors	Specify the maximum percentage of packet errors that can occur before an event is raised. The default is 50%.

Parameter	How to Set It
Event severity when packet errors exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of packet errors exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.3 Chassis_Usage

Use this Knowledge Script to monitor the physical chassis of a network device and create datastreams for the following:

- CPU usage
- Memory buffer error rate
- Backplane usage
- Voltage values
- Fan status
- Memory poll usage
- Flash memory usage
- Temperature values
- Power supply status

This script raises an event if any value exceeds a specified threshold. In addition, this script generates datastreams for CPU usage, RAM usage, flash memory usage, backplane usage, temperature and voltage states, and power supply and fan status.

48.3.1 Troubleshooting Events

The topic discusses possible causes and corrective actions for events that are raised when usage exceeds the threshold you set. You should understand your network's normal behavior so that you know when to examine usage levels more closely.

Determine usage levels on your current network: ethernet, Fiber Distributed Data Interface (FDDI), token ring, and Asynchronous Transfer Mode (ATM). On most networks, usage gradually increases as users begin using more network resources, such as email, network printing, and file sharing. Be concerned with usage peaks that *do not* follow this pattern.

Examine your network's typical usage over time and note whether your network has experienced a gradual or sudden increase in usage.

- A sharp increase in usage indicates an abnormal condition. Search the area of the network where the increase occurred. For example, a device may be causing "broadcast storms."
- A sustained high or low level of usage indicates an increasing or decreasing load on your network. If necessary, redistribute network traffic by segmenting your LAN with a bridge, router, or switch.

48.3.2 Resource Object

NetworkDevice Chassis Folder

48.3.3 Default Schedule

By default, this script runs every 5 minutes.

48.3.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Chassis_Usage job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
CPU	
Monitor CPU?	Select **Yes** to monitor CPU usage and to activate the parameters in this section. The default is Yes.
Collect data for CPU utilization?	Select **Yes** to collect data about CPU usage for charts and reports. The default is Yes.mum percentage of CPU usage that can occur before an event i
Threshold - Maximum CPU utilization	Specify the maxis raised. The default is 50%.
Event severity when CPU utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which CPU usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event for excessive CPU usage. The default is 10.
RAM	
Monitor RAM?	Select **Yes** to monitor RAM usage and to activate the parameters in this section. The default is Yes. RAM usage includes NVRAM, DRAM, and SRAM, depending on whether you are monitoring a switch or a router.
Collect data for RAM utilization?	Select **Yes** to collect data about RAM usage for charts and reports. The default is Yes.
Threshold - Maximum memory pool utilization	Specify the maximum percentage of memory pool usage that can occur before an event is raised. The default is 50%.This figure represents the maximum usage for all memory pools (NVRAM, DRAM, and SRAM).
Event severity when memory pool utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which memory pool usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event for excessive memory pool usage. The default is 10.
Threshold - Maximum memory buffer error rate	Specify the maximum number of memory buffer errors that can occur per second before an event is raised. The default is 0.
Event severity when memory buffer error rate exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the number of memory buffer errors exceeds the threshold that you set. Enter **0** if you do not want to raise an event for excessive memory buffer error rate. The default is 10.

Parameter	How to Set It
Flash Memory	
Monitor flash memory?	Select **Yes** to monitor flash memory and to activate the parameters in this section. The default is Yes.
Collect data for flash memory utilization?	Select **Yes** to collect data about flash memory usage for charts and reports. The default is No.
Threshold - Maximum flash memory utilization	Specify the maximum percentage of flash memory usage that can occur before an event is raised. The default is 90%.
Event severity when flash memory utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which flash memory usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event for excessive flash memory usage. The default is 10.
Backplane	
Monitor backplane?	Select **Yes** to monitor backplane usage and to activate the parameters in this section. The default is Yes.
Collect data for backplane utilization?	Select **Yes** to collect data about backplane usage for charts and reports. The default is Yes.
Threshold - Maximum backplane utilization	Specify the maximum percentage of backplane usage that can occur before an event is raised. The default is 75%.
Event severity when backplane utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which backplane usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event for excessive backplane usage. The default is 10.
Temperature Sensors	
Monitor temperature sensors?	Select **Yes** to monitor temperature sensors and to activate the parameters in this section. The default is Yes.
Collect data for temperature?	Select **Yes** to collect data about temperature states for charts and reports. The default is No.
Threshold - Maximum temperature	Specify the maximum temperature that can be reached before an event is raised. The default is 50 degrees Celsius.
Event severity when temperature exceeds threshold or sensor state not OK	Set the severity level, between 1 and 40, to indicate the importance of an event in which the temperature exceeds the threshold that you set or if the state of the temperature sensor is not "OK." Enter **0** if you do not want to raise an event. The default is 10.
Voltage Sensors	
Monitor voltage sensors?	Select **Yes** to monitor voltage sensors and to activate the parameters in this section. The default is Yes.
Collect data for voltage sensor state?	Select **Yes** to collect data about voltage states for charts and reports. The default is No.
Event severity when voltage state not OK	Set the severity level, between 1 and 40, to indicate the importance of an event in which the voltage state is not "OK." The default is 10.
Power Supplies	
Monitor power supplies?	Select **Yes** to monitor power supplies and to activate the parameters in this section. The default is Yes.
Collect data for power supply state?	Select **Yes** to collect data about power supply states for charts and reports. The default is No.

Parameter	How to Set It
Event severity when power supply state not OK	Set the severity level, between 1 and 40, to indicate the importance of an event in which the power supply state is not "OK." The default is 10.
Fans	
Monitor fans?	Select **Yes** to monitor fans and to activate the parameters in this section. The default is Yes.
Collect data for fan state?	Select **Yes** to collect data about fan states for charts and reports. The default is No.
Event severity when fan state not OK	Set the severity level, between 1 and 40, to indicate the importance of an event in which the fan state is not "OK." The default is 10.
DSP Cards	
Monitor DSP cards?	Select **Yes** to monitor DSP (Digital Signal Processing) cards and to activate the parameters in this section. The default is Yes. DSP cards provide transcoding functionality between the PSTN and IP network.
Collect data for DSP card utilization?	Select **Yes** to collect data about DSP card resource usage and status. The default is No.
Maximum DSP card utilization	Specify the maximum percentage of DSP card usage that can occur before an event is raised. The default is 75%.
Event severity when DSP card utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which DSP card usage exceeds the threshold that you set. The default is 10.
Event severity when DSP card state not OK	Set the severity level, between 1 and 40, to indicate the importance of an event in which the DSP card state is not "Normal." Events will be raised for the following states: **Warning**, **Critical**, **Fatal**, and **offLine**. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to No.

48.4 Device_Ping

Use this AppManager for Network DevicesKnowledge Script to check the availability of network devices that respond to Internet Control Message Protocol (ICMP) Echo requests. This script raises an event if any value exceeds a specified threshold. In addition, this script generates datastreams for device Coexisting with Microsoft SNMP Trap Serviceavailability.

48.4.1 Resource Object

NetworkDevice

48.4.2 Default Schedule

By default, this script runs every 5 minutes.

48.4.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General	
Collect data for device availability?	Select **Yes** to collect data about timeouts and echo requests for charts and graphs. The default is Yes.
Event severity when ping test fails	Set the severity level, between 1 and 40, to indicate the importance of an event in which a ping test fails. For example, a ping test could fail because the command is not found or because a device's IP address is incorrect. The default is 5.
Echo Settings	
Number of echo requests to send	Specify the number of times to send the ping echo request per job iteration. The default is 3 requests.
Number of seconds before timeout	Specify the maximum number of seconds to wait for a response before timing out ping echo request. The default is 3 seconds.
Maximum number of request timeouts	Specify the maximum number of ping echo request timeouts that you want to allow before raising an event. The default is 1 timeout

Parameter	How to Set It
Require request timeouts to be consecutive?	Select **Yes** if you want the number of ping echo request timeouts to be consecutive before raising an event. For example, you select Yes for this parameter, specify the *Maximum number of request timeouts* to be 2, and specify the *Number of echo requests to send* to be 3. When you run this script, if the first echo request succeeds and second and third echo requests fail, then AppManager raises an event. On the other hand, if the first echo request fails, the second echo request succeeds, and the third echo request fails, then AppManager does not raise an event. If you want to raise an event after the specified number of request timeouts, and the failure need not be consecutive, then select No. The default is Yes.
Consecutive job iterations before raising event	Specify the number of job iterations the script should run consecutively before raising an event. The default is 1 job iteration. For example, specify 2 for this parameter and run this script. Assume that in the first and second iteration, the job meets the specified event condition. In this case, AppManager raises an event in the second iteration. Then in the third iteration, if the job meets the event condition, AppManager raises an event again. On the fourth iteration, if the job does not meet the specified event condition, then AppManager does not raise an event. AppManager raises further events only on the iteration when the event condition is met consecutively following the iterations where the event condition is not met. For example, on the fifth and sixth iteration, if the job meets the specified event criteria, AppManager raises an event in the sixth iteration.

48.5 Device_Syslog

Syslog is a notification system by which devices on a network, such as routers, switches, and even hosts, can send notifications and alerts to a central server. Syslog traffic is transported by UDP over port 514. Use this Knowledge Script to listen for UDP traffic on port 514.

When you change a parameter value in the script while the job is running, the job stops and immediately restarts. It is possible for the job to restart before Windows has a chance to free the port 514. Therefore, the script job will fail on restart because it cannot listen on the Syslog port. You should wait 5 seconds or so before restarting the job. Waiting gives Windows a chance to free the port for listening.

Because AppManager performs active SNMP polling as well as passive Syslog monitoring, you may receive event notifications from both sources. For example, SNMP polling alerts AppManager when an interface goes down and, as a result, you receive an AppManager event. In addition, you may receive a Syslog message that provides the same information.

48.5.1 Prerequisite

Before using the Device_Syslog Knowledge Script, configure your network devices to send Syslog messages to the proxy agent computer. Configuration procedures are device specific. Consult the documentation for your particular device. The following procedure is for Cisco devices.

To configure Cisco devices:

1. Telnet to the device you want to configure.
2. Type the requested password and press [`Enter`].
3. Type `enable` and press [`Enter`].
4. Type the requested password and press [`Enter`].
5. Type `config` and press [`Enter`].
6. Type `logging <host name or IP address of device that you want to configure>`.
7. Exit.

48.5.2 Resource Object

NetworkDevice

Because this script listens on port 514, run this script only once on a proxy agent computer.

48.5.3 Default Schedule

By default, this script runs on an asynchronous schedule in order to report events as they occur. Once you start the Knowledge Script, its job status is “Running” and will remain so until you stop the job.

48.5.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General	
Has the most commonly used panels minimized on the right side	Has the most commonly used panels minimized on the right side
Has the most commonly used panels minimized on the right side	Has the most commonly used panels minimized on the right side
Has the most commonly used panels minimized on the right side	Has the most commonly used panels minimized on the right side
Monitor Syslog messages from all devices?	Select **Yes** to accept all Syslog messages from all devices, including messages from devices that are not in the TreeView pane. If a device is in the TreeView pane, events are raised against the device. If a device is not in the TreeView pane, events are raised against the proxy agent computer. Select **No** to monitor Syslog messages only from those devices on which you run this script. The default is No.
Message text filter	Using regular expression, provide the text you want to find in the Syslog. Leave this parameter blank to find all text.
Event severity when error messages found	Set the severity level, between 1 and 40, to indicate the importance of an event in which error messages are found in the log. The default is 5. Set the severity level to **0** if you do not want to raise an event.
Event severity when warning messages found	Set the severity level, between 1 and 40, to indicate the importance of an event in which warning messages are found in the log. The default is 15. Set the severity level to **0** if you do not want to raise an event.
Event severity when informational messages found	Set the severity level, between 1 and 40, to indicate the importance of an event in which informational messages are found in the log. The default is 0. Set the severity level to **0** if you do not want to raise an event.

48.6 Device_Uptime

Use this Knowledge Script to monitor one of the following:

- The number of hours that a network device has been operational since it was last restarted.
- The number of hours that a device's network management component, such as the SNMP agent, has been operational since it was last restarted.

This script raises an event if the device is restarted during the monitoring interval. In addition, this script generates datastreams for device uptime.

In the event of a device restart, you can set an action on the Actions tab to automatically run the Action_RunDiscoveryNetworkDevice Knowledge Script. The Action script discovers network device resources on the rebooted device.

48.6.1 Resource Object

NetworkDevice

48.6.2 Default Schedule

By default, this script runs every 5 minutes.

48.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Device_Uptime job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.

Parameter	How to Set It
Collect data for uptime?	Select **Yes** to collect data about uptime for charts and graphs. The default is No. This script generates a datastream for the number of hours that a device has been operational since its last reboot or for the number of hours that the management component has been operational since its last restart. The datastream legend is the same for host or management component: "`Device uptime [<device>] (hours)`"
Monitor host uptime or uptime of the network management portion of the system	Select whether to monitor the device itself or the device's management component: • Select **Host uptime** to monitor the uptime of a host device. • Select **Management component uptime** to monitor the management component of a device, independent of the uptime of the host device.
Event severity when device reboots	Set the severity level, between 1 and 40, to indicate the importance of an event in which the monitored device has been rebooted. Set the severity level to **0** if you do not want to raise an event. The default severity level is 5.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.7 FrameRelayLink_QoS

Use this Knowledge Script to monitor Quality of Service (QoS) on frame relay links on a Cisco IOS device. This script monitors traffic class usage, dropped packet rate, and queue depth. This script raises an event if a monitored item exceeds the threshold that you set and generates datastreams for traffic class usage, dropped packet rates, and queue depth by class name.

Traffic class

A particular category of traffic on an interface. For example, voice and data can be classified as individual traffic classes.

Queue

The virtual buffer associated with a particular traffic class.

Dropped packet rate

The rate at which packets are dropped because of factors such as queuing, policing, early detection, or traffic shaping.

Queue depth

The number of packets in a queue.

Policy

The action that QoS takes within a traffic class upon the traffic that enters the class, such as dropping packets. Pre-policy traffic is the traffic that flows into a traffic class, before QoS applies a policy. Post-policy refers to the traffic that leaves a traffic class after a policy has been applied.

48.7.1 Resource Object

NetworkDevice FR Link Folder

48.7.2 Default Schedule

By default, this script runs every 5 minutes.

48.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the FrameRelayLink_QoS job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	

Parameter	How to Set It
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Link name filter	Using regular expression, specify the names of the frame relay links you want to monitor or do not want to monitor. Use this parameter in conjunction with the *Include or exclude link name filter* parameter. **Examples** • To monitor all frame relay links, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude link name filter.* • To monitor all frame relay links, enter `"*"` and select **Include** in *Include or exclude link name filter.* • To monitor nothing, enter `"*"` and select **Exclude** in *Include or exclude link name filter.* • To monitor only serial links, enter `(?=serial)` and select **Include** in *Include or exclude link name filter.* • To monitor all interfaces EXCEPT serial links, enter `(?=serial)` and select **Exclude** in *Include or exclude link name filter.*
Include or exclude link name filter	Select **Include** to monitor only the frame relay links you specified in *Link name filter*. Select **Exclude** to monitor all frame relay links except those you specified in *Link name filter.*
Class name filter	Using regular expression, specify the name of the traffic classes that you want to monitor. Leave this parameter blank to monitor all traffic classes.
Traffic Class Utilization	
Monitor traffic class utilization?	Select **Yes** to monitor traffic class usage and to activate the parameters in this section. The default is Yes.
Collect data for traffic class utilization?	Select **Yes** to collect data for charts and graphs. The default is No. This script creates datastreams for the pre-policy and post-policy bandwidth used by each configured traffic class.
Threshold - Maximum traffic class utilization	Specify the maximum percentage of traffic class usage that can occur before an event is raised. The default is 25%.
Event severity when traffic class utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of traffic class usage exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Collect data for traffic class pre/post policy bytes?	Select **Yes** to collect data for charts and graphs. The default is No. This script creates datastreams for the number of pre-policy and post-policy bytes per second.
Select unit for traffic class pre/post policy bytes	Select the unit for collecting data for the pre/post policy bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Queue Depth	

Parameter	How to Set It
Monitor queue depth?	Select **Yes** to monitor queue depth and to activate the parameters in this section. The default is Yes.
Collect data for queue depth?	Select **Yes** to collect data for charts and graphs. The default is No. This script generates datastreams for queue depth (number of packets) by class name.
Threshold - Maximum priority queue depth	Specify the maximum number of packets that a priority queue can contain before an event is raised. The default is 0 packets.
Threshold - Maximum non-priority queue depth	Specify the highest number of packets that a non-priority queue can contain before an event is raised. The default is 10 packets.
Event severity when queue depth exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the queue depth exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Dropped Packets	
Monitor dropped packet rate?	Select **Yes** to monitor the rate at which packets are dropped from the traffic class and to activate the parameters in this section. The default is Yes.
Collect data for dropped packet rate?	Select **Yes** to collect data for charts and graphs. The default is No.This script generates datastreams for the percentage of dropped packets, and for the number of packets dropped per second.
Threshold - Maximum dropped packet rate	Specify the maximum rate at which packets can be dropped from the traffic class before an event is raised. The default is 1%.
Event severity when dropped packet rate exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the dropped packet rate exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.8 FrameRelayLink_Util

Use this Knowledge Script to monitor the usage of a parent resource for the frame relay links on a network device. A frame relay link uses a packet-switching protocol for connecting devices on a Wide Area Network (WAN). This script raises an event if a monitored value exceeds the threshold you set. In addition, this script generates datastreams for the following:

- Bandwidth usage
- Frame rate
- FECN (Forward Explicit Congestion Notification) rate. A *FECN* is a frame relay message that notifies the receiving device when there is congestion in the network. A FECN bit is sent in the direction in which the frame is traveling, toward its destination.
- BECN (Backward Explicit Congestion Notification) rate. A *BECN* is a frame relay message that notifies the sending device when there is congestion in the network. A BECN bit is sent in the direction from which the frame is traveling, toward its transmission source.

NOTE: FrameRelayLink_Util differs from SingleFrameRelayLink_Util in that it lets you monitor all links for all devices of any parent resource. SingleFrameRelayLink_Util allows you to monitor selected links for only one device.

48.8.1 Resource Object

NetworkDevice FR Link Folder

48.8.2 Default Schedule

By default, this script runs every 5 minutes.

48.8.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the FrameRelayLink_Util job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	

Parameter	How to Set It
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Link name filter	Using regular expression, specify the names of the frame relay links you want to monitor or do not want to monitor. Use this parameter in conjunction with the *Include or exclude link name filter* parameter. **Examples** • To monitor all frame relay links, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude link name filter.* • To monitor all frame relay links, enter `"*"` and select **Include** in *Include or exclude link name filter.* • To monitor nothing, enter `"*"` and select **Exclude** in *Include or exclude link name filter.* • To monitor only serial links, enter `(?=serial)` and select **Include** in *Include or exclude link name filter.* • To monitor all interfaces EXCEPT serial links, enter `(?=serial)` and select **Exclude** in *Include or exclude link name filter.*
Include or exclude link name filter	Select **Include** to monitor only the frame relay links you specified in *Link name filter*. Select **Exclude** to monitor all frame relay links except those you specified in *Link name filter.*
Link Utilization	
Monitor link utilization?	Select **Yes** to monitor link usage and to activate the parameters in this section. The default is Yes.
Collect data for link bandwidth utilization?	Select **Yes** to collect data about bandwidth usage for charts and graphs. The default is Yes.
Threshold - Maximum bandwidth utilization	Specify the maximum percentage of bandwidth usage that can occur before an event is raised. The default is 50%.
Event severity when bandwidth utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the bandwidth usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Collect data for bytes sent/received?	Select **Yes** to collect data about sent and received bytes for charts and graphs. The default is Yes.
Select unit for bytes sent/received	Select the unit for collecting data for the sent/received bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Collect data for inbound/outbound bandwidth utilization?	Select **Yes** to collect data for inbound/outbound bandwidth utilization. The data value is the maximum of the bandwidth inbound value or the bandwidth outbound value, whichever value is larger. The default is No.
Link Errors	
Monitor FECNs/BECNs?	Select **Yes** to monitor FECN and BECN rates and to activate the parameters in this section. The default is Yes.

Parameter	How to Set It
Collect data for FECNs/BECNs?	Select **Yes** to collect data about FECN and BECN rates for charts and graphs. The default is No.
Threshold - Maximum FECNs/BECNs	Specify the maximum percentage of FECN/BECN rates that can occur before an event is raised. The default is 8%.
Event severity when FECNs/BECNs exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of FECN/BECN rates exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.9 FXOPort_Health

Use this Knowledge Script to monitor signal errors on a Foreign Exchange Office (FXO) port on a network device. This script raises an event if the number of signal errors exceeds the specified threshold. In addition, this script generates datastreams for signal errors.

48.9.1 Resource Object

NetworkDevice FXO Port Folder

48.9.2 Default Schedule

By default, this script runs every 5 minutes.

48.9.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the FXOPort_Health job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Collect data for signal errors?	Select **Yes** to collect data about signal errors for charts and graphs. The default is No.
Threshold - Maximum signal errors	Specify the maximum number of signal errors that can occur before an event is raised. The default is 0 errors.
Event severity when signal errors exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the number of signal errors exceeds the threshold that you set. Enter **0** if you do not want to raise an event for excessive signal errors. The default is 10.

Parameter	How to Set It
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.10 FXOPort_Util

Use this Knowledge Script to monitor Foreign Exchange Office (FXO) port usage on a network device. This script raises an event if port usage exceeds the specified threshold. In addition, this script generates datastreams for port usage.

48.10.1 Resource Object

NetworkDevice FXO Port Folder

48.10.2 Default Schedule

By default, this script runs every 5 minutes.

48.10.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the FXOPort_Util job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Collect data for FXO port utilization?	Select **Yes** to collect data about port usage for charts and graphs. The default is Yes.
Threshold - Maximum FXO port utilization	Specify the maximum percentage of port usage that can occur before an event is raised. The default is 80%.
Event severity when port utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which port usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event for port usage. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.11 FXSPort_Health

Use this Knowledge Script to monitor signal errors on a Foreign Exchange Station (FXS) port on a network device. This script raises an event if the number of signal errors exceeds the specified threshold. In addition, this script generates datastreams for signal errors.

48.11.1 Resource Object

NetworkDevice FXS Port Folder

48.11.2 Default Schedule

By default, this script runs every 5 minutes.

48.11.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the FXSPort_Health job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Collect data for signal errors?	Select **Yes** to collect data about signal errors for charts and graphs. The default is No.
Threshold - Maximum signal errors	Specify the maximum number of signal errors that can occur before an event is raised. The default is 0 errors.
Event severity when signal errors exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the number of signal errors exceeds the threshold that you set. Enter **0** if you do not want to raise an event for excessive signal errors. The default is 10.

Parameter	How to Set It
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.12 FXSPort_Util

Use this Knowledge Script to monitor Foreign Exchange Station (FXS) port usage on a network device. This script raises an event if port usage exceeds the specified threshold. In addition, this script generates datastreams for port usage.

48.12.1 Resource Object

NetworkDevice FXS Port Folder

48.12.2 Default Schedule

By default, this script runs every 5 minutes.

48.12.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the FXSPort_Util job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Collect data for FXS port utilization?	Select **Yes** to collect data about port usage for charts and graphs. The default is Yes.
Threshold - Maximum FXS port utilization	Specify the maximum percentage of port usage that can occur before an event is raised. The default is 80%.
Event severity when port utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which port usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event for port usage. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.13 Host_CPULoaded

Use this Knowledge Script to access the Host Resource MIB to monitor CPU usage on a host device. This script raises an event if CPU usage exceeds the threshold that you set. In addition, this script generates a datastream for percentage of CPU usage during the monitoring period.

NOTE: For a Nortel CS1000 version 4.5 Call Server, this script monitors call capacity usage rather than CPU usage. In version 4.5 devices, the MIB value for the CPU processor load represents call capacity usage.

48.13.1 Resource Object

NetworkDevice Host Processor

48.13.2 Default Schedule

By default, this script runs every 5 minutes.

48.13.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Host_CPULoaded job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Collect data for CPU utilization?	Select **Yes** to collect data for charts, graphs, and reports. When enabled, data collection returns the overall CPU usage percentage. The default is No.
Threshold - Maximum CPU utilization	Specify the maximum CPU usage that must occur before an event is raised. The default is 50%.
Event severity when CPU utilization exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. If you do not want to raise an event, set the severity level to **0**. The default is 10.

Parameter	How to Set It
Raise one-time events?	Select **Yes** to raise an event for all one-time events. If you set this parameter to Yes, then AppManager raises an event when a particular performance counter cannot be found in an iteration. For example, if this script does not find a particular performance counter in the first iteration, AppManager raises an event on the first iteration and does not raise further events for consecutive failures. This script raises further one-time events only on the iteration when there are failure events following successful retrieval of the performance counters. If you do not want to see such one-time events, set this parameter to **No**.

48.14 Host_DeviceStatus

Use this Knowledge Script to access the Host Resource MIB to monitor the status of a device and the number of errors that have occurred since the last iteration of the script. This script raises an event if a device is down or if errors occur. In addition, this script generates datastreams for device status and the number of errors.

NOTE: This script retrieves the error count from the DeviceErrors field of the Host Resource MIB.

48.14.1 Resource Object

NetworkDevice Host Device

48.14.2 Default Schedule

By default, this script runs every 5 minutes.

48.14.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Host_DeviceStatus job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Raise event if device is down?	Select **Yes** to raise an event if the monitored device is down. The default is Yes.
Event severity when device is down	Set the severity level, between 1 and 40, to indicate the importance of an event in which the monitored device is down. The default is 10.
Collect data for device status?	Select **Yes** to collect data for charts, graphs, and reports. When enabled, data collection returns 100 if the device is up or 0 if the device is down. The default is No.

Parameter	How to Set It
Raise event if device errors occur?	Select **Yes** to raise an event if errors occurred since the last iteration of the script. The default is Yes.
Event severity when device errors occur	Set the severity level, between 1 and 40, to indicate the importance of an event in which errors occurred since the last iteration of the script. The default is 10.
Collect data for device errors?	Select **Yes** to collect data for charts, graphs, and reports. When enabled, data collection returns a datastream for the number of errors that have occurred since the last iteration of the script. The default is No.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. If you set this parameter to Yes, then AppManager raises an event when a particular performance counter cannot be found in an iteration. For example, if this script does not find a particular performance counter in the first iteration, AppManager raises an event on the first iteration and does not raise further events for consecutive failures. This script raises further one-time events only on the iteration when there are failure events following successful retrieval of the performance counters. If you do not want to see such one-time events, set this parameter to No.

48.15 Host_MemoryUsage

Use this Knowledge Script to access the Host Resource MIB to monitor memory usage on a device. This script raises an event if memory usage exceeds the threshold you set. In addition, this script generates a datastream for memory usage on the device.

48.15.1 Resource Object

NetworkDevice Host Memory

48.15.2 Default Schedule

By default, this script runs every 5 minutes.

48.15.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Host_MemoryUsage job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Collect data for memory usage?	Select **Yes** to collect data for charts, graphs, and reports. When enabled, data collection returns the percentage of memory usage for the monitoring period. The default is No.
Threshold - Maximum memory usage	Specify the maximum memory usage that must occur before an event is raised. The default is 90%.
Event severity when memory usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory usage exceeds the threshold. If you do not want to raise an event, set the severity level to **0**. The default is 10.

Parameter	How to Set It
Raise one-time events?	Select **Yes** to raise an event for all one-time events. If you set this parameter to Yes, then AppManager raises an event when a particular performance counter cannot be found in an iteration. For example, if this script does not find a particular performance counter in the first iteration, AppManager raises an event on the first iteration and does not raise further events for consecutive failures. This script raises further one-time events only on the iteration when there are failure events following successful retrieval of the performance counters. If you do not want to see such one-time events, set this parameter to No.

48.16 Host_ProcessDown

Use this Knowledge Script to access the Host Resource MIB to determine whether specified processes are not running. This script raises an event if a specified process is not running. In addition, this script generates datastreams for process status.

48.16.1 Resource Object

NetworkDevice Host Processor Folder

48.16.2 Default Schedule

By default, this script runs every 5 minutes.

48.16.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Host_ProcessDown job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Raise event if process is not running?	Select **Yes** to raise an event if a specified process is not running. The default is Yes.
Collect data for process status?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns a value of 100 when a specified process is running, or a value of 0 when the process is not running. The default is No.
Processes to monitor	Specify one or more process names, separated by commas and no spaces. For example: `grep.exe,batch.exe` **NOTE:** If the device being monitored is running on Microsoft Windows, the process name specified should match the Image Name seen on the Process tab in Task Manager.

Parameter	How to Set It
Event severity when process is not running	Set the severity level, from 1 to 40, to indicate the importance of an event in which specified processes are not running. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. If you set this parameter to Yes, then AppManager raises an event when a particular performance counter cannot be found in an iteration. For example, if this script does not find a particular performance counter in the first iteration, AppManager raises an event on the first iteration and does not raise further events for consecutive failures. This script raises further one-time events on the iteration when there are failure events following successful retrieval of the performance counters. If you do not want to see such one-time events, set this parameter to **No**.

48.17 Host_ProcessUp

Use this Knowledge Script to access the Host Resource MIB to verify whether a specified process is running. This script raises an event if a specified process is running and generates datastreams for process status.

48.17.1 Resource Object

NetworkDevice Host Processor Folder

48.17.2 Default Schedule

By default, this script runs every 5 minutes.

48.17.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Host_ProcessUp job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Raise event if process is running?	Select **Yes** to raise an event if a specified process is running. The default is Yes.
Collect data for process status?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns a value of 100 when a specified process is running, or a value of 0 when the process is not running. The default is No.
Processes to monitor	Specify one or more process names, separated by commas and no spaces. For example: `grep.exe,batch.exe` **NOTE:** If the device being monitored is running on Microsoft Windows, the process name specified should match the Image Name seen on the **Process** tab in Task Manager.

Parameter	How to Set It
Event severity when process is running	Set the severity level, from 1 to 40, to indicate the importance of an event in which the specified processes are running. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. If you set this parameter to Yes, then AppManager raises an event when a particular performance counter cannot be found in an iteration. For example, if this script does not find a particular performance counter in the first iteration, AppManager raises an event on the first iteration and does not raise further events for consecutive failures. This script raises further one-time events only on the iteration when there are failure events following successful retrieval of the performance counters. If you do not want to see such one-time events, set this parameter to **No**.

48.18 Host_StorageUsage

Use this Knowledge Script to access the Host Resource MIB to monitor storage usage on a device. This script raises an event if storage usage exceeds the threshold that you set. In addition, this script generates a datastream for storage usage on the device.

48.18.1 Resource Object

NetworkDevice Host Storage

48.18.2 Default Schedule

By default, this script runs every 5 minutes.

48.18.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Host_StorageUsage job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Collect data for storage usage?	Select **Yes** to collect data for charts, graphs, and reports. When enabled, data collection returns the percentage of storage usage for the monitoring period. The default is No.
Threshold - Maximum storage usage	Specify the maximum storage usage that can occur before an event is raised. The default is 90%.
Event severity when storage usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which storage usage exceeds the threshold. If you do not want to raise an event, set the severity level to **0**. The default is 10.

Parameter	How to Set It
Raise one-time events?	Select **Yes** to raise an event for all one-time events. If you set this parameter to Yes, then AppManager raises an event when a particular performance counter cannot be found in an iteration. For example, if this script does not find a particular performance counter in the first iteration, AppManager raises an event on the first iteration and does not raise further events for consecutive failures. This script raises further one-time events only on the iteration when there are failure events following successful retrieval of the performance counters. If you do not want to see such one-time events, set this parameter to No.

48.19 Interface_Health

Use this Knowledge Script to monitor the parent resource for the interfaces on a network device. This script raises an event if the interface status changes or if any value exceeds a specified threshold. This script generates datastreams indicating the number of "up" interfaces and the total number of interfaces.

NOTE: Interface_Health differs from SingleInterface_Health in that it lets you monitor all interfaces for all devices of any parent resource. SingleInterface_Health allows you to monitor selected interfaces for only one device.

48.19.1 Troubleshooting Events

The table below identifies possible causes and corrective actions for events that are raised when an interface's status changes. These events can lead to unacceptable service levels for an interface that remains down.

Narrow the usage problem to ports that have excessively high or low usage. If necessary, redistribute network traffic by segmenting your LAN with a bridge, router, or switch.

Determine usage levels on your current network. Try to locate the segments that are experiencing high or low usage levels, which are an indicator of the usage on the chassis.

Possible Cause	Corrective Action
No cable connected	Reconnect the cable on the switch to a known good device.
Wrong port	Ensure both ends of the cable are plugged into the correct ports.
Device has no power	Ensure both devices are powered on and connected to a power source.
Wrong cable type	Verify your cable selection.
Bad cable	Swap the suspect cable with a known good cable. Look for broken or missing pins on the connector.
Loose connections	Unplug a cable and reinsert it. A cable may not be as fully seated in a jack as it appears.
Patch panels	Eliminate faulty patch panel connections. If possible, bypass the patch panel to rule it out as a possible cause.
Media convertors	Eliminate faulty media convertors, such as fiber-to-copper. If possible, bypass the media convertor to rule it out as a possible cause.
Bad or wrong gigabit	Swap the suspect GBOC with a known good GBIC.
Interface convertor (GBIC)	Verify hardware and software support for this type of GBIC.
Bad port or module	Move the cable to a known good port to troubleshoot a suspect port or module.
Port, interface, or module not enabled	Use the `show port` command for CatOS or the `show interface` command for Cisco IOS to look for errdisable, disable, or shutdown status. Use the `show module` command to look for faulty status, which could indicate a hardware problem.

48.19.2 Resource Object

NetworkDevice Interface Folder

48.19.3 Default Schedule

By default, this script runs every 5 minutes.

48.19.4 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Interface_Health job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Filter details	
Interface name filter	Using regular expression, provide the name of the interface for the devices you want to monitor or the devices you do not want to monitor. **Examples** • To monitor all interfaces, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude interface name filter.* • To monitor all interfaces, enter `"*"` and select **Include** in *Include or exclude interface name filter.* • To monitor nothing, enter `"*"` and select **Exclude** in *Include or exclude interface name filter.* • To monitor only ethernet interfaces, enter `(?=Ethernet)` and select **Include** in *Include or exclude interface name filter.* • To monitor all interfaces EXCEPT ethernet interfaces, enter `(?=Ethernet)` and select **Exclude** in *Include or exclude interface name filter.*
Include or exclude interface name filter	Select **Include** to monitor only the devices for the interfaces you specified in *Interface name filter*. Select **Exclude** to monitor all devices except for those associated with the interfaces you specified in *Interface name filter.*

Parameter	How to Set It
Collect data for operational interfaces and total interfaces?	Select **Yes** to collect data about the number of interfaces that are operational and the total number of interfaces for use in charts and reports. The default is No.
Event severity when interface goes down	Set the severity level, between 1 and 40, to indicate the importance of an event in which the interface's operational status changes from Up to Down. Enter **0** if you do not want to raise an event. The default is 5. By default, this script raises one event only when the operational status changes to Down. If you want to raise an event every time the Knowledge Script runs to indicate that the interface is *still* down, use the *Raise the "Interface down" event on every job iteration* parameter.
Event severity when interface comes up	Set the severity level, between 1 and 40, to indicate the importance of an event in which the interface's operational status changes from Down to Up. Enter **0** if you do not want to raise an event. The default is 25.
Event severity when interface goes administratively down	Set the severity level, between 1 and 40, to indicate the importance of an event in which the interface's administrative status changes from Up to Down. The default is 15. By default, this script raises one event only when the administrative status changes to Down. If you want to raise an event every time the Knowledge Script runs to indicate that the interface is *still* down, use the *Raise the "Interface down" event on every job iteration* parameter.
Event severity when interface comes administratively and operationally back up	Set the severity level, between 1 and 40, to indicate the importance of an event in which the interface's administrative *and* operational statuses change from Down to Up. The default is 30.
Raise the "Interface down" event on every job iteration	Select **Yes** to raise an event for each job iteration in which an interface's operational or administrative status is Down. To raise one event only when the status changes from Up to Down, set this parameter to No. The default is No.
Ignore the administratively down interfaces	Select **Yes** to prevent AppManager from raising an event when an interface is down for administrative purposes. Accept the default of **No** if you want AppManager to raise an event when an interface is down for administrative purposes.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.20 IPSubsystem_Util

Use this Knowledge Script to monitor the IP subsystem of a network device, including inbound and outbound packet rates and packet error rates. This script raises an event if the packet error rate exceeds the threshold you set. In addition, this script generates datastreams for packet error rates and the number of packet errors.

48.20.1 Resource Object

NetworkDevice IP Subsystem

48.20.2 Default Schedule

By default, this script runs every 5 minutes.

48.20.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the IPSubsystem_Util job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Collect data for packet rate and packet errors?	Select **Yes** to collect data about packet rates and packet errors for charts and graphs. The default is No.
Threshold - Maximum packet error rate	Specify the maximum packet error rate that can occur before an event is raised. The default is 8%.
Event severity when packet error rate exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the packet error rate exceeds the threshold that you set. Enter **0** if you do not want to raise an event for excessive packet error rate. The default is 10.

Parameter	How to Set It
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to No.

48.21 ISDNChannel_CallVolume

Use this Knowledge Script to measure the number of incoming calls, the number of outgoing calls, and the percentage of call failures (dropped calls) on a device. This script raises an event if the dropped call rate exceeds the threshold you set. In addition, this script generates datastreams for incoming and outgoing call rates and dropped calls.

48.21.1 Resource Object

NetworkDevice ISDN Channel Folder

48.21.2 Default Schedule

By default, this script runs every 5 minutes.

48.21.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the ISDNChannel_CallVolume job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Filter Details	
Channel name filter	Using regular expression, specify the names of the channels you want to monitor or do not want to monitor. Use this parameter in conjunction with the *Include or exclude channel name filter* parameter. **Examples** • To monitor all channels, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude channel name filter.* • To monitor all channels, enter "*" and select **Include** in *Include or exclude channel name filter.* • To monitor nothing, enter "*" and select **Exclude** in *Include or exclude channel name filter.*

Parameter	How to Set It
Include or exclude channel name filter	Select **Include** to monitor only the channels you specified in *Channel name filter*. Select **Exclude** to monitor all channels except those you specified in *Channel name filter.*
Collect data for call rate and dropped calls?	Select **Yes** to collect data about incoming call rates, outgoing call rates, and percentage of dropped calls for charts and graphs.
Threshold - Maximum dropped call rate	Specify the maximum percentage of dropped (failed) calls that can occur before an event is raised.
Event severity when dropped call rate exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of dropped calls exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to No.

48.22 ISDNChannel_Health

Use this Knowledge Script to monitor the operational status of ISDN bearer channels and the up-or-down status of signaling channels. This script raises an event if the percentage of operational ISDN bearer channels falls below the threshold that you set or if a signaling channel is down. In addition, this script generates datastreams for operational ISDN bearer channels (as a percentage of all bearer channels) and signaling channel status.

48.22.1 Resource Object

NetworkDevice ISDN Channel Folder

48.22.2 Default Schedule

By default, this script runs every 5 minutes.

48.22.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the ISDNChannel_Health job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Filter Details	
Channel name filter	Using regular expression, specify the names of the channels you want to monitor or do not want to monitor. Use this parameter in conjunction with the *Include or exclude channel name filter* parameter. **Examples** • To monitor all channels, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude channel name filter.* • To monitor all channels, enter "*" and select **Include** in *Include or exclude channel name filter.* • To monitor nothing, enter "*" and select **Exclude** in *Include or exclude channel name filter.*

Parameter	How to Set It
Include or exclude channel name filter	Select **Include** to monitor only the channels you specified in *Channel name filter*. Select **Exclude** to monitor all channels except those you specified in *Channel name filter.*
Collect data for operational bearer channels?	Select **Yes** to collect data for charts and graphs. If enabled, data collection returns the percentage of bearer channels that were operational during the monitoring period. The default is Yes.
Threshold - Minimum operational bearer channels	Specify the minimum percentage of channels that must be operational to prevent an event from being raised. The default is 99%.
Event severity when operational bearer channels fall below threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the number of operational channels falls below the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Collect data for ISDN signaling channel status?	Select **Yes** to collect data for charts and graphs. If enabled, data collection returns 100 if the signaling channel is up and 0 if the signaling channel is down. The default is Yes.
Event severity when the ISDN signaling channel is down	Set the severity level, between 1 and 40, to indicate the importance of an event in which the signaling channel is down. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to No.

48.23 ISDNChannel_Util

Use this Knowledge Script to measure the usage of ISDN channels on a device. This script raises an event if channel usage exceeds the specified threshold. In addition, this script generates datastreams for ISDN channel usage.

48.23.1 Resource Object

NetworkDevice ISDN Channel Folder

48.23.2 Default Schedule

By default, this script runs every minute.

48.23.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the ISDNChannel_Util job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Filter Details	
Channel name filter	Using regular expression, specify the names of the channels you want to monitor or do not want to monitor. Use this parameter in conjunction with the *Include or exclude channel name filter* parameter. **Examples** • To monitor all channels, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude channel name filter.* • To monitor all channels, enter "*" and select **Include** in *Include or exclude channel name filter.* • To monitor nothing, enter "*" and select **Exclude** in *Include or exclude channel name filter.*

Parameter	How to Set It
Include or exclude channel name filter	Select **Include** to monitor only the channels you specified in *Channel name filter*. Select **Exclude** to monitor all channels except those you specified in *Channel name filter.*
Collect data for ISDN channel utilization?	Select **Yes** to collect data about channel usage for charts and graphs. The default is Yes.
Threshold - Maximum ISDN channel utilization	Specify the maximum percentage of channel usage that can occur before an event is raised. The default is 80%.
Event severity when ISDN channel utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of channel usage exceeds the threshold that you set. The default is 10. Set the severity level to **0** if you do not want to raise an event.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to No.

48.24 LANLink_QoS

Use this Knowledge Script to monitor Quality of Service (QoS) on LAN links on a Cisco IOS device. This script monitors traffic class usage, dropped packet rate, and queue depth. This script raises an event if a monitored value exceeds the threshold you set.

Traffic class

A particular category of traffic on an interface. For example, voice and data can be classified as individual traffic classes.

Queue

The virtual buffer associated with a particular traffic class.

Dropped packet rate

The rate at which packets are dropped because of factors such as queuing, policing, early detection, or traffic shaping.

Queue depth

The number of packets in a queue.

Policy

The action that QoS takes within a traffic class upon the traffic that enters the class, such as dropping packets. Pre-policy traffic is the traffic that flows into a traffic class, before QoS applies a policy. Post-policy is the traffic that leaves a traffic class after a policy has been applied.

48.24.1 Resource Object

NetworkDevice LAN Link Folder

48.24.2 Default Schedule

By default, this script runs every 5 minutes.

48.24.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the LANLink_QoS job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	

Parameter	How to Set It
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Link name filter	Using regular expression, specify the names of the LAN links you want to monitor or do not want to monitor. Use this parameter in conjunction with the *Include or exclude link name filter* parameter. **Examples** • To monitor all LAN links, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude link name filter.* • To monitor all LAN links, enter `"*"` and select **Include** in *Include or exclude link name filter.* • To monitor nothing, enter `"*"` and select **Exclude** in *Include or exclude link name filter.* • To monitor only ip links, enter `(?=ip)` and select **Include** in *Include or exclude link name filter.* • To monitor all interfaces EXCEPT ip links, enter `(?=ip)` and select **Exclude** in *Include or exclude link name filter.*
Include or exclude link name filter	Select **Include** to monitor only the LAN links you specified in *Link name filter*. Select **Exclude** to monitor all LAN links except those you specified in *Link name filter.*
Class name filter	Using regular expression, specify the name of the traffic classes that you want to monitor. Leave this parameter blank to monitor all traffic classes.
Traffic Class Utilization	
Monitor traffic class utilization?	Select **Yes** to monitor traffic class usage and to activate the parameters in this section. The default is Yes.
Collect data for traffic class utilization?	Select **Yes** to collect data for charts and graphs. This script generates datastreams for the pre-policy and post-policy bandwidth used by each configured traffic class. The default is No.
Threshold - Maximum traffic class utilization	Specify the maximum percentage of traffic class usage that can occur before an event is raised. The default is 25%.
Event severity when traffic class utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of traffic class usage exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Collect data for traffic class pre/post policy bytes?	Select **Yes** to collect data for charts and graphs. The default is No. This script generates datastreams for the number of pre- and post-policy bytes per second.
Select unit for traffic class pre/post policy bytes	Select the unit for collecting data for the pre/post policy bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Queue Depth	
Monitor queue depth?	Select **Yes** to monitor the queue depth. The default is Yes.

Parameter	How to Set It
Collect data for queue depth?	Select **Yes** to collect data for charts and graphs. The default is No. This script generates datastreams for queue depth (number of packets) by class name.
Threshold - Maximum priority queue depth	Specify the highest number of packets that a priority queue can contain before an event is raised. The default is 0 packets.
Threshold - Maximum non-priority queue depth	Specify the highest number of packets that a non-priority queue can contain before an event is raised. The default is 10 packets.
Event severity when queue depth exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the queue depth exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Dropped Packets	
Monitor dropped packet rate?	Select **Yes** to monitor the rate at which packets are dropped from the traffic class and to activate the parameters in this section. The default is Yes.
Collect data for dropped packet rate?	Select **Yes** to collect data for charts and graphs. The default is No. This script generates datastreams for the percentage of dropped packets, and for the number of packets dropped per second.
Threshold - Maximum dropped packet rate	Specify the maximum rate at which packets can be dropped from the traffic class before an event is raised. The default is 1%.
Event severity when dropped packet rate exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the dropped packet rate exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to No.

48.25 LANLink_Util

Use this Knowledge Script to monitor the parent resource for the Local Area Network (LAN) links on a network device. This script creates datastreams for bandwidth usage, inbound and outbound packet rates, and inbound and outbound packet error rates. This script raises an event if a monitored value exceeds the threshold you set. In addition, this script generates datastreams for bandwidth usage and link errors.

NOTE: LANLink_Util differs from SingleLANLink_Util in that it lets you monitor all links for all devices of any parent resource. SingleLANLink_Util allows you to monitor selected links for only one device.

48.25.1 Resource Object

NetworkDevice LAN Link Folder

48.25.2 Default Schedule

By default, this script runs every 5 minutes.

48.25.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the LANLink_Util job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.

Parameter	How to Set It
Link name filter	Using regular expressions, specify the names of the LAN links you want to monitor or do not want to monitor. Use this parameter in conjunction with the *Include or exclude link name filter* parameter. **Examples** • To monitor all LAN links, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude link name filter.* • To monitor all LAN links, enter `"*"` and select **Include** in *Include or exclude link name filter.* • To monitor nothing, enter `"*"` and select **Exclude** in *Include or exclude link name filter.* • To monitor only ip links, enter `(?=ip)` and select **Include** in *Include or exclude link name filter.* • To monitor all interfaces EXCEPT ip links, enter `(?=ip)` and select **Exclude** in *Include or exclude link name filter.*
Include or exclude link name filter	Select **Include** to monitor only the LAN links you specified in *Link name filter*. Select **Exclude** to monitor all LAN links except those you specified in *Link name filter.*
Link Utilization	
Monitor link utilization?	Select **Yes** to monitor link usage and to activate the parameters in this section. The default is Yes.
Collect data for bandwidth utilization?	Select **Yes** to collect data about bandwidth usage for charts and graphs. The default is Yes.
Threshold - Maximum bandwidth utilization	Specify the maximum percentage of bandwidth usage that can occur before an event is raised. The default is 50%.
Event severity when bandwidth utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the bandwidth usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Collect data for bytes sent/received?	Select **Yes** to collect data about sent and received bytes for charts and graphs. The default is No.
Select unit for bytes sent/received	Select the unit for collecting data for the sent/received bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Collect data for inbound/outbound bandwidth utilization?	Select **Yes** to collect data for inbound/outbound bandwidth utilization. The data value is the maximum of the bandwidth inbound value or the bandwidth outbound value, whichever value is larger. The default is No.
Link Errors	
Monitor link errors?	Select **Yes** to monitor link errors and to activate the parameters in this section. The default is Yes.
Collect data for link errors?	Select **Yes** to collect data about link errors for charts and graphs. The default is No.
Threshold - Maximum packet errors	Specify the maximum percentage of packet errors that can occur before an event is raised. The default is 8%.

Parameter	How to Set It
Event severity when packet errors exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of packet errors exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Include discards in link errors?	Select **Yes** to include discarded incoming packets in the packet error calculation. The default is Yes. If set to Yes, the calculation for packet errors is as follows: `(notdeliveredpackets/deliveredpackets)*100%/time elapsed` where *delivered packets* = sum(UCastPkts, NUCastPkts) and *not delivered packets* = sum(errors, discards, unknown protocols) Errors are defined as packet errors. Unknown protocols are unsupported protocols. Discards are packets discarded for any other reason.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.26 Report_DeviceAvailability

Use this Knowledge Script to summarize the availability of selected network devices over a specified time period. This script uses the data collected by the Device_Ping Knowledge Script.

48.26.1 Resource Object

Report agent

48.26.2 Default Schedule

By default, this script runs once.

48.26.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
Data Source	
Select devices for report	Select the network devices whose data you want to include in your report.
Select Knowledge Script	Specify the name of the Knowledge Script to include in your report. Specify one script per report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregate by	Select the time period by which the data in your report is aggregated. The default is Hour.
Report Settings	
Decimal accuracy for % values	Specify the number of decimal places that you want to see in the percentage values generated by this report. The default is 3.
Include parameter card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include charts?	Select **Yes** to include charts of datastream values in the report. The default is Yes.
Include tables?	Select **Yes** to include a table of datastream values in the report. The default is Yes.
Select chart style	Define the graphic properties of the charts in your report. The default chart style is Line.
Select output folder	Set parameters for the output folder. The default folder name is NetworkDeviceAvailability.

Parameter	How to Set It
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. The default is No. The job ID helps you correlate a specific instance of a Report script with the corresponding report.
Select properties	Set the report properties as desired. The default report name is Network Device Availability.
Add time stamp to title?	Select **Yes** to append a time stamp to the title of the report, making each title unique. The default is No. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event when report succeeds?	Select **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

48.27 Report_ChassisUsage

Use this Knowledge Script to summarize the Good-Acceptable-Poor (GAP) ratings and average usage for CPU, memory pool, and backplane for a network device. This script uses the data collected by the Chassis_Usage Knowledge Script.

48.27.1 Resource Object

Report agent

48.27.2 Default Schedule

By default, this script runs once.

48.27.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
Data Source	
Select device(s) for report	Select the network devices whose data you want to include in your report.
Select Knowledge Scripts	Select the Knowledge Scripts to include in your report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekdays	Select the days of the week to include in your report. The default is every day of the week.
Aggregate by	Select the time period by which the data in your report is aggregated. The default is Hour.
Chart Thresholds	
Good-Acceptable CPU utilization threshold	Specify the Good-Acceptable CPU usage threshold to display on the charts in the report. The default is 30%.
Acceptable-Poor CPU utilization threshold	Specify the Acceptable-Poor CPU usage threshold to display on the charts in the report. The default is 50%.
Good-Acceptable memory pool utilization threshold	Specify the Good-Acceptable memory pool usage threshold to display on the charts in the report. The default is 30%.
Acceptable-Poor memory pool utilization threshold	Specify the Acceptable-Poor memory pool usage threshold to display on the charts in the report. The default is 50%.
Good-Acceptable backplane utilization threshold	Specify the Good-Acceptable backplane usage threshold to display on the charts in the report. The default is 50%.
Acceptable-Poor backplane utilization threshold	Specify the Acceptable-Poor backplane usage threshold to display on the charts in the report. The default is 75%.
Report Settings	

Parameter	How to Set It
Include parameter card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include charts?	Select **Yes** to include charts of datastream values in the report. The default is Yes.
Include tables?	Select **Yes** to include tables of datastream values in the report. The default is Yes.
Select Average Utilization chart properties	Set chart properties, such as style, thresholds, and size. The default style is Area.
Select output folder	Set parameters for the output folder. The default folder name is NetworkDeviceChassisUsage.
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. The default is No. The job ID helps you correlate a specific instance of a Report script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default report name is Network Device Chassis Usage Summary.
Add time stamp to title?	Select **Yes** to append a time stamp to the title of the report, making each title unique. The default is No. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event when report succeeds?	Select **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

48.28 Report_ISDNCallVolume

Use this Knowledge Script to summarize the average ISDN channel call volume for the links on selected devices over a time range. This Knowledge Script uses data collected by the ISDNChannel_CallVolume Knowledge Script.

48.28.1 Resource Object

Report agent

48.28.2 Default Schedule

By default, this script runs once.

48.28.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
Data Source	
Select device(s) for report	Select the network devices whose data you want to include in your report.
Select granularity filter	Select **Trunk** or **Gateway** to determine the granularity of data gathered for your report. Selecting **Trunk** generates one chart per gateway, while selecting **Gateway** generates a single chart displaying data for each gateway. The default is Trunk.
Select Knowledge Scripts	Select the Knowledge Scripts to include in your report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Chart Thresholds	
Call volume threshold	Specify the call volume threshold to display on the charts in the report. Accept the default of **0** if you do not want to display this threshold.
Dropped call threshold	Specify the dropped call threshold to display on the charts in the report. Accept the default of **0** if you do not want to display this threshold.
Report Settings	
Include parameter card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include charts?	Select **Yes** to include charts of datastream values in the report. The default is Yes.
Include tables?	Select **Yes** to include tables of datastream values in the report. The default is Yes.
Select output folder	Set parameters for the output folder. The default folder name is NetworkDeviceISDNChannelCallVolume.

Parameter	How to Set It
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. The default is No. The job ID helps you correlate a specific instance of a Report script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default report name is Network Device ISDN Channel Call Volume Summary.
Add time stamp to title?	Select **Yes** to append a time stamp to the title of the report, making each title unique. The default is No. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event when report succeeds?	Select **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

48.29 Report_ISDNTimeDetail

Use this Knowledge Script to summarize the average ISDN statistics on selected trunks over a time range. This script uses data collected by the ISDNChannel_Util and ISDNChannel_CallVolume Knowledge Scripts.

48.29.1 Resource Object

Report agent

48.29.2 Default Schedule

By default, this script runs once.

48.29.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
Data Source	
Select link(s) for report	Select the links whose data you want to include in your report.
Select Knowledge Scripts	Select the Knowledge Scripts to include in your report.
Aggregate by	Select the time period by which the data in your report is aggregated. The default is Hour.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Report Settings	
Include parameter card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include charts?	Select **Yes** to include charts of datastream values in the report. The default is Yes.
Include tables?	Select **Yes** to include tables of datastream values in the report. The default is Yes.
Select output folder	Set parameters for the output folder. The default folder name is NetworkDeviceISDNTimeDetail.
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. The default is No. The job ID helps you correlate a specific instance of a Report script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default report name is Network Device ISDN Time Detail Summary.

Parameter	How to Set It
Add time stamp to title?	Select **Yes** to append a time stamp to the title of the report, making each title unique. The default is No. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event when report succeeds?	Select **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

48.30 Report_ISDNUtilization

Use this Knowledge Script to summarize the average ISDN channel call volume for the trunks on selected devices over a time range. This script uses the data collected by the ISDNChannel_CallVolume Knowledge Script.

48.30.1 Resource Object

Report agent

48.30.2 Default Schedule

By default, this script runs once.

48.30.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
Data Source	
Select device(s) for report	Select the network devices whose data you want to include in your report.
Select granularity filter	Select **Trunk** or **Gateway** to determine the granularity of data gathered for your report. Selecting **Trunk** generates one chart per gateway, while selecting **Gateway** generates a single chart displaying data for each gateway. The default is Trunk.
Select Knowledge Scripts	Select the Knowledge Scripts to include in your report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Chart Thresholds	
Good-Acceptable channel utilization threshold	Specify the Good-Acceptable channel usage threshold to display on the charts in the report. The default is 30%.
Acceptable-Poor channel utilization threshold	Specify the Acceptable-Poor channel usage threshold to display on the charts in the report. The default is 50%.
Channel utilization threshold	Specify the channel usage threshold to display on the charts in the report. Accept the default of 0% if you do not want to display this threshold.
Channel Utilization Chart Settings	
Select chart properties	Set chart properties, such as style, thresholds, and size. The default chart style is Bar.
Report Settings	
Include parameter card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.

Parameter	How to Set It
Include charts?	Select **Yes** to include charts of datastream values in the report. The default is Yes.
Include tables?	Select **Yes** to include a table of datastream values in the report. The default is Yes.
Select output folder	Set parameters for the output folder. The default folder name is NetworkDeviceISDNChannelUtilization.
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. The default is No. The job ID helps you correlate a specific instance of a Report script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default report name is Network Device ISDN Channel Utilization Summary.
Add time stamp to title?	Select **Yes** to append a time stamp to the title of the report, making each title unique. The default is No. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event when report succeeds?	Select **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

48.31 Report_LinkUtilization

Use this Knowledge Script to summarize average link usage within a specified time frame. This script uses the data collected by the link usage Knowledge Scripts.

NOTE: The Report_LinkUtilization Knowledge Script displays the datastream values on charts in megabytes per second irrespective of the units you select in the different _Util Knowledge Scripts.

48.31.1 Resource Object

Report agent

48.31.2 Default Schedule

By default, this script runs once.

48.31.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
Data Source	
Select device(s) for report	Select the network devices whose data you want to include in your report.
Select Knowledge Script	Select the Knowledge Script to include in your report. Select one script per report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregate by	Select the time period by which the data in your report is aggregated. The default is Hour.
Chart Thresholds	
Good-Acceptable bandwidth utilization threshold	Specify the Good-Acceptable bandwidth usage threshold to display on the charts in the report. The default is 30%.
Acceptable-Poor bandwidth utilization threshold	Specify the Acceptable-Poor bandwidth usage threshold to display on the charts in the report. The default is 50%.
Total volume threshold	Specify the volume threshold to display on the charts in the report. Enter **0** if you do not want to display a threshold. The default is 0 megabytes/second.
Packet Errors Chart Settings	
Select chart properties	Set chart properties, such as style, thresholds, and size. The default chart style is Bar.

Parameter	How to Set It
Report Settings	
Include parameter card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include charts?	Select **Yes** to include charts of datastream values in the report. The default is Yes.
Include tables?	Select **Yes** to include tables of datastream values in the report. The default is Yes.
Select output folder	Set parameters for the output folder. The default folder name is NetworkDeviceLinkUtilization.
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. The default is No. The job ID helps you correlate a specific instance of a Report script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default report name is Network Device Link Utilization.
Add time stamp to title?	Select **Yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is No.
Event Notification	
Raise event when report succeeds?	Select **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

48.32 Report_QoSUtilization

Use this Knowledge Script to summarize average traffic class statistics for the links on selected devices over a time range. This script uses data collected by the link QoS Knowledge Scripts.

48.32.1 Resource Object

Report agent

48.32.2 Default Schedule

By default, this script runs once.

48.32.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
Data Source	
Select device(s) for report	Select the network devices whose data you want to include in your report.
Select datastream type	Select the type of datastream to include in your report. The default is Post-policy bandwidth. **NOTE:** For Pre-policy bytes and Post-policy bytes, this report Knowledge Script displays the datastream values on charts in megabytes/second irrespective of the units you select in the different _QoS Knowledge Scripts.
Select Knowledge Script	Specify the name of the Knowledge Script to include in your report. Specify one script per report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Report Settings	
Include parameter card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include charts?	Select **Yes** to include charts of datastream values in the report. The default is Yes.
Include tables?	Select **Yes** to include tables of datastream values in the report. The default is Yes.
Select output folder	Set parameters for the output folder. The default folder name is NetworkDeviceQoSUtilization.
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. The default is No. The job ID helps you correlate a specific instance of a Report script with the corresponding report.

Parameter	How to Set It
Select properties	Provide a name for the report and set any other report parameters. The default report name is Network Device QoS Utilization Summary.
Add time stamp to title?	Select **Yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is No.
Event Notification	
Raise event when report succeeds?	Select **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

48.33 Report_QoSVolume

Use this Knowledge Script to summarize average traffic class statistics for the links on selected devices over a time range. This Knowledge Script uses data collected by the link QoS Knowledge Scripts.

48.33.1 Resource Object

Report agent

48.33.2 Default Schedule

By default, this script runs once.

48.33.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
Data Source	
Select link(s) for report	Select the network devices whose data you want to include in your report.
Select datastream type	Select the type of datastream to include in your report. The default is Post-policy bandwidth. **NOTE:** For Pre-policy bytes and Post-policy bytes, this report Knowledge Script displays the datastream values on charts in megabytes/second irrespective of the units you select in the different _QoS Knowledge Scripts.
Select Knowledge Script	Specify the name of the Knowledge Script to include in your report. Specify one Knowledge Script per report.
Aggregate by	Select the time period by which the data in your report is aggregated. The default is Hour.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Report Settings	
Include parameter card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include charts?	Select **Yes** to include charts of datastream values in the report. The default is Yes.
Include tables?	Select **Yes** to include tables of datastream values in the report. The default is Yes.
Select output folder	Set parameters for the output folder. The default folder name is NetworkDeviceQoSVolume.

Parameter	How to Set It
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. The default is No. The job ID helps you correlate a specific instance of a Report script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default report name is Network Device QoS Volume Summary.
Add time stamp to title?	Select **Yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is No.
Event Notification	
Raise event when report succeeds?	Select **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

48.34 Report_TotalVolume

Use this Knowledge Script to summarize total volume for selected devices within a specified time frame. This Knowledge Script uses the data collected by the link usage Knowledge Scripts.

48.34.1 Resource Object

Report agent

48.34.2 Default Schedule

By default, this script runs once.

48.34.3 Setting Parameter Values

Set the following parameters as needed.

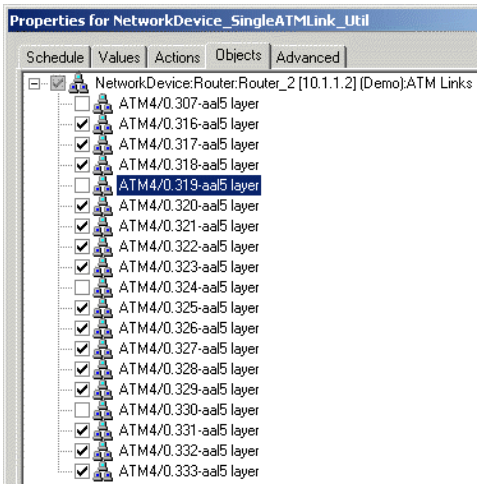
Parameter	How to Set It
Data Source	
Select device(s) for report	Select the network devices whose data you want to include in your report.
Select Knowledge Script	Provide the name of the Knowledge Script to include in your report. Specify one script per report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekday(s)	Select the days of the week to include in your report. The default is every day of the week.
Aggregate by	Select the time period by which the data in your report is aggregated. The default is Hour.
Chart Settings	
Chart size	Select the size of the rendered chart. Choose from **Large**, **Medium**, and **Small**. The default is Medium.
Horizontal chart?	Select **Yes** to include a horizontal chart in your report. The default is No.
Chart color scheme	Select a color scheme template. The default template is NetIQ1.
Chart threshold value	Specify the threshold to be shown on reports. The default is 0 bytes/sec.
Report Settings	
Include parameter card?	Select **Yes** to include a table in the report that lists parameter settings for the report script. The default is Yes.
Include charts?	Select **Yes** to include charts of datastream values in the report. The default is Yes.

Parameter	How to Set It
Include tables?	Select **Yes** to include tables of datastream values in the report. The default is Yes.
Select output folder	Set parameters for the output folder. The default folder name is NetworkDeviceTotalVolume.
Add job ID to output folder name?	Select **Yes** to append the job ID to the name of the output folder. The default is No. The job ID helps you correlate a specific instance of a Report script with the corresponding report.
Select properties	Provide a name for the report and set any other report parameters. The default report name is Network Device Total Volume.
Add time stamp to title?	Select **Yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp allows you to run consecutive iterations of the same report without overwriting previous output. The default is No.
Event Notification	
Raise event when report succeeds?	Select **Yes** to raise an event when the report is successfully generated. The default is Yes.
Event severity when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

48.35 SingleATMLink_Util

Use this Knowledge Script to monitor the usage of the Asynchronous Transfer Mode (ATM) links on a single network device. This script raises an event if any value exceeds a specified threshold. In addition, this script generates datastreams for bandwidth usage, packet rate, and packet error rate.

SingleATMLink_Util differs from ATMLink_Util in that it allows you to choose the link you want to monitor for a single device. Click the Objects tab and select the appropriate links.



48.35.1 Resource Object

NetworkDevice

If you run the script on a large number of objects (roughly 100 or more), the Operator Console or Control Center console may take up to 30 seconds to display the Properties dialog box for the Knowledge Script. In addition, 100% of system CPU may be consumed during this 30-second period.

48.35.2 Default Schedule

By default, this script runs every 5 minutes.

48.35.3 Setting Parameter Values

Set the following parameters as needed.

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the SingleATMLink_Util job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.

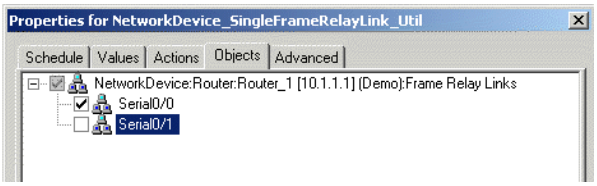
Description	How to Set It
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Link Utilization	
Monitor link utilization?	Select **Yes** to monitor link usage and to activate the parameters in this section. The default is Yes.
Collect data for bandwidth utilization?	Select **Yes** to collect data about bandwidth usage for charts and graphs. The default is Yes.
Threshold - Maximum bandwidth utilization	Specify the maximum percentage of bandwidth usage that can occur before an event is raised. The default is 50%.
Event severity when bandwidth utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the bandwidth usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Collect data for bytes sent/received?	Select **Yes** to collect data about sent and received bytes for charts and graphs. The default is Yes.
Select unit for bytes sent/received	Select the unit for collecting data for the sent/received bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Collect data for inbound/outbound bandwidth utilization?	Select **Yes** to collect data for inbound/outbound bandwidth utilization. The data value is the maximum of the bandwidth inbound value or the bandwidth outbound value, whichever value is larger. The default is No.
Link Errors	
Monitor link errors?	Select **Yes** to monitor link errors and to activate the parameters in this section. The default is Yes.
Collect data for link errors?	Select **Yes** to collect data about link errors for charts and graphs. The default is Yes.
Threshold - Maximum packet errors	Specify the maximum percentage of packet errors that can occur before an event is raised. The default is 8%.
Event severity when packet errors exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of packet errors exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to No.

48.36 SingleFrameRelayLink_Util

Use this Knowledge Script to monitor the usage of the frame relay links on a single network device. A frame relay link uses a packet-switching protocol for connecting devices on a Wide Area Network (WAN). This script raises an event if any value exceeds a specified threshold. In addition, this script generates datastreams for the following:

- Bandwidth usage
- Frame rate
- FECN (Forward Explicit Congestion Notification) rate. A *FECN* is a frame relay message that notifies the receiving device that there is congestion in the network. A FECN bit is sent in the direction in which the frame is traveling, toward its destination.
- BECN (Backward Explicit Congestion Notification) rate. A *BECN* is a frame relay message that notifies the sending device that there is congestion in the network. A BECN bit is sent in the direction from which the frame is traveling, toward its transmission source.

SingleFrameRelayLink_Util differs from FrameRelayLink_Util in that it allows you to choose which links you want to monitor for a single device. On the Objects tab, select the appropriate links. For example:



48.36.1 Resource Object

NetworkDevice

If you run the script on a large number of objects (roughly 100 or more), the Operator Console may take up to 30 seconds to display the Properties dialog box. In addition, 100% of system CPU may be consumed during this 30-second period.

48.36.2 Default Schedule

By default, this script runs every 5 minutes.

48.36.3 Setting Parameter Values

Set the following parameters as needed.

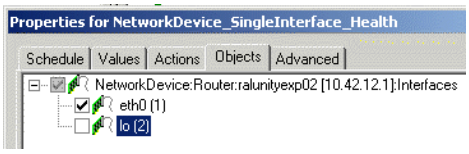
Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the SingleFrameRelayLink_Util job. The default is 5.

Parameter	How to Set It
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Link Utilization	
Monitor link utilization?	Select **Yes** to monitor link usage and to activate the parameters in this section. The default is Yes.
Collect data for bandwidth utilization?	Select **Yes** to collect data about bandwidth usage for charts and graphs. The default is Yes.
Threshold - Maximum bandwidth utilization	Specify the maximum percentage of bandwidth usage that can occur before an event is raised. The default is 50%.
Event severity when bandwidth utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the bandwidth usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Collect data for bytes sent/received?	Select **Yes** to collect data about sent and received bytes for charts and graphs. The default is Yes.
Select unit for bytes sent/received	Select the unit for collecting data for the sent/received bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Collect data for inbound/outbound bandwidth utilization?	Select **Yes** to collect data for inbound/outbound bandwidth utilization. The data value is the maximum of the bandwidth inbound value or the bandwidth outbound value, whichever value is larger. The default is No.
Link Errors	
Monitor FECNs/BECNs?	Select **Yes** to monitor FECN and BECN rates and to activate the parameters in this section. The default is Yes.
Collect data for FECNs/BECNs?	Select **Yes** to collect data about FECN and BECN rates for charts and graphs. The default is Yes.
Threshold - Maximum FECNs/BECNs	Specify the maximum percentage of FECN/BECN rates that can occur before an event is raised. The default is 8%.
Event severity when FECNs/BECNs exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of FECN/BECN rates exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.37 SingleInterface_Health

Use this Knowledge Script to monitor the interfaces on a single network device. This script raises an event if the interface status changes or if any value exceeds a specified threshold. In addition, this script generates a datastream indicating the up or down status of the interface.

SingleInterface_Health differs from Interface_Health in that it allows you to choose which interface you want to monitor for a single device. On the Objects tab, select the appropriate interfaces. For example:



48.37.1 Resource Object

NetworkDevice

If you run the script on a large number of objects (roughly 100 or more), the Operator Console or Control Center console may take up to 30 seconds to display the Properties dialog box for the Knowledge Script. In addition, 100% of system CPU may be consumed during this 30-second period.

48.37.2 Default Schedule

By default, this script runs every 5 minutes.

48.37.3 Setting Parameter Values

Set the following parameters as needed.

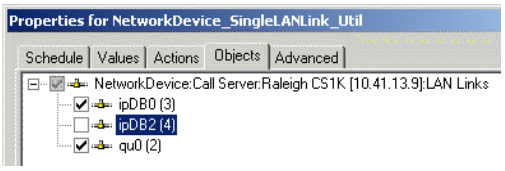
Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the SingleInterface_Health job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.

Parameter	How to Set It
Collect data for interface status?	Select **Yes** to collect data about interface status for charts and graphs. The default is Yes.
Event severity when interface goes down	Set the severity level, between 1 and 40, to indicate the importance of an event in which the interface status changes from Up to Down. Enter **0** if you do not want to raise an event. The default is 5.
Event severity when interface comes back up	Set the severity level, between 1 and 40, to indicate the importance of an event in which the interface status changes from Down to Up. Enter **0** if you do not want to raise an event. The default is 15.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.38 SingleLANLink_Util

Use this Knowledge Script to monitor the Local Area Network (LAN) links on a single network device. This script raises an event if a threshold is exceeded. In addition, this script generates datastreams for bandwidth usage, inbound and outbound packet rates, and inbound and outbound packet error rates.

SingleLANLink_Util differs from LANLink_Util in that it allows you to choose which links you want to monitor for a single device. On the Objects tab, select the appropriate links. For example:



48.38.1 Resource Object

NetworkDevice

If you run the script on a large number of objects (roughly 100 or more), the Operator Console or Control Center console may take up to 30 seconds to display the Properties dialog box for the Knowledge Script. In addition, 100% of system CPU may be consumed during this 30-second period.

48.38.2 Default Schedule

By default, this script runs every 5 minutes.

48.38.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the SingleLANLink_Util job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.

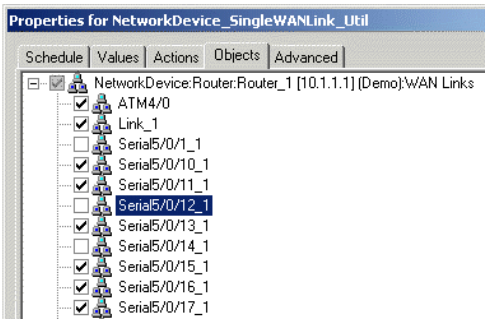
Parameter	How to Set It
Link Utilization	
Monitor link utilization?	Select **Yes** to monitor link usage and to activate the parameters in this section. The default is Yes.
Collect data for bandwidth utilization?	Select **Yes** to collect data about bandwidth usage for charts and graphs. the default is Yes.
Threshold - Maximum bandwidth utilization	Specify the maximum percentage of bandwidth usage that can occur before an event is raised. The default is 50%.
Event severity when bandwidth utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the bandwidth usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Collect data for bytes sent/received?	Select **Yes** to collect data about sent and received bytes for charts and graphs. The default is Yes.
Select unit for bytes sent/received	Select the unit for collecting data for the sent/received bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Collect data for inbound/outbound bandwidth utilization?	Select **Yes** to collect data for inbound/outbound bandwidth utilization. The data value is the maximum of the bandwidth inbound value or the bandwidth outbound value, whichever value is larger. The default is No.
Link Errors	
Monitor link errors?	Select **Yes** to monitor link errors and to activate the parameters in this section. The default is Yes.
Collect data for link errors?	Select **Yes** to collect data about link errors for charts and graphs. The default is Yes.
Threshold - Maximum packet errors	Specify the maximum percentage of packet errors that can occur before an event is raised. The default is 8%.
Event severity when packet errors exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of packet errors exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Include discards in link errors?	Select **Yes** to include discarded incoming packets in the packet error calculation. The default is Yes. If set to Yes, the packet error calculation is as follows: `(notdeliveredpackets/deliveredpackets)*100%/time elapsed` where *delivered packets* = sum(UCastPkts, NUCastPkts) and *not delivered packets* = sum(errors, discards, unknown protocols) Errors are defined as packet errors. Unknown protocols are unsupported protocols. Discards are packets discarded for any other reason.

Parameter	How to Set It
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to No.

48.39 SingleWANLink_Util

Use this Knowledge Script to monitor the serial, T1, or T3 links on a single network device. This script raises an event if any value exceeds a threshold you set. In addition, this script generates datastreams for bandwidth usage, inbound and outbound packet rates, and inbound and outbound packet error rates.

SingleWANLink_Util differs from WANLink_Util in that it allows you to choose the link you want to monitor for a single device. On the Objects tab, select the appropriate links. For example:



48.39.1 Resource Object

NetworkDevice

If you run the script on a large number of objects (roughly 100 or more), the Operator Console or Control Center console may take up to 30 seconds to display the Properties dialog box for the Knowledge Script. In addition, 100% of system CPU may be consumed during this 30-second period.

48.39.2 Default Schedule

By default, this script runs every 5 minutes.

48.39.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the SingleWANLink_Util job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	

Parameter	How to Set It
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Link Utilization	
Monitor link utilization?	Select **Yes** to monitor link usage and to activate the parameters in this section. The default is Yes.
Collect data for bandwidth utilization?	Select **Yes** to collect data about bandwidth usage for charts and graphs. The default is Yes.
Threshold - Maximum bandwidth utilization	Specify the maximum percentage of bandwidth usage that can occur before an event is raised. The default is 50%.
Event severity when bandwidth utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the bandwidth usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Collect data for bytes sent/received?	Select **Yes** to collect data about sent and received bytes for charts and graphs. The default is Yes.
Select unit for bytes sent/received	Select the unit for collecting data for the sent/received bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Collect data for inbound/outbound bandwidth utilization?	Select **Yes** to collect data for inbound/outbound bandwidth utilization. The data value is the maximum of the bandwidth inbound value or the bandwidth outbound value, whichever value is larger. The default is No.
Link Errors	
Monitor link errors?	Select **Yes** to monitor link errors and to activate the parameters in this section. The default is Yes.
Collect data for link errors?	Select **Yes** to collect data about link errors for charts and graphs. The default is Yes.
Threshold - Maximum packet errors	Specify the maximum percentage of packet errors that can occur before an event is raised. The default is 8%.
Event severity when packet errors exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of packet errors exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Include discards in link errors?	Select **Yes** to include discarded incoming packets in the packet error calculation. The default is Yes. If set to Yes, the calculation for packet errors is as follows: `(notdeliveredpackets/deliveredpackets)*100%/time elapsed` where *delivered packets* = sum(UCastPkts, NUCastPkts) and *not delivered packets* = sum(errors, discards, unknown protocols) Errors are defined as packet errors. Unknown protocols are unsupported protocols. Discards are packets discarded for any other reason.

Parameter	How to Set It
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to No.

48.40 SNMPTrap_AddMIB

Use this Knowledge Script to add MIB (management information base) files to the MIB tree that is monitored by the SNMPTrap_Async Knowledge Script. The MIB files should be `ASN.1` text file with a `.txt` or `.my` file extension, and not compiled MIB files.

With this script you can copy a MIB file from an arbitrary directory to the MIB tree located in the `<AppManager directory>\bin\MIBs` directory. And, by using the *Reload MIB tree?* parameter, you can also reload all MIBs in the tree without restarting the AppManager agent. A restart of the AppManager agent automatically reloads the MIB tree.

Scenarios for using this script include the following examples:

In This Scenario	Set These Parameters
You want to add a MIB file to the MIB tree, but do not want the addition to take effect until after the next restart of the AppManager agent.	*Full path to MIB files* and *List of MIB files*: Provide location and name of MIB file you want to add. *Reload MIB tree?*: Select **No** (unselected).
You manually copied a MIB file to the MIB directory and want to reload all MIBs in the directory.	*Full path to MIB files* and *List of MIB files*: Leave blank. *Reload MIB tree?*: Select **Yes**. *MIB reload timeout*: Set new timeout value or accept default of 10 seconds.
Due to compiler errors, you edited some MIBs in the MIB directory. Now you want to reload the MIBs to ensure the errors have been fixed.	*Full path to MIB files* and *List of MIB files*: Leave blank. *Reload MIB tree?*: Select **Yes**. *MIB reload timeout*: Set new timeout value or accept default of 10 seconds.

48.40.1 Resource Object

NetworkDevice Trap Receiver

48.40.2 Default Schedule

By default, this script runs once.

48.40.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
Full path to MIB files	Specify the full path to the folder that contains the MIB files you want to install. The AppManager agent on the proxy agent computer must have network access to the location you specify.

Parameter	How to Set It
List of MIB files	Provide a comma-separated list of the MIB files you want to install. The MIB files should be `ASN.1` text files with a `.txt` or `.my` file extension. The MIB files should not be compiled MIB files. The MIB files you specify must be located in the folder you identified in the *Full path to MIB files* parameter.
Reload MIB tree?	Select **Yes** to update the MIB tree.
MIB reload timeout	Specify the length of time AppManager should attempt to update the MIB tree before timing out and raising a failure event. The default is 10 seconds.
Event Notification	
Raise event if installation and reloading of MIB tree succeeds?	Select **Yes** to raise an event if installation of the MIB files and/or reloading of the MIB tree succeeds. The default is Yes. Note that reloading of the MIB tree can be successful even if no new MIB files are installed. Reloading of the MIB tree can proceed even if you provide no MIB files in the *List of MIB files* or *Full path to list of MIB files* parameter.
Event severity when installation and reloading of MIB tree succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the installation of MIB files and/or the reloading of the MIB tree succeeds. The default is 25.
Raise event if "reload MIB parser" warnings received?	Select **Yes** to raise an event if warning messages are received during the reload process. The default is Yes. Warning scenarios include: • MIBs are installed successfully but the *Reload MIB tree?* parameter is not set to Yes. • Not all specified MIB files were loaded to the MIB tree.
Event severity when "reload MIB parser" warnings received	Set the severity level, from 1 to 40, to indicate the importance of an event in which warning messages are received during the reload process. The default is 15.
Raise event if installation and reloading of MIB tree fails?	Select **Yes** to raise an event if AppManager fails to install or reload the specified MIB files. The default is Yes. Failure scenarios include: • MIB reload timeout period expired. • Not all specified MIB files were installed.
Event severity when installation and reloading of MIB tree fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the installation or reloading of the MIB tree fails. The default is 10.
Raise event with the list of currently installed MIBs?	Select **Yes** to raise an informational event that provides a list of all MIBs installed in the MIB tree. The default is Yes.
Event severity for list of currently installed MIBs	Set the severity level, from 1 to 40, to indicate the importance of an event that provides a list of all MIBs installed in the MIB tree. The default is 25.

48.41 SNMPTrap_Async

Use this Knowledge Script to check for SNMP traps forwarded from NetIQ SNMP Trap Receiver. This script raises an event when an SNMP trap is received and when Trap Receiver is unavailable or subsequently becomes available. In addition, this script generates datastreams for Trap Receiver availability.

This script checks for SNMP traps in the MIB tree. You can add Management Information Bases (MIBs) to the MIB tree. For more information, see the SNMPTrap_AddMIB Knowledge Script.

In general, a trap receiver is an application that receives traps from SNMP agents. NetIQ SNMP Trap Receiver (Trap Receiver) receives SNMP traps, filters them, and then forwards the traps to AppManager. For more information, see "Working with NetIQ SNMP Trap Receiver" on page 2813.

To run this Knowledge Script, you must configure SNMP permissions in Security Manager. For more information, see .

48.41.1 Resource Object

NetworkDevice Trap Receiver

48.41.2 Default Schedule

By default, this script runs on an asynchronous schedule.

48.41.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Trap Filters	
List of trap OIDs	Specify the OIDs (object identifiers) of the traps you want to monitor. You can type one OID or a list of OIDs. If you type a list, separate the OIDs with a comma. For example: `1.3.6.1.2.1.2.2.1.1.1,1.3.6.1.2.1.2.2.1.7.1`

Full path to file with list of trap OIDs	If you have many OIDs to monitor, you can provide the full path to a file that contains a list of the OIDs. Each OID in the file should be on a separate line. For example:
	`1.3.6.1.2.1.2.2.1.1.1`
	`1.3.6.1.2.1.2.2.1.7.1`
	Because the file must be accessible from the AppManager agent, the path must be a local directory on the agent computer or a UNC path.
	Important For a UNC path, the `netiqmc` service must have permission to access the path.

Event Notification	
Raise trap events?	Select **Yes** to raise an event when a trap message is received from Trap Receiver. The default is Yes.

Parameter	How to Set It
Event severity when trap is received	Set the severity level, from 1 and 40, to indicate the importance of an event in which a trap is received. The default is 15.
Format trap data according to SNMP version	Select the version of SNMP whose formatting should be used for trap event messages. The data provided by each format is the same; only the layout is different. An event message in SNMP v1 format looks like this:  An event message in SNMP v2 format looks like this: Raise Trap Receiver availability events?	Select **Yes** to raise an event when Trap Receiver becomes unavailable and when Trap Receiver becomes available once again. The default is Yes.
Event severity when Trap Receiver is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which Trap Receiver becomes unavailable. The default is 5.
Event severity when Trap Receiver becomes available	Set the severity level, from 1 to 40, to indicate the importance of an event in which Trap Receiver becomes available after being unavailable. The default is 25.
Data Collection	
Collect data for Trap Receiver availability?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns a “1” if Trap Receiver is available and a “0” if Trap Receiver is unavailable. The default is unselected.
Interval for collecting Trap Receiver availability data	Specify the frequency with which the script collects Trap Receiver availability data. The default is every 5 minutes.

48.41.4 Working with NetIQ SNMP Trap Receiver

Installation of the AppManager for Network Devices module automatically installs Trap Receiver, which runs as a service: `NetIQTrapReceiver.exe`. Trap Receiver may compete for port usage with any other trap receiver installed on the same computer.

48.41.4.1 What is NetIQ SNMP Trap Receiver?

At its most basic, a trap receiver is an application that receives traps from SNMP agents. NetIQ SNMP Trap Receiver (Trap Receiver) receives, filters, and forwards SNMP traps to AppManager. When you use Trap Receiver with AppManager for Network Device, the SNMPTrap_Async Knowledge Script raises events when SNMP traps are received.

48.41.4.2 What is an SNMP Trap?

Simple Network Management Protocol (SNMP) is a protocol-based system used to manage devices on TCP/IP-based networks. From devices on which an SNMP agent resides, such as routers and switches, SNMP sends unsolicited notifications, called traps, to network administrators when thresholds for certain conditions are exceeded. These conditions are defined by the vendor in a device's Management Information Base (MIB); the network administrator sets the thresholds.

Traps are composed of Protocol Data Units (PDUs). Each PDU contains the following information, organized in various ways depending on the version of SNMP in use:

- SNMP version number
- Community name of the SNMP agent
- PDU type
- Enterprise OID (object identifier), a unique number that identifies an enterprise and its system objects in the MIB
- IP address of the SNMP agent
- Generic trap type: Cold start, Warm start, Link down, Link up, Authentication failure, and Enterprise
- Specific trap type. When the Generic trap type is set to "Enterprise," a specific trap type is included in the PDU. A specific trap is unique or specific to an enterprise.
- Time the event occurred
- Varbind (variable binding), a sequence of two fields that contain the OID and a value

48.41.4.3 Understanding Trap Receiver Architecture

Trap Receiver operates on a Client-Server architecture: the *Server*—the stand-alone Trap Receiver application—receives, filters, and forwards SNMP traps to the *Client*—an application that receives traps, such as AppManager. The Server may receive traps from standard UDP port 162 or from any other configured port. The Client and the Server can reside on the same computer or on separate (proxy) computers.

Communication between Client and Server is implemented as XML messages over a TCP connection. Only one Server is allowed per computer, however, several Clients are allowed per computer. Clients that are registered to the same Server share the same TCP connection. The Server TCP port should be known to all potential Clients.

48.41.4.4 Understanding the Trap Receiver Configuration File

The configuration file for Trap Receiver, `NetIQTrapReceiver.conf`, identifies the UDP and TCP ports used by Trap Receiver: the UDP port is used for receiving traps; the TCP port is used for communicating with the Client, such as AppManager or another supported NetIQ application. The configuration file also identifies the level of logging you want to use and whether port forwarding is enabled.

By default, the configuration file is installed in `[installation directory]\config`, and has the following format:

```
############################################################
#
# NetIQTrapReceiver.conf
#
# A configuration file for NetIQ SNMP Trap Receiver
#
############################################################
#########################
# TCP port
# Syntax: tcp_port [port]
# E.g. : tcp_port 2735
#########################
tcp_port 2735
#########################
# UDP port
# Syntax: udp_port [port]
# E.g. : udp_port 162
#########################
udp_port 162
#########################
# Forwarding
# Syntax: forward [address]:[port] [v1]
# E.g. : forward 127.0.0.1:1000 v1
#########################
#########################
# Log level
# Syntax: log_level error|warning|info|debug|xml
# E.g. : log_level info
#########################
log_level debug
```

If the configuration file cannot be found, cannot be parsed, or does not contain one of the required values, Trap Receiver is initialized with the default configuration as shown above.

When changing values in the configuration file, take into account the following:

- If you change the TCP port number, stop all asynchronous Knowledge Script jobs associated with the modules that support Trap Receiver. Run the Discovery Knowledge Script on all monitored devices to enable the devices to recognize the new TCP port number.
- If you change the UDP port number, also change the UDP port number configured on the devices that send traps to Trap Receiver.
- If another service uses port 2735 or port 162, Trap Receiver *will not start*. The Trap Receiver log file will contain different levels of messages, based on the log_level you choose. Either change the port numbers in the configuration file, stop the service that is using the default Trap Receiver port numbers, or forward the traps coming in to UDP port 162.

- To forward incoming traps to another trap receiver, such as Microsoft SNMP Trap Service, set the Forwarding values as follows: `forward [IP address of other trap receiver]:[port number of other trap receiver] [SNMP version]`. For example: `forward 10.40.40.25:167 v1`. By default, incoming traps are not forwarded. For more information, see "Coexisting with Microsoft SNMP Trap Service" on page 2815.
- Restart Trap Receiver after any change to the configuration file. From Control Panel, double-click **Administrative Tools** and then double-click **Services**. Right-click **NetIQ Trap Receiver** and select **Restart**.

48.41.4.5 Coexisting with Microsoft SNMP Trap Service

Two trap receivers cannot be in use on the same computer while using the same standard UDP port (162). If NetIQ SNMP Trap Receiver and another trap receiver such as Microsoft SNMP Trap Service are installed on the same computer and both are receiving traps, then configure Trap Receiver to use the standard UDP port and to forward incoming traps (UDP forwarding) to the other trap receiver. For more information, see "Understanding the Trap Receiver Configuration File" on page 2813.

Then, configure the other trap receiver to use a different, non-standard, UDP port that is not in use by another application. The following are instructions for configuring Microsoft SNMP Trap Service.

To configure Microsoft SNMP Trap Service to use another port:

1. Navigate to `c:\Windows\system32\drivers\etc`.
2. Open the **services** file.
3. In the row for `snmptrap`, change the value for **udp** from 162 to another port number that is not in use by any other application. Use the same port number you set as the forwarding port in the Trap Receiver configuration file.
4. Save and close the **services** file.
5. Restart Windows SNMP Trap Service. In Control Panel, double-click **Administrative Tools** and then double-click **Services**. Right-click **SNMP Trap Service** and select **Restart**.

TIP: To see which ports are in use, run `netstat.exe` from a command prompt. Then select an available port as the port for the other trap receiver service.

48.42 WANLink_QoS

Use this Knowledge Script to monitor Quality of Service (QoS) on WAN links on a Cisco IOS device. This script monitors traffic class usage, dropped packet rate, and queue depth. This script raises an event if a monitored value exceeds the threshold you set.

Traffic class

A particular category of traffic on an interface. For example, voice and data can be classified as individual traffic classes.

Queue

The virtual buffer associated with a particular traffic class.

Dropped packet rate

The rate at which packets are dropped because of factors such as queuing, policing, early detection, or traffic shaping.

Queue depth

The number of packets in a queue.

Policy

The action that QoS takes within a traffic class upon the traffic that enters the class, such as dropping packets. Pre-policy traffic is the traffic that flows into a traffic class, before QoS applies a policy. Post-policy is the traffic that leaves a traffic class after a policy has been applied.

48.42.1 Resource Object

NetworkDevice

48.42.2 Default Schedule

By default, this script runs every 5 minutes.

48.42.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the WANLink_QoS job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	

Parameter	How to Set It
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.
Link name filter	Using regular expression, specify the names of the WAN links you want to monitor or do not want to monitor. Use this parameter in conjunction with the *Include or exclude link name filter* parameter. **Examples** • To monitor all WAN links, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude link name filter.* • To monitor all WAN links, enter `"*"` and select **Include** in *Include or exclude link name filter.* • To monitor nothing, enter `"*"` and select **Exclude** in *Include or exclude link name filter* • To monitor only serial links, enter `(?=serial)` and select **Include** in *Include or exclude link name filter.* • To monitor all interfaces EXCEPT serial links, enter `(?=serial)` and select **Exclude** in *Include or exclude link name filter.*
Include or exclude link name filter	Select **Include** to monitor only the WAN links you specified in *Link name filter*. Select **Exclude** to monitor all WAN links except those you specified in *Link name filter.*
Class name filter	Using regular expression, specify the name of the traffic classes that you want to monitor. Leave this parameter blank to monitor all traffic classes.
Traffic Class Utilization	
Monitor traffic class utilization?	Select **Yes** to monitor traffic class usage and to activate the parameters in this section. The default is Yes.
Collect data for traffic class utilization?	Select **Yes** to collect data for charts and graphs. The default is No. This script generates datastreams for the pre-policy and post-policy bandwidth used by each configured traffic class.
Threshold - Maximum traffic class utilization	Specify the maximum percentage of traffic class usage that can occur before an event is raised. The default is 25%.
Event severity when traffic class utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of traffic class usage exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Collect data for traffic class pre/post policy bytes?	Select **Yes** to collect data for charts and graphs. This script generates datastreams for the number of pre- and post-policy bytes per second. The default is No.
Select unit for traffic class pre/post policy bytes	Select the unit for collecting data for the pre/post policy bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Queue Depth	
Monitor queue depth?	Select **Yes** to monitor the queue depth. The default is Yes.

Parameter	How to Set It
Collect data for queue depth?	Select **Yes** to collect data for charts and graphs. The default is No. This script generates datastreams for queue depth (number of packets) by class name.
Threshold - Maximum priority queue depth	Specify the maximum number of packets that a priority queue can contain before an event is raised. The default is 0 packets.
Threshold - Maximum non-priority queue depth	Specify the maximum number of packets that a non-priority queue can contain before an event is raised. The default is 10 packets.
Event severity when queue depth exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the queue depth exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Dropped Packets	
Monitor dropped packet rate?	Select **Yes** to monitor the rate at which packets are dropped from the traffic class. The default is Yes.
Collect data for dropped packet rate?	Select **Yes** to collect data for charts and graphs. The default is No. This script generates datastreams for the percentage of dropped packets, and for the number of packets dropped per second.
Threshold - Maximum dropped packet rate	Specify the maximum rate at which packets can be dropped from the traffic class before an event is raised. The default is 1%.
Event severity when dropped packet rate exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the dropped packet rate exceeds the threshold that you set. Set the severity level to **0** if you do not want to raise an event. The default is 10.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.43 WANLink_Util

Use this Knowledge Script to monitor the parent resource for the serial, T1, or T3 links on a network device. This script raises an event if a monitored value exceeds the threshold you set. In addition, this script generates datastreams for bandwidth usage, inbound and outbound packet rates, and inbound and outbound packet error rates.

NOTE: WANLink_Util differs from SingleWANLink_Utilin that it lets you monitor all links for all devices of any parent resource. SingleWANLink_Util allows you to monitor selected links for only one device.

48.43.1 Resource Object

NetworkDevice WAN Link Folder

48.43.2 Default Schedule

By default, this script runs every 5 minutes.

48.43.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the WANLink_Util job. The default is 5.
Event severity when job returns warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the job completes with warnings. The default is 25.
Event severity when monitoring fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when monitoring fails. The default is 25.
SNMP Settings	
SNMP timeout	Specify the length of time in milliseconds that the job should wait for the SNMP response from the monitored network device before timing out and raising a failure event. The default is 2000 milliseconds.
SNMP retries	Specify the number of times the job should attempt to get the SNMP response from the monitored network device. The default is 1 attempt.

Parameter	How to Set It
Link name filter	Using regular expression, specify the names of the WAN links you want to monitor or do not want to monitor. Use this parameter in conjunction with the *Include or exclude link name filter* parameter. **Examples** • To monitor all WAN links, leave this parameter blank and select **Include** or **Exclude** in *Include or exclude link name filter.* • To monitor all WAN links, enter `"*"` and select **Include** in *Include or exclude link name filter.* • To monitor nothing, enter `"*"` and select **Exclude** in *Include or exclude link name filter* • To monitor only serial links, enter `(?=serial)` and select **Include** in *Include or exclude link name filter.* • To monitor all interfaces EXCEPT serial links, enter `(?=serial)` and select **Exclude** in *Include or exclude link name filter.*
Include or exclude link name filter	Select **Include** to monitor only the WAN links you specified in *Link name filter*. Select **Exclude** to monitor all WAN links except those you specified in *Link name filter.*
Link Utilization	
Monitor link utilization?	Select **Yes** to monitor link usage and to activate the parameters in this section. The default is Yes. **Hint** If you set this parameter to **No**, the WANLink_Util job does not raise events for usage and does not generate datastreams. To generate datastreams for usage without raising events, perform the following steps: Set the *Monitor link utilization?* parameter to Yes. Set the *Threshold - Maximum bandwidth utilization* parameter to 100%.
Collect data for bandwidth utilization?	Select **Yes** to collect data about bandwidth usage for charts and graphs. The default is Yes.
Threshold - Maximum bandwidth utilization	Specify the maximum percentage of bandwidth usage that can occur before an event is raised. The default is 50%.
Event severity when bandwidth utilization exceeds threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the bandwidth usage exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Collect data for bytes sent/received?	Select **Yes** to collect data about sent and received bytes for charts and graphs. The default is Yes.
Select unit for bytes sent/received	Select the unit for collecting data for the sent/received bytes. You can select from bytes per second, kilobytes per second, and megabytes per second. The default is bytes per second.
Collect data for inbound/outbound bandwidth utilization?	Select **Yes** to collect data for inbound/outbound bandwidth utilization. The data value is the maximum of the bandwidth inbound value or the bandwidth outbound value, whichever value is larger. The default is No.
Link Errors	
Monitor link errors?	Select **Yes** to monitor link errors and to activate the parameters in this section. The default is Yes.

Parameter	How to Set It
Collect data for link errors?	Select **Yes** to collect data about link errors for charts and graphs. The default is No.
Threshold - Maximum packet errors	Specify the maximum percentage of packet errors that can occur before an event is raised. The default is 8%.
Event severity when packet errors exceed threshold	Set the severity level, between 1 and 40, to indicate the importance of an event in which the percentage of packet errors exceeds the threshold that you set. Enter **0** if you do not want to raise an event. The default is 10.
Include discards in link errors?	Select **Yes** to include discarded incoming packets in the packet error calculation. The default is Yes. If set to Yes, the packet error calculation is as follows: `(notdeliveredpackets/deliveredpackets)*100%/time elapsed` where *delivered packets* = sum(UCastPkts, NUCastPkts) and *not delivered packets* = sum(errors, discards, unknown protocols) Errors are defined as packet errors. Unknown protocols are unsupported protocols. Discards are packets discarded for any other reason.
Raise one-time events?	Select **Yes** to raise an event for all one-time events. For example, if you set this parameter to Yes, then, on the first iteration of this script, AppManager raises an event when a particular performance counter cannot be found. If you do not want to see such one-time events, set this parameter to **No**.

48.44 Recommended Knowledge Scripts

NetIQ Corporation recommends using the following Knowledge Scripts to ensure optimal monitoring of network devices.

- ATMLink_Util
- Chassis_Usage
- Device_Ping
- Device_Uptime
- FrameRelayLink_Util
- FXOPort_Health
- FXOPort_Util
- FXSPort_Health
- FXSPort_Util
- Interface_Health
- IPSubsystem_Util
- LANLink_Util
- WANLink_Util

49 Networks-RT Knowledge Scripts

The Networks-RT category provides the following Knowledge Scripts and reports for monitoring AppManager resources. Because these scripts simulate actual network transactions, you can use them to test the health and performance of your network.

NOTE: If you generate Knowledge Scripts using the KSGenerator, you can select and edit them by clicking the Net-RT-Import tab. The parameters and names of these scripts will vary depending on the settings you select during the import process. For more information, see "Net-RT-Import_KSGenerator" on page 3074.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
[ResponseTime]	Checks network response time.
[Throughput]	Tests network throughput.
Action_Traceroute	Collects exception traceroute data between a specified source and target location in response to an event in a separate Knowledge Script.
Action_TracerouteNetworks-RT	Collects exception traceroute data between a specified source and target location in response to an event in a separate Networks-RT Knowledge Script.
ActiveDirectoryAddUser	Emulates adding a user to a domain in the Active Directory.
ActiveDirectoryLogin	Emulates logging in to Active Directory.
ActiveDirectoryReplication	Emulates network traffic generated between two PCs during full domain directory replication.
ActiveDirectoryResetPassword	Emulates resetting a user's password in Active Directory.
BaanAddItem	Emulates adding an item to a Baan database.
BaanGenerateMPSMRPBatches	Emulates generating MPS MRP batches in Baan.
BaanLoadDEM	Emulates loading Baan Dynamic Enterprise Management (DEM).
BaanLoadItemMaster	Emulates loading Baan Item Master.
BaanMaintainCustomer	Emulates performing Baan customer maintenance.
BaanMaintainEmployeeAdd	Emulates adding an employee to the Baan system.
BaanMaintainProductBom	Emulates maintenance of a standard Baan Bill of Materials (BOM).

Knowledge Script	What It Does
BaanMaintainPurchaseOrder	Emulates maintaining a purchase order in the Baan system.
BaanMaintainSalesOrder	Emulates maintaining a sales order in the Baan system.
BaanMaintainServiceOrder	Emulates maintaining a service order in the Baan system.
BaanPrintCompaniesListSelect	Emulates printing a list of selected companies in the Baan system.
BackWebSignupAndInfoPakDnld	Emulates subscribing to and downloading the contents of a new Back Web channel.
BackWebUpdate	Emulates updating an existing Back Web channel.
CastanetChannelDownload	Emulates downloading of Castanet channels.
CastanetInitialRun	Emulates a user running the Castanet Tuner for the first time.
ccMail	Emulates sending a mail message using ccMail.
CitrixICAExcelStartup	Emulates starting Excel within a Citrix Independent Computing Architecture (ICA)
CitrixICAIEStartup	Emulates starting Internet Explorer within a Citrix Independent Computing Architecture (ICA)
CitrixICAOutlookOpenFullBox	Emulates opening Outlook within a Citrix Independent Computing Architecture (ICA).
CitrixICATerminalServerLogon	Emulates logging on to a terminal server within a Citrix Independent Computing Architecture (ICA).
CitrixICAWordStartUp	Emulates starting MS Word within a Citrix Independent Computing Architecture (ICA).
CreditCheckShortConnection	Emulates transactions that make a series of credit approvals. Creates a separate connection for each script transaction.
DatabaseUpdateShortConnect	Emulates updating a record in a database.
DNSNameLookup	Emulates performing a name lookup on a DNS server.
ExchangeDirectoryService	Emulates accessing the Microsoft Exchange Directory.
ExchangeReadMail	Emulates retrieving email from an Exchange server.
ExchangeReceiveMail	Emulates receiving periodic new mail notification from an Exchange server.
ExchangeSendMail	Emulates sending email from an Exchange client to the server.
FileReceiveShortConnection	Emulates requesting a file and receiving it.
FileSendShortConnection	Emulates sending a file and receiving an acknowledgment.
FTPGetÂă	Emulates an FTP `GET`.
FTPPut	Emulates an FTP `PUT`.
HeadlinerInitialLoad	Emulates an initial run of Headliner using default settings.
HeadlinerSubsequentUpdate	Emulates updating a Headliner channel.
HTTPGIFTransfer	Emulates traffic of an HTTP GIF transfer from a Web server to a Web browser.
HTTPSSecureTransaction	Emulates HTTPS secure transfer of text or graphics between a Web server and a Web browser using SSL.

Knowledge Script	What It Does
HTTPTextTransfer	Emulates traffic of an HTTP text transfer from a Web server to a Web browser.
InquiryShortConnection	Emulates typical client/server inquiry and reply.
LDAPDirectoryLookup	Emulates performing a lookup in an LDAP directory.
MicrosoftRDPExcelStartUp	Emulates Excel startup on a Microsoft remote desktop using RDP.
MicrosoftRDPIEStartLoadMSN	Emulates starting and loading MSN Explorer on a Microsoft remote desktop using RDP.
MicrosoftRDPOutlookOpenBox	Emulates opening an Outlook box on a Microsoft remote desktop using RDP.
MicrosoftRDPTermServerLogon	Emulates logon to a Microsoft remote desktop using Terminal Services.
MicrosoftRDPWordStartUp	Emulates starting MS Word on a Microsoft remote desktop using RDP.
MSSQLQuery	Emulates queries to the SQL server.
NetworkNewsTransferProtocol	Emulates typical Usenet news reader activities using NNTP.
NotesAttachOpenDB	Emulates opening a document with an attachment in a Lotus Notes database.
NotesAttachOpenInitDB	Emulates opening a document with an attachment in a Lotus Notes database that you initialize.
NotesAttachServerDetach	Emulates doing a Lotus Notes server attachment and detachment.
NotesAttachServers2Detach	Emulates doing multiple server attachments and detachments.
NotesBrowserDBAttach	Emulates using a Lotus Notes browser to do an attach.
NotesBrowserDBOpen	Emulates using a Lotus Notes browser to do a database open.
NotesBrowserDBSearch	Emulates using a Lotus Notes browser to do a database search.
NotesCheckForUnreadEmail	Emulates Lotus Notes client periodically checking server for new mail.
NotesCreateSaveMailNote	Emulates Lotus Notes client creating, then saving an email message.
NotesCreateSaveSendAttach	Emulates a Lotus Notes client creating, saving, and sending a mail message with an attachment.
NotesCreateSaveSendMailNote	Emulate a Lotus Notes client creating, saving, and sending a mail message.
NotesCreateTextIndexServer	Emulates creating a text index on the Lotus Notes server.
NotesIndexedDBLookup	Emulates performing an indexed Lotus Notes database lookup.
NotesNonIndexedDBLookup	Emulates performing a non-indexed Lotus Notes database lookup.
NotesReceiveEmail	Emulates mail receipt by a Lotus Notes client.

Knowledge Script	What It Does
NotesReplicateMail	Emulates replicating a Lotus Notes mail database.
NotesReplicateServer1DB	Emulates replicating one database in Lotus Notes.
NotesReplicateServer50Auto	Emulates Lotus Notes replication.
NotesReplicateServer50Docs	Emulates Lotus Notes replication of 50 documents.
NotesReplicateServerCheck	Emulates replicating a Lotus Notes server check.
NotesSendEmail	Emulates a Lotus Notes client sending email to the server.
NTFilePrintPrintaFile	Emulates a Windows client requesting a print server to print a file.
OracleAPTier1FindInvoice	Emulates traffic between end user computer and the Tier 1 application server when finding an Accounts Payable invoice.
OracleAPTier1InvoiceMultDist	Emulates traffic between end user computer and the Tier 1 application server when handling multiple distribution of an invoice.
OracleAPTier2FindInvoice	Emulates traffic between the application server and the database server when finding an Accounts Payable invoice.
OracleAPTier2InvoiceMultDist	Emulates traffic between the application server and the database server when handling an Accounts Payable invoice.
OracleARTier1InsertCustomer	Emulates traffic between the end user computer and the Tier 1 application server when adding an Accounts Receivable customer.
OracleARTier1ViewCustomer	Emulates traffic between the end user computer and the Tier 1 application server when viewing an Accounts Receivable customer.
OracleARTier2InsertCustomer	Emulates traffic between the application server and the database server when adding a customer.
OracleARTier2ViewCustomer	Emulates traffic between the application server and the database server when viewing an Accounts Receivable customer.
OracleFATier1AssetInquiry	Emulates traffic between the end user computer and the Tier 1 application server when making a Fixed Assets asset inquiry.
OracleFATier1ManualAddition	Emulates traffic between the end user computer and the Tier 1 application server when doing a Fixed Assets manual addition.
OracleFATier2AssetInquiry	Emulates traffic between the application server and the database server when doing a Fixed Assets asset inquiry.
OracleFATier2ManualAddition	Emulates traffic between the application server and the database server when doing a Fixed Assets manual addition.
OracleGLTier1AccountInquiry	Emulates traffic between the end user computer and the Tier 1 application server when making a General Ledger account inquiry.
OracleGLTier1JournalEntry	Emulates traffic between the end user computer and the Tier 1 application server when making a General Ledger journal entry.

Knowledge Script	What It Does
OracleGLTier2AccountInquiry	Emulates making a General Ledger account inquiry on an Oracle Tier 2 server.
OracleGLTier2JournalEntry	Emulates making a General Ledger journal entry on an Oracle Tier 2 server.
PacketBlasterLongConnection	Continuously sends packets from Endpoint 1 to Endpoint 2 using a long connection.
PacketBlasterRevLongConnect	Continually receives packets at Endpoint 1 using a long connection, without waiting for any response.
PointCastv1InitialUpdate	Emulates a user getting an update of default content selections for PointCast Network version 1.
PointCastv2InitialUpdate	Emulates a user getting an update of default content selections for PointCast Network version 2.
POP3ReceiveEmail	Emulates email receipt using POP3 standard.
SAPR3AuthPaymentOnInvoice	Emulates payment authorization for an invoice.
SAPR3BasicStock	Emulates basic stock network transactions in SAPR3.
SAPR3BatchCharacterizeStock	Emulates stock characterization in SAP R/3.
SAPR3CreatePurchaseOrder	Emulates creation of a purchase order by an SAP R/3 operator at the client.
SAPR3CreateSalesOrder	Emulates creation of a sales order by an SAP R/3 operator at the client.
SAPR3GoodsReceipt	Emulates receipt of goods by an SAP R/3 operator at the client.
SAPR3GoodsReceiptInspection	Emulates a goods receipt inspection transaction by an SAP R/3 operator at the client.
SAPR3Login	Emulates a client login to an SAP R/3 server.
SAPR3MaterialToMaterialXfer	Emulates an SAP R/3 material transfer.
SAPR3PickingBatchDetermine	Emulates an SAP R/3 picking batch determination.
SAPR3PostGoods	Emulates posting goods by an SAP R/3 operator at the client.
SAPR3PrepareAnInvoice	Emulates invoice preparation based on a purchase order created using SAPpuror.
SAPR3QMResultsRecording	Emulates recording SAP R/3 QM module results by an SAP R/3 operator at the client.
SAPR3SalesOrderDelivery	Emulates a sales order delivery transaction by an SAP R/3 operator at the client.
SMTPSendEmail	Emulates sending email messages using TCP/IP's SMTP standard.
Telnet	Emulates a TCP/IP Telnet session.
Traceroute	Collects traceroute data for a specified source and target location on demand, or at regularly scheduled intervals.
Report_ResponseTimeSummary	Summary report of availability and response time for Networks-RT Knowledge Scripts.
Report_ThroughputSummary	Summary report of availability and throughput for Networks-RT Knowledge Scripts.

Knowledge Script	What It Does
Report_TracerouteException	Compares exception traceroute data against the averaged baseline traceroute statistics from the associated source and target locations.
Report_TracerouteProfile	Summary report of the averaged baseline traceroute statistics for a given source and target location combination, along with the last ten exception traceroutes for the pair.
Net-RT-Import_KSGenerator	Custom scripts imported using the KSGenerator.

49.1 [ResponseTime]

Use this Knowledge Script to check response time between a pair of endpoints. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability: returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.1.1 Resource Object

Networks-RT.

49.1.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view you select determines which computers are available for selection. Select one or more endpoint computers. Click **Finish**.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when threshold is exceeded parameter* is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Provide a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Size of record to send	Specify the number of bytes to send in a record. The default is 100.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size	Specify the size (in bytes) for the reply. The default is 100.
Transaction delay	Provide a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.2 [Throughput]

Use this Knowledge Script to test network throughput. If you choose to collect data, this Knowledge Script generates the following data streams:

- The throughput in kbps. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability: returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.2.1 Resource Object

Networks-RT throughput.

49.2.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when throughput is less than threshold?	Select **Yes** to raise an event when measured throughput falls below the threshold you set. By default, events are enabled.
Select endpoints to run the test to	Select the endpoint names, separated by commas, where the test will run.
Throughput threshold	Set the minimum throughput. The units are set in the *Throughput units for threshold and data* parameter. When throughput falls below this value, an event is raised. On threshold events, the event message contains a breakdown of the total throughput.
Throughput units for threshold and data	Select the units from the list. “K” represents 1024; “k” represents 1000. “B” represents bytes; “b” represents bits. The choices are: • **KBps** 1,024 Bytes per second • **kBps** 1,000 Bytes per second • **Kbps** 1,024 bits per second (128 Bytes per second) • **kbps** 1,000 bits per second (125 Bytes per second) • **Mbps** 1,000,000 bits per second (125,000 Bytes per second) • **Gbps** 1,000,000,000 bits per second (125,000,000 Bytes per second) **NOTE:** Data is stored as kbps in the database regardless of the threshold units you set here. However, when you run the [Throughput] Report, you can specify the units that are used in the report.

Description	How to Set It
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Provide a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
File size	Specify the number of bytes in the transferred file. The default is 100,000.
Transaction delay	Provide a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.3 Action_Traceroute

Use this Knowledge Script to collect exception traceroute data between a specified source and target location in response to an event in another Knowledge Script.

When you select this Action Knowledge Script to run automatically in association with another Knowledge Script job, you must specify the source and target locations of the traceroute as parameters. The source location must have the ResponseTime for Networks managed object installed and discovered.

To associate this action with a particular monitoring script:

1. Double-click the desired monitoring Knowledge Script. Click the Actions tab in the Properties dialog box.
2. Select **Action_Traceroute** from the list in the **Action** column.
3. Set the **Location** parameter to "**MC**" (managed client). Otherwise, this action will create an error event and will not collect traceroute data when it is invoked.

   NOTE: The ResponseTime for Networks module must be installed on the computer you select as Location.

4. Set the action **Type** value to **Repeat Event - 1** if you want a new traceroute to run at each event.

NOTE: The "Type" value is dependent on the settings for event collapsing and on the schedule of the associated Knowledge Script. If the Knowledge Script runs and raises events more often than the event collapsing interval (default is 20 minutes), the traceroute action will not occur at every event. A new child event must be raised for the action to be executed.

49.3.1 Example

Before you launch a Knowledge Script (other than one of the Networks-RT scripts), double-click it to see its Properties dialog box. Click the **Actions** tab. Click **New** and select **Action_Traceroute** from the list. Then click **Properties** to specify the source location and target location for the traceroute. If an event is raised by the Knowledge Script, the Action_Traceroute Knowledge Script is launched automatically. It collects traceroute data between the source and target you selected and stores the traceroute data in the AppManager repository.

The traceroute data is associated with the event that triggered the traceroute. Run the Report_TracerouteException Knowledge Script to generate a report that compares the traceroute data collected for this event with the historical traceroute data for the associated source and target locations.

49.3.2 Resource Object

Windows resource

49.3.3 Default Schedule

The default interval for this script is Run once.

49.3.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Traceroute source location	Select a ResponseTime for Networks node where the traceroute will originate. Specify only one source. Maximum length is 64 characters.
Traceroute target location	Select a node where the traceroute will finish—a ResponseTime for Networks node, some other AppManager node, an IP address, or a URL. Specify only one target. The script validates whether the source and target locations are the same; generates an error if they are identical. Maximum length is 64 characters.
Maximum number of hops	Set the maximum number of hops allowed before the traceroute is abandoned. Allowable values are integers 1-30. The default is 30.
Event when traceroute fails?	Select **Yes** to raise events. By default, events are enabled.
Traceroute failed event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 20.

49.4 Action_TracerouteNetworks-RT

Use this Knowledge Script to collect exception traceroute data between a specified source and target location in response to an event in a separate Networks-RT Knowledge Script.

You do not have to specify source or target information when associating the action script with the Knowledge Script. This script automatically determines the source and target locations for the traceroute, based on the event details from the Knowledge Script.

To associate this action with a particular monitoring script:

1. Double-click the desired monitoring Knowledge Script. Click the **Actions** tab in the Properties dialog box.
2. Select **Action_Traceroute** from the list in the **Action** column.
3. Set the **Location** parameter must be set to "**MC**" (managed client). Otherwise, this action will create an error event and will not collect traceroute data when it is invoked.

   NOTE: The ResponseTime for Networks module must be installed on the monitored computer.

4. Set the action "Type" value to "Repeat Event - 1" if you want a new traceroute to run at each event.

NOTE: The "Type" value is dependent on the settings for event collapsing and on the schedule of the associated Knowledge Script. If the Knowledge Script runs and raises events more often than the event collapsing interval (default is 20 minutes), the traceroute action will not occur at every event. A new child event must be raised for the action to be executed.

49.4.1 Example

Before you launch a Networks-RT Knowledge Script, double-click it and click the **Actions** tab on the Properties dialog box. Click **New**, and select **Action_TracerouteNetworks-RT** from the list. If an event is raised by the Knowledge Script, the Action_TracerouteNetworks-RT Knowledge Script is launched automatically. It collects traceroute data between the source and target locations associated with the event, and stores the traceroute data in the AppManager database.

The traceroute data is associated with the event that triggered the traceroute. Run the Report_TracerouteException Knowledge Script to generate a report that compares the traceroute data collected for this event with the historical traceroute data for the given pair of endpoints.

49.4.2 Resource Object

Networks-RT.

49.4.3 Default Schedule

The default interval for this script is run once.

49.4.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Maximum number of hops	Set the maximum number of hops allowed before the traceroute is abandoned. The default is 30.
Event when traceroute fails?	Select **Yes** to raise events. By default, events are enabled.
Traceroute failed event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 20.

49.5 ActiveDirectoryAddUser

Use this Knowledge Script to emulate adding a user to a domain in the Active Directory. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability–Returns one of two values:
  - 1 – the test was successful
  - 0 – the test was not successful

An event is raised when one of the following occurs:

- A threshold is exceeded.
- A test fails because of a service availability failure.
- Any other error.

49.5.1 Resource Object

Networks-RT

49.5.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

49.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

Description	How to Set It
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. This value is ignored if events are disabled.
Detailed Parameters	
Transactions per record	Specify the number of transactions to be entered per timing record. The default is 5.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Number of users	Specify the number of users added at one time. The default is 1.
User data	Specify the amount of data sent for one user in the group. The default is 3500.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.6 ActiveDirectoryLogin

Use this Knowledge Script to emulate the data flows generated when a user logs in to a Windows server. It is useful for determining the response time that a single user experiences when attempting to log in to a domain controller.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability–Returns one of two values:
  - 1 – the test was successful
  - 0 – the test was not successful

49.6.1 Resource Object

Networks-RT

49.6.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the test event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.7 ActiveDirectoryReplication

Use this Knowledge Script to emulate the network traffic generated between two computers during the full replication of a domain directory.

Editing the **Objects loop** and **Transfer amount** variables determines the number of times script commands are repeated. The values of these variables should depend on the number of object in a directory. The `objects_loop` (which controls the number of times the script commands are performed) increases by 2 for every 60 additional objects. When emulating 200 objects or fewer, the `transfer_amount` increases by 40,000 bytes for every 60 additional objects; with quantities of 200 objects or more, the `transfer_amount` increases by 20,000 bytes for every 60 additional objects. The following table provides an illustration:

Number of Objects	Script Variable Objects_Loop	Transfer Amount
60	8	580,000 bytes
120	10	620,000 bytes
180	12	660,000 bytes
480	22	760,000 bytes

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.7.1 Resource Object

Networks-RT

49.7.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.

Description	How to Set It
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. the default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Transfer amount	Set the average amount of data transferred for each `SEND` in a directory replication. When you change this value for a number of users, also change the Objects loop variable. The default is 580,000.
Objects loop	Specify the number of objects transferred in a full directory replication from one domain controller to another. The default of 8 represents 60 objects. When you change this value, also change the Transfer amount variable.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.8 ActiveDirectoryResetPassword

Use this Knowledge Script to emulate the data flows that occur when you reset a user's password. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.8.1 Resource Object

Networks-RT

49.8.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.9 BaanAddItem

Use this Knowledge Script to emulate the Baan function of adding an item to the Baan database. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.9.1 Resource Object

Networks-RT

49.9.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.10 BaanGenerateMPSMRPBatches

Use this Knowledge Script to emulate the Baan function of generating Baan MPS MRP batches. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.10.1 Resource Object

Networks-RT

49.10.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.11 BaanLoadDEM

Use this Knowledge Script to emulate the Baan function of loading Baan Dynamic Enterprise Management framework (DEM). This framework supports Baan implementation by using best-practice "Target" implementation methodology.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.11.1 Resource Object

Networks-RT

49.11.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.12 BaanLoadItemMaster

Use this Knowledge Script to emulate the Baan function of loading Baan Item Master. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – the test was successful
  - 0 - the test was not successful

49.12.1 Resource Object

Networks-RT

49.12.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. Simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.13 BaanMaintainCustomer

Use this Knowledge Script to emulate the Baan function of maintaining a customer in Baan. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.13.1 Resource Object

Networks-RT

49.13.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when threshold is exceeded* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. Simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.14 BaanMaintainEmployeeAdd

Use this Knowledge Script to emulate the Baan function of adding an employee. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.14.1 Resource Object

Networks-RT

49.14.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when threshold is exceeded* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. Simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment.

49.15 BaanMaintainProductBom

Use this Knowledge Script to emulate the Baan function of maintaining a standard Baan Bill of Materials (BOM). If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.15.1 Resource Object

Networks-RT

49.15.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.15.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when threshold is exceeded* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. Simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.16 BaanMaintainPurchaseOrder

Use this Knowledge Script to emulate the Baan function of maintaining a purchase order. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.16.1 Resource Object

Networks-RT

49.16.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.16.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when threshold is exceeded* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. Simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.17 BaanMaintainSalesOrder

Use this Knowledge Script to emulate the Baan function of maintaining a sales order. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.17.1 Resource Object

Networks-RT

49.17.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.17.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. Simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.18 BaanMaintainServiceOrder

Use this Knowledge Script to emulate the Baan function of maintaining a service order in the Baan system. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.18.1 Resource Object

Networks-RT

49.18.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.18.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.19 BaanPrintCompaniesListSelect

Use this Knowledge Script to emulate the Baan function of printing a selected list of companies in the Baan system. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.19.1 Resource Object

Networks-RT

49.19.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.19.3 Setting Parameter Values

Set the following parameters as needed

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.20 BackWebSignupAndInfoPakDnld

Use this Knowledge Script to emulate subscribing to and downloading the contents of a new Back Web channel. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.20.1 Resource Object

Networks-RT

49.20.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.20.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Size of record to send	Specify the number of bytes to send in a record. The default is 300.
File size	Specify the number of bytes in the transferred file. The default is 3,000.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. Simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.21 BackWebUpdate

Use this Knowledge Script to emulate updating an existing Back Web channel. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.21.1 Resource Object

Networks-RT

49.21.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.21.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Size of record to send	Specify the number of bytes to send in a record. The default is 400.
File size	Specify the number of bytes in the transferred file. The default is 11,000.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.22 CastanetChannelDownload

Use this Knowledge Script to emulate the downloading of channels. Each timing record represents a single channel download. The default file size is 500,000 bytes. However, this value depends on the channel that is being downloaded.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.22.1 Resource Object

Networks-RT

49.22.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.22.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 300.
Reply size	Specify the number of bytes in the reply. The default is 2,000.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
File control size	Specify the size of the file control information to be sent and received, in preparation for transferring the file. In a real file transfer, this usually consists of directory and filename information. The default is 1500.
File size	Specify the number of bytes in the transferred file. The default is 500,000.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.23 CastanetInitialRun

Use this Knowledge Script to emulate a user running the Castanet Tuner for the first time. When running, this Tuner checks to verify that it is up-to-date by querying the Marimba home base. Next, it downloads the portion of the Java-based Tuner that is not up-to-date.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.23.1 Resource Object

Networks-RT

49.23.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.23.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 300.
Reply size	Specify the number of bytes in the reply. The default is 2,000.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
File control size	Specify the number of bytes that are in the control flows. The default is 1500.
File size	Specify the number of bytes in the transferred file. The default is 1,350,000.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.24 ccMail

Use this Knowledge Script to emulate sending a ccMail message. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.29 CitrixICAWordStartUp

Use this Knowledge Script to emulate starting up MS Word within the Citrix Independent Computer Architecture (ICA). If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.29.1 Resource Object

Networks-RT

49.29.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.29.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.30 CreditCheckShortConnection

Use this Knowledge Script to emulate transactions that make a series of credit approvals. Each record is sent from Endpoint 1. Endpoint 2 receives the record and sends back a confirmation. This script uses *short* connections: it creates a separate connection for each transaction in the script.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.30.1 Resource Object

Networks-RT

49.30.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.30.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 100.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.31 DatabaseUpdateShortConnect

Use this Knowledge Script to emulate requesting a record from Endpoint 2, getting and updating the record, and sending it back. Endpoint 1 receives a confirmation that the update was completed. This script uses *short* connections: it creates a separate connection for each transaction in the script.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.31.1 Resource Object

Networks-RT

49.31.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.31.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 100.
Reply size	Specify the number of bytes in the reply. The default is 100.
Update size	Specify the number of bytes in the update. The default is 100.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.32 DNSNameLookup

Use this Knowledge Script to emulate looking up a name on the DNS server. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.32.1 Resource Object

Networks-RT

49.32.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.32.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
DNS answer size	Specify the number of bytes in the reply of the DNS server to the requesting client. The default is 150.
DNS question size	Specify the number of bytes in the DNS question request for the resolution of a name to an address. The default is 35.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.33 ExchangeDirectoryService

Use this Knowledge Script to emulate accessing Microsoft Exchange Directory. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.33.1 Resource Object

Networks-RT

49.33.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.33.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.34 ExchangeReadMail

Use this Knowledge Script to emulate retrieving email. Endpoint 1 (the client) requests the full list of unread email messages. Endpoint 2 (the server) sends the unread email messages to the client. You can change the Exchange mail size variable from 2800 to a value that more accurately represents the average email message size you are using in testing.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.34.1 Resource Object

Networks-RT

49.34.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.34.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.

Description	How to Set It
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Exchange mail size	Specify the amount of bytes in the average email message. The default is 2800.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.35 ExchangeReceiveMail

Use this Knowledge Script to emulate a Microsoft Exchange client periodically receiving notification for new email. Endpoint 1 (the client) requests the list of unread email headers; Endpoint 2 (the server) sends this list to the client.

NOTE: The script does not include an 8-byte UDP message that the mail server sends to the client informing the client that a new message is on the server.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.35.1 Resource Object

Networks-RT

49.35.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.35.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

Description	How to Set It
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.36 ExchangeSendMail

Use this Knowledge Script to emulate sending an email message from a Microsoft Exchange client to the server. The transaction only includes sending the message. Endpoint 2 (the server) acknowledges the message back to the Endpoint 1 (the client).

The default Exchange mail size of 1420 bytes includes 700 bytes of email control information. The remainder is text. You should always set this value to at least 700 bytes to include the email overhead.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.36.1 Resource Object

Networks-RT

49.36.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.36.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

Description	How to Set It
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Exchange mail size	Specify the number of bytes in the email message. The default is 1420.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.37 FileReceiveShortConnection

Use this Knowledge Script to emulate Endpoint 1 requesting a file, then receiving it. This script uses *short* connections: it creates a separate connection for each transaction in the script.

If you choose to collect data, this Knowledge Script generates the following data streams:

- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful
- The throughput in kbps. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.

49.37.1 Resource Objects

Networks throughput.

49.37.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.37.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when throughput is less than threshold?	Select **Yes** to raise an event when throughput falls below the threshold you set. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Throughput threshold	Set the minimum throughput. The units are set in the *Throughput units for threshold and data* parameter. When throughput falls below this value, an event is raised. On threshold events, the event message contains a breakdown of the total throughput.

Description	How to Set It
Throughput units for threshold and data	Select the units from the drop-list. “K” represents 1024; “k” represents 1000. “B” represents bytes; “b” represents bits. The choices are: • **KBps** 1,024 Bytes per second • **kBps** 1,000 Bytes per second • **Kbps** 1,024 bits per second (128 Bytes per second) • **kbps** 1,000 bits per second (125 Bytes per second) • **Mbps** 1,000,000 bits per second (125,000 Bytes per second) • **Gbps** 1,000,000,000 bits per second (125,000,000 Bytes per second) **NOTE:** Data is stored as kbps in the database regardless of the threshold unit you set here. However, when you run the Networks-RT_Throughput Report, you can specify the unit that displays on the report.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 100.
File size	Specify the number of bytes in the transferred file. The default is 100,000.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.38 FileSendShortConnection

Use this Knowledge Script to emulate Endpoint 1 sending a file to Endpoint 2 and receiving an acknowledgment. This script uses *short* connections: it creates a separate connection for each transaction in the script.

If you choose to collect data, this Knowledge Script generates the following data streams:

- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful
- The throughput in kbps. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.

49.38.1 Resource Objects

Networks throughput

49.38.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.38.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when throughput is less than threshold?	Select **Yes** to raise an event when throughput falls below the threshold you set. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Throughput threshold	Set the minimum throughput. The units are set in the *Throughput units for threshold and data* parameter. When throughput falls below this value, an event is raised. On threshold events, the event message contains a breakdown of the total throughput.

Description	How to Set It
Throughput units for threshold and data	Select the units from the drop-list. “K” represents 1024; “k” represents 1000. “B” represents bytes; “b” represents bits. The choices are: • **KBps** 1,024 Bytes per second • **kBps** 1,000 Bytes per second • **Kbps** 1,024 bits per second (128 Bytes per second) • **kbps** 1,000 bits per second (125 Bytes per second) • **Mbps** 1,000,000 bits per second (125,000 Bytes per second) • **Gbps** 1,000,000,000 bits per second (125,000,000 Bytes per second) **NOTE:** Data is stored as kbps in the database regardless of the threshold unit you set here. However, when you run the Networks-RT_Throughput Report, you can specify the unit that displays on the report.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
File size	Specify the number of bytes in the transferred file. The default is 100,000.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.39 FTPGet

Use this Knowledge Script to emulate receiving a file at Endpoint 1 from Endpoint 2, using TCP/IP's FTP application (the `GET` function).

This script consists of three sections; each has its own connection. The first section emulates a logon by Endpoint 2 to Endpoint 1. The second section (the only one that is timed) emulates the transfer of a 100,000-byte file. The third section emulates a user logoff. Most variables in the first and third sections are hardcoded. These sections are components of the total network traffic that a real FTP transaction creates, but they are not in the timed loop.

If you choose to collect data, this Knowledge Script generates the following data streams:

- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful
- The throughput in kbps. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.

49.39.1 Resource Objects

Networks throughput

49.39.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.39.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when throughput is less than threshold?	Select **Yes** to raise an event when throughput falls below the threshold you set. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Throughput threshold	Set the minimum throughput. The units are set in the *Throughput units for threshold and data* parameter. When throughput falls below this value, an event is raised. On threshold events, the event message contains a breakdown of the total throughput.

Description	How to Set It
Throughput units for threshold and data	Select the units from the drop-list. “K” represents 1024; “k” represents 1000. “B” represents bytes; “b” represents bits. The choices are: • **KBps** 1,024 Bytes per second • **kBps** 1,000 Bytes per second • **Kbps** 1,024 bits per second (128 Bytes per second) • **kbps** 1,000 bits per second (125 Bytes per second) • **Mbps** 1,000,000 bits per second (125,000 Bytes per second) • **Gbps** 1,000,000,000 bits per second (125,000,000 Bytes per second) **NOTE:** Data is stored as kbps in the database regardless of the threshold unit you set here. However, when you run the Networks-RT_Throughput Report, you can specify the unit that displays on the report.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 100,000.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
File control size	Specify the size of the file control information to be sent and received, in preparation for transferring the file. (In a real file transfer, this usually consists of directory and filename information.) The default is 30.
Login size	Specify the number of bytes in the login flows.The default is 15.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.40 FTPPut

Use this Knowledge Script to emulate sending a file from Endpoint 1 to Endpoint 2 using the `PUT` function of the TCP/IP FTP application.

This script consists of three sections.Each has its own connection. The first section emulates a logon by Endpoint 1 to Endpoint 2. The second section, which is the only one that is timed, emulates the transfer of a 100,000-byte file. The third section emulates a user logoff. Most variables in the first and third sections are hardcoded. These sections are components of the total network traffic that a real FTP transaction creates, but they are not in the timed loop.

If you choose to collect data, this Knowledge Script generates the following data streams:

- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful
- The throughput in kbps. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.

49.40.1 Resource Objects

Networks throughput

49.40.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.40.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when throughput is less than threshold?	Select **Yes** to raise an event when throughput falls below the threshold you set. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Throughput threshold	Set the minimum throughput. The units are set in the *Throughput units for threshold and data* parameter. When throughput falls below this value, an event is raised. On threshold events, the event message contains a breakdown of the total throughput.

Description	How to Set It
Throughput units for threshold and data	Select the units from the drop-list. “K” represents 1024; “k” represents 1000. “B” represents bytes; “b” represents bits. The choices are: • **KBps** 1,024 Bytes per second • **kBps** 1,000 Bytes per second • **Kbps** 1,024 bits per second (128 Bytes per second) • **kbps** 1,000 bits per second (125 Bytes per second) • **Mbps** 1,000,000 bits per second (125,000 Bytes per second) • **Gbps** 1,000,000,000 bits per second (125,000,000 Bytes per second) **NOTE:** Data is stored as kbps in the database regardless of the threshold unit you set here. However, when you run the Networks-RT_Throughput Report, you can specify the unit that displays on the report.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 100,000.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
File control size	Specify the size of the file control information to be sent and received, in preparation for transferring the file. In a real file transfer, this usually consists of directory and filename information. The default is 30.
Login size	Specify the number of bytes in the login flows. The default is 15.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.41 HeadlinerInitialLoad

Use this Knowledge Script to emulate the initial run of Headliner, using its default settings. Five channels are automatically selected. The list of channels is downloaded, in addition to the channel contents. Because the connections are not all serialized, the set of connections needs to be spread over a set of endpoint connections. Each channel is downloaded independently of the others.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.41.1 Resource Objects

Networks-RT

49.41.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.41.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.

Description	How to Set It
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 300.
File size	Specify the number of bytes in the transferred file. The default is 15,000.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.42 HeadlinerSubsequentUpdate

Use this Knowledge Script to emulate the updating of a Headliner channel. In this script, the list of channels is not downloaded again, as it is in HeadlinerInitialLoad. When new channels become available, the list of channels is then downloaded. However, this is not reflected in this emulation because this does not occur at a known time.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.42.1 Resource Objects

Networks-RT

49.42.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.42.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.

Description	How to Set It
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 300.
File size	Specify the number of bytes in the transferred file. The default is 15,000.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.43 HTTPGIFTransfer

Use this Knowledge Script to emulate the traffic of an HTTP graphical image file (GIF) transfer from a Web server to a Web browser. Endpoint 1 (the client) requests a GIF file from Endpoint 2 (the server).

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.43.1 Resource Objects

Networks-RT

49.43.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.43.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 300.
File size	Specify the size of the transferred file. The default is 10,000.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.44 HTTPSSecureTransaction

Use this Knowledge Script to emulate an HTTPS secure text or graphics transfer between a Web server and a Web browser using SSL. The default values for the user data and response sizes reflect those commonly found in current Web browsers and servers.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.44.1 Resource Objects

Networks-RT

49.44.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.44.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User data size	Specify the number of bytes of user data that is sent to the secure transaction server. Examples of this type of information include: name, password, email address, contact address, etc. The default is 1,000.
Response size	Specify the number of bytes in the response. The default is 5,000.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.45 HTTPTextTransfer

Use this Knowledge Script to emulate traffic on an HTTP text transfer from a Web server to a Web browser. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.45.1 Resource Objects

Networks-RT

49.45.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.45.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Size of record to send	Specify the number of bytes to send in a record. The default is 300.
File size	Specify the number of bytes in the transmitted file. The default is 1,000.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.46 InquiryShortConnection

Use this Knowledge Script to emulate a typical client/server inquiry transaction. This script uses *short* connections: it creates a separate connection for each transaction in the script.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.46.1 Resource Objects

Networks-RT

49.46.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.46.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 100.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size	Specify the number of bytes in the reply. The default is 100.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.47 LDAPDirectoryLookup

Use this Knowledge Script to emulate a directory lookup in an LDAP directory. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.48 MicrosoftRDPExcelStartUp

Use this Knowledge Script to emulate starting up Excel on a Microsoft remote desktop that uses RDP. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.48.1 Resource Objects

Networks-RT

49.48.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.48.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.49 MicrosoftRDPIEStartLoadMSN

Use this Knowledge Script to emulate starting and loading MSN Explorer on a Microsoft remote desktop that uses RDP. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.49.1 Resource Objects

Networks-RT

49.49.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.49.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.50 MicrosoftRDPOutlookOpenBox

Use this Knowledge Script to emulate opening Outlook on a remote desktop that uses Microsoft RDP. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.50.1 Resource Objects

Networks-RT

49.50.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.50.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.51 MicrosoftRDPTermServerLogon

Use this Knowledge Script to emulate logon to a Microsoft remote desktop via Terminal Services. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.51.1 Resource Objects

Networks-RT

49.51.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.51.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.52 MicrosoftRDPWordStartUp

Use this Knowledge Script to emulate starting MS Word on a remote desktop that uses RDP. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.52.1 Resource Objects

Networks-RT

49.52.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.52.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.53 MSSQLQuery

Use this Knowledge Script to emulate a query to a SQL server. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.53.1 Resource Objects

Networks-RT

49.53.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.53.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Query string size	Specify the number of bytes in the query string. The default is 500.
Query result size	Specify the number of bytes in the query result. The default is 20,000.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.54 NetworkNewsTransferProtocol

Use this Knowledge Script to emulate activities on a typical Usenet news reader using NNTP. The script assumes that a typical user acts as follows: starts the news reader, opens a news server, selects a newsgroup about every 5-10 minutes, and reads a message about once every 10-60 seconds. Endpoint 1 emulates the news reader and Endpoint 2 emulates the news server.

The well-known port number for NNTP flows in TCP/IP is 119.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.54.1 Resource Objects

Networks-RT

49.54.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.54.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

Description	How to Set It
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Server info size	Specify the size of the server ID message, in bytes, to be sent and received in preparation for transferring news articles. The default is 25.
Size of record to send	Specify the number of bytes to send in a record The default is 25.
Reply size	Specify the number of bytes in the reply. The default is 25.
Header response size	Specify the size of the article header, in bytes, to be sent and received. The default is 500.
Article response size	Specify the number of bytes in the article. The default is 1500.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Number of groups	Specify the number of groups to be retrieved. The default is 10.
Number of articles	Specify the number of articles to be retrieved. The default is 10.
Group delay	Specify a value to simulate user delay or processing between groups. The value can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)` where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Article delay	Specify a floating point number in seconds for the pause between articles.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.55 NotesAttachOpenDB

Use this Knowledge Script to emulate opening a document with an attachment in a Lotus Notes database. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.55.1 Resource Objects

Networks-RT.Default Schedule

The default interval for this script is Every 15 minutes.

49.55.2 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.

Description	How to Set It
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.56 NotesAttachOpenInitDB

Use this Knowledge Script to emulate opening a document with an attachment in a Lotus Notes database that you initialize. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.56.1 Resource Objects

Networks-RT

49.56.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.56.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.57 NotesAttachServerDetach

Use this Knowledge Script to emulate doing an attachment and a detachment. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.57.1 Resource Objects

Networks-RT

49.57.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.57.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.58 NotesAttachServers2Detach

Use this Knowledge Script to emulate performing multiple server attachments and detachments. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.58.1 Resource Objects

Networks-RT

49.58.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.58.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.59 NotesBrowserDBAttach

Use this Knowledge Script to emulate using a Lotus Notes browser to perform an attach. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.59.1 Resource Objects

Networks-RT

49.59.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.59.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. Default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.60 NotesBrowserDBOpen

Use this Knowledge Script to emulate using a Lotus Notes browser to perform a database open. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.60.1 Resource Objects

Networks-RT

49.60.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.60.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.61 NotesBrowserDBSearch

Use this Knowledge Script to emulate a using a Lotus Notes browser to perform a database search. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.61.1 Resource Objects

Networks-RT

49.61.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.61.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.62 NotesCheckForUnreadEmail

Use this Knowledge Script to emulate a Lotus Notes client periodically checking for new email. Endpoint 1 (the client) requests the list of unread email "headers" (sender and subject). Endpoint 2 (the server) sends the list of unread email headers to the client.

The well-known port number for Lotus Notes flows in TCP/IP is 1352.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.62.1 Resource Objects

Networks-RT

49.62.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.62.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.

Description	How to Set It
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
File control size	Specify the number of bytes for the file control information to be sent and received in preparation for transferring the file. (In an actual file transfer, this usually consists of the directory and filename information. The default is 100.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size	Specify the number of bytes in the reply. The default is 1,000.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.63 NotesCreateSaveMailNote

Use this Knowledge Script to emulate creating, then saving a Lotus Notes email message. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.63.1 Resource Objects

Networks-RT

49.63.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.63.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default `AUTO` for automatic assignment. Must be an integer between 1 and 65,535.

49.64 NotesCreateSaveSendAttach

Use this Knowledge Script to emulate creating, saving, and sending a Lotus Notes email note with an attachment. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.64.1 Resource Objects

Networks-RT

49.64.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.64.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.67 NotesIndexedDBLookup

Use this Knowledge Script to emulate performing an indexed Lotus Notes database lookup. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.67.1 Resource Objects

Networks-RT

49.67.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.67.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.68 NotesNonIndexedDBLookup

Use this Knowledge Script to emulate performing a non-indexed Lotus Notes database lookup. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.68.1 Resource Objects

Networks-RT

49.68.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.68.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.69 NotesReceiveEmail

Use this Knowledge Script to emulate email receipt by a Lotus Notes client. Each transaction represents the transfer of an email message from the server to the client. Endpoint 1 (the client) requests an email. Endpoint 2 (the server) sends it back to the client.

The default email message size, 2,000 bytes, includes 1,000 bytes of Lotus Note email control information and 1,000 bytes of readable text. You should therefore set this variable at no less than 1,000 bytes.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.69.1 Resource Objects

Networks-RT

49.69.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.69.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

Description	How to Set It
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
File control size	Specify the number of bytes for the file control information to be sent and received in preparation for transferring the file. (In an actual file transfer, this usually consists of the directory and filename information. The default is 50.
File size	Specify the number of bytes in the email message to be transferred. The default is 2,000.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.70 NotesReplicateMail

Use this Knowledge Script to emulate replicating a Lotus Notes mail database. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.70.1 Resource Objects

Networks-RT

49.70.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.70.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.71 NotesReplicateServer1DB

Use this Knowledge Script to replicate one database. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.71.1 Resource Objects

Networks-RT

49.71.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.71.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.72 NotesReplicateServer50Auto

Use this Knowledge Script to emulate Notes replication. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

Networks-RT

49.72.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.72.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.73 NotesReplicateServer50Docs

Use this Knowledge Script to emulate replicating 50 documents. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.73.1 Resource Objects

Networks-RT

49.73.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.73.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.

Networks-RT

49.74.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.74.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.75 NotesSendEmail

Use this Knowledge Script to emulate a Lotus Notes client sending email. Each transaction represents the transfer of an email message from the client to the server. Each transaction includes both the lookup of the recipient's name on the Lotus Notes local network database and the actual email message.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.75.1 Resource Objects

- Networks-RT

49.75.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

49.75.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
File control size	Specify the number of bytes for the file control information to be sent and received in preparation for transferring the file. (In an actual file transfer, this usually consists of the directory and filename information. The default is 25.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
File size	Specify the number of bytes in the email message. The default is 2,000.
Reply size	Specify the number of bytes in the reply. The default is 100.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.76 NTFilePrintPrintaFile

Use this Knowledge Script to emulate a Windows client requesting a print server to print a file. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.80 OracleAPTier2InvoiceMultDist

Use this Knowledge Script to emulate multiple distributions of an Accounts Payable invoice. If you deploy the application on separate servers for the application and database components, use this script to emulate traffic between the application server and the database server.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.80.1 Resource Objects

Networks-RT

49.80.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.80.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.81 OracleARTier1InsertCustomer

Use this Knowledge Script to emulate inserting an Accounts Receivable customer record. If you deploy the application on separate servers for the application and database components, use this script to emulate traffic between the end user and computer and the application server.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.90 OracleGLTier1JournalEntry

Use this Knowledge Script to emulate making a General Ledger journal entry. If you deploy the application on separate servers for the application and database components, use this script to emulate traffic between the end user and computer and the application server.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.90.1 Resource Objects

Networks-RT

49.90.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.90.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.91 OracleGLTier2AccountInquiry

Use this Knowledge Script to emulate making a General Ledger account inquiry. If you deploy the application on separate servers for the application and database components, use this script to emulate traffic between the application server and the database server.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.91.1 Resource Objects

Networks-RT

49.91.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.91.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no delay). Can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.93 PacketBlasterLongConnection

Use this Knowledge Script to continuously send packets from Endpoint1 to Endpoint 2. This script uses a `long` connection; that is, it makes only one connection for the entire series of transactions in the script. There is no acknowledgment that data has been received. You may find this script helpful for generating background traffic.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.93.1 Resource Objects

Networks-RT

49.93.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.93.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.

Description	How to Set It
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes in the record to be sent. The default is 100.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.94 PacketBlasterRevLongConnect

Use this Knowledge Script to continually receive individual packets to Endpoint 1, as quickly as possible, without waiting for any response. Endpoint 1 thus has an exact record of how many bytes have been successfully received in each timing record. You may find this script helpful for generating background traffic.

This script uses a `long` connection; that is, it makes only one connection for the entire series of transactions in the script.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.94.1 Resource Objects

Networks-RT

49.94.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.94.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

Description	How to Set It
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 100.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.95 PointCastv1InitialUpdate

Use this Knowledge Script to emulate a user getting an update of the default content selections for PointCast Network version 1. A record has 75 transactions, because about that many are required to download all the content.

Because each connection is serialized, only one endpoint connection is necessary. Each connection is made up of a request (from client to server) and a response, which contains the requested content.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.95.1 Resource Objects

Networks-RT

49.95.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.95.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

Description	How to Set It
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 150.
File size	Specify the number of bytes in the transferred file. The default is 15,000.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.96 PointCastv2InitialUpdate

Use this Knowledge Script to emulate a user getting an update of the default content selections for PointCast Network version 2. Some connections occur in parallel and others in serial. Up to five connections occur in parallel. Therefore, five identical endpoint connections are needed, with 25 transactions per record, to download all the contents.

Because each connection is serialized, only one endpoint connection is necessary. Each connection is made up of a request (from client to server) and a response, which contains the requested content.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.96.1 Resource Objects

Networks-RT

49.96.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.96.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

Description	How to Set It
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 250.
File size	Specify the number of bytes in the transferred file. The default is 10,000.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.

Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.97 POP3ReceiveEmail

Use this Knowledge Script to emulate receipt of email messages using TCP/IP's POP3 standard. The script has three sections.

- In the first section, Endpoint 1 receives a logon request, and replies by sending a user name. It then receives a request for and sends the associated password. Next, it receives the acknowledgment of a successful logon. Finally, it sends a request for the number of available email messages and receives the response.
- In the second section's inner loop, Endpoint 1 sends a request for a specific email message. It then receives the message header, followed by the message body. Next, it sends a request to delete the email message, and receives an acknowledgment. To emulate a user who receives a large number of mail messages in a single logon, increase the Transactions per record variable.
- In the third section, Endpoint 1 sends a message that the transfer is complete, and receives an acknowledgment.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.97.1 Resource Objects

Networks-RT

49.97.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.97.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.

Description	How to Set It
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 6.
Reply size	Specify the number of bytes in the reply. The default is 20.
File size	Specify the sized of the file control information to be sent and received in preparation for transferring the file. In an actual file transfer, this usually consists of directory and filename information. The default is 1,000.
File control size	Specify the number of bytes that are in the control flows. The default is 70.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.98 SAPR3AuthPaymentOnInvoice

Use this Knowledge Script to emulate authorizing payment on an invoice prepared using SAP R/3. Each transaction represents one payment authorization and invoice release. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.98.1 Resource Objects

Networks-RT

49.98.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.98.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 100.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size	Specify the number of bytes in the reply. The default is 600.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.99 SAPR3BasicStock

Use this Knowledge Script to emulate a basic stock network transaction by an SAP R/3 operator at the client. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.99.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Delay before responding1	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Size of record to send1	Specify the number of bytes to send in a record. The default is 62.
Reply size1	Specify the number of bytes in the reply. The default is 1103.
User delay1	Specify a value to simulate a user delay: Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution (Uniform, Normal, Poisson, or Exponential) expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Size of record to send2	Specify the number of bytes to send in a record. The default is 89.
Delay before responding2	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size2	Specify the number of bytes in the reply. The default is 2111.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.100 SAPR3BatchCharacterizeStock

Use this Knowledge Script to emulate stock characterization procedures by an SAP R/3 operator at the client. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.100.1 Resource Objects

Networks-RT

49.100.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.100.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Size of record to send1	Specify the number of bytes to send in a record. The default is 52.
Delay before responding1	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size1	Specify the number of bytes in the reply. The default is 1103.
Size of record to send2	Specify the number of bytes to send in a record. The default is 60.
Reply size2	Specify the number of bytes in the reply. The default is 2111.
Size of record to send3	Specify the number of bytes to send in a record. The default is 51.
Reply size3	Specify the number of bytes in the reply. The default is 1466.
Size of record to send4	Specify the number of bytes to send in a record. The default is 53.
Reply size4	Specify the number of bytes in the reply. The default is 2696.
Size of record to send5	Specify the number of bytes to send in a record. The default is 55.
Reply size5	Specify the number of bytes in the reply. The default is 1354.
Delay before responding2 *(also 3, 4, and 5)*	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Client delay1 *(also 2, 3, and 4)*	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.101 SAPR3CreatePurchaseOrder

Use this Knowledge Script to emulate the creation of a purchase order by an SAP R/3 operator at the client. Each transaction represents the transfer of one purchase order in the SAP system. Endpoint 1 (the client) sends a purchase order request. Endpoint 2 (the server) responds with order information.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.101.1 Resource Objects

Networks-RT

49.101.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.101.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 50.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size	The default is 1400.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.102 SAPR3CreateSalesOrder

Use this Knowledge Script to emulate the creation of a sales order by an SAP R/3 operator at the client. Each transaction represents the transfer of one sales order in the SAP system. Endpoint 1 (the client) sends a sales order request. Endpoint 2 (the server) responds with order information.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.102.1 Resource Objects

Networks-RT

49.102.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.102.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Size of record to send1	Specify the number of bytes to send in a record. The default is 54.
Delay before responding1	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size1	Specify the number of bytes in the reply. The default is 265.
Size of record to send2	Specify the number of bytes to send in a record. The default is 45.
Reply size2	Specify the number of bytes in the reply. The default is 239.
Size of record to send3	The default is 47.
Reply size3	Specify the number of bytes in the reply. The default is 271.
Size of record to send4	Specify the number of bytes to send in a record. The default is 45.
Reply size4	Specify the number of bytes in the reply. The default is 249.
Size of record to send5	Specify the number of bytes to send in a record. The default is 52.
Reply size5	Specify the number of bytes in the reply. The default is 808.
Size of record to send6	Specify the number of bytes to send in a record. The default is 114.
Reply size6	Specify the number of bytes in the reply. The default is 1838.
Size of record to send7	Specify the number of bytes to send in a record. The default is 164.
Reply size7	Specify the number of bytes in the reply. The default is 298.
Size of record to send8	Specify the number of bytes to send in a record. The default is 62.
Reply size8	Specify the number of bytes in the reply. The default is 130.
Size of record to send9	Specify the number of bytes to send in a record. The default is 64.
Reply size9	Specify the number of bytes in the reply. The default is 1698.
Size of record to send10	Specify the number of bytes to send in a record. The default is 66.
Reply size10	Specify the number of bytes in the reply. The default is 1668.
Delay before responding2 *(also 3 through 9)*	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Control delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.

Description	How to Set It
Delay before responding10	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Client delay1 *(also 2 through 9)*	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.103 SAPR3GoodsReceipt

Use this Knowledge Script to emulate obtaining a receipt for goods purchased (GR) in the SAP R/3 system. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.103.1 Resource Objects

Networks-RT

49.103.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.103.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Size of record to send1	Specify the number of bytes to send in a record. The default is 52.
Delay before responding1	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size1	Specify the number of bytes in the reply. The default is 840.
Size of record to send2	Specify the number of bytes to send in a record. The default is 111.
Reply size2	Specify the number of bytes in the reply. The default is 1427.
Size of record to send3	Specify the number of bytes to send in a record. The default is 134.
Reply size3	Specify the number of bytes in the reply. The default is 1051.
Size of record to send4	Specify the number of bytes to send in a record. The default is 94.
Reply size4	Specify the number of bytes in the reply. The default is 1468.
Size of record to send5	Specify the number of bytes to send in a record. The default is 59.
Reply size5	Specify the number of bytes in the reply. The default is 878.
Delay before responding2 *(also 3 through 5)*	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Client delay1 *(also 2 through 4)*	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.104 SAPR3GoodsReceiptInspection

Use this Knowledge Script to emulate obtaining a goods inspection receipt by an SAP R/3 operator at the client. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.104.1 Resource Objects

Networks-RT

49.104.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.104.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Size of record to send1	Specify the number of bytes to send in a record. The default is 52.
Delay before responding1	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size1	Specify the number of bytes in the reply. The default is 844.
Size of record to send2	Specify the number of bytes to send in a record. The default is 103.
Reply size2	Specify the number of bytes in the reply. The default is 1427.
Size of record to send3	Specify the number of bytes to send in a record. The default is 135.
Reply size3	Specify the number of bytes in the reply. The default is 258.
Size of record to send4	Specify the number of bytes to send in a record. The default is 67.
Reply size4	Specify the number of bytes in the reply. The default is 128.
Size of record to send5	Specify the number of bytes to send in a record. The default is 67.
Reply size5	Specify the number of bytes in the reply. The default is 1056.
Size of record to send6	Specify the number of bytes to send in a record. The default is 94.
Reply size6	Specify the number of bytes in the reply. The default is 1470.
Size of record to send7	Specify the number of bytes to send in a record. The default is 59.
Reply size7	Specify the number of bytes in the reply. The default is 880.
Delay before responding2 *(also 3 through 7)*	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Client delay1 *(also 2 through 6)*	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.105 SAPR3Login

Use this Knowledge Script to emulate a login to an SAP R/3 server by operator at the client. Endpoint 1 (the SAP R/3 client) sends login and control messages to Endpoint 2 (the server).

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.105.1 Resource Objects

Networks-RT

49.105.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.105.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	

Description	How to Set It
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 100.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size	Specify the number of bytes in the reply. The default is 500.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.106 SAPR3MaterialToMaterialXfer

Use this Knowledge Script to emulate an SAPR3 material to material transfer by an SAP R/3 operator at the client. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.106.1 Resource Objects

Networks-RT

49.106.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.106.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Size of record to send1	Specify the number of bytes to send in a record. The default is 52.
Delay before responding1	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size1	Specify the number of bytes in the reply. The default is 832.
Size of record to send2	Specify the number of bytes to send in a record. The default is 103.
Reply size2	Specify the number of bytes in the reply. The default is 1399.
Size of record to send3	Specify the number of bytes to send in a record. The default is 152.
Reply size3	Specify the number of bytes in the reply. The default is 577.
Size of record to send4	Specify the number of bytes to send in a record. The default is 119.
Reply size4	Specify the number of bytes in the reply. The default is 259.
Size of record to send5	Specify the number of bytes to send in a record. The default is 67.
Reply size5	Specify the number of bytes in the reply. The default is 128.
Size of record to send6	Specify the number of bytes to send in a record. The default is 67.
Reply size6	Specify the number of bytes in the reply. The default is 1038.
Size of record to send7	Specify the number of bytes to send in a record. The default is 95.
Reply size7	Specify the number of bytes in the reply. The default is 1488.
Size of record to send8	Specify the number of bytes to send in a record. The default is 59.
Reply size8	Specify the number of bytes in the reply. The default is 868.
Delay before responding2 *(also 3 through 8)*	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Client delay1 *(also 2 through 7)*	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.107 SAPR3PickingBatchDetermine

Use this Knowledge Script to emulate the process of determining a picking batch in SAP R/3. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.107.1 Resource Objects

Networks-RT

49.107.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.107.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Size of record to send1	Specify the number of bytes to send in a record. The default is 45.
Delay before responding1	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size1	Specify the number of bytes in the reply. The default is 284.
Size of record to send2	Specify the number of bytes to send in a record. The default is 46.
Reply size2	Specify the number of bytes in the reply. The default is 198.
Size of record to send3	Specify the number of bytes to send in a record. The default is 47.
Reply size3	Specify the number of bytes in the reply. The default is 271.
Size of record to send4	Specify the number of bytes to send in a record. The default is 58.
Reply size4	Specify the number of bytes in the reply. The default is 1617.
Size of record to send5	Specify the number of bytes to send in a record. The default is 95.
Reply size5	Specify the number of bytes in the reply. The default is 176.
Size of record to send6	Specify the number of bytes to send in a record. The default is 58.
Reply size6	Specify the number of bytes in the reply. The default is 1803.
Size of record to send7	Specify the number of bytes to send in a record. The default is 58.
Reply size7	Specify the number of bytes in the reply. The default is 228.
Size of record to send8	Specify the number of bytes to send in a record. The default is 59.
Reply size8	Specify the number of bytes in the reply. The default is 1481.
Size of record to send9	Specify the number of bytes to send in a record. The default is 67.
Reply size9	Specify the number of bytes in the reply. The default is 1512.
Size of record to send10	Specify the number of bytes to send in a record. The default is 62.
Reply size10	Specify the number of bytes in the reply. The default is 1386.
Client delay1 *(also 2 through 9)*	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Control delay1	Specify a value to simulate a client delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Loop reply1	Specify the number of bytes in the loop reply. The default is 185.

Description	How to Set It
Loop client delay	Specify a value to simulate a client delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Loop reply2	Specify the number of bytes in the loop reply. The default is 1450.
Loop server delay2	Specify a value to simulate a client delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Size of record to send11	Specify the number of bytes in the transmitted record. The default is 59.
Reply size11	Specify the number of bytes in the reply. The default is 1800.
Client delay10	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Delay before responding11	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Loop size to send3	Specify the number of bytes in the loop file. The default is 85.
Loop reply3	Specify the number of bytes in the loop reply. The default is 332.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.108 SAPR3PostGoods

Use this Knowledge Script to emulate the posting of goods in the SAP R/3 system by an operator at the client. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.108.1 Resource Objects

Networks-RT

49.108.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.108.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Size of record to send1	Specify the number of bytes to send in a record. The default is 47.
Delay before responding1	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size1	Specify the number of bytes in the reply. The default is 667.
Size of record to send2	Specify the number of bytes to send in a record. The default is 59.
Reply size2	Specify the number of bytes in the reply. The default is 225.
Size of record to send3	Specify the number of bytes to send in a record. The default is 60.
Reply size3	Specify the number of bytes in the reply. The default is 577.
Size of record to send4	Specify the number of bytes to send in a record. The default is 58.
Reply size4	Specify the number of bytes in the reply. The default is 1727.
Size of record to send5	Specify the number of bytes to send in a record. The default is 95.
Reply size5	Specify the number of bytes in the reply. The default is 176.
Size of record to send6	Specify the number of bytes to send in a record.57.
Reply size6	Specify the number of bytes in the reply. The default is 1828.
Size of record to send7	Specify the number of bytes to send in a record.59.
Reply size7	Specify the number of bytes in the reply. The default is 224.
Size of record to send8	Specify the number of bytes to send in a record. The default is 67.
Reply size8	Specify the number of bytes in the reply. The default is 607.
Delay before responding2 *(also 3 through 8)*	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Client delay1 *(also 2 through 7)*	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Control delay1	Specify a value to simulate a client delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.109 SAPR3PrepareAnInvoice

Use this Knowledge Script to emulate the preparation of an invoice based on the purchase order created using SAPpuror. Each transaction represents one invoice transfer for payment in the SAP R/3 system. Endpoint 1 (the client) requests invoice and payment information. Endpoint 2 (the server) responds with a customer invoice.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.109.1 Resource Objects

Networks-RT

49.109.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.109.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.

Description	How to Set It
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 100.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size	Specify the number of bytes in the reply. The default is 1,000.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.110 SAPR3QMResultsRecording

Use this Knowledge Script to emulate the recording of SAP R/3 QM module results by an operator at the client. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.110.1 Resource Objects

Networks-RT

49.110.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.110.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Size of record to send1	Specify the number of bytes to send in a record. The default is 59.
Delay before responding1	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size1	Specify the number of bytes in the reply. The default is 399.
Size of record to send2	Specify the number of bytes to send in a record. The default is 45.
Reply size2	Specify the number of bytes in the reply. The default is 265.
Size of record to send3	Specify the number of bytes to send in a record. The default is 46.
Reply size3	Specify the number of bytes in the reply. The default is 203.
Size of record to send4	Specify the number of bytes to send in a record. The default is 48.
Reply size4	Specify the number of bytes in the reply. The default is 399.
Size of record to send5	Specify the number of bytes to send in a record. The default is 46.
Reply size5	Specify the number of bytes in the reply. The default is 316.
Size of record to send6	Specify the number of bytes to send in a record. The default is 46.
Reply size6	Specify the number of bytes in the reply. The default is 1177.
Size of record to send7	Specify the number of bytes to send in a record. The default is 122.
Reply size7	Specify the number of bytes in the reply. The default is 873.
Size of record to send8	Specify the number of bytes to send in a record. The default is 53.
Reply size8	Specify the number of bytes in the reply. The default is 941.
Size of record to send9	Specify the number of bytes to send in a record. The default is 53.
Reply size9	Specify the number of bytes in the reply. The default is 2102.
Size of record to send10	Specify the number of bytes to send in a record. The default is 161.
Reply size10	Specify the number of bytes in the reply. The default is 1194.
Delay before responding2 *(also 3 through 10)*	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Client delay1 *(also 2 through 9)*	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Control delay1 *(also 2)*	Specify a value to simulate a server delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.

Description	How to Set It
Size of loop record	Specify the number of bytes in the loop record.
Loop reply size	Specify the number of bytes in the loop reply.
Loop client delay	Specify a value to simulate a client delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Loop respond delay	Specify a floating point number of seconds for a delay at the loop endpoint.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.111 SAPR3SalesOrderDelivery

Use this Knowledge Script to emulate the delivery of an SAP R/3 sales order by an operator at the client. If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.111.1 Resource Objects

Networks-RT

49.111.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.111.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.

Description	How to Set It
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Size of record to send1	Specify the number of bytes to send in a record. The default is 45.
Delay before responding1	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Reply size1	Specify the number of bytes in the reply. The default is 284.
Size of record to send2	Specify the number of bytes to send in a record. The default is 46.
Reply size2	Specify the number of bytes in the reply. The default is 860.
Size of record to send3	Specify the number of bytes to send in a record. The default is 58.
Reply size3	Specify the number of bytes in the reply. The default is 1838.
Size of record to send4	Specify the number of bytes to send in a record. The default is 164.
Reply size4	Specify the number of bytes in the reply. The default is 299.
Size of record to send5	Specify the number of bytes to send in a record. The default is 62.
Reply size5	Specify the number of bytes in the reply. The default is 130.
Size of record to send6	Specify the number of bytes to send in a record. The default is 63.
Reply size6	Specify the number of bytes in the reply. The default is 1699.
Size of record to send7	Specify the number of bytes to send in a record. The default is 95.
Reply size7	Specify the number of bytes in the reply. The default is 176.
Size of record to send8	Specify the number of bytes to send in a record. The default is 58.
Reply size8	Specify the number of bytes in the reply. The default is 228.
Size of record to send9	Specify the number of bytes to send in a record. The default is 57.
Reply size9	Specify the number of bytes in the reply. The default is 1803.
Size of record to send10	Specify the number of bytes to send in a record. The default is 59.
Reply size10	Specify the number of bytes in the reply. The default is 1481.
Delay before responding2 *(also 3 through 10)*	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Client delay1 *(also 2 through 9)*	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Loop reply1	Specify the number of bytes in the loop reply. The default is 155.

Description	How to Set It
Loop client delay	Specify a value to simulate a client delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Loop reply2	Specify the number of bytes in the loop reply. The default is 1450.
Control delay2	Specify a value to simulate a server delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Loop client delay2	Specify a value to simulate a client delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Client delay10	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Loop size to send3	Specify the number of bytes in the loop file. The default is 63.
Loop reply3	Specify the number of bytes in the loop reply. The default is 1575.
Control delay	Specify a value to simulate a server delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Client delay11	Specify a floating point number of seconds to simulate a delay or processing at the client side.
Size of record to send12	Specify the number of bytes to send in a record. The default is 123.
Reply size12	Specify the number of bytes in the reply. The default is 168.
Delay before responding12	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.112 SMTPSendEmail

Use this Knowledge Script to emulate the sending of email messages from Endpoint 1 to Endpoint 2, using TCP/IP's SMTP standard.

The response time will be faster if you use a file size that is larger than the underlying MTU size; for example, use 1461 bytes or larger on Ethernet. The default data type for the email message is `NEWS.CMP`, a file containing text resembling a news article. The script has three sections.

- In the first section, Endpoint 1 establishes a connection with the SMTP server and sends the identity of the mail sender and receiver.
- In the second section, Endpoint 1 sends the body of the email message. (Note the "Size of record to send" variable.)
- In the third section, Endpoint 1 sends a message that the email message is complete, and receives an acknowledgment.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.112.1 Resource Objects

Networks-RT

49.112.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.112.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.

Description	How to Set It
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If you disable throughput events, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 40.
Reply size	Specify the number of bytes in the reply. The default is 10.
File size	Specify the number of bytes in the transmitted email message. The default is 1,000.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.113 Telnet

Use this Knowledge Script to emulate a TCP/IP Telnet session. Default values indicate that Endpoint 1 sends one byte of data to Endpoint 2, which replies by echoing the same one-byte record. Endpoint 1 contains a `SLEEP` inside the inner loop: `user_delay`. Set this sleep period to a non-zero value to approximate the time the users being emulated pause between keystrokes when typing. The default data type for the exchanged bytes is `TRANS.CMP`.

The well-known port number for Telnet flows in TCP/IP is 23.

If you choose to collect data, this Knowledge Script generates the following data streams:

- The response time in seconds. Additional details are saved with the data point, and can be viewed by double-clicking the data point in the Graph Pane or Chart Console.
- Availability – Returns one of two values:
  - 1 – test was successful
  - 0 – test was not successful

49.113.1 Resource Objects

Networks-RT

49.113.2 Default Schedule

The default interval for this script is Every 15 minutes.

49.113.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect data for graphs and reports. By default, data is collected.
Event when test fails to run?	Select **Yes** to raise an event when the test fails to run. By default, events are enabled.
Event when response time exceeds threshold?	Select **Yes** to raise an event when the threshold is exceeded. By default, events are enabled.
Select endpoints to run the test to	Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish.
Response time threshold (seconds)	Specify a floating point number in seconds. When response time exceeds this value, an event is raised. On threshold events, the event message contains a breakdown of the total response time. Required, unless the *Event when response time exceeds threshold* parameter is disabled.
Unsuccessful test event severity	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 5.

Description	How to Set It
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 15. If response time events are disabled, this value is ignored.
Detailed Parameters	
Transactions per record	Specify a positive integer to represent the number of transactions to simulate. The value varies according to the application script.
Size of record to send	Specify the number of bytes to send in a record. The default is 1.
Delay before responding	Specify a number of seconds to simulate a server delay. The default is 0 (no delay). Before executing the next script, the server pauses for the specified value, which can be either a positive integer or a random distribution expressed in milliseconds. The format for random distributions is `r(l,u)`, where `r` = U (uniform), N (normal), P (poisson), or E (exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
User delay	Specify a value to simulate a user delay. Before executing the next command, the script pauses for the specified time. The default is 0 (no pause). The value can be a positive integer or random distribution expressed in milliseconds. The random distribution format is `r(l,u)`, where `r` = U (Uniform), N (Normal), P (Poisson), or E (Exponential); `l` = lower limit; `u` = upper limit. For example, `u(1,10)`.
Transaction delay	Specify a positive integer in milliseconds to control the frequency of transaction execution. This simulates an end user running the transaction on a regular basis. The default of 0 sets no delay, so that the script executes the number of transactions per record as quickly as possible.
Destination port	Specify the destination port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.
Source port	Specify the source port number, or use the default AUTO for automatic assignment. Must be an integer between 1 and 65,535.

49.114 Traceroute

Use this Knowledge Script to collect traceroute data for a specified source and target location on demand, or at regularly scheduled intervals.

49.114.1 Resource Object

Networks-RT

49.114.2 Default Schedule

The default interval for this script is Every 4 hours.

49.114.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Select **Yes** to collect traceroute data. By default, data is collected.
Event when traceroute fails?	Select **Yes** to raise events. By default, events are enabled.
Event when total latency exceeds threshold?	Select **Yes** to raise events. The default is n.
Select the traceroute target locations	Specify an AppManager ResponseTime for Networks node, some other AppManager node, an IP address, or a URL. The maximum length is 64 characters. **NOTE:** The source location is the computer where the script is run. Click the Browse [...] button to display the Select a View dialog box. Highlight a view from the list and click **Next** to open the Select Desired Computer(s) dialog box. The view determines which computers are available for selection. Select one or more endpoint computers. Click Finish. Or specify multiple targets separated by commas in the text input field. The script validates whether at least one of the target locations is different from the source location where the script is run.
Maximum number of hops	Specify an integer, 1-30. Set the maximum number of hops allowed in the traceroute. The default is 30.
Total latency threshold (sec)	Set the threshold for the total latency in seconds. The default is 1.000 seconds. The latency threshold must not be blank if the *Event when total latency exceeds threshold?* parameter is enabled.
Traceroute failed event severity	Set the event severity, from 1 to 40, to indicate the importance of the event. The default is 15.
Threshold event severity	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25.

49.114.4 Example of How this Script Is Used

This script can be used to collect baseline traceroute data between a specified source and target location. This is particularly useful if you have also selected the Action_Traceroute or Action_TracerouteNetworks-RT script as an action associated with a separate Knowledge Script. If you are collecting exception traceroutes by means of an action traceroute script, the baseline data collected by the Networks-RT_Traceroute script may be used as a comparison with the exception data. However, for comparison of baseline and exception data, you must run the Networks-RT_Traceroute script against the same source and target location as the Knowledge Scripts that might generate exception traceroutes.

In addition to comparing the Networks-RT_Traceroute data against exception data, the baseline data may also be viewed on its own. You may run the Report_TracerouteProfile script to generate a report that summarizes the accumulated traceroute data for a given source and target location thus far.

49.115 Report_ResponseTimeSummary

Use this Knowledge Script to generate a summary report detailing availability and response time for response time-specific Networks-RT Knowledge Scripts.

49.115.1 Resource Object

Report agent

49.115.2 Default Schedule

By default, this Knowledge Script is set to **Run once**.

49.115.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
KS for report	Select one of the following: • **Show scripts where report data is currently available.** Displays a filtered list of scripts that have been previously executed and have generated report data streams. • **Show All Networks-RT scripts.** Displays all Networks-RT scripts, including those with no associated data. Select this option if, for example, you are configuring reports for tests that have not yet started running. Click **OK** to show the Select a Knowledge Script dialog box. Highlight a Networks-RT script from the Knowledge Script Name list and click **Finish** to select it.
Endpoint 1 computer(s)	Select from one to twenty-five views. Your subsequent selections are limited to computers or server groups that are visible in the selected views. Select one of the Filters options: • **View:** Includes all computers in the views you selected. • **Computer:** Select from individual computers in the views you selected. • **Server Group:** Select from server groups in the views you selected. Selecting a server group includes all computers in that group.
Endpoint 2 computer or “All”	Provide the name of the Endpoint 2 computer, or type “All” to designate all computers as Endpoint 2 computers.
Select time range	In the Select Date/Time Range dialog box, set specific start and end report information dates (good for historical or ad hoc reports), or a sliding range (the default) that sets the time range of data to include in the report. This option is useful for reports running on a regular schedule and is the default.
Select peak weekday(s)	In the Select Peak Weekday(s) dialog box, press **Shift** to select a contiguous day range, or **Ctrl** to select non-contiguous days.

Description	How to Set It
Aggregation by	Select the time unit by which to aggregate data. The default is Hour. Works in conjunction with the next field (Aggregation interval), which determines the number of units for one interval of data aggregation.
Aggregation interval	Select the interval units in which to aggregate data. The default is 1. For example, if you aggregate by the Hour and select 1 here, data is aggregated once every hour.
Report settings	
Include parameter card?	Specify whether to display a table of parameters used in the report.
Include Availability detail table?	Specify whether to display the Availability detail table as part of the report. By default, the table is included.
Include Availability chart?	Specify whether to display the Availability chart as part of the report. By default, the chart is included.
Threshold on Availability chart	Specify an integer for the percent. The default is 0 (no threshold is displayed).
Include Response Time detail table?	Specify whether to display the Response Time detail table as part of the report. By default, the table is included.
Include Response Time chart?	Specify whether to display the Response Time chart as part of the report. By default, the chart is included.
Units for Response Time report	Select the response time unit of msec (the default) or sec.
Threshold on Response Time chart (selected units)	Specify the units in seconds > 0, or use the default of 0.0. (Zero suppresses the threshold indicator in the chart.)
Select chart style	Options in the Chart Settings dialog box set the appearance of the chart. The same parameters are used in both the availability and response time charts, if both are produced. The default is Ribbon.
Select output folder	In the Specify report folder/filename dialog box, enter an output filename and fill in the remote folder fields.
Add job ID to output folder name?	Specify whether to append a job ID to the output folder name. By default, the job ID is not appended.
Index-Report Title	In the Report Properties dialog box, configure report title settings.
Add time stamp to title	Specify whether to add a timestamp to the report title.
Event notification	
Generate event on success?	Specify whether an event is raised when a report is generated. By default, events are enabled.
Severity level for report success	Set the severity level for a successful report. The default is 35.
Severity level for report with no data	Set the severity level for a report with no data. The default is 25.
Severity level for report failure	Set the severity level for a report with no data. The default is 5.

49.116 Report_ThroughputSummary

Use this Report Knowledge Script to generate a summary report detailing availability and throughput for the following Networks-RT scripts:

- [Throughput]
- FileReceiveShortConnection
- FileSendShortConnection
- FTPGetÂă
- FTPPut

49.116.1 Resource Object

AppManager repository

49.116.2 Default Schedule

By default, this Knowledge Script is set to **Run once**.

49.116.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
KS for report	Select one of the following: • **Show scripts where report data is currently available.** Displays a filtered list of scripts that have been previously executed and have generated report data streams. • **Show All Networks-RT scripts.** Displays all Networks-RT scripts, including those with no associated data. Select this option if, for example, you are configuring reports for tests that have not yet started running. Click **OK** to show the Select a Knowledge Script dialog box. Highlight a Networks-RT script from the Knowledge Script Name list and click **Finish** to select it.
Endpoint 1 computer(s)	Select from one to twenty-five views. Your subsequent selections are limited to computers or server groups that are visible in the selected views. Select one of the Filters options: • **View:** Includes all computers in the views you selected. • **Computer:** Select from individual computers in the views you selected. • **Server Group:** Select from server groups in the views you selected. Selecting a server group includes all computers in that group.
Endpoint 2 computer or “All”	Type the name of the Endpoint 2 computer, or type “All” to designate all computers as Endpoint 2 computers.

Description	How to Set It
Select time range	In the Select Date/Time Range dialog box, set specific start and end report information dates (good for historical or ad hoc reports), or a sliding range (the default) that sets the time range of data to include in the report. This option is useful for reports running on a regular schedule and is the default.
Select peak weekday(s)	In the Select Peak Weekday(s) dialog box, press **Shift** to select a contiguous day range, or **Ctrl** to select non-contiguous days.
Aggregation by	Select the time unit by which to aggregate data. The default is Hour. Works in conjunction with the next field (Aggregation interval), which determines the number of units for one interval of data aggregation.
Aggregation interval	Select the interval units in which to aggregate data. The default is 1. For example, if you aggregate by the Hour and select 1 here, data is aggregated once every hour.
Report settings	
Include parameter card?	Specify whether to display a table of parameters used in the report.
Include Availability detail table?	Specify whether to display the Availability detail table as part of the report. By default, the table is included.
Include Availability chart?	Specify whether to display the Availability chart as part of the report. By default, the chart is included.
Threshold on Availability chart	Specify an integer for the percent. The default is 0 (no threshold is displayed).
Include Throughput detail table?	Specify whether to display the Response Time detail table as part of the report. By default, the table is included.
Include Throughput chart?	Specify whether to display the Response Time chart as part of the report. By default, the chart is included.
Units for Throughput report	Select the units from the drop-list. “K” represents 1024; “k” represents 1000. “B” represents bytes; “b” represents bits. The choices are: • **KBps** 1,024 Bytes per second • **kBps** 1,000 Bytes per second • **Kbps** 1,024 bits per second (128 Bytes per second) • **kbps** 1,000 bits per second (125 Bytes per second) • **Mbps** 1,000,000 bits per second (125,000 Bytes per second) • **Gbps** 1,000,000,000 bits per second (125,000,000 Bytes per second)
Threshold on Throughput chart (selected units)	Specify the units in seconds > 0, or use the default of 0.0. (Zero suppresses the threshold indicator in the chart.)
Select chart style	Options in the Chart Settings dialog box set the appearance of the chart. The same parameters are used in both the availability and response time charts, if both are produced. The default is Ribbon.
Select output folder	In the Specify report folder/filename dialog box, enter an output filename and fill in the remote folder fields.
Add job ID to output folder name?	Specify whether to append a job ID to the output folder name. By default, the job ID is not appended.
Index-Report Title	In the Report Properties dialog box, configure report title settings.
Add time stamp to title	Specify whether to add a timestamp to the report title.
Event notification	

Description	How to Set It
Generate event on success?	Specify whether an event is raised when a report is generated. By default, events are enabled.
Severity level for report success	Set the severity level for a successful report. The default is 35.
Severity level for report with no data	Set the severity level for a report with no data. The default is 25.
Severity level for report failure	Set the severity level for a report with no data. The default is 5.

49.117 Report_TracerouteException

Use this Knowledge Script to generate a report that compares exception traceroute data collected in response to an event by means of an action traceroute script against the averaged traceroute statistics from the associated source and target locations.

The data used in the comparison will be from the two weeks immediately prior to the time the exception traceroute was collected.

NOTE: If an Action Traceroute fails, then the TracerouteException Report will NOT be able to create an Exception Report for the event that initiated the Action Traceroute. If the Action Traceroute fails, an event is raised to denote the failure.

49.117.1 Resource Object

Report agent (with Networks-RT subfolder)

49.117.2 Default Schedule

The default interval for this script is Run once.

49.117.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Event Id	Specify the event ID associated with the exception traceroute data to compare with the baseline traceroute data. The report checks whether traceroute data is associated with the event ID, and reports an error if there is no traceroute data.
Report settings	
Include parameter card?	Select whether to include a table of report parameters at the end of the report. By default, the table is included.
Include traceroute analysis table?	Select whether to include comparison table of exception route vs. most common baseline route in the report. By default, the table is included.
Include route frequency table?	Select whether to include table of route frequencies in the report. By default, the table is included.
Include route details table?	Select whether to include route details table(s) in the report. By default, the table is included.
Include last 10 exception route tables?	Select whether to include last 10 exception route table(s) in the report. By default, the table is included.
Select output folder	Specify a report filename and folder. The default is "`Networks-RT_TracerouteException\default.htm`".

Add job ID to output folder name?	Select whether to append the report job ID to the report output folder name. By default, the job ID is not appended.
Index-Report Title	Choose report title, author, company, component, description, expiration period, and custom fields. Defaults: Title = Networks-RT Traceroute Exception Author = NetIQ AppManager Company = Your company here Component = NetIQ AppManager 5.0 Networks-RT Module Description = Reports for Networks-RT: Traceroute Exception Expiration Period = Expires after 7 days Custom Field 1 = Networks-RT Endpoint, Traceroute Exception Custom Field 2 = Exception traceroute data for selected event ID
Add time stamp to title	Select whether to include the time of the report in the report title. By default, the time is not included.
Event notification	
Generate event on success?	Select whether to raise an event when the report is successfully generated. By default, events are enabled.
Severity level for report success	Specify a severity level for the event raised when the report is generated successfully. The default is 35.
Severity level for report with no data	Specify a severity level for the event raised when no data for the report is found within the selected time interval. The default is 25.
Severity level for report failure	Specify a severity level for the event raised when report generation fails. The default is 5.

49.117.4 TracerouteException Report Details

The following topics explain the different sections of the report output.

49.117.4.1 Exception Traceroute

This section summarizes an "exception traceroute," a traceroute test run automatically when a threshold was crossed. The exception traceroute reported on is the one associated with the event whose ID was specified in the report script parameters.

The table includes the source and target locations of the exception traceroute, the time the traceroute was run, the route ID of the traceroute, the number of hops in the traceroute, the total latency of the traceroute, the Knowledge Script that raised the associated event, the ID of the job that raised the associated event, the ID of the associated event, the message of the associated event, and the time of the first occurrence of the associated event.

The route ID of the exception traceroute refers to the route ID associated with the routes listed in the "Route Frequency" and "Route Details" sections.

49.117.4.2 Traceroute Analysis

This section compares the details of the exception traceroute that is the focus of this report against the details of the most common baseline traceroute.

The hop locations and latencies of the exception traceroute are listed side-by-side with the hop locations and latencies of the baseline traceroute. If a hop location is the same for both traceroutes (based on the IP addresses of the hops), the hop location is listed in the column of common hops.

The most common baseline traceroute is determined using the following steps:

1. Find the traceroute with the highest baseline frequency.
2. If more than one traceroute shares the highest baseline frequency, select the traceroute that has the same route ID as the exception traceroute. Or else select the traceroute that has the lowest exception frequency.
3. If multiple traceroutes share the highest baseline frequency and the lowest exception frequency, choose the traceroute with the lowest route ID.

NOTE: If no baseline data is available, the table is not created.

49.117.4.3 Route Frequency

This section summarizes all of the distinct routes from the source location to the target location seen during the time period of the report. When comparing routes, two routes are considered to be the same if all of the following conditions are met:

- The source location names are identical.
- The target location names are identical.
- The number of hops for both routes are identical.
- The IP addresses at each hop are identical. The hop names are not considered.

For each distinct route, the table lists its route ID, the frequency of the route when collected using the Traceroute Knowledge Script (Baseline Route Frequency), the average latency of this route when collected using the Networks-RT_Traceroute Knowledge Script (Average Baseline Route Latency), the frequency of the route when collected using either traceroute Action Knowledge Script (Exception Route Frequency), and the average latency of this route when collected using either traceroute Action Knowledge Script (Average Exception Route Latency).

If no data has been collected using the Traceroute Knowledge Script for a route, the route has a Baseline Route Frequency of 0.00%, and the Average Baseline Route Latency is blank. Likewise, if no data has been collected using either traceroute Action Knowledge Script for a route, the route has an Exception Route Frequency of 0.00%, and the Average Exception Route Latency is blank.

NOTE: The route ID for each route is not guaranteed to be constant between reports with different time periods for a given source and target pair. The route IDs are determined at the time the report is generated, and are dependent on the data points included in the report. For example, you may have collected data points for three distinct routes between source "A" and target "E" like the following:

- A - B - C - D - E
- A - F - G - H - E
- A - X - Y - Z - E

If the time period for the report covers all of these data points, the report may list the "A-B-C-D-E" route with Route ID = 1, the "A-F-G-H-E" route with Route ID = 2, and the "A-X-Y-Z-E" route with Route ID = 3. However, if the time period of the report is changed to exclude the "A-B-C-D-E" data points, then the Route ID values for the remaining routes are shifted up by 1 - the "A-F-G-H-E" route will have Route ID = 1, and the "A-X-Y-Z-E" route will have Route ID = 2.

49.117.4.4 Route Details

This section provides details for each of the distinct routes from the source location to the target location seen during the time period of the report. A separate table is created for each distinct route.

Each table lists the hops for a particular route, with one hop per table row. For each hop, the row contains the average latency for the hop when collected using the Traceroute Knowledge Script (Average Baseline Hop Latency), the average latency for the hop when collected using either traceroute Action Knowledge Script (Average Exception Hop Latency), the IP address for the hop (Address), and the resolved name for the hop (Name).

Similar to the Route Frequency table, if no data has been collected using the Traceroute Knowledge Script for a route, the Average Baseline Hop Latency is blank for each hop. Likewise, if no data has been collected using either traceroute Action Knowledge Script for a route, the Average Exception Hop Latency is blank for each hop. And if an individual hop could not be determined, the Average Baseline Hop Latency and Average Exception Hop Latency is "0.000", the Address is "0.0.0.0", and the Name is blank.

49.117.4.5 Last 10 Exception Routes

This section provides details for up to ten exception traceroutes from the source location to the target location seen during the time period of the report. If fewer than ten exception traceroutes are collected during the time period of the report, only those traceroutes are included. If more than ten exception traceroutes are collected during the time period of the report, the report selects the ten most recent exception traceroutes. A separate table is created for each exception traceroute.

The data in the exception traceroute tables is similar to that in the Route Details tables. However, the data in the exception traceroute tables is the raw data for only one particular traceroute instance. The latency values in the exception traceroute tables are not averaged against other traceroute instances.

49.117.4.6 Parameters

This section provides details about the creation of the report itself. The table lists the ID of the event associated with the exception traceroute used as the basis of the report, the description of the report, and the time the report was created.

49.118 Report_TracerouteProfile

Use this Report Knowledge Script to generate a report that summarizes the averaged traceroute statistics for a given source and target location combination, along with the last 10 exception traceroutes for the pair.

Specify any time range from which to include data for the report; the default is 14 days before the time the report is created.

49.118.1 Resource Object

Report Agent (with Networks-RT subfolder)

49.118.2 Default Schedule

The default interval for this script is Run once.

49.118.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Traceroute source location	Select an AppManager ResponseTime for Networks node, the node from which the traceroute was run. Do not leave blank. Specify only one source.
Traceroute target location	Select an AppManager ResponseTime for Networks node, some other AppManager node, an IP address, or a URL to which the traceroute was run. Do not leave blank. The report validates whether traceroute data is associated with the source-target pair and reports an error if none is. Specify only one target.
Select time range	Specify the time period whose baseline and exception data should be included. Default includes all data from the previous 14 days up to the current time.
Report settings	
Include parameter card?	Select whether to include a table of report parameters at the end of the report. By default, the table is included.
Include route frequency table?	Select whether to include table of route frequencies in the report. By default, the table is included.
Include route details table?	Select whether to include route details table(s) in the report. By default, the table is included.
Include last 10 exception route tables?	Select whether to include last 10 exception route table(s) in the report. By default, the table is included.
Select output folder	Select a report filename and folder. The default is "`Networks-RT_TracerouteProfile\default.htm`".
Add job ID to output folder name?	Select whether to append the report job ID to the report output folder name. By default, the job ID is not appended.

Index-Report Title	Choose report title, author, company, component, description, expiration period, and custom fields. Defaults are: Title = Networks-RT Traceroute Profile Author = NetIQ AppManager Company = Your company here Component = NetIQ AppManager 5.0 Networks-RT Module Description = Reports for Networks-RT: Traceroute Profile Expiration Period = Expires after 7 days Custom Field 1 = Networks-RT Endpoint, Traceroute Profile Custom Field 2 = Baseline and exception traceroute data for selected source and target locations.
Add time stamp to title	Select whether to include the time of the report in the report title. By default, the time is not included.
Event notification	
Generate event on success?	Select whether to raise an event when the report is successfully generated. By default, events are enabled.
Severity level for report success	Specify a severity level, from 1 to 40, to indicate the importance of the successful report generation event. The default is 35.
Severity level for report with no data	Specify a severity level, from 1 to 40, to indicate the importance of the event when no data for the report is found within the selected time interval. The default is 25.
Severity level for report failure	Specify a severity level, from 1 to 40, to indicate the importance of the event when report generation fails. The default is 5.

49.118.4 TracerouteProfile Report Details

The Traceroute report output contains several different sections:

49.118.4.1 Traceroute

This section lists the traceroute source and target locations specified in the report script parameters.

49.118.4.2 Route Frequency

This section summarizes all of the distinct routes from the source location to the target location seen during the time period of the report. When comparing routes, two routes are considered to be the same if all of the following conditions are met:

- The source location names are identical.
- The target location names are identical.
- The number of hops for both routes are identical.
- The IP addresses at each hop are identical. Hop names are not considered.

For each distinct route, the table lists its route ID, the frequency of the route when collected using the Traceroute Knowledge Script (Baseline Route Frequency), the average latency of this route when collected using the Traceroute Knowledge Script (Average Baseline Route Latency), the frequency of the route when collected using either traceroute Action Knowledge Script (Exception Route Frequency), and the average latency of this route when collected using either traceroute Action Knowledge Script (Average Exception Route Latency).

If no data has been collected using the Traceroute Knowledge Script for a route, the route has a Baseline Route Frequency of 0.00%, and the Average Baseline Route Latency is blank. Likewise, if no data has been collected using either traceroute Action Knowledge Script for a route, the route has an Exception Route Frequency of 0.00%, and the Average Exception Route Latency is blank.

NOTE: The route ID for each route is not guaranteed to be constant between reports with different time periods for a given source and target pair. The route IDs are determined at the time the report is generated and are dependent on the data points included in the report. For example, you may have collected data points for three distinct routes between source "A" and target "E" like the following:

- A - B - C - D - E
- A - F - G - H - E
- A - X - Y - Z - E

If the time period for the report covers all of these data points, the report may list the "A-B-C-D-E" route with Route ID = 1, the "A-F-G-H-E" route with Route ID = 2, and the "A-X-Y-Z-E" route with Route ID = 3. However, if the time period of the report is changed to exclude the "A-B-C-D-E" data points, the Route ID values for the remaining routes are shifted up by 1, the "A-F-G-H-E" route has Route ID = 1, and the "A-X-Y-Z-E" route has Route ID = 2.

49.118.4.3 Route Details

This section provides details for each of the distinct routes from the source location to the target location seen during the time period of the report. A separate table is created for each distinct route.

Each table lists the hops for a particular route, with one hop per table row. For each hop, the row contains the average latency for the hop when collected using the Traceroute Knowledge Script (Average Baseline Hop Latency), the average latency for the hop when collected using either traceroute Action Knowledge Script (Average Exception Hop Latency), the IP address for the hop (Address), and the resolved name for the hop (Name).

Similar to the Route Frequency table, if no data has been collected using the Traceroute Knowledge Script for a route, the Average Baseline Hop Latency is blank for each hop. Likewise, if no data has been collected using either traceroute Action Knowledge Script for a route, the Average Exception Hop Latency is blank for each hop. And if an individual hop could not be determined, the Average Baseline Hop Latency and Average Exception Hop Latency is "0.000", the Address is "0.0.0.0", and the Name is blank.

49.118.4.4 Last 10 Exception Routes

This section provides details for up to 10 exception traceroutes from the source location to the target location seen during the time period of the report. If fewer than ten exception traceroutes were collected during the time period of the report, only those traceroutes are included. If more than ten exception traceroutes were collected during the time period of the report, the report selects the ten most recent exception traceroutes. A separate table is created for each exception traceroute.

The data in the exception traceroute tables is similar to that in the Route Details tables. However, the data in the exception traceroute tables is the raw data for only one particular traceroute instance. The latency values in the exception traceroute tables are not averaged against other traceroute instances.

49.118.4.5 Parameters

This section provides details about the creation of the report itself. The table lists the source and target locations as specified in the report script parameters, the start time and end time between which to include traceroute data as specified in the report script parameters, a description of the report, and the time it was created.

49.119 Net-RT-Import_KSGenerator

These Knowledge Scripts are created using the KSGenerator They are accessed from the Net-RT-Import tab in the AppManager Console.

NOTE: Context-sensitive Help is not available for imported Knowledge Scripts. To access Help for Net-RT-Import scripts, launch the online Help for AppManager. In the left pane (Table of Contents) of the Help window, click **Knowledge Script Reference**, then **Networks-RT Knowledge Scripts**. Scroll through the table shown in the right pane and click **Net-RT-Import_KSGenerator** to view generic Help for imported scripts.

Four types of random mathematical distributions can be used for values in certain parameters, such as delay parameters:

Uniform

The distribution between the upper and lower limit is completely uniform. Any number within the upper and lower limits is as likely to be used as any other number.

Normal

The Marsaglia-Bray algorithm is used to generate the normal distribution. The average value of the distribution is determined from the upper and lower limit. In a normal distribution, most values occur within +/-3 standard deviations with respect to the average. The standard deviation is also calculated from the upper and lower limits, as no value exceeds those limits.

Poisson

This distribution is calculated as follows:

```
standard deviation=(high-low)/6
mean=standard deviation**2
```

The random number generator only returns the numbers in the given low/high range, effectively truncating the distribution curve at the ends.

Exponential

This distribution is calculated as follows:

```
mean=[(low + high)/2]- low
a= 1/mean
variance= 1/(a**2)
standard deviation= 1/a
standard deviation=mean
```

The random number generator generates numbers between 0 and (high-low), and increments each number by low to ensure no number is less than low (effectively shifting the distribution curve to the right.

49.119.1 Resource Object

Networks-RT

49.119.2 Default Schedule

The default interval for this script is **Every 15 minutes**.

49.119.3 Setting Parameter Values

The following table describes many of the common parameters found in imported Knowledge Scripts. Not all parameters are available in every script.

Parameter	How to Set It
How many timing records to generate	An endpoint creates a timing record each time it goes through this loop. Many scripts have two loops: the outer loop controls the number of timing records, while the inner loop controls the number of transactions per timing record. (By adjusting the inner loop, you can run large scripts without ending up with too many timing records.) Defaults to 1, and is marked as a Hidden Parameter in the KSGenerator. It is recommended to set this value to 1.
Transactions per timing record	Many scripts have two loops (controlled by `LOOP` commands): the outer loop controls the number of timing records, while the inner loop controls the number of transactions per timing record. (By adjusting the inner loop, you can run large scripts without generating too many timing records.) This variable controls the number of transactions performed per timing record. A setting of “1” equates to one timing record per transaction. While this setting yields the most granular results, revealing variations in performance metrics, it also tends to create a huge number of timing records. Larger values lets you run long tests that generate fewer timing records. Because endpoints return a timing record for each collection of transactions in this loop, results are averaged, which may hide variations in network response. The best values for this variable make the script loop enough times to generate a timing record about once a second. The proper setting requires a bit of trial and error, and depends on the speed of the network and the type of transaction.
How many bytes of data in each SEND	The `SEND` command has four variables: • how many bytes to send • what size buffers to use on each `SEND` • what type of data to send • the rate at which to send the data. For example, if you chose "`SEND 1000, 100, ZEROS, UNLIMITED`," an endpoint would send 1000 bytes, 100 bytes at a time, with all zeros as data, as fast as possible. This `SEND` command would result in 10 `Send` calls to the communications API. Some scripts use the same variable for the send size and the buffer size. This was designed so that the data is always sent in one block. Send and receive buffers can be set to the value "`DEFAULT`." This tells the endpoint to use buffers that are the default size for the network protocol being used. `DEFAULT` lets you use the default buffer size for each protocol, without having to modify the script to handle protocol differences. The default value is different depending on the protocol and platform being used. An endpoint uses the common value for its particular environment. To have the endpoint send data of varying packet sizes, use one of the random distributions: Uniform, Normal, Poisson, or Exponential.

Parameter	How to Set It
How many bytes of data in each RECEIVE	The RECEIVE command has two variables: • how many bytes to receive • what size buffers to use on each RECEIVE. For example, if you chose "RECEIVE 1000, 100," an endpoint would receive 1000 bytes, 100 bytes at a time. This RECEIVE command would result in 10 calls to the communications API. Some scripts use the same variable for the receive size and the buffer size. This was designed so that all of the data is received in one block. Send and receive buffers can be set to the value "DEFAULT." This tells the endpoint to use buffers that are the default size for the network protocol being used. DEFAULT lets you use the default buffer size for each protocol, without having to modify the script to handle protocol differences. The default value is different depending on the protocol and platform being used. An endpoint uses the most common value for its particular environment. To have the endpoint send data of varying packet sizes, use one of the random distributions: Uniform, Normal, Poisson, or Exponential.
Amount of data to be sent	The SEND command has four variables: • how many bytes to send • what size buffers to use on each SEND • what type of data to send • the rate at which to send the data. For example, if you chose "SEND 1000, 100, ZEROS, UNLIMITED," an endpoint would send 1000 bytes, 100 bytes at a time, with all zeros as data, as fast as possible. This SEND command would result in 10 Send calls to the communications API.
How many bytes in the transferred file	he SEND command has four variables: • how many bytes to send • what size buffers to use on each SEND • what type of data to send • the rate at which to send the data. For example, if you chose "SEND 1000, 100, ZEROS, UNLIMITED," an endpoint would send 1000 bytes, 100 bytes at a time, with all zeros as data, as fast as possible. This SEND command would result in 10 Send calls to the communications API. In the file transfer scripts, you can set the size of the simulated file to be sent. Remember that an endpoint is sending this amount of data, but it is not doing any file I/O.

Parameter	How to Set It
Milliseconds to wait before responding	This variable lets you simulate a user delay or processing at the endpoint. Before the next script command is executed, the endpoint sleeps for the number of milliseconds specified here. The `SLEEP` does not consume CPU cycles, so it is only simulating the delay, not the CPU or other overhead of a real application or user. Endpoints can sleep the same amount every time, or for a random period of time (if you select one of the random distributions: Uniform, Normal, Poisson, or Exponential). A Constant value of 1000 causes an endpoint to sleep for 1 second. For a Uniform distribution, enter the range for the random sleep time. For example, if you want the endpoint to sleep for somewhere between 2 and 5 seconds, enter 2000 for the Lower limit value and 5000 for the Upper limit. By default the delay is set to a Constant value of 0, which means that an endpoint immediately begins executing the script commands.
Milliseconds to pause	Control how frequently transactions are executed. Set the number of milliseconds to sleep before starting to execute more commands. Normally used to simulate an end user running a transaction on a regular basis, for example, once per second. A value of 1000 will cause an endpoint to sleep for one second. By default the delay is set to 0, which means that an endpoint executes the scripts as quickly as possible.
What type of data to send	This variable lets you control the contents of the data sent during a test. The default, `NOCOMPRESS`, defeats most network compression algorithms by sending a loop of randomly generated data. `ZEROS` sends all zero data. The standard text file `NEWS.CMP` and the standard graphics file `LENA.CMP` should be used for most cases where text data or graphics data is required. Data types `ZEROS` and `NOCOMPRESS` are internally generated and therefore don't require any external files. All others require that the corresponding `.CMP` files be installed on the endpoints, and are loaded during test initialization. Only the standard data types, `NEWS.CMP`, `LENA.CMP`, and `TRANS.CMP` are installed by default.
Pause before the first transaction	Simulates a user delay or processing at the client side. Before the first script command is executed, Endpoint 1 sleeps for the number of milliseconds specified here. A `SLEEP` does not consume CPU cycles, so it only simulates a delay, not the CPU or other overhead of a real application or user. The longest allowable time for `initial_delay` is 90 minutes, or 5400000 milliseconds. Longer values cause Endpoint 2 to time out, and the connection to fail. Endpoints can sleep the same amount every time, or for a random period of time (if you select one of the random distributions: Uniform, Normal, Poisson, or Exponential). A Constant value of 1000 causes an endpoint to sleep for one second. For any of the distributions, enter a range for the random sleep time. For example, if you want the endpoints to sleep for somewhere between 2 and 5 seconds, enter 2000 for the Lower limit value and 5000 for the Upper limit. By default the delay is set to a Constant value of 0, which means that an endpoint immediately begins executing the script commands.

Parameter	How to Set It
Pause before answering	Simulates a user delay or processing at the client side. Before the next script command is executed, Endpoint 1 sleeps for the number of milliseconds specified. The SLEEP does not consume CPU cycles, so it only simulates a delay, not the CPU or other overhead of a real application or user. Endpoints can sleep the same amount every time, or for a random period of time (if you select one of the random distributions: Uniform, Normal, Poisson, or Exponential). A Constant value of 1000 causes an endpoint to sleep for one second. For any of the four distributions, enter a range for the random sleep time. For example, if you want the endpoints to sleep for somewhere between 2 and 5 seconds, enter 2000 for the Lower limit value and 5000 for the Upper limit. By default the delay is set to a Constant value of 0, which means that an endpoint immediately begins executing the script commands.
What type of control data to send	This variable lets you control the contents of the control data sent by some scripts. The standard text file NEWS.CMP is used, to simulate the transfer of text information (like file and directory names). Data types ZEROS and NOCOMPRESS are internally generated and therefore do not require any external files. All others require that the corresponding .CMP files be installed on the endpoints, and are loaded during test initialization. Only the standard data types, NEWS.CMP, LENA.CMP, and TRANS.CMP are installed by default.
How many bytes in server RECEIVEs	The RECEIVE command issued by the server has two variables: • how many bytes to receive • what size buffers to use on each RECEIVE For example, if you choose "RECEIVE 1000, 100," an endpoint receives 1000 bytes, 100 bytes at a time. This RECEIVE command would result in 10 calls to the communications API. This script variable emulates the buffer size commonly used in server applications. Some scripts use the same variable for the receive size and the buffer size; they are designed so that all data is received in one block. Send and receive buffers can be set to the value "DEFAULT." This tells an endpoint to use buffers that are the default size for the network protocol being used. DEFAULT lets you use the default buffer size for each protocol, without having to modify the script to handle protocol differences. The default value is different depending on the protocol and platform being used. An endpoint uses the most common value for its particular environment.
How many times to repeat the script	Some test scripts have three LOOPs. This outer loop repeats the entire sequence of flows, including the setup and takedown flows (which aren't within the timing loops). The next loop controls the number of timing records created; the inner loop controls the number of transactions per timing record. By adjusting these three loops, you can run large test scripts without creating excessive test overhead. This variable controls the number of repetitions of the entire set of flows. Setting it to "1" causes this scripts to spend most of its time on the two inner loops–where the timing records and transactions are counted. Only set this value greater than its default of 1 when you're using this script for stress-testing–never for true performance measurements. The untimed traffic outside the timing loops can give you misleading throughput numbers.

Parameter	How to Set It
Buffer size for control flows	The SEND and RECEIVE commands have variables that let you tailor the size of the buffers they use for sending and receiving (respectively). The variables determine the size of the buffer used for sending or receiving control flows. Send and receive buffers can be set to the value "DEFAULT." This tells an endpoint to use buffers that are the default size for the network protocol being used. DEFAULT lets you use the default buffer size for each protocol, without having to modify the script to handle protocol differences. The default value is different depending on the protocol and platform being used. An endpoint uses the most common value for its particular environment.
How many bytes are in the control flows	You can set the size of the file control information to be sent and received, in preparation for transferring the file. In a real file transfer, this usually consists of directory and filename information.
How many bytes are in the login flows	Set the size of the login information to be sent and received, in preparation for transferring the file. In a real file transfer, this usually consists of user ID and password information. This value is typically 15 to 30 bytes.
What port to use for Endpoint 2	You can specify the destination port number to use when setting up the connection between the endpoints, or you can let it be automatically assigned. Select AUTO to let it be assigned automatically; this gives the best performance. Clear AUTO and enter a port number between 1 and 65535 if you are trying to emulate a specific application. This capability is useful when testing devices that filter traffic based on their port number, such as firewalls. Use AUTO if possible when testing with multiple pairs. If the same port is specified for multiple pairs, the performance degrades, since the pairs must share (serialize) the use of the port to run the test. Here are the categories of port numbers: • 1-1023: reserved for well-known services (such as FTP) • 1024: reserved by IANA • 1025 - 5000: typical range for user-defined services • 5000 - 65535: typical range for server software
How many bytes in the server info	Set the size of the server ID message to be sent and received, in preparation for transferring news articles. This value is typically 15 to 30 bytes.
How many bytes in the header	Set the size of the article header to be sent and received, in preparation for transferring news articles.
How many bytes in the article	Set the size of the article to be sent and received, in preparation for transferring news articles.
Number of groups	Set the number of groups to be retrieved.
Number of articles	Set the number of articles to be retrieved.

Parameter	How to Set It
Pause between groups	This variable lets you simulate a user delay or processing the between groups. Before the next script command is executed, the endpoint sleeps for the number of milliseconds specified. The `SLEEP` does not consume CPU cycles, so it is only simulating the delay, not the CPU or other overhead of a real application or user. Endpoints can sleep the same amount every time, or for a random time period (by choosing one of the distributions). A Constant value of 1000 causes an endpoint to sleep for one second. For a Uniform distribution, enter the range for the random sleep time. For example, if you want the endpoints to sleep for somewhere between 2 and 5 seconds, enter 2000 for the Lower limit value and 5000 for the Upper limit value. By default the delay is set to a Constant value of 0, which means that an endpoint immediately begins executing the script commands.
Pause between articles	Simulates a user delay or processing the between articles. Before the next script command is executed, the endpoint sleeps for the number of milliseconds specified here. The `SLEEP` does not consume CPU cycles, so it is only simulating the delay, not the CPU or other overhead of a real application or user. Endpoints can sleep the same amount every time, or for a random period (if you choose one of the random distributions). A Constant value of 1000 causes an endpoint to sleep for one second. For a Uniform distribution, enter the range for the random sleep time. For example, if you want to sleep for somewhere between 2 and 5 seconds, enter 2000 for the Lower limit value and 5000 for the Upper limit. By default the delay is set to a Constant value of 0, which means that an endpoint immediately begins executing the script commands.
How fast to send data	This variable controls the rate at which data is sent. To send data at a certain speed, enter the rate value and units. To send data as fast as possible, select `UNLIMITED`. Or select common data rates. The format for common data rates must include a numeric value and the data rate units. For example: • 28.8 kbps (kilobits (1,000) per second) • 1420 KBps (kilobytes (1,024) per second) • 1.544 Mbps (megabits (1,000,000) per second) Valid units are: • kbps: 1,000 bits per second • kBps: 1,000 bytes per second • Kbps: 1,024 bits per second • KBps: 1,024 bytes per second • Mbps: 1,000,000 bits per second • Gbps: 1,000,000,000 bits per second
How connections are terminated	Determines whether `TCP DISCONNECT` commands in application scripts are abortive or normal. By default, NetIQ application scripts use an abortive close, with a `RST` flag, which closes the connection immediately. Change the `close_type` to normal to use a `FIN` flag to close the connection slowly, with acknowledgments from the receiving computer. With an abortive close, the protocol stack on the receiving endpoint cannot reclaim network resources taken by the connection if the `RST` is lost, and may linger indefinitely in `FIN_WAIT` state. The normal close specifies that if the `FIN` is lost, the endpoints remain in `TIME_WAIT` state only until the stack's timeout period elapses. Valid for TCP only.

Parameter	How to Set It
What port to use for Endpoint 1	You can specify the source port number to use when setting up the connection between the endpoints, or you can let it be automatically assigned. Select AUTO to let it be assigned automatically; this gives the best performance. Clear AUTO and enter a port number from 1 to 65535 to emulate a specific application. This capability is useful when testing devices that filter traffic based on their port number, such as firewalls. Use AUTO if possible when testing with multiple pairs. If the same port is specified for multiple pairs, performance degrades because the pairs must share (serialize) the use of the port to run the test. Here are the categories of port numbers: • 1-1023: reserved for well-known services (such as FTP) • 1024: reserved by IANA • 1025 - 5000: typical range for user-defined services • 5000 - 65535: typical range for server software

50 NortelBCMx Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring Nortel BCM software version 4.0 or later on hardware models 200, 400 and 1000, and Nortel BCM firmware version 1.00.2.04j or greater on hardware model 50, including versions 50a and 50e. From within the Operator Console, select a Knowledge Script on the NortelBCMx tab in the Knowledge Script pane and press **F1** for complete details.

Knowledge Script	What It Does
Alarms	Monitors the Nortel BCMx proxy computer for Nortel BCM alarms.
CallByCallLimits	Monitors the number of incoming and outgoing calls denied because call-by-call limits were exceeded.
ChassisUsage	Monitors the physical chassis of a BCM device.
HealthCheck	Monitors the operational status of BCM services.
HuntGroupUsage	Monitors call statistics for one or more hunt groups.
InterfaceHealth	Monitors the operational status of the interfaces on a network device.
LinkUtilization	Monitors LAN links for utilization and packet errors.
LogicalDiskSpace	Monitors logical disk space usage and availability.
PSTNFallback	Monitors PSTN fallback attempts and failures.
QoSLog	Monitors the MOS estimates for several codecs: G.711a, G.711u, G.723 5.3. kbps, G.723 6.3 kbps, G.729, and G.729A.
SystemUpTime	Monitors the number of seconds that the system has been operational since its last reboot.
SystemUsage	Monitors BCM CPU and memory usage.
UPSHealth	Monitors any attached uninterruptible power supply.
Recommended Knowledge Script Group	Performs essential monitoring of your Nortel BCM environment.

50.1 Alarms

Use this Knowledge Script to monitor the Nortel BCMx proxy computer for Nortel BCM alarms. Nortel BCM devices send alarms to the proxy computer using SNMP traps.

When setting parameters for this script, you are asked to provide a list of alarm identifiers (system messages) that you want to include or exclude from monitoring. Their format consists of a multi-digit alarm number, such as 18 or 10029.

50.1.1 Prerequisites

- Install the Windows SNMP service before running this script. If you installed the service before you installed the Nortel BCMx module that contains this script, you do not need to do anything else. If you installed the service after you installed the Nortel BCMx module, stop and restart the AppManager agent on the proxy agent computer before using this script.
- Configure Nortel BCM devices to send SNMP traps to the proxy agent. For more information, see "Identifying the SNMP Trap Receiver" on page 3086.

50.1.2 Monitoring in SRG Mode

This script supports BCM 50 hardware running Nortel Survivable Remote Gateway (SRG) software, including instances when the SRG shifts to local mode for any reason.

50.1.3 Resource Object

Nortel_BCMx

50.1.4 Default Schedule

By default, this script runs on an asynchronous schedule.

50.1.5 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
Notes for the alarm categories: • If you choose to "Include only" selected alarm identifiers in a category, AppManager will raise events *only* for those identifiers. *AppManager will not raise events for the other identifiers included in the category*. • If you choose to "Exclude" selected alarm identifiers from a category, AppManager will raise events for all alarm identifiers included in the category *except* those that you specifically excluded. • If you accept the default parameter settings, which are "Exclude" and blank (in the *Alarm identifiers* parameter), AppManager will raise events for all identifiers in the category, because you excluded nothing from the category.	

Parameter	How to Set It
Monitor PVQM alarms?	Select **Yes** to monitor the Nortel BCMx proxy server for alarms in the “PVQM” category. The default is Yes.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers that you specify in the following parameter. By default, AppManager monitors all alarms with PVQM severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the “PVQM” category. By default, the list contains the 50501, 50504, 50507, and 50510 identifiers.
Monitor critical alarms?	Select **Yes** to monitor the Nortel BCMx proxy server for alarms in the “critical” category. The default is Yes.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. By default, AppManager monitors all alarms with critical severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the “critical” category. The default is an empty list.
Monitor major alarms?	Select **Yes** to monitor the Nortel BCMx proxy server for alarms in the “major” category. The default is unselected.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. By default, AppManager monitors all alarms with major severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the “major” category. The default is an empty list.
Monitor minor alarms?	Select **Yes** to monitor the Nortel BCMx proxy server for alarms in the “minor” category. The default is unselected.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. By default, AppManager monitors all alarms with minor severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the “minor” category. The default is an empty list.
Monitor warning alarms?	Select **Yes** to monitor the Nortel BCMx proxy server for alarms in the “warning” category. The default is unselected.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. By default, AppManager monitors all alarms with warning severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the “warning” category. The default is an empty list.
Monitor info alarms?	Select **Yes** to monitor the Nortel BCMx proxy server for alarms in the “informational” category. The default is unselected.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers you specify in the following parameter. By default, AppManager monitors all alarms with informational severity in the SNMP trap.
Alarm identifiers	Provide a comma-separated list of the alarm identifiers you want to include in or exclude from the “informational” category. The default is an empty list.

Parameter	How to Set It
Event Severities	
Severity - Critical alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a critical alarm is detected. The default is 10.
Severity - Major alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a major alarm is detected. The default is 15.
Severity - Minor alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a minor alarm is detected. The default is 20.
Severity - Warning alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a warning alarm is detected. The default is 25.
Severity - Info alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which an informational alarm is detected. The default is 30.

50.1.6 Identifying the SNMP Trap Receiver

Manually configure Nortel BCM to send SNMP traps to AppManager. Use Element Manager to identify the AppManager proxy computer as an SNMP trap receiver.

To identify the proxy computer as a trap receiver:

1. Log in to Element Manager.
2. On the Administration tab, expand the **General** folder and select **SNMP Trap Destinations**.
3. In the right pane, click **Add**, and then complete the fields as described in the table below:

Field	Instructions
Name	Provide the host name of the proxy agent computer to which you want to send SNMP traps (the computer on which the BCMx module is installed).
Host address	Provide the IP address of the proxy agent computer.
Port	Accept the default: port 162.
SNMP version	Accept the default: v1/v2C.
Community string	Provide the SNMP community string of the proxy agent computer.
User name	Leave this field blank.

4. Click **OK**.

50.2 CallByCallLimits

Use this Knowledge Script to monitor incoming and outgoing calls that were denied because call-by-call limits were exceeded. PRI pools that support call-by-call services have maximum and minimum call limits for each service. You can assess the capacity of the PRI call services on your system by monitoring the number of calls that were denied because they exceeded or fell below the limits.

This script raises an event when any monitored value exceeds a threshold that you set.

Call-by-call limits are programmed in Element Manager and are defined as follows:

Limit	Definition
Incoming maximum	The maximum number of calls that can enter the PRI pools for a particular service. Any calls that exceed the maximum will be denied.
Incoming minimum	The minimum number of calls that can enter the PRI pools for a particular service. If the number of calls falls below the minimum, the calls will be denied and the PRI pools will be allocated to a different service.
Outgoing maximum	The maximum number of calls that can exit the PRI pools for a particular service. Any calls that exceed the maximum will be denied.
Outgoing minimum	The minimum number of calls that can exit the PRI pools for a particular service. If the number of calls falls below the minimum, the calls will be denied and the PRI pools will be allocated to a different service.

50.2.1 Monitoring in SRG Mode

This script supports BCM 50 hardware running Nortel Survivable Remote Gateway (SRG) software, including instances when the SRG shifts to local mode for any reason.

50.2.2 Resource Object

Nortel_BCMx_PRIPool

50.2.3 Default Schedule

The default interval for this script is five minutes.

50.2.4 Setting Parameter Values

Set the following parameters as needed.

Parameter	How To Set It
General Settings	
Job Failure Notification	

Parameter	How To Set It
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event raised when the CallByCallLimits job fails. The default is 5.
Monitor incoming calls denied after maximum limit exceeded	
Event Notification	
Raise event if denied incoming calls exceed threshold?	Select **Yes** to raise an event if the number of denied incoming calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum denied incoming calls	Specify the highest number of incoming calls that can be denied before an event is raised. The default is 0 calls.
Event severity when denied incoming calls exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of denied incoming calls exceeds the threshold. The default is 10.
Data Collection	
Collect data for incoming calls denied after maximum limit exceeded?	Select **Yes** to collect data about incoming calls that were denied after the maximum limit was exceeded. The default is unselected.
Monitor incoming calls denied after minimum limit not reached	
Event Notification	
Raise event if denied incoming calls exceed threshold?	Select **Yes** to raise an event if the number of denied incoming calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum denied incoming calls	Specify the maximum number of incoming calls that can be denied before an event is raised. The default is 0 calls.
Event severity when denied incoming calls exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of denied incoming calls exceeds the threshold. The default is 10.
Data Collection	
Collect data for incoming calls denied after minimum limit not reached	Select **Yes** to collect data about incoming calls that were denied after the minimum limit was not reached. The default is unselected.
Monitor outgoing calls denied after maximum limit exceeded	
Event Notification	
Raise event if denied outgoing calls exceed threshold?	Select **Yes** to raise an event if the number of denied outgoing calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum denied outgoing calls	Specify the highest number of outgoing calls that can be denied before an event is raised. The default is 0 calls.
Event severity when denied outgoing calls exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of denied outgoing calls exceeds the threshold. The default is 10.
Data Collection	
Collect data for outgoing calls denied after maximum limit exceeded?	Select **Yes** to collect data about outgoing calls that were denied after the maximum limit was exceeded. The default is unselected.
Monitor outgoing calls denied after minimum limit not reached	

Parameter	How To Set It
Event Notification	
Raise event if denied outgoing calls exceed threshold?	Select **Yes** to raise an event if the number of denied outgoing calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum denied outgoing calls	Specify the highest number of outgoing calls that can be denied before an event is raised. The default is 0 calls.
Event severity when denied outgoing calls exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of denied outgoing calls exceeds the threshold. The default is 10.
Data Collection	
Collect data for outgoing calls denied after minimum limit not reached?	Select **Yes** to collect data about outgoing calls that were denied after the minimum limit was not reached. The default is unselected.

50.3 ChassisUsage

Use this Knowledge Script to monitor the physical chassis of a BCM device, including temperature sensors, voltage sensors, and fan speeds. This script raises events for status changes in BCM 200/400 components (running BCM software version 4.0) and for monitored values that exceed or fall below the threshold that you set. In addition, this script generates data streams for the following metrics:

- Remote temperature for BCM 50
- Local temperature
- CPU temperature for BCM 200/400
- Fan 1 and fan 2 speeds for BCM 50
- Power supply voltage levels:
  - v5
  - v+12
  - v-12 for BCM 200/400
  - vcc for BCM 50
  - vccp for BCM 50
  - v3.3 (Standby, One, and Two) for BCM 200/400

NOTE:

- BCM model 1000 does not support the monitoring of voltage, fan speed, or temperature. This script raises an event if you attempt to monitor any of these chassis components on BCM 1000.
- In this script, the monitoring of fan speeds, temperatures, and voltages is disabled by default. BCM itself will raise an alarm if any of these values is abnormal, and then send the alarm as an SNMP trap to the Alarms script. If you enable the monitoring of fan speeds, temperatures, or voltages, be aware that you may receive duplicate or conflicting alarm and events. For instance, AppManager may raise an event indicating a high temperature based on a threshold that you set, but the BCM does not raise an alarm because the temperature has not yet reached the abnormal level as determined by Nortel.

50.3.1 Monitoring in SRG Mode

This script supports BCM 50 hardware running Nortel Survivable Remote Gateway (SRG) software, including instances when the SRG shifts to local mode for any reason.

50.3.2 Resource Object

Nortel_BCMx

50.3.3 Default Schedule

The default interval for this script is five minutes.

50.3.4 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event raised when the ChassisUsage job fails. The default is 5.
The ChassisUsage script monitors status changes only for BCM 200/400 models running BCM software version 4.0. The event message indicates the type of change, such as "The status for local temperature has changed to Above Tolerance" or "The status of fan 1 has changed to Stopped."	
Raise event if local temperature status changes?	Select **Yes** to raise an event if the status of the local temperature changes. The default is unselected.
Event severity when local temperature status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of the local temperature has changed. The default is 30.
Raise event if CPU temperature status changes?	Select **Yes** to raise an event if the status of the CPU temperature changes. The default is unselected.
Event severity when CPU temperature status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of the CPU temperature has changed. The default is 30.
Raise event if fan 1 status changes?	Select **Yes** to raise an event if the status of fan 1 changes. The default is unselected.
Event severity when fan 1 status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of fan 1 has changed. The default is 30.
Raise event if CPU fan status changes?	Select **Yes** to raise an event if the status of the CPU fan changes. The default is unselected.
Event severity when CPU fan status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of the CPU fan has changed. The default is 30.
Raise event if v5 voltage status changes?	Select **Yes** to raise an event if the status of the v5 power supply voltage changes. The default is unselected.
Event severity when v5 voltage status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of the v5 power supply voltage has changed. The default is 30.
Raise event if v+12 voltage status changes?	Select **Yes** to raise an event if the status of the v+12 power supply voltage changes. The default is unselected.
Event severity when v+12 voltage status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of the v+12 power supply voltage has changed. The default is 30.
Raise event if v-12 voltage status changes?	Select **Yes** to raise an event if the status of the v-12 power supply voltage changes. The default is unselected.
Event severity when v-12 voltage status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of the v-12 power supply voltage has changed. The default is 30.
Raise event if v3.3 Standby voltage status changes?	Select **Yes** to raise an event if the status of the v3.3 Standby power supply voltage changes. The default is unselected.
Event severity when v3.3 Standby voltage status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of the v3.3 Standby power supply voltage has changed. The default is 30.

Description	How To Set It
Raise event if v3.3 One voltage status changes?	Select **Yes** to raise an event if the status of the v3.3 One power supply voltage changes. The default is unselected.
Event severity when v3.3 One voltage status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of the v3.3 One power supply voltage has changed. The default is 30.
Raise event if v3.3 Two voltage status changes?	Select **Yes** to raise an event if the status of the v3.3 Two power supply voltage changes. The default is unselected.
Event severity when v3.3 Two voltage status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of the v3.3 Two power supply voltage has changed. The default is 30.
Monitor local temperature	
Event Notification	
Raise event if local temperature exceeds threshold?	Select **Yes** to raise an event if the local temperature exceeds the threshold that you set. The default is unselected.
Threshold - Maximum local temperature	Specify the highest local temperature that can occur before an event is raised. The default is 55Âž Celsius.
Event severity when local temperature exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the local temperature exceeds the threshold. The default is 10.
Data Collection	
Collect data for local temperature?	Select **Yes** to collect data about local temperature for reports and graphs. The default is unselected.
Monitor remote temperature (BCM 50 only)	
Event Notification	
Raise event if remote temperature exceeds threshold?	Select **Yes** to raise an event if the remote temperature on a BCM 50 exceeds the threshold that you set. The default is unselected.
Threshold - Maximum remote temperature	Specify the highest remote temperature that can occur on a BCM 50 before an event is raised. The default is 55Âž Celsius.
Event severity when remote temperature exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the remote temperature on a BCM 50 exceeds the threshold. The default is 10.
Data Collection	
Collect data for remote temperature?	Select **Yes** to collect data about remote temperature for reports and graphs. The default is unselected.
Monitor CPU temperature (BCM 200/400 only)	
Event Notification	
Raise event if CPU temperature exceeds threshold?	Select **Yes** to raise an event if the CPU temperature on a BCM 200 or 400 exceeds the threshold that you set. The default is unselected.
Threshold - Maximum CPU temperature	Specify the highest CPU temperature that can occur on a BCM 200 or 400 before an event is raised. The default is 55Âž Celsius.

Description	How To Set It
Event severity when CPU temperature exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU temperature on a BCM 200 or 400 exceeds the threshold. The default is 10.
Data Collection	
Collect data for CPU temperature?	Select **Yes** to collect data about CPU temperature for reports and graphs. The default is unselected.
Monitor fan 1 speed (BCM 50 only)	
Event Notification	
Raise event if fan 1 speed exceeds threshold?	Select **Yes** to raise an event if the speed of fan 1 on a BCM 50 exceeds the threshold that you set. The default is unselected.
Threshold - Maximum fan 1 speed	Specify the highest fan speed that can occur before an event is raised. The default is 10000 RPMs.
Event severity when fan 1 speed exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the fan speed exceeds the threshold. The default is 10.
Data Collection	
Collect data for fan 1 speed?	Select **Yes** to collect data about fan speed for reports and graphs. The default is unselected.
Monitor fan 2 speed (BCM 50 only)	
Event Notification	
Raise event if fan 2 speed exceeds threshold?	Select **Yes** to raise an event if the speed of fan 2 on a BCM 50 exceeds the threshold that you set. The default is unselected.
Threshold - Maximum fan 2 speed	Specify the highest fan speed that can occur before an event is raised. The default is 10000 RPMs.
Event severity when fan 2 speed exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the fan speed exceeds the threshold. The default is 10.
Data Collection	
Collect data for fan 2 speed?	Select **Yes** to collect data about fan speed for reports and graphs. The default is unselected.
Monitor v5 voltage level	
Event Notification	
Raise event if v5 voltage level exceeds or falls below threshold?	Select **Yes** to raise an event if the v5 power supply voltage level exceeds or falls below the thresholds that you set. The default is unselected. **NOTE:** You cannot enable an upper or lower threshold unless you check this option.
Upper threshold	Select **Enable** to use an upper threshold value. The default is unselected.
Threshold - Maximum v5 voltage level	Specify the highest voltage level that can occur before an event is raised. The default is 5.25 volts.
Event severity when v5 voltage level exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level exceeds the threshold. The default is 10.
Lower threshold	Select **Enable** to use a lower threshold value. The default is unselected.

Description	How To Set It
Threshold - Minimum v5 voltage level	Specify the lowest voltage level that can occur before an event is raised. The default is 4.75 volts.
Event severity when v5 voltage level falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level falls below the threshold. The default is 10.
Data Collection	
Collect data for v5 voltage level?	Select **Yes** to collect data about voltage level for reports and graphs. The default is unselected.
Monitor v+12 voltage level	
Event Notification	
Raise event if v+12 voltage level exceeds or falls below threshold?	Select **Yes** to raise an event if the v+12 power supply voltage level exceeds or falls below the thresholds that you set. The default is unselected. **NOTE:** You cannot enable an upper or lower threshold unless you check this option.
Upper threshold	Select **Enable** to use an upper threshold value. The default is unselected.
Threshold - Maximum v+12 voltage level	Specify the highest voltage level that can occur before an event is raised. The default is 12.6 volts.
Event severity when v+12 voltage level exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level exceeds the threshold. The default is 10.
Lower threshold	Select **Enable** to use a lower threshold value. The default is unselected.
Threshold - Minimum v+12 voltage level	Specify the lowest voltage level that can occur before an event is raised. The default is 11.4 volts.
Event severity when v+12 voltage level falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level falls below the threshold. The default is 10.
Data Collection	
Collect data for v+12 voltage level?	Select **Yes** to collect data about voltage level for reports and graphs. The default is unselected.
Monitor v-12 voltage level (BCM 200/400 only)	
Event Notification	
Raise event if v-12 voltage level exceeds or falls below threshold?	Select **Yes** to raise an event if the v-12 power supply voltage level exceeds or falls below the thresholds that you set. The default is unselected. **NOTE:** You cannot enable an upper or lower threshold unless you check this option.
Upper threshold	Select **Enable** to use an upper threshold value. The default is unselected.
Threshold - Maximum v-12 voltage level	Specify the highest voltage level that can occur before an event is raised. The default is -12.6 volts.
Event severity when v-12 voltage level exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level exceeds the threshold. The default is 10.
Lower threshold	Select **Enable** to use a lower threshold value. The default is unselected.
Threshold - Minimum v-12 voltage level	Specify the lowest voltage level that can occur before an event is raised. The default is -11.4 volts.

Description	How To Set It
Event severity when v-12 voltage level falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level falls below the threshold. The default is 10.
Data Collection	
Collect data for v-12 voltage level?	Select **Yes** to collect data about voltage level for reports and graphs. The default is unselected.
Monitor vcc voltage level (BCM 50 only)	
Event Notification	
Raise event if vcc voltage level exceeds or falls below threshold?	Select **Yes** to raise an event if the vcc power supply voltage level exceeds or falls below the thresholds that you set. The default is unselected. vcc refers to voltage from a power supply connected to the collector terminal of a bipolar transistor. **NOTE:** You cannot enable an upper or lower threshold unless you check this option.
Upper threshold	Select **Enable** to use an upper threshold value. The default is unselected.
Threshold - Maximum vcc voltage level	Specify the highest voltage level that can occur before an event is raised. The default is 3.4 volts.
Event severity when vcc voltage level exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level exceeds the threshold. The default is 10.
Lower threshold	Select **Enable** to use a lower threshold value. The default is unselected.
Threshold - Minimum vcc voltage level	Specify the lowest voltage level that can occur before an event is raised. The default is 3.2 volts.
Event severity when vcc voltage level falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level falls below the threshold. The default is 10.
Data Collection	
Collect data for vcc voltage level?	Select **Yes** to collect data about voltage level for reports and graphs. The default is unselected.
Monitor vccp voltage level (BCM 50 only)	
Event Notification	
Raise event if vccp voltage level exceeds or falls below threshold?	Select **Yes** to raise an event if the vccp power supply voltage level exceeds or falls below the thresholds that you set. The default is unselected. **NOTE:** You cannot enable an upper or lower threshold unless you check this option.
Upper threshold	Select **Enable** to use an upper threshold value. The default is unselected.
Threshold - Maximum vccp voltage level	Specify the highest voltage level that can occur before an event is raised. The default is 1.442 volts.
Event severity when vccp voltage level exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level exceeds the threshold. The default is 10.
Lower threshold	Select **Enable** to use a lower threshold value. The default is unselected.
Threshold - Minimum vccp voltage level	Specify the lowest voltage level that can occur before an event is raised. The default is 1.358 volts.

Description	How To Set It
Event severity when vccp voltage level falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level falls below the threshold. The default is 10.
Data Collection	
Collect data for vccp voltage level?	Select **Yes** to collect data about voltage level for reports and graphs. The default is unselected.
Monitor v3.3 Standby voltage level (BCM 200/400 only)	
Event Notification	
Raise event if v3.3 Standby voltage level exceeds or falls below threshold?	Select **Yes** to raise an event if the v3.3 Standby power supply voltage level exceeds or falls below the thresholds that you set. The default is Yes. **NOTE:** You cannot enable an upper or lower threshold unless you check this option.
Upper threshold	Select **Enable** to use an upper threshold value. The default is unselected.
Threshold - Maximum v3.3 Standby voltage level	Specify the highest voltage level that can occur before an event is raised. The default is 3.4 volts.
Event severity when v3.3 Standby voltage level exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level exceeds the threshold. The default is 10.
Lower threshold	Select **Enable** to use a lower threshold value. The default is unselected.
Threshold - Minimum v3.3 Standby voltage level	Specify the lowest voltage level that can occur before an event is raised. The default is 3.2 volts.
Event severity when v3.3 Standby voltage level falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level falls below the threshold. The default is 10.
Data Collection	
Collect data for v3.3 Standby voltage level?	Select **Yes** to collect data about voltage level for reports and graphs. The default is unselected.
Monitor v3.3 One voltage level (BCM 200/400 only)	
Event Notification	
Raise event if v3.3 One voltage level exceeds or falls below threshold?	Select **Yes** to raise an event if the v3.3 One power supply voltage level exceeds or falls below the thresholds that you set. The default is Yes. **NOTE:** You cannot enable an upper or lower threshold unless you check this option.
Upper threshold	Select **Enable** to use an upper threshold value. The default is Unchecked.
Threshold - Maximum v3.3 One voltage level	Specify the highest voltage level that can occur before an event is raised. The default is 3.4 volts.
Event severity when v3.3 One voltage level exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level exceeds the threshold. The default is 10.
Lower threshold	Select **Enable** to use a lower threshold value. The default is unselected.
Threshold - Minimum v3.3 One voltage level	Specify the lowest voltage level that can occur before an event is raised. The default is 3.2 volts.
Event severity when v3.3 One voltage level falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level falls below the threshold. The default is 10.

Description	How To Set It
Data Collection	
Collect data for v3.3 One voltage level?	Select **Yes** to collect data about voltage level for reports and graphs. The default is unselected.
Monitor v3.3 Two voltage level (BCM 200/400 only)	
Event Notification	
Raise event if v3.3 Two voltage level exceeds or falls below threshold?	Select **Yes** to raise an event if the v3.3 Two power supply voltage level exceeds or falls below the thresholds that you set. The default is Yes. **NOTE:** You cannot enable an upper or lower threshold unless you check this option.
Upper threshold	Select **Enable** to use an upper threshold value. The default is Unchecked.
Threshold - Maximum v3.3 Two voltage level	Specify the highest voltage level that can occur before an event is raised. The default is 3.4 volts.
Event severity when v3.3 Two voltage level exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level exceeds the threshold. The default is 10.
Lower threshold	Select **Enable** to use a lower threshold value. The default is Unchecked.
Threshold - Minimum v3.3 Two voltage level	Specify the lowest voltage level that can occur before an event is raised. The default is 3.2 volts.
Event severity when v3.3 Two voltage level falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the voltage level falls below the threshold. The default is 10.
Data Collection	
Collect data for v3.3 Two voltage level?	Select **Yes** to collect data about voltage level for reports and graphs. The default is unselected.

50.4 HealthCheck

Use this Knowledge Script to monitor the operational status of Nortel BCM services. A data point of 100 is recorded if the service is running; a data point of 0 is recorded if the service is not running. Possible non-running states include start pending, stopped, stop pending, continue pending, paused, and pause pending.

This script raises an event when a monitored value exceeds a threshold that you set.

It is important to monitor the up-and-down status of vital Nortel BCM services. If any service consumes excessive CPU resources, other services may be adversely affected. Run this script to notify you when a critical service goes down or when the overall percentage of important services drops below the specified threshold. The BCM Reset utility should restart any down service in a timely manner.

50.4.1 Monitored Services

The HealthCheck script monitors the operational status of several BCM services. In addition, the script can be configured to monitor the availability percentage of key services. The following table identifies the services that you can monitor with HealthCheck.

Service Name	Description	Key?
BackupRestoreProviderAgent	CIMOM Provider	
BCM_DataInterfacesProviderAgent	CIMOM Provider	
BCM_DCMProviderAgent	CIMOM Provider	
BCM_DNSProviderAgent	CIMOM Provider	
BCM_Doorphone	CIMOM Provider	
BCM_HostProviderAgent	CIMOM Provider	
BCM_IPMusicProviderAgent	CIMOM Provider	
BCM_ISDNProviderAgent	CIMOM Provider	
BCM_LicenseProviderAgent	CIMOM Provider	
BCM_LogProviderAgent	CIMOM Provider	
BCM_MIB2ProviderAgent	CIMOM Provider	
BCM_ModemDialUpProviderAgent	CIMOM Provider	
BCM_NetLinkMgrProviderAgent	CIMOM Provider	
BCM_NetworkInterfacesProviderAgent	CIMOM Provider	
BCM_PPPoEProviderAgent	CIMOM Provider	
BCM_PSM_ProviderAgent	CIMOM Provider	
BCM_RASProviderAgent	CIMOM Provider	
BCM_RoutingProviderAgent	CIMOM Provider	
BCM_SecurityProviderAgent	CIMOM Provider

tmwservice	Time service	
ToneSrvr	Tone Server	
utps	UniSTIM Terminal Proxy Server	Yes
voicemail	Voice Mail Process	Yes
Wan	WAN Service	Yes

50.4.2 Monitoring in SRG Mode

This script supports BCM 50 hardware running Nortel Survivable Remote Gateway (SRG) software, including instances when the SRG shifts to local mode for any reason.

50.4.3 Resource Object

Nortel_BCMx

50.4.4 Default Schedule

The default interval for this script is 12 minutes.

50.4.5 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event raised when the HealthCheck job fails. The default is 5.
Raise event if services are not available?	Select **Yes** to raise an event if any monitored service is not available. The default is Yes.
Event severity when services are not available	Set the severity level, from 1 to 40, to indicate the importance of an event in which a monitored service is not available. The default is 10.
Monitor Key Service Availability	
Event Notification	
Raise event if key service availability falls below threshold?	Select **Yes** to raise an event if the percentage of key service availability falls below the threshold that you set. The default is Yes.
Threshold - Minimum key service availability	Specify the lowest percentage of key service availability that can occur before an event is raised. The default is 100%.
Event severity when key service availability falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of key service availability falls below the threshold. The default is 10.
Data Collection	
Collect data for key service availability?	Select **Yes** to collect data about key service availability for reports and graphs. The default is unselected.

50.5 HuntGroupUsage

Use this Knowledge Script to monitor call statistics for one or more hunt groups: busy percentage, abandoned percentage, average time in queue, and overflow percentage. This script raises an event if any monitored value exceeds the threshold that you set. In addition, this script generates data streams for percentage of abandoned calls, percentage of busy calls, overflow percentage, average time in queue, total calls, and total answers.

50.5.1 Monitoring in SRG Mode

This script supports BCM 50 hardware running Nortel Survivable Remote Gateway (SRG) software, including instances when the SRG shifts to local mode for any reason.

50.5.2 Resource Object

Nortel_BCMx_HuntGroup

50.5.3 Default Schedule

The default interval for this script is five minutes.

50.5.4 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event raised when the HuntGroupUsage job fails. The default is 5.
Monitor Abandoned Percentage	
Event Notification	
Raise event if abandoned percentage exceeds threshold?	Select **Yes** to raise an event if the percentage of abandoned calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum abandoned percentage	Specify the highest percentage of abandoned calls that can occur before an event is raised. The default is 5%.
Event severity when abandoned percentage exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of abandoned calls exceeds the threshold. The default is 10.
Data Collection	
Collect data for abandoned percentage?	Select **Yes** to collect data about the percentage of abandoned calls for reports and graphs. The default is unselected.

Description	How To Set It
Monitor Busy Percentage	
Event Notification	
Raise event if busy percentage exceeds threshold?	Select **Yes** to raise an event if the percentage of busy calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum busy percentage	Specify the highest percentage of busy calls that can occur before an event is raised. The default is 5%.
Event severity when busy percentage exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of busy calls exceeds the threshold. The default is 10.
Data Collection	
Collect data for busy percentage?	Select **Yes** to collect data about the percentage of busy calls for reports and graphs. The default is unselected.
Monitor Overflow Percentage	
Event Notification	
Raise event if overflow percentage exceeds threshold?	Select **Yes** to raise an event if the percentage of overflow calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum overflow percentage	Specify the highest percentage of overflow calls that can occur before an event is raised. The default is 25%.
Event severity when overflow percentage exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of overflow calls exceeds the threshold. The default is 10.
Data Collection	
Collect data for overflow percentage?	Select **Yes** to collect data about the percentage of overflow calls for reports and graphs. The default is unselected.
Monitor Average Time in Queue	
Event Notification	
Raise event if average time in queue exceeds threshold?	Select **Yes** to raise an event if the average time calls spend in queue exceeds the threshold that you set. The default is Yes.
Threshold - Maximum average time in queue	Specify the longest average time that calls can spend in queue before an event is raised. The default is 45 seconds.
Event severity when average time in queue exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the average time calls spend in queue exceeds the threshold. The default is 10.
Data Collection	
Collect data for average time in queue?	Select **Yes** to collect data about average queue time for reports and graphs. The default is unselected.
Monitor Total Calls	
Data Collection	
Collect data for total calls?	Select **Yes** to collect data about the total number of calls for reports and graphs. The default is unselected.
Monitor Total Answers	

Description	How To Set It
Data Collection	
Collect data for total answers?	Select **Yes** to collect data about the total number of answered calls for reports and graphs. The default is unselected.

50.6 InterfaceHealth

Use this Knowledge Script to monitor the operational status of interfaces for a BCM. This script raises an event when interface status changes. In addition, this script generates a data stream for interface availability.

50.6.1 Monitoring in SRG Mode

This script supports BCM 50 hardware running Nortel Survivable Remote Gateway (SRG) software, including instances when the SRG shifts to local mode for any reason.

50.6.2 Resource Object

Nortel_BCMx_LANLink

50.6.3 Default Schedule

The default interval for this script is five minutes.

50.6.4 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event raised when the InterfaceHealth job fails. The default is 5.
Raise event if interface goes down?	Select **Yes** to raise an event if interface status changes to “down.” The default is Yes.
Event severity when interface is down	Set the severity level, from 1 to 40, to indicate the importance of an event in which interface status changes to “down.” The default is 5.
Raise event if interface comes up?	Select **Yes** to raise an event if an interface’s status changes to “up.” The default is Yes.
Event severity when interface is up	Set the severity level, from 1 to 40, to indicate the importance of an event in which interface status changes to “up.” The default is 30.
Monitor Interface Availability	
Data Collection	
Collect data for interface availability?	Select **Yes** to collect data about interface availability for reports and graphs. If enabled, data collection returns a value of 100 if the interface is available or a value of 0 if the interface is not available. The default is unselected.

50.7 LinkUtilization

Use this Knowledge Script to monitor LAN links on a BCM. This script monitors bandwidth utilization (including inbound and outbound utilization), bytes sent and received (bytes per second since the last polling period), and percentage of packet errors.

This script raises an event when a monitored value exceeds the threshold that you set. In addition, this script generates data streams for bandwidth utilization, packet errors, outbound bandwidth utilization, inbound bandwidth utilization, sent bytes, and received bytes.

50.7.1 Monitoring in SRG Mode

This script supports BCM 50 hardware running Nortel Survivable Remote Gateway (SRG) software, including instances when the SRG shifts to local mode for any reason.

For both modes, this script can monitor packet errors, sent bytes, and received bytes. It cannot monitor bandwidth utilization for either mode.

50.7.2 Resource Object

Nortel_BCMx_LANLink

50.7.3 Default Schedule

The default interval for this script is five minutes.

50.7.4 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event raised when the LinkUtilization job fails. The default is 5.
Monitor Bandwidth Utilization	
Event Notification	
Raise event if bandwidth utilization exceeds threshold?	Select **Yes** to raise an event if bandwidth (inbound and outbound) utilization exceeds the threshold that you set. The default is Yes.
Threshold - Maximum bandwidth utilization	Specify the highest percentage of bandwidth utilization that can occur before an event is raised. The default is 50%.
Event severity when bandwidth utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which bandwidth utilization exceeds the threshold. The default is 10.

Description	How To Set It
Data Collection	
Collect data for bandwidth utilization?	Select **Yes** to collect data about inbound and outbound bandwidth utilization for reports and graphs. The default is unselected.
Monitor Packet Errors	
Event Notification	
Raise event if packet errors exceed threshold?	Select **Yes** to raise an event if the percentage of packet errors exceeds the threshold that you set. The default is Yes. **Hint** When a packet is dropped during a VoIP transmission, a conversation can lose an entire syllable or word. Obviously, data loss can severely impair call quality. Set this parameter to **Yes** to receive immediate notification of packet loss that exceeds the threshold that you set.
Threshold - Maximum packet errors	Specify the highest percentage of packet errors that can occur before an event is raised. The default is 8%.
Event severity when packet errors exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of packet errors exceeds the threshold. The default is 10.
Data Collection	
Collect data for packet errors?	Select **Yes** to collect data about the percentage of packet errors for reports and graphs. The default is unselected.
Monitor Outbound Bandwidth Utilization	
Event Notification	
Raise event if outbound bandwidth utilization exceeds threshold?	Select **Yes** to raise an event if outbound bandwidth utilization exceeds the threshold that you set. The default is Yes.
Threshold - Maximum outbound bandwidth utilization	Specify the highest percentage of outbound bandwidth utilization that can occur before an event is raised. The default is 50%.
Event severity when outbound bandwidth utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which outbound bandwidth utilization exceeds the threshold. The default is 10.
Data Collection	
Collect data for outbound bandwidth utilization?	Select **Yes** to collect data about the percentage of outbound bandwidth utilization for reports and graphs. The default is unselected.
Monitor Inbound Bandwidth Utilization	
Event Notification	
Raise event if inbound bandwidth utilization exceeds threshold?	Select **Yes** to raise an event if inbound bandwidth utilization exceeds the threshold that you set. The default is Yes.
Threshold - Maximum inbound bandwidth utilization	Specify the highest percentage of inbound bandwidth utilization that can occur before an event is raised. The default is 50%.
Event severity when inbound bandwidth utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which inbound bandwidth utilization exceeds the threshold. The default is 10.

Description	How To Set It
Data Collection	
Collect data for inbound bandwidth utilization?	Select **Yes** to collect data about the percentage of inbound bandwidth utilization for reports and graphs. The default is unselected.
Monitor Bytes Sent	
Data Collection	
Collect data for bytes sent?	Select **Yes** to collect data about the number of bytes sent per second for reports and graphs. The default is unselected.
Monitor Bytes Received	
Data Collection	
Collect data for bytes received?	Select **Yes** to collect data about the number of bytes received per second for reports and graphs. The default is unselected.

50.8 LogicalDiskSpace

Use this Knowledge Script to monitor logical disk space usage and availability. This script raises an event when any monitored value exceeds a threshold that you set. In addition, this script generates data streams for used disk space and available disk space.

50.8.1 Resource Object

Nortel_BCMx_LogicalDisk

The LogicalDiskSpace Knowledge Script is a member of the NortelBCMx Recommended Knowledge Script Group (KSG), which allows you to run all recommended scripts at one time. However, there are limits on the number of Logical Disk objects on which the LogicalDiskSpace script can run. If you run the KSG on more objects than the LogicalDiskSpace script allows, you will receive an error message indicating that the number of target objects has exceeded its limit. If you receive this error message, remove the LogicalDiskSpace script from the KSG and run LogicalDiskSpace alone on fewer Logical Disk resources.

50.8.2 Default Schedule

The default interval for this script is five minutes.

50.8.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event raised when the LogicalDiskSpace job fails. The default is 5.
Monitor Used Disk Space	
Event Notification	
Raise event if used disk space exceeds threshold?	Select **Yes** to raise an event if the amount of used disk space exceeds the threshold that you set. The default is Yes.
Threshold - Maximum used disk space	Specify the highest percentage of disk space that can be used before an event is raised. The default is 80%.
Event severity when used disk space exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which used disk space exceeds the threshold. The default is 10.
Data Collection	
Collect data for used disk space?	Select **Yes** to collect data about used disk space for reports and graphs. The default is unselected.
Monitor Available Disk Space	

Description	How To Set It
Event Notification	
Raise event if available disk space falls below threshold?	Select **Yes** to raise an event if available disk space falls below the threshold that you set. The default is Yes.
Threshold - Minimum available disk space	Specify the lowest amount of disk space that can be available before an event is raised. The default is 10 MB.
Event severity when available disk space falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which available disk space falls below the threshold. The default is 10.
Data Collection	
Collect data for available disk space	Select **Yes** to collect data about available disk space for reports and graphs. The default is unselected.

50.9 PSTNFallback

Use this Knowledge Script to monitor the number of PSTN (Public Switched Telephone Network) fallback attempts and failures that have occurred since the last polling period. Attempts are calls that were not able to route through the preferred trunk. Failures are calls that were not able to route through the fallback trunk.

This script raises an event when any monitored value exceeds a threshold that you set. In addition, this script generates data streams for PSTN fallback attempts and failures.

50.9.1 Monitoring in SRG Mode

This script supports BCM 50 hardware running Nortel Survivable Remote Gateway (SRG) software, including instances when the SRG shifts to local mode for any reason.

50.9.2 Resource Object

Nortel_BCMx_TelephonyFolder

50.9.3 Default Schedule

The default interval for this script is five minutes.

50.9.4 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event raised when the PSTNFallback job fails. The default is 5.
Monitor PSTN Fallback Attempts	
Event Notification	
Raise event if PSTN fallback attempts exceed threshold?	Select **Yes** to raise an event if the number of fallback attempts exceeds the threshold that you set. The default is Yes.
Threshold - Maximum PSTN fallback attempts	Specify the highest number of fallback attempts that can occur before an event is raised. The default is 0 attempts.
Event severity when PSTN fallback attempts exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of fallback attempts exceeds the threshold. The default is 20.
Data Collection	

Description	How To Set It
Collect data for PSTN fallback attempts	Select **Yes** to collect data about the number of fallback attempts for reports and graphs. The default is unselected.
Monitor PSTN Fallback Failures	
Event Notification	
Raise event if PSTN fallback failures exceed threshold?	Select **Yes** to raise an event if the number of fallback failures exceeds the threshold that you set. The default is Yes.
Threshold - Maximum PSTN fallback failures	Specify the highest number of fallback failures that can occur before an event is raised. The default is 0 failures.
Event severity when PSTN fallback failures exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of fallback failures exceeds the threshold. The default is 10.
Data Collection	
Collect data for available PSTN fallback failures	Select **Yes** to collect data about the number of fallback failures for reports and graphs. The default is unselected.

50.10 QoSLog

Use this Knowledge Script to monitor the MOS estimates for several codecs: G.711a, G.711u, G.723 5.3 kbps, G.723 6.3 kbps, and G.729 and G.729A (in the outgoing call direction only). This script raises an event if any MOS estimate falls below the threshold you set. In addition, this script generates data streams for MOS estimates for each monitored codec.

If you use VoIP trunks, run this script to gather information from the BCM QoS Monitor log in order to verify that QoS between target BCMs is maintaining acceptable MOS. For more information, see "Understanding the Mean Opinion Score" on page 3116.

50.10.1 Prerequisite

Enable the QoS Monitor to log MOS scores. For more information, see "Enabling QoS Monitor" on page 3115.

50.10.2 Resource Object

Nortel_BCMx_TelephonyFolder

50.10.3 Default Schedule

The default interval for this script is five minutes.

50.10.4 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the QOSLog job fails. The default is 5.
Raise event if QoS monitor is not running from device?	Select **Yes** to raise an event if QoS Monitor is not running. The default is Yes. The QoS Monitor must be running in order to log the MOS scores this script monitors.
Event severity when QoS monitor is not running from device	Set the severity level, from 1 to 40, to indicate the importance of an event in which QoS Monitor is not running. The default is 5.
Monitor G.711a MOS	
Event Notification	
Raise event if G.711a MOS falls below threshold?	Select **Yes** to raise an event if the MOS for the G.711a codec falls below the threshold that you set. The default is Yes.

Description	How To Set It
Threshold - Minimum G.711a MOS	Specify the lowest MOS that can occur before an event is raised. The default is 3.60.
Event severity when G.711a MOS falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MOS falls below the threshold. The default is 5.
Data Collection	
Collect data for G.711a MOS?	Select **Yes** to collect data about G.711a MOS for reports and graphs. The default is unselected.
Monitor G.711u MOS	
Event Notification	
Raise event if G.711u MOS falls below threshold?	Select **Yes** to raise an event if the MOS for the G.711u codec falls below the threshold that you set. The default is Yes.
Threshold - Minimum G.711u MOS	Specify the lowest MOS that can occur before an event is raised. The default is 3.60.
Event severity when G.711u MOS falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MOS falls below the threshold. The default is 5.
Data Collection	
Collect data for G.711u MOS?	Select **Yes** to collect data about G.711u MOS for reports and graphs. The default is unselected.
Monitor G.723 5.3 kbps MOS	
Event Notification	
Raise event if G.723 5.3 kbps MOS falls below threshold?	Select **Yes** to raise an event if the MOS for the G.723 5.3 kbps codec falls below the threshold that you set. The default is Yes.
Threshold - Minimum G.723 5.3 kbps MOS	Specify the lowest MOS that can occur before an event is raised. The default is 3.60.
Event severity when G.723 5.3 kbps MOS falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MOS falls below the threshold. The default is 5.
Data Collection	
Collect data for G.723 5.3 kbps MOS?	Select **Yes** to collect data about G.723 5.3 kbps MOS for reports and graphs. The default is unselected.
Monitor G.723 6.3 kbps MOS	
Event Notification	
Raise event if G.723 6.3 kbps MOS falls below threshold?	Select **Yes** to raise an event if the MOS for the G.723 6.3 kbps codec falls below the threshold that you set. The default is Yes.
Threshold - Minimum G.723 6.3 kbps MOS	Specify the lowest MOS that can occur before an event is raised. The default is 3.60.
Event severity when G.723 6.3 kbps MOS falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MOS falls below the threshold. The default is 5.

Description	How To Set It
Data Collection	
Collect data for G.723 6.3 kbps MOS?	Select **Yes** to collect data about G.723 6.3 kbps MOS for reports and graphs. The default is unselected.
Monitor G.729 MOS	
Event Notification	
Raise event if G.729 MOS falls below threshold?	Select **Yes** to raise an event if the MOS for the G.729 codec falls below the threshold that you set. The default is Yes.
Threshold - Minimum G.729 MOS	Specify the lowest MOS that can occur before an event is raised. The default is 3.60.
Event severity when G.729 MOS falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MOS falls below the threshold. The default is 5.
Data Collection	
Collect data for G.729 MOS?	Select **Yes** to collect data about G.729 MOS for reports and graphs. The default is unselected.
Monitor G.729A MOS	
Event Notification	
Raise event if G.729A MOS falls below threshold?	Select **Yes** to raise an event if the MOS for the G.729A codec falls below the threshold that you set. The default is Yes.
Threshold - Minimum G.729A MOS	Specify the lowest MOS that can occur before an event is raised. The default is 3.60.
Event severity when G.729A MOS falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MOS falls below the threshold. The default is 5.
Data Collection	
Collect data for G.729A MOS?	Select **Yes** to collect data about G.729A MOS for reports and graphs. The default is unselected.

50.10.5 Enabling QoS Monitor

If you use VoIP trunks, enable QoS Monitor in BCM before running the QoSLog Knowledge Script.

To enable QoS Monitor:

1. Log in to Element Manager.
2. On the Administration tab, expand **System Metrics** (for BCM 50 devices) or **System Status** (for BCM 4.0 devices), and then select **QoS Monitor**.
3. From the **Monitoring mode** list, select **Enabled in QoS-Monitor mode**.

For more information about VoIP trunks, see the "VoIP trunk gateways" chapter of the *Networking Configuration Guide* for your BCM device. For information about enabling the QoS Monitor, see the *Administration Guide* for your BCM device.

50.10.6 Understanding Codecs

In a VoIP transmission, the codec samples the sound and determines the data rate. A codec converts analog signals to digital (outbound) and digital signals to analog (inbound) for voice transmissions, and compresses (outbound) and decompresses (inbound) the digital information.

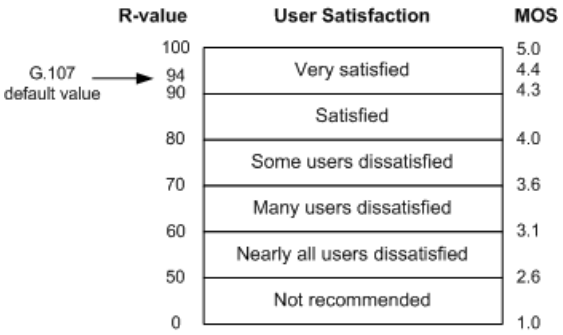
If you use VoIP trunks, use the QoSLog Knowledge Script to monitor the Mean Opinion Score (MOS) for six codec types. For more information, see "Understanding the Mean Opinion Score" on page 3116.

Codec	Description
G.711a	ITU standard for H.323-compliant codecs. Uses the A-law for companding, a popular standard in Europe.
G.711u	ITU standard for H.323-compliant codecs. Uses the U-law for companding, the most frequently used method in North America.
G.723-5.3 kbps	Dual-rate speech codec for multimedia communications transmitting at 5.3 kbps. Uses the conjugate structure algebraic code excited linear predictive compression (ACELP) algorithm.
G.723-6.3 kbps	Dual-rate speech codec for multimedia communications transmitting at 6.3 kbps. Uses the multipulse maximum likelihood quantization (MPMLQ) compression algorithm.
G.729	High-performing codec that offers compression with high quality.
G.729A	Less-complex version of the G.729 codec. Developed for simultaneous voice and data applications for which the G.729 codec was too complex. Speech quality is virtually indistinguishable between G.729 and G.729A.

50.10.7 Understanding the Mean Opinion Score

The Mean Opinion Score (MOS) is an overall score representing the quality of a call. The MOS is a number between 1 and 5. A MOS of 5 is excellent; a MOS of 1 is unacceptably bad. A modified version of the ITU (International Telecommunications Union) G.107 standard E-model equation is used to calculate the MOS. This algorithm is used to evaluate the quality of a transmission by factoring in the "mouth to ear" characteristics of a speech path.

The E-model is a complex calculation, the output of which is a single score called an R-value that is derived from delays and equipment impairment factors. An R-value can be mapped to an estimated MOS. R-values range from 100 (excellent) to 0 (poor). As shown below, an estimated MOS can be calculated directly from an R-value:



50.11 SystemUpTime

Use this Knowledge Script to monitor the number of seconds that the BCM has been operational since its last reboot. This script raises an event if the system has rebooted. In addition, this script generates a data stream for system availability.

You want to be informed when your BCM has been rebooted. While a BCM is rebooting, calls are not going through. Knowing that the BCM has been rebooted can help prepare you for calls from disgruntled users whose calls were incomplete.

50.11.1 Monitoring in SRG Mode

This script supports BCM 50 hardware running Nortel Survivable Remote Gateway (SRG) software, including instances when the SRG shifts to local mode for any reason.

50.11.2 Resource Object

Nortel_BCMx

50.11.3 Default Schedule

The default interval for this script is five minutes.

50.11.4 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event raised when the SystemUpTime job fails. The default is 5.
Raise event if system has rebooted?	Select **Yes** to raise an event if the BCM has been rebooted. The default is Yes.
Event severity when system has rebooted	Set the severity level, from 1 to 40, to indicate the importance of an event in which the BCM has been rebooted. The default is 10.
Monitor System Up Time	
Data Collection	
Collect data for system up time?	Select **Yes** to collect data about system up time (number of seconds that the BCM has been powered on or since its last reboot) for reports and graphs. The default is unselected.

50.12 SystemUsage

Use this Knowledge Script to monitor the total CPU usage and memory usage for the BCM. This script raises an event when any monitored value exceeds a threshold that you set. In addition, this script generates data streams for CPU usage and memory usage.

50.12.1 Monitoring in SRG Mode

This script supports BCM 50 hardware running Nortel Survivable Remote Gateway (SRG) software, including instances when the SRG shifts to local mode for any reason.

50.12.2 Resource Object

Nortel_BCMx

50.12.3 Default Schedule

The default interval for this script is five minutes.

50.12.4 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event raised when the SystemUsage job fails. The default is 5.
Monitor CPU Usage	
Event Notification	
Raise event if CPU usage exceeds threshold?	Select **Yes** to raise an event if CPU usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum CPU usage	Specify the highest CPU usage that can occur before an event is raised. The default is 80%.
Event severity when CPU usage exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. The default is 10.
Data Collection	
Collect data for CPU usage?	Select **Yes** to collect data about CPU usage for reports and graphs. The default is unselected.
Monitor Memory Usage	
Event Notification	

Description	How To Set It
Raise event if memory usage exceeds threshold?	Select **Yes** to raise an event if memory usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum memory usage	Specify the highest memory usage that can occur before an event is raised. The default is 80%.
Event severity when memory usage exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which memory usage exceeds the threshold. The default is 10.
Data Collection	
Collect data for memory usage?	Select **Yes** to collect data about memory usage for reports and graphs. The default is unselected.

50.13 UPSHealth

Use this Knowledge Script to monitor an attached uninterruptible power supply (UPS) for changes in operational status, load status, temperature status, and output and input voltage statuses, as well as temperature, load, and output and input voltage.

By warning you of changes to UPS status, this script can help you prevent outages that affect your users.

This script raises an event if a monitored status changes or if a monitored value exceeds a threshold that you set. In addition, this script generates data streams for UPS temperature, UPS load, UPS output voltage, and UPS input voltage.

50.13.1 Resource Object

Nortel_BCMx_UPS

50.13.2 Default Schedule

The default interval for this script is five minutes.

50.13.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event raised when the UPSHealth job fails. The default is 5.
Raise event if UPS operational status changes?	Select **Yes** to raise an event if the UPS operational status changes. The default is unselected.
Event severity when UPS operational status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the UPS operational status changes. The default is 30.
Raise event if UPS temperature status changes?	Select **Yes** to raise an event if the UPS temperature status changes. The default is unselected.
Event severity when UPS temperature status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the UPS temperature status changes. The default is 30.
Raise event if UPS load status changes?	Select **Yes** to raise an event if the UPS load status changes. The default is unselected.
Event severity when UPS load status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the UPS load status changes. The default is 30.
Raise event if UPS output voltage status changes?	Select **Yes** to raise an event if the UPS output voltage status changes. The default is unselected.

Description	How To Set It
Event severity when UPS output voltage status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the UPS output voltage status changes. The default is 30.
Raise event if UPS input voltage status changes?	Select **Yes** to raise an event if the UPS input voltage status changes. The default is unselected.
Event severity when UPS input voltage status changes	Set the severity level, from 1 to 40, to indicate the importance of an event in which the UPS input voltage status changes. The default is 30.
Monitor Temperature	
Event Notification	
Raise event if temperature exceeds threshold?	Select **Yes** to raise an event if the UPS temperature exceeds the threshold that you set. The default is Yes.
Threshold - Maximum temperature	Specify the temperature that can occur before an event is raised. The default is 55Âž Celsius.
Event severity when temperature exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the temperature exceeds the threshold. The default is 10.
Data Collection	
Collect data for temperature?	Select **Yes** to collect data about temperature for reports and graphs. The default is unselected.
Monitor Load	
Event Notification	
Raise event if load exceeds threshold?	Select **Yes** to raise an event if the UPS load exceeds the threshold that you set. The default is unselected.
Threshold - Maximum load	Specify the highest percentage of load that can occur before an event is raised. The default is 80%.
Event severity when load exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which load exceeds the threshold. The default is 10.
Data Collection	
Collect data for load?	Select **Yes** to collect data about load for reports and graphs. The default is unselected.
Monitor Output Voltage	
Event Notification	
Raise event if output voltage exceeds or falls below threshold?	Select **Yes** to raise an event if the output voltage level exceeds or falls below the thresholds that you set. The default is unselected.
Upper threshold	Select **Enable** to use an upper threshold value. The default is Enable.
Threshold - Maximum output voltage	Specify the highest output voltage that can occur before an event is raised. The default is 130 volts.
Event severity when output voltage exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which output voltage exceeds the threshold. The default is 10.
Lower threshold	Select **Enable** to use a lower threshold value. The default is Enable.

Description	How To Set It
Threshold - Minimum output voltage	Specify the lowest output voltage that can occur before an event is raised. The default is 100 volts.
Event severity when output voltage falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which output voltage falls below the threshold. The default is 10.
Data Collection	
Collect data for output voltage?	Select **Yes** to collect data about output voltage for reports and graphs. The default is unselected.
Monitor Input Voltage	
Event Notification	
Raise event if input voltage exceeds or falls below threshold?	Select **Yes** to raise an event if the input voltage level exceeds or falls below the thresholds that you set. The default is unselected.
Upper threshold	Select **Enable** to use an upper threshold value. The default is Enable.
Threshold - Maximum input voltage	Specify the highest input voltage that can occur before an event is raised. The default is 130 volts.
Event severity when input voltage exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which input voltage exceeds the threshold. The default is 10.
Lower threshold	Select **Enable** to use a lower threshold value. The default is Enable.
Threshold - Minimum input voltage	Specify the lowest input voltage that can occur before an event is raised. The default is 100 volts.
Event severity when input voltage falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which input voltage falls below the threshold. The default is 10.
Data Collection	
Collect data for input voltage?	Select **Yes** to collect data about input voltage for reports and graphs. The default is unselected.

50.14 Recommended Knowledge Script Group

The following Knowledge Scripts in the AppManager for Nortel BCMx module are members of the NortelBCMx recommended Knowledge Script Group (KSG).

- Alarms (Configure your Nortel BCM to send SNMP traps to AppManager before using this script. For more information, see "Identifying the SNMP Trap Receiver" on page 3086).
- ChassisUsage
- HealthCheck
- InterfaceHealth
- LogicalDiskSpace
- SystemUpTime
- SystemUsage

You can find the NortelBCMx KSG on the RECOMMENDED tab of the Knowledge Script pane of the Operator Console.

All the scripts in the KSG have their parameters set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab, and then run the NortelBCMx group on a Nortel BCMx resource.

Run the KSG from the Master view, not the NortelBCMx view. In order to use the Discovery_NortelBCMx Knowledge Script in a monitoring policy, the view must include root objects, which are not visible in the NortelBCMx view.

The NortelBCMx KSG enables a "best practices" usage of AppManager for monitoring your Nortel BCM environment. You can use this KSG with AppManager monitoring policies. A monitoring policy, which enables you to efficiently and consistently monitor all the resources in your environment, uses a set of pre-configured Knowledge Scripts to automatically monitor resources as they appear in the TreeView. For more information, see "About Policy-Based Monitoring" in the AppManager Help.

A KSG is composed of a subset of a module's Knowledge Scripts. The script that belongs to a KSG is a different copy of the original script you access from the NortelBCMx tab. If you modify a script that belongs to a KSG, the parameter settings of the original script in the NortelBCMx tab are not affected.

In some cases, default script parameter settings are different when the script is deployed as part of a KSG, as opposed to when it is deployed alone. The default settings of a script within a group depend on its monitoring purpose within the larger group, and on the intended monitoring scope of that group.

If you modify or remove a script associated with the NortelBCMx KSG and want to restore it to its original form, you can reinstall AppManager for Nortel BCMX on the repository computer or check in the appropriate script from the `AppManager\qdb\kp\NortelBCMx` directory.

51 NortelCC Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring Nortel Contact Center Manager Server. From within the Operator Console, you can select a Knowledge Script in the Knowledge Script pane and press **F1** for complete details.

Knowledge Script	What It Does
AgentTimes	Monitors the total and percentage of time that agents spend in various states.
Alarms	Monitors the Contact Center Manager Server for alarms (SNMP traps).
CallsAbandoned	Monitors various metrics related to abandoned calls.
CallsAnswered	Monitors various metrics related to answered calls.
CallsConfTrans	Monitors calls that have been conferenced in and out, and transferred in and out.
CallsOffered	Monitors the number of offered calls.
CallsTerminated	Monitors the number and percentage of terminated calls.
CallTimes	Monitors the amount of time calls spent in Contact Center Manager Server before being transferred or receiving a type of call treatment.
CallTreatments	Monitors the number and percentage of calls that receive a type of call treatment.
Database	Monitors free space and used space for the Master, Blue, and Call-by-Call databases.
HealthCheck	Monitors the availability of services on the Contact Center Manager Server.
SkillsetTimes	Monitors the amount of time skillsets spent in the following states: Active, All Agents Busy, and Staffed.
SystemUsage	Monitors system resource usage: CPU, memory, disk space, and network interfaces.

51.1 AgentTimes

Use this Knowledge Script to monitor the amount of time that Contact Center Manager Server agents spend in the following states:

- Logged In Time
- Not Ready Time
- Talk Time
- Waiting Time

This script raises events if a value exceeds the threshold that you set. In addition, this script generates data streams for the percentage and total time spent in each state.

Not every data stream is generated for each resource object for which this script is valid. The following table provides a matrix for determining whether a data stream is generated for the resource object you are using.

	DNIS Object	IVR Port Object
Talk Time	Yes	Yes
Logged In Time	No	Yes
Not Ready Time	No	Yes
Waiting Time	No	Yes

The first time you run this script, it marks the time and date (a starting point) in the database. With subsequent iterations, the script monitors and collects data based on changes in the database since the last time the script ran.

51.1.1 Understanding How Datastreams Are Calculated

AppManager retrieves all of its call and agent statistics from the database on the Contact Center Manager Server. However, not all of the statistics that users find necessary (such as percentage statistics) are available in raw form directly from the databases. AppManager must calculate the statistics to provide the data streams that each Knowledge Script generates.

The following table illustrates how each data stream is calculated:

Datastream	Description and Calculation
%LoggedInTime	Calculated from the amount of time agents are logged in. `100 x (LoggedInTime/900)`
%NotReadyTime	Calculated from the amount of time agents spend in Not Ready state and the amount of time agents are logged in. `100 x (NotReadyTime/LoggedInTime)`
%TalkTime	Calculated from the amount of time agents spend in Talk state and the amount of time agents are logged in. `100 x (TalkTime/LoggedInTime)`

Datastream	Description and Calculation
%WaitingTime	Calculated from the amount of time agents spend in Waiting state and the amount of time agens are logged in. `100 x (WaitingTime/LoggedInTime)`

51.1.2 Resource Objects

- NT_NORTELCC_IVRPORT
- NT_NORTELCC_DNIS

51.1.3 Default Schedule

By default, this script runs every 15 minutes. Because monitoring and data collection do not occur during the first iteration of this script, do not select the "Run Once" schedule.

51.1.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the AgentTimes job fails. The default is 5.
Raise event if SQL query fails?	Select **Yes** to raise an event if the SQL query fails. The default is Yes. AppManager uses a SQL query to retrieve Contact Center Manager Server database configuration information.
Event severity when SQL query fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the SQL query fails to retrieve database configuration information. The default is 15.
Raise event if no new data is found?	Select **Yes** to raise an event if the agent data has not changed since the last time the script ran. The default is Yes.
Event severity when no new data is found	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the agent data has not changed since the last time the script ran. The default is 15.
Monitor Total Logged In Time	
Data Collection	
Collect data for total Logged In time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total amount of time agents were Logged In during the monitoring period. The default is unselected.
Monitor Percentage of Time Logged In	

Parameter	How to Set It
Event Notification	
Raise event if percentage of time Logged In falls below threshold?	Select **Yes** to raise an event if the percentage of time that agents are Logged In falls below the threshold that you set. The default is Yes.
Threshold - Minimum percentage of time Logged In	Specify the minimum percentage of time that agents must be Logged In before an event is raised. The default is 100%.
Event severity when percentage of time Logged In exceeds threshold	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the percentage of time that agents are Logged In falls below the threshold you set. The default is 25.
Data Collection	
Collect data for percentage of time Logged In?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of time agents were Logged In during the monitoring period. The default is unselected.
Monitor Total Not Ready Time	
Data Collection	
Collect data for total Not Ready time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total amount of time agents were Not Ready during the monitoring period. The default is unselected.
Monitor Percentage of Time Not Ready	
Event Notification	
Raise event if percentage of time Not Ready exceeds threshold?	Select **Yes** to raise an event if the percentage of time that agents are Not Ready exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of time Not Ready	Specify the maximum percentage of time that agents must be Not Ready before an event is raised. The default is 70%.
Event severity when percentage of time Not Ready exceeds threshold	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the percentage of time that agents are Not Ready exceeds the threshold you set. The default is 25.
Data Collection	
Collect data for percentage of time Not Ready?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of time agents were Not Ready during the monitoring period. The default is unselected.
Monitor Total Talk Time	
Data Collection	
Collect data for total Talk time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total amount of time agents were in Talk Time during the monitoring period. The default is unselected.
Monitor Percentage of Time Talking	
Event Notification	
Raise event if percentage of time Talking exceeds threshold?	Select **Yes** to raise an event if the percentage of time that agents are in Talk Time exceeds the threshold that you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum percentage of time Talking	Specify the maximum percentage of time that agents must be in Talk Time before an event is raised. The default is 70%.
Event severity when percentage of time Talking exceeds threshold	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the percentage of time that agents are in Talk Time exceeds the threshold you set. The default is 25.
Data Collection	
Collect data for percentage of time Talking?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of time agents were in Talk Time during the monitoring period. The default is unselected.
Monitor Total Time Waiting	
Data Collection	
Collect data for total Waiting time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total amount of time agents were in Waiting Time during the monitoring period. The default is unselected.
Monitor Percentage of Time Waiting	
Event Notification	
Raise event if percentage of time Waiting exceeds threshold?	Select **Yes** to raise an event if the percentage of time that agents are in Waiting Time exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of time Waiting	Specify the maximum percentage of time that agents must be in Waiting Time before an event is raised. The default is 70%.
Event severity when percentage of time Waiting exceeds threshold	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the percentage of time that agents are in Waiting Time exceeds the threshold you set. The default is 25.
Data Collection	
Collect data for percentage of time Waiting?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of time agents were in Waiting Time during the monitoring period. The default is unselected.

51.2 Alarms

Use this Knowledge Script to monitor the Contact Center Manager Server for alarms (SNMP traps): critical, major, minor, and indeterminate. This script raises events if any alarm is detected.

When setting parameters for this script, you will be asked to provide a list of alarm identifiers (system messages) that you want to include in or exclude from monitoring. Their format consists of a multi-letter mnemonic followed by a multi-digit alarm number, such as AUD000 or SRPT194. If you want to enter more than one alarm identifier, separate them with a comma as in the following example: `AUD000,SRPT194`.

If you choose to "Include only" selected alarm identifiers in a category, AppManager will generate events only for those identifiers. AppManager will not generate events for the other identifiers included in the category.

If you choose to "Exclude" selected alarm identifiers from a category, AppManager will generate events for all alarm identifiers included in the category except those that you specifically excluded.

If you accept the default parameter settings, which are "Exclude" and blank (in the Alarm identifiers parameter), AppManager will generate events for all identifiers in the category, because you excluded nothing from the category.

51.2.1 Prerequisite

To allow this Knowledge Script to receive alarms from Contact Center Manager Server, configure the server's SNMP service.

To configure the SNMP service:

1. On the Contact Center Manager Server, navigate to the Control Panel, double-click **Administrative Tools**, and then double-click **Services**.
2. Double-click **SNMP Service** and then click the **Traps** tab.
3. In the **Community name** field, type the community string name for Contact Center Manager Server. The default community string name is "`public`."
4. In the **Trap destinations** field, type the CLAN address of the Contact Center Manager Server.
5. Click **OK**.
6. Restart the SNMP service.

NOTE: If you change SNMP service configuration while the Alarms script is running, the script may terminate abnormally. To prevent abnormal termination, simply configure the SNMP service to send to the CLAN before you run the Alarms script.

51.2.2 Resource Object

NT_NORTELCC_SCCS

51.2.3 Default Schedule

By default, this script runs on an asynchronous schedule.

51.2.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Monitor critical alarms?	Select **Yes** to monitor Contact Center Manager Server for alarms in the critical category. The default is Yes.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers that you specify in the following parameter. • Select **Exclude** to exclude the listed identifiers from the critical category. • Select **Include only** to include *only* the listed identifiers in the critical category. By default, the critical category includes all alarms with critical severity in the SNMP trap.
Alarm identifiers	Type a comma-separated list of the alarm identifiers that you want to include in or exclude from the critical category. The default is an empty list.
Monitor major alarms?	Select **Yes** to monitor Contact Center Manager Server for alarms in the major category. The default is Yes.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers that you specify in the following parameter. • Select **Exclude** to exclude the listed identifiers from the major category. • Select **Include only** to include *only* the listed identifiers in the major category. By default, the critical category includes all alarms with major severity in the SNMP trap.
Alarm identifiers	Type a comma-separated list of the alarm identifiers that you want to include in or exclude from the major category. The default is an empty list.
Monitor minor alarms?	Select **Yes** to monitor Contact Center Manager Server for alarms in the minor category. The default is Yes.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers that you specify in the following parameter. • Select **Exclude** to exclude the listed identifiers from the minor category. • Select **Include only** to include *only* the listed identifiers in the minor category. By default, the critical category includes all alarms with minor severity in the SNMP trap.
Alarm identifiers	Type a comma-separated list of the alarm identifiers that you want to include in or exclude from the minor category. The default is an empty list.
Monitor indeterminate alarms?	Select **Yes** to monitor Contact Center Manager Server for alarms in the indeterminate category. The default is Yes.
Include or exclude alarms?	Select whether you want to **Include only** or **Exclude** the alarm identifiers that you specify in the following parameter. • Select **Exclude** to exclude the listed identifiers from the indeterminate category. • Select **Include only** to include *only* the listed identifiers in the indeterminate category. By default, the critical category includes all alarms with indeterminate severity in the SNMP trap.

Parameter	How to Set It
Alarm identifiers	Type a comma-separated list of the alarm identifiers that you want to include in or exclude from the indeterminate category. The default is an empty list.
Event Severities	
Severity - Critical alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a critical alarm is detected. The default is 10.
Severity - Major alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a major alarm is detected. The default is 15.
Severity - Minor alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which a minor alarm is detected. The default is 20.
Severity - Indeterminate alarms	Set the severity level, between 1 and 40, to indicate the importance of an event in which an indeterminate alarm is detected. The default is 30.

51.3 CallsAbandoned

Use this Knowledge Script to monitor various metrics related to abandoned calls:

- Number and percentage of abandoned calls
- Number and percentage of calls abandoned after meeting or exceeding the delay threshold
- Total delay of abandoned calls
- Average and maximum delay of abandoned calls

This script raises an event if a value exceeds the threshold you set. In addition, this script generates data streams for each metric. For more information, see "Reviewing Call Metric Definitions" on page 3176.

Not every data stream is generated for each resource object for which this script is valid. The following table is a matrix for determining whether a data stream is generated for the resource object you are using.

	CDN Object	DNIS Object	Application Object	AppSkillset Object
Calls Abandoned	Yes	Yes	Yes	Yes
% Calls Abandoned	Yes	Yes	Yes	Yes
Calls Abandoned After Threshold	No	Yes	Yes	Yes
% Calls Abandoned After Threshold	No	Yes	Yes	Yes
Calls Abandoned Delay	No	Yes	Yes	Yes
Maximum Abandoned Delay	No	Yes	Yes	Yes
Average Abandoned Delay	No	Yes	Yes	No

The first time you run this script, it marks the time and date (a starting point) in the database. With subsequent iterations, the script monitors and collects data based on changes in the database since the last time the script ran.

51.3.1 Understanding How Datastreams Are Calculated

AppManager retrieves all of its call and agent statistics from the database on the Contact Center Manager Server. However, not all of the statistics that users find necessary (such as percentage statistics) are available in raw form directly from the databases. AppManager must calculate the statistics to provide the data streams that each Knowledge Script generates.

The following table illustrates how each data stream is calculated:

Datastream	Description and Calculation
%CallsAbandoned	Calculated from the number of abandoned calls and the number of offered calls. `100 x (CallsAbandoned/CallsOffered)`
%SkillsetAbandoned	Calculated from the number of calls abandoned while in queue for a skillset and the number of calls offered to a skillset. `100 x (SkillsetAbandoned/CallsOffered)`

Datastream	Description and Calculation
AvgCallsAbandonedDelay	Calculated from the amount of time calls spend in ContactCenter Manager Server before being abandoned (delay) and the number of abandoned calls. `CallsAbandonedDelay/CallsAbandoned`
AvgSkillsetAbandonedDelay	Calculated from the amount of time calls spend in queue for a skillset before being abandoned and the number of calls abandoned while in queue for a skillset. `SkillsetAbandonedDelay/SkillsetAbandoned`

51.3.2 Resource Objects

- NT_NORTELCC_CDN
- NT_NORTELCC_DNIS
- NT_NORTELCC_APPLICATION
- NT_NORTELCC_APPSKILLSET

The TreeView pane of the Operator Console contains Application and Skillset objects under the NortelCC object. Within the Application and Skillset object folders are Application/Skillset (AppSkillset) pairs. The same pairs are represented within the Application and Skillset object folders. Their placement within the Application and Skillset folders allows you to search for a particular pair by either Application or Skillset. You can drop this Knowledge Script on a pair in either location.

51.3.3 Default Schedule

By default, this script runs every 15 minutes. Because monitoring and data collection do not occur during the first iteration of this script, do not select the "Run Once" schedule.

51.3.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CallsAbandoned job fails. The default is 5.
Raise event if SQL query fails?	Select **Yes** to raise an event if the SQL query fails. The default is Yes. AppManager uses a SQL query to retrieve Contact Center Manager Server database configuration information.
Event severity when SQL query fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the SQL query fails to retrieve database configuration information. The default is 15.

Parameter	How to Set It
Raise event if no new data is found?	Select **Yes** to raise an event if the agent data has not changed since the last time the script ran. The default is Yes.
Event severity when no new data is found	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the agent data has not changed since the last time the script ran. The default is 15.
Monitor Calls Abandoned	
Data Collection	
Collect data for calls abandoned?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that were abandoned during the monitoring period. The default is unselected.
Monitor Percentage of Calls Abandoned	
Event Notification	
Raise event if percentage of calls abandoned exceeds threshold?	Select **Yes** to raise an event if the percentage of abandoned calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls abandoned	Specify the maximum percentage of calls that must be abandoned before an event is raised. The default is 90%.
Event severity when percentage of calls abandoned exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of abandoned calls exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls abandoned?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that were abandoned during the monitoring period. The default is unselected.
Monitor Calls Abandoned After Meeting or Exceeding Delay Ceiling	
Data Collection	
Collect data for calls abandoned after meeting or exceeding delay ceiling?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that were abandoned during the monitoring period after meeting or exceeding the delay ceiling. The default is unselected.
Monitor Percentage of Calls Abandoned After Meeting or Exceeding Delay Ceiling	
Event Notification	
Raise event if percentage of calls abandoned after meeting or exceeding delay ceiling exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that were abandoned after meeting or exceeding the delay ceiling exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls abandoned after meeting or exceeding delay ceiling	Specify the maximum percentage of calls that can be abandoned after meeting or exceeding the delay ceiling before an event is raised. The default is 70%.

Parameter	How to Set It
Event severity when percentage of calls abandoned after meeting or exceeding delay ceiling exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that were abandoned after meeting or exceeding the delay ceiling exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls abandoned after meeting or exceeding delay ceiling?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that were abandoned during the monitoring period after meeting or exceeding the delay ceiling. The default is unselected.
Monitor Total Delay of Calls Abandoned	
Data Collection	
Collect data for total delay of calls abandoned?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total amount of delay experienced by abandoned calls during the monitoring period. The default is unselected.
Monitor Average Abandoned Delay	
Event Notification	
Raise event if average abandoned delay exceeds threshold?	Select **Yes** to raise an event if the average amount of delay experienced by abandoned calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum average abandoned delay	Specify the maximum average amount of delay that abandoned calls can experience before an event is raised. The default is 10 seconds.
Event severity when average abandoned delay exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the average amount of delay experienced by abandoned calls exceeds the threshold. The default is 25.
Data Collection	
Collect data for average abandoned delay?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average amount of delay that occurred during the monitoring period. The default is unselected.
Monitor Maximum Abandoned Delay	
Event Notification	
Raise event if maximum abandoned delay exceeds threshold?	Select **Yes** to raise an event if the maximum amount of delay experienced by abandoned calls exceeds the threshold that you set. The default is Yes.
Threshold - Highest maximum abandoned delay	Specify the highest amount of maximum delay that abandoned calls can experience before an event is raised. The default is 10 seconds.
Event severity when maximum abandoned delay exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the average amount of delay experienced by abandoned calls exceeds the threshold. The default is 25.
Data Collection	
Collect data for maximum abandoned delay?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the maximum amount of delay experienced by abandoned calls during the monitoring period. The default is unselected.

51.4 CallsAnswered

Use this Knowledge Script to monitor various metrics related to answered calls:

- Number and percentage of answered calls
- Number and percentage of calls answered after meeting or exceeding the delay threshold
- Total delay of answered calls
- Average and maximum delay of answered calls
- Total delay of calls answered at skillset
- Average and maximum delay of calls answered at skillset

This script raises an event if a value exceeds the threshold you set. In addition, this script generates data streams for each metric. For more information, see "Reviewing Call Metric Definitions" on page 3176.

Not every data stream is generated for each resource object for which this script is valid. The following table is a matrix for determining whether a data stream is generated for the resource object you are using.

	CDN Object	DNIS Object	IVRQueue Object	IVRPort Object	Application Object	AppSkillset Object
Calls Answered	Yes	Yes	Yes	Yes	Yes	Yes
% Calls Answered	Yes	Yes	Yes	No	Yes	Yes
Calls Answered After Threshold	No	Yes	Yes	No	Yes	Yes
% Calls Answered After Threshold	No	Yes	Yes	No	Yes	Yes
Calls Answered Delay	No	Yes	Yes	No	Yes	Yes
Maximum Answered Delay	No	Yes	No	No	Yes	Yes
Average Answered Delay	No	Yes	Yes	No	Yes	Yes
Calls Answered Delay at Skillset	No	No	No	No	Yes	Yes
Maximum Answered Delay at Skillset	No	No	No	No	Yes	Yes
Average Answered Delay at Skillset	No	No	No	No	Yes	Yes

When dropped on a proper resource object, AppManager generates data streams as noted in the table.

The first time you run this script, it marks the time and date (a starting point) in the database. With subsequent iterations, the script monitors and collects data based on changes in the database since the last time the script ran.

51.4.1 Understanding How Datastreams Are Calculated

AppManager retrieves all of its call and agent statistics from the database on the Contact Center Manager Server. However, not all of the statistics that users find necessary (such as percentage statistics) are

available in raw form directly from the databases. AppManager must calculate the statistics to provide the data streams that each Knowledge Script generates.

The following table illustrates how each data stream is calculated:

Datastream	Description and Calculation
%CallsAnswered	Calculated from the number of answered calls and the number of offered calls. `100 x (CallsAnswered/CallsOffered)`
%CallsAnsweredAfterThreshold	Calculated from the number of calls answered after exceeding the delay threshold and the number of offered calls. `100 x (CallsAnsweredAfterThreshold/CallsOffered)`
AvgCallsAnsweredDelay	Calculated from the amount of time calls spend in Contact Center Manager Server before being answered (delay) and the number of answered calls. `CallsAnsweredDelay/CallsAnswered`
AvgCallsAnsweredDelayAtSkillset	Calculated from the amount of time calls spend in Contact Center Manager Server before being answered (delay) at a particular skillset and the number of answered calls. `CallsAnsweredDelayAtSkillset/CallsAnswered`

51.4.2 Resource Objects

- NT_NORTELCC_CDN
- NT_NORTELCC_DNIS
- NT_NORTELCC_IVRQUEUE
- NT_NORTELCC_IVRPORT
- NT_NORTELCC_APPLICATION
- NT_NORTELCC_APPSKILLSET

  The TreeView pane of the Operator Console contains Application and Skillset objects under the NortelCC object. Within the Application and Skillset object folders are Application/Skillset (AppSkillset) pairs. The same pairs are represented within the Application and Skillset object folders. Their placement within the Application and Skillset folders allows you to search for a particular pair by either Application or Skillset. You can drop this Knowledge Script on a pair in either location.

51.4.3 Default Schedule

By default, this script runs every 15 minutes. Because monitoring and data collection do not occur during the first iteration of this script, do not select the “Run Once” schedule.

51.4.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CallsAnswered job fails. The default is 5.
Raise event if SQL query fails?	Select **Yes** to raise an event if the SQL query fails. The default is Yes. AppManager uses a SQL query to retrieve Contact Center Manager Server database configuration information.
Event severity when SQL query fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the SQL query fails to retrieve database configuration information. The default is 15.
Raise event if no new data is found?	Select **Yes** to raise an event if the agent data has not changed since the last time the script ran. The default is Yes.
Event severity when no new data is found	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the agent data has not changed since the last time the script ran. The default is 15.
Monitor Calls Answered	
Data Collection	
Collect data for calls answered?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that were answered during the monitoring period. The default is unselected.
Monitor Percentage of Calls Answered	
Event Notification	
Raise event if percentage of calls answered falls below threshold?	Select **Yes** to raise an event if the percentage of answered calls falls below the threshold that you set. The default is Yes. **Important** If you drop this script on a resource object that is not configured to answer calls, AppManager raises an event indicating that the percentage of answered calls for that object has indeed fallen below the threshold. The threshold is 90%. An object that is not configured to answer calls will have 0% answered calls — a value well below the threshold. To prevent this sort of invalid event, drop this script on a resource object that is configured to answer calls.
Threshold - Minimum percentage of calls answered	Specify the minimum percentage of calls that can be answered to prevent an event from being raised. The default is 90%.
Event severity when percentage of calls answered falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of answered calls falls below the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls answered?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that were answered during the monitoring period. The default is unselected.
Monitor Calls Answered After Meeting or Exceeding Delay Ceiling	
Data Collection	

Parameter	How to Set It
Collect data for calls answered after meeting or exceeding delay ceiling?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that were answered during the monitoring period after meeting or exceeding the delay ceiling. The default is unselected.
Monitor Percentage of Calls Answered After Meeting or Exceeding Delay Ceiling	
Event Notification	
Raise event if percentage of calls answered after meeting or exceeding delay ceiling exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that were answered after meeting or exceeding the delay ceiling exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls answered after meeting or exceeding delay ceiling	Specify the maximum percentage of calls that can be answered after meeting or exceeding the delay ceiling before an event is raised. The default is 70%.
Event severity when percentage of calls answered after meeting or exceeding delay ceiling exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that were answered after meeting or exceeding the delay ceiling exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls answered after meeting or exceeding delay ceiling?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that were answered during the monitoring period after meeting or exceeding the delay ceiling. The default is unselected.
Monitor Total Delay of Calls Answered	
Data Collection	
Collect data for total delay of calls answered?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total amount of delay experienced by answered calls during the monitoring period. The default is unselected.
Monitor Average Answered Delay	
Event Notification	
Raise event if average answered delay exceeds threshold?	Select **Yes** to raise an event if the average amount of delay experienced by answered calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum average answered delay	Specify the maximum average amount of delay that answered calls can experience before an event is raised. The default is 10 seconds.
Event severity when average answered delay exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the average amount of delay experienced by answered calls exceeds the threshold. The default is 25.
Data Collection	
Collect data for average answered delay?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average amount of delay that occurred during the monitoring period. The default is unselected.
Monitor Maximum Answered Delay	
Event Notification	

Parameter	How to Set It
Raise event if maximum answered delay exceeds threshold?	Select **Yes** to raise an event if the maximum amount of delay experienced by answered calls exceeds the threshold that you set. The default is Yes.
Threshold - Highest maximum answered delay	Specify the highest amount of maximum delay that answered calls can experience before an event is raised. The default is 10 seconds.
Event severity when maximum answered delay exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the average amount of delay experienced by answered calls exceeds the threshold. The default is 25.
Data Collection	
Collect data for maximum answered delay?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the maximum amount of delay experienced by answered calls during the monitoring period. The default is unselected.
Monitor Total Answered Delay at Skillset	
Data Collection	
Collect data for total answered delay at skillset?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total amount of delay experienced by calls answered by a particular skillset during the monitoring period. The default is unselected.
Monitor Average Answered Delay at Skillset	
Event Notification	
Raise event if average answered delay at skillset exceeds threshold?	Select **Yes** to raise an event if the average amount of delay experienced by calls answered by a particular skillset exceeds the threshold that you set. The default is Yes.
Threshold - Maximum average answered delay at skillset	Specify the maximum average amount of delay that answered calls can experience at a particular skillset before an event is raised. The default is 10 seconds.
Event severity when average answered delay at skillset exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the average amount of delay experienced by calls answered by a particular skillset exceeds the threshold. The default is 25.
Data Collection	
Collect data for average answered delay at skillset?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average amount of delay experienced by calls answered by a particular skillset during the monitoring period. The default is unselected.
Monitor Maximum Answered Delay at Skillset	
Event Notification	
Raise event if maximum answered delay at skillset exceeds threshold?	Select **Yes** to raise an event if the maximum amount of delay experienced by calls answered by a particular skillset exceeds the threshold that you set. The default is Yes.
Threshold - Highest maximum answered delay at skillset	Specify the highest amount of maximum delay that answered calls can experience at a particular skillset before an event is raised. The default is 10 seconds.
Event severity when maximum answered delay at skillset exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the maximum amount of delay experienced by calls answered by a particular skillset exceeds the threshold. The default is 25.

Parameter	How to Set It
Data Collection	
Collect data for maximum answered delay at skillset?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the maximum amount of delay experienced by calls answered by a particular skillset during the monitoring period. The default is unselected.

51.5 CallsConfTrans

Use this Knowledge Script to monitor calls that are transferred in and out of Contact Center Manager Server, and to monitor calls that have been conferenced in and out of Contact Center Manager Server. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for each metric. For more information, see "Reviewing Call Metric Definitions" on page 3176.

Not every data stream is generated for each resource object for which this script is valid. The following table is a matrix for determining whether a data stream is generated for the resource object you are using.

	IVRQueue Object	IVRPort Object	Application Object
Calls Conferenced Out	Yes	Yes	Yes
Calls Conferenced In	No	No	Yes
% Calls Conferenced Out	Yes	Yes	Yes
% Calls Conferenced In	No	No	Yes
Calls Transferred Out	Yes	Yes	Yes
Calls Transferred In	No	No	Yes
% Calls Transferred Out	Yes	Yes	Yes
% Calls Transferred In	No	No	Yes

The first time you run this script, it marks the time and date (a starting point) in the database. With subsequent iterations, the script monitors and collects data based on changes in the database since the last time the script ran.

51.5.1 Understanding How Datastreams Are Calculated

AppManager retrieves all of its call and agent statistics from the database on the Contact Center Manager Server. However, not all of the statistics that users find necessary (such as percentage statistics) are available in raw form directly from the databases. AppManager must calculate the statistics to provide the data streams that each Knowledge Script generates.

The following table illustrates how each data stream is calculated:

Datastream	Description and Calculation
%CallsConferenced	Calculated from the number of conferenced calls and the number of answered calls. Applies to the IVR Port object. `100 x (CallsConferenced/CallsAnswered)`
%CallsConferenced	Calculated from the number of conferenced calls and the number of offered calls. Applies to the IVR Queue object. `100 x (CallsConferenced/CallsOffered)`
%CallsConferencedIn	Calculated from the number of calls conferenced in and the number of offered calls. `100 x (CallsConferencedIn/CallsOffered)`

Datastream	Description and Calculation
%CallsConferencedOut	Calculated from the number of calls conferenced out and the number of offered calls. `100 x (CallsConferencedOut/CallsOffered)`
%CallsTransferred	Calculated from the number of transferred calls and the number of answered calls. Applies to the IVR Port object. `100 x (CallsTransferred/CallsAnswered)`
%CallsTransferred	Calculated from the number of transferred calls and the number of offered calls. Applies to the IVR Queue object. `100 x (CallsTransferred/CallsOffered)`
%CallsTransferredIn	Calculated from the number of calls transferred in and the number of offered calls. `100 x (CallsTransferredIn/CallsOffered)`
%CallsTransferredOut	Calculated from the number of calls transferred out and the number of offered calls. `100 x (CallsTransferredOut/CallsOffered)`

51.5.2 Resource Objects

- NT_NORTELCC_IVRQUEUE
- NT_NORTELCC_IVRPORT
- NT_NORTELCC_APPLICATION

51.5.3 Default Schedule

By default, this script runs every 15 minutes. Because monitoring and data collection do not occur during the first iteration of this script, do not select the "Run Once" schedule.

51.5.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CallsConfTrans job fails. The default is 5.
Raise event if SQL query fails?	Select **Yes** to raise an event if the SQL query fails. The default is Yes. AppManager uses a SQL query to retrieve Contact Center Manager Server database configuration information.

Parameter	How to Set It
Event severity when SQL query fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the SQL query fails to retrieve database configuration information. The default is 15.
Raise event if no new data is found?	Select **Yes** to raise an event if the agent data has not changed since the last time the script ran. The default is Yes.
Event severity when no new data is found	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the agent data has not changed since the last time the script ran. The default is 15.
Monitor Calls Conferenced In	
Data Collection	
Collect data for calls answered?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that were conferenced in during the monitoring period. The default is unselected.
Monitor Percentage of Calls Conferenced In	
Event Notification	
Raise event if percentage of calls conferenced in exceeds threshold?	Select **Yes** to raise an event if the percentage of conferenced-in calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls conferenced in	Specify the maximum percentage of calls that must be conferenced in before an event is raised. The default is 0%.
Event severity when percentage of calls conferenced in exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of conferenced-in calls exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls conferenced in?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that were conferenced in during the monitoring period. The default is unselected.
Monitor Calls Conferenced Out	
Data Collection	
Collect data for calls conferenced out?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that were conferenced out during the monitoring period. The default is unselected.
Monitor Percentage of Calls Conferenced Out	
Event Notification	
Raise event if percentage of calls conferenced out exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that were conferenced out exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls conferenced out	Specify the maximum percentage of calls that can be conferenced out before an event is raised. The default is 0%.
Event severity when percentage of calls conferenced out exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of conferenced-out calls exceeds the threshold. The default is 25.

Parameter	How to Set It
Data Collection	
Collect data for percentage of calls conferenced out?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that were conferenced out during the monitoring period. The default is unselected.
Monitor Calls Transferred In	
Data Collection	
Collect data for calls transferred in?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that were transferred in during the monitoring period. The default is unselected.
Monitor Percentage of Calls Transferred In	
Event Notification	
Raise event if percentage of calls transferred in exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that were transferred in exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls transferred in	Specify the maximum percentage of calls that must be transferred in before an event is raised. The default is 0%.
Event severity when percentage of calls transferred in exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of transferred-in calls exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls transferred in?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls transferred in during the monitoring period. The default is unselected.
Monitor Calls Transferred Out	
Data Collection	
Collect data for calls transferred out?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of calls transferred out during the monitoring period. The default is unselected.
Monitor Percentage of Calls Transferred Out	
Event Notification	
Raise event if percentage of calls transferred out exceeds threshold?	Select **Yes** to raise an event if the percentage of calls transferred out exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls transferred out	Specify the maximum percentage of calls that must be transferred out before an event is raised. The default is 0 calls.
Event severity when percentage of calls transferred out exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of transferred-out calls exceeds the threshold. The default is 25.
Data Collection	

Parameter	How to Set It
Collect data for percentage of calls transferred out?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls transferred out during the monitoring period. The default is unselected.

51.6 CallsOffered

Use this Knowledge Script to monitor the number of calls that have been offered to Contact Center Manager Server. This script generates data streams for the number of offered calls per resource object.

The first time you run this script, it marks the time and date (a starting point) in the database. With subsequent iterations, the script monitors and collects data based on changes in the database since the last time the script ran.

51.6.1 Resource Objects

- NT_NORTELCC_CDN
- NT_NORTELCC_DNIS
- NT_NORTELCC_IVRQUEUE
- NT_NORTELCC_APPLICATION
- NT_NORTELCC_APPSKILLSET

51.6.2 Default Schedule

By default, this script runs every 15 minutes. Because monitoring and data collection do not occur during the first iteration of this script, do not select the "Run Once" schedule.

51.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CallsOffered job fails. The default is 5.
Raise event if SQL query fails?	Select **Yes** to raise an event if the SQL query fails. The default is Yes. AppManager uses a SQL query to retrieve Contact Center Manager Server database configuration information.
Event severity when SQL query fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the SQL query fails to retrieve database configuration information. The default is 15.
Raise event if no new data is found?	Select **Yes** to raise an event if the agent data has not changed since the last time the script ran. The default is Yes.
Event severity when no new data is found	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the agent data has not changed since the last time the script ran. The default is 15.
Monitor Calls Offered	

Parameter	How to Set It
Data Collection	
Collect data for calls offered?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that were offered to Contact Center Manager Server during the monitoring period. The default is unselected.

51.7 CallsTerminated

Use this Knowledge Script to monitor the number and percentage of terminated calls. This script raises an event if the percentage of terminated calls falls below the threshold that you set. In addition, this script generates data streams for the number and percentage of terminated calls.

The first time you run this script, it marks the time and date (a starting point) in the database. With subsequent iterations, the script monitors and collects data based on changes in the database since the last time the script ran.

51.7.1 Understanding How Datastreams Are Calculated

AppManager retrieves all of its call and agent statistics from the database on the Contact Center Manager Server. However, not all of the statistics that users find necessary (such as percentage statistics) are available in raw form directly from the databases. AppManager must calculate the statistics to provide the data streams that each Knowledge Script generates.

The following table illustrates how each data stream is calculated:

Datastream	Description and Calculation
%CallsTerminated	Calculated from the number of terminated calls and the number of offered calls. `100 x (CallsTerminated/CallsOffered)`

51.7.2 Resource Object

NT_NORTELCC_CDN

51.7.3 Default Schedule

By default, this script runs every 15 minutes. Because monitoring and data collection do not occur during the first iteration of this script, do not select the "Run Once" schedule.

51.7.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CallsTerminated job fails. The default is 5.
Raise event if SQL query fails?	Select **Yes** to raise an event if the SQL query fails. The default is Yes. AppManager uses a SQL query to retrieve Contact Center Manager Server database configuration information.

Parameter	How to Set It
Event severity when SQL query fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the SQL query fails to retrieve database configuration information. The default is 15.
Raise event if no new data is found?	Select **Yes** to raise an event if the agent data has not changed since the last time the script ran. The default is Yes.
Event severity when no new data is found	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the agent data has not changed since the last time the script ran. The default is 15.
Monitor Calls Terminated	
Data Collection	
Collect data for calls terminated?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that were terminated during the monitoring period. The default is unselected.
Monitor Percentage of Calls Terminated	
Event Notification	
Raise event if percentage of calls terminated falls below threshold?	Select **Yes** to raise an event if the percentage of terminated calls falls below the threshold that you set. The default is Yes.
Threshold - Minimum percentage of calls terminated	Specify the minimum percentage of calls that must be terminated before an event is raised. The default is 90%.
Event severity when percentage of calls terminated falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of terminated calls falls below the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls terminated?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that were terminated during the monitoring period. The default is unselected.

51.8 CallTimes

Use this Knowledge Script to monitor the time that calls spend in Contact Center Manager Server before being transferred or receiving a type of call treatment. This script raises an event if a value exceeds a threshold that you set. In addition, this script generates the following data streams:

- TimeBeforeDefault
- TimeBeforeForceBusy
- TimeBeforeForceDisconnect
- TimeBeforeForceOverflow
- TimeBeforeInterflow
- TimeBeforeIVRTransfer
- TimeBeforeRouteTo
- AvgTimeBeforeDefault
- AvgTimeBeforeForceBusy
- AvgTimeBeforeForceDisconnect
- AvgTimeBeforeForceOverflow
- AvgTimeBeforeInterflow
- AvgTimeBeforeRouteTo

For more information, see "Reviewing Call Metric Definitions" on page 3176.

The first time you run this script, it marks the time and date (a starting point) in the database. With subsequent iterations, the script monitors and collects data based on changes in the database since the last time the script ran.

51.8.1 Understanding How Datastreams Are Calculated

AppManager retrieves all of its call and agent statistics from the database on the Contact Center Manager Server. However, not all of the statistics that users find necessary (such as percentage statistics) are available in raw form directly from the databases. AppManager must calculate the statistics to provide the data streams that each Knowledge Script generates.

The following table illustrates how each data stream is calculated:

Datastream	Description and Calculation
AvgTimeBeforeDefaut	Calculated from the amount of time calls spend in Contact Center Manager Server before receiving the default treatment and the number of calls given the default treatment. `TimeBeforeDefault/CallsGivenDefault`
AvgTimeBeforeForceBusy	Calculated from the amount of time calls spend in Contact Center Manager Server before receiving the force busy treatment and the number of calls given the force busy treatment. `TimeBeforeForceBusy/CallsGivenForceBusy`

Datastream	Description and Calculation
AvgTimeBeforeForceDisconnect	Calculated from the amount of time calls spend in Contact Center Manager Server before receiving the force disconnect treatment and the number of calls given the force disconnect treatment. `TimeBeforeForceDisconnect/CallsGivenForceDisconnect`
AvgTimeBeforeForceOverflow	Calculated from the amount of time calls spend in Contact Center Manager Server before receiving the force overflow treatment and the number of calls given the force overflow treatment. `TimeBeforeForceOverflow/CallsGivenForceOverflow`
AvgTimeBeforeInterflow	Calculated from the amount of time calls spend in Master_Script and the number of offered calls. `TimeBeforeInterflow/CallsOffered`
AvgTimeBeforeRouteTo	Calculated from the amount of time calls spend in Contact Center Manager Server before receiving the route call treatment and the number of cals given the route call treatment. `TimeBeforeRouteTo/CallsGivenRouteTo`

51.8.2 Resource Object

NT_NORTELCC_APPLICATION

51.8.3 Default Schedule

By default, this script runs every 15 minutes. Because monitoring and data collection do not occur during the first iteration of this script, do not select the "Run Once" schedule.

51.8.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CallTimes job fails. The default is 5.
Raise event if SQL query fails?	Select **Yes** to raise an event if the SQL query fails. The default is Yes. AppManager uses a SQL query to retrieve Contact Center Manager Server database configuration information.
Event severity when SQL query fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the SQL query fails to retrieve database configuration information. The default is 15.

Parameter	How to Set It
Raise event if no new data is found?	Select **Yes** to raise an event if the agent data has not changed since the last time the script ran. The default is Yes.
Event severity when no new data is found	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the agent data has not changed since the last time the script ran. The default is 15.
Monitor Total Time Calls Spent in System Before Default Treatment	
Data Collection	
Collect data for total time calls spent in system before default treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of seconds that calls spent in Contact Center Manager Server before receiving the default treatment. The default is unselected.
Monitor Average Time Calls Spent in System Before Default Treatment	
Event Notification	
Raise event if average time calls spent in system before default treatment exceeds threshold?	Select **Yes** to raise an event if the average time that calls spent in Contact Center Manager Server before receiving the default treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum average time calls spent in system before default treatment	Specify the highest average time that calls can spend in Contact Center Manager Server (before receiving the default treatment) before an event is raised. The default is 10 seconds.
Event severity when average time calls spent in system before default treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the highest average time that calls spent in Contact Center Manager Server (before receiving the default treatment) exceeds the threshold. The default is 25.
Data Collection	
Collect data for average time calls spent in system before default treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the highest average time that calls spent in Contact Center Manager Server during the monitoring period before receiving the default treatment. The default is unselected.
Monitor Total Time Calls Spent in System Before Force Busy Treatment	
Data Collection	
Collect data for total time calls spent in system before force busy treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of seconds that calls spent in Contact Center Manager Server before receiving the force busy treatment. The default is unselected.
Monitor Average Time Calls Spent in System Before Force Busy Treatment	
Event Notification	
Raise event if average time calls spent in system before force busy treatment exceeds threshold?	Select **Yes** to raise an event if the average time that calls spent in Contact Center Manager Server before receiving the force busy treatment exceeds the threshold that you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum average time calls spent in system before force busy treatment	Specify the highest average time that calls can spend in Contact Center Manager Server (before receiving the force busy treatment) before an event is raised. The default is 10 seconds.
Event severity when average time calls spent in system before force busy treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the highest average time that calls spent in Contact Center Manager Server (before receiving the force busy treatment) exceeds the threshold. The default is 25.
Data Collection	
Collect data for average time calls spent in system before force busy treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the highest average time that calls spent in Contact Center Manager Server during the monitoring period before receiving the force busy treatment. The default is unselected.
Monitor Total Time Calls Spent in System Before Disconnect Treatment	
Data Collection	
Collect data for total time calls spent in system before disconnect treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of seconds that calls spent in Contact Center Manager Server before receiving the disconnect treatment. The default is unselected.
Monitor Average Time Calls Spent in System Before Disconnect Treatment	
Event Notification	
Raise event if average time calls spent in system before disconnect treatment exceeds threshold?	Select **Yes** to raise an event if the average time that calls spent in Contact Center Manager Server before receiving the disconnect treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum average time calls spent in system before disconnect treatment	Specify the highest average time that calls can spend in Contact Center Manager Server (before receiving the disconnect treatment) before an event is raised. The default is 10 seconds.
Event severity when average time calls spent in system before disconnect treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the highest average time that calls spent in Contact Center Manager Server (before receiving the disconnect treatment) exceeds the threshold. The default is 25.
Data Collection	
Collect data for average time calls spent in system before disconnect treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the highest average time that calls spent in Contact Center Manager Server during the monitoring period before receiving the disconnect treatment. The default is unselected.
Monitor Total Time Calls Spent in System Before Force Overflow Treatment	
Data Collection	
Collect data for total time calls spent in system before force overflow treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of seconds that calls spent in Contact Center Manager Server before receiving the force overflow treatment. The default is unselected.

Parameter	How to Set It
Monitor Average Time Calls Spent in System Before Force Overflow Treatment	
Event Notification	
Raise event if average time calls spent in system before force overflow treatment exceeds threshold?	Select **Yes** to raise an event if the average time that calls spent in Contact Center Manager Server before receiving the force overflow treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum average time calls spent in system before force overflow treatment	Specify the highest average time that calls can spend in Contact Center Manager Server (before receiving the force overflow treatment) before an event is raised. The default is 10 seconds.
Event severity when average time calls spent in system before force overflow treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the highest average time that calls spent in Contact Center Manager Server (before receiving the force overflow treatment) exceeds the threshold. The default is 25.
Data Collection	
Collect data for average time calls spent in system before force overflow treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the highest average time that calls spent in Contact Center Manager Server during the monitoring period before receiving the force overflow treatment. The default is unselected.
Monitor Total Time Calls Spent in Master_Script	
Data Collection	
Collect data for total time calls spent in Master_Script?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of seconds that calls spent in Master_Script. The default is unselected.
Monitor Average Time Calls Spent in Master_Script	
Event Notification	
Raise event if average time calls spent in Master_Script exceeds threshold?	Select **Yes** to raise an event if the average time that calls spent in Master_Script exceeds the threshold that you set. The default is Yes.
Threshold - Maximum average time calls spent in Master_Script	Specify the highest average time that calls can spend in Master_Script before an event is raised. The default is 10 seconds.
Event severity when average time calls spent in Master_Script exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the highest average time that calls spent in Master_Script exceeds the threshold. The default is 25.
Data Collection	
Collect data for average time calls spent in Master_Script?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the highest average time that calls spent in Master_Script. The default is unselected.
Monitor Total Time Calls Spent in System Before Transfer to IVR	
Data Collection	

Parameter	How to Set It
Collect data for total time calls spent in system before transfer to IVR?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of seconds that calls spent in Contact Center Manager Server before being transferred to an Interactive Voice Response (IVR) system. The default is unselected.
Monitor Total Time Calls Spent in System Before Route Call Treatment	
Data Collection	
Collect data for total time calls spent in system before route call treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of seconds that calls spent in Contact Center Manager Server before receiving route call treatment. The default is unselected.
Monitor Average Time Calls Spent in System Before Route Call Treatment	
Event Notification	
Raise event if average time calls spent in system before route call treatment exceeds threshold?	Select **Yes** to raise an event if the average time that calls spent in Contact Center Manager Server before receiving route call treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum average time calls spent in system before route call treatment	Specify the highest average time that calls can spend in Contact Center Manager Server (before receiving route call treatment) before an event is raised. The default is 10 seconds.
Event severity when average time calls spent in system before route call treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the highest average time that calls spent in Contact Center Manager Server (before receiving route call treatment) exceeds the threshold. The default is 25.
Data Collection	
Collect data for average time calls spent in system before route call treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the highest average time that calls spent in Contact Center Manager Server before receiving route call treatment. The default is unselected.

51.9 CallTreatments

Use this Knowledge Script to monitor the number and percentage of calls that receive several types of call treatments:

- Broadcast
- Default
- Force Busy
- Force Disconnect
- Force Overflow
- Host Lookup
- IVR
- Music
- RAN
- Route Call

This script raises an event if a threshold is exceeded. In addition, this script generates data streams for each metric. For more information, see "Reviewing Call Metric Definitions" on page 3176.

Not every data stream is generated for each resource object for which this script is valid. The following table is a matrix for determining whether a data stream is generated for the resource object you are using.

	DNIS Object	Application Object
Calls Given Broadcast	No	Yes
% Calls Given Broadcast	No	Yes
Calls Given Default	Yes	Yes
% Calls Given Default	Yes	Yes
Calls Given Force Busy	Yes	Yes
% Calls Given Force Busy	Yes	Yes
Calls Given Force Disconnect	Yes	Yes
% Calls Given Force Disconnect	Yes	Yes
Calls Given Force Overflow	Yes	Yes
% Calls Given Force Overflow	Yes	Yes
Calls Given Host Lookup	No	Yes
% Calls Given Host Lookup	No	Yes
Calls Given IVR	No	Yes
% Calls Given IVR	No	Yes
Calls Given Music	No	Yes
% Calls Given Music	No	Yes
Calls Given RAN	No	Yes
% Calls Given RAN	No	Yes
Calls Given Route Call	Yes	Yes
% Calls Given Route Call	Yes	Yes

The first time you run this script, it marks the time and date (a starting point) in the database. With subsequent iterations, the script monitors and collects data based on changes in the database since the last time the script ran.

51.9.1 Understanding How Datastreams Are Calculated

AppManager retrieves all of its call and agent statistics from the database on the Contact Center Manager Server. However, not all of the statistics that users find necessary (such as percentage statistics) are available in raw form directly from the databases. AppManager must calculate the statistics to provide the data streams that each Knowledge Script generates.

The following table illustrates how each data stream is calculated:

Datastream	Description and Calculation
%CallsGivenBroadcast	Calculated from the number of calls given the broadcast treatment and the number of offered calls. `100 x (CallsGivenBroadcast/CallsOffered)`
%CallsGivenDefault	Calculated from the number of calls given the default treament and the number of offered calls. `100 x (CallsGivenDefault/CallsOffered)`
%CallsGivenForceBusy	Calculated from the number of calls given the force busy treatment and the number of offered calls. `100 x (CallsGivenForceBusy/CallsOffered)`
%CallsGivenForceDisconnect	Calculated from the number of calls given the force disconnect treatment and the number of offered calls. `100 x (CallsGivenForceDisconnect/CallsOffered)`
%CallsGivenForceOverflow	Calculated from the number of calls given the force overflow treatment and the number of offered calls. `100 x (CallsGivenForceOverflow/CallsOffered)`
%CallsGivenHostLookup	Calculated from the number of calls given the host lookup treatment and the number of offered calls. `100 x (CallsGivenHostLookup/CallsOffered)`
%CallsGivenIVR	Calculated from the number of calls given the IVR treatment and the number of offered calls. `100 x (CallsGivenIVR/CallsOffered)`
%CallsGivenMusic	Calculated from the number of calls given the music treatment and the number of offered calls. `100 x (CallsGivenMusic/CallsOffered)`
%CallsGivenRAN	Calculated from the number of calls given the recorded announcement treatment and the number of offered calls. `100 x (CallsGivenRAN/CallsOffered)`
%CallsGivenRouteTo	Calculated from the number of calls given the route call treatment and the number of offered calls. `100 x (CallsGivenRouteTo/CallsOffered)`

51.9.2 Resource Objects

- NT_NORTELCC_DNIS
- NT_NORTELCC_APPLICATION

51.9.3 Default Schedule

By default, this script runs every 15 minutes. Because monitoring and data collection do not occur during the first iteration of this script, do not select the "Run Once" schedule.

51.9.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CallTreatments job fails. The default is 5.
Raise event if SQL query fails?	Select **Yes** to raise an event if the SQL query fails. The default is Yes. AppManager uses a SQL query to retrieve Contact Center Manager Server database configuration information.
Event severity when SQL query fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the SQL query fails to retrieve database configuration information. The default is 15.
Raise event if no new data is found?	Select **Yes** to raise an event if the agent data has not changed since the last time the script ran. The default is Yes.
Event severity when no new data is found	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the agent data has not changed since the last time the script ran. The default is 15.
Monitor Calls Given Broadcast Treatment	
Data Collection	
Collect data for calls given broadcast treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that received broadcast treatment during the monitoring period. The default is unselected.
Monitor Percentage of Calls Given Broadcast Treatment	
Event Notification	
Raise event if percentage of calls given broadcast treatment exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that received broadcast treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls given broadcast treatment	Specify the maximum percentage of calls that must receive broadcast treatment before an event is raised. The default is 70%.

Parameter	How to Set It
Event severity when percentage of calls given broadcast treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that received broadcast treatment exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls given broadcast treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that received broadcast treatment during the monitoring period. The default is unselected.
Monitor Calls Given Default Treatment	
Data Collection	
Collect data for calls given default treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that received default treatment during the monitoring period. The default is unselected.
Monitor Percentage of Calls Given Default Treatment	
Event Notification	
Raise event if percentage of calls given default treatment exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that received default treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls given default treatment	Specify the maximum percentage of calls that can receive default treatment before an event is raised. The default is 70%.
Event severity when percentage of calls given default treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that received default treatment exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls given default treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that received default treatment during the monitoring period. The default is unselected.
Monitor Calls Given Force Busy Treatment	
Data Collection	
Collect data for calls given force busy treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls that received force busy treatment during the monitoring period. The default is unselected.
Monitor Percentage of Calls Given Force Busy Treatment	
Event Notification	
Raise event if percentage of calls given force busy treatment exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that received force busy treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls given force busy treatment	Specify the maximum percentage of calls that can receive force busy treatment before an event is raised. The default is 70%.

Parameter	How to Set It
Event severity when percentage of calls given force busy treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that received force busy treatment exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls given force busy treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that received force busy treatment during the monitoring period. The default is unselected.
Monitor Calls Given Force Disconnect Treatment	
Data Collection	
Collect data for calls given force disconnect treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of calls that received force disconnect treatment during the monitoring period. The default is unselected.
Monitor Percentage of Calls Given Force Disconnect Treatment	
Event Notification	
Raise event if percentage of calls given force disconnect treatment exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that received force disconnect treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls given force disconnect treatment	Specify the maximum percentage of calls that can receive force disconnect treatment before an event is raised. The default is 70%.
Event severity when percentage of calls given force disconnect treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that received force disconnect treatment exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls given force disconnect treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that received force disconnect treatment during the monitoring period. The default is unselected.
Monitor Calls Given Force Overflow Treatment	
Data Collection	
Collect data for calls given force overflow treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of calls that received force overflow treatment during the monitoring period. The default is unselected.
Monitor Percentage of Calls Given Force Overflow Treatment	
Event Notification	
Raise event if percentage of calls given force overflow treatment exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that received force overflow treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls given force overflow treatment	Specify the maximum percentage of calls that can receive force overflow treatment before an event is raised. The default is 70%.

Parameter	How to Set It
Event severity when percentage of calls given force overflow treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that received force overflow treatment exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls given force overflow treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that received force overflow treatment during the monitoring period. The default is unselected.
Monitor Calls Given Host Lookup Treatment	
Data Collection	
Collect data for calls given host lookup treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of calls that received host lookup treatment during the monitoring period. The default is unselected.
Monitor Percentage of Calls Given Host Lookup Treatment	
Event Notification	
Raise event if percentage of calls given host lookup treatment exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that received host lookup treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls given host lookup treatment	Specify the maximum percentage of calls that can receive host lookup treatment before an event is raised. The default is 70%.
Event severity when percentage of calls given host lookup treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that received host lookup treatment exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls given host lookup treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that received host lookup treatment during the monitoring period. The default is unselected.
Monitor Calls Given IVR Treatment	
Data Collection	
Collect data for calls given IVR treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of calls that received IVR treatment during the monitoring period. The default is unselected.
Monitor Percentage of Calls Given IVR Treatment	
Event Notification	
Raise event if percentage of calls given IVR treatment exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that received IVR treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls given IVR treatment	Specify the maximum percentage of calls that can receive IVR treatment before an event is raised. The default is 70%.

Parameter	How to Set It
Event severity when percentage of calls given IVR treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that received IVR treatment exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls given IVR treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that received IVR treatment during the monitoring period. The default is unselected.
Monitor Calls Given Music Treatment	
Data Collection	
Collect data for calls given music treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of calls that received music treatment during the monitoring period. The default is unselected.
Monitor Percentage of Calls Given Music Treatment	
Event Notification	
Raise event if percentage of calls given music treatment exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that received music treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls given music treatment	Specify the maximum percentage of calls that can receive music treatment before an event is raised. The default is 70%.
Event severity when percentage of calls given music treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that received music treatment exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls given music treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that received music treatment during the monitoring period. The default is unselected.
Monitor Calls Given RAN Treatment	
Data Collection	
Collect data for calls given RAN treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of calls that received a recorded announcement during the monitoring period. The default is unselected.
Monitor Percentage of Calls Given RAN Treatment	
Event Notification	
Raise event if percentage of calls given RAN treatment exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that received a recorded announcement exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls given RAN treatment	Specify the maximum percentage of calls that can receive a recorded announcement before an event is raised. The default is 70%.

Parameter	How to Set It
Event severity when percentage of calls given RAN treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that received a recorded announcement exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls given RAN treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that received a recorded announcement during the monitoring period. The default is unselected.
Monitor Calls Given Route Call Treatment	
Data Collection	
Collect data for calls given route call treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total number of calls that received route call treatment during the monitoring period. The default is unselected.
Monitor Percentage of Calls Given Route Call Treatment	
Event Notification	
Raise event if percentage of calls given route call treatment exceeds threshold?	Select **Yes** to raise an event if the percentage of calls that received route call treatment exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of calls given route call treatment	Specify the maximum percentage of calls that can receive route call treatment before an event is raised. The default is 70%.
Event severity when percentage of calls given route call treatment exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that received route call treatment exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage of calls given route call treatment?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of calls that received route call treatment during the monitoring period. The default is unselected.

51.10 Database

Use this Knowledge Script to monitor free and used space in the Master, Blue, and Call-by-Call databases. This script raises an event if a value exceeds or falls below a threshold. In addition, this script generates data streams for the following metrics:

- Total free space
- Percentage of used space

51.10.1 Resource Object

NT_NORTELCC_DATABASE

51.10.2 Default Schedule

By default, this script runs every 15 minutes.

51.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Database job fails. The default is 5.
Raise event if SQL query fails?	Select **Yes** to raise an event if the SQL query fails. The default is Yes. AppManager uses a SQL query to retrieve Contact Center Manager Server database configuration information.
Event severity when SQL query fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the SQL query fails to retrieve database configuration information. The default is 15.
Raise event if no new data is found?	Select **Yes** to raise an event if database data has not changed since the last time the script ran. The default is Yes.
Event severity when no new data is found	Set the event severity level, from 1 to 40, to reflect the importance of an event in which database data has not changed since the last time the script ran. The default is 15.
Monitor Free Space	
Data Collection	
Collect data for free space?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total amount of free disk space on the databases. The default is unselected.
Monitor Percentage Used Space	

Parameter	How to Set It
Event Notification	
Raise event if percentage used space exceeds threshold?	Select **Yes** to raise an event if the percentage of used disk space exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage used space	Specify the maximum percentage of disk space that can be used before an event is raised. The default is 90%.
Event severity when percentage used space exceeds threshold.	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of used disk space exceeds the threshold. The default is 25.
Data Collection	
Collect data for percentage used space?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of used disk space for the databases. The default is unselected.

51.11 HealthCheck

Use this Knowledge Script to monitor the availability of services on the Contact Center Manager Server server. This script raises an event if a service is unavailable. In addition, this script can generate data streams for service availability.

This script can monitor the services listed in the following table. All but two, Host Application Integration and TAO NT Naming Service, are monitored by default. Nortel does not consider these two services to be critical. Refer to your Nortel Symposium Call Center documentation (*Installation and Maintenance Guide for Windows 2000* and *Installation and Maintenance Guide for Windows 2003*) to determine the relevancy of the other monitored services in your Contact Center Manager Server environment.

Use the Services to monitor parameters to select and deselect services as appropriate for your installation of Contact Center Manager Server. If your initial selection does not suit your needs, simply rerun this script until you are monitoring an ideal combination of services.

AUDIT_Service	DBNotifier_Service	EB_Service
ES_Service	HDC_Service	HDM_Service
Host Application Integration	IceEmHlpService	IceRTDService
IS_Service	MAS Backup/Restore	MAS Configuration Manager
MAS Event Scheduler	MAS Fault Manager	MAS LinkHandler Port #2
MAS OM Server	MAS Security	MAS Service Daemon
MAS Service Manager	MAS Time Service	MLSM_Service
NBNM_Service	NBTSM_Service	NCCOAM_Service
NDLOAM_Service	NITSM_Service	OAM_Service
pcAnywhere Host Service	RDC_Service	RSM_Service
SDMCA_Service	SDP_Service	Sybase BCKServer
Sybase MONServer	Sybase SQLServer	Sybase XPServer
SymposiumWC	TAO NT Naming Service	TFA_Service
TFABridge_Service	TFE_Service	VSM_Service

51.11.1 Resource Object

NortelCC_SCCS

51.11.2 Default Schedule

By default, this script runs every minute.

51.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the HealthCheck job fails. The default is 5.

Parameter	How to Set It
Raise event if a service is not found?	Select **Yes** to raise an event if a monitored service cannot be found on the Contact Center Manager Server. The default is Yes. Use the Services to Monitor parameters to select the services that you want to monitor.
Event severity when a service is not found	Set the severity level, from 1 to 40, to indicate the importance of an event in which a monitored service cannot be found on the Contact Center Manager Server. The default is 25.
Monitor Service Availability	
Event Notification	
Raise event if a service is down?	Select **Yes** to raise an event if a monitored service is unavailable. The default is Yes. Use the Services to Monitor parameters to select the services that you want to monitor.
Event severity when a service is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which a monitored service is unavailable. The default is 25.
Data Collection	
Collect data for service availability?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the availability of specified services. The default is unselected.
Services to Monitor	
Monitor ...	Select **Yes** to monitor any combination of the listed services. By default, all services are monitored except Host Application Integration and TAO NT Naming Service.

51.12 SkillsetTimes

Use this Knowledge Script to monitor the amount of time that Contact Center Manager Server skillsets spent in the following states:

- Active Time
- All Agents Busy Time
- Staffed Time

This script raises an event if the amount of time in any state exceeds the threshold that you set. In addition, this script generates data streams for the percentage of time and total number of minutes that a skillset spent in a particular state.

A *skillset* is a component of skill-based routing, which matches contacts to the most qualified Contact Center Manager Server agent. The most qualified agent is the agent with the appropriate skillset or unique abilities for handling the type of call or contact.

51.12.1 Resource Object

NT_NORTELCC_APPSKILLSET

The TreeView pane of the Operator Console contains Application and Skillset objects under the NortelCC object. Within the Application and Skillset object folders are Application/Skillset (AppSkillset) pairs. The same pairs are represented within the Application and Skillset object folders. Their placement within the Application and Skillset folders allows you to search for a particular pair by either Application or Skillset. You can drop this Knowledge Script on a pair in either location.

51.12.2 Default Schedule

By default, this script runs every 15 minutes.

51.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SkillsetTimes job fails. The default is 5.
Raise event if SQL query fails?	Select **Yes** to raise an event if the SQL query fails. The default is Yes. AppManager uses a SQL query to retrieve Contact Center Manager Server database configuration information.
Event severity when SQL query fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the SQL query fails to retrieve database configuration information. The default is 15.

Parameter	How to Set It
Raise event if no new data found?	Select **Yes** to raise an event if skillset data has not changed since the last time the script ran. The default is Yes.
Event severity when no new data found	Set the event severity level, from 1 to 40, to reflect the importance of an event in which skillset data has not changed since the last time the script ran. The default is 15.
Monitor Total Active Time	
Data Collection	
Collect data for total Active time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of minutes that skillsets spent in the Active state during the monitoring period. The default is unselected.
Monitor Total All Agents Busy Time	
Data Collection	
Collect data for total All Agents Busy time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of minutes that skillsets spent in the All Agents Busy state during the monitoring period. The default is unselected.
Monitor Percentage of Time All Agents Busy	
Event Notification	
Raise event if percentage of time All Agents Busy exceeds threshold?	Select **Yes** to raise an event if the percentage of time that skillsets spent in the All Agents Busy state exceeds the threshold that you set. The default is Yes.
Threshold - Maximum percentage of time All Agents Busy	Specify the maximum percentage of time that skillsets can spend in the All Agents Busy state before an event is raised. The default is 70%.
Event severity when percentage of time All Agents Busy exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of time that skillsets spent in the All Agents Busy state exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for percentage of time All Agents Busy?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of time that skillsets spent in the All Agents Busy state during the monitoring period. The default is unselected.
Monitor Total Staffed Time	
Data Collection	
Collect data for total Staffed time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of minutes that skillsets spent in the Staffed state during the monitoring period. The default is unselected.

51.13 SystemUsage

Use this Knowledge Script to monitor Contact Center Manager Server usage of system resources: CPU, interrupts, page faults, committed bytes, CLAN, and ELAN. This script raises an event if a value exceeds the threshold that you set.

This script generates data streams for the following metrics:

- CPU utilization: average and instantaneous (%)
- Interrupts per second (#)
- Committed bytes (%) as a percentage of the commit limit
- CLAN utilization (%). CLAN is the network used to communicate application information between the Contact Center Manager Server and customer applications.
- ELAN utilization (%). ELAN is the network used to communicate management information between the Contact Center Manager Server, the Call Pilot server, and the Nortel Communications Server switch.

51.13.1 Resource Object

NT_NortelCC_SCCS

51.13.2 Default Schedule

By default, this script runs every minute.

51.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SystemUsage job fails. The default is 5.
Raise event if an error occurs reading a perfmon counter?	Select **Yes** to raise an event if the script encounters a problem in reading the Performance Monitor counter for a particular metric. The default is Yes.
Event severity when an error occurs reading a perfmon counter	Set the severity level, from 1 to 40, to indicate the importance of an event in which the script encountered a problem in reading the Performance Monitor counter for a particular metric. The default is 40.
Raise event if a perfmon counter is invalid or unusable?	Select **Yes** to raise an event if the Performance Monitor counter for a particular metric is invalid or unusable. The default is Yes.

Parameter	How to Set It
Event severity when a perfmon counter is invalid or unusable	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Performance Monitor counter for a particular metric is invalid or unusable. The default is 40.
Raise event if a WMI error occurs	Select **Yes** to raise an event if the script encounters a WMI (Windows Management Instrumentation) error. The default is Yes. This script uses WMI to retrieve performance metrics from the Windows operating system.
Event severity when a WMI error occurs	Set the severity level, from 1 to 40, to indicate the importance of an event in which the script encounters a WMI error. The default is 40.
Monitor Instantaneous CPU Utilization	
Event Notification	
Raise event if instantaneous CPU utilization exceeds threshold?	Select **Yes** to raise an event if the percentage of instantaneous CPU utilization exceeds the threshold that you set. The default is Yes. Instantaneous CPU utilization is the value at the moment the data was collected.
Threshold - Maximum instantaneous CPU utilization	Specify the maximum percentage of instantaneous CPU utilization that can occur before an event is raised. The default is 99%.
Event severity when instantaneous CPU utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of instantaneous CPU utilization exceeds the threshold. The default is 25.
Data Collection	
Collect data for instantaneous CPU utilization?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of instantaneous CPU utilization for the monitoring period. The default is unselected.
Monitor Average CPU Utilization	
Event Notification	
Raise event if average CPU utilization exceeds threshold?	Select **Yes** to raise an event if the percentage of average CPU utilization exceeds the threshold that you set. The default is Yes.
Threshold - Maximum average CPU utilization	Specify the maximum percentage of average CPU utilization that can occur before an event is raised. The default is 50%.
Event severity when average CPU utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of average CPU utilization exceeds the threshold. The default is 25.
Data Collection	
Collect data for average CPU utilization?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of average CPU utilization for the monitoring period. The default is unselected.
Monitor Interrupts Per Second	
Event Notification	
Raise event if interrupts per second exceed threshold?	Select **Yes** to raise an event if the number of interrupts that occur per second exceeds the threshold that you set. The default is Yes.
Threshold - Maximum interrupts per second	Specify the maximum number of interrupts that can occur per second before an event is raised. The default is 3000 interrupts.

Parameter	How to Set It
Event severity when interrupts per second exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of interrupts that occur per second exceeds the threshold. The default is 25.
Data Collection	
Collect data for interrupts per second?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of interrupts that occurred per second during the monitoring period. The default is unselected.
Monitor Committed Bytes as Percentage of Commit Limit	
Event Notification	
Raise event if committed bytes as percentage of commit limit exceeds threshold?	Select **Yes** to raise an event if committed bytes (represented as a percentage of the commit limit) exceed the threshold that you set. The default is Yes. Committed bytes are those that have been allocated by processes. They are a measure of the demand for virtual memory. The commit limit is the amount of virtual memory, in bytes, that can be committed without having to extend the paging files.
Threshold - Maximum committed bytes as percentage of commit limit	Specify the maximum percentage of committed bytes that can occur before an event is raised. The default is 90%.
Event severity when committed bytes as percentage of commit limit exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of committed bytes exceeds the threshold. The default is 25.
Data Collection	
Collect data for committed bytes as percentage of commit limit?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of committed bytes for the monitoring period. The default is unselected.
Monitor CLAN Utilization	
Event Notification	
Raise event if CLAN utilization exceeds threshold?	Select **Yes** to raise an event if the percentage of CLAN utilization exceeds the threshold that you set. The default is Yes.
Threshold - Maximum CLAN utilization	Specify the maximum percentage of CLAN utilization that can occur before an event is raised. The default is 30%.
Event severity when CLAN utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of CLAN utilization exceeds the threshold. The default is 25.
Data Collection	
Collect data for CLAN utilization?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of CLAN utilization for the monitoring period. The default is unselected.
Monitor ELAN Utilization	
Event Notification	
Raise event if ELAN utilization exceeds threshold?	Select **Yes** to raise an event if the percentage of ELAN utilization exceeds the threshold that you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum ELAN utilization	Specify the maximum percentage of ELAN utilization that can occur before an event is raised. The default is 30%.
Event severity when ELAN utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of ELAN utilization exceeds the threshold. The default is 25.
Data Collection	
Collect data for ELAN utilization?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of ELAN utilization for the monitoring period. The default is unselected.

51.14 Reviewing Call Metric Definitions

AppManager for Nortel CC collects the following call metrics from the Contact Center Manager Server database, the Control Directory Number (CDN), the Dialed Number Identification Service (DNIS), IVR ports, IVR queues, and application-skillset pairs.

Metric	Description
Abandoned call wait time	The amount of time that a local or incoming network DNIS call waited before being abandoned. Or the total and average wait time experienced by all calls abandoned or pulled back from an IVR queue. *Or* the total wait time experienced by calls abandoned while in queue for a skillset.
Abandoned calls	The number and percentage of local and incoming network calls abandoned by the CDN, including local calls networked out and abandoned or terminated at the destination site. A call is considered abandoned when the caller hangs up before an agent answers. Or the number and percentage of abandoned local and incoming network DNIS calls. Or the number and percentage of calls abandoned or pulled back while waiting in an IVR queue. *Or* the number and percentage of calls abandoned while in queue for a skillset. This metric does not include calls abandoned while being presented to an agent.
Active time	The total time that a skillset is in service. A skillset is in service when it is not in Out of Service mode and at least one agent is logged in.
Agent time	The total time spent by all agents on local and incoming network DNIS calls, including hold time.
All Agents Busy time	The amount and percentage of time that all agents assigned to a skillset are busy with contacts (calls) or when no agents are logged in.
Answered call wait time	The amount of time that a local or incoming network call waited before being answered. *Or* the amount of time that all local calls or incoming NSBR calls waited before being answered by a skillset.
Answered calls	The number and percentage of local and incoming network calls answered by the CDN, including local calls that have been networked out and answered by an agent or IVR at the destination site. Or the number and percentage of answered local and incoming network DNIS calls. Or the number and percentage of calls answered by an IVR port. Or the number and percentage of calls answered by an IVR queue. *Or* the number and percentage of calls answered by agents in a skillset.
Average abandoned delay	The average wait time experienced by abandoned local and incoming network calls.
Average answered delay	The average wait time experienced by answered local and incoming network calls.

Metric	Description
Calls abandoned after delay threshold	The number and percentage of abandoned local and incoming network calls that experienced a delay greater than or equal to the service level threshold for the DNIS number. You use the DNIS Properties property sheet to define the service level threshold. Or the number and percentage of calls abandoned or pulled back that experienced a delay greater than or equal to the service level threshold for the threshold class to which the IVR ACD-DN belongs. *Or* the number and percentage of calls abandoned while in queue for a skillset that experienced a delay greater than or equal to the service level threshold for the threshold class to which the skillset belongs.
Calls answered after delay threshold	The number and percentage of answered local and incoming network calls that experienced a delay greater than or equal to the service level threshold for the DNIS number. You use the DNIS Properties property sheet to define the service level threshold. Or the number and percentage of answered calls that experienced a delay greater than or equal to the service level threshold for the threshold class to which the IVR ACD-DN belongs. *Or* the number and percentage of calls answered while in queue for a skillset that experienced a delay greater than or equal to the service level threshold for the threshold class to which the skillset belongs.
Calls given broadcast treatment	The number and percentage of local and incoming network calls that were given broadcast treatment. Broadcast treatment occurs when the Give Controlled Broadcast Announcement script command is executed.
Calls given default treatment	The number and percentage of local and incoming network DNIS calls that were given default treatment. Default treatment occurs when a caller does not respond to any menu options. The phone call is then handled in whatever manner is configured as “default,” such as a transfer to an agent.
Calls given force busy treatment	The number and percentage of local and incoming network DNIS calls that were given force busy treatment. To subject a call to force busy treatment is to send the call a busy signal.
Calls given force disconnect treatment	The number and percentage of local and incoming network DNIS calls that were given force disconnect treatment. Force disconnect treatment is the disconnecting of a call from Contact Center Manager Server and returning it to a dial tone.
Calls given force overflow treatment	The number and percentage of local and incoming network DNIS calls that were given force overflow treatment. To subject a call to force overflow treatment is to send it a “fast busy” signal that indicates an error.
Calls given host lookup treatment	The number and percentage of local and incoming network calls for which data was obtained from a remote host.
Calls given IVR treatment	The number and percentage of local and incoming network calls transferred to an Interactive Voice Response (IVR) system.
Calls given music treatment	The number and percentage of local and incoming network calls given music treatment through a music route. Music treatment allows callers to hear music while they wait in queue.
Calls given RAN treatment	The number and percentage of local and incoming network calls that received a recorded announcement (RAN).

Metric	Description
Calls given route call treatment	The number and percentage of local and incoming network DNIS calls that were given route call treatment. Route call treatment is the transferring of a call out of Contact Center Manager Server, such as to an extension or an outside number.
Calls in Master_Script	The total and average time that calls spend in Master_Script, which is the first script executed for every call arriving at Contact Center Manager Server. A script is a set of instructions that relates to a particular type of call, caller, or set of calling conditions, such as time of day or day of week.
Calls networked out	The number and percentage of local calls that were routed to a remote site and then answered or abandoned.
Calls networked through an NACD queue	The number and percentage of local calls networked out through an NACD queue and answered at remote sites. An NACD queue can receive calls from another Contact Center Manager Server.
Calls routed over a non-ISDN trunk	The number and percentage of local calls that reached a non-ISDN trunk while being routed to a remote site.
Calls transferred from an IVR session	The number and percentage of local and incoming network DNIS calls that were transferred from an Interactive Voice Response system.
Committed bytes	Committed bytes are those that have been allocated by processes. They are a measure of the demand for virtual memory. AppManager reflects committed bytes as a percentage of the commit limit. The commit limit is the amount of virtual memory, in bytes, that can be committed without having to extend the paging files.
Conferenced calls	The number and percentage of calls conferenced out from an IVR port or an IVR queue.
CPU utilization	The instantaneous and average percentage of CPU utilization during the monitoring period. Instantaneous utilization is the value at the time the data was collected.
Digits collected	The number and percentage of calls that received IVR treatment and arrived at the CDN accompanied by data collected during the IVR session. Collected digits are those phone buttons pressed by the caller in response to IVR menu options.
Free space	The number of bytes of free space in the Contact Center Manager Server database. Or the percentage of database space that is free.
Idle time	The total amount of time that an IVR port is idle. An idle port is capable of accepting calls, but not actively doing so.
In use time	The amount and percentage of time that an IVR port is in use.
Offered calls	The number of local and incoming network calls offered to the CDN or a DNIS number. *Or* the number of calls offered to an IVR queue.
Logged on time	The total amount of time that an IVR port is logged on. This value is the sum of the Idle time and the In use time.
Maximum abandoned delay	The wait time experienced by the local or NSBR call that waited the longest before being abandoned while in queue for a skillset. This metric excludes DN, ACD, and NACD calls.
Maximum answered delay	The wait time experienced by the local or NSBR call that waited the longest before being answered or accepted. This metric excludes DN, ACD, and NACD calls.

Metric	Description
Not Ready time	The amount and percentage of time that an IVR port is in the Not Ready state. An IVR port that is Not Ready is incapable of accepting calls.
Staffed time	The amount and percentage of time that all skillsets spent in the Staffed state.
Terminated calls	The number and percentage of local and incoming network calls that terminated under one of the following conditions: • The call was given a Force Busy, Force Overflow, Force Disconnect, Route Call, or Default treatment. • The call reached a non-ISDN trunk while being routed to a remote site. • The call was transferred to an IVR queue. • The call was networked out through an NACD queue.
Transferred calls	The number and percentage of calls transferred out from an IVR port. Or the number and percentage of calls transferred out during an IVR session.
Used space	The number of bytes of used space in the Contact Center Manager Server database. Or the percentage of database space that is used.
Wait time	Both the total and average wait time experienced by all answered calls for an IVR queue.

52 NortelCS Knowledge Scripts

AppManager provides Knowledge Scripts that enable you to monitor CS1000 devices. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, select a Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
Alarms	Monitors the proxy agent computer for CS1000 alarms.
BMZ_CallQuality	Monitors call quality statistics for Bandwidth Management Zones (BMZs) for CS1000 versions 4.50 and later.
CallCapacity	Retrieves the call capacity utilization calculation from a Call Server for CS1000 versions 4.50 and 5.0.
GetOMReport	Retrieves the most recent Operational Management (OM) report and the report from the previous day, if one exists.
HealthCheck	Monitors the state of the Call Server, Media Gateway Controller, Signaling Server, MC32S, Network Routing Server, VGMC, and SIP Gateway.
PhoneInventory	Creates an inventory of IP phones based on data from the Call Server Entity MIB.
SS_CallQuality	Monitors Signaling Server statistics: jitter, latency, voice time, audio setups, and lost packets. This script also monitors R-factor for CS1000 versions 4.0 and later.
SS_H323Stats	Monitors Signaling Server H.323 trunk statistics: incoming voice and fax calls, and outgoing voice and fax calls.
