Event severity when threshold is breached	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded or not met. The default is 15.
Threshold - Maximum active transcoder resources	Specify the maximum number of transcoder resources that can be active before an event is raised. The default is 10 resources.
Threshold - Minimum available transcoder resources	Specify the minimum number of transcoder resources that must be available to prevent an event from being raised. The default is 2 resources.

19.140 TranscoderUnavailable

A transcoder is a device that takes the output stream of one codec and transcodes (converts) it from one compression type to another compression type. In CallManager, the transcoders convert between the G.711, G.723, and G.729 codecs.

Cisco CallManager invokes a transcoder on behalf of endpoint devices when the two devices are using different codecs. When inserted into a call, the transcoder converts the data streams between the different codecs, enabling communication between them.

Use this Knowledge Script to monitor the number of times that CallManager attempted to allocate a transcoder resource from one of the transcoder devices registered to this CallManager when none was available, either because all were in use or none was registered.

19.140.1 Resource Object

CCM Call Processor

19.140.2 Default Schedule

By default, this script runs every five minutes.

19.140.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if transcoder resources are unavailable?	Set to **y** to raise an event. if transcoder resources are unavailable. The default is y.
Collect data?	Set to **y** to collect data about unavailable transcoder resources for reports and graphs. The default is n.
Event severity when transcoder resources are unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of unavailable resource instances exceeds the threshold. The default is 10.
Threshold - Maximum unavailable resource instances	Specify the maximum number of times that transcoder resources can be unavailable before an event is raised. The default is 0 resources.

19.141 UnicastConfActive

Use this Knowledge Script to monitor the number of active Unicast software and hardware conferences. This script raises an event if the number of active conferences exceeds the threshold.

19.141.1 Resource Object

CCM Call Processor

19.141.2 Default Schedule

By default, this script runs every five minutes.

19.141.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if threshold is exceeded?	Set to **y** to raise an event if a the number of active hardware or software conferences exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data about active conferences for graphs and reports. The default is n.
Monitor active Unicast software conferences?	Set to **y** to monitor the number of active Unicast software conferences. The default is y
Threshold - Maximum active Unicast software conferences	Specify the maximum number of software conferences that can be active before an event is raised. The default is 50 conferences.
Monitor active Unicast hardware conferences?	Set to **y** to monitor the number of active Unicast hardware conferences. The default is y.
Threshold - Maximum active hardware conferences	Specify the maximum number of hardware conferences that can be active before an event is raised. The default is 50 conferences.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active hardware or software conferences exceeds the threshold. The default is 25.

19.142 UnicastConfAvailable

Use this Knowledge Script to monitor the number of new Unicast conferences that can be started. This script raises an event if the number of available hardware or software conferences falls below the threshold.

19.142.1 Resource Object

CCM Call Processor

19.142.2 Default Schedule

By default, this script runs every five minutes.

19.142.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if threshold is not met?	Set to **y** to raise an event if the number of available hardware or software conferences falls below the threshold. The default is y.
Collect data?	Set to **y** to collect data about available conferences for reports and graphs. The default is n.
Suppress event when Role is set to Backup?	Set to **y** to suppress event generation on CallManager resources whose role is set to "backup." The default is y. By suppressing event generation, you can run a script on all CallManager resources without raising an event on a resource that is not actively handling calls.
Monitor available Unicast software conferences?	Set to **y** to monitor the number of available Unicast software conferences. The default is y.
Threshold - Minimum available software conferences	Specify the minimum number of software conferences that must be available to prevent an event from being raised. The default is 3 conferences.
Monitor available Unicast hardware conferences?	Set to **y** to monitor the number of available Unicast hardware conferences. The default is y.
Threshold - Minimum available hardware conferences	Specify the minimum number of hardware conferences that must be available to prevent an event from being raised. The default is 3 conferences.
Event severity when threshold is not met	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of available hardware or software conferences falls below the threshold. The default is 15.

19.143 UnicastConfBridge_Device

Use this Knowledge Script to monitor the number of active and available resources for an individual Unicast software or hardware conference bridge device. This script also detects whether the Unicast device ran out of resources at any time during the specified interval.

19.143.1 Resource Objects

CCM Unicast Software Conference Bridge object

CCM Unicast Hardware Conference Bridge object

19.143.2 Default Schedule

By default, this script runs every 15 minutes.

19.143.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if threshold is breached?	Set to **y** to raise an event if a threshold is exceeded or not met. The default is y.
Collect data?	Set to **y** to collect data about active and available resources for graphs and reports. The default is n.
Event severity when resource threshold is breached	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a resource threshold is exceeded or not met. The default is 15.
Suppress event when Role is set to Backup?	Set to **y** to suppress event generation on CallManager resources whose role is set to "backup." The default is y. By suppressing event generation, you can run a script on all CallManager resources without raising an event on a resource that is not handling calls.
Threshold - Maximum active hardware resources	Specify the maximum number of conference bridge hardware resources that can be active (in use) before an event is raised. The default is 8 resources.
Threshold - Maximum active software resources	Specify the maximum number of conference bridge software resources that can be active (in use) before an event is raised. The default is 36 resources.
Threshold - Minimum available resources	Specify the minimum number of software and hardware resources that must be available to prevent an event from being raised. The default is 0 resources.
Monitor for active participants?	Set to n if you do not want to monitor or collect data for the number of active conference participants. The default is y.
Threshold - Maximum active participants	Specify the maximum number of participants that can be active before an event is raised. The default is 10.

Parameter	How to Set It
Event severity when active participants exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active participants exceeds the threshold. Set to 0 to ignore an active participant event. The default is 25.
Monitor for completed conferences?	Set to **n** if you do not want to monitor or collect data for the number of conferences completed during the interval. The default is y.
Threshold - Maximum completed conferences	Specify the maximum number of conferences that can have been completed since the last time this script ran. If the number of completed conferences exceeds this amount, an event is raised. The default is 20 conference. A conference is started when the first call is connected to the bridge. The conference is completed when the last call is disconnected from the bridge.
Event severity when completed conferences exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of completed conferences exceeds the threshold. Set to 0 to ignore a completed conference event. The default is 25.
Event severity when conference bridge device is out of resources	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the conference bridge device ran out of resources at least once during the interval. Set to 0 to ignore an out-of-resource event. The default is 25.

19.144 UnicastConfComplete

Use this Knowledge Script to monitor the number of Unicast conferences completed during an interval. This script raises an event if the number of completed hardware or software conferences exceeds the threshold.

The event message for the out-of-resources event contains the number of times that the device ran out of resources. Short messages, detailed event messages, and data stream headers will specify whether the device was a hardware or software conference bridge device.

19.144.1 Resource Object

CCM Call Processor

19.144.2 Default Schedule

By default, this script runs every five minutes.

19.144.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if completed conferences exceed the threshold?	Set to **y** to raise an event if the number of completed hardware and software conferences exceed the threshold. The default is y.
Collect data?	Set to **y** to collect data about completed conferences for graphs and reports. The default is n.
Monitor completed Unicast software conferences?	Set to **y** to monitor the number of completed Unicast software conferences. The default is y.
Threshold - Maximum completed software conferences	Specify the maximum number of software conferences that can be completed before an event is raised. The default is 50 conferences.
Monitor completed Unicast hardware conferences?	Set to **y** to monitor the number of completed Unicast hardware conferences. The default is y.
Threshold - Maximum completed hardware conferences	Set the threshold for the most hardware conferences that can be completed before an event is raised. The default is 50 conferences.
Event severity when completed conferences exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of completed hardware and software conferences exceed the threshold. The default is 25.

19.145 UnicastConfParticipants

Use this Knowledge Script to monitor the number of active Unicast participants. This script raises an event if the number of active software or hardware participants exceeds a threshold.

19.145.1 Resource Object

CCM Call Processor

19.145.2 Default Schedule

By default, this script runs every five minutes.

19.145.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if active participants exceed threshold?	Set to **y** to raise an event if the number of active software or hardware participants exceed a threshold. The default is y.
Collect data?	Set to **y** to collect data about active participants for graphs and reports. The default is n.
Monitor active Unicast software participants?	Set to **y** to monitor the number of active Unicast software participants. The default is y.
Threshold - Maximum active software participants	Specify the maximum number of software participants that can be active before an event is raised. The default is 100 participants.
Monitor active Unicast hardware participants?	Set to **y** to monitor the number of active Unicast hardware participants. The default is y.
Threshold - Maximum active hardware participants	Specify the maximum number of hardware participants that can be active before an event is raised. The default is 100 participants.
Event severity when active participants exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active software or hardware participants exceeds a threshold. The default is 25.

19.146 UnicastConfUnavailable

Use this Knowledge Script to monitor the number of times during an interval that a Unicast conference resource was requested when none was available. This script raises an event if the number exceeds the threshold.

19.146.1 Resource Object

CCM Call Processor

19.146.2 Default Schedule

By default, this script runs every five minutes.

19.146.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if threshold is exceeded?	Set to **y** to raise an event if the number of unavailable resource instances exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data about unavailable resources for graphs and reports. The default is n.
Monitor Unicast software conference unavailable resource instances?	Set to **y** to monitor the number of times that a Unicast software conference resource was unavailable. The default is y.
Threshold - Maximum software unavailable resource instances	Specify the maximum number of times that a software conference resource can be unavailable before an event is raised. The default is 0.
Monitor Unicast hardware conference unavailable resource instances?	Set to **y** to monitor the number of times that a Unicast hardware conference resource was unavailable. The default is y.
Threshold - Maximum hardware unavailable resource instances	Specify the maximum number of times that a hardware conference resource can be unavailable before an event is raised. The default is 0.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of unavailable resource instances exceeds the threshold. The default is 5.

19.147 VerifyPasswords

Use this Knowledge Script to verify the sa, Administrator, and Directory Manager passwords on a CallManager computer. Cisco CallManager requires these passwords to be the same for all computers in a cluster. You can run this script daily to monitor whether any password has changed. This script raises an event if a password cannot be verified.

Reasons other than an invalid password can prevent this script from verifying the password, such as services being down or connection failures.

19.147.1 Resource Object

CCM parent object

19.147.2 Default Schedule

By default, this script runs every 24 hours.

19.147.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if any verification fails or if all verifications succeed?	Set to **y** to raise an event if any password verification fails or if all verifications succeed. The default is y.
Event severity when any verification fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which any password verification attempt fails. The default is 15.
Event severity when all verifications succeed	Set the severity level, from 1 to 40, to indicate the importance of an event in which all password verification attempts succeed. Accept the default of **0** if you do not want to raise an event for this scenario.
Windows username	Provide the name of the Windows user whose password you want to verify. Leave this parameter blank to skip Windows verification. The default is Administrator.
Windows password	Provide the Windows password that you want to verify.
Domain name	Specify the domain name of the Windows user whose password you want to verify. Leave this parameter blank to use the name of the computer on which the script will be running. This parameter is optional if you are verifying a Windows password.
SQL username	Provide the user login account required to access the SQL Server database. Configure the login and password using AppManager Security Manager before running this script. On the SQL tab of Security Manager, provide the IP address or hostname of the **SQL Server** computer, as well as the **SQL Login Name** and **SQL Login password**. Leave this parameter blank to skip SQL verification. The default is sa.

Parameter	How to Set It
SQL password	SPecify the SQL password that you want to verify.
SQL Server name	Specify the name of the server where the user is to be verified. Leave this parameter blank to use the name of the computer on which the script will be running. This parameter is optional if you are verifying a SQL password.
SQL database name	Specify the name of the database for which the SQL password is to be verified. The default is master.
DC Directory username	SPecify the name of the DC Directory (LDAP) user whose password you want to verify. Leave this parameter blank to skip DC Directory verification. The default is Directory Manager.
DC Directory password	SPecify the DC Directory password that you want to verify.

19.148 Recommended Knowledge Script Groups

The several CiscoCallMgr Knowledge Scripts are members of recommended Knowledge Script Groups (KSG). The parameters of all scripts in the KSG are set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab and run the KSG on a CallManager resource.

NetIQ Corporation does not recommend you run large numbers of jobs all at the same time on one CallManager system. Running a large numbers of jobs that are collecting data and running at frequent intervals may impact the performance of the CallManager server. The Knowledge Scripts in the KSGs are optimized to run continually on CallManager systems with minimal performance impact.

The KSGs provide a "best practices" usage of AppManager for monitoring your CallManager environment. You can use these KSG with AppManager monitoring policies. A monitoring policy, which enables you to efficiently and consistently monitor all the resources in your environment, uses a set of pre-configured Knowledge Scripts to automatically monitor resources as they appear in the TreeView. For more information, see "About Policy-Based Monitoring" in the AppManager Help.

A KSG is composed of a subset of a module's Knowledge Scripts. The script that belongs to a KSG is a different copy of the original script you access from the CiscoCallMgr tab. If you modify a script that belongs to a KSG, the parameter settings of the original script in the CiscoCallMgr tab are not affected.

When deployed as part of a KSG, a script's default script parameter settings may differ from when the script is deployed alone. The default settings of a script within a group depend on its monitoring purpose within the larger group, and on the intended monitoring scope of that group.

If you modify or remove a script associated with the KSGs and want to restore it to its original form, you can reinstall the AppManager for Cisco CallManager module on the repository computer or check in the appropriate script from the AppManager\qdb\kp\CiscoCallMgr\RECOMMENDED directory.

19.148.1 Monitoring Scripts

You can find these scripts in a the **CiscoCallMgr** group on the RECOMMENDED tab of the Knowledge Script pane, or individually on the CiscoCallMgr tab.

- CallActivity
- CallsInProgress
- LossOfHardwarePhones
- CCM_HealthCheck
- CCM_HeartBeat
- CCM_RoleStatus
- CCM_SystemUsage
- CCM_WebPageCheck
- CiscoBackupStatus
- SQL_DBGrowthRate
- SQL_NearFileMaxSize
- SQL_RepTransactions
- TftpHeartBeat
- TftpRequests

19.148.2 Report Scripts

You can find these scripts in a the **CiscoCallMgr_Reports** group on the RECOMMENDED tab of the Knowledge Script pane, or individually on the CiscoCallMgr tab.

- Report_CallActivity
- Report_CallsByHour
- Report_ServicesAvailability
- Report_SystemUsage

20 CiscoUCM Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring resources for Cisco Unified Communications servers such as the Cisco Universal Presence Server (CUPS).

You can use this module in combination with the AppManager for Cisco Unified Communications Manager (CiscoCM) module. The AppManager for CiscoCM module provides monitoring for Cisco CUCM call managers. The AppManager for CiscoUCM module provides monitoring for additional Cisco Communications servers, such Cisco CUPS, which are not call managers.

From the Knowledge Script view of Control Center, you can access more information about any Knowledge Script by selecting it and clicking **Help**. In the Operator Console, select any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
CTIManager	Monitors the usage of the Cisco Unified Communications server CTI Manager.
CUPS_ActiveCalendarSubscriptions	Monitors the number of calendar subscriptions that are currently active on a Cisco Unified Presence server.
CUPS_ActiveIMSessions	Monitors the number of active instant message sessions between SIP and XMPP on a Cisco Unified Presence server.
CUPS_ActiveJsmSessions	Monitors the number of client emulation sessions between Presence Engine and Jabber Session Manager for a Cisco Unified Presence server.
CUPS_IncomingSIPSubscriptions	Monitors the number of active incoming subscriptions for a Cisco Unified Presence server.
CUPS_JsmFailedLogins	Monitors the total number of failed logins for the Jabber Session Manager on a Cisco Unified Presence server.
CUPS_JsmMsgsInLastSlice	Monitors the total messages in the last time slice for the Jabber Session Manager on a Cisco Unified Presence server.
CUPS_JsmOnlineUsers	Monitors the current number of online users being managed by the Jabber Session Manager component of a Cisco Unified Presence server.
CUPS_JsmTotalMessagePackets	Monitors the total message packets through the Jabber Session Manager on a Cisco Unified Presence server.
CUPS_OutgoingSIPSubscriptions	Monitors the number of active outgoing SIP subscriptions for a Cisco Unified Presence Server.
CUPS_TotalAdhocChatRooms	Monitors the total number of ad-hoc text conferencing rooms for a Cisco Unified Presence server.

Knowledge Script	What It Does
CUPS_TotalPersistentChatRooms	Monitors the total number of persistent text conferencing rooms for a Cisco Unified Presence Server.
ExtensionMobility	Monitors activity for the Extension Mobility application.
GeneralCounter	Monitors a user-specified Performance Monitor counter.
HealthCheck	Monitors the operational status of active services on Unified Communications servers.
SystemUpTime	Monitors the number of hours the Unified Communications server has been operational since its last reboot.
SystemUsage	Monitors CPU, memory, and disk usage for a Unified Communications server.
WebPageCheck	Monitors the availability of and round-trip time to the ccmadmin and ccmuser Web pages.
Recommended Knowledge Script Groups	Performs essential monitoring of your Cisco Unified Communications environment and Cisco Unified Presence Server environment.

20.1 CTIManager

Use the CiscoUCM_CTIManager Knowledge Script to monitor the activity and resource usage of the Computer Telephony Integration (CTI) Manager on a Cisco Unified Communications server.

This script raises an event if a value exceeds or falls below its threshold. In addition, this script generates data streams for the number of connected applications, open lines, open devices, and active Unified Communications links.

20.1.1 Resource Object

CiscoUCM_CTIMgrService

20.1.2 Default Schedule

By default, this script runs every 15 minutes.

20.1.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CTIManager job. The default is 5.
Monitor Connected Applications	
Event Notification	
Raise event if connected applications exceed threshold?	Select **Yes** to raise an event if the number of connected applications exceeds the threshold you set. The default is Yes.
Threshold - Maximum connected applications	Specify the maximum number of applications that must be connected before an event is raised. The default is 100 applications.
Event severity when connected applications exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of connected applications exceeds the threshold. The default is 15.
Data Collection	
Collect data for connected applications?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of applications connected at each script iteration. The default is unselected.
Monitor Open Lines	
Event Notification	
Raise event if open lines exceed threshold?	Select **Yes** to raise an event if the number of open lines exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum open lines	Specify the maximum number of lines that must be open before an event is raised. The default is 100 lines.
Event severity when open lines exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of open lines exceeds the threshold. The default is 15.
Data Collection	
Collect data for open lines?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of lines open at each script iteration. The default is unselected.
Monitor Open Devices	
Event Notification	
Raise event if open devices exceed threshold?	Select **Yes** to raise an event if the number of open devices exceeds the threshold you set. The default is Yes.
Threshold - Maximum open devices	Specify the maximum number of devices that must be open before an event is raised. The default is 100 devices.
Event severity when open devices exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of open devices exceeds the threshold. The default is 15.
Data Collection	
Collect data for open devices?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of devices open at each script iteration. The default is unselected.
Monitor Active Communications Links	
Event Notification	
Raise event if active Communications links fall below threshold?	Select **Yes** to raise an event if the number of active Unified Communications links falls below the threshold you set. The default is Yes.
Threshold - Minimum active Communications links	Specify the minimum number of Unified Communications links that must be active before an event is raised. The default is one link.
Event severity when active Communications links fall below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active Unified Communications links falls below the threshold. The default is 15.
Data Collection	
Collect data for active Communications links?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of Unified Communications links active at each script iteration. The default is unselected.

20.2 CUPS_ActiveCalendarSubscriptions

Use the CiscoUCM_CUPS_ActiveCalendarSubscriptions Knowledge Script to monitor the number of calendar subscriptions that are currently active on a Cisco Unified Presence server.

This script raises an event if a counter or instance is not accessible, or if the current number of calendar subscriptions exceeds a threshold you set. The script also raises an event if the delta value for calendar subscriptions (the amount of present subscriptions minus previous subscriptions) exceeds a threshold. In addition, this script collects data for current and delta values.

20.2.1 Resource Object

CiscoUCM_CMServer

20.2.2 Default Schedule

By default, this script runs every five minutes.

20.2.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CUPS_ActiveCalendarSubscriptions job. The default is 5.
Counter Specifications	
Name of the object to monitor	Specify the name of the object you want to monitor. The default is Cisco Presence Engine.
Name of the counter to monitor	Specify the name of the performance counter you want to monitor for calendar subscriptions. The default is ActiveCalendarSubscriptions.
Name of the instance to monitor	Specify the name or names of the Unified Presence server instances you want to monitor for calendar subscriptions. Separate multiple instance names with commas.
Raise event if counter or instance not found?	Select **Yes** to raise an event if the script cannot find the specified counter or instance. The default is Yes.
Event severity when counter or instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the specified counter or instance. The default is 25.
Monitor Current Value	
Event Notification	
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the number of current calendar subscriptions exceeds the threshold you set. The default is unselected.

Parameter	How to Set It
Threshold - Maximum current value	Specify the maximum number of current calendar subscriptions that must exist before an event is raised. The default is 500 subscriptions.
Event severity when current value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of current calendar subscriptions exceeds the threshold. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data about the number of current calendar subscriptions for charts and reports. The default is Yes.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold?	Select **Yes** to raise an event if the delta value for calendar subscriptions (the amount of present subscriptions minus previous subscriptions) exceeds the threshold you set. The default is unselected.
Threshold - Maximum delta value	Specify the maximum delta value for calendar subscriptions that must exist before an event is raised. The default is 100 subscriptions.
Event severity when delta value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the delta value for calendar subscriptions exceeds the threshold. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data about the delta value for current calendar subscriptions for charts and reports. The default is unselected.

20.3 CUPS_ActiveIMSessions

Use the CiscoUCM_CUPS_ActiveIMSessions Knowledge Script to monitor the number of active instant message sessions between SIP and XMPP on a Cisco Unified Presence server.

This script raises an event if a counter or instance is not accessible, or if the current number of active instant message sessions exceeds a threshold you set. The script also raises an event if the delta value for active instant message sessions (the amount of present subscriptions minus previous subscriptions) exceeds a threshold. In addition, this script collects data for current and delta values.

20.3.1 Resource Object

CiscoUCM_CMServer

20.3.2 Default Schedule

By default, this script runs every five minutes.

20.3.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CUPS_ActiveIMSessions job. The default is 5.
Counter Specifications	
Name of the object to monitor	Specify the name of the object you want to monitor. The default is Cisco Presence Engine.
Name of the counter to monitor	Specify the name of the performance counter you want to monitor for active instant message sessions. The default is ActiveIMSessions.
Name of the instance to monitor	Specify the name or names of the Unified Presence server instances you want to monitor for active instant message sessions. Separate multiple instance names with commas.
Raise event if counter or instance not found?	Select **Yes** to raise an event if the script cannot find the specified counter or instance. The default is Yes.
Event severity when counter or instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the specified counter or instance. The default is 25.
Monitor Current Value	
Event Notification	
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the number of current active instant message sessions exceeds the threshold you set. The default is unselected.

Parameter	How to Set It
Threshold - Maximum current value	Specify the maximum number of current active instant message sessions that must exist before an event is raised. The default is 500 sessions.
Event severity when current value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of current active instant message sessions exceeds the threshold. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data about the number of current active instant message sessions for charts and reports. The default is Yes.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold?	Select **Yes** to raise an event if the delta value for active instant message sessions (the amount of present sessions minus previous sessions) exceeds the threshold you set. The default is unselected.
Threshold - Maximum delta value	Specify the maximum delta value for active instant message sessions that must exist before an event is raised. The default is 100 sessions.
Event severity when delta value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the delta value for active instant message sessions exceeds the threshold. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data about the delta value for current active instant message sessions for charts and reports. The default is unselected.

20.4 CUPS_ActiveJsmSessions

Use the CiscoUCM_CUPS_ActiveJsmSessions Knowledge Script to monitor the number of client emulation sessions between Presence Engine and Jabber Session Manager on a Cisco Unified Presence server.

This script raises an event if a counter or instance is not accessible, or if the current number of client emulation sessions exceeds a threshold you set. The script also raises an event if the delta value for client emulation sessions (the amount of present subscriptions minus previous subscriptions) exceeds a threshold. In addition, this script collects data for current and delta values.

20.4.1 Resource Object

CiscoUCM_CMServer

20.4.2 Default Schedule

By default, this script runs every five minutes.

20.4.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CUPS_ActiveJsmSessions job. The default is 5.
Counter Specifications	
Name of the object to monitor	Specify the name of the object you want to monitor. The default is Cisco Presence Engine.
Name of the counter to monitor	Specify the name of the performance counter you want to monitor for client emulation sessions. The default is ActiveJsmSessions.
Name of the instance to monitor	Specify the name or names of the Unified Presence server instances you want to monitor for client emulation sessions. Separate multiple instance names with commas.
Raise event if counter or instance not found?	Select **Yes** to raise an event if the script cannot find the specified counter or instance. The default is Yes.
Event severity when counter or instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the specified counter or instance. The default is 25.
Monitor Current Value	
Event Notification	

Parameter	How to Set It
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the number of current client emulation sessions exceeds the threshold you set. The default is unselected.
Threshold - Maximum current value	Specify the maximum number of current client emulation sessions that must exist before an event is raised. The default is 500 sessions.
Event severity when current value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of current client emulation sessions exceeds the threshold. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data about the number of current client emulation sessions for charts and reports. The default is Yes.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold?	Select **Yes** to raise an event if the delta value for client emulation sessions (the amount of present sessions minus previous sessions) exceeds the threshold you set. The default is unselected.
Threshold - Maximum delta value	Specify the maximum delta value for client emulation sessions that must exist before an event is raised. The default is 100 sessions.
Event severity when delta value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the delta value for client emulation sessions exceeds the threshold. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data about the delta value for current client emulation sessions for charts and reports. The default is unselected.

20.5 CUPS_IncomingSIPSubscriptions

Use the CiscoUCM_CUPS_IncomingSIPSubscriptions Knowledge Script to monitor the number of incoming SIP subscriptions that are currently active on a Cisco Unified Presence server.

This script raises an event if a counter or instance is not accessible, or if the current number of incoming SIP subscriptions exceeds a threshold you set. The script also raises an event if the delta value for incoming SIP subscriptions (the amount of present subscriptions minus previous subscriptions) exceeds a threshold. In addition, this script collects data for current and delta values.

20.5.1 Resource Object

CiscoUCM_CMServer

20.5.2 Default Schedule

By default, this script runs every five minutes.

20.5.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CUPS_IncomingSIPSubscriptions job. The default is 5.
Counter Specifications	
Name of the object to monitor	Specify the name of the object you want to monitor. The default is Cisco XCP SIP S2S.
Name of the counter to monitor	Specify the name of the performance counter you want to monitor for incoming SIP subscriptions. The default is SIPS2SSubscriptionsIn.
Name of the instance to monitor	Specify the name or names of the Unified Presence server instances you want to monitor for incoming SIP subscriptions. Separate multiple instance names with commas.
Raise event if counter or instance not found?	Select **Yes** to raise an event if the script cannot find the specified counter or instance. The default is Yes.
Event severity when counter or instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the specified counter or instance. The default is 25.
Monitor Current Value	
Event Notification	
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the number of current incoming SIP subscriptions exceeds the threshold you set. The default is unselected.

Parameter	How to Set It
Threshold - Maximum current value	Specify the maximum number of current incoming SIP subscriptions that must exist before an event is raised. The default is 500 subscriptions.
Event severity when current value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of current incoming SIP subscriptions exceeds the threshold. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data about the number of current incoming SIP subscriptions for charts and reports. The default is Yes.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold?	Select **Yes** to raise an event if the delta value for incoming SIP subscriptions (the amount of present subscriptions minus previous subscriptions) exceeds the threshold you set. The default is unselected.
Threshold - Maximum delta value	Specify the maximum delta value for incoming SIP subscriptions that must exist before an event is raised. The default is 100 subscriptions.
Event severity when delta value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the delta value for incoming SIP subscriptions exceeds the threshold. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data about the delta value for current incoming SIP subscriptions for charts and reports. The default is unselected.

20.6 CUPS_JsmFailedLogins

Use the CiscoUCM_CUPS_JsmFailedLogins Knowledge Script to monitor the number of failed logins for the Jabber Session Manager on a Cisco Unified Presence server.

This script raises an event if a counter or instance is not accessible, or if the current number of failed logins exceeds a threshold you set. The script also raises an event if the delta value for incoming failed logins (the amount of present failed logins minus previous amount of failed logins) exceeds a threshold. In addition, this script collects data for current and delta values.

20.6.1 Resource Object

CiscoUCM_CMServer

20.6.2 Default Schedule

By default, this script runs every five minutes.

20.6.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CUPS_JsmFailedLogins job. The default is 5.
Counter Specifications	
Name of the object to monitor	Specify the name of the object you want to monitor. The default is Cisco XCP JSM.
Name of the counter to monitor	Specify the name of the performance counter you want to monitor for failed logins. The default is JsmFailedLogins.
Name of the instance to monitor	Specify the name or names of the Unified Presence server instances you want to monitor for failed logins. Separate multiple instance names with commas.
Raise event if counter or instance not found?	Select **Yes** to raise an event if the script cannot find the specified counter or instance. The default is Yes.
Event severity when counter or instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the specified counter or instance. The default is 25.
Monitor Current Value	
Event Notification	
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the number of current failed logins exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum current value	Specify the maximum number of current failed logins that must exist before an event is raised. The default is 1 failed login sessions.
Event severity when current value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of current failed logins exceeds the threshold. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data about the number of current failed logins for charts and reports. The default is Yes.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold?	Select **Yes** to raise an event if the delta value for failed logins (the amount of present logins minus previous logins) exceeds the threshold you set. The default is Yes.
Threshold - Maximum delta value	Specify the maximum delta value for failed logins that must exist before an event is raised. The default is 10 failed logins.
Event severity when delta value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the delta value for failed logins exceeds the threshold. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data about the delta value for current failed logins for charts and reports. The default is unselected.

20.7 CUPS_JsmMsgsInLastSlice

Use the CiscoUCM_CUPS_JsmMsgsInLastSlice Knowledge Script to monitor the total messages in the last time slice for the Jabber Session Manager on a Cisco Unified Presence server.

This script raises an event if a counter or instance is not accessible, or if the current number of messages in the last time slice exceeds a threshold you set. The script also raises an event if the delta value for messages in the last time slice (the amount of present messages minus previous amount of messages) exceeds a threshold. In addition, this script collects data for current and delta values.

20.7.1 Resource Object

CiscoUCM_CMServer

20.7.2 Default Schedule

By default, this script runs every five minutes.

20.7.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CUPS_JsmMsgsInLastSlice job. The default is 5.
Counter Specifications	
Name of the object to monitor	Specify the name of the object you want to monitor. The default is Cisco XCP JSM.
Name of the counter to monitor	Specify the name of the performance counter you want to monitor for messages in the last time slice. The default is JsmMsgsInLastSlice.
Name of the instance to monitor	Specify the name or names of the Unified Presence server instances you want to monitor for messages in the last time slice. Separate multiple instance names with commas.
Raise event if counter or instance not found?	Select **Yes** to raise an event if the script cannot find the specified counter or instance. The default is Yes.
Event severity when counter or instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the specified counter or instance. The default is 25.
Monitor Current Value	
Event Notification	
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the number of total messages in the last time slice exceeds the threshold you set. The default is unselected.

Parameter	How to Set It
Threshold - Maximum current value	Specify the maximum number of total messages in the last time slice that must exist before an event is raised. The default is 500 messages.
Event severity when current value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of total messages in the last time slice exceeds the threshold. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data about the number of current total messages in the last time slice for charts and reports. The default is Yes.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold?	Select **Yes** to raise an event if the delta value for total messages in the last time slice (the amount of present messages in the last time slice minus previous messages) exceeds the threshold you set. The default is unselected.
Threshold - Maximum delta value	Specify the maximum delta value for total messages in the last time slice that must exist before an event is raised. The default is 100 total messages in the last time slice.
Event severity when delta value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the delta value for total messages in the last time slice exceeds the threshold. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data about the delta value for current total messages in the last time slice for charts and reports. The default is unselected.

20.8 CUPS_JsmOnlineUsers

Use the CiscoUCM_CUPS_JsmOnlineUsers Knowledge Script to monitor the number of online users being managed by the Jabber Session Manager component of a Cisco Unified Presence server.

This script raises an event if a counter or instance is not accessible, or if the current number of online users being managed by Jabber Session Manager exceeds a threshold you set. The script also raises an event if the delta value for online users in the last time slice (the amount of present online users minus previous amount of online users) exceeds a threshold. In addition, this script collects data for current and delta values.

20.8.1 Resource Object

CiscoUCM_CMServer

20.8.2 Default Schedule

By default, this script runs every five minutes.

20.8.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CUPS_JsmOnlineUsers job. The default is 5.
Counter Specifications	
Name of the object to monitor	Specify the name of the object you want to monitor. The default is Cisco XCP JSM.
Name of the counter to monitor	Specify the name of the performance counter you want to monitor for online users. The default is JsmOnlineUsers.
Name of the instance to monitor	Specify the name or names of the Unified Presence server instances you want to monitor for online users. Separate multiple instance names with commas.
Raise event if counter or instance not found?	Select **Yes** to raise an event if the script cannot find the specified counter or instance. The default is unselected.
Event severity when counter or instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the specified counter or instance. The default is 25.
Monitor Current Value	
Event Notification	
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the number of online users exceeds the threshold you set. The default is unselected.

Parameter	How to Set It
Threshold - Maximum current value	Specify the maximum number of online users that must exist before an event is raised. The default is 500 online users.
Event severity when current value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of online users exceeds the threshold. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data about the number of current online users for charts and reports. The default is Yes.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold?	Select **Yes** to raise an event if the delta value for online users (the amount of present online users minus previous online users) exceeds the threshold you set. The default is unselected.
Threshold - Maximum delta value	Specify the maximum delta value for online users that must exist before an event is raised. The default is 100 online users.
Event severity when delta value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the delta value for online users exceeds the threshold. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data about the delta value for current online users for charts and reports. The default is unselected.

20.9 CUPS_JsmTotalMessagePackets

Use the CiscoUCM_CUPS_JsmTotalMessagePackets Knowledge Script to monitor the total message packets through the Jabber Session Manager on a Cisco Unified Presence server.

This script raises an event if a counter or instance is not accessible, or if the current number of total message packets exceeds a threshold you set. The script also raises an event if the delta value for total message packets in the last time slice (the amount of present total message packets minus previous amount of total message packets) exceeds a threshold. In addition, this script collects data for current and delta values.

20.9.1 Resource Object

CiscoUCM_CMServer

20.9.2 Default Schedule

By default, this script runs every five minutes.

20.9.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CUPS_JsmTotalMessagePackets job. The default is 5.
Counter Specifications	
Name of the object to monitor	Specify the name of the object you want to monitor. The default is Cisco XCP JSM.
Name of the counter to monitor	Specify the name of the performance counter you want to monitor for total message packets. The default is JsmTotalMessagePackets.
Name of the instance to monitor	Specify the name or names of the Unified Presence server instances you want to monitor for total message packets. Separate multiple instance names with commas.
Raise event if counter or instance not found?	Select **Yes** to raise an event if the script cannot find the specified counter or instance. The default is Yes.
Event severity when counter or instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the specified counter or instance. The default is 25.
Monitor Current Value	
Event Notification	
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the number of total message packets exceeds the threshold you set. The default is unselected.

Parameter	How to Set It
Threshold - Maximum current value	Specify the maximum number of total message packets that must exist before an event is raised. The default is 500 total message packets.
Event severity when current value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of total message packets exceeds the threshold. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data about the number of current total message packets for charts and reports. The default is Yes.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold?	Select **Yes** to raise an event if the delta value for total message packets (the amount of present total message packets minus previous total message packets) exceeds the threshold you set. The default is unselected.
Threshold - Maximum delta value	Specify the maximum delta value for total message packets that must exist before an event is raised. The default is 100 total message packets.
Event severity when delta value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the delta value for total message packets exceeds the threshold. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data about the delta value for current total message packets for charts and reports. The default is unselected.

20.10 CUPS_OutgoingSIPSubscriptions

Use the CiscoUCM_CUPS_OutgoingSIPSubscriptions Knowledge Script to monitor the number of active outgoing SIP subscriptions for a Cisco Unified Presence Server

This script raises an event if a counter or instance is not accessible, or if the current number of active outgoing SIP subscriptions exceeds a threshold you set. The script also raises an event if the delta value for active outgoing SIP subscriptions in the last time slice (the amount of present active outgoing SIP subscriptions minus previous amount of active outgoing SIP subscriptions) exceeds a threshold. In addition, this script collects data for current and delta values.

20.10.1 Resource Object

CiscoUCM_CMServer

20.10.2 Default Schedule

By default, this script runs every fiver minutes.

20.10.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CUPS_OutgoingSIPSubscriptions job. The default is 5.
Counter Specifications	
Name of the object to monitor	Specify the name of the object you want to monitor. The default is Cisco XCP SIP S2S.
Name of the counter to monitor	Specify the name of the performance counter you want to monitor for active outgoing SIP subscriptions. The default is SIPS2SSubscriptionsOut.
Name of the instance to monitor	Specify the name or names of the Unified Presence server instances you want to monitor for active outgoing SIP subscriptions. Separate multiple instance names with commas.
Raise event if counter or instance not found?	Select **Yes** to raise an event if the script cannot find the specified counter or instance. The default is Yes.
Event severity when counter or instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the specified counter or instance. The default is 25.
Monitor Current Value	
Event Notification	

Parameter	How to Set It
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the number of active outgoing SIP subscriptions exceeds the threshold you set. The default is unselected.
Threshold - Maximum current value	Specify the maximum number of active outgoing SIP subscriptions that must exist before an event is raised. The default is 500 active outgoing SIP subscriptions.
Event severity when current value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active outgoing SIP subscriptions exceeds the threshold. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data about the number of current active outgoing SIP subscriptions for charts and reports. The default is Yes.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold?	Select **Yes** to raise an event if the delta value for active outgoing SIP subscriptions (the amount of present active outgoing SIP subscriptions minus previous active outgoing SIP subscriptions) exceeds the threshold you set. The default is unselected.
Threshold - Maximum delta value	Specify the maximum delta value for active outgoing SIP subscriptions that must exist before an event is raised. The default is 100 active outgoing SIP subscriptions.
Event severity when delta value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the delta value for active outgoing SIP subscriptions exceeds the threshold. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data about the delta value for current active outgoing SIP subscriptions for charts and reports. The default is unselected.

20.11 CUPS_TotalAdhocChatRooms

Use the CiscoUCM_CUPS_TotalAdhocChatRooms Knowledge Script to monitor the total number of ad-hoc text conferencing rooms for a Cisco Unified Presence server.

This script raises an event if a counter or instance is not accessible, or if the current number of ad-hoc text conferencing rooms exceeds a threshold you set. The script also raises an event if the delta value for ad-hoc text conferencing rooms in the last time slice (the amount of present ad-hoc text conferencing rooms minus previous amount of ad-hoc text conferencing rooms) exceeds a threshold. In addition, this script collects data for current and delta values.

20.11.1 Resource Object

CiscoUCM_CMServer

20.11.2 Default Schedule

By default, this script runs every five minutes.

20.11.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CUPS_TotalAdhocChatRooms job. The default is 5.
Counter Specifications	
Name of the object to monitor	Specify the name of the object you want to monitor. The default is Cisco XCP TC.
Name of the counter to monitor	Specify the name of the performance counter you want to monitor for ad-hoc text conferencing rooms. The default is TcAdhocRooms.
Name of the instance to monitor	Specify the name or names of the Unified Presence server instances you want to monitor for ad-hoc text conferencing rooms. Separate multiple instance names with commas.
Raise event if counter or instance not found?	Select **Yes** to raise an event if the script cannot find the specified counter or instance. The default is Yes.
Event severity when counter or instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the specified counter or instance. The default is 25.
Monitor Current Value	
Event Notification	

Parameter	How to Set It
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the number of ad-hoc text conferencing rooms exceeds the threshold you set. The default is unselected.
Threshold - Maximum current value	Specify the maximum number of ad-hoc text conferencing rooms that must exist before an event is raised. The default is 500 ad-hoc text conferencing rooms.
Event severity when current value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of ad-hoc text conferencing rooms exceeds the threshold. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data about the number of current ad-hoc text conferencing rooms for charts and reports. The default is Yes.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold?	Select **Yes** to raise an event if the delta value for ad-hoc text conferencing rooms (the amount of present ad-hoc text conferencing rooms minus previous ad-hoc text conferencing rooms) exceeds the threshold you set. The default is unselected.
Threshold - Maximum delta value	Specify the maximum delta value for ad-hoc text conferencing rooms that must exist before an event is raised. The default is 100 ad-hoc text conferencing rooms.
Event severity when delta value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the delta value for ad-hoc text conferencing rooms exceeds the threshold. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data about the delta value for current ad-hoc text conferencing rooms for charts and reports. The default is unselected.

20.12 CUPS_TotalPersistentChatRooms

Use the CiscoUCM_CUPS_TotalPersistentChatRooms Knowledge Script to monitor the total number of persistent text conferencing rooms for a Cisco Unified Presence Server.

This script raises an event if a counter or instance is not accessible, or if the current number of persistent text conferencing rooms exceeds a threshold you set. The script also raises an event if the delta value for persistent text conferencing rooms in the last time slice (the amount of present persistent text conferencing rooms minus previous amount of persistent text conferencing rooms) exceeds a threshold. In addition, this script collects data for current and delta values.

20.12.1 Resource Object

CiscoUCM_CMServer

20.12.2 Default Schedule

By default, this script runs every five minutes.

20.12.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_CUPS_TotalPersistentChatRooms job. The default is 5.
Counter Specifications	
Name of the object to monitor	Specify the name of the object you want to monitor. The default is Cisco XCP TC.
Name of the counter to monitor	Specify the name of the performance counter you want to monitor for persistent text conferencing rooms. The default is TcPersistentRooms.
Name of the instance to monitor	Specify the name or names of the Unified Presence server instances you want to monitor for persistent text conferencing rooms. Separate multiple instance names with commas.
Raise event if counter or instance not found?	Select **Yes** to raise an event if the script cannot find the specified counter or instance. The default is Yes.
Event severity when counter or instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the script cannot find the specified counter or instance. The default is 25.
Monitor Current Value	
Event Notification	

Parameter	How to Set It
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the number of persistent text conferencing rooms exceeds the threshold you set. The default is unselected.
Threshold - Maximum current value	Specify the maximum number of persistent text conferencing rooms that must exist before an event is raised. The default is 500 persistent text conferencing rooms.
Event severity when current value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of persistent text conferencing rooms exceeds the threshold. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data about the number of current persistent text conferencing rooms for charts and reports. The default is Yes.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold?	Select **Yes** to raise an event if the delta value for persistent text conferencing rooms (the amount of present persistent text conferencing rooms minus previous persistent text conferencing rooms) exceeds the threshold you set. The default is unselected.
Threshold - Maximum delta value	Specify the maximum delta value for persistent text conferencing rooms that must exist before an event is raised. The default is 100 persistent text conferencing rooms.
Event severity when delta value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the delta value for persistent text conferencing rooms exceeds the threshold. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data about the delta value for current persistent text conferencing rooms for charts and reports. The default is unselected.

20.13 ExtensionMobility

Use the CiscoUCM_ExtensionMobility Knowledge Script to monitor the Extension Mobility application. Extension Mobility allows users to temporarily access their Cisco IP phone configuration, such as line appearances, services, and speed dials, from other Cisco IP phones.

This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the number of throttled requests, in-progress requests, login/logout requests, successful logins, successful logouts, and total requests.

20.13.1 Resource Object

CiscoUCM_ExtMobility

20.13.2 Default Schedule

By default, this script runs every 15 minutes.

20.13.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_ExtensionMobility job. The default is 5.
Monitor Login/Logout Requests	
Event Notification	
Raise event if login/logout requests exceed threshold?	Select **Yes** to raise an event if the number of requests to log in or log out exceeds the threshold you set. The default is Yes.
Threshold - Maximum login/logout requests	Specify the maximum number of login and logout requests that must occur before an event is raised. The default is 100 requests.
Event severity when login/logout requests exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of login and logout requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for login/logout requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of login and log out requests that occurred during the monitoring period. The default is unselected.
Monitor Successful Logins	
Data Collection	

Parameter	How to Set It
Collect data for successful logins?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of logins that were successful during the monitoring period. The default is unselected.
Monitor Successful Logouts	
Data Collection	
Collect data for successful logouts?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of logouts that were successful during the monitoring period. The default is unselected.
Monitor Requests in Progress	
Event Notification	
Raise event if requests in progress exceed threshold?	Select **Yes** to raise an event if the number of in-progress requests exceeds the threshold you set. The default is Yes.
Threshold - Maximum requests in progress	Specify the maximum number of requests that must be in progress before an event is raised. The default is 500 requests.
Event severity when requests in progress exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-progress requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for requests in progress?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of requests in progress at each script iteration. The default is unselected.
Monitor Throttled Requests	
Event Notification	
Raise event if throttled requests exceed threshold?	Select **Yes** to raise an event if the number of throttled requests exceeds the threshold you set. The default is Yes.
Threshold - Maximum throttled requests	Specify the maximum number of requests that must be throttled before an event is raised. The default is 10 requests.
Event severity when throttled requests exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of throttled requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for throttled requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of requests throttled during the monitoring period. The default is unselected.
Monitor Total Requests	
Data Collection	
Collect data for total requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of all requests that occurred during the monitoring period. The default is unselected.

20.14 GeneralCounter

Use this Knowledge Script to monitor a user-specified Performance Monitor counter on a Cisco Unified Communications server. You can monitor both the current value of the counter as well as the delta value (current value minus the previous value). This script raises an event if the value of the monitored counter exceeds the threshold and if the counter you want to monitor is not accessible.

This script generates data streams for current and delta counter values.

20.14.1 Resource Object

CiscoUCM_CMServer

20.14.2 Default Schedule

By default, this script runs every five minutes.

20.14.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_GeneralCounter job. The default is 5.
Counter Specifications	
Name of the object to monitor	Type the name of the performance object you want to monitor. An object is any resource, program or service for which performance data can be collected. The default object name is `System`.
Name of the counter to monitor	Type the name of the performance counter you want to monitor. A counter represents the data associated with aspects of an object. The default counter name is `Total Threads`.
Name of the instance to monitor	Type the name of the performance instance you want to monitor. An instance distinguishes between multiple objects of the same type on a single computer. You can type multiple instance names, separated by commas. Not all counters or objects require or have an instance.
Raise event if counter/instance not found?	Select **Yes** to raise an event if this script cannot find the counter or instance you specify. The default is Yes.
Event severity when counter/instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this script cannot find the counter or instance you specify. The default is 25.
Monitor Current Value	
Event Notification	

Parameter	How to Set It
Raise event if current value exceeds threshold?	Select **Yes** to raise an event if the current value of the counter exceeds the threshold you set. The default is Yes.
Threshold - Maximum current value	Specify the maximum current value the counter can attain before an event is raised. The default is 500.
Event severity when current value exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the current value of the counter exceeds the threshold you set. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the current value of the counter at each script iteration. The default is unselected.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold	Select **Yes** to raise an event if the delta value of the counter exceeds the threshold you set. The default is Yes. The delta value is the difference between the current value and the previous value.
Threshold - Maximum delta value	Specify the maximum delta value the counter can attain before an event is raised. The default is 100.
Event severity when delta value exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the delta value of the counter exceeds the threshold you set. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the delta value of the counter as measured during the monitoring period. The default is unselected.‘

20.15 HealthCheck

Use this Knowledge Script to monitor the operational status of active services on Cisco Unified Communications servers. Although the script monitors the following services by default, you can choose to exclude any default service, or include any other service not mentioned in the list.

- A Cisco DB
- Cisco AMC Service
- Cisco Communications
- Cisco CDR Agent
- Cisco CTL Provider
- Cisco Database Layer Monitor
- Cisco DRF Local
- Cisco Extension Mobilitycitetitle/
- Cisco Presence Datastore
- Cisco Presence Engine
- Cisco RIS Data Collector
- Cisco Tftp
- Cisco XCP Router

The script checks the target server to determine whether the default services are configured on that server, and it only monitors the services that are actually configured.

This script raises an event if a stopped service is restarted or fails to restart, or if a service is stopped but the *Start service if it is stopped?* parameter has not been set to **Yes**. In addition, this script generates data streams for service availability.

You can exclude default services by specifying those services in the *Default services to exclude* parameter, and you can include additional services not listed about by specifying those services in the *Other services to include* parameter.

This script is a member of the CiscoUCM recommended Knowledge Script Group (KSG). For more information, see "Recommended Knowledge Script Groups" on page 1098.

20.15.1 Resource Object

CiscoUCM_CMServer

20.15.2 Default Schedule

By default, this script runs every two minutes.

If you are running this script as part of the Recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered to lessen the impact on CPU utilization when you run the KSG.

20.15.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_HealthCheck job. The default is 5.
Monitor Services	
Default services to exclude	Type the name of any default service you do not want to automatically start. You can specify the names of multiple services, separated by commas.
Other services to include	Type the name of any service you want to automatically start, but is not included in the list of default services. You can specify the names of multiple services, separated by commas.
Start service if it is stopped?	Select **Yes** to automatically start all stopped default services on Unified Communications servers. Any service you specify in *Default services to exclude* will not be started. The default is Yes. **NOTE:** Only “activated” services can be automatically started. If an administrator has “deactivated” a service, then AppManager cannot start it.
Event Notification	
Raise event if service is stopped and should not be started?	Select **Yes** to raise an event if a monitored service is stopped but *Start service if it is stopped?* is unchecked. The default is Yes.
Event severity when service is stopped and should not be started	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service is stopped but *Start service if it is stopped?* is unchecked. The default is 15.
Raise event if service fails to start?	Select **Yes** to raise an event if AppManager cannot start a monitored service. The default is Yes.
Event severity when service fails to start	Set the event severity level, from 1 to 40, to indicate the importance of an event in AppManager cannot start a monitored service. The default is 5.
Raise event if stopped service has been started?	Select **Yes** to raise an event if AppManager successfully starts a monitored service. The default is Yes.
Event severity when stopped service has been started	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully starts a monitored service. The default is 25.
Raise event if service is deactivated?	Select **Yes** to raise an event if a monitored service has been deactivated by an administrator. The default is unselected.
Event severity when service is not active	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service has been deactivated by an administrator. The default is 15.
Data Collection	
Collect data for service availability?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns 0 for a stopped service or 1 for a started service. The default is Yes. **NOTE:** This script generates data streams for services running when the job starts or automatically restarted while the job runs. If a service is deactivated when the job starts, no data stream is generated.

20.16 SystemUpTime

Use this Knowledge Script to monitor the number of hours that a Cisco Unified Communications server has been up since the last reboot. This script raises an event if a reboot occurs. In addition, this script generates a data stream for the number of hours that the Unified Communications server has been operational since the last reboot.

This script is a member of the CiscoUCM recommended Knowledge Script Group (KSG). For more information, see "Recommended Knowledge Script Groups" on page 1098.

20.16.1 Resource Object

CiscoUCM_CMServer

20.16.2 Default Schedule

By default, this script runs every five minutes.

If you are running this script as part of the Recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered to lessen the impact on CPU utilization when you run the KSG.

20.16.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_SystemUpTime job. The default is 5.
Raise event if system has rebooted?	Select **Yes** to raise an event if the Unified Communications server has rebooted during the monitoring period. The default is Yes.
Event severity when system has rebooted	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Unified Communications server has rebooted. The default is 10.
Monitor System Uptime	
Data Collection	
Collect data for system uptime?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of hours that the Unified Communications server has been operational since the last reboot. The default is Yes.

20.17 SystemUsage

Use this Knowledge Script to monitor CPU, memory, and disk usage for a Unified Communications server. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the following metrics:

- CPU usage (%)
- Physical and virtual memory usage (%)
- Swap space usage (%)
- Active, common, and swap partition usage (%)
- Total processes
- Total threads

This script is a member of the CiscoUCM recommended Knowledge Script Group (KSG). For more information, see "Recommended Knowledge Script Groups" on page 1098.

20.17.1 Resource Object

CiscoUCM_CMServer

20.17.2 Default Schedule

By default, this script runs every two minutes.

If you are running this script as part of the Recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered so as to lessen the impact on CPU utilization when you run the KSG.

20.17.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_SystemUsage job. The default is 5.
Monitor CPU Usage	
Event Notification	
Raise event if CPU usage exceeds threshold?	Select **Yes** to raise an event if CPU usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum CPU usage	Specify the highest percentage of CPU usage that must occur before an event is raised. The default is 80%.

Parameter	How to Set It
Event severity when CPU usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for CPU usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of CPU usage during the monitoring period. The default is Yes.
Monitor Physical Memory Usage	
Event Notification	
Raise event if physical memory usage exceeds threshold?	Select **Yes** to raise an event if physical memory usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum physical memory usage	Specify the highest percentage of physical memory usage that must occur before an event is raised. The default is 80%.
Event severity when physical memory usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which physical memory usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for physical memory usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of physical memory usage during the monitoring period. The default is Yes.
Monitor Virtual Memory Usage	
Event Notification	
Raise event if virtual memory usage exceeds threshold?	Select **Yes** to raise an event if virtual memory usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum virtual memory usage	Specify the highest percentage of virtual memory usage that must occur before an event is raised. The default is 80%.
Event severity when virtual memory usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which virtual memory usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for virtual memory usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of virtual memory usage during the monitoring period. The default is Yes.
Monitor Swap Space Usage	
Event Notification	
Raise event if swap space usage exceeds threshold?	Select **Yes** to raise an event if swap space usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum swap space usage	Specify the highest percentage of swap space that must be in use before an event is raised. The default is 80%.
Event severity when swap space usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which swap space usage exceeds the threshold you set. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for swap space usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of swap space usage during the monitoring period. The default is unselected.
Monitor Active Partition Usage	
Event Notification	
Raise event if active partition usage exceeds threshold?	Select **Yes** to raise an event if active partition usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum active partition usage	Specify the highest percentage of active partition usage that must occur before an event is raised. The default is 80%.
Event severity when active partition usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which active partition usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active partition usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of active partition usage during the monitoring period. The default is unselected.
Monitor Common Partition Usage	
Event Notification	
Raise event if common partition usage exceeds threshold?	Select **Yes** to raise an event if common partition usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum common partition usage	Specify the highest percentage of common partition usage that must occur before an event is raised. The default is 80%.
Event severity when common partition usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which common partition usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for common partition usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of common partition usage during the monitoring period. The default is unselected.
Monitor Swap Partition Usage	
Event Notification	
Raise event if swap partition usage exceeds threshold?	Select **Yes** to raise an event if swap partition usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum swap partition usage	Specify the highest percentage of swap partition usage that must occur before an event is raised. The default is 50%.
Event severity when swap partition usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which swap partition usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for swap partition usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of swap partition usage during the monitoring period. The default is unselected.

Parameter	How to Set It
Monitor Total Processes	
Event Notification	
Raise event if total processes exceed threshold?	Select **Yes** to raise an event if the number of active processes exceeds the threshold that you set. The default is Yes.
Threshold - Maximum total processes	Specify the highest number of processes that must be active before an event is raised. The default is 250 processes.
Event severity when total processes exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of active processes exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for total processes?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of processes that are active at each script iteration. The default is unselected.
Monitor Total Threads	
Event Notification	
Raise event if total threads exceed threshold?	Select **Yes** to raise an event if the number of threads exceeds the threshold that you set. The default is Yes.
Threshold - Maximum total threads	Specify the highest number of threads that must be created before an event is raised. The default is 2500 threads.
Event severity when total threads exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of threads exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for total threads?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of threads detected at each script iteration. The default is unselected.

20.18 WebPageCheck

Use this Knowledge Script to monitor the availability of and round-trip connection time to the `ccmadmin` and `ccmuser` Web pages. This script raises an event if either Web page is unavailable or if round-trip connection time exceeds the threshold that you set. In addition, this script generates data streams for Web page availability and round-trip time.

If either Web page is unavailable, the detail message records the reason, such as the format of the request was invalid or the server name was not found.

This script monitors Web page availability only. To monitor Web page content and usage, use the Knowledge Scripts in a different module: AppManager ResponseTime for Web.

20.18.1 Resource Object

CiscoUCM_CMServer

20.18.2 Default Schedule

By default, this script runs every 30 minutes.

20.18.3 Setting Parameter Values

Set the following parameters on the **Values** tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CiscoUCM_WebPageCheck job. The default is 5.
Is Web server secure?	Select **Yes** to indicate that your Unified Communications Web server is a secure Web server (HTTPS). The default is Yes.
Monitor CCMAdmin Web Page Availability	
Event Notification	
Raise event if Web page is unavailable?	Select **Yes** to raise an event if the `ccmadmin` Web page is unavailable. The default is Yes.
Event severity when Web page is unavailable	Set the even severity level, from 1 to 40, to indicate the importance of an event in which the `ccmadmin` Web page is unavailable. The default is 15.
Data Collection	
Collect data for CCMAdmin Web page availability?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns 100 if the Web page is available and 0 if the Web page is unavailable.
Monitor CCMAdmin Web Page Round-Trip Time	
Event Notification	

Parameter	How to Set It
Raise event if round-trip time exceeds threshold?	Select **Yes** to raise an event if the round-trip connection time for the `ccmadmin` Web page exceeds the threshold that you set. The default is Yes.
Threshold - Maximum round-trip time	Specify the longest round-trip connection time that can occur before an event is raised. The default is 100 milliseconds.
Event severity when round-trip time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which round-trip connection time for the `ccmadmin` Web page exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for round-trip time?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the `ccmadmin` Web page's round-trip connection time during the monitoring period. The default is unselected.
Monitor CCMUser Web Page Availability	
Event Notification	
Raise event if Web page is unavailable?	Select **Yes** to raise an event if the `ccmuser` Web page is unavailable. The default is Yes.
Event severity when Web page is unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the `ccmuser` Web page is unavailable. The default is 15.
Data Collection	
Collect data for CCMUser Web page availability?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns 100 if the Web page is available and 0 if the Web page is unavailable.
Monitor CCMUser Web Page Round-Trip Time	
Event Notification	
Raise event if round-trip time exceeds threshold?	Select **Yes** to raise an event if the round-trip connection time for the `ccmuser` Web page exceeds the threshold that you set. The default is Yes.
Threshold - Maximum round-trip time	Specify the longest round-trip connection time that can occur before an event is raised. The default is 100 milliseconds.
Event severity when round-trip time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which round-trip connection time for the `ccmuser` Web page exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for round-trip time?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the round-trip connection time for the `ccmuser` Web page during the monitoring period. The default is unselected.

20.19 Recommended Knowledge Script Groups

The following Knowledge Scripts are members of the CiscoUCM recommended Knowledge Script Group (KSG).

- HealthCheck
- SystemUpTime
- SystemUsage

The following Knowledge Scripts are members of the CiscoUCM_CUPS recommended Knowledge Script Group (KSG).

- CUPS_ActiveCalendarSubscriptions
- CUPS_ActiveIMSessions
- CUPS_ActiveJsmSessions
- CUPS_IncomingSIPSubscriptions
- CUPS_JsmFailedLogins
- CUPS_JsmMsgsInLastSlice
- CUPS_JsmOnlineUsers
- CUPS_JsmTotalMessagePackets
- CUPS_OutgoingSIPSubscriptions
- CUPS_TotalAdhocChatRooms
- CUPS_TotalPersistentChatRooms
- HealthCheck

The parameters of all scripts in the KSG are set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab and run the KSG on a resource.

Run the KSG on only one cluster at a time. Running the KSG on multiple clusters all at once hinders the proxy agent's ability to spread out processing over time. You can monitor multiple clusters by running the KSG on the first cluster, and then repeating the process for each additional cluster.

The CiscoUCM KSGs provide a "best practices" usage of AppManager for monitoring your Unified Communications environment. You can use these KSGs with AppManager monitoring policies. A monitoring policy, which enables you to efficiently and consistently monitor all the resources in your environment, uses a set of pre-configured Knowledge Scripts to automatically monitor resources as they appear in the Navigation pane or TreeView. For more information, see "About Policy-Based Monitoring" in the AppManager Help.

A KSG is composed of a subset of a module's Knowledge Scripts. The script that belongs to a KSG is a different copy of the original script you access from the CiscoUCM tab. If you modify a script that belongs to a KSG, the parameter settings of the original script in the CiscoUCM tab are not affected.

When deployed as part of a KSG, a script's default script parameter settings might differ from when the script is deployed alone. The default settings of a script within a group depend on its monitoring purpose within the larger group, and on the intended monitoring scope of that group.

If you modify or remove a script associated with the CiscoUCM KSGs and want to restore it to its original form, you can reinstall AppManager for Cisco Unified Communications server on the repository computer or check in the appropriate script from the AppManager\qdb\kp\CiscoUCM\RECOMMENDED_CiscoUCM directory.

21 CiscoCM Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring a Unified Communications Manager environment.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, select any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
4x_PhoneDeregistrations	Monitors phone deregistrations on a Communications Manager 4.x cluster and maintains a history of deregistrations in the Cisco CM supplemental database.
4x_RetrieveConfigData	Retrieves Communications Manager 4.x configuration data and stores it the Cisco CM supplemental database.
4x_SetupSupplementalDB	Creates a Cisco CM supplemental database in which to store Communications Manager 4.x configuration and phone deregistration information.
AnalogAccess_GatewayUsage	Monitors resource usage for analog access gateways.
Annunciator_Device	Monitors resource usage for annunciator devices.
AttendantConsole	Monitors activity for the Attendant Console application.
CCM_CallActivity	Monitors call activity on a Communications Manager server.
CCM_MediaResources	Monitors media resources for a Communications Manager.
CCM_MGCPResources	Monitors active MGCP gateway resource usage for a Communications Manager.
CCM_RegisteredResources	Monitors changes in the number of resources registered to a Communications Manager server.
CCM_ResourceAvailability	Monitors the number of times Communications Manager requests a resource that is unavailable.
CCM_SystemPerformance	Monitors call throttling and signal processing queues for a Communications Manager.
CDR_CallFailures	Monitors call detail records retrieved from Communications Manager for calls that ended with an abnormal termination code.
CDR_CallQuality	Monitors call detail records and call management records retrieved from Communications Manager for jitter, latency, lost data, and MOS.
CDR_Query	Queries call detail records retrieved from Communications Manager and stored in the Cisco CM supplemental database.

Knowledge Script	What It Does
CDR_RetrieveCallRecords	Retrieves call detail records from Communications Manager and places them in the Cisco CM supplemental database.
CDR_RetrieveConfigData	Retrieves Communications Manager configuration data and stores it the Cisco CM supplemental database.
CFB_Hardware_Device	Monitors the resource usage of registered hardware conference bridge devices.
CFB_Software_Device	Monitors the resource usage of registered software conference bridge devices.
CFB_Video_Device	Monitors the resource usage of registered video conference bridge devices.
CTIManager	Monitors the usage of the Communications Manager CTI Manager.
ExtensionMobility	Monitors activity for the Extension Mobility application.
GatekeeperActivity	Monitors the activity on a gatekeeper.
GeneralCounter	Monitors a user-specified Performance Monitor counter.
H323_Gateway_CallActivity	Monitors call activity for H323 gateway devices.
H323_Trunk_CallActivity	Monitors call activity for H323 trunk devices.
HealthCheck	Monitors the operational status of active services on Communications Manager servers.
HuntAndRouteList	Monitors hunt lists and route lists for availability and call activity.
LicenseUsage	Monitors authorized, used, remaining, and the percentage of used licenses on a Cisco Unified Communications Manager cluster.
Locations	Monitors Cisco locations for voice and video bandwidth availability and usage.
MediaStreamingApp	Monitors the resources handled by the Media Streaming Application.
MGCP_FXO_CallActivity	Monitors completed calls, blocked calls, outbound busy attempts, and port status on MGCP FXO devices.
MGCP_FXS_CallActivity	Monitors completed calls, blocked calls, outbound busy attempts, and port status on MGCP FXS devices.
MGCP_GatewayUsage	Monitors active and in-service ports, active channels, and in-service spans for MGCP gateways.
MGCP_PRI_CallActivity	Monitors completed calls, outbound busy attempts, active calls, blocked calls, and data link availability for MGCP PRI devices.
MGCP_PRI_ChannelHealth	Monitors the status of channels for MGCP PRI devices.
MGCP_T1CAS_CallActivity	Monitors completed calls, outbound busy attempts, active calls, and blocked calls for MGCP T1CAS devices.
MGCP_T1CAS_ChannelHealth	Monitors the status of channels for an MGCP T1CAS device.
MOH_Device	Monitors the resource usage for a registered Music-on-Hold device.
MTP_Device	Monitors the resource usage for a registered Media Termination Point device.
PhoneDeregistrations	Monitors phone deregistrations for a Communications Manager and retains deregistration history in the Cisco CM supplemental database.

Knowledge Script	What It Does
PhoneInventory	Creates an inventory of the phones configured in a Communications Manager cluster.
Report_PhoneDeregAudit	Creates a history of phone deregistrations and reregistrations.
Report_PhoneDeregWatchList	Creates a list of phones that frequently deregister.
RoleStatus	Monitors status changes for primary and backup Communications Managers in a Communications Manager group.
SetupSupplementalDB	Creates a Cisco CM supplemental database in which to store Communications Manager call detail records.
SIP_Trunk_CallActivity	Monitors call activity for SIP trunk devices.
SNMPTrap_AddMIB	Add management information bases for monitoring by the SNMPTrap_Async Knowledge Script.
SNMPTrap_Async	Checks for incoming SNMP traps forwarded from NetIQ SNMP Trap Receiver.
SystemUpTime	Monitors the number of hours Communications Manager has been operational since its last reboot.
SystemUsage	Monitors CPU, memory, and disk usage for a Communications Manager server.
TFTPActivity	Monitors activity on the Cisco TFTP server.
Transcoder_Device	Monitors the resources used by registered transcoder devices.
WebDialer	Monitors activity for the Cisco Web Dialer application.
WebPageCheck	Monitors the availability of and round-trip time to the ccmadmin and ccmuser Web pages.
Recommended Knowledge Script Group	Performs essential monitoring of your Cisco Unified Communications Manager environment.

21.1 4x_PhoneDeregistrations

Use this Knowledge Script to monitor phone deregistrations on a Communications Manager 4.x cluster and to maintain a history of deregistrations in the Cisco CM supplemental database. This script raises an event if the number or percentage of lost phones exceeds the threshold you set. You determine how long a phone must be deregistered before it is considered "lost." In addition, you determine whether to group events by cluster, device pool, location, or partition.

21.1.1 Prerequisites

Run the 4x_SetupSupplementalDB Knowledge Script to create the Cisco CM supplemental database. Then, run the 4x_RetrieveConfigData Knowledge Script to retrieve Communications Manager 4.x configuration information.

21.1.2 Resource Object

CiscoCM_Cluster4xMgmt

21.1.3 Default Schedule

By default, this script runs every five minutes.

21.1.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the 4x_PhoneDeregistration job. The default is 5.
Event Notification	
Raise event if lost phones in group exceed threshold?	Select **Yes** to raise an event if the number or percentage of lost phones in a group exceeds the threshold you set. The default is Yes. Use *Select event grouping* to select how to group the lost phones. Use *Maximum time phone deregistered before counted as lost* to determine how long a phone must be deregistered before it is considered lost.

Parameter	How to Set It
Select event grouping	Select whether to group lost phones by **Cluster**, **Device Pool**, **Location**, or **Partition**. AppManager raises an event based on whether the number of lost phones in *each* group exceeds the threshold you set. For example, you set *Maximum number of lost phones in the group* to 5, you set *Select event grouping* to Device Pool, and you have three device pools. If AppManager detects six lost phones in the first pool, two in the second, and seven in the third, it will raise two events: one for the six lost phones in the first pool and another for the seven lost phones in the third pool. Because you set the threshold to "5," no event is raised for the lost phones in the second pool. The default is Cluster.
Maximum time phone deregistered before counted as lost	Specify the number of minutes that must elapse before a deregistered phone can be considered a "lost" phone. The default is 0 minutes. Accept the default if you want *all* deregistered phones to be considered lost.
Type of threshold	Select whether you want to raise events based on the **Number** or **Percent** of lost phones. The default is Number.
Threshold - Maximum number of lost phones	Use this parameter if you selected **Number** in *Type of threshold*. Specify the maximum number of phones that can be lost before an event is raised. The default is 0.
Threshold - Maximum percent of lost phones	Use this parameter if you selected **Percent** in *Type of threshold*. Specify the maximum percentage of phones that can be lost before an event is raised. The default is 0.
Event severity when lost phones exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number or percentage of lost phones in a group exceeds the threshold you set. The default is 15.
Include lost phone details in event message	Select **Yes** to include details of the lost phones in the event message. Phone details can include device name, device IP address, directory number, description, name of device pool, time of deregistration, and the Communications Manager from which the phone was deregistered. The default is Yes.
Maximum number of detail rows to include in event detail	Specify the maximum number of detail rows to include in an event message. Each row contains details for one phone. Rows are sorted in order by most recently lost phone. Specify "0" to include all rows. The default is 20. This parameter is applicable only if you selected **Yes** for *Include lost phone details in event message*.

21.2 4x_RetrieveConfigData

Use this Knowledge Script to retrieve Communications Manager configuration data from the Communications Manager 4.x Publisher and store it in the Cisco CM supplemental database.

21.2.1 Prerequisite

Run the 4x_SetupSupplementalDB Knowledge Script to create the Cisco CM supplemental database.

21.2.2 Resource Object

CiscoCM_Cluster4xMgmt

21.2.3 Default Schedule

By default, this script runs once a day, at 3 A.M, so as to perform its possibly CPU-intensive function at a time when the Communications Manager is least busy.

However, because the 4x_PhoneDeregistrations script uses the configuration data this script retrieves, you might want to set this script to "Run Once" so the configuration data is retrieved immediately. Once the "Run Once" job is complete, you can then run this script using the default schedule of once daily.

21.2.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the 4x_RetrieveConfigData job. The default is 5.
Raise event if configuration retrieval succeeds?	Select **Yes** to raise an event if Communications Manager 4.x configuration data is successfully retrieved from the Cisco CM supplemental database. The default is unselected.
Event severity when configuration retrieval succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which configuration data is successfully retrieved from the Cisco CM supplemental database. The default is 25.

21.3 4x_SetupSupplementalDB

Use this Knowledge Script to create a Cisco CM supplemental database in which to store Communications Manager 4.x phone deregistration information.

21.3.1 Resource Object

CiscoCM_Cluster4xMgmt

21.3.2 Default Schedule

By default, this script runs once.

21.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the 4x_SetupSupplementalDB job. The default is 5.
Raise event if database setup succeeds?	Select **Yes** to raise an event if the Cisco CM supplemental database is successfully created on the proxy agent computer. The default is unselected.
Event severity when database setup succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Cisco CM supplemental database is successfully created. The default is 25.
Phone Deregistration Parameters	
Number of days to keep phone deregistration audit entries	Specify the number of days' worth of phone deregistration audit entries you want to keep in the Cisco CM supplemental database. Any data older than what you specify is discarded. The default is 180 days.
Is your CallManager configured to use secure Web access (HTTPS)?	Select **Yes** if you use secure HTTP (HTTPS) to access your Communications Manager. AppManager uses this information to build the Communications Manager URL that is displayed in event message details. The default is unselected.
SQL Server Information	
Local SQL Server Instance name	Specify the name of the local SQL Server instance (on the proxy agent computer) in which you want to create the new Cisco CM supplemental database. Leave this parameter blank to accept the default name.

21.4 AnalogAccess_GatewayUsage

Use this Knowledge Script to monitor active ports, out-of-service ports, and outbound busy attempts for analog access gateways. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for active ports, out-of-service ports, and outbound busy attempts.

21.4.1 Resource Object

CiscoCM_AnalogAccessObj

21.4.2 Default Schedule

By default, this script runs every 15 minutes.

21.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the AnalogAccess_GatewayUsage job. The default is 5.
Monitor Active Ports	
Event Notification	
Raise event if active ports exceed threshold?	Select **Yes** to raise an event if the number of active ports exceeds the threshold you set. The default is Yes.
Threshold - Maximum active ports	Specify the maximum number of ports that can be active before an event is raised. The default is 20 ports.
Event severity when active ports exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active ports exceeds the threshold. The default is 15.
Data Collection	
Collect data for active ports?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of ports that are active at each script iteration. The default is unselected.
Monitor Busy Attempts	
Event Notification	
Raise event if busy attempts exceed threshold?	Select **Yes** to raise an event if the number of times that the gateway received a busy signal exceeds the threshold you set. The default is Yes.
Threshold - Maximum busy attempts	Specify the maximum number of times the gateway can attempt a connection that receives a busy signal before an event is raised. The default is 0 attempts.
Event severity when busy attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of busy attempts exceeds the threshold. The default is 15.

Parameter	How to Set It
Data Collection	
Collect data for busy attempts?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of gateway connection attempts that received a busy signal during the monitoring period. The default is unselected.
Monitor Out of Service Ports	
Event Notification	
Raise event if out of service ports exceed threshold?	Select **Yes** to raise an event if the number of ports that were out of service exceeds the threshold you set. The default is Yes.
Threshold - Maximum out of service ports	Specify the maximum number of ports that must be out of service before an event is raised. The default is 0 ports.
Event severity when out of service ports exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of out-of-service ports exceeds the threshold. The default is 15.
Data Collection	
Collect data for out of service ports?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of ports that are out of service at each script iteration. The default is unselected.

21.5 Annunciator_Device

Use this Knowledge Script to monitor the annunciator resource usage for a Communications Manager. An annunciator enables Communications Manager to play recorded announcements and tones to Cisco IP phones, gateways, and other configurable devices.

This script raises an event if the number of times annunciator resources were unavailable exceeds the threshold, or if the percentage of resource usage exceeds the threshold. In addition, this script generates data streams for the number of active resources, the number of available resources, the number of times resources were unavailable, and the percentage of resource usage.

21.5.1 Resource Object

CiscoCM_AnnunciatorObj

21.5.2 Default Schedule

By default, this script runs every 15 minutes.

21.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Annunciator_Device job. The default is 5.
Monitor Resource Usage	
Event Notification	
Raise event if resource usage exceeds threshold?	Select **Yes** to raise an event if the percentage of annunciator resource usage exceeds the threshold you set. The default is Yes.
Threshold - Maximum resource usage	Specify the highest percentage of annunciator resource usage that must be detected before an event is raised. The default is 80%.
Event severity when resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which annunciator resource usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of annunciator resource usage at each script iteration.
Monitor Active Resources	
Data Collection	

Parameter	How to Set It
Collect data for active resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of annunciator resources that are active at each script iteration.
Monitor Available Resources	
Data Collection	
Collect data for available resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of annunciator resources that are available at each script iteration.
Monitor Unavailable Resources	
Event Notification	
Raise event if number of times resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times that annunciator resources were unavailable exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of times resources were unavailable	Specify the maximum number of times annunciator resources must be unavailable before an event is raised. The default is 0 instances.
Event severity when number of times resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times annunciator resources were unavailable exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of times resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times annunciator resources were unavailable during the monitoring period.

21.6 AttendantConsole

Use this Knowledge Script to monitor handled and in-progress requests for the Attendant Console application. Attendant Console allows you to set up Cisco IP phones to use speed-dial buttons and quick directory access, look up phone numbers, monitor line status, and redirect calls.

This script raises an event if the number of redirected calls and online clients exceed the threshold you set. In addition, this script generates data streams for the number of redirected calls, the number of total calls, the number of online clients, the number of registered clients, and the line connection state.

NOTE: Cisco Systems no longer supports the Cisco Unified Communications Manager Attendant Console. As a result, the CiscoCM_AttendantConsole Knowledge Script will not work on Cisco Unified Communications Manager 8.0 or later.

21.6.1 Resource Object

CiscoCM_AttendConsole

21.6.2 Default Schedule

By default, this script runs every 15 minutes.

21.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the AttendantConsole job. The default is 5.
Monitor Redirected Calls	
Event Notification	
Raise event if redirected calls exceed threshold?	Select **Yes** to raise an event if the number of redirected calls exceeds the threshold you set. The default is Yes.
Threshold - Maximum redirected calls	Specify the maximum number of calls that must be redirected before an event is raised. The default is 50 calls.
Event severity when redirected calls exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of redirected calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for redirected calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that were redirected during the monitoring period.
Monitor Total Calls	

Parameter	How to Set It
Data Collection	
Collect data for total calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of calls handled by Attendant Console during the monitoring period.
Monitor Online Clients	
Event Notification	
Raise event if online clients exceed threshold?	Select **Yes** to raise an event if the number of online clients exceeds the threshold you set. The default is Yes.
Threshold - Maximum online clients	Specify the maximum number of clients that must be online before an event is raised. The default is 100 clients.
Event severity when online clients exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of online clients exceeds the threshold. The default is 15.
Data Collection	
Collect data for online clients?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of clients that are online at each script iteration.
Monitor Registered Clients	
Data Collection	
Collect data for registered clients?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of clients that are registered at each script iteration.
Monitor Connection State	
Data Collection	
Collect data for connection state?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the line connection state for the Cisco Telephony Call Dispatcher (TCD) at each script iteration. Attendant Console uses TCD for login services, line state, and directory services. You can choose from the following line connection states: • 0 - Not registered or not receiving line link state information from Communications Manager • 1 - Registered and receiving line link state information from Communications Manager • 10 - TCD is logged in, but has not registered or received line link state information from Communications Manager • 11 - TCD is logged in, has registered, and is receiving line link state information from Communications Manager

21.7 CCM_CallActivity

Use this Knowledge Script to monitor call activity on a Communications Manager server. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the following metrics:

- Attempted calls
- Completed calls
- Active calls
- In-progress calls
- Incomplete calls (%)
- Attempted system calls
- Completed video calls

This script is a member of the CiscoCM recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 1245.

21.7.1 Resource Object

CiscoCM_CMServer

21.7.2 Default Schedule

By default, this script runs every five minutes.

If you are running this script as part of the recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered so as to lessen the impact on CPU utilization when you run the KSG.

21.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CCM_CallActivity job. The default is 5.
Monitor Active Calls	
Data Collection	
Collect data for active calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that are active at each script iteration. The default is Yes. A call is considered "active" once a connection is made.

Parameter	How to Set It
Monitor Attempted Calls	
Event Notification	
Raise event if attempted calls exceed threshold?	Select **Yes** to raise an event if the number of attempted calls exceeds the threshold you set. The default is Yes.
Threshold - Maximum attempted calls	Specify the maximum number of calls that must be attempted before an event is raised. The default is 500 calls.
Event severity when attempted calls exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of attempted calls exceeds the threshold. The default is 25.
Data Collection	
Collect data for attempted calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that were attempted during the monitoring period. The default is Yes.
Monitor Completed Calls	
Data Collection	
Collect data for completed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that were completed during the monitoring period. The default is Yes.
Monitor Calls in Progress	
Event Notification	
Raise event if calls in progress exceed threshold?	Select **Yes** to raise an event if the number of in-progress calls exceeds the threshold you set. The default is Yes. A call is considered “in-progress” as soon as the receiver is lifted.
Threshold - Maximum calls in progress	Specify the maximum number of calls that must be in progress before an event is raised. The default is 100 calls.
Event severity when calls in progress exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-progress calls exceeds the threshold. The default is 25.
Data Collection	
Collect data for calls in progress?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls in progress at each script iteration. The default is Yes.
Monitor Incomplete Calls	
Event Notification	
Raise event if incomplete calls exceeds threshold?	Select **Yes** to raise an event if the percentage of incomplete calls exceeds the threshold you set. The default is Yes.
Threshold - Maximum incomplete calls	Specify the highest percentage of incomplete calls that must be detected before an event is raised. The default is 75%.
Event severity when incomplete calls exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of incomplete calls exceeds the threshold. The default is 25.
Data Collection	
Collect data for incomplete calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of incomplete calls during the monitoring period. The default is Yes.

Parameter	How to Set It
Monitor Attempted System Calls	
Event Notification	
Raise event if attempted system calls exceed threshold?	Select **Yes** to raise an event if the number of attempted system calls exceeds the threshold you set. The default is Yes. System calls are signals sent to phones to turn on/off the Message Waiting indicator. A system call is sent to illuminate the indicator when a message is left, and another one is sent to turn off the indicator when the user listens to that message.
Threshold - Maximum attempted system calls	Specify the highest number of system calls that must be attempted before an event is raised. The default is 500 calls.
Event severity when attempted system calls calls exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of attempted system calls exceeds the threshold. The default is 25.
Data Collection	
Collect data for attempted system calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of system calls attempted during the monitoring period. The default is unselected.
Monitor Completed Video Calls	
Data Collection	
Collect data for completed video calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of video calls that were completed during the monitoring period. The default is unselected.

21.8 CCM_MediaResources

Use this Knowledge Script to monitor Communications Manager media resources:

- Annunciators
- Conference bridges
- Music-on-Hold (MOH)
- Media Termination Points (MTP)
- Transcoders

This script raises an event if a threshold is exceeded. In addition, this script generates percentage and active data streams for annunciator resource usage, conference bridge resource usage (hardware, software, and video), MTP resource usage, MOH (unicast and multicast) resource usage, and transcoder resource usage.

21.8.1 Resource Object

CiscoCM_CallProcessor

21.8.2 Default Schedule

By default, this script runs every 15 minutes.

21.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CCM_MediaResources job. The default is 5.
Monitor Annunciator Resource Usage	
Event Notification	
Raise event if annunciator resource usage exceeds threshold?	Select **Yes** to raise an event if annunciator resource usage exceeds the threshold you set. The default is Yes.
Threshold - Maximum annunciator resource usage	Specify the maximum percentage of annunciator resource usage that must be detected before an event is raised. The default is 90%.
Event severity when annunciator resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which annunciator resource usage exceeds the threshold. The default is 15.

Parameter	How to Set It
Data Collection	
Collect data for annunciator resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of annunciator resource usage at each script iteration. The default is unselected.
Monitor Hardware Conference Bridge Resource Usage	
Event Notification	
Raise event if hardware conference bridge resource usage exceeds threshold?	Select **Yes** to raise an event if hardware conference bridge resource usage exceeds the threshold you set. The default is Yes.
Threshold - Maximum hardware conference bridge resource usage	Specify the maximum percentage of hardware conference bridge resource usage that must be detected before an event is raised. The default is 90%.
Event severity when hardware conference bridge resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which hardware conference bridge resource usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for hardware conference bridge resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of hardware conference bridge resource usage at each script iteration. The default is unselected.
Monitor Software Conference Bridge Resource Usage	
Event Notification	
Raise event if software conference bridge resource usage exceeds threshold?	Select **Yes** to raise an event if software conference bridge resource usage exceeds the threshold you set. The default is Yes.
Threshold - Maximum software conference bridge resource usage	Specify the maximum percentage of software conference bridge resource usage that must be detected before an event is raised. The default is 90%.
Event severity when software conference bridge resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which software conference bridge resource usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for software conference bridge resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of software conference bridge resource usage at each script iteration. The default is unselected.
Monitor Video Conference Bridge Resource Usage	
Event Notification	
Raise event if video conference bridge resource usage exceeds threshold?	Select **Yes** to raise an event if video conference bridge resource usage exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum video conference bridge resource usage	Specify the maximum percentage of video conference bridge resource usage that must be detected before an event is raised. The default is 90%.
Event severity when video conference bridge resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which video conference bridge resource usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for video conference bridge resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of video conference bridge resource usage at each script iteration. The default is unselected.
Monitor Media Termination Point Resource Usage	
Event Notification	
Raise event if Media Termination Point resource usage exceeds threshold?	Select **Yes** to raise an event if MTP resource usage exceeds the threshold you set. The default is Yes.
Threshold - Maximum Media Termination Point resource usage	Specify the maximum percentage of MTP resource usage that must be detected before an event is raised. The default is 90%.
Event severity when Media Termination Point resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which MTP resource usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for Media Termination Point resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of MTP resource usage at each script iteration. The default is unselected.
Monitor Music-on-Hold Multicast Resource Usage	
Event Notification	
Raise event if Music-on-Hold multicast resource usage exceeds threshold?	Select **Yes** to raise an event if MOH multicast resource usage exceeds the threshold you set. The default is Yes.
Threshold - Maximum Music-on-Hold multicast resource usage	Specify the maximum percentage of MOH multicast resource usage that must be detected before an event is raised. The default is 90%.
Event severity when Music-on-Hold multicast resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which MOH multicast resource usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for Music-on-Hold multicast resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of MOH multicast resource usage at each script iteration. The default is unselected.
Monitor Music-on-Hold Unicast Resource Usage	
Event Notification	

Parameter	How to Set It
Raise event if Music-on-Hold unicast resource usage exceeds threshold?	Select **Yes** to raise an event if MOH unicast resource usage exceeds the threshold you set. The default is Yes.
Threshold - Maximum Music-on-Hold unicast resource usage	Specify the maximum percentage of MOH unicast resource usage that must be detected before an event is raised. The default is 90%.
Event severity when Music-on-Hold unicast resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which MOH unicast resource usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for Music-on-Hold unicast resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of MOH unicast resource usage at each script iteration. The default is unselected.
Monitor Transcoder Resource Usage	
Event Notification	
Raise event if transcoder resource usage exceeds threshold?	Select **Yes** to raise an event if transcoder resource usage exceeds the threshold you set. The default is Yes.
Threshold - Maximum transcoder resource usage	Specify the maximum percentage of transcoder resource usage that must be detected before an event is raised. The default is 90%.
Event severity when transcoder resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which transcoder usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for transcoder resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of transcoder resource usage at each script iteration. The default is unselected.
Monitor Active Annunciator Resources	
Data Collection	
Collect data for active annunciator resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of annunciator resources that are active at each script iteration. The default is unselected.
Monitor Active Hardware Conference Resources	
Data Collection	
Collect data for active hardware conference resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of hardware conference resources that are active at each script iteration. The default is unselected.
Monitor Active Software Conference Resources	
Data Collection	
Collect data for active software conference resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of software conference resources that are active at each script iteration. The default is unselected.
Monitor Active Video Conference Resources	

Parameter	How to Set It
Data Collection	
Collect data for active video conference resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of video conference resources that are active at each script iteration. The default is unselected.
Monitor Active Media Termination Point Resources	
Data Collection	
Collect data for active Media Termination Point resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of MTP resources that are active at each script iteration. The default is unselected.
Monitor Active Music-on-Hold Multicast Resources	
Data Collection	
Collect data for active Music-on-Hold multicast resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of MOH multicast resources that are active at each script iteration. The default is unselected.
Monitor Active Music-on-Hold Unicast Resources	
Data Collection	
Collect data for active Music-on-Hold unicast resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of MOH unicast resources that are active at each script iteration. The default is unselected.
Monitor Active Transcoder Resources	
Data Collection	
Collect data for active transcoder resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of transcoder resources that are active at each script iteration. The default is unselected.

21.9 CCM_MGCPResources

Use this Knowledge Script to monitor active and in-service MGCP gateway resource usage for a Communications Manager:

- BRI (basic rate interface) channels and spans
- FXO (foreign exchange office) ports
- FXS (foreign exchange station) ports
- PRI (primary rate interface) channels and spans
- T1CAS (channel associated signaling) channels and spans

An *active* resource is currently handling a call. An *in-service* resource is available to handle a call.

This script raises an event if any threshold is exceeded. In addition, this script generates data streams for active and in-service ports/channels/spans for any monitored resources.

This script is a member of the CiscoCM recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 1245.

21.9.1 Resource Object

CiscoCM_CallProcessor

21.9.2 Default Schedule

By default, this script runs every ten minutes.

If you are running this script as part of the Recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered so as to lessen the impact on CPU utilization when you run the KSG.

21.9.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CCM_MGCPResources job. The default is 5.
Monitor Active BRI Channels	
Event Notification	
Raise event if active BRI channels exceed threshold?	Select **Yes** to raise an event if the number of active BRI channels exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum active BRI channels	Specify the maximum number of BRI channels that must be active before an event is raised. The default is 100 channels.
Event severity when active BRI channels exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active BRI channels exceeds the threshold. The default is 15.
Data Collection	
Collect data for active BRI channels?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of BRI channels that are active at each script iteration. The default is unselected.
Monitor BRI Spans in Service	
Data Collection	
Collect data for BRI spans in service?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of BRI spans that are in service at each script iteration. The default is Yes.
Monitor Active FXO Ports	
Event Notification	
Raise event if active FXO ports exceed threshold?	Select **Yes** to raise an event if the number of active FXO ports exceeds the threshold you set. The default is Yes.
Threshold - Maximum active FXO ports	Specify the maximum number of FXO ports that must be active before an event is raised. The default is 25 ports.
Event severity when active FXO ports exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active FXO ports exceeds the threshold. The default is 15.
Data Collection	
Collect data for active FXO ports?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of FXO ports that are active at each script iteration. The default is unselected.
Monitor FXO Ports in Service	
Data Collection	
Collect data for FXO ports in service?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of FXO ports that are in service at each script iteration. The default is Yes.
Monitor Active FXS Ports	
Event Notification	
Raise event if active FXS ports exceed threshold?	Select **Yes** to raise an event if the number of active FXS ports exceeds the threshold you set. The default is Yes.
Threshold - Maximum active FXS ports	Specify the maximum number of FXS ports that must be active before an event is raised. The default is 25 ports.
Event severity when active FXS ports exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active FXS ports exceeds the threshold. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for active FXS ports?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of FXS ports that are active at each script iteration. The default is unselected.
Monitor FXS Ports in Service	
Data Collection	
Collect data for FXS ports in service?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of FXS ports that are in service at each script iteration. The default is Yes.
Monitor Active PRI Channels	
Event Notification	
Raise event if active PRI channels exceed threshold?	Select **Yes** to raise an event if the number of active PRI channels exceeds the threshold you set. The default is Yes.
Threshold - Maximum active PRI channels	Specify the maximum number of PRI channels that must be active before an event is raised. The default is 100 channels.
Event severity when active PRI channels exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active PRI channels exceeds the threshold. The default is 15.
Data Collection	
Collect data for active PRI channels?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of PRI channels that are active at each script iteration. The default is unselected.
Monitor PRI Spans in Service	
Data Collection	
Collect data for PRI spans in service?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of PRI spans that are in service at each script iteration. The default is Yes.
Monitor Active T1CAS Channels	
Event Notification	
Raise event if active T1CAS channels exceed threshold?	Select **Yes** to raise an event if the number of active T1CAS channels exceeds the threshold you set. The default is Yes.
Threshold - Maximum active T1CAS channels	Specify the maximum number of T1CAS channels that must be active before an event is raised. The default is 100 channels.
Event severity when active T1CAS channels exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active T1CAS channels exceeds the threshold. The default is 15.
Data Collection	
Collect data for active T1CAS channels?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of T1CAS channels that are active at each script iteration. The default is unselected.
Monitor T1CAS Spans in Service	
Data Collection	

Parameter	How to Set It
Collect data for T1CAS spans in service?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of T1CAS spans that are in service at each script iteration. The default is Yes.

21.10 CCM_RegisteredResources

Use this Knowledge Script to monitor changes in the number of resources (phones, gateways, and station devices) registered to a Communications Manager server. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the percentage of increase or decrease in registered resources, as well as data streams for the number of registered resources related to those percentages of increases or decreases.

If the number of registered resources increases from zero to a larger number, this script reports the increase as 100% multiplied by the number of new registered resources. For example, if the previous number of registered gateways is zero, and the latest iteration of this script finds seven new registered gateways, then the script reports the increase in registered gateways as 700%. For more information about phone resources, see PhoneInventory.

This script is a member of the CiscoCM recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 1245.

21.10.1 Resource Object

CiscoCM_CMServer

21.10.2 Default Schedule

By default, this script runs every five minutes.

If you are running this script as part of the Recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered so as to lessen the impact on CPU utilization when you run the KSG.

21.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CCM_RegisteredResources job. The default is 5.
Monitor Registered Hardware Phones	
Data Collection	
Collect data for registered hardware phones?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number hardware phones that are registered at each script iteration.
Monitor Increase in Registered Hardware Phones	
Event Notification	

Parameter	How to Set It
Raise event if increase in registered hardware phones exceeds threshold?	Select **Yes** to raise an event if the increase in registered hardware phones exceeds the threshold you set. The default is unselected.
Threshold - Maximum increase in registered hardware phones	Specify the maximum increase in the number of registered hardware phones that can occur before an event is raised. The default is 1 phone.
Event severity when increase in registered hardware phones exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of new registered hardware phones exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for increase in registered hardware phones?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of increase in hardware phones during the monitoring period. The default is unselected.
Monitor Percentage Increase in Registered Hardware Phones	
Event Notification	
Raise event if percentage increase in registered hardware phones exceeds threshold?	Select **Yes** to raise an event if the percentage increase in registered hardware phones exceeds the threshold you set. The default is Yes.
Threshold - Maximum percentage increase in registered hardware phones	Specify the maximum decrease in registered hardware phones that can occur before an event is raised. The default is 10%.
Event severity when percentage increase in registered hardware phones exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of increase in registered hardware phones exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for decrease in registered hardware phones?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of decrease in hardware phones during the monitoring period. The default is unselected.
Monitor Decrease in Registered Hardware Phones	
Event Notification	
Raise event if decrease in registered hardware phones exceeds threshold?	Select **Yes** to raise an event if the decrease in registered hardware phones exceeds the threshold you set. The default is unselected.
Threshold - Maximum decrease in registered hardware phones	Specify the maximum decrease in the number of registered hardware phones that can occur before an event is raised. The default is 1 phone.
Event severity when decrease in registered hardware phones exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the decrease in number of registered hardware phones exceeds the threshold you set. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for decrease in registered hardware phones?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the decreasing number of registered hardware phones during the monitoring period.
Monitor Percentage Decrease in Registered Hardware Phones	
Event Notification	
Raise event if percentage decrease in registered hardware phones exceeds threshold?	Select **Yes** to raise an event if the percentage decrease in registered hardware phones exceeds the threshold you set. The default is Yes.
Threshold - Maximum percentage decrease in registered hardware phones	Specify the maximum percentage decrease in registered hardware phones that can occur before an event is raised. The default is 10%.
Event severity when percentage decrease in registered hardware phones exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of decrease in registered hardware phones exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for percentage decrease in registered hardware phones?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of decrease in hardware phones during the monitoring period. The default is unselected.
Monitor Registered MGCP Gateways	
Data Collection	
Collect data for registered MGCP gateways?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of MGCP gateways registered at each script iteration.
Monitor Increase in Registered MGCP Gateways	
Event Notification	
Raise event if increase in registered MGCP gateways exceeds threshold?	Select **Yes** to raise an event if the increase in registered MGCP gateways exceeds the threshold you set. The default is Yes.
Threshold - Maximum increase in registered MGCP gateways	Specify the maximum increase in registered MGCP gateways that can occur before an event is raised. The default is 10%.
Event severity when increase in registered MGCP gateways exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of increase in registered MGCP gateways exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for increase in registered MGCP gateways?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of increase in registered MGCP gateways during the monitoring period.
Monitor Decrease in Registered MGCP Gateways	
Event Notification	

Parameter	How to Set It
Raise event if decrease in registered MGCP gateways exceeds threshold?	Select **Yes** to raise an event if the decrease in registered MGCP gateways exceeds the threshold you set. The default is Yes.
Threshold - Maximum decrease in registered MGCP gateways	Specify the maximum decrease in registered MGCP gateways that can occur before an event is raised. The default is 10%.
Event severity when decrease in registered MGCP gateways exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of decrease in registered MGCP gateways exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for decrease in registered MGCP gateways?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of decrease in registered MGCP gateways during the monitoring period.
Monitor Registered Analog Access Gateways	
Data Collection	
Collect data for registered Analog Access gateways?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of Analog Access gateways registered at each script iteration.
Monitor Increase in Registered Analog Access Gateways	
Event Notification	
Raise event if increase in registered Analog Access gateways exceeds threshold?	Select **Yes** to raise an event if the increase in registered Analog Access gateways exceeds the threshold you set. The default is Yes.
Threshold - Maximum increase in registered Analog Access gateways	Specify the maximum increase in registered Analog Access gateways that can occur before an event is raised. The default is 10%.
Event severity when increase in registered Analog Access gateways exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of increase in registered Analog Access gateways exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for increase in registered Analog Access gateways?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the increase in registered Analog Access gateways during the monitoring period.
Monitor Decrease in Registered Analog Access Gateways	
Event Notification	
Raise event if decrease in registered Analog Access gateways exceeds threshold?	Select **Yes** to raise an event if the decrease in registered Analog Access gateways exceeds the threshold you set. The default is Yes.
Threshold - Maximum decrease in registered Analog Access gateways	Specify the maximum decrease in registered Analog Access gateways that can occur before an event is raised. The default is 10%.

Parameter	How to Set It
Event severity when decrease in registered Analog Access gateways exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of decrease in registered Analog Access gateways exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for decrease in registered Analog Access gateways?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of decrease in registered Analog Access gateways during the monitoring period.
Monitor Registered Other Station Devices	
Data Collection	
Collect data for registered other station devices?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of other station devices registered at each script iteration.
Monitor Increase in Registered Other Station Devices	
Event Notification	
Raise event if increase in registered other station devices exceeds threshold?	Select **Yes** to raise an event if the increase in registered other station devices exceeds the threshold you set. The default is Yes.
Threshold - Maximum increase in registered other station devices	Specify the maximum increase in registered other station devices that can occur before an event is raised. The default is 10%.
Event severity when increase in registered other station devices exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of increase in registered other station devices exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for increase in registered other station devices?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of increase in registered other station devices during the monitoring period.
Monitor Decrease in Registered Other Station Devices	
Event Notification	
Raise event if decrease in registered other station devices exceeds threshold?	Select **Yes** to raise an event if the decrease in registered other station devices exceeds the threshold you set. The default is Yes.
Threshold - Maximum decrease in registered other station devices	Specify the maximum decrease in registered other station devices that can occur before an event is raised. The default is 10%.
Event severity when decrease in registered other station devices exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of decrease in registered other station devices exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for decrease in registered other station devices?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of decrease in registered other station devices during the monitoring period.

21.11 CCM_ResourceAvailability

Use this Knowledge Script to monitor the number of times Communications Manager requests a resource that is unavailable. This script monitors the following resources:

- Annunciators
- Hardware, software, and video conference bridges
- Locations
- Media Termination Points (MTPs)
- Music-on-Hold (MOH)
- Transcoders

This script raises an event if an availability threshold is exceeded. In addition, this script generates data streams for instances of unavailability for each monitored resource.

This script is a member of the CiscoCM recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 1245.

21.11.1 Resource Object

CiscoCM_CallProcessor

21.11.2 Default Schedule

By default, this script runs every 15 minutes.

If you are running this script as part of the Recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered so as to lessen the impact on CPU utilization when you run the KSG.

21.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CCM_ResourceAvailability job. The default is 5.
Monitor Unavailable Annunciator Resources	
Event Notification	
Raise event if number of times annunciator resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times annunciator resources were unavailable exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum number of times annunciator resources were unavailable	Specify the maximum number of times an annunciator resource can be unavailable before an event is raised. The default is 0 times
Event severity when number of times annunciator resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times an annunciator resource was unavailable exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of times annunciator resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times annunciator resources were unavailable during the monitoring period.
Monitor Unavailable Hardware Conference Bridge Resources	
Event Notification	
Raise event if number of times hardware conference bridge resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times hardware conference bridge resources were unavailable exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of times hardware conference bridge resources ere unavailable	Specify the maximum number of times a hardware conference bridge resource can be unavailable before an event is raised. The default is 0 times.
Event severity when number of times hardware conference bridge resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times a hardware conference bridge resource was unavailable exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of times hardware conference bridge resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times hardware conference bridge resources were unavailable during the monitoring period.
Monitor Unavailable Software Conference Bridge Resources	
Event Notification	
Raise event if number of times software conference bridge resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times software conference bridge resources were unavailable exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum number of times software conference bridge resources were unavailable	Specify the maximum number of times a software conference bridge resource can be unavailable before an event is raised. The default is 0 times.
Event severity when number of times software conference bridge resource were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times a software conference bridge resource was unavailable exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of times software conference bridge resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times software conference bridge resources were unavailable during the monitoring period.
Monitor Unavailable Video Conference Bridge Resources	
Event Notification	
Raise event if number of times video conference bridge resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times video conference bridge resources were unavailable exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of times video conference bridge resources were unavailable	Specify the maximum number of times a video conference bridge resource can be unavailable before an event is raised. The default is 0 times.
Event severity when number of times video conference bridge resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times a video conference bridge resource was unavailable exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of times video conference bridge resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times video conference bridge resources were unavailable during the monitoring period.
Monitor Unavailable Location Resources	
Event Notification	
Raise event if number of times location resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number times location resources were unavailable exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of times location resources were unavailable	Specify the maximum number of times a location resource can be unavailable before an event is raised. The default is 0 times.

Parameter	How to Set It
Event severity when number of times location resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times a location resource was unavailable exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of times location resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times location resources were unavailable during the monitoring period.
Monitor Unavailable Media Termination Point Resources	
Event Notification	
Raise event if number of times Media Termination Point resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times MTP resources were unavailable exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of times Media Termination Point resources were unavailable	Specify the maximum number of times an MTP resource can be unavailable before an event is raised. The default is 0 times.
Event severity when number of times Media Termination Point resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times an MTP resource was unavailable exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of times Media Termination Point resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times MTP resources were unavailable during the monitoring period.
Monitor Unavailable Music-on-Hold Resources	
Event Notification	
Raise event if number of times Music-on-Hold resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times MOH resources were unavailable exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of times Music-on-Hold resources were unavailable	Specify the maximum number of times an MOH resource can be unavailable before an event is raised. The default is 0 times.
Event severity when number of times Music-on-Hold resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times an MOH resource was unavailable exceeds the threshold you set. The default is 15.

Parameter	How to Set It
Data Collection	
Collect data for number of times Music-on-Hold resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times MOH resources were unavailable during the monitoring period.
Monitor Unavailable Transcoder Resources	
Event Notification	
Raise event if number of times transcoder resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times transcoder resources were unavailable exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of times transcoder resources were unavailable	Specify the maximum number of times a transcoder resource can be unavailable before an event is raised. The default is 0 times.
Event severity when number of times transcoder resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times a transcoder resource was unavailable exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of times transcoder resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times transcoder resources were unavailable during the monitoring period.

21.12 CCM_SystemPerformance

Use this Knowledge Script to monitor call throttling and signal processing queues for a Communications Manager. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the following metrics:

- Low, normal, and high priority signals that are processed and in queue
- Calls rejected due to throttling
- Throttled SCCP (Skinny Client Control Protocol) devices
- Number of times the Communications Manager went into a throttling state
- Average amount of expected delay

Throttling refers to an internal process within Communications Manager that prevents it from being inundated with heavy call traffic.

This script is a member of the CiscoCM recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 1245.

21.12.1 Resource Object

CiscoCM_CallProcessor

21.12.2 Default Schedule

By default, this script runs every five minutes.

If you are running this script as part of the Recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered so as to lessen the impact on CPU utilization when you run the KSG.

21.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CCM_SystemPerformance job. The default is 5.
Event Notification	
Raise event if call-throttling state entered?	Select **Yes** to raise an event if Communications Manager enters a call-throttling state. The default is Yes.
Event severity when call-throttling state entered	Set the event severity level, from 1 to 40, to indicate the importance of an event in which Communications Manager enters a call-throttling state. The default is 10.

Parameter	How to Set It
Raise event if severe call-throttling state entered?	Select **Yes** to raise an event if Communications Manager enters a severe call-throttling state. The default is Yes.
Event severity when severe call-throttling state entered	Set the event severity level, from 1 to 40, to indicate the importance of an event in which Communications Manager enters a severe call-throttling state. The default is 5.
Monitor High Priority Signals in Queue	
Event Notification	
Raise event if high priority signals in queue exceed threshold?	Select **Yes** to raise an event if the number of high-priority signals in queue exceeds the threshold you set. The default is Yes.
Threshold - Maximum high priority signals in queue	Specify the maximum number of high-priority signals that must be in queue before an event is raised. The default is 25 signals.
Event severity when high priority signals in queue exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of high-priority signals in queue exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for high priority signals in queue?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of high-priority signals in queue at each script iteration.
Monitor High Priority Signals Processed	
Data Collection	
Collect data for high priority signals processed?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of high-priority signals that were recently processed at each script iteration.
Monitor Normal Priority Signals in Queue	
Event Notification	
Raise event if normal priority signals in queue exceed threshold?	Select **Yes** to raise an event if the number of normal priority signals in queue exceeds the threshold you set. The default is Yes.
Threshold - Maximum normal priority signals in queue	Specify the maximum number of normal-priority signals that must be in queue before an event is raised. The default is 50 signals.
Event severity when normal priority signals in queue exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of normal-priority signals in queue exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for normal priority signals?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of normal-priority signals in queue at each script iteration.
Monitor Normal Priority Signals Processed	
Data Collection	
Collect data for normal priority signals processed?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of normal-priority signals that were recently processed at each script iteration.
Monitor Low Priority Signals in Queue	

Parameter	How to Set It
Event Notification	
Raise event if low priority signals in queue exceed threshold?	Select **Yes** to raise an event if the number of low-priority signals in queue exceeds the threshold you set. The default is Yes.
Threshold - Maximum low priority signals in queue	Specify the maximum number of low-priority signals that must be in queue before an event is raised. The default is 100 signals.
Event severity when low priority signals in queue exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of low-priority signals in queue exceeds the threshold you set. The default is 10.
Data Collection	
Collect data for low priority signals in queue?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of low-priority signals in queue at each script iteration.
Monitor Low Priority Signals Processed	
Data Collection	
Collect data for low priority signals processed?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of low-priority signals that were recently processed at each script iteration.
Monitor Rejected Calls	
Event Notification	
Raise event if rejected calls exceed threshold?	Select **Yes** to raise an event if the number of rejected calls exceeds the threshold you set. The default is Yes.
Threshold - Maximum rejected calls	Specify the maximum number of calls that must be rejected before an event is raised. The default is 0 calls.
Event severity when rejected calls exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of rejected calls exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for rejected calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls rejected during the monitoring period.
Monitor Throttled SCCP Devices	
Event Notification	
Raise event if throttled SCCP devices exceed threshold?	Select **Yes** to raise an event if the number of throttled SCCP devices exceeds the threshold you set. The default is Yes.
Threshold - Maximum throttled SCCP devices	Specify the maximum number of SCCP devices that must be throttled before an event is raised. The default is 0 devices.
Event severity when throttled SCCP devices exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of throttled SCCP devices exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for throttled SCCP devices?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of SCCP devices throttled during the monitoring period.
Monitor Call-Throttling	
Event Notification	

Parameter	How to Set It
Raise event if number of times in call-throttling mode exceeds threshold?	Select **Yes** to raise an event if the number of times Communications Manager entered a call-throttling state exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of times in call-throttling mode	Specify the maximum number of times Communications Manager must enter a call-throttling state before an event is raised. The default is 0 times.
Event severity when number of times in call-throttling mode exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times Communications Manager entered a call-throttling state exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of times in call-throttling mode?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times Communications Manager entered a call-throttling state during the monitoring period.
Monitor Average Expected Delay	
Event Notification	
Raise event if average expected delay exceeds threshold?	Select **Yes** to raise an event if the average amount of time it takes Communications Manager to handle incoming messages exceeds the threshold. The default is Yes.
Threshold - Maximum average expected delay	Specify the maximum amount of average delay Communications Manager can expect before an event is raised. The default is 2 seconds.
Event severity when average expected delay exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average amount of expected delay exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for average expected delay?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the average amount of expected delay. The default is unselected.

21.13 CDR_CallFailures

Use this Knowledge Script to monitor call detail records (CDRs) retrieved from the primary Communications Manager for calls that ended with an abnormal termination code.

This script raises an event if the number of failed calls exceeds the threshold you set. In addition, this script generates a data stream for the number of failed calls.

This script provides the following features:

- **Monitoring**. In monitoring mode, this script checks the CDR tables at each specified interval for new records that match your query. In the first iteration of the job, this script finds the last record in the CDR table and checks back one interval from there. In subsequent iterations, this script checks for new records that match the query in each interval.
- **Troubleshooting**. In troubleshooting mode, this script runs once and checks the CDR tables for calls whose disconnect time is within the range you select in the *Select call disconnect time range* parameter.

  To run this script in troubleshooting mode, select **Run once** on the Schedule tab.
- **Diagnosing**. In diagnostic mode, this script works in conjunction with NetIQ Vivinet Diagnostics to diagnose VoIP quality problems detected monitoring. If the *Maximum number of failed calls* threshold is exceeded, then, by default, this script launches Action_DiagnoseVoIPQuality, a Knowledge Script that in turn launches Vivinet Diagnostics to generate a diagnosis of the problem.

  To turn off diagnostic mode, click the Actions tab, select **Action_DiagnoseVoIPQuality**, and click **Delete**. Turning diagnostic mode off or on does not affect the events raised by this script.

21.13.1 Prerequisites

- Run the SetupSupplementalDB Knowledge Script to create the Cisco CM supplemental database that will house the call detail records.
- Run the CDR_RetrieveCallRecords and CDR_RetrieveConfigData Knowledge Script to populate the database.

For more information, see "Understanding the Cisco CM Supplemental Database" on page 1217.

21.13.2 Resource Object

CiscoCM_CDRMgmt

21.13.3 Default Schedule

By default, this script runs every five minutes.

21.13.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CallFailures job. The default is 5.
Include call details?	Select **Yes** to include call details in the events raised by this script. Leave this parameter unchecked to suppress call details. If you select **Yes**, an event includes the following details: • Originating Device Name • Originating IP Address • Calling Party Number • Originating Media Cap - Payload Capacity • Destination Device Name • Destination IP Address • Original Called Party Number • Final Called Party Number • Originating Cause • Destination Cause
Raise event if no records found?	Select **Yes** to raise an event if there are no CDRs to monitor. Note that we do not mean there are no CDRs with abnormal termination codes, but that there are no CDRs at all. The default is unselected.
Event severity when no records found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no CDRs were found. The default is 25.
Query Filters Despite the number of calls AppManager might find that match the filters you select, an event displays only the first 50 calls.	
Maximum table size	Specify the maximum number of rows you want to include in the query table. Default is 50 rows.
Ignore unknown cause codes?	Select Yes if you want to ignore CDRs that have cause codes of "Unknown." The default is unselected.
Exclude these failure codes	Type a list of termination codes (separated by commas) that are not to be considered failures. See Termination Codes for a list of available codes. **NOTE:** Codes 0, 16, 31, and 393216 are automatically excluded. They are normal termination codes. However, these codes might appear in events if the other side of the call has a failure code that has not been excluded.
Minimum duration	Set this parameter to filter out records whose call duration is less than the specified value. Accept the default of 0 to ignore the filter for minimum call duration.
Maximum duration	Set this parameter to filter out records whose call duration is less than or equal to the specified value. Accept the default of 0 to ignore the filter for maximum call duration.
Calling directory number	Specify the number of the calling directory you want to find in the CDRs. Wildcard characters are acceptable. Leave this parameter blank to search for any calling directory number.

Parameter	How to Set It
Directory number connector	Set this parameter ONLY if you specify both a Calling directory number and a Called directory number. Your selection indicates how the script will connect the two parameters: AND or OR. The default is AND.
Called directory number	Specify the number of the called directory you want to find in the CDRs. Wildcard characters are acceptable. Leave this parameter blank to search for any called directory number.
Originating device name	Set this parameter to query for those calls whose originating device name matches the specified value. Wildcard characters are acceptable. Leave this parameter blank to search for any originating device name.
Device name connector	Set this parameter ONLY if you specify both an Originating device name and a Destination device name. Your selection indicates how the script will connect the two parameters: AND or OR. The default is AND.
Destination device name	Set this parameter to query for those calls whose destination device name matches the specified value. Wildcard characters are acceptable. Leave this parameter blank to search for any destination device name.
Troubleshooting	
Select call disconnect time range	Select a **Specific** or **Sliding** date/time range for which the query should search for data. The default time range is fixed at 24 hours. **NOTE:** This parameter is valid only when you select **Run once** on the **Schedule** tab.
Monitor Failed Calls	
Event Notification	
Raise event if number of failed calls exceeds threshold?	Select **Yes** to raise an event if the number of calls that failed with an abnormal termination code exceeds the threshold. The default is Yes.
Threshold - Maximum number of failed calls	Specify the maximum number of calls that can fail before an event is raised. The default is 0 calls.
Event severity when number of failed calls exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of failed calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of failed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that failed with an abnormal termination code during the monitoring period.

21.13.5 Termination Codes

Use this list of termination codes (also known as call release cause codes) to complete the *Exclude these failure codes* parameter.

Termination Code	Description	Explanation
0	No error	No error.

Termination Code	Description	Explanation
1	Unallocated (unassigned) number	Indicates the called party cannot be reached because, although the called party number is in a valid format, it is not currently allocated (assigned).
2	No route to specified transit network (national use)	Indicates one of the following: • The equipment sending this code has received a request to route the call through a transit network that it does not recognize. The equipment does not recognize the transit network either because the transit network does not exist or because the transit network exists but does not serve the equipment that is sending the code. • The prefix 0 is invalid for the entered number.
3	No route to destination	Indicates one of the following: • The called party cannot be reached because the network through which the call has been routed does not service the desired destination. This cause is supported on a network-dependent basis. • A 1 was dialed when not required. Redial without the 1.
4	Send special information tone	Indicates one of the following: • The prefix 1 is not required for this number. • The called party cannot be reached for reasons of a long-term nature. The special information tone should be returned to the calling party.
5	Misdialed trunk prefix (national use)	Indicates the erroneous inclusion of a trunk prefix in the called party number.
6	Channel unacceptable	Indicates a called user cannot negotiate for a B-channel other than that specified in the SETUP message.
7	Call awarded and being delivered in an established channel	Indicates the user has been awarded the incoming call and the call is being connected to a channel (such as packet mode or X.25 virtual calls) already established to that user for similar calls.
8	Preemption	Indicates a call has been preempted.
9	Preemption - circuit reserved for reuse	Indicates a call has been preempted because the circuit is reserved for reuse.
16	Normal call clearing	Indicates normal call clearing has occurred.
17	User busy	Indicates the called party is unable to accept another call because the user busy condition has been encountered. Code 17 might be generated by the called user or by the network. In the case of user-determined user busy, it is noted that the user equipment is compatible with the call.
18	No user responding	Indicates a called party does not respond to a call establishment message with an alerting or connect indication within the allotted prescribed period of time (before timer T303 or T310 has expired).
19	No answer from user (user alerted)	Indicates the called user has provided an alerting indication, but not a connect indication within a prescribed period of time (before timer T301 has expired).

Termination Code	Description	Explanation
20	Subscriber absent	Indicates one of the following: • A mobile station has logged off. • Radio contact is not obtained with a mobile station. • A personal telecommunications user is temporarily not addressable at any user-network interface.
21	Call rejected	Indicates one of the following: • The equipment sending this cause does not wish to accept the call, although it could have accepted the call because it is neither busy nor incompatible. • May be generated by the network, indicating the call was cleared due to a supplementary service constraint.
22	Number changed	Indicates the called party number indicated by the calling party is no longer assigned. The new called party number might optionally be included in the diagnostic field. If a network does not support this cause, then cause #1 shall be used.
26	Non-selected user clearing	Indicates the user has not been awarded the incoming call.
27	Destination out of order	Indicates the destination indicated by the user cannot be reached because the interface to the destination is not functioning correctly. The term "not functioning correctly" indicates a signal message was unable to be delivered to the remote party, as in the following examples: • Physical layer or data link layer failure at the remote party • User equipment off-line
28	Invalid number format (address incomplete)	Indicates one of the following: • The called party cannot be reached because the called party number is not in a valid format or is not complete. • The user should be returned a Special Intercept Announcement.
29	Facility rejected	Indicates one of the following: • The network cannot provide the requested facility. • A user in a special business group, such as a Centrex, dialed an undefined code.
30	Response to STATUS ENQUIRY	Indicates one of the following: • This cause is included in the Status Message when the reason for sending the Status Message was the previous receipt of a Status Enquiry message. • A user from outside a basic business group, such as a Centrex, has violated an access restriction feature.
31	Normal, unspecified	Used to report a normal event only when no other cause in the normal class applies.
34	No circuit/channel available	Indicates no appropriate circuit or channel is available to handle the call.

Termination Code	Description	Explanation
38	Network out of order	Indicates the network is not functioning correctly and the condition is likely to last a relatively long time. Immediately re-attempting the call is not likely to be successful.
39	Permanent frame mode connection out of service	Indicates a permanent connection was terminated, probably due to equipment failure.
40	Permanent frame mode connection operational	Indicates a permanent connection is operational again. The connection was previously terminated, probably due to equipment failure.
41	Temporary failure	Indicates the network is not functioning correctly and the condition is not likely to last a long time. The user might wish to attempt another call almost immediately. May also indicate a data link layer malfunction locally or at the remote network interface, or a call was cleared due to protocol error(s) at the remote network interface.
42	Switching equipment congestion	Indicates the switching equipment generating this cause is experiencing a period of high traffic.
43	Access information discarded	Indicates the network is unable to deliver user information (such as user-to-user information, low-level compatibility, or sub-address) to the remote users as requested.
44	Requested circuit/channel not available	Indicates the other side of the interface cannot provide the circuit or channel indicated by the requesting entity.
46	Precedence call blocked	Indicates the remote device that was called is busy.
47	Resource unavailable, unspecified	Indicates one of the following: • No other cause in the resource unavailable class applies. • The original destination is unavailable. Invoke redirection to a new destination.
49	Quality of Service not available	Indicates the network cannot provide the requested Quality of Service. This might be a subscription problem.
50	Requested facility not subscribed	Indicates this facility is unavailable because the user has not subscribed to it.
53	Service operation violated	Indicates the user has violated the service operation.
54	Incoming calls barred	Indicates the user will not accept the call delivered in the SETUP message.
55	Incoming calls barred within Closed User Group (CUG)	Indicates the network does not allow the user to receive calls.
57	Bearer capability not authorized	Indicates the user has requested a bearer capability implemented by the equipment that generated this cause. However, the user is not authorized to use it. This common problem is caused by incorrect Telco provisioning of the line at the time of installation.
58	Bearer capability not presently available	Indicates the user has requested a bearer capability implemented by the equipment that generated this cause. However, bearer capability is unavailable at the present time. This problem might be due to a temporary network problem or a subscription problem.

Termination Code	Description	Explanation
62	Inconsistency in designated outgoing access information and subscriber class	Indicates an inconsistency in the designated outgoing access information and subscriber class.
63	Service or option not available, unspecified	Indicates a service or option is not available. Used only when no other cause in this class applies.
65	Bearer capability not implemented	Indicates the equipment sending this cause does not support the requested bearer capability.
66	Channel type not implemented	Indicates the called party has reached an unsupported channel type.
69	Requested facility not implemented	Indicates the network (or node) does not support the requested bearer capability and therefore cannot be accessed at this time.
70	Only restricted digital information bearer capability available (national use)	Indicates the calling party has requested an unrestricted bearer service. However, the equipment sending this cause supports only the restricted version of the requested bearer capability.
79	Service or option not implemented, unspecified	Indicates a service or option was not implemented. Used only when no other cause in this class applies.
81	Invalid call reference value	Indicates the equipment sending this cause has received a message with a call reference not currently in use on the user-network interface. This value applies only if the call reference value is 1 or 2 octets long and is not the global call reference.
82	Identified channel does not exist	Indicates the equipment sending this cause has received a request to use a channel not active on the interface for a call.
83	A suspended call exists, but this call identity does not	Indicates suspended call exists but the call's identity does not.
84	Call identity in use	Indicates a call identity is in use.
85	No call suspended.	Indicates no call is suspended.
86	Call having the requested call identity has been cleared	Indicates the call having the requested call identity has cleared.
87	User not member of Closed User Group (CUG)	Indicates the call was not completed, probably due to one of the following reasons: • The dialed number is incorrect • The user is not authorized to use (or has not subscribed to) the requested service • User is using a service the remote device is not authorized to use
88	Incompatible destination	Indicates the equipment sending this cause has received a request to establish a call that has low layer compatibility, high layer compatibility, or other compatibility attributes (such as data rate or DN subaddress), which cannot be accommodated. This call can be returned by a switch to a CPE when trying to route a call to an incompatible facility, or one without a data rate.

Termination Code	Description	Explanation
90	Destination number missing and DC not subscribed	Indicates the call was not completed, probably due to one of the following reasons: • The dialed number is incorrect • The user is not authorized to use (or has not subscribed to) the requested service • User is using a service the remote device is not authorized to use
91	Invalid transit network selection (national use)	Indicates an invalid transit network selection has been requested.
95	Invalid message, unspecified	Indicates the entity sending this cause has received an invalid message. Used when no other cause in this class applies.
96	Mandatory information element is missing	Indicates the equipment sending this cause has received a message missing an information element that must be present in the message before the message can be processed.
97	Message type non-existent or not implemented	Indicates one of the following: • The equipment sending this cause has received a message type it does not recognize. Either the message is not defined, or it is defined and not implemented by the equipment sending this cause. • A problem with the remote configuration or with the local D-channel.
98	Message not compatible with the call state, or the message type is non-existent or not implemented	Indicates one of the following: • Message received is not compatible with the call state • Message type is non-existent or not implemented
99	An information element or parameter non-existent or not implemented	Indicates the equipment sending this cause has received a message that includes information elements not recognized because either the information element identifier is not defined, or it is defined but not implemented by the equipment sending the cause. However, the information element is not required for the equipment sending the cause to process the message.
100	Invalid information element contents	Indicates the equipment sending this cause has received an information element it has implemented. However, one or more fields of the information elements are coded in such a way (such as truncated, invalid extension bit, invalid field values) that the information element has not been implemented by the equipment sending this cause.
101	The message not compatible with the call state	Indicates one of the following: • The equipment sending this cause has received a message procedures indicate is not a permissible message to receive at this time. • The switch sending this cause is clearing the call because a threshold has been exceeded for multiple protocol errors during an active call.
102	Call terminated when timer expired; a recovery routine executed to recover from the error	Indicates a procedure has been initiated by the expiration of a timer in associated with error-handling procedures.

Termination Code	Description	Explanation
103	Parameter non-existent or not implemented - passed on (national use)	Indicates the equipment sending this cause has received a message that includes parameters not recognized because the parameters are defined but not implemented by the equipment sending the cause. The parameters were ignored. In addition, if the equipment sending this cause is an intermediate point, then this cause indicates the parameters were passed on unchanged.
110	Message with unrecognized parameter discarded	Indicates the equipment sending this cause has discarded a received message that includes a parameter that is not recognized.
111	Protocol error, unspecified	Reports a protocol error event only when no other cause in this class applies. This cause might be displayed if the user failed to dial a 9 or an 8 for an outside line. In addition, this cause might be returned in the event of certain types of restrictions as to number of calls.
122	Precedence level exceeded	Indicates users attempted to make a call with a higher level of precedence than the highest precedence level authorized for their line.
123	Device not preemptable	Indicates one of the following: • The dialed number is non preemptable. That is, the dialed number registers as busy and has no call waiting, no call forwarding, and no alternate party designations. • The dialed number has a higher precedence level (or priority) than the dialing number and cannot be preempted.
125	Out of bandwidth	Indicates not enough bandwidth was found to connect a call to the destination location.
127	Interworking, unspecified	Indicates an interworking call (usually a call to SW56 service) has ended. This might also be seen in the event of a non-specific rejection by a long distance carrier.
129	Precedence out of bandwidth	Indicates not enough bandwidth was found to connect a precedence call to the destination location.
162144 0x40000	Conference full	A Cisco-specific code. Indicates a conference is at full capacity and can accept no new callers.
393216 0x60000	Call split	A Cisco-specific code. Indicates a call was terminated during a transfer operation because it was split off and terminated (not part of the final transferred call). This code can help determine which calls were terminated as part of a feature operation.
458752 0x70000	Drop any party/drop last party	A Cisco-specific code. Indicates a call was dropped from a conference by the new feature "drop any party/drop last party."

21.14 CDR_CallQuality

Use this Knowledge Script to monitor call detail records (CDRs) and call management records (CMRs) retrieved from the primary Communications Manager for jitter, latency, packet loss, and MOS (Mean Opinion Score).

This script raises an event if a monitored value exceeds or falls below a threshold. In addition, this script generates data streams for average and minimum MOS, and maximum jitter, latency, and packet loss.

This script provides the following features:

- **Monitoring**. In monitoring mode, this script checks the CDR tables at each specified interval for new records that match your query. In the first iteration of the job, this script finds the last record in the CDR table and checks back one interval from there. In subsequent iterations, this script checks for new records that match the query in each interval.
- **Troubleshooting**. In troubleshooting mode, this script runs once and checks the CDR tables for calls whose disconnect time is within the range you select in the *Select call disconnect time range* parameter.

  To run this script in troubleshooting mode, select **Run once** on the Schedule tab.
- **Diagnosing**. In diagnostic mode, this script works in conjunction with NetIQ Vivinet Diagnostics to diagnose VoIP quality problems detected during monitoring. If a call quality threshold is exceeded, then, by default, this script launches Action_DiagnoseVoIPQuality, a Knowledge Script that in turn launches Vivinet Diagnostics to generate a diagnosis of the problem.

  To turn off diagnostic mode, click on the Actions tab, select **Action_DiagnoseVoIPQuality**, and click **Delete**. Turning diagnostic mode off or on does not affect the events raised by this script.

21.14.1 Prerequisites

- Run the SetupSupplementalDB Knowledge Script to create the Cisco CM supplemental database that will house the call detail records.
- Run the CDR_RetrieveCallRecords and CDR_RetrieveConfigData Knowledge Script to populate the database.

For more information, see Understanding the Cisco CM Supplemental Database.

21.14.2 Resource Object

CiscoCM_CDRMgmt

21.14.3 Default Schedule

By default, this script runs every five minutes.

21.14.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CDR_CallQuality job. The default is 5.
Include call details?	Select **Yes** to include call details in the events raised by this script. Leave this parameter unchecked to suppress call details. If you select **Yes**, an event includes the following details: • Average and minimum MOS • Jitter • Latency • Lost Packets (%) • Originating and Destination Devices • Calling and Called Numbers • Origination and Disconnect Times • Duration (seconds) • Calling and Called Number Partitions
Sort call details table by this value	Select the value from the call details data by which you want to sort. Your can choose from all of the options listed in the previous parameter.
Sort type for call details table	Select a sort type for the call details data. Your options are Ascending or Descending.
Raise event if no records found?	Select **Yes** to raise an event if there are no CDRs to monitor. Note that we do not mean there are no CDRs with call quality data, but that there are no CDRs at all. The default is unselected.
Event severity when no records found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no CDRs were found. The default is 25.
Query Filters • Despite the number of calls AppManager might find that match the filters you select, an event displays only the first 50 calls. • Regardless of the filters you select (or if you select no filters at all), an event displays call data in two tables labeled Inbound and Outbound. The Inbound table contains details of calls coming into the Originating Device (according to the CMR table). The Outbound table contains details of calls going out from the Originating Device (according to the CMR table).	
Minimum duration	Set this parameter to filter out records whose call duration is less than the specified value. Accept the default of 0 to ignore the filter for minimum duration.
Maximum duration	Set this parameter to filter out records whose call duration is more than or equal to the specified value. Accept the default of 0 to ignore the filter for maximum duration.
Directory number	Set this parameter to query for those calls whose directory number matches the specified value. Wildcard characters are acceptable. If you use multiple expressions, separate each expression with a comma, such as `123*,2345, 234*`. Leave this parameter blank to search for any directory number.
Device name	Set this parameter to query for those calls whose device name matches the specified value. Wildcard characters are acceptable. Wildcard characters are acceptable. If you use multiple expressions, separate each expression with a comma, such as `123*,2345,234*`. Leave this parameter blank to search for any device name.

Parameter	How to Set It
Troubleshooting	
Select call disconnect time range	Select a **Specific** or **Sliding** date/time range for which the query should search for data. The default time range is fixed at 24 hours. **NOTE:** This parameter is valid only when you select **Run once** on the **Schedule** tab.
Monitor Average Acceptable Listening MOS	
Event Notification	
Raise event if average MOS falls below threshold?	Select **Yes** to raise an event if the average MOS value falls below the threshold. The default is Yes.
Threshold - Average MOS	Specify the lowest average MOS value that must occur to prevent an event from being raised. The default is 3.60.
Event severity when average MOS falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average MOS value falls below the threshold. The default is 5.
Data Collection	
Collect data for average MOS?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the average MOS value during the monitoring period.
Monitor Minimum Acceptable Listening MOS	
Event Notification	
Raise event if minimum MOS falls below threshold?	Select **Yes** to raise an event if the minimum MOS value falls below the threshold. The default is Yes.
Threshold - Minimum MOS	Specify the lowest MOS value that must occur to prevent an event from being raised. The default is 3.60.
Event severity when minimum MOS falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the minimum MOS value falls below the threshold. The default is 5.
Data Collection	
Collect data for minimum MOS?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the minimum MOS value during the monitoring period.
Monitor Jitter	
Event Notification	
Raise event if jitter exceeds threshold?	Select **Yes** to raise an event if the jitter value exceeds the threshold. The default is Yes.
Threshold - Maximum jitter	Specify the highest jitter value that can occur before an event is raised. The default is 60 milliseconds.
Event severity when jitter exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the jitter value exceeds the threshold. The default is 15.
Data Collection	
Collect data for jitter?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of jitter that occurred during the monitoring period.
Monitor Latency	

Parameter	How to Set It
Event Notification	
Raise event if latency exceeds threshold?	Select **Yes** to raise an event if the latency value exceeds the threshold. The default is Yes.
Threshold - Maximum latency	Specify the highest amount of latency that can occur before an event is raised. The default is 400 milliseconds.
Event severity when latency exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the latency value exceeds the threshold. The default is 15.
Data Collection	
Collect data for latency?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of latency that occurred during the monitoring period.
Monitor Packet Loss	
Event Notification	
Raise event if packet loss exceeds threshold?	Select **Yes** to raise an event if the packet loss value exceeds the threshold. The default is Yes.
Threshold - Maximum packet loss	Specify the highest amount of packet loss that can occur before an event is raised. The default is 1%.
Event severity when packet loss exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the packet loss value exceeds the threshold. The default is 15.
Data Collection	
Collect data for packet loss?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of packet loss that occurred during the monitoring period.

21.15 CDR_Query

Use this Knowledge Script to search for call detail records (CDRs) retrieved from the primary Communications Manager and stored in the local SQL database. The search is based on query filters you select. This script raises an event if no CDRs are found or if the number of CDRs found exceeds the threshold you set. In addition, this script generates a data stream for the number of records found.

This script provides the following features:

- **Monitoring**. In monitoring mode, this script checks the CDR tables at each specified interval for new records that match your query. In the first iteration of the job, this script finds the last record in the CDR table and checks back one interval from there. In subsequent iterations, this script checks for new records that match the query in each interval.
- **Troubleshooting**. In troubleshooting mode, this script runs once and checks the CDR tables for calls whose disconnect time is within the range you select in the *Select call disconnect time range* parameter.

  To run this script in troubleshooting mode, select **Run once** on the Schedule tab.

21.15.1 Resource Object

CiscoCM_CDRMgmt

21.15.2 Default Schedule

By default, this script runs every five minutes.

21.15.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CDR_Query job. The default is 5.
Raise event if no records found?	Select **Yes** to raise an event if there are no CDRs to monitor. Note that we do not mean there are no CDRs with call quality data, but that there are no CDRs at all. The default is unselected.
Event severity when no records found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no CDRs were found. The default is 25.
Query Filters	Despite the number of calls AppManager might find that match the filters you select, an event displays only the first 50 calls.
Minimum duration	Set this parameter to filter out records whose call duration is less than the specified value. Accept the default of 0 to ignore the filter for minimum call duration.
Maximum duration	Set this parameter to filter out records whose call duration is less than or equal to the specified value. Accept the default of 0 to ignore the filter for maximum call duration.

Parameter	How to Set It
Calling directory number	Specify the number of the calling directory you want to find in the CDRs. Wildcard characters are acceptable. Leave this parameter blank to search for any calling directory number.
Directory number connector	Set this parameter ONLY if you specify both a Calling directory number and a Called directory number. Your selection indicates how the script will connect the two parameters: AND or OR. The default is AND.
Called directory number	Specify the number for the called directory you want to find in the CDRs. Wildcard characters are acceptable. Leave this parameter blank to search for any called directory number.
Called directory number type	Select the type of called directory number you want to find in the CDRs. You can filter the CDRs by the originally called directory number, the most recently called directory number, or by either directory number. The default is *either* directory number.
Originating device name	Set this parameter to query for those calls whose originating device name matches the specified value. Wildcard characters are acceptable. Leave this parameter blank to search for any originating device name.
Device name connector	Set this parameter ONLY if you specify values for both the *Originating device name* and *Destination device name* parameters. Your selection indicates how the script will connect the two parameters: AND or OR. The default is AND.
Destination device name	Set this parameter to query for those calls whose destination device name matches the specified value. Wildcard characters are acceptable. Leave this parameter blank to search for any destination device name.
Troubleshooting	
Select call disconnect time range	Select a **Specific** or **Sliding** date/time range for which the query should search for data. The default time range is fixed at 24 hours. **NOTE:** This parameter is valid only when you select **Run once** on the Schedule tab.
Call time range type	Select the type of call time range you want to use when troubleshooting. The time ranges can match on the following options: • Origination time of calls • Disconnect time of calls • Either origination or disconnect time • Both origination and disconnect time • All calls that span some portion of the time range, including calls that started before the range, and calls that ended after the range. The default is DisconnectTime. **NOTE:** This filter will only work if you schedule the script to *Run Once*.
Monitor Records Found	
Event Notification	
Raise event if number of records exceeds threshold?	Select **Yes** to raise an event if the number of CDRs found exceeds the threshold. The default is Yes.
Threshold - Maximum number of records	Specify the maximum number of CDRs that can be found before an event is raised. The default is 0 CDRs.
Event severity when number of records exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of CDRs found exceeds the threshold. The default is 15.

Parameter	How to Set It
Data Collection	
Collect data for number of records?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of CDRs found during the monitoring period.

21.16 CDR_RetrieveCallRecords

The primary Communications Manager sends call detail records (CDRs) to a folder you specified on the proxy agent computer. Use this script to retrieve the CDRs from the folder and insert them into the Cisco CM supplemental database. This script will archive the records, if indicated.

21.16.1 Prerequisite

Run the SetupSupplementalDB Knowledge Script to create the supplemental database. For more information, see "Understanding the Cisco CM Supplemental Database" on page 1217.

21.16.2 Resource Object

CiscoCM_CDRMgmt

21.16.3 Default Schedule

By default, this script runs every five minutes.

21.16.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CDR_RetrieveCallRecords job. The default is 5.
Archive call detail records after processing?	Select **Yes** to copy CDRs to an archive folder after processing. If you leave this parameter unchecked, CDRs are deleted after processing.
Archive folder	Specify the full path to a location on the agent computer in which to create the archive folder.

21.17 CDR_RetrieveConfigData

Use this Knowledge Script to retrieve Communications Manager configuration data from the primary Communications Manager and store it in the Cisco CM supplemental database.

21.17.1 Prerequisite

Run the SetupSupplementalDB Knowledge Script to create the supplemental database that will house the configuration data. For more information, see "Understanding the Cisco CM Supplemental Database" on page 1217.

21.17.2 Resource Object

CiscoCM_CDRMgmt

21.17.3 Default Schedule

By default, this script runs once a day, at 3 A.M, so as to perform its possibly CPU-intensive function at a time when the Communications Manager is least busy.

However, because the PhoneDeregistrations script uses the configuration data this script retrieves, you might want to set this script to "Run Once" so the configuration data is retrieved immediately. When the "Run Once" job is complete, you can then run this script using the default schedule of once daily.

21.17.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CDR_RetrieveConfigData job. The default is 5.
Raise event if data collection succeeds?	Select **Yes** to raise an event if the data-collection process succeeds. The default is unselected.
Event severity when data collection succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data collection succeeds. The default is 25.

21.18 CFB_Hardware_Device

Use this Knowledge Script to monitor the resource usage of a registered hardware conference bridge device.

- Active conferences
- Completed conferences
- Resource usage
- Active resources
- Unavailable resources

This script raises an event if a threshold is exceeded. In addition, this script generates data streams for active and completed conferences, active resources, and resource usage (%).

21.18.1 Resource Object

CiscoCM_HW_CFBObj

21.18.2 Default Schedule

By default, this script runs every 15 minutes.

21.18.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CFB_Hardware_Device job. The default is 5.
Monitor Active Conferences	
Event Notification	
Raise event if active conferences exceed threshold?	Select **Yes** to raise an event if the number of active hardware conferences exceeds the threshold you set. The default is Yes.
Threshold - Maximum active conferences	Specify the maximum number of hardware conferences that must be active before an event is raised. The default is 250 conferences.
Event severity when active conferences exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active hardware conferences exceeds the threshold. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for active conferences?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of hardware conferences active during the monitoring period.
Monitor Completed Conferences	
Data Collection	
Collect data for completed conferences?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of hardware conferences completed during the monitoring period.
Monitor Resource Usage	
Event Notification	
Raise event if resource usage exceeds threshold?	Select **Yes** to raise an event if the percentage of hardware conference usage exceeds the threshold you set. The default is Yes.
Threshold - Maximum resource usage	Specify the maximum percentage of hardware conference usage that must be detected before an event is raised. The default is 80%.
Event severity when resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of hardware conference usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of hardware conference usage at each script iteration.
Monitor Active Resources	
Data Collection	
Collect data for active resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of hardware conferences active at each script iteration.
Monitor Unavailable Resources	
Event Notification	
Raise event if number of times resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times hardware conferences were unavailable exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of times resources were unavailable	Specify the maximum number of times hardware conferences must be unavailable before an event is raised. The default is 0 instances.
Event severity when number of times resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times hardware conferences were unavailable exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of times resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times hardware conferences were unavailable during the monitoring period.

21.19 CFB_Software_Device

Use this Knowledge Script to monitor the resource usage of a registered software conference bridge device.

- Active conferences
- Completed conferences
- Resource usage
- Active resources
- Unavailable resources

This script raises an event if a threshold is exceeded. In addition, this script generates data streams for active and completed conferences, active resources, and resource usage (%).

21.19.1 Resource Object

CiscoCM_SW_CFBObj

21.19.2 Default Schedule

By default, this script runs every 15 minutes.

21.19.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CFB_Software_Device job. The default is 5.
Monitor Active Conferences	
Event Notification	
Raise event if active conferences exceed threshold?	Select **Yes** to raise an event if the number of active software conferences exceeds the threshold you set. The default is Yes.
Threshold - Maximum active conferences	Specify the maximum number of software conferences that must be active before an event is raised. The default is 250 conferences.
Event severity when active conferences exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active software conferences exceeds the threshold. The default is 15.
Data Collection	
Collect data for active conferences?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of software conferences active during the monitoring period.

Parameter	How to Set It
Monitor Completed Conferences	
Data Collection	
Collect data for completed conferences?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of software conferences completed during the monitoring period.
Monitor Resource Usage	
Event Notification	
Raise event if resource usage exceeds threshold?	Select **Yes** to raise an event if the percentage of software conference resource usage exceeds the threshold you set. The default is Yes.
Threshold - Maximum resource usage	Specify the maximum percentage of software conference resource usage that must be detected before an event is raised. The default is 80%.
Event severity when resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of software conference resource usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of software conference resource usage at each script iteration.
Monitor Active Resources	
Data Collection	
Collect data for active resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of software conference resources active at each script iteration.
Monitor Unavailable Resources	
Event Notification	
Raise event if number of times resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times a software conference resource was unavailable exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of times resources were unavailable	Specify the maximum number of times software conference resources must be unavailable before an event is raised. The default is 0 conferences.
Event severity when number of times resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times software conference resources were unavailable exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of times resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times software conference resources were unavailable.

21.20 CFB_Video_Device

Use this Knowledge Script to monitor the resource usage of a registered video conference bridge device.

- Active conferences
- Completed conferences
- Resource usage
- Active resources
- Unavailable resources

This script raises an event if a threshold is exceeded. In addition, this script generates data streams for active and completed conferences, active resources, and resource usage (%).

21.20.1 Resource Object

CiscoCM_VideoCFBObj

21.20.2 Default Schedule

By default, this script runs every 15 minutes.

21.20.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CFB_Video_Device job. The default is 5.
Monitor Active Conferences	
Event Notification	
Raise event if active conferences exceed threshold?	Select **Yes** to raise an event if the number of active video conferences exceeds the threshold you set. The default is Yes.
Threshold - Maximum active conferences	Specify the maximum number of video conferences that must be active before an event is raised. The default is 250 conferences.
Event severity when active conferences exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active video conferences exceeds the threshold. The default is 10.
Data Collection	
Collect data for active conferences?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of video conferences active during the monitoring period.

Parameter	How to Set It
Monitor Completed Conferences	
Data Collection	
Collect data for completed conferences?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of video conferences completed during the monitoring period.
Monitor Resource Usage	
Event Notification	
Raise event if resource usage exceeds threshold?	Select **Yes** to raise an event if the percentage of video conference usage exceeds the threshold you set. The default is Yes.
Threshold - Maximum resource usage	Specify the maximum percentage of video conference usage that must be detected before an event is raised. The default is 80%.
Event severity when resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of video conference usage exceeds the threshold. The default is 10.
Data Collection	
Collect data for resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of video conference usage at each script iteration.
Monitor Active Resources	
Data Collection	
Collect data for active resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of video conferences active at each script iteration.
Monitor Unavailable Resources	
Event Notification	
Raise event if number of times resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times video conferences were unavailable exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of times resources were unavailable	Specify the maximum number of times video conferences must be unavailable before an event is raised. The default is 0 instances.
Event severity when number of times resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times video conferences were unavailable exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of times resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times video conferences were unavailable during the monitoring period.

21.21 CTIManager

Use this Knowledge Script to monitor the usage of the Communications Manager CTI Manager. CTI Manager allows applications to access the resources and functionality of all Communications Managers in the cluster.

This script raises an event if a value exceeds or falls below its threshold. In addition, this script generates data streams for the number of connected applications, open lines, open devices, and active Communications Manager links.

21.21.1 Resource Object

CiscoCM_CTIMgrService

21.21.2 Default Schedule

By default, this script runs every 15 minutes.

21.21.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the CTIManager job. The default is 5.
Monitor Connected Applications	
Event Notification	
Raise event if connected applications exceed threshold?	Select **Yes** to raise an event if the number of connected applications exceeds the threshold you set. The default is Yes.
Threshold - Maximum connected applications	Specify the maximum number of applications that must be connected before an event is raised. The default is 100 applications.
Event severity when connected applications exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of connected applications exceeds the threshold. The default is 15.
Data Collection	
Collect data for connected applications?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of applications connected at each script iteration.
Monitor Open Lines	
Event Notification	
Raise event if open lines exceed threshold?	Select **Yes** to raise an event if the number of open lines exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum open lines	Specify the maximum number of lines that must be open before an event is raised. The default is 100 lines.
Event severity when open lines exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of open lines exceeds the threshold. The default is 15.
Data Collection	
Collect data for open lines?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of lines open at each script iteration.
Monitor Open Devices	
Event Notification	
Raise event if open devices exceed threshold?	Select **Yes** to raise an event if the number of open devices exceeds the threshold you set. The default is Yes.
Threshold - Maximum open devices	Specify the maximum number of devices that must be open before an event is raised. The default is 100 devices.
Event severity when open devices exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of open devices exceeds the threshold. The default is 15.
Data Collection	
Collect data for open devices?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of devices open at each script iteration.
Monitor Active CallManager Links	
Event Notification	
Raise event if active CallManager links fall below threshold?	Select **Yes** to raise an event if the number of active Communications Manager links falls below the threshold you set. The default is Yes.
Threshold - Minimum active CallManager links	Specify the minimum number of Communications Manager links that must be active before an event is raised. The default is one link.
Event severity when active CallManager links fall below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active Communications Manager links falls below the threshold. The default is 15.
Data Collection	
Collect data for active CallManager links?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of Communications Manager links active at each script iteration.

21.22 ExtensionMobility

Use this Knowledge Script to monitor the Extension Mobility application. Extension Mobility allows users to temporarily access their Cisco IP phone configuration, such as line appearances, services, and speed dials, from other Cisco IP phones.

This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the number of throttled requests, in-progress requests, login/logout requests, successful logins, successful logouts, and total requests.

21.22.1 Resource Object

CiscoCM_ExtMobility

21.22.2 Default Schedule

By default, this script runs every 15 minutes.

21.22.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the ExtensionMobility job. The default is 5.
Monitor Login/Logout Requests	
Event Notification	
Raise event if login/logout requests exceed threshold?	Select **Yes** to raise an event if the number of requests to log in or log out exceeds the threshold you set. The default is Yes.
Threshold - Maximum login/logout requests	Specify the maximum number of login and logout requests that must occur before an event is raised. The default is 100 requests.
Event severity when login/logout requests exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of login and logout requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for login/logout requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of login and log out requests that occurred during the monitoring period.
Monitor Successful Logins	
Data Collection	
Collect data for successful logins?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of logins that were successful during the monitoring period.

Parameter	How to Set It
Monitor Successful Logouts	
Data Collection	
Collect data for successful logouts?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of logouts that were successful during the monitoring period.
Monitor Requests in Progress	
Event Notification	
Raise event if requests in progress exceed threshold?	Select **Yes** to raise an event if the number of in-progress requests exceeds the threshold you set. The default is Yes.
Threshold - Maximum requests in progress	Specify the maximum number of requests that must be in progress before an event is raised. The default is 500 requests.
Event severity when requests in progress exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-progress requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for requests in progress?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of requests in progress at each script iteration.
Monitor Throttled Requests	
Event Notification	
Raise event if throttled requests exceed threshold?	Select **Yes** to raise an event if the number of throttled requests exceeds the threshold you set. The default is Yes.
Threshold - Maximum throttled requests	Specify the maximum number of requests that must be throttled before an event is raised. The default is 10 requests.
Event severity when throttled requests exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of throttled requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for throttled requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of requests throttled during the monitoring period.
Monitor Total Requests	
Data Collection	
Collect data for total requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of all requests that occurred during the monitoring period.

21.23 GatekeeperActivity

Use this Knowledge Script to monitor the activity on a gatekeeper. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the following monitored activities:

- Received admission confirm messages (ACFs)
- Attempted admission requests
- Retried acknowledgement messages (RASs)
- Failed video stream requests

21.23.1 Resource Object

CiscoCM_GatekeeperObj

21.23.2 Default Schedule

By default, this script runs every 15 minutes.

21.23.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the GatekeeperActivity job. The default is 5.
Monitor Failed Video Stream Requests	
Event Notification	
Raise event if failed video stream requests exceed threshold?	Select **Yes** to raise an event if the number of failed video stream requests exceeds the threshold you set. The default is Yes.
Threshold - Maximum failed video stream requests	Specify the maximum number of video stream requests that must fail before an event is raised. The default is 0 requests.
Event severity when failed video stream requests exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of failed video stream requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for failed video stream requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of video stream requests that failed during the monitoring period.
Monitor Retries	

Parameter	How to Set It
Event Notification	
Raise event if retries exceed threshold?	Select **Yes** to raise an event if the number of RASs exceeds the threshold you set. The default is Yes.
Threshold - Maximum retries	Specify the maximum number of acknowledgement messages that must be retried before an event is raised. The default is 50 messages.
Event severity when retries exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of RASs exceeds the threshold. The default is 15.
Data Collection	
Collect data for retries?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of acknowledgement messages that were retried during the monitoring period.
Monitor Admission Confirm Messages	
Data Collection	
Collect data for admission confirm messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of ACFs received during the monitoring period.
Monitor Admission Request Messages	
Data Collection	
Collect data for admission request messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of admission requests attempted during the monitoring period.

21.24 GeneralCounter

Use this Knowledge Script to monitor a user-specified Performance Monitor counter on a Communications Manager server. You can monitor both the current value of the counter as well as the delta value (current value minus the previous value). This script raises an event if the value of the monitored counter exceeds the threshold and if the counter you want to monitor is not accessible.

This script generates data streams for current and delta counter values.

21.24.1 Resource Object

CiscoCM_CMServer

21.24.2 Default Schedule

By default, this script runs every five minutes.

21.24.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the GeneralCounter job.
Counter Specifications	
Name of the object to monitor	Type the name of the performance object you want to monitor. An object is any resource, program or service for which performance data can be collected. The default object name is System.
Name of the counter to monitor	Type the name of the performance counter you want to monitor. A counter represents the data associated with aspects of an object. The default counter name is `Total Threads`.
Name of the instance to monitor	Type the name of the performance instance you want to monitor. An instance distinguishes between multiple objects of the same type on a single computer. You can type multiple instance names, separated by commas. Not all counters or objects require or have an instance.
Raise event if counter/instance not found?	Select **Yes** to raise an event if this script cannot find the counter or instance you specify. The default is Yes.
Event severity when counter/instance not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which this script cannot find the counter or instance you specify. The default is 25.
Monitor Current Value	
Event Notification	

Parameter	How to Set It
Raise event if current value exceeds threshold	Select **Yes** to raise an event if the current value of the counter exceeds the threshold you set. The default is Yes.
Threshold - Maximum current value	Specify the maximum current value the counter can attain before an event is raised. The default is 500.
Event severity when current value exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the current value of the counter exceeds the threshold you set. The default is 10.
Data Collection	
Collect data for current value?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the current value of the counter at each script iteration.
Monitor Delta Value	
Event Notification	
Raise event if delta value exceeds threshold	Select **Yes** to raise an event if the delta value of the counter exceeds the threshold you set. The default is Yes. The delta value is the difference between the current value and the previous value.
Threshold - Maximum delta value	Specify the maximum delta value the counter can attain before an event is raised. The default is 100.
Event severity when delta value exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the delta value of the counter exceeds the threshold you set. The default is 10.
Data Collection	
Collect data for delta value?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the delta value of the counter as measured during the monitoring period.

21.25 H323_Gateway_CallActivity

Use this Knowledge Script to monitor completed, attempted, in-progress, and active calls on an H.323 gateway device. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for completed calls, attempted calls, in-progress calls, and active calls.

21.25.1 Resource Object

CiscoCM_H323GatewayObj

21.25.2 Default Schedule

By default, this script runs every 15 minutes.

21.25.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the H323_Gateway_CallActivity job.
Monitor Attempted Calls	
Event Notification	
Raise event if attempted calls exceed threshold	Select **Yes** to raise an event if the number of attempted calls exceeds the threshold you set. The default is Yes.
Threshold - Maximum attempted calls	Specify the highest number of calls that must be attempted before an event is raised. The default is 500.
Event severity when attempted calls exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of attempted calls exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for attempted calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls attempted during the monitoring period.
Monitor Completed Calls	
Data Collection	
Collect data for completed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls completed during the monitoring period.
Monitor Active Calls	
Data Collection	
Collect data for active calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls active at each script iteration.

Parameter	How to Set It
Monitor Calls In Progress	
Event Notification	
Raise event if calls in progress exceed threshold	Select **Yes** to raise an event if the number of calls in progress exceeds the threshold you set. The default is Yes.
Threshold - Maximum calls in progress	Specify the highest number of calls that must be in progress before an event is raised. The default is 1000.
Event severity when calls in progress exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of calls in progress exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for calls in progress?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls in progress at each script iteration.

21.26 H323_Trunk_CallActivity

Use this Knowledge Script to monitor attempted calls, completed calls, active calls, and calls in progress for H.323 trunks. This script can raise an event if any threshold is exceeded. In addition, this script generates data streams for attempted calls, completed calls, active calls, and calls in progress per trunk.

21.26.1 Resource Object

Cluster object

21.26.2 Default Schedule

By default, this script runs every 15 minutes.

21.26.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity if job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the H323_Trunk_CallActivity job. The default is 5.
Monitor Attempted Calls	
Event Notification	
Raise event if attempted calls exceed threshold	Select **Yes** to raise an event if the number of attempted calls exceeds the threshold you set. The default is Yes.
Threshold - Maximum attempted calls	Specify the highest number of calls that must be attempted before an event is raised. The default is 500.
Event severity when attempted calls exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of attempted calls exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for attempted calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls attempted during the monitoring period.
Monitor Completed Calls	
Data Collection	
Collect data for completed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls completed during the monitoring period.
Monitor Active Calls	
Data Collection	
Collect data for active calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls active at each script iteration.

Parameter	How to Set It
Monitor Calls In Progress	
Event Notification	
Raise event if calls in progress exceed threshold	Select **Yes** to raise an event if the number of calls in progress exceeds the threshold you set. The default is Yes.
Threshold - Maximum calls in progress	Specify the highest number of calls that must be in progress before an event is raised. The default is 1000 calls.
Event severity when calls in progress exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of calls in progress exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for calls in progress?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls in progress at each script iteration.

21.27 HealthCheck

Use this Knowledge Script to monitor the operational status of active services on Communications Manager servers. Although the script monitors the following services by default, you can choose to exclude any default service, or include any other service not mentioned in the list.

- A Cisco DB
- Cisco AMC Service
- Cisco CallManager
- Cisco CDR Agent
- Cisco CTL Provider
- Cisco Database Layer Monitor
- Cisco DRF Local
- Cisco Extension Mobility
- Cisco RIS Data Collector
- Cisco Tftp

This script raises an event if a stopped service is restarted or fails to restart, or if a service is stopped but the *Start service if it is stopped?* parameter has not been set to **Yes**. In addition, this script generates data streams for service availability.

This script is a member of the CiscoCM recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 1245.

21.27.1 Resource Object

CiscoCM_CMServer

21.27.2 Default Schedule

By default, this script runs every two minutes.

If you are running this script as part of the Recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered so as to lessen the impact on CPU utilization when you run the KSG.

21.27.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	

Parameter	How to Set It
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the HealthCheck job. The default is 5.
Monitor Services	
Default services to exclude	Type the name of any default service you do not want to automatically start. You can specify the names of multiple services, separated by commas.
Other services to include	Type the name of any service you want to automatically start, but is not included in the list of default services. You can specify the names of multiple services, separated by commas.
Start service if it is stopped?	Select **Yes** to automatically start all stopped default services on Communications Manager servers. Any service you specify in *Default services to exclude* will not be started. The default is Yes. **NOTE:** Only “activated” services can be automatically started. If an administrator has “deactivated” a service, then AppManager cannot start it.
Event Notification	
Raise event if service is stopped and should not be started?	Select **Yes** to raise an event if a monitored service is stopped but *Start service if it is stopped?* is unchecked. The default is Yes.
Event severity when service is stopped and should not be started	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service is stopped but *Start service if it is stopped?* is unchecked. The default is 15.
Raise event if service fails to start?	Select **Yes** to raise an event if AppManager cannot start a monitored service. The default is Yes.
Event severity when service fails to start	Set the event severity level, from 1 to 40, to indicate the importance of an event in AppManager cannot start a monitored service. The default is 5.
Raise event if stopped service has been started?	Select **Yes** to raise an event if AppManager successfully starts a monitored service. The default is Yes.
Event severity when stopped service has been started	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully starts a monitored service. The default is 25.
Raise event if service is deactivated?	Select **Yes** to raise an event if a monitored service has been deactivated by an administrator. The default is unselected.
Event severity when service is not active	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service has been deactivated by an administrator. The default is 15.
Data Collection	
Collect data for service availability?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns 0 for a stopped service or 1 for a started service. the default is Yes. **NOTE:** This script generates data streams for services running when the job starts or automatically restarted while the job runs. If a service is deactivated when the job starts, no data stream is generated.

21.28 HuntAndRouteList

Use this Knowledge Script to monitor hunt lists and route lists for availability and call activity. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the number of abandoned calls, busy attempts, unanswered calls, active calls, in-progress calls, and available members, and for hunt and route list availability.

21.28.1 Resource Object

CiscoCM_HuntListObj

21.28.2 Default Schedule

By default, this script runs every 15 minutes.

21.28.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the HuntAndRouteList job. The default is 5.
Monitor Abandoned Calls	
Event Notification	
Raise event if abandoned calls exceed threshold?	Select **Yes** to raise an event if the number of abandoned calls exceeds the threshold. The default is Yes.
Threshold - Maximum abandoned calls	Specify the maximum number of calls that must be abandoned before an event is raised. The default is 0 calls.
Event severity when abandoned calls exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of abandoned calls exceeds the threshold. The default is 15.
Data Collection	
Collect data for abandoned calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls abandoned during the monitoring period.
Monitor Busy Attempts	
Event Notification	
Raise event if busy attempts exceed threshold?	Select **Yes** to raise an event if the number of busy attempts exceeds the threshold. The default is Yes.
Threshold - Maximum busy attempts	Specify the maximum number of busy attempts that must be detected to prevent an event from being raised. The default is 0 attempts.

Parameter	How to Set It
Event severity when busy attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of busy attempts exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for busy attempts?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of busy attempts that occurred during the monitoring period.
Monitor Unanswered Calls	
Event Notification	
Raise event if unanswered calls exceed threshold?	Select **Yes** to raise an event if the number of unanswered calls exceeds the threshold. The default is Yes.
Threshold - Maximum unanswered calls	Specify the maximum number of calls that must go unanswered before an event is raised. The default is 0 calls.
Event severity when unanswered calls exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of unanswered calls exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for unanswered calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that went unanswered during the monitoring period.
Monitor Active Calls	
Data Collection	
Collect data for active calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls active at each script iteration.
Monitor Calls In Progress	
Data Collection	
Collect data for calls in progress?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls in progress at each script iteration.
Monitor Hunt or Route List Availability	
Data Collection	
Collect data for hunt or route list availability?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the availability of a hunt or route list at each script iteration.
Monitor Members Available	
Data Collection	
Collect data for members available?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of hunt and route list members available at each script iteration.

21.29 LicenseUsage

Use this Knowledge Script to monitor authorized, used, and remaining phone and node licenses on a Cisco Unified Communications Manager cluster. This script raises an event if the number of remaining licenses falls below a threshold, or if the percentage of licenses used exceeds a threshold you set.

In addition, this script generates data streams for authorized licenses, used licenses, and remaining licenses for both phones and Cisco Unified Communications Manager nodes. The script also generates data streams for the percentage of licenses used by phones and nodes.

21.29.1 Resource Object

Cluster object

21.29.2 Default Schedule

By default, this script runs every day.

21.29.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the LicenseUsage job. The default is 5.
Phone License Units	
Monitor Phone License Units Authorized	
Data Collection	
Collect data for phone license units authorized?	Select Yes to collect data for charts and reports. If enabled, data collection returns the number of authorized phone licenses on the License Server. The default is Yes.
Monitor Phone License Units Used	
Data Collection	
Collect data for phone license units used?	Select Yes to collect data for charts and reports. If enabled, data collection returns the number of phone licenses currently being used on the License Server. The default is Yes.
Monitor Phone License Units Remaining	
Event Notification	
Raise event if phone license units remaining fall below threshold?	Select Yes to raise an event if the number of remaining phone licenses falls below the threshold you set. The default is No.

Parameter	How to Set It
Threshold – Minimum phone license units remaining	Specify the minimum number of phone license units that must be remaining and not in use before an event is raised. The default is 0.
Event severity when phone license units remaining fall below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of phone licenses that must be remaining and not in use falls below the threshold. The default is 25.
Data Collection	
Collect data for phone license units remaining?	Select Yes to collect data for charts and reports. If enabled, data collection returns the number of remaining phone licenses remaining on the License Server. The default is Yes.
Monitor the Percentage of Phone Licenses Used	
Event Notification	
Raise event if the percentage of phone licenses used exceeds threshold?	Select Yes to raise an event if the percentage of phone licenses in use exceeds the threshold you set. The default is No.
Threshold – Maximum percentage of phone licenses used	Specify the highest percentage of phone licenses that must be in use before an event is raised. The default is 90%.
Event severity when the percentage of phone licenses used exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of phone licenses that are in use exceeds the threshold. The default is 25.
Data Collection	
Collect data for the percentage of phone licenses used?	Select Yes to collect data for charts and reports. If enabled, data collection returns the percentage of phone licenses currently being used on the License Server. The default is Yes.
Node License Units	
Monitor Node License Units Authorized	
Data Collection	
Collect data for node license units authorized?	Select Yes to collect data for charts and reports. If enabled, data collection returns the number of authorized node licenses on the License Server. The default is Yes.
Monitor Node License Units Used	
Data Collection	
Collect data for node license units used?	Select Yes to collect data for charts and reports. If enabled, data collection returns the number of node licenses currently being used on the License Server. The default is Yes.
Monitor Node License Units Remaining	
Event Notification	
Raise event if node license units remaining fall below threshold?	Select Yes to raise an event if the number of remaining node licenses falls below the threshold you set. The default is No.
Threshold – Minimum node license units remaining	Specify the minimum number of node licenses that must be remaining and not in use before an event is raised. The default is 0.
Event severity when node license units remaining fall below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of node licenses that must be remaining and not in use falls below the threshold. The default is 25.

Parameter	How to Set It
Data Collection	
Collect data for node license units remaining?	Select Yes to collect data for charts and reports. If enabled, data collection returns the number of remaining node licenses remaining on the License Server. The default is Yes.
Monitor the Percentage of Node Licenses Used	
Event Notification	
Raise event if the percentage of node licenses used exceeds threshold?	Select Yes to raise an event if the percentage of node licenses in use exceeds the threshold you set. The default is No.
Threshold – Maximum percentage of node licenses used	Specify the highest percentage of node licenses that must be in use before an event is raised. The default is 90%.
Event severity when the percentage of node licenses used exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of node license units exceed the threshold.
Data Collection	
Collect data for the percentage of node licenses used?	Select Yes to collect data for charts and reports. If enabled, data collection returns the percentage of node licenses currently being used on the License Server. The default is Yes. The default is Yes.
Overdraft License Options	
Include overdraft licenses in authorized counts and calculations?	Select Yes to count the overdraft value of your license into the authorized licenses and when calculating the remaining Units.

21.30 Locations

Use this Knowledge Script to monitor Cisco locations for voice and video bandwidth availability and usage. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the bandwidth availability, bandwidth usage (%), bandwidth-related call failures, video bandwidth availability, video bandwidth usage (%), and bandwidth-related failures of video stream requests.

21.30.1 Resource Object

CiscoCM_LocationObj

21.30.2 Default Schedule

By default, this script runs every 15 minutes.

21.30.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Locations job. The default is 5.
Monitor Available Bandwidth	
Data Collection	
Collect data for available bandwidth?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of bandwidth available at each script iteration.
Monitor Bandwidth Usage	
Event Notification	
Raise event if bandwidth usage exceeds threshold?	Select **Yes** to raise an event if the percentage of bandwidth usage exceeds the threshold. The default is Yes.
Threshold - Maximum bandwidth usage	Specify the maximum percentage of bandwidth usage that must be detected before an event is raised. The default is 90%.
Event severity when bandwidth usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of bandwidth usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for bandwidth usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of bandwidth usage at each script iteration.
Monitor Call Failures Caused By Insufficient Bandwidth	
Event Notification	

Parameter	How to Set It
Raise event if call failures exceed threshold	Select **Yes** to raise an event if the number of calls that failed because of insufficient bandwidth exceeds the threshold. The default is Yes.
Threshold - Maximum failed calls	Specify the maximum number of calls that must fail before an event is raised. The default is 0 calls.
Event severity when failed calls exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of call that failed because of insufficient bandwidth exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for failed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of call failures caused by insufficient bandwidth during the monitoring period.
Monitor Available Video Bandwidth	
Data Collection	
Collect data for available video bandwidth?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of video bandwidth available at each script iteration.
Monitor Video Bandwidth Usage	
Event Notification	
Raise event if video bandwidth usage exceeds threshold?	Select **Yes** to raise an event if the percentage of video bandwidth usage exceeds the threshold. The default is Yes.
Threshold - Maximum video bandwidth usage	Specify the maximum percentage of video bandwidth usage that must occur before an event is raised. The default is 90%.
Event severity when video bandwidth usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of video bandwidth usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for video bandwidth usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of video bandwidth usage at each script iteration.
Monitor Failed Video Stream Requests Caused by Insufficient Bandwidth	
Event Notification	
Raise event if failed video stream requests exceed threshold?	Select **Yes** to raise an event if the number of video stream requests that fail because of insufficient bandwidth exceeds the threshold. The default is Yes.
Threshold - Maximum failed video stream requests	Specify the maximum number of video stream requests that must fail before an event is raised. The default is 0 requests.
Event severity when failed video stream requests exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of video stream requests that fail because of insufficient bandwidth exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for failed video stream requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of bandwidth-related failures of video stream requests that occurred during the monitoring period.

21.31 MediaStreamingApp

Use this Knowledge Script to monitor the resources handled by the Media Streaming Application: annunciators, conference bridges, and Music-on-Hold (MOH) resources. This script raises an event if a threshold is exceeded. In addition, this script generates the following data streams:

- Lost Communications Manager connections
- Active and total annunciator streams
- Active and total software conferences
- Active and total software conference streams
- Active MOH audio sources
- Active and total MOH streams
- Active and total Media Termination Point streams

21.31.1 Resource Object

CiscoCM_MediaStreamingApp

21.31.2 Default Schedule

By default, this script runs every 15 minutes.

21.31.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the MediaStreamingApp job. The default is 5.
Monitor Lost CallManager Connections	
Event Notification	
Raise event if lost CallManager connections exceed threshold	Select **Yes** to raise an event if the number of lost Communications Manager connections exceeds the threshold. The default is Yes.
Threshold - Maximum lost CallManager connections	Specify the maximum number of Communications Manager connections that must be lost before an event is raised. The default is 0 connections.
Event severity when lost CallManager connections exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of lost Communications Manager connections exceeds the threshold you set. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for lost CallManager connections?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of Communications Manager connections lost during the monitoring period.
Monitor Active Annunciator Streams	
Event Notification	
Raise event if active annunciator streams exceed threshold?	Select **Yes** to raise an event if the number of active annunciator streams exceeds the threshold you set. The default is Yes.
Threshold - Maximum active annunciator streams	Specify the maximum number of annunciator streams that can be active before an event is raised. The default is 200 streams.
Event severity when active annunciator streams exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active annunciator streams exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active annunciator streams?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of annunciator streams active at each script iteration.
Monitor Total Annunciator Streams	
Data Collection	
Collect data for total annunciator streams?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of annunciator streams during the monitoring period.
Monitor Active Software Conferences	
Event Notification	
Raise event if active software conferences exceed threshold?	Select **Yes** to raise an event if the number of active software conferences exceeds the threshold. The default is Yes.
Threshold - Maximum active software conferences	Specify the maximum number of software conferences that can be active before an event is raised. The default is 200 conferences.
Event severity when active software conferences exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active software conferences exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active software conferences?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of software conferences active at each script iteration.
Monitor Total Software Conferences	
Data Collection	
Collect data for total software conferences?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of software conferences during the monitoring period.
Monitor Active Software Conference Streams	
Event Notification	
Raise event if active software conference streams exceed threshold?	Select **Yes** to raise an event if the number of active software conference streams exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum active software conference streams	Specify the maximum number of software conference streams that can be active before an event is raised. The default is 500 streams.
Event severity when active software conference streams exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active software conference streams exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active software conference streams?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of software conference streams active at each script iteration.
Monitor Total Software Conference Streams	
Data Collection	
Collect data for total software conference streams?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of software conference streams during the monitoring period.
Monitor Active Music-On-Hold Audio Sources	
Event Notification	
Raise event if active music-on-hold audio sources exceed threshold?	Select **Yes** to raise an event if the number of active MOH audio sources exceeds the threshold you set. The default is Yes.
Threshold - Maximum active music-on-hold audio sources	Specify the maximum number of MOH audio sources that can be active before an event is raised. The default is 200 sources.
Event severity when active music-on-hold audio sources exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active MOH audio sources exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active music-on-hold audio sources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of MOH audio sources active at each script iteration.
Monitor Active Music-On-Hold Streams	
Event Notification	
Raise event if active music-on-hold streams exceed threshold?	Select **Yes** to raise an event if the number of active MOH streams exceeds the threshold you set. The default is Yes.
Threshold - Maximum active music-on-hold streams	Specify the maximum number of MOH streams that can be active before an event is raised. The default is 500 streams.
Event severity when active music-on-hold streams exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active MOH streams exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active music-on-hold streams?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of MOH streams active at each script iteration.

Parameter	How to Set It
Monitor Total Music-on-Hold Streams	
Data Collection	
Collect data for total music-on-hold streams?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of MOH streams during the monitoring period.
Monitor Active Media Termination Point Streams	
Event Notification	
Raise event if active media termination point streams exceed threshold?	Select **Yes** to raise an event if the number of active MTP streams exceeds the threshold you set. The default is Yes.
Threshold - Maximum active media termination point streams	Specify the maximum number of MTP streams that can be active before an event is raised. The default is 500 streams.
Event severity when active media termination point streams exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active MTP streams exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active media termination point streams?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of MTP streams active at each script iteration.
Monitor Total Media Termination Point Streams	
Data Collection	
Collect data for total media termination point streams?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of MTP streams during the monitoring period.

21.32 MGCP_FXO_CallActivity

Use this Knowledge Script to monitor completed calls, blocked calls, and outbound busy attempts on MGCP FXO (Media Gateway Control Protocol Foreign Exchange Office) devices. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the number of completed calls and busy attempts, percentage of blocked calls, and port status.

21.32.1 Resource Object

CiscoCM_MGCPFXSObj

21.32.2 Default Schedule

By default, this script runs every 15 minutes.

21.32.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the MGCP_FXO_CallActivity job. The default is 5.
Monitor Busy Attempts	
Event Notification	
Raise event if busy attempts exceed threshold?	Select **Yes** to raise an event if the number of busy attempts exceeds the threshold. The default is Yes. A busy attempt is a call attempted when no voice channels are available.
Threshold - Maximum busy attempts	Specify the maximum number of busy attempts that must be detected before an event is raised. The default is 0 attempts.
Event severity when busy attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of busy attempts exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for busy attempts?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of busy attempts that occurred during the monitoring period.
Monitor Completed Calls	
Data Collection	
Collect data for completed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls completed during the monitoring period.
Monitor Blocked Calls	
Data Collection	

Parameter	How to Set It
Collect data for blocked calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of calls blocked during the monitoring period. AppManager computes the blocked call percentage as follows: (Outbound busy attempts delta x 100) / Total calls.
Monitor Ports Out of Service	
Data Collection	
Collect data for ports out of service?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of ports out of service or that had an unknown status during the monitoring period.

21.33 MGCP_FXS_CallActivity

Use this Knowledge Script to monitor completed calls, blocked calls, and outbound busy attempts on MGCP FXS (Media Gateway Control Protocol Foreign Exchange Station) devices. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the number of completed calls and busy attempts, and for port status.

21.33.1 Resource Object

CiscoCM_MGCPFXSObj

21.33.2 Default Schedule

By default, this script runs every 15 minutes.

21.33.3 Setting Parameter Values

Set the following parameters as needed

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the MGCP_FXS_CallActivity job. The default is 5.
Monitor Busy Attempts	
Event Notification	
Raise event if busy attempts exceed threshold?	Select **Yes** to raise an event if the number of busy attempts exceeds the threshold. The default is Yes. A busy attempt is a call attempted when no voice channels are available.
Threshold - Maximum busy attempts	Specify the maximum number of busy attempts that must be detected before an event is raised. The default is 0 attempts.
Event severity when busy attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of busy attempts exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for busy attempts?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of busy attempts that occurred during the monitoring period.
Monitor Completed Calls	
Data Collection	
Collect data for completed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls completed during the monitoring period.
Monitor Blocked Calls	
Data Collection	

Parameter	How to Set It
Collect data for blocked calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of calls blocked during the monitoring period. AppManager computes the blocked call percentage as follows: (Outbound busy attempts delta x 100) / Total calls.
Monitor Ports Out of Service	
Data Collection	
Collect data for ports out of service?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of ports out of service or that had an unknown status during the monitoring period.

21.34 MGCP_GatewayUsage

Use this Knowledge Script to monitor active and in-service ports, active channels, and in-service spans for the following components of MGCP (Media Gateway Control Protocol) gateways:

- BRI (basic rate interface) spans
- FXO (foreign exchange office) ports
- FXS (foreign exchange station) ports
- PRI (primary rate interface) spans
- T1CAS (channel associated signaling) spans

An active port or channel is actively handling a call. An in-service port or span is registered to a Communications Manager and available for handling a call.

This script raises an event if a threshold is exceeded. In addition, this script generates data streams for active ports and active channels.

21.34.1 Resource Object

CiscoCM_MGCPGatewayObj

21.34.2 Default Schedule

By default, this script runs every 15 minutes.

21.34.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the MGCP_GatewayUsage job. The default is 5.
Event Notification	
Raise event if number of BRI spans in service decreases?	Select **Yes** to raise an event if the number of in-service BRI spans has decreased since the last monitoring interval. The default is unselected.
Event severity when number of BRI spans in service decreases	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-service BRI spans has decreased since the last monitoring interval. The default is 15.
Raise event if number of FXO ports in service decreases?	Select **Yes** to raise an event if the number of in-service FXO ports has decreased since the last monitoring interval. The default is unselected.

Parameter	How to Set It
Event severity when number of FXO ports in service decreases	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-service FXO ports has decreased since the last monitoring interval. The default is 15.
Raise event if number of FXS ports in service decreases?	Select **Yes** to raise an event if the number of in-service FXS ports has decreased since the last monitoring interval. The default is unselected.
Event severity when number of FXS ports in service decreases	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-service FXS ports has decreased since the last monitoring interval. The default is 15.
Raise event if number of PRI spans in service decreases?	Select **Yes** to raise an event if the number of in-service PRI spans has decreased since the last monitoring interval. The default is unselected.
Event severity when number of PRI spans in service decreases	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-service PRI spans has decreased since the last monitoring interval. The default is 15.
Raise event if number of T1CAS spans in service decreases?	Select **Yes** to raise an event if the number of in-service T1CAS spans has decreased since the last monitoring interval. The default is unselected.
Event severity when number of T1CAS spans in service decreases	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-service T1CAS spans has decreased since the last monitoring interval. The default is 15.
Monitor Active BRI Channels	
Event Notification	
Raise event if active BRI channels exceed threshold?	Select **Yes** to raise an event if the number of active BRI channels exceeds the threshold. The default is Yes.
Threshold - Maximum active BRI channels	Specify the maximum number of BRI channels that must be active before an event is raised. The default is 25 channels.
Event severity when active BRI channels exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active BRI channels exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active BRI channels?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of BRI channels active at each script iteration.
Monitor Active FXO Ports	
Event Notification	
Raise event if active FXO ports exceed threshold?	Select **Yes** to raise an event if the number of active FXO ports exceeds the threshold. The default is Yes.
Threshold - Maximum active FXO ports	Specify the maximum number of FXO ports that must be active before an event is raised. The default is 100 ports.
Event severity when active FXO ports exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active FXO ports exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active FXO ports?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of FXO ports active at each script iteration.

Parameter	How to Set It
Monitor Active FXS Ports	
Event Notification	
Raise event if active FXS ports exceed threshold?	Select **Yes** to raise an event if the number of active FXS ports exceeds the threshold. The default is Yes.
Threshold - Maximum active FXS ports	Specify the maximum number of FXS ports that must be active before an event is raised. The default is 100 ports.
Event severity when active FXS ports exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active FXS ports exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active FXS ports?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of FXS ports active at each script iteration.
Monitor Active PRI Channels	
Event Notification	
Raise event if active PRI channels exceed threshold?	Select **Yes** to raise an event if the number of active PRI channels exceeds the threshold. The default is Yes.
Threshold - Maximum PRI channels	Specify the maximum number of PRI channels that must be active before an event is raised. The default is 100 channels.
Event severity when active PRI channels exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active PRI channels exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active PRI channels?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of PRI channels active at each script iteration.
Monitor Active T1CAS Channels	
Event Notification	
Raise event if active T1CAS channels exceed threshold?	Select **Yes** to raise an event if the number of active T1CAS channels exceeds the threshold. The default is Yes.
Threshold - Maximum T1CAS channels	Specify the maximum number of T1CAS channels that must be active before an event is raised. The default is 100 channels.
Event severity when active T1CAS channels exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of active T1CAS channels exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active T1CAS channels?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of T1CAS channels active at each script iteration.

21.35 MGCP_PRI_CallActivity

Use this Knowledge Script to monitor active calls, completed calls, blocked calls, outbound busy attempts, and data link availability on an MGCP PRI (Media Gateway Control Protocol Primary Rate Interface) device. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the following metrics:

- Active calls
- Completed calls
- Busy attempts
- Blocked calls

21.35.1 Resource Object

CiscoCM_MGCPPRIObj

21.35.2 Default Schedule

By default, this script runs every 15 minutes.

21.35.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the MGCP_PRI_CallActivity job. The default is 5.
Event Notification	
Raise event if Data Link out of service?	Select **Yes** to raise an event if any data link is unavailable. The default is Yes.
Event severity when Data Link out of service	Set the event severity level, from 1 to 40, to indicate the importance of an event in which any data link is unavailable. The default is 5.
Monitor Busy Attempts	
Event Notification	
Raise event if busy attempts exceed threshold?	Select **Yes** to raise an event if the number of busy attempts exceeds the threshold. The default is Yes. A busy attempt is a call attempted when no voice channels are available.
Threshold - Maximum busy attempts	Specify the maximum number of busy attempts that must be detected before an event is raised. The default is 0 attempts.
Event severity when busy attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of busy attempts exceeds the threshold you set. The default is 15.

Parameter	How to Set It
Data Collection	
Collect data for busy attempts?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of busy attempts that occurred during the monitoring period.
Monitor Active Calls	
Data Collection	
Collect data for active calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls active during the monitoring period.
Monitor Completed Calls	
Data Collection	
Collect data for completed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls completed during the monitoring period.
Monitor Blocked Calls	
Data Collection	
Collect data for blocked calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of calls blocked during the monitoring period. AppManager computes the blocked call percentage as follows: (Outbound busy attempts delta x 100) / Total calls.

21.36 MGCP_PRI_ChannelHealth

Use this Knowledge Script to monitor the status of channels for an MGCP PRI (Media Gateway Control Protocol Primary Rate Interface) device. This script raises an event if a channel is not available.

21.36.1 Resource Object

CiscoCM_MGCPPRIObj

21.36.2 Default Schedule

By default, this script runs every two minutes.

21.36.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the MGCP_PRI_ChannelHealth job. The default is 5.
Monitor PRI Channels	
Select PRI channels to monitor	Select one or more PRI channels to monitor. To monitor all channels, select **All**. To select individual channels in the list, press `[Ctrl]` while clicking on the channels you want. To select an entire range of channels, press `[Shift]` while clicking on the first and last channel in the range.
Treat unknown channel status as out-of-service	Select **Yes** to classify as out-of-service any selected channel whose status is unknown. The default is unselected. An out-of-service channel will trigger this script to raise an event.
Event Notification	
Raise event if channel is not available?	Select **Yes** to raise an event if the selected PRI channels are not available. The default is Yes.
Event severity when channel is not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which at least one of the selected PRI channels is not available. The default is 5.

21.37 MGCP_T1CAS_CallActivity

Use this Knowledge Script to monitor active calls, completed calls, blocked calls, and outbound busy attempts on an MGCP T1CAS (Media Gateway Control Protocol Channel Associated Signaling) device. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the following metrics:

- Active calls
- Completed calls
- Blocked calls
- Busy attempts

21.37.1 Resource Object

CiscoCM_MGCPT1CASObj

21.37.2 Default Schedule

By default, this script runs every 15 minutes.

21.37.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the MGCP_T1CAS_CallActivity job. The default is 5.
Monitor Busy Attempts	
Event Notification	
Raise event if busy attempts exceed threshold?	Select **Yes** to raise an event if the number of busy attempts exceeds the threshold. The default is Yes. A busy attempt is a call attempted when no voice channels are available.
Threshold - Maximum busy attempts	Specify the maximum number of busy attempts that must be detected before an event is raised. The default is 0 attempts.
Event severity when busy attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of busy attempts exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for busy attempts?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of busy attempts that occurred during the monitoring period.
Monitor Active Calls	

Parameter	How to Set It
Data Collection	
Collect data for active calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls active during the monitoring period.
Monitor Completed Calls	
Data Collection	
Collect data for completed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls completed during the monitoring period.
Monitor Blocked Calls	
Data Collection	
Collect data for blocked calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of calls blocked during the monitoring period. AppManager computes the blocked call percentage as follows: (Outbound busy attempts delta x 100) / Total calls.

21.38 MGCP_T1CAS_ChannelHealth

Use this Knowledge Script to monitor the status of channels for an MGCP T1CAS (Media Gateway Control Protocol Channel Associated Signaling) device. This script raises an event if a channel is not available.

21.38.1 Resource Object

CiscoCM_MGCPT1CASObj

21.38.2 Default Schedule

By default, this script runs every two minutes.

21.38.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the MGCP_T1CAS_ChannelHealth job. The default is 5.
Monitor T1CAS Channels	
Select T1CAS channels to monitor	Select one or more T1CAS channels to monitor. To monitor all channels, select **All**. To monitor selected channels, press `[Ctrl]` while clicking on the channels you want.
Treat unknown channel status as out-of-service?	Select **Yes** to classify as out-of-service any selected channel whose status is unknown. The default is unselected. An out-of-service channel will trigger this script to raise an event.
Event Notification	
Raise event if channel is not available?	Select **Yes** to raise an event if the selected T1CAS channels are not available. The default is Yes.
Event severity when channel is not available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the selected T1CAS channels are not available. The default is 5.

21.39 MOH_Device

Use this Knowledge Script to monitor the resource usage for a registered Music-on-Hold (MOH) device. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for multicast resource usage (%), active multicast resources, unicast resource usage (%), active unicast resources, and resource availability.

21.39.1 Resource Object

CiscoCM_MOH_DeviceObj

21.39.2 Default Schedule

By default, this script runs every 15 minutes.

21.39.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the MOH_Device job. The default is 5.
Monitor Multicast Resource Usage	
Event Notification	
Raise event if multicast resource usage exceeds threshold?	Select **Yes** to raise an event if the percentage of multicast resource usage exceeds the threshold. The default is Yes.
Threshold - Maximum multicast resource usage	Specify the maximum percentage of multicast resource usage that must be detected before an event is raised. The default is 80%.
Event severity when multicast resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of multicast resource usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for multicast resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of multicast resource at each script iteration.
Monitor Active Multicast Resources	
Data Collection	
Collect data for active multicast resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of multicast resources active at each script iteration.
Monitor Unicast Resource Usage	
Event Notification	

Parameter	How to Set It
Raise event if unicast resource usage exceeds threshold?	Select **Yes** to raise an event if the percentage of unicast resource usage exceeds the threshold. The default is Yes.
Threshold - Maximum unicast resource usage	Specify the maximum percentage of unicast resource usage that must be detected before an event is raised. The default is 80%.
Event severity when unicast resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of unicast resource usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for unicast resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of unicast resource usage at each script iteration.
Monitor Active Unicast Resources	
Data Collection	
Collect data for active unicast resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of unicast resources active at each script iteration.
Monitor Unavailable Resources	
Event Notification	
Raise event if number of times resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times MOH resources were unavailable exceeds the threshold. The default is Yes.
Threshold - Maximum number of times resources were unavailable	Specify the maximum number of times MOH resources can be unavailable before an event is raised. The default is 0 instances.
Event severity when number of times resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of unavailability instances exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of times resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times MOH resources were unavailable during the monitoring period.

21.40 MTP_Device

Use this Knowledge Script to monitor the resource usage for a registered Media Termination Point (MTP) device. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for resource usage (%), active resources, and resource availability.

21.40.1 Resource Object

CiscoCM_MTP_DeviceObj

21.40.2 Default Schedule

By default, this script runs every 15 minutes.

21.40.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the MTP_Device job. The default is 5.
Monitor Resource Usage	
Event Notification	
Raise event if resource usage exceeds threshold?	Select **Yes** to raise an event if the percentage of MTP resource usage exceeds the threshold. The default is Yes.
Threshold - Maximum resource usage	Specify the maximum percentage of MTP resource usage that must be detected before an event is raised. The default is 80%.
Event severity when resource usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of MTP resource usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of MTP resource usage at each script iteration.
Monitor Active Resources	
Data Collection	
Collect data for active resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of MTP resources active at each script iteration.
Monitor Unavailable Resources	
Event Notification	

Parameter	How to Set It
Raise event if number of times resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times MTP resources were unavailable exceeds the threshold. The default is Yes.
Threshold - Maximum number of times resources were unavailable	Specify the maximum number of times MTP resources can be unavailable before an event is raised. The default is 0 instances.
Event severity when number of times resources were unavailable exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of times MTP resources were unavailable exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of times resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times MTP resources were unavailable during the monitoring period.

21.41 PhoneDeregistrations

Use this Knowledge Script to monitor phone deregistrations on a Unified Communications Manager and to maintain a history of phone deregistrations in the Cisco CM supplemental database. This script raises an event if the number or percentage of lost phones exceeds the threshold you set. You determine how long a phone must be deregistered before it is considered "lost." In addition, you determine whether to group the events by cluster, device pool, location, or partition.

Unified Communications Manager reports a phone as deregistered even after that phone has been deleted from Communications Manager configuration, unplugged, and moved to a different cluster. As long as Unified Communications Manager indicates the phone is deregistered, AppManager continues to raise an event that identifies the deregistered phone. When Unified Communications Manager stops reporting the phone as deregistered, three days after the phone has been deleted, AppManager stops raising a "deregistered" event.

21.41.1 Prerequisites

- Run the SetupSupplementalDB Knowledge Script to create the Cisco CM supplemental database that will house the deregistration data.
- Run the CDR_RetrieveCallRecords and CDR_RetrieveConfigData Knowledge Scripts to populate the database.

For more information, see "Understanding the Cisco CM Supplemental Database" on page 1217.

21.41.2 Resource Object

CiscoCM_CDRMgmt

21.41.3 Default Schedule

By default, this script runs every five minutes.

21.41.4 Setting Parameter Values

Set the following parameters as needed

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the PhoneDeregistrations job. The default is 5.
Event Notification	

Parameter	How to Set It
Raise event if lost phones in group exceed threshold?	Select **Yes** to raise an event if the number or percentage of lost phones in a group exceeds the threshold you set. The default is Yes. Use *Select event grouping* to select how to group the lost phones. Use *Maximum time phone deregistered before counted as lost* to determine how long a phone must be deregistered before it is considered lost.
Select event grouping	Select whether to group lost phones by **Cluster**, **Device Pool**, **Location**, or **Partition**. AppManager raises an event based on whether the number of lost phones in *each* group exceeds the threshold you set. For example, you set *Maximum number of lost phones in the group* to 5, you set *Select event grouping* to Device Pool, and you have three device pools. If AppManager detects six lost phones in the first pool, two in the second, and seven in the third, it will raise two events: one for the six lost phones in the first pool and another for the seven lost phones in the third pool. Because you set the threshold to "5," no event is raised for the lost phones in the second pool. The default is Cluster.
Maximum time phone deregistered before counted as lost	Specify the number of minutes that must elapse before a deregistered phone can be considered a "lost" phone. The default is 0 minutes. Accept the default if you want *all* deregistered phones to be considered lost.
Type of threshold	Select whether you want to raise events based on the **Number** or **Percent** of lost phones. The default is Number.
Threshold - Maximum number of lost phones	Use this parameter if you selected **Number** in *Type of threshold*. Specify the maximum number of phones that can be lost before an event is raised. The default is 0.
Threshold - Maximum percent of lost phones	Use this parameter if you selected **Percent** in *Type of threshold*. Specify the maximum percentage of phones that can be lost before an event is raised. The default is 0.
Event severity when lost phones exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number or percentage of lost phones in a group exceeds the threshold you set. The default is 15.
Include lost phone details in event message	Select **Yes** to include details of the lost phones in the event message. Phone details can include device name, device IP address, directory number, description, name of device pool, time of deregistration, and the Communications Manager from which the phone was deregistered. The default is Yes.
Maximum number of detail rows to include in event detail	Specify the maximum number of detail rows to include in an event message. Each row contains details for one phone. Rows are sorted in order by most recently lost phone. Specify "0" to include all rows. The default is 20. This parameter is applicable only if you selected **Yes** for *Include lost phone details in event message*.

21.42 PhoneInventory

Use this Knowledge Script to create an inventory of the phones configured in a Communications Manager cluster. You choose both the search criteria for the inventory and the location of the output folder (for the results file containing the inventory list). Unless you specify a UNC path (`\\servername\sharename\directoryname\filename`), the results file is written to the computer on which the NetIQ AppManager agent is running. If you specify a UNC path, ensure the `NetIQmc` service is running as an account that has the proper permissions on the UNC path.

21.42.1 Monitoring Phone Registration After Failover

You can determine the status, registered or deregistered, of Communications Manager phones for Unified Communications Manager clusters on which failover has occurred. Failover occurs when Communications Manager status changes from Primary to Backup.

Communications Managers that fail over contain only a list of phones that registered since failover occurred. They do not provide a list of phones that deregistered as a result of failover. To determine which phones have deregistered, use the PhoneInventory Knowledge Script.

To determine whether failover has occurred, use the RoleStatus or CCM_RegisteredResources script.

21.42.2 Resource Object

CiscoCM_Devices

21.42.3 Default Schedule

By default, this script runs once.

21.42.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the PhoneInventory job. The default is 5.
Raise event if phone inventory succeeds?	Select **Yes** to raise an event when a phone inventory file is successfully generated. The default is Yes.
Event severity when phone inventory succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the inventory file is successfully generated. The default is 25.
Raise event if no records found?	Select **Yes** to raise an event when the PhoneInventory job finds no phones based on the criteria you selected. The default is Yes.

Parameter	How to Set It
Event severity when no records found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the PhoneInventory job found no phones based on the criteria you selected. The default is 25.
Search Options	
Select by	Choose the type of selection criteria you want to use to create the list of phones. • Name (the default) • DirectoryNumber. If you select this option, you must also enable the *Include directory number and partition columns in report?* parameter. • Description • DevicePool • CallingSearchSpace • Location • Partition. If you select this option, you must also enable the *Include directory number and partition columns in report?* parameter. • Subnet. If you select this option, you must enter the subnet address in the *Selection criteria* parameter. Use the following format: `172.16.10.0/20` • SubnetFilepath. If you select this option, then, in the *Selection criteria* parameter, enter the UNC or full path to a file on the agent computer that contains a list of subnet specifications. The file must be located on the agent computer.
Selection criteria	Type the selection criteria for the phones to be listed. You can specify the actual item or you can specify a pattern by using the * wildcard. For example, to monitor all the phones with device names that begin with SEP, enter `SEP*`. You can enter multiple items by separating each item with a comma. For example: `SEP0009A*,SEP0009B*` The items you enter must be of the same type as the *Select by* parameter. So if *Select by* is Name, then the items you enter must be device names or patterns. If *Select by* is DirectoryNumber, then the items you enter must be directory numbers or patterns.

Parameter	How to Set It
List only phones with status of	To further filter the list of phones, select a status. Only phones of this status type, matching the criteria you specified in *Selection criteria* and *Select by*, will be included in the inventory list. Select from the following status types: • Any • Not Registered • Registered • Unregistered • Rejected **NOTE:** Setting this parameter to a value of **Not Registered** will also list those phones with a status of **Unregistered**.
Result File Options	
Full path to output folder for result file	Type the full path or a UNC path to a location on the agent computer in which to save the inventory `.csv` file. The default path is blank.
Order by	Select **Name** to display the contents of the results file in order by phone name. The default is Name. Select **DirectoryNumber** to display the contents of the results file in order by directory numbers. If you select DirectoryNumber, also enable the *Include directory number and partition columns in report?* parameter.
Include directory number and partition columns in report?	Because a phone can be associated with multiple directory numbers and partitions, your inventory report can present the same phone several times, once for each directory number or partition. Select **Yes** to include the directory number and partition columns in the inventory, allowing multiple entries per phone. Disable this option to remove the directory number and partition columns from the inventory, allowing only one entry per phone. **NOTE:** You must select **Yes** if you selected any of the following parameter options: • The *Select by* parameter is set to **DirectoryNumber** or **Partition**. • The *Order by* parameter is set to **DirectoryNumber**.

21.43 Report_PhoneDeregAudit

Use this Knowledge Script to create a history of phone deregistrations and reregistrations. This script uses the data stored in the Cisco CM supplemental database and collected by the PhoneDeregistrations script.

The completed Phone Deregistrations Audit report contains a column titled "Entry Type." In this column, you might occasionally see an entry of "Reregister - Missed." This entry indicates a phone that has, apparently, deregistered and then reregistered within a single iteration of this script. AppManager can tell something happened because the timestamp on the reregistration is different from the last time the phone was polled. However, because the phone is registered, AppManager is unable to determine exactly what transpired.

21.43.1 Prerequisite

For the AppManager for Cisco Unified Communications Manager module, the Report agent pulls data from the Cisco CM supplemental database rather than from the AppManager repository. The `netiqmc` service on the Report agent computer must be running as an account that has permission to access the supplemental database you created using the SetupSupplementalDB Knowledge Script. The Report agent and supplemental database must be located on the same computer for the PhoneDeregAudit report to work.

21.43.2 Resource Object

Report agent

21.43.3 Default Schedule

By default, this script runs once.

21.43.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Data Source	
Select cluster	Select the Communications Manager cluster for which you want to create a deregistered phone audit report.
Cisco CM SQL instance	Specify the SQL instance that contains the Cisco CM supplemental database from which the report should pull data. Use the same SQL instance you specified in the PhoneDeregistrations script parameters. Leave this parameter blank to accept the default instance.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Search Criteria	

Parameter	How to Set It
Note for entering search criteria: If you enter only the wildcard (*) for a field (such as Partition name), then AppManager matches *only* those deregistered phones that have a value for that field. Phones for which that field has no value (i.e., is NULL) will not be matched. For example, if you enter * in the "Partition name" parameter, then the search matches only those phones that have been configured for some partition name. To match all deregistered phones (including phones that have no value for the selected field), leave the search criteria parameter blank.	
Directory number	Type the directory number for which you want to identify phone deregistrations.
Device name	Type the name of the device for which you want to identify phone deregistrations.
Device IP address	Type the IP address of the device for which you want to identify phone deregistrations. You can use one of the following formats: • Single dotted-decimal IP address, such as 10.41.2.31 • Dotted-decimal IP address that includes a wildcard, such as 10.41.*.*, which would search for all IP addresses in the range of 10.41.0.0 to 10.41.255.255. • Range of dotted-decimal IP addresses separated by a hyphen, such as 10.41.2.31-10.41.2.41. The first address indicates the beginning of the range; the second IP address marks the end of the range.
Device pool	Type the name of the device pool for which you want to identify phone deregistrations.
Location	Type the name of the device location for which you want to identify phone deregistrations. **NOTE:** The device location is the location configured on the Communications Manager.
Partition name	Type the name of the partition for which you want to identify phone deregistrations.
Report Settings	
Order rows by?	Select the column by which you want to sort the rows in the report. The default is DeregTimeDescending.
Show outage time in minutes or seconds?	Select whether the Outage Time column of the report displays the deregistration period in **Minutes** or **Seconds**. The default is Minutes. The outage time is calculated as the difference between the time of deregistration and the time of reregistration.
Include parameter help card?	Select y to include a table in the report that lists parameter settings for this script. The default is y.
Select output folder	Set parameters for the output folder. The default folder name is PhoneDeregistrationAudit.
Add job ID to output folder name?	Select y to append the job ID to the name of the output folder. The default is n. A job ID is helpful for making the correlation between a specific instance of a Report script and the corresponding report.
Select properties	Set miscellaneous report properties as desired. The default report name is Phone Deregistration Audit.

Parameter	How to Set It
Add time stamp to title?	Select y to append a time stamp to the title of the report, making each title unique. The default is n. The time stamp is made up of the date and time the report was generated. Adding a time stamp is useful in order to run consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event if report succeeds?	Select y to raise an event when the report is successfully generated. The default is y.
Event severity when report succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successful. The default is 35.
Event severity when report has no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

21.44 Report_PhoneDeregWatchList

Use this Knowledge Script to create a list of phones that deregister frequently. This script uses the data stored in the Cisco CM supplemental database and collected by the PhoneDeregistrations script.

21.44.1 Prerequisite

For the AppManager for Cisco Unified Communications Manager module, the Report agent pulls data from the Cisco CM supplemental database rather than from the AppManager repository. The `netiqmc` service on the Report agent computer must be running as an account that has permission to access the supplemental database you created using the SetupSupplementalDB Knowledge Script. The Report agent and supplemental database must be located on the same computer for the PhoneDeregWatchList report to work.

21.44.2 Resource Object

Report agent

21.44.3 Default Schedule

By default, this script runs once.

21.44.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Data Source	
Select cluster	Select the Communications Manager cluster for which you want to create a deregistered phone report.
Cisco CM SQL instance	Specify the SQL instance that contains the Cisco CM supplemental database from which the report should pull data. Use the same SQL instance you specified in the PhoneDeregistrations script parameters.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Search Criteria	
Note for entering search criteria: If you enter only the wildcard (*) for a field (such as Partition name), then AppManager matches *only* those deregistered phones that have a value for that field. Phones for which that field has no value (i.e., is NULL) will not be matched. For example, if you enter * in the “Partition name” parameter, then the search matches only those phones that have been configured for some partition name. To match all deregistered phones (including phones that have no value for the selected field), leave the search criteria parameter blank.	
Minimum number of deregistrations	Specify the minimum number of deregistrations that must have occurred on a phone before that phone is included in the deregistration report. For example, if you specify “5” as the minimum, then any phone that has four or fewer deregistrations is not included in the report.

Parameter	How to Set It
Directory number	Type the directory number for which you want to watch phone deregistrations.
Device name	Type the name of the device for which you want to watch phone deregistrations.
Device IP address	Type the IP address of the device for which you want to watch phone deregistrations. You can use one of the following formats: • Single dotted-decimal IP address, such as 10.41.2.31 • Dotted-decimal IP address that includes a wildcard, such as 10.41.*.*, which would search for all IP addresses in the range of 10.41.0.0 to 10.41.255.255. • Range of dotted-decimal IP addresses separated by a hyphen, such as 10.41.2.31-10.41.2.41. The first address indicates the beginning of the range; the second IP address marks the end of the range.
Device pool	Type the name of the device pool for which you want to watch phone deregistrations.
Location	Type the name of the device location for which you want to watch phone deregistrations. **NOTE:** The device location is the location that is configured on the Communications Manager.
Partition name	Type the name of the partition for which you want to watch phone deregistrations.
Report Settings	
Order rows by?	Select the column by which you want to sort the rows in the report. The default is Deregistrations.
Include parameter help card?	Select y to include a table in the report that lists parameter settings for this script. The default is y.
Select output folder	Set parameters for the output folder. The default folder name is PhoneDeregistrationWatchList.
Add job ID to output folder name?	Select y to append the job ID to the name of the output folder. The default is n. A job ID is helpful for making the correlation between a specific instance of a Report script and the corresponding report.
Select properties	Set miscellaneous report properties as desired. The default report name is Phone Deregistration Watch List.
Add time stamp to title?	Select y to append a time stamp to the title of the report, making each title unique. The default is n. The time stamp is made up of the date and time the report was generated. Adding a time stamp is useful in order to run consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event if report succeeds?	Select y to raise an event when the report is successfully generated. The default is y.
Event severity when report succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successful. The default is 35.

Parameter	How to Set It
Event severity when report has no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

21.45 RoleStatus

Use this Knowledge Script to monitor a Communications Manager group for changes in the status of its primary and backup Communications Managers. This script raises an event if the initial status of the primary Communications Manager is "not active." In addition, this script raises an event if the status of the primary or backup Communications Manager changes.

For more information, see PhoneInventory.

This script is a member of the CiscoCM recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 1245.

21.45.1 Resource Object

CiscoCM_CMGroupObj

21.45.2 Default Schedule

By default, this script runs every five minutes.

If you are running this script as part of the Recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered so as to lessen the impact on CPU utilization when you run the KSG.

21.45.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the RoleStatus job. The default is 5.
Event Notification	
Raise event if primary CallManager is not active?	Select **Yes** to raise an event if the primary Communications Manager is not active when you start the RoleStatus job. The default is unselected.
Event severity when primary CallManager is not active	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the primary Communications Manager is not active when you start the RoleStatus job. The default is 5.
Raise event if primary CallManager status changes?	Select **Yes** to raise an event if the status of the primary Communications Manager changes while the RoleStatus job is running. The default is Yes.
Event severity when primary CallManager status changes	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of the primary Communications Manager changes while the RoleStatus job is running. The default is 5.

Parameter	How to Set It
Raise event if backup CallManager status changes?	Select **Yes** to raise an event if the status of the backup Communications Manager changes while the RoleStatus job is running. The default is Yes.
Event severity when backup CallManager status changes	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of the backup Communications Manager changes while the RoleStatus job is running. The default is 5.

21.46 SetupSupplementalDB

Use this Knowledge Script to verify that Communications Manager is properly configured for the collection of Call Detail Records (CDRs). This script creates a Cisco CM supplemental database, plus the tables and stored procedures needed to store CDRs. In addition, this script creates a SQL job that removes old records from the supplemental database.

21.46.1 Understanding the Cisco CM Supplemental Database

The Cisco CM supplemental database is a SQL Server database you create on the proxy agent computer. The supplemental database fulfills three functions:

- **Storage for CDRs.** The Unified Communications Manager server pushes CDRs, which are flat files, to a folder on the proxy agent computer. From there, the CDRs are saved to tables in the Cisco CM supplemental database, from which the CDR_CallFailures, CDR_CallQuality, and CDR_Query Knowledge Scripts can easily monitor and retrieve data.

  When you create the supplemental database, you specify how long data is retained before being deleted and archived. AppManager automatically archives any flat files older than the retention age you specify. That way, no time or CPU is wasted by transferring to the supplemental database any files that will be immediately slated for deletion.

- **Data source for Call Data Analysis module.** By creating a supplemental database in which to store CDRs, you establish a means of using the AppManager for Call Data Analysis module for analyzing call activity for Unified Communications Manager. The Call Data Analysis module was designed to analyze CDRs that are pushed to a supplemental database. The CDR_RetrieveConfigData script retrieves the Unified Communications Manager configuration information Call Data Analysis requires and stores it in the supplemental database.

  When using AppManager for Call Data Analysis, simply identify the Cisco CM supplemental database as a Data Source when you run the CallDataAnalysis_AddDataSource_CiscoCM Knowledge Script.

- **Storage for phone deregistration data.** The PhoneDeregistrations Knowledge Script uses AXL queries to create a list of unregistered phones and to identify when they reregister. The script stores the deregistration data in an audit table in the Cisco CM supplemental database, from which it is easily accessed for reporting. The CDR_RetrieveConfigData script retrieves the Communications Manager configuration information the Report scripts need to accommodate your grouping choices and stores it in the supplemental database.

To use the supplemental database:

1. **Create the database**. Use the SetupSupplementalDB Knowledge Script to create one Cisco CM supplemental database per Unified Communications Manager cluster you are monitoring.

2. **Populate the database**. Use CDR_RetrieveConfigData to retrieve configuration data from Unified Communications Manager and save it to the Cisco CM supplemental database. Then run CDR_RetrieveCallRecords to retrieve the CDR flat files from the folder into which they were pushed (using FTP) by the primary Communications Manager. This folder is located on the proxy agent computer; you configure the primary Communications Manager to send CDRs to this location.

   Although the PhoneDeregistrations script does not monitor data in the supplemental database, it does populate the audit table in the database with phone deregistration data, which is subsequently used by the Report_PhoneDeregAudit and Report_PhoneDeregWatchList Report scripts.

3. **Monitor the data in the database**. Depending on your monitoring objectives, use the following scripts to analyze the data in the database.
   - CDR_CallFailures monitors CDRs for calls that ended with an abnormal termination code.
   - CDR_CallQuality monitors CDRs for jitter, latency, lost data, and MOS.
   - CDR_Query searches CDRs based on query filters you select.
   - PhoneDeregistrations monitors phone deregistrations and maintains a history of phone deregistrations in the supplemental database
4. **Run the Report Knowledge Scripts**. The Report_PhoneDeregAudit and Report_PhoneDeregWatchList scripts organize and display the information in the Cisco CM supplemental database. The reporting function requires the `netiqmc` service on the Report agent computer to be running as an account that has permissions on the supplemental database.

21.46.2 Resource Object

CiscoCM CDR Mgmt

21.46.3 Default Schedule

By default, this script runs once.

21.46.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the SetupSupplementalDB job. The default is 5.
Raise event if database setup succeeds?	Select **Yes** to raise an event if the setup of the Cisco CM supplemental database is successful. The default is unselected.
Event severity when database setup succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the success of the setup of the Cisco CM supplemental database. The default is 25.
Phone Deregistration Parameters	
Number of days to keep phone deregistration audit entries	Specify the number of days' worth of phone deregistration audit entries you want to keep in the Cisco CM supplemental database. Any data older than what you specify is discarded. The default is 180 days.
CDR Parameters	
Full path to call detail records	Specify the full path to the location of the CDRs on the proxy agent computer. The TreeView cluster name must appear in the path. Use the same TreeView cluster name you used when configuring the proxy agent computer as a billing server. For example, *if* you entered `CCM80-01\` as the host name of the primary server when you configured the billing server *and* your FTP server is installed in the default location, then enter the following: `c:\inetpub\ftproot\CCM80-01`

Parameter	How to Set It
Number of days to keep call detail records	Specify the number of days' worth of call detail records you want to keep in the Cisco CM supplemental database. Any data older than what you specify is discarded. The default is 7 days.
SQL Server Information	
Local SQL Server Instance name	Specify the name of the local SQL Server instance (on the proxy agent computer) in which you want to create the new Cisco CM supplemental database. Leave this parameter blank to accept the default name.

21.47 SIP_Trunk_CallActivity

Use this Knowledge Script to monitor attempted, completed, in-progress, and active calls for SIP trunks. This script raises an event if any threshold is exceeded. In addition, this script generates data streams for the following metrics:

- Attempted calls per trunk
- Completed calls per trunk
- In-progress calls per trunk
- Active calls per trunk

21.47.1 Resource Object

SIPTrunk object

21.47.2 Default Schedule

By default, this script runs every 15 minutes.

21.47.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity if job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the SIP_Trunk_CallActivity job. The default is 5.
Monitor Attempted Calls	
Event Notification	
Raise event if attempted calls exceed threshold	Select **Yes** to raise an event if the number of attempted calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum attempted calls	Specify the highest number of calls that must be attempted before an event is raised. The default is 500.
Event severity when attempted calls exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of attempted calls exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for attempted calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that were attempted during the monitoring period.
Monitor Completed Calls	
Data Collection	

Parameter	How to Set It
Collect data for completed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that were completed during the monitoring period.
Monitor Active Calls	
Data Collection	
Collect data for active calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that are active at each script iteration.
Monitor Calls In Progress	
Event Notification	
Raise event if calls in progress exceed threshold	Select **Yes** to raise an event if the number of calls in progress exceeds the threshold that you set. The default is Yes.
Threshold - Maximum calls in progress	Specify the highest number of calls that must be in progress before an event is raised. The default is 1000.
Event severity when calls in progress exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of calls in progress exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for calls in progress?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that are in progress at each script iteration.

21.48 SNMPTrap_AddMIB

Use this Knowledge Script to add MIB (management information base) files to the MIB tree that is monitored by the SNMPTrap_Async Knowledge Script. The MIB files should be `ASN.1` text file with a `.txt` or `.my` file extension, and not compiled MIB files.

With this script you can copy a MIB file from an arbitrary directory to the MIB tree located in the `<AppManager directory>\bin\MIBs` directory. And, by using the *Reload MIB tree?* parameter, you can also reload all MIBs in the tree without restarting the AppManager agent. A restart of the AppManager agent automatically reloads the MIB tree, a directory of MIBs.

Scenarios for using this script include the following examples:

In This Scenario	Set These Parameters
You want to add a MIB file to the MIB tree, but do not want the addition to take effect until after the next restart of the AppManager agent.	*Full path to MIB files* and *List of MIB files*: Provide location and name of MIB file you want to add. *Reload MIB tree?*: Select **No** (unchecked).
You manually copied a MIB file to the MIB directory and want to reload all MIBs in the tree.	*Full path to MIB files* and *List of MIB files*: Leave blank. *Reload MIB tree?*: Select **Yes**. *MIB reload timeout*: Set new timeout value or accept default of 10 seconds.
Due to compiler errors, you edited some MIBs in the MIB directory. Now you want to reload the MIBs to ensure the errors have been fixed.	*Full path to MIB files* and *List of MIB files*: Leave blank. *Reload MIB tree?*: Select **Yes**. *MIB reload timeout*: Set new timeout value or accept default of 10 seconds.

For more information, see "Working with NetIQ SNMP Trap Receiver" on page 1226.

21.48.1 Resource Object

CiscoCM_TrapReceiver

21.48.2 Default Schedule

By default, this script runs once.

21.48.3 Setting Parameter Values

Set the following parameters as needed.

Parameter	How to Set It
Full path to MIB files	Specify the full path to the folder that contains the MIB files you want to install. The AppManager agent on the proxy computer must have SNMP access to the location you specify.

Parameter	How to Set It
List of MIB files	Type a comma-separated list of the MIB files you want to install. The MIB files should be `ASN.1` text files with a `.TXT` or `.MY` file extension. The MIB files should not be compiled MIB files. The MIB files you specify must be located in the folder you identified in the *Full path to MIB files* parameter.
Reload MIB tree?	Select **Yes** to update the MIB tree.
MIB reload timeout	Specify the length of time AppManager should attempt to update the MIB tree before timing out and raising a failure event. The default is 10 seconds.
Event Notification	
Raise event if installation and reloading of MIB tree succeeds?	Select **Yes** to raise an event if installation of the MIB files and/or reloading of the MIB tree succeeds. The default is Yes. Note that reloading of the MIB tree can be successful even if no new MIB files are installed. Reloading of the MIB tree can proceed even if you provide no MIB files in the *List of MIB files* or *Full path to list of MIB files* parameters.
Event severity when installation and reloading of MIB tree succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the installation of MIB files and/or the reloading of the MIB tree succeeds. The default is 25.
Raise event if "reload MIB parser" warnings received?	Select **Yes** to raise an event if warning messages are received during the reload process. The default is Yes. Warning scenarios include: • MIBs are installed successfully but the *Reload MIB tree?* parameter is not set to Yes. • Not all specified MIB files were loaded to the MIB tree.
Event severity when "reload MIB parser" warnings received	Set the severity level, from 1 to 40, to indicate the importance of an event in which warning messages are received during the reload process. The default is 15.
Raise event if installation and reloading of MIB tree fails?	Select **Yes** to raise an event if AppManager fails to install or reload the specified MIB files. The default is Yes. Failure scenarios include: • MIB reload timeout period expired. • Not all specified MIB files were installed.
Event severity when installation and reloading of MIB tree fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the installation or reloading of the MIB tree fails. The default is 10.
Raise event with the list of currently installed MIBs?	Select **Yes** to raise an informational event that provides a list of all MIBs installed in the MIB tree. The default is Yes.
Event severity for list of currently installed MIBs	Set the severity level, from 1 to 40, to indicate the importance of an event that provides a list of all MIBs installed in the MIB tree. The default is 25.

21.49 SNMPTrap_Async

Use this Knowledge Script to monitor SNMP traps forwarded from NetIQ SNMP Trap Receiver. This script raises an event when an SNMP trap is received and when Trap Receiver is unavailable or subsequently becomes available. In addition, this script generates data streams for Trap Receiver availability.

This script checks for SNMP traps in the MIB tree. You can add Management Information Bases (MIBs) to the MIB tree. For more information, see the SNMPTrap_AddMIB Knowledge Script.

In general, a trap receiver is an application that receives traps from SNMP agents. Trap Receiver receives SNMP traps, filters them, and then forwards the traps to AppManager. For more information, see "Working with NetIQ SNMP Trap Receiver" on page 1226.

21.49.1 Prerequisite

To allow this script to access the MIBs for Unified Communications Manager servers, configure your SNMP permissions in AppManager Security Manager *before* using the SNMPTrap_Async script. For more information, see "Configuring SNMP Permissions in Security Manager" on page 1229.

21.49.2 Resource Object

CiscoCM_TrapReceiver

21.49.3 Default Schedule

By default, this script runs on an asynchronous schedule.

21.49.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Trap Filters	
List of trap OIDs	Use this parameter to provide a list of the OIDs (object identifiers) of the traps you want to monitor. Separate multiple OIDs with a comma. For example: `1.3.6.1.2.1.2.2.1.1.1,1.3.6.1.2.1.2.2.1.7.1`

Full path to file with list of trap OIDs	If you have many OIDs to monitor, use this parameter to identify the full path to a file that contains a list of the OIDs. Each OID in the file should be on a separate line. For example:
	`1.3.6.1.2.1.2.2.1.1.1`
	`1.3.6.1.2.1.2.2.1.7.1`
	Because the file must be accessible from the AppManager agent, the path must be a local directory on the agent computer or a UNC path. The `netiqmc` service must be running as a user that has access to the UNC path.

Parameter	How to Set It
List of MIB subtrees	Use this parameter to monitor an OID *and* all of its subtrees. Provide a comma-separated list of the OIDs you want to monitor. For example: `1.3.6,1.3.7`

Full path to file with list of MIB subtrees	If you have many subtrees to monitor, use this parameter to provide the full path to a file that contains a list of the OIDs. Each OID in the file should be on a separate line. For example:
	`1.3.6`
	`1.3.7`
	Because the file must be accessible from the AppManager agent, the path must be a local directory on the agent computer or a UNC path. The `netiqmc` service must be running as a user that has access to the UNC path.

Event Notification	
Format trap data according to SNMP version	Select the version of SNMP whose formatting should be used for trap event messages. The data provided by each format is the same; only the layout is different. The default is SNMPv2.
Raise emergency alarm event?	Select **Yes** to raise an event when the SNMP trap message contains information about an emergency alarm. The default is Yes.
Event severity when emergency alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP trap message contains information about an emergency alarm. The default is 1.
Raise alert alarm event?	Select **Yes** to raise an event when the SNMP trap message contains information about an alert alarm. The default is Yes.
Event severity when alert alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP trap message contains information about an alert alarm. The default is 2.
Raise critical alarm event?	Select **Yes** to raise an event when the SNMP trap message contains information about a critical alarm. The default is Yes.
Event severity when critical alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP trap message contains information about a critical alarm. The default is 3.
Raise error alarm event?	Select **Yes** to raise an event when the SNMP trap message contains information about an error alarm. The default is Yes.
Event severity when error alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP trap message contains information about an error alarm. The default is 5.
Raise warning alarm event?	Select **Yes** to raise an event when the SNMP trap message contains information about a warning alarm. The default is unselected.
Event severity when warning alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP trap message contains information about a warning alarm. The default is 15.
Raise notice alarm event?	Select **Yes** to raise an event when the SNMP trap message contains information about a notice alarm. The default is unselected.
Event severity when notice alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP trap message contains information about a notice alarm. The default is 25.

Parameter	How to Set It
Raise informational alarm event?	Select **Yes** to raise an event when the SNMP trap message contains information about an informational alarm. The default is unselected.
Event severity when informational alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which the SNMP trap message contains information about an informational alarm. The default is 35.
Raise unmapped alarm event?	Select **Yes** to raise an event an SNMP trap is received but is not reflected in the `.CSV` mapping file. The default is Yes. Disable this parameter if you do not want to be informed about SNMP traps that are not mapped in the `.CSV` file.
Event severity when unmapped alarm received	Set the severity level, from 1 to 40, to indicate the importance of an event in which an SNMP trap is not mapped in the `.CSV` file. The default is 15.
Raise Trap Receiver availability events?	Select **Yes** to raise an event when Trap Receiver becomes unavailable and when Trap Receiver becomes available once again. The default is Yes.
Event severity when Trap Receiver is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which Trap Receiver becomes unavailable. The default is 5.
Event severity when Trap Receiver becomes available	Set the severity level, from 1 to 40, to indicate the importance of an event in which Trap Receiver becomes available after being unavailable. The default is 25.
Data Collection	
Collect data for Trap Receiver availability?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns a “1” if Trap Receiver is available and a “0” if Trap Receiver is unavailable. The default is unselected.
Interval for collecting Trap Receiver availability data	Specify the frequency with which the script collects Trap Receiver availability data. The default is every 5 minutes.

21.49.5 Working with NetIQ SNMP Trap Receiver

NetIQ SNMP Trap Receiver (Trap Receiver) is installed automatically when you install AppManager for Cisco Unified Communications Manager. Trap Receiver runs as a service, `NetIQTrapReceiver.exe`, and might compete for port usage with any other trap receiver installed on the same computer.

21.49.5.1 What is NetIQ SNMP Trap Receiver?

At its most basic, a trap receiver is an application that receives traps from SNMP agents. Trap Receiver receives, filters, and forwards SNMP traps to AppManager. When you use Trap Receiver with AppManager for Cisco Unified Communications Manager, the SNMPTrap_Async Knowledge Script raises events when SNMP traps are received.

21.49.5.2 What is an SNMP Trap?

Simple Network Management Protocol (SNMP) is a protocol-based system used to manage devices on TCP/IP-based networks. From devices on which an SNMP agent resides, such as routers and switches, SNMP sends unsolicited notifications, called traps, to network administrators when thresholds for certain conditions are exceeded. These conditions are defined by the vendor in a device’s MIB; the network administrator sets the thresholds.

Traps are composed of Protocol Data Units (PDUs). Each PDU contains the following information, organized in various ways depending on the version of SNMP in use:

- SNMP version number
- Community name of the SNMP agent
- PDU type
- Enterprise OID (object identifier), a unique number that identifies an enterprise and its system objects in the MIB
- IP address of the SNMP agent
- Generic trap type: Cold start, Warm start, Link down, Link up, Authentication failure, and Enterprise
- Specific trap type. When the Generic trap type is set to "Enterprise," a specific trap type is included in the PDU. A specific trap is one that is unique or specific to an enterprise.
- Time the event occurred
- Varbind (variable binding), a sequence of two fields that contain the OID and a value

21.49.5.3 Understanding Trap Receiver Architecture

Trap Receiver operates on a Client-Server architecture: the *Server*—the stand-alone Trap Receiver application—receives, filters, and forwards SNMP traps to the *Client*—an application that receives traps, such as AppManager. The Server can receive traps on standard UDP port 162 or on any other configured port. The Client and the Server can reside on the same computer or on separate computers.

Communication between Client and Server is implemented as XML messages over a TCP connection. Only one Server is allowed per computer, however, several Clients are allowed per computer. Clients that are registered to the same Server share the same TCP connection. The Server TCP port should be known to all potential Clients.

21.49.5.4 Understanding the Trap Receiver Configuration File

The configuration file for Trap Receiver, `NetIQTrapReceiver.conf`, identifies the UDP and TCP ports used by Trap Receiver: the UDP port is used for receiving traps; the TCP port is used for communicating with the Client, such as AppManager or another supported NetIQ application. The configuration file also identifies the level of logging you want to use and whether port forwarding is enabled.

By default, the configuration file is installed in `[installation directory]\config`, and has the following format:

```
############################################################
#
# NetIQTrapReceiver.conf
#
# A configuration file for NetIQ SNMP Trap Receiver
#
############################################################
#########################
# TCP port
# Syntax: tcp_port [port]
# E.g. : tcp_port 2735
#########################
```

```
tcp_port 2735
########################
# UDP port
# Syntax: udp_port [port]
# E.g. : udp_port 162
########################
udp_port 162
########################
# Forwarding
# Syntax: forward [address]:[port] [v1]
# E.g. : forward 127.0.0.1:1000 v1
########################
########################
# Log level
# Syntax: log_level error|warning|info|debug|xml
# E.g. : log_level info
########################
log_level debug
```

If the configuration file cannot be found, cannot be parsed, or does not contain one of the required values, Trap Receiver is initialized with the default configuration as shown above.

When changing values in the configuration file, take into account the following:

- If you change the TCP port number, stop all asynchronous Knowledge Script jobs associated with the modules that support Trap Receiver. Run the Discovery Knowledge Script on all monitored devices to enable the devices to recognize the new TCP port number.
- If you change the UDP port number, also change the UDP port number configured on the devices that send traps to Trap Receiver.
- If another service uses port 2735 or port 162, Trap Receiver *will not start*. The Trap Receiver log file will contain different levels of messages, based on the log_level you choose. Either change the port numbers in the configuration file, stop the service that is using the default Trap Receiver port numbers, or forward the traps coming in to UDP port 162.
- To forward incoming traps to another trap receiver, such as Microsoft SNMP Trap Service, set the Forwarding values as follows:

  ```
  forward [IP address of other trap receiver]:[port number of other trap receiver] [SNMP version]
  ```

  For example: `forward 10.40.40.25:167 v1`. By default, incoming traps are not forwarded. For more information, see "Coexisting with Microsoft SNMP Trap Service" on page 1228.
- Restart Trap Receiver after any change to the configuration file. From Control Panel, double-click **Administrative Tools** and then double-click **Services**. Right-click **NetIQ Trap Receiver** and select **Restart**.

21.49.5.5 Coexisting with Microsoft SNMP Trap Service

Two trap receivers cannot be in use on the same computer while using the same standard UDP port (162). If NetIQ SNMP Trap Receiver and another trap receiver such as Microsoft SNMP Trap Service are installed on the same computer and both are receiving traps, configure Trap Receiver to use the standard UDP port and to forward incoming traps (UDP forwarding) to the other trap receiver. For more information, see "Understanding the Trap Receiver Configuration File" on page 1227.

Then, configure the other trap receiver to use a different, non-standard, UDP port that is not in use by another application. The following are instructions for configuring Microsoft SNMP Trap Service.

To configure Microsoft SNMP Trap Service to use another port:

1. Navigate to `c:\Windows\system32\drivers\etc`.
2. Open the **services** file.
3. In the row for `snmptrap`, change the value for **udp** from 162 to another port number that is not in use by any other application. Use the same port number you set as the forwarding port in the Trap Receiver configuration file.
4. Save and close the **services** file.
5. Restart Windows SNMP Trap Service. In Control Panel, double-click **Administrative Tools** and then double-click **Services**. Right-click **SNMP Trap Service** and select **Restart**.

TIP: To see which ports are in use, run netstat.exe from a command prompt. Then select an available port as the port for the other trap receiver service.

21.49.6 Configuring SNMP Permissions in Security Manager

To allow the SNMPTrap_Async Knowledge Script to access the Management Information Bases (MIBs) for Unified Communications Manager servers, configure your SNMP permissions in AppManager Security Manager *before* using the SNMPTrap_Async script. The SNMP permissions act as a filter for incoming SNMP traps.

The type of information you configure varies according to the version of SNMP that is implemented in your network. AppManager for Cisco Unified Communications Manager supports SNMP versions 1, 2, and 3.

21.49.6.1 Adding Permissions for SNMP Versions 1 and 2

Configure community string and version information for each Unified Communications Manager server that is monitored by the proxy agent computer. Complete the following fields in the Custom tab of Security Manager.

Field	Description
Label	`SNMP`
Sub-label	Indicates whether the community string information you are configuring will be used for a single Communications Manager or for all Communications Managers. • type `default`.
Value 1	Appropriate read-only community string value, such as `private` or `public`.

21.49.6.2 Adding Permissions for SNMP Version 3

SNMP trap monitoring in AppManager for Cisco Unified Communications Manager supports the following modes for SNMPv3:

- No authentication; no privacy
- Authentication; no privacy
- Authentication and privacy

In addition, the module supports the following protocols for SNMPv3:

- MD5 (Message-Digest algorithm 5, an authentication protocol)
- SHA (Secure Hash Algorithm, an authentication protocol)
- DES (Data Encryption Standard, encryption protocol)

Your SNMPv3 implementation might support one or more combinations of mode and protocol. That combination dictates the type of information you configure in AppManager Security Manager: user name (or entity), context name, protocol name, and protocol passwords.

Configure community string and version information for each Unified Communications Manager server that is monitored by the proxy agent computer. Complete the following fields in the Custom tab of Security Manager.

Field	Description
Label	`SNMP`
Sub-label	Indicates whether the community string information you are configuring will be used for a single Communications Manager or for all Communications Managers. • For a single device supported by a particular proxy agent computer, provide the name of the Communications Manager. • For all devices supported by a particular proxy agent computer, type `default`.
Value 1	SNMP user name or entity configured for the device. All SNMPv3 modes require an entry in the **Value 1** field.
Value 2	Name of the context associated with the user name or entity you entered in the **Value 1** field. A context is a collection of SNMP information that is accessible by an entity. If possible, enter a context that provides access to all MIBS for a device. If the device does not support context, type an asterisk (*). All SNMPv3 modes require an entry in the **Value 2** field.
Value 3	Combination of protocol and password appropriate for the SNMPv3 mode you have implemented. • For *no authentication/no privacy mode*, leave the **Value 3** field blank. • For *authentication/no privacy mode*, type `md5` or `sha` and the password for the protocol, separating each entry with a comma. For example, type `md5,abcdefgh` • For *authentication/privacy mode*, type `md5` or `sha` and the associated password, and then type `des` and the associated password, separating each entry with a comma. For example, type `sha,hijklmno,des,nopqrstu`

21.50 SystemUpTime

Use this Knowledge Script to monitor the number of hours that the Communications Manager system has been up since the last reboot. This script raises an event if a reboot occurs. In addition, this script generates a data stream for the number of hours that the Communications Manager system has been operational since the last reboot.

This script is a member of the CiscoCM recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 1245.

21.50.1 Resource Object

CiscoCM_CMServer

21.50.2 Default Schedule

By default, this script runs every five minutes.

If you are running this script as part of the Recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered so as to lessen the impact on CPU utilization when you run the KSG.

21.50.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the SystemUpTime job. The default is 5.
Raise event if system has rebooted?	Select **Yes** to raise an event if Communications Manager has rebooted during the monitoring period. The default is Yes.
Event severity when system has rebooted	Set the event severity level, from 1 to 40, to indicate the importance of an event in which Communications Manager has rebooted. The default is 10.
Monitor System Uptime	
Data Collection	
Collect data for system uptime?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of hours that the Communications Manager system has been operational since the last reboot. The default is Yes.

21.51 SystemUsage

Use this Knowledge Script to monitor CPU, memory, and disk usage for a Communications Manager server. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the following metrics:

- CPU usage (%)
- Physical and virtual memory usage (%)
- Swap space usage (%)
- Active, common, and swap partition usage (%)
- Total processes
- Total threads

This script is a member of the CiscoCM recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 1245.

21.51.1 Resource Object

CiscoCM_CMServer

21.51.2 Default Schedule

By default, this script runs every two minutes.

If you are running this script as part of the Recommended KSG, do not change the schedule. The schedules for the recommended scripts are staggered so as to lessen the impact on CPU utilization when you run the KSG.

21.51.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the SystemUsage job. The default is 5.
Monitor CPU Usage	
Event Notification	
Raise event if CPU usage exceeds threshold?	Select **Yes** to raise an event if CPU usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum CPU usage	Specify the highest percentage of CPU usage that must occur before an event is raised. The default is 80%.

Parameter	How to Set It
Event severity when CPU usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for CPU usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of CPU usage during the monitoring period. The default is Yes.
Monitor Physical Memory Usage	
Event Notification	
Raise event if physical memory usage exceeds threshold?	Select **Yes** to raise an event if physical memory usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum physical memory usage	Specify the highest percentage of physical memory usage that must occur before an event is raised. The default is 80%.
Event severity when physical memory usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which physical memory usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for physical memory usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of physical memory usage during the monitoring period. The default is Yes.
Monitor Virtual Memory Usage	
Event Notification	
Raise event if virtual memory usage exceeds threshold?	Select **Yes** to raise an event if virtual memory usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum virtual memory usage	Specify the highest percentage of virtual memory usage that must occur before an event is raised. The default is 80%.
Event severity when virtual memory usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which virtual memory usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for virtual memory usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of virtual memory usage during the monitoring period. The default is Yes.
Monitor Swap Space Usage	
Event Notification	
Raise event if swap space usage exceeds threshold?	Select **Yes** to raise an event if swap space usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum swap space usage	Specify the highest percentage of swap space that must be in use before an event is raised. The default is 80%.
Event severity when swap space usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which swap space usage exceeds the threshold you set. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for swap space usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of swap space usage during the monitoring period. The default is unselected.
Monitor Active Partition Usage	
Event Notification	
Raise event if active partition usage exceeds threshold?	Select **Yes** to raise an event if active partition usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum active partition usage	Specify the highest percentage of active partition usage that must occur before an event is raised. The default is 80%.
Event severity when active partition usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which active partition usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for active partition usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of active partition usage during the monitoring period. The default is unselected.
Monitor Common Partition Usage	
Event Notification	
Raise event if common partition usage exceeds threshold?	Select **Yes** to raise an event if common partition usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum common partition usage	Specify the highest percentage of common partition usage that must occur before an event is raised. The default is 80%.
Event severity when common partition usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which common partition usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for common partition usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of common partition usage during the monitoring period. The default is unselected.
Monitor Swap Partition Usage	
Event Notification	
Raise event if swap partition usage exceeds threshold?	Select **Yes** to raise an event if swap partition usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum swap partition usage	Specify the highest percentage of swap partition usage that must occur before an event is raised. The default is 50%.
Event severity when swap partition usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which swap partition usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for swap partition usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of swap partition usage during the monitoring period. The default is unselected.

Parameter	How to Set It
Monitor Total Processes	
Event Notification	
Raise event if total processes exceed threshold?	Select **Yes** to raise an event if the number of active processes exceeds the threshold that you set. The default is Yes.
Threshold - Maximum total processes	Specify the highest number of processes that must be active before an event is raised. The default is 250 processes.
Event severity when total processes exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of active processes exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for total processes?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of processes that are active at each script iteration. The default is unselected.
Monitor Total Threads	
Event Notification	
Raise event if total threads exceed threshold?	Select **Yes** to raise an event if the number of threads exceeds the threshold that you set. The default is Yes.
Threshold - Maximum total threads	Specify the highest number of threads that must be created before an event is raised. The default is 2500 threads.
Event severity when total threads exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of threads exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for total threads?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of threads detected at each script iteration. The default is unselected.

21.52 TFTPActivity

Use this Knowledge Script to monitor activity on the Cisco TFTP server. This script raises an event when the number of change notifications for the monitored activity exceeds the threshold that you set. In addition, this script generates data streams for the following metrics:

- Change notifications
- Builds
- Aborted requests
- Not-found requests
- Rejected requests
- Total requests
- Successful requests

21.52.1 Resource Object

CiscoCM_TFTP

21.52.2 Default Schedule

By default, this script runs every 15 minutes.

21.52.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the TFTPActivity job. The default is 5.
Monitor Change Notifications	
Event Notification	
Raise event if change notifications exceed threshold?	Select **Yes** to raise an event if the number of change notifications exceeds the threshold that you set. The default is Yes.
Threshold - Maximum change notifications	Specify the highest number of change notifications that must occur before an event is raised. The default is 10 notifications.
Event severity when change notifications exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of change notifications exceeds the threshold you set. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for change notifications?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of change notifications that occurred during the monitoring period.
Monitor Builds	
Event Notification	
Raise event if builds exceed threshold?	Select **Yes** to raise an event if the number of builds exceeds the threshold that you set. The default is Yes.
Threshold - Maximum builds	Specify the highest number of builds that must occur before an event is raised. The default is 50 builds.
Event severity when builds exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of builds exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for builds?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of builds that occurred during the monitoring period.
Monitor Aborted Requests	
Event Notification	
Raise event if aborted requests exceed threshold?	Select **Yes** to raise an event if the number of aborted requests exceeds the threshold that you set. The default is Yes.
Threshold - Maximum aborted requests	Specify the highest number of aborted requests that must occur before an event is raised. The default is 0 requests.
Event severity when aborted requests exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of aborted requests exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for aborted requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of aborted requests that occurred during the monitoring period.
Monitor Requests Not Found	
Event Notification	
Raise event if requests not found exceed threshold?	Select **Yes** to raise an event if the number of requests that are not found exceeds the threshold that you set. The default is Yes.
Threshold - Maximum requests not found	Specify the highest number of requests that must be “not found” before an event is raised. The default is 0 requests.
Event severity when requests not found exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of requests that are not found exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for requests not found?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of requests that were not found during the monitoring period.
Monitor Rejected Requests	
Event Notification	
Raise event if rejected requests exceed threshold?	Select **Yes** to raise an event if the number of rejected requests exceeds the threshold that you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum rejected requests	Specify the highest number of rejected requests that must occur before an event is raised. The default is 0 requests.
Event severity when rejected requests exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of rejected requests exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for rejected requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of requests that were rejected during the monitoring period.
Monitor Total Requests	
Data Collection	
Collect data for total requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of requests, which includes aborted, not-found, rejected, and successful requests.
Monitor Successful Requests	
Data Collection	
Collect data for successful requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of requests that were successful during the monitoring period.

21.53 Transcoder_Device

Use this Knowledge Script to monitor the usage of registered transcoder devices. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the number of active resources and for resource usage (%).

21.53.1 Resource Object

CiscoCM_XCode_DeviceObj

21.53.2 Default Schedule

By default, this script runs every 15 minutes.

21.53.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the Transcoder_Device job. The default is 5.
Monitor Resource Usage	
Event Notification	
Raise event if resource usage exceeds threshold?	Select **Yes** to raise an event if the percentage of transcoder device usage exceeds the threshold that you set. The default is Yes.
Threshold - Maximum resource usage	Specify the highest percentage of transcoder device usage that must occur before an event is raised. The default is 80%.
Event severity when resource usage exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the percentage of transcoder usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for resource usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of transcoder usage at each script iteration.
Monitor Active Resources	
Data Collection	
Collect data for active resources?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of transcoder devices that are active at each script iteration.
Monitor Unavailable Resources	
Event Notification	

Parameter	How to Set It
Raise event if number of times resources were unavailable exceeds threshold?	Select **Yes** to raise an event if the number of times that transcoder devices were unavailable exceeds the threshold that you set. The default is Yes.
Threshold - Maximum number of times resources were unavailable	Specify the maximum number of times that transcoder devices can be unavailable before an event is raised. The default is 0 instances.
Event severity number of times resources were unavailable exceeds threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of times that transcoder devices were unavailable exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for number of times resources were unavailable?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of times that transcoder devices were unavailable during the monitoring period.

21.54 WebDialer

Use this Knowledge Script to monitor activity for the Cisco Web Dialer application. Web Dialer enables users to place calls from their computers.

This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the following monitored activities:

- Failed calls
- Completed calls
- In-progress CTI sessions
- Total CTI sessions
- In-progress HTTP sessions
- Total HTTP sessions

21.54.1 Resource Object

CiscoCM_WebDialer

21.54.2 Default Schedule

By default, this script runs every 15 minutes.

21.54.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the WebDialer job. The default is 5.
Monitor Failed Calls	
Event Notification	
Raise event if failed calls exceed threshold?	Select **Yes** to raise an event if the number of failed calls exceeds the threshold that you set. The default is Yes.
Threshold - Maximum failed calls	Specify the highest number of calls that must fail before an event is raised. The default is 0 calls.
Event severity when failed calls exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of failed calls exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for failed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that failed during the monitoring period.

Parameter	How to Set It
Monitor Completed Calls	
Data Collection	
Collect data for completed calls?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of calls that were completed during the monitoring period.
Monitor CTI Sessions in Progress	
Event Notification	
Raise event if CTI sessions in progress exceed threshold?	Select **Yes** to raise an event if the number of CTI sessions in progress exceeds the threshold that you set. The default is Yes.
Threshold - Maximum CTI sessions in progress	Specify the highest number of CTI sessions that must be in progress before an event is raised. The default is 100 sessions.
Event severity when CTI sessions in progress exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of CTI sessions in progress exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for CTI sessions in progress?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of CTI sessions that are in progress at each script iteration.
Monitor CTI Sessions	
Data Collection	
Collect data for CTI sessions?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of CTI sessions that were handled during the monitoring period.
Monitor HTTP Sessions in Progress	
Event Notification	
Raise event if HTTP sessions in progress exceed threshold?	Select **Yes** to raise an event if the number of HTTP sessions in progress exceeds the threshold that you set. The default is Yes.
Threshold - Maximum HTTP sessions in progress	Specify the highest number of HTTP sessions that must be in progress before an event is raised. The default is 100 sessions.
Event severity when HTTP sessions in progress exceed threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the number of HTTP sessions in progress exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for HTTP sessions in progress?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of HTTP sessions that are in progress at each script iteration.
Monitor HTTP Sessions	
Data Collection	
Collect data for HTTP sessions?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number of HTTP sessions that were handled during the monitoring period.

21.55 WebPageCheck

Use this Knowledge Script to monitor the availability of and round-trip connection time to the `ccmadmin` and `ccmuser` Web pages. This script raises an event if either Web page is unavailable or if round-trip connection time exceeds the threshold that you set. In addition, this script generates data streams for Web page availability and round-trip time.

If either Web page is unavailable, the detail message records the reason, for example, because the format of the request was invalid or the server name was not found.

This script monitors Web page availability only. To monitor Web page content and usage, use the Knowledge Scripts in a different module: AppManager ResponseTime for Web.

21.55.1 Resource Object

CiscoCM_CMServer

21.55.2 Default Schedule

By default, this script runs every 30 minutes.

21.55.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the failure of the WebPageCheck job. The default is 5.
Is Web server secure?	Select **Yes** to indicate that your Communications Manager Web server is a secure Web server (HTTPS). The default is Yes.
Monitor CCMAdmin Web Page Availability	
Event Notification	
Raise event if Web page is unavailable?	Select **Yes** to raise an event if the `ccmadmin` Web page is unavailable. The default is Yes.
Event severity when Web page is unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the `ccmadmin` Web page is unavailable. The default is 15.
Data Collection	
Collect data for ccmadmin Web page availability?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns 100 if the Web page is available and 0 if the Web page is unavailable.
Monitor CCMAdmin Web Page Round-Trip Time	
Event Notification	

Parameter	How to Set It
Raise event if round-trip time exceeds threshold?	Select **Yes** to raise an event if the round-trip connection time for the `ccmadmin` Web page exceeds the threshold that you set. The default is Yes.
Threshold - Maximum round-trip time	Specify the longest round-trip connection time that can occur before an event is raised. The default is 100 milliseconds.
Event severity when round-trip time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which round-trip connection time for the `ccmadmin` Web page exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for round-trip time?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the `ccmadmin` Web page's round-trip connection time during the monitoring period.
Monitor CCMUser Web Page Availability	
Event Notification	
Raise event if Web page is unavailable?	Select **Yes** to raise an event if the `ccmuser` Web page is unavailable. The default is Yes.
Event severity when Web page is unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the `ccmuser` Web page is unavailable. The default is 15.
Data Collection	
Collect data for ccmuser Web page availability?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns 100 if the Web page is available and 0 if the Web page is unavailable.
Monitor CCMUser Web Page Round-Trip Time	
Event Notification	
Raise event if round-trip time exceeds threshold?	Select **Yes** to raise an event if the round-trip connection time for the `ccmuser` Web page exceeds the threshold that you set. The default is Yes.
Threshold - Maximum round-trip time	Specify the longest round-trip connection time that can occur before an event is raised. The default is 100 milliseconds.
Event severity when round-trip time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which round-trip connection time for the `ccmuser` Web page exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for round-trip time?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the round-trip connection time for the `ccmuser` Web page during the monitoring period.

21.56 Recommended Knowledge Script Group

The following Knowledge Scripts are members of the CiscoCM recommended Knowledge Script Group (KSG).

- CCM_CallActivity
- CCM_MGCPResources
- CCM_RegisteredResources
- CCM_ResourceAvailability
- CCM_SystemPerformance
- HealthCheck
- RoleStatus
- SystemUpTime
- SystemUsage

The parameters of all scripts in the KSG are set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab and run the CiscoCM group on a Unified Communications Manager resource.

Run the KSG on only one cluster at a time. Running the KSG on multiple clusters all at once hinders the proxy agent's ability to spread out processing over time. You can monitor multiple clusters by running the KSG on the first cluster, and then repeating the process for each additional cluster.

The CiscoCM KSG provides a "best practices" usage of AppManager for monitoring your Unified Communications Manager environment. You can use this KSG with AppManager monitoring policies. A monitoring policy, which enables you to efficiently and consistently monitor all the resources in your environment, uses a set of pre-configured Knowledge Scripts to automatically monitor resources as they appear in the TreeView. For more information, see "About Policy-Based Monitoring" in the AppManager Help.

A KSG is composed of a subset of a module's Knowledge Scripts. The script that belongs to a KSG is a different copy of the original script you access from the CiscoCM tab. If you modify a script that belongs to a KSG, the parameter settings of the original script in the CiscoCM tab are not affected.

When deployed as part of a KSG, a script's default script parameter settings might differ from when the script is deployed alone. The default settings of a script within a group depend on its monitoring purpose within the larger group, and on the intended monitoring scope of that group.

If you modify or remove a script associated with the CiscoCM KSG and want to restore it to its original form, you can reinstall AppManager for Cisco Unified Communications Manager on the repository computer or check in the appropriate script from the AppManager\qdb\kp\CiscoCM\RECOMMENDED_CiscoCM directory.

21.57 Troubleshooting Missing Data Points

AppManager for Cisco Unified Communications Manager sends consolidated requests to the Unified Communications Manager server to collect the data used by several CiscoCM Knowledge Scripts. AppManager sends these requests 30 seconds before a script begins each iteration. This 30-second data-collection offset allows enough time for AppManager to execute the query before a script requires the data.

If you notice data points are missing from a job's data stream, it may be that 30 seconds is not enough time for AppManager to execute all of the queries you need, most likely because you are running several scripts on the same schedule.

You can increase the data-collection offset time by changing a Registry setting:

```
HKEY_LOCAL_MACHINE\SOFTWARE\NetIQ\AppManager\4.0\NetIQmc\DataRecorder
\CollectionOffset
```

In the right pane of the Registry Editor, double-click **CiscoCM** and change the **Decimal** value from 30 seconds to a larger value that will allow enough time for AppManager to execute the queries for all of the scripts you are running. Keep the value *less* than the shortest interval specified by any Knowledge Script. For example, if one script runs every one minute, but the others run every five minutes, do not change the Registry setting to a value equal to or greater than 60 seconds.

Changes to this Registry setting affect the data-collection offset time for the following Knowledge Scripts:

AnalogAccess_GatewayUsage
Annunciator_Device
AttendantConsole
CCM_CallActivity
CCM_MediaResources
CCM_MGCPResources
CCM_RegisteredResources
CCM_ResourceAvailability
CCM_SystemPerformance
CFB_Hardware_Device
CFB_Software_Device
CFB_Video_Device
CTIManager
ExtensionMobility
GatekeeperActivity
GeneralCounter
H323_Gateway_CallActivity
H323_Trunk_CallActivity
HuntAndRouteList
Locations
MediaStreamingApp
MGCP_FXO_CallActivity
MGCP_FXS_CallActivity
MGCP_GatewayUsage
MGCP_PRI_CallActivity
MGCP_PRI_ChannelHealth
MGCP_T1CAS_CallActivity
MGCP_T1CAS_ChannelHealth
MOH_Device
MTP_Device
SIP_Trunk_CallActivity
SystemUpTime
SystemUsage
TFTPActivity
Transcoder_Device
WebDialer

22 CiscoCME Knowledge Scripts

Cisco Unified Communications Manager Express is a unified communications solution for small business or branch offices. This solution provides call processing for Cisco IP phones as part of a converged voice and data solution empowered by a Cisco router.

AppManager for Cisco Unified Communications Manager Express provides the following Knowledge Scripts for monitoring Cisco Unified Communications Manager Express resources. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
Device_Reset	Resets Unified Communications Manager Express IP phones for reasons such as troubleshooting or picking up new default firmware.
Device_Status	Monitors the status of key Unified Communications Manager Express devices.
Extension_Check	Monitors for duplicate phone extension numbers. This script looks for all phones configured in Unified Communications Manager Express, regardless of whether they are registered.
Phone_Inventory	Generates an inventory of the phone details for phones attached to Unified Communications Manager Express.
Set_Key_Phones	Designates one or more "key" phones. After you designate key phones, you then can choose to monitor only key phones.
SRST_Failover	Monitors a device operating in SRST (Survivable Remote Site Telephony) mode for registered phones or network connectivity failure, which indicates a failover from Unified Communications Manager.
Recommended Knowledge Script Group	Performs essential monitoring of your Cisco Unified Communications Manager Express environment.

22.1 Device_Reset

Use this Knowledge Script to reset or restart Unified Communications Manager Express IP phones for reasons such as troubleshooting or picking up new default firmware. Use this script along with Device_Status to ensure selected phones have upgraded successfully.

NOTE:

- Only an AppManager administrator should run this script.
- The AXL API does not return a failure in any of the following situations. Therefore, in each of these situations, AppManager has no way of knowing that a reset did not succeed:
  - If you try to reset an unregistered phone
  - If you try to reset a phone with an invalid or incorrect name
  - If you try to reset a phone that has never been registered with the router.

22.1.1 Resource Object

CiscoCME

22.1.2 Default Schedule

By default, this script runs once.

22.1.3 Setting Parameter Values

Set the following values as needed:

Parameter	How To Set It
Event Notification	
Raise event if reset/restart succeeds?	Select **Yes** to raise an event if the device was successfully reset or restarted. The default is Yes.
Event severity when reset/restart succeeds	Set the severity level of the event, from 1 to 40, to indicate the importance of a successful event. The default is 25.
Event severity when reset/restart error occurs	Set the severity level of the event, from 1 to 40, to indicate the importance of an event in which errors occurred. The default is 5.
Options	
Function type	Choose **Reset** to shut down a registered device and then bring it back up. Choose **Restart** to restart a registered device without first shutting it down. The default is Reset.

Parameter	How To Set It
Device selection type	Select the type of device you want to reset or restart. All devices of that type will be reset or restarted. • Select **DeviceName** to reset or restart a specific device or devices. If you select this type, you must type a device name or list of name in the *Device name list* parameter, or identify the location of a list of devices in *Full path to file with list of devices*. • Select **All** to reset or restart all phones at once. • Select **AllSequenced** to reset/restart phones in sequential order. **NOTE:** The **All** and **AllSequenced** actions may take a long time to complete.
Device name list	Use this parameter if you selected **DeviceName** in the *Device selection type* parameter. Type the name of the device you want to reset or restart. You can also type a list of device names, separated by a comma. For example: `SEP999999994000,SEP999999994001`. **NOTE:** If you type a device name, ignore the *Full path to file with list of devices* parameter.
Full path to file with list of devices	Use this parameter if you selected **DeviceName** in the *Device selection type* parameter. Type the full path to a file on the agent computer containing a list of the devices you want to restart or reset. The file should contain the device names on one or more lines. If you specify the criteria on one line, separate each item with a comma. For example: `SEP999999994000,SEP999999994001`. If you specify the criteria on multiple lines, ensure each line contains only one entry. For example: • SEP999999994002 • SEP999999994000 • SEP999999994004 **NOTE:** If you type a file path, ignore the *Device name list* parameter.

22.2 Device_Status

Use this Knowledge Script to monitor the status of key Unified Communication Manager Express devices. The possible statuses are:

- **Registered**. This status indicates the device is available.
- **Unregistered**. This status indicates a device previously registered with Unified Communication Manager Express has become unregistered. This status may be generated as part of a normal unregistration event, or can be due to another reason such as loss of keepalives.
- **Deceased**. This status indicates the device has not been registered to Unified Communication Manager Express for a long time, or the device was added to Unified Communication Manager Express but never registered.

NOTE: Phones of model type 7905G are designated in event messages as an "Others" type. (Cisco issue CSCee28952)

The first time you run this script, it builds a device list from the criteria you have selected. At each subsequent interval, the script checks the status of these devices. If the number or percentage of these devices that are registered does not meet the threshold you set, an event is raised.

22.2.1 Resource Object

CiscoCME

22.2.2 Default Schedule

By default, this script runs every one minute.

22.2.3 Setting Parameter Values

Set the following values as needed:

Parameter	How To Set It
Event Notification	
Raise event if key devices fall below threshold?	Select **Yes** to raise an event if the number or percentage of registered key devices falls below the threshold you set. The default is Yes. The detailed message for an event contains the following information about each device that is not registered: • Device Name • Directory numbers • IP address (if available) • Status • Unified Communication Manager Express address where device was registered (if available) • Model

Parameter	How To Set It
Event severity when key devices fall below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number or percentage of key devices fell below the threshold. The default is 10.
Raise event if key devices cross threshold and then return?	Select **Yes** to raise an event if the number or percentage of key devices falls below the minimum, but is now within an acceptable range. The default is Yes. The detailed message for the event will contain the percentage of registered devices and the threshold percentage.
Event severity when key devices cross threshold and then return	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number or percentage of key devices fell below the minimum, but is now within an acceptable range. The default is 20.
Raise initial event with current status?	Select **Yes** to raise an informational event that contains the current status of selected devices. The default is Yes. This event is raised only upon the first run of this script. The event message returns the following details about each device: • Device Name • Directory numbers • IP address (if available) • Status • Unified Communication Manager Express address where device was registered (if available) • Model
Format status event in XML?	Select **Yes** to format the informational event containing the current status in XML. The default is Yes. If you use XML for the event, it will not be sent to any Actions defined for the script. If you want this information sent to an Action, do not select this checkbox. The detailed message will then be formatted in .csv format.
Event severity for initial event with current status	Set the severity level, from 1 to 40, to indicate the importance of the informational event. The default is 30.
Data Collection	
Collect data?	Select **Yes** to collect data for graphs and charts. If enabled, data collection returns the number of devices being monitored and the number of those devices that are registered. The default is unchecked.
Monitoring	
Select by type	Choose the type of the selection criteria to be used to get the list of devices to monitor. Some criteria may not make sense for every device type. Valid values are: • DeviceName, which is the default • KeyPhones

Parameter	How To Set It
Selection criteria	Specify the selection criteria for the devices to be monitored. You can specify the actual item or you can specify a pattern by using the * wildcard. For example, to monitor all devices with device names that begin with SEP, type `SEP*`. The wildcard works only at the end of a string. To monitor all devices, accept the default of *. You can type multiple items by separating each item with a comma. For example: `SEP0009A*,SEP0009B*` . **NOTE:** If you type a file path in *Full path to file with list of selection criteria,* ignore this parameter.
Full path to file with selection criteria	Specify the full path to a file on the agent computer containing a list of the selection criteria. The file should contain the selection criteria on one or more lines. You can specify the actual item or you can specify a pattern by using the * wildcard. If you specify the criteria on one line, separate each item with a comma. For example: `SEP0009A*,SEP0009B*`. If you specify the criteria on multiple lines, ensure each line contains only one entry. For example: • SEP0009A* • SEP999999994000 • SEP00044* **NOTE:** If you type a file path, ignore the *Selection criteria* parameter.
Threshold type	Select whether you want to monitor for a **Percentage** threshold or a **Number** threshold. The default is percentage.
Threshold - Minimum % devices registered	Specify the minimum percentage of devices that must have a status of "Registered" before an event is raised. The default is 75%.
Threshold - Minimum # devices registered	Specify the minimum number of devices that must have a status of "Registered" before an event is raised. The default is 0.

22.3 Extension_Check

Use this Knowledge Script to monitor for duplicate phone extension numbers. This script will look for all phones configured in Unified Communications Manager Express, regardless of whether they are registered. This script automatically raises an event if duplicate extension numbers are discovered.

22.3.1 Resource Object

CiscoCME

22.3.2 Default Schedule

By default, this script runs every four hours.

22.3.3 Setting Parameter Values

Set the following values as needed:

Parameter	How To Set It
Event Notification	
Raise event if no duplicate extensions found?	Select **Yes** to create an event if no duplicate extension numbers are discovered. The default is Yes.
Event severity when no duplicate extensions found	Set the severity level, from 1 to 40, to indicate the importance of an event in which no duplicates are found. The default is 25.
Event severity when duplicate extensions found	Set the severity level, from 1 to 40, to indicate the importance of an event in which duplicates are found. The default is 10.

22.4 Phone_Inventory

Use this Knowledge Script to create an inventory of phone details for phones attached to Unified Communications Manager Express.

NOTE: Phones of model type 7905G are designated in event messages as an "Others" type. (Cisco issue CSCee28952)

22.4.1 Resource Object

CiscoCME

22.4.2 Default Schedule

By default, this script runs once.

22.4.3 Setting Parameter Values

Set the following values as needed:

Parameter	How To Set It
Event Notification	
Raise informational event when inventory completes?	Select **Yes** to raise an event when the inventory is complete. The event message contains the phone inventory details. The default is Yes.
Event severity when informational event is raised	Set the severity level of the event, from 1 to 40, to indicate the importance an informational event. The default is 25.
Event severity when no phones are found	Set the severity level of the event, from 1 to 40, to indicate the importance of an event in which no phones are found. The default is 30.
Event severity when inventory fails	Set the severity level of the event, from 1 to 40, to indicate the importance of an event in which the inventory fails. The default is 15.
Selection Options	
Select by	Choose the type of the selection criteria you want to use to create the list of phones. Valid values are: • Name, which is the default • KeyPhones
Selection criteria	Specify the selection criteria for the devices to be monitored. You can specify the actual item or you can specify a pattern by using the * wildcard. For example, to monitor all devices with device names that begin with SEP, type SEP*. The wildcard works only at the end of a string. To monitor all devices, accept the default of *. You can type multiple items by separating each item with a comma. For example: SEP0009A*,SEP0009B*. **NOTE:** If you type selection criteria, then ignore the *Full path to file with selection criteria* parameter.

Parameter	How To Set It
Full path to file with selection criteria	Specify the full path to a file on the agent computer containing a list of the selection criteria. The file should contain the selection criteria on one or more lines. You can specify the actual item or you can specify a pattern by using the * wildcard. If you specify the criteria on one line, separate each item with a comma. For example: `SEP0009A*,SEP0009B*.` If you specify the criteria on multiple lines, ensure each line contains only one entry. For example: • SEP0009A* • SEP999999994000 • SEP00044* **NOTE:** If you type a file path, ignore the *Selection criteria* parameter.
Result File Options	
Write details to result file?	Select **Yes** to output the inventory results to a .csv file. The default is Yes.
Result file name	Specify the full path or a UNC path to a location on the agent computer where the inventory result file should be written. The default location is `c:\Program Files\NetIQ\Temp\NetIQ_Debug\PhoneInventory`. The following details are returned about each phone: • Name • Directory numbers • Model • IP address (if available) • Unified Communications Manager Express where device is\was registered (if available) • Status • Status Time **NOTE:** The Phone_Inventory script can be run against multiple devices at one time. To avoid confusion, the name of the device is added to the name of the output file. The inventory results for each device are output to a separate file, identified by the device name.
Overwrite existing file?	Select **Yes** to overwrite the existing file. Disable this parameter to add any new results to the existing file. The default is unselected. **Warning** Deselecting Yes and then running the script many times could result in the creation of a very large file.
List only phone with status of	Use this parameter to limit the phones listed in the results file to only those whose status is one of the following: • Any, which is the default • Not Registered • Registered • Unregistered • Deceased **NOTE:** Setting this parameter to a value of **Not Registered** will list those phones with a status of Unregistered or Deceased.

Parameter	How To Set It
Order by	Accept the default of **Name** to display the contents of the results file in order by the phone name. Select **DirectoryNumber** to display the contents of the results file in order by directory number.

22.5 Set_Key_Phones

Use this Knowledge Script to designate one or more phones as "key" phones. The "key phone" feature of Unified Communications Manager Express allows you to specify certain phones to be used for monitoring or management purposes. For example, you may not want to monitor all phones at a particular location, but instead monitor only a select subset of important, or key, phones.

The AXL API identifies which phones are key and which are not.

NOTE:

- This script does not support devices operating in SRST (Survivable Remote Site Telephony) mode. Devices go into SRST mode when the WAN link to the Cisco Unified Communications Manager at the central site goes down, or when the connection to the Unified Communications Manager is lost.
- You cannot designate an ATA186 device as a key phone. (Cisco issue `CSCee28929`)

22.5.1 Removing Key Phones

The "key phone" feature of Unified Communications Manager Express allows you to specify certain key phones to be used for monitoring or management purposes. For example, you may not want to monitor all phones at a particular location, but instead monitor only a select subset of important phones.

Although you can use a Knowledge Script to set a key phone, you need to use the IOS configuration command line interface to remove a key designation from a phone. The following is an example of removing a key designation from a phone using Ethernet phone (ephone) entry number 4.

```
RalLabRT04#config t
RalLabRT04(config)#ephone 4
RalLabRT04(config-ephone)#no keyphone
RalLabRT04(config-ephone)#exit
RalLabRT04(config)#exit
```

22.5.2 Resource Object

CiscoCME

22.5.3 Default Schedule

By default, this script runs once.

22.5.4 Setting Parameter Values

Set the following values as needed:

Parameter	How To Set It
Event Notification	

Parameter	How To Set It
Raise event if key designation succeeds?	Select **Yes** to generate an event when key phones are successfully designated. The default is Yes.
Event severity when key designation succeeds	Set the severity level of the event, from 1 to 40, to indicate the importance of an event in which key phones are successfully designated. The default is 25.
Event severity when key designation fails	Set the severity level of the event, from 1 to 40, to indicate the importance of the event in which the key designation attempt fails. The default is 5.
Set Options	
List of phones	Specify the names of phones you want to designate as key phones. You must specify at least one phone. You can type multiple names by separating them with a comma. For example: `SEP999999994002,SEP999999994007`. **NOTE:** If you type a list of phones, ignore the *Full path to file with list of phones* parameter.
Full path to file with list of phones	Specify the full path to a file on the agent computer containing a list of the names of key phones. The file should contain the names on one or more lines. If you specify the key phones on one line, separate each item with a comma. For example: `SEP999999994000,SEP999999994001`. If you specify the phones on multiple lines, ensure each line contains only one entry. For example: • SEP999999994002 • SEP999999994000 • SEP999999994004 **NOTE:** If you type a full path, ignore the *List of phones* parameter.

22.6 SRST_Failover

Use this Knowledge Script to monitor for registered phones or connectivity failure to the SRST (Survivable Remote Site Telephony) device, which indicate a failover has occurred. A device operating in SRST mode can be monitored for SRST failover. Failover occurs when the WAN link to the Unified Communications Manager at the central site goes down, or when the connection to the Unified Communications Manager is lost.

During SRST failover, there may be no connectivity at all to the remote site and the SRST router. With no connectivity, AppManager cannot access the SRST router to determine whether phones are registered. Therefore, you can choose to have this script script raise an event when connectivity has failed.

All CiscoCME Knowledge Scripts work with SRST mode except Set_Key_Phones. Because SRST mode does not provide any phone configuration information, you cannot set an SRST phone to be a key phone.

This script raises events that identify registered phones and connectivity failures.

NOTE: This script cannot be used on a router operating in CME mode.

22.6.1 Resource Object

CiscoCME

22.6.2 Default Schedule

By default, this script runs once.

22.6.3 Setting Parameter Values

Set the following values as needed:

Parameter	How To Set It
Event Notification	
Raise event when phones register with SRST?	Select **Yes** to raise an event when phones register with SRST, indicating failover. The default is Yes.
Event severity when phones register with SRST	Set the severity level, from 1 to 40, to indicate the importance of an event in which phones register with SRST. The default is 10.
Raise event when connectivity fails?	Select **Yes** to raise an event when connectivity failure occurs. The default is Yes.
Event severity when connectivity fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which connectivity fails. The default is 10.

22.7 Recommended Knowledge Script Group

The following Knowledge Scripts are members of the CiscoCME Knowledge Script Group. You can find these scripts individually on the CiscoCME tab and in a group on the RECOMMENDED tab of the Operator Console.

- Device_Status
- Extension_Check

All scripts in the KSG have their parameters set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab and run the CiscoCME group on a Unified Communications Manager Express resource.

The CiscoCME KSG enables a "best practices" usage of AppManager for monitoring your Cisco Unified Communications Manager Express environment. You can use this KSG with AppManager monitoring policies. A monitoring policy, which enables you to efficiently and consistently monitor all the resources in your environment, uses a set of pre-configured Knowledge Scripts to automatically monitor resources as they appear in the TreeView.

A KSG is composed of a subset of a module's Knowledge Scripts. The script that belongs to a KSG is a different copy of the original script you access from the CiscoCME tab. If you modify a script that belongs to a KSG, the parameter settings of the original script in the CiscoCME tab are not affected.

In some cases, default script parameter settings are different when the script is deployed as part of a KSG, as opposed to when it is deployed alone. The default settings of a script within a group depend on its monitoring purpose within the larger group, and on the intended monitoring scope of that group.

If you modify or remove a script associated with the CiscoCME KSG and want to restore it to its original form, you can reinstall AppManager for Cisco Unified Communications Manager Express on the repository computer or check in the appropriate script from the `AppManager\qdb\kp\CiscoCME` directory.

23 CiscoICD Knowledge Scripts

AppManager for Cisco Integrated Contact Distribution provides the following Knowledge Scripts for monitoring a Cisco Unified Contact Center Express (UCCX) environment. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. From the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
AgentsLoggedOn	Determines how many licensed (active) agents are logged on and ready for work.
CallStatistics	Monitors the number of incoming and outgoing calls that are being accepted or generated.
CSQ_ServiceLevel	Monitors handled calls, caller wait time, and percentage of calls that met the service level agreement (SLA) for a contact service queue.
ICD_CpuHigh	Monitors CPU utilization for each monitored Cisco UCCX service.
ICD_EventLog	Monitors the CPU resources that UCCX services are consuming.
ICD_HealthCheck	Monitors the status of Cisco UCCX services and to restart any selected service that is down.
ICD_MemoryHigh	Monitors memory pool usage and total memory usage for each monitored Cisco UCCX service.
ICD_RestartService	Schedules a Cisco UCCX service to stop and then restart after a specified time interval.
ICD_SystemUsage	Monitors the amount of CPU and memory that UCCX is using.
IIS_CpuHigh	Monitors CPU usage for IIS application processes.
IIS_HealthCheck	Checks IIS servers, Web site status, and the queue length for blocked I/O requests.
IIS_KillTopCPUProcs	Monitors the CPU usage for the IIS dllhost and mtx processes.
IIS_MemoryHigh	Detects whether an IIS application process has exceeded the memory usage threshold you set.
IIS_ServiceUpTime	Monitors the uptime for Web sites and services.
SQL_Accessibility	Monitors whether the SQL Server database is accessible.
SQL_CPUUtil	Monitors CPU usage by SQL Server processes.
SQL_DataGrowthRate	Monitors data growth and shrink rates for all SQL Server databases.
SQL_DBGrowthRate	Monitors database growth and shrink rates.
SQL_MemUtil	Monitors memory usage by SQL Server processes.

Knowledge Script	What It Does
SQL_RestartServer	Restarts a SQL server.
Recommended Knowledge Script Group	Performs essential monitoring of your Cisco UCCX environment.

23.1 AgentsLoggedOn

Use this Knowledge Script to determine how many licensed (active) agents are logged on and ready for work. This script raises an event if a monitored value exceeds or falls below a threshold. In addition, this script can generate data streams for total number of agents and number of agents logged on.

23.1.1 Resource Object

Agent child object under the CiscoICD parent object

23.1.2 Default Schedule

By default, this script runs every 15 minutes.

23.1.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if logged-on agents exceed the threshold?	Select **Yes** to raise an event if the percentage of logged-on agents exceeds the maximum threshold you set. The default is Yes.
Severity when logged-on agents exceed the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of logged-on agents exceeds the maximum threshold you set. The default is 15.
Raise event if logged-on agents fall below the threshold	Select **Yes** to raise an event when the percentage of logged-on agents is less than the minimum threshold you set. The default is Yes.
Severity when logged-on agents fall below the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of logged-on agents is less than the minimum threshold you set. The default is 15.
Data Collection	
Collect data?	Select **Yes** to collect data for charts and graphs. The default is unselected. This script generates two data streams: • Total number of agents • Number of agents logged on
Monitoring	
Threshold - Maximum agents logged on	Specify the highest percentage of agents that can be logged on before an event is raised. The default is 100%.
Threshold - Minimum agents logged on	Specify the lowest percentage of agents that can be logged on before an event is raised. The default is 1%.

Parameter	How To Set It
SQL username	Specify the database user login account you want to use to access SQL Server. You can use the sa account or other user login accounts that have been set up in the managed client's SQL Server. Leave this parameter blank in order to use Windows authentication. **NOTE:** If a SQL username is required, configure the username into AppManager Security Manager.

23.2 CallStatistics

Use this Knowledge Script to monitor the following call statistics for a UCCX server:

- Incoming calls - the number of calls coming in to the UCCX system
- Outgoing calls - the number of calls going out of the UCCX system
- Internal calls - the number of calls made within the UCCX system
- Redirect in calls - the number of incoming calls that are automatically redirected to an appropriate agent or other destination
- Transfer in calls - the number of calls transferred in to the UCCX system
- Preview outbound calls - the number of calls for which an agent reviewed lead history before dialing
- Average call duration - the average length of incoming and outgoing calls

This script raises an event if a threshold is exceeded. In addition, this script generates data streams for all monitored statistics.

23.2.1 Resource Object

CiscoICD parent object

23.2.2 Default Schedule

By default, this script runs every 30 minutes.

23.2.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if incoming calls exceed the threshold?	Select **Yes** to raise an event if the number of incoming calls exceeds the threshold you set. The default is Yes.
Event severity when incoming calls exceed the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of incoming calls exceeds the threshold you set. The default is 15.
Raise event if outgoing calls exceed the threshold?	Select **Yes** to raise an event if the number of outgoing calls exceeds the threshold you set. The default is Yes.
Event severity when outgoing calls exceed the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of outgoing calls exceeds the threshold you set. The default is 15.

Parameter	How To Set It
Raise event if internal calls exceed the threshold?	Select **Yes** to raise an event if the number of internal calls exceeds the threshold you set. The default is Yes.
Event severity when internal calls exceed the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of internal calls exceeds the threshold you set. The default is 15.
Raise event if redirect in calls exceed the threshold?	Select **Yes** to raise an event if the number of redirected incoming calls exceeds the threshold you set. The default is Yes.
Event severity when redirect in calls exceed the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of redirected incoming calls exceeds the threshold you set. The default is 15.
Raise event if transfer in calls exceed the threshold?	Select **Yes** to raise an event if the number of transferred incoming calls exceeds the threshold you set. The default is Yes.
Event severity when transfer in calls exceed the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of transferred incoming calls exceeds the threshold you set. The default is 15.
Raise event if preview outbound calls exceed the threshold?	Select **Yes** to raise an event if the number of preview outbound calls exceeds the threshold you set. The default is Yes.
Event severity when preview outbound calls exceed the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of preview outbound calls exceeds the threshold you set. The default is 15.
Raise event if call duration exceeds the threshold?	Select **Yes** to raise an event if the duration of calls exceeds the threshold you set. The default is Yes.
Event severity when call duration exceeds the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the duration of calls exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for incoming calls?	Select **Yes** to collect data for charts and graphs. When enabled, data collection returns the number of incoming calls for the monitoring interval. The default is unselected.
Collect data for outgoing calls?	Select **Yes** to collect data for charts and graphs. When enabled, data collection returns the number of outgoing calls for the monitoring interval. The default is unselected.
Collect data for internal calls?	Select **Yes** to collect data for charts and graphs. When enabled, data collection returns the number of internal calls for the monitoring interval. The default is unselected.
Collect data for redirect in calls?	Select **Yes** to collect data for charts and graphs. When enabled, data collection returns the number of redirected incoming calls for the monitoring interval. The default is unselected.
Collect data for transfer in calls?	Select **Yes** to collect data for charts and graphs. When enabled, data collection returns the number of transferred incoming calls for the monitoring interval. The default is unselected.

Parameter	How To Set It
Collect data for preview outbound calls?	Select **Yes** to collect data for charts and graphs. When enabled, data collection returns the number of preview outbound calls for the monitoring interval. The default is unselected.
Collect data for call duration?	Select **Yes** to collect data for charts and graphs. When enabled, data collection returns the average length of incoming and outgoing calls for the monitoring interval. The default is unselected.
Monitoring	
Threshold - Maximum incoming calls	Specify the highest number of incoming calls that can be received before an event is raised. The default is 100 calls.
Threshold - Maximum outgoing calls	Specify the highest number of outgoing calls that can be made before an event is raised. The default is 100 calls.
Threshold - Maximum internal calls	Specify the highest number of internal calls that can be made before an event is raised. The default is 100 calls.
Threshold - Maximum redirect in calls	Specify the highest number of incoming calls that can be redirected before an event is raised. The default is 100 calls.
Threshold - Maximum transfer in calls	Specify the highest number of incoming calls that can be transferred before an event is raised. The default is 100 calls.
Threshold - Maximum preview outbound calls	Specify the highest number of preview outbound calls that can be made before an event is raised. The default is 100 calls.
Threshold - Maximum call duration	Specify the longest duration for incoming and outgoing calls that can occur before an event is raised. The default is 5 minutes.
SQL username	Enter the database user login account you want to use to access the UCCX SQL Server database. You can use the sa account or other user login account that has been configured on the agent computer. Leave this parameter blank in order to use Windows authentication. **NOTE:** If a SQL username is required, configure the username into AppManager Security Manager.

23.3 CSQ_ServiceLevel

Use this Knowledge Script to monitor handled calls, caller wait time, and percentage of calls that do not meet the service level agreement (SLA) for the Contact Service queue. This script raises an event if a threshold is exceeded. In addition, this script can generate data streams for the number of handled calls, the total amount of caller wait time, and the number of calls not meeting SLA.

23.3.1 Resource Object

Cisco ICD Contact Service queue object

23.3.2 Default Schedule

By default, this script runs every 15 minutes.

23.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if handled calls exceed the threshold?	Select **Yes** to raise an event if the number of handled calls exceeds the threshold you set. The default is Yes.
Event severity when handled calls exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of handled calls exceeds the threshold you set. The default is 15.
Raise event if caller wait time exceeds the threshold?	Select **Yes** to raise an event if the caller wait time exceeds the threshold you set. The default is Yes.
Event severity when caller wait time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the amount of caller wait time exceeds the threshold you set. The default is 15.
Raise event if calls not meeting the SLA exceed the threshold?	Select **Yes** to raise an event when the percentage of calls not meeting the SLA exceeds the threshold you set. The default is Yes.
Event severity when calls not meeting SLA exceed the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of calls that do not meet the SLA exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for handled calls?	Select **Yes** to collect data for charts and graphs. When enabled, data collection returns the number of calls that were handled during the monitoring interval. The default is unselected.
Collect data for caller wait time?	Select **Yes** to collect data for charts and graphs. When enabled, data collection returns the average amount of time that callers waited during the monitoring interval. The default is unselected.
Collect data for calls not meeting the SLA?	Select **Yes** to collect data for charts and graphs. When enabled, data collection returns the percentage of calls that did not meed the SLA during the monitoring interval. The default is unselected.

Parameter	How To Set It
Monitoring	
Threshold - Maximum handled calls	Specify the highest number calls that can be handled before an event is raised. The default is 20 calls.
Threshold - Maximum caller wait time	Specify the longest amount of time a caller can wait before an event is raised. The default is 5 minutes.
Threshold - Maximum calls not meeting SLA	Enter the highest percentage of calls-not-meeting-the-SLA that can occur before an event is raised. The default is 5%.
SQL username	Enter the database user login account you want to use to access SQL Server. You can use the sa account or other user login accounts that have been set up in the managed client's SQL Server. Leave this parameter blank in order to use Windows authentication. **NOTE:** If a SQL username is required, configure the username into AppManager Security Manager.

23.4 ICD_CpuHigh

Use this Knowledge Script to monitor the CPU resources that UCCX services are consuming. This script raises an event if a service's CPU utilization exceeds the thresholds you set. The script monitors CPU usage for each service individually and the total CPU usage for all services. If a process is not found, the script assumes the process is not running, and reports zero as the CPU result.

23.4.1 Resource Object

Service child object

23.4.2 Default Schedule

By default, this script runs every 15 minutes.

23.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if CPU usage exceeds the threshold?	Select **Yes** to raise an event if the CPU usage of any monitored service exceeds the threshold you set. The default is Yes.
Event severity when CPU usage exceeds the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CPU usage of any monitored service exceeds the threshold you set. The default is 10.
Data Collection	
Collect data?	Select **Yes** to collect data about CPU usage for graphs and reports.When enabled, data collection returns the percentage of CPU monitored services consumed during the monitoring interval. The default is unselected.
Monitoring	
Version 3.x Services	
Monitor Cisco CRA Engine?	Select **Yes** to monitor CPU usage for the Cisco CRA Engine. The default is Yes.
Threshold: Maximum Cisco CRA Engine CPU usage	Specify the highest percentage of CPU that the CRA Engine can use before an event is raised. The default is 80%.
Monitor Cisco AVVID Alarm?	Select **Yes** to monitor CPU usage for the Cisco AVVID Alarm. The default is Yes.
Threshold: Maximum Cisco AVVID Alarm CPU usage	Specify the highest percentage of CPU that the AVVID Alarm can use before an event is raised. The default is 20%.
Monitor Cisco Purging Scheduler?	Select **Yes** to monitor CPU usage for the Cisco Purging Scheduler. The default is Yes.
Threshold: Maximum Cisco Purging Scheduler CPU usage	Specify the highest percentage of CPU that the Purging Scheduler can use before an event is raised. The default is 20%.

Parameter	How To Set It
Monitor Cisco CRA Servlet Engine?	Select **Yes** to monitor CPU usage for the Cisco CRA Servlet Engine. The default is Yes.
Threshold: Maximum Cisco CRA Servlet Engine CPU usage	Specify the highest percentage of CPU that the CRA Servlet Engine can use before an event is raised. The default is 20%.
Monitor Cisco Desktop Enterprise Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop Enterprise Service. The default is Yes.
Threshold: Maximum Cisco Desktop Enterprise Service CPU usage	Specify the highest percentage of CPU that the Desktop Enterprise Service can use before an event is raised. The default is 20%.
Monitor Cisco Desktop RASCAL Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop RASCAL Service. The default is Yes.
Threshold: Maximum Cisco Desktop RASCAL Service CPU usage	Specify the highest percentage of CPU that the Desktop RASCAL Service can use before an event is raised. The default is 20%.
Monitor Cisco Desktop Sync Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop Sync Service. The default is Yes.
Threshold: Maximum Cisco Desktop Sync Service CPU usage	Specify the highest percentage of CPU that the Desktop Sync Service can use before an event is raised. The default is 20%.
Monitor Cisco Desktop TAI Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop TAI Service. The default is Yes.
Threshold: Maximum Cisco Desktop TAI Service CPU usage	Specify the highest percentage of CPU that the Desktop TAI Service can use before an event is raised. The default is 20%.
Monitor Cisco Desktop VoIP Monitor Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop VoIP Monitor Service. The default is Yes.
Threshold: Maximum Cisco Desktop VoIP Monitor Service CPU usage	Specify the highest percentage of CPU that the Desktop VoIP Monitor Service can use before an event is raised. The default is 20%.
Version 4.x Services	
Monitor Cisco CRS Node Manager?	Select **Yes** to monitor CPU usage for the Cisco CRS Node Manager. The default is Yes.
Threshold: Maximum Cisco CRS Node Manager CPU usage	Specify the highest percentage of CPU that the CRS Node Manager can use before an event is raised. The default is 80%.
Monitor Cisco AVVID Alarm?	Select **Yes** to monitor CPU usage for the Cisco AVVID Alarm. The default is Yes.
Threshold: Maximum Cisco AVVID Alarm CPU usage	Specify the highest percentage of CPU that the AVVID Alarm can use before an event is raised. The default is 20%.
Monitor Cisco Desktop Enterprise Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop Enterprise Service. The default is Yes.
Threshold: Maximum Cisco Desktop Enterprise Service CPU usage	Specify the highest percentage of CPU that the Desktop Enterprise Service can use before an event is raised. The default is 20%.

Parameter	How To Set It
Monitor Cisco Desktop IP Phone Agent Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop IP Phone Agent Service. The default is Yes.
Threshold: Maximum Cisco Desktop IP Phone Agent Service CPU usage	Specify the highest percentage of CPU that the Desktop IP Phone Agent Service can use before an event is raised. The default is 20%.
Monitor Cisco Desktop LDAP Monitor Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop LDAP Monitor Service. The default is Yes.
Threshold: Maximum Cisco Desktop LDAP Monitor Service CPU usage	Specify the highest percentage of CPU that the Desktop LDAP Monitor Service can use before an event is raised. The default is 20%.
Monitor Cisco Desktop License and Resource Manager Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop License and Resource Manager Service. The default is Yes.
Threshold: Maximum Cisco Desktop License and Resource Manager Service CPU usage	Specify the highest percentage of CPU that the Desktop License and Resource Manager Service can use before an event is raised. The default is 20%.
Monitor Cisco Desktop Recording and Statistics Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop Recording and Statistics Service. The default is Yes.
Threshold: Maximum Cisco Desktop Recording and Statistics Service CPU usage	Specify the highest percentage of CPU that the Desktop Recording and Statistics Service can use before an event is raised. The default is 20%.
Monitor Cisco Desktop Recording Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop Recording Service. The default is Yes.
Threshold: Maximum Cisco Desktop Recording Service CPU usage	Specify the highest percentage of CPU that the Desktop Recording Service can use before an event is raised. The default is 20%.
Monitor Cisco Desktop Sync Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop Sync Service. The default is Yes.
Threshold: Maximum Cisco Desktop Sync Service CPU usage	Specify the highest percentage of CPU that the Desktop Sync Service can use before an event is raised. The default is 20%.
Monitor Cisco Desktop VoIP Monitor Service?	Select **Yes** to monitor CPU usage for the Cisco Desktop VoIP Monitor Service. The default is Yes.
Threshold: Maximum Cisco Desktop VoIP Monitor Service CPU usage	Specify the highest percentage of CPU that the Desktop VoIP Monitor Service can use before an event is raised. The default is 20%.

23.5 ICD_EventLog

Use this Knowledge Script to monitor Windows event log entries from Cisco UCCX during the past *n* hours. This script raises an event if log entries are detected. In addition, this script generates data streams for entries from different log files.

23.5.1 Resource Object

CiscoICD parent object

23.5.2 Default Schedule

By default, this script runs every 10 minutes.

23.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event for log entries?	Select **y** to raise an event when the log contains entries that match your filtering criteria. The default is y.
Collect data?	Select **y** to collect data about log entries for charts and graphs. When enabled, data collection returns the number of entries placed in different log files during the monitoring interval. The default is n.
Separate data?	Select **y** to separate events entries from different log files into different data streams. If n selected, all event entries matching your filtering criteria are placed in the same data stream and the data detail message may include event entries from multiple log sources. The default is n. For example, if you are monitoring both the System and Application logs, you can set this parameter to **y** so that events in the System log are tracked separately from events in the Application log.
Log source	Specify the event log you want to monitor. You can specify multiple event logs, separated by commas. For example: `System,Application`. The default is Application.
Type: Error	Select **y** to monitor for error events. If n is selected, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for *Collect data?* The default is y.
Type: Warning	Select **y** to monitor for warning events. If n is selected, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for *Collect data?* The default is y.
Type: Information	Select **y** to monitor for information events. If n is selected, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for *Collect data?* The default is n.
Type: Success Audit	Select **y** to monitor for success audit events. If n is selected, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for *Collect data?* The default is n.

Parameter	How To Set It
Type: Failure Audit	Select **y** to monitor for failure audit events. If n is selected, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for *Collect data?* The default is n.
Instructions for filters: To limit the types of entries that raise events and the type of data that is collected, enter a search string that filters the following fields in the event log. The search string can contain criteria used to include entries, exclude entries, or both. • Separate include and exclude criteria with a colon (:). For example, `net:logon`. • Separate multiple include or exclude entries with commas. For example, `finance,sales:corp00,HQ`. • If you are specifying only include criteria, the colon is not necessary. For example, `SQL`. • If you are specifying only exclude criteria, start the search string with a colon. For example, `:defragmentation,cleanup`.	
Event source filter	Specify the names of event sources to look for, separating multiple names with commas. For example: `NTDS KCC,NTDS General`
Event category filter	Specify the names of event categories to look for, separating multiple names with commas.
Event ID filter	Specify a single event ID or a range of event IDs, separating multiple entries with commas. For example: `1094,1404-1463`
Event user filter	Specify user names to look for, separating multiple entries with commas. For example: `Pat,Chris,Alex`
Computer filter	Specify a single or multiple computer names to look for; separate multiple entries by commas. For example: `SHASTA,MARS`
Event description filter	Specify keywords or phrases to look for in event descriptions. The string can contain spaces, underscores, and periods. Separate multiple entries with commas. For example: `data loss during system failures,corrupt indices,Inter-Site Transport objects failed`
Maximum number of entries per event report	Specify the maximum number of Windows log entries that can be returned in each event report. For example, if this value is set to 30 and 67 log entries are found, three reports are created: two reports containing 30 entries and one report containing seven entries. The default is 30. The Message column on the Events tab in the Operator Console displays the number of entries in each report, the type of log the events are from, and the event report batch number. The batch number is the sequential number of the event report. Batch numbers start at 1 for each Knowledge Script iteration.
Event severity for log entries	Set the event severity level, from 1 to 40, to indicate the importance of an event. You may want to adjust the severity depending on the types of events for which you are checking. The default is 15.

23.6 ICD_HealthCheck

Use this Knowledge Script to monitor the status of Cisco UCCX services and to restart any selected service that is down. This script raises an event if a service is not running, if a service does not restart automatically, if a service successfully restarts, if a service has been set to not restart, or if a selected service does not exist.

23.6.1 Resource Object

Contact Service Queue child object

23.6.2 Default Schedule

By default, this script runs every one minute.

23.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if service is not running?	Select **Yes** to raise an event if a monitored services is not running. The default is Yes.
Event severity when service is not running	Set the severity level, from 1 to 40, to indicate the importance of an event in which a monitored service is not running. The default is 15.
Raise event if service auto-start fails?	Select **Yes** to raise an event when a monitored service fails to restart. The default is Yes.
Event severity when service auto-start fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the a monitored service fails to restart. The default is 5.
Raise event if service auto-start succeeds?	Select **Yes** to raise an event when a monitored service successfully restarts. The default is Yes.
Event severity when service auto-start succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which a monitored service successfully restarts. The default is 25.
Raise event if service auto-start is set to "n"?	Select **Yes** to raise an event when the *Auto-start the monitored services?* parameter is disabled. The default is Yes.
Event severity when service auto-start set to "n"	Set the severity level, from 1 to 40, to indicate the importance of an event in which the a *Auto-start the monitored services?* parameter is disabled. The default is 5.
Raise event if service doesn't exist?	Select **Yes** to raise an event when a monitored service does not exist. The default is Yes.
Event severity when service doesn't exist	Set the severity level, from 1 to 40, to indicate the importance of an event in which a monitored service does not exist. The default is 15.
Data Collection	
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns information about service status. The default is unselected.

Parameter	How To Set It
Monitoring	
Auto-start the monitored services?	Select **Yes** to automatically start any monitored service that is down. The default is Yes.
Monitor Cisco CRA Engine? (V3.x)	Select **Yes** to monitor the Cisco CRA Engine for Cisco UCCX version 3.x. The default is Yes.
Monitor Cisco CRS Node Manager? (V4.x)	Select **Yes** to monitor the Cisco CRS Node Manager for Cisco UCCX version 4.x. The default is Yes.
Additional V3.x Services	
Monitor Cisco AVVID Alarm?	Select **Yes** to monitor the Cisco AVVID Alarm. The default is unselected.
Monitor Cisco Purging Scheduler?	Select **Yes** to monitor the Cisco Purging Scheduler. The default is unselected.
Monitor Cisco CRA Servlet Engine?	Select **Yes** to monitor the Cisco CRA Servlet Engine. The default is unselected.
Monitor Cisco Desktop Enterprise Service?	Select **Yes** to monitor the Cisco Desktop Enterprise Service. The default is unselected.
Monitor Cisco Desktop RASCAL Service?	Select **Yes** to monitor the Cisco Desktop RASCAL Service. The default is unselected.
Monitor Cisco Desktop Sync Service?	Select **Yes** to monitor the Cisco Desktop Sync Service. The default is unselected.
Monitor Cisco Desktop TAI Service?	Select **Yes** to monitor the Cisco Desktop TAI Service. The default is unselected.
Monitor Cisco Desktop VoIP Monitor Service?	Select **Yes** to monitor the Cisco Desktop VoIP Monitor Service. The default is unselected.
Additional V4.x Services	
Monitor Cisco AVVID Alarm?	Select **Yes** to monitor the Cisco AVVID Alarm. The default is unselected.
Monitor Cisco Desktop Enterprise Service?	Select **Yes** to monitor the Cisco Desktop Enterprise Service. The default is unselected.
Monitor Cisco Desktop IP Phone Agent Service?	Select **Yes** to monitor the Cisco Desktop IP Phone Agent Service. The default is unselected.
Monitor Cisco Desktop LDAP Monitor Service?	Select **Yes** to monitor the Cisco Desktop LDAP Monitor Service. The default is unselected.
Monitor Cisco Desktop License and Resource Manager Service?	Select **Yes** to monitor the Cisco Desktop License and Resource Manager Service. The default is unselected.
Monitor Cisco Desktop Recording and Statistics Service?	Select **Yes** to monitor the Cisco Desktop Recording and Statistics Service. The default is unselected.
Monitor Cisco Desktop Recording Service?	Select **Yes** to monitor the Cisco Desktop Recording Service. The default is unselected.
Monitor Cisco Desktop Sync Service?	Select **Yes** to monitor the Cisco Desktop Sync Service. The default is unselected.
Monitor Cisco Desktop VoIP Monitor Service?	Select **Yes** to monitor the Cisco Desktop VoIP Monitor Service. The default is unselected.

23.7 ICD_MemoryHigh

Use this Knowledge Script to monitor the memory an application's processes are consuming. This script checks the memory used by each UCCX process individually, and the total memory used by all processes. If a process is not found, the script assumes the process is not running, and reports zero as the memory result.

23.7.1 Resource Object

Service child object

23.7.2 Default Schedule

By default, this script runs every five minutes.

23.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if service memory pool usage exceeds the threshold?	Select **Yes** to raise an event if the memory pool usage of a monitored service exceeds the threshold you set. The default is Yes.
Event severity when service memory pool usage exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the memory pool usage of a monitored service exceeds the threshold you set. The default is 10.
Raise event if service total memory usage exceeds the threshold?	Select **Yes** to raise an event if the total memory usage of a monitored service exceeds the threshold you set. The default is Yes.
Event severity when service total memory usage exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the total memory usage of a monitored service exceeds the threshold you set. The default is 10.
Data Collection	
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns memory usage data and memory pool usage data for the monitoring interval. The default is unselected.
Monitoring	
Version 3.x Services	
Monitor Cisco CRA Engine?	Select **Yes** to monitor the memory usage of Cisco CRA Engine. The default is Yes.
Threshold: Maximum Cisco CRA Engine memory usage	Specify the maximum amount of memory the Cisco CRA Engine can consume before an event is raised. The default is 200000 KB.

Parameter	How To Set It
Threshold: Maximum Cisco CRA Engine memory pool usage	Specify the maximum amount of memory pool the Cisco CRA Engine can consume before an event is raised. The default is 5000 KB.
Monitor Cisco AVVID Alarm?	Select **Yes** to monitor the memory usage of Cisco AVVID Alarm. The default is Yes.
Threshold: Maximum Cisco AVVID Alarm memory usage	Specify the maximum amount of memory the Cisco AVVID Alarm can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco AVVID Alarm memory pool usage	Specify the maximum amount of memory pool the Cisco AVVID Alarm can consume before an event is raised. The default is 5000 KB.
Monitor Cisco Purging Scheduler?	Select **Yes** to monitor the memory usage of Cisco Purging Scheduler. The default is Yes.
Threshold: Maximum Cisco Purging Scheduler memory usage	Specify the maximum amount of memory the Cisco Purging Scheduler can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Purging Scheduler memory pool usage	Specify the maximum amount of memory pool the Cisco Purging Scheduler can consume before an event is raised. The default is 5000 KB.
Monitor Cisco CRA Servlet Engine?	Select **Yes** to monitor the memory usage of Cisco CRA Servlet Engine. The default is Yes.
Threshold: Maximum Cisco CRA Servlet Engine memory usage	Specify the maximum amount of memory the Cisco CRA Servlet Engine can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco CRA Servlet Engine memory pool usage	Specify the maximum amount of memory pool the Cisco CRA Servlet Engine can consume before an event is raised. The default is 5000 KB.
Monitor Cisco Desktop Enterprise Service?	Select **Yes** to monitor the memory usage of Cisco Desktop Enterprise Service. The default is Yes.
Threshold: Maximum Cisco Desktop Enterprise Service memory usage	Specify the maximum amount of memory the Cisco Desktop Enterprise Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Desktop Enterprise Service memory pool usage	Specify the maximum amount of memory pool the Cisco Desktop Enterprise Service can consume before an event is raised. The default is 5000 KB.
Monitor Cisco Desktop RASCAL Service?	Select **Yes** to monitor the memory usage of Cisco Desktop RASCAL Service. The default is Yes.
Threshold: Maximum Cisco Desktop RASCAL Service memory usage	Specify the maximum amount of memory the Cisco Desktop RASCAL Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Desktop RASCAL Service memory pool usage	Specify the maximum amount of memory pool the Cisco Desktop RASCAL Service can consume before an event is raised. The default is 5000 KB.
Monitor Cisco Desktop Sync Service?	Select **Yes** to monitor the memory usage of Cisco Desktop Sync Service. The default is Yes.

Parameter	How To Set It
Threshold: Maximum Cisco Desktop Sync Service memory usage	Specify the maximum amount of memory the Cisco Desktop Sync Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Desktop Sync Service memory pool usage	Specify the maximum amount of memory pool the Cisco Desktop Sync Service can consume before an event is raised. The default is 5000 KB.
Monitor Cisco Desktop TAI Service?	Select **Yes** to monitor the memory usage of Cisco Desktop TAI Service. The default is Yes.
Threshold: Maximum Cisco Desktop TAI Service memory usage	Specify the maximum amount of memory the Cisco Desktop TAI Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Desktop TAI Service memory pool usage	Specify the maximum amount of memory pool the Cisco Desktop TAI Service can consume before an event is raised. The default is 5000 KB.
Monitor Cisco VoIP Monitor Service?	Select **Yes** to monitor the memory usage of Cisco VoIP Monitor Service. The default is Yes.
Threshold: Maximum Cisco VoIP Monitor Service memory usage	Specify the maximum amount of memory the Cisco VoIP Monitor Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco VoIP Monitor Service memory pool usage	Specify the maximum amount of memory pool the Cisco VoIP Monitor Service can consume before an event is raised. The default is 5000 KB.
Version 4.x Services	
Monitor Cisco CRS Node Manager?	Select **Yes** to monitor the memory usage of Cisco CRS Node Manager. The default is Yes.
Threshold: Maximum Cisco CRS Node Manager memory usage	Specify the maximum amount of memory the Cisco CRS Node Manager can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco CRS Node Manager memory pool usage	Specify the maximum amount of memory pool the Cisco CRS Node Manager can consume before an event is raised. The default is 5000 KB.
Monitor Cisco AVVID Alarm?	Select **Yes** to monitor the memory usage of Cisco AVVID Alarm. The default is Yes.
Threshold: Maximum Cisco AVVID Alarm memory usage	Specify the maximum amount of memory the Cisco AVVID Alarm can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco AVVID Alarm memory pool usage	Specify the maximum amount of memory pool the Cisco AVVID Alarm can consume before an event is raised. The default is 5000 KB.
Monitor Cisco Desktop Enterprise Service?	Select **Yes** to monitor the memory usage of Cisco Desktop Enterprise Service. The default is Yes.
Threshold: Maximum Cisco Desktop Enterprise Service memory usage	Specify the maximum amount of memory the Cisco Desktop Enterprise Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Desktop Enterprise Service memory pool usage	Specify the maximum amount of memory pool the Cisco Desktop Enterprise Service can consume before an event is raised. The default is 5000 KB.

Parameter	How To Set It
Monitor Cisco Desktop IP Phone Agent Service?	Select **Yes** to monitor the memory usage of Cisco Desktop IP Phone Agent Service. The default is Yes.
Threshold: Maximum Cisco Desktop IP Phone Agent Service memory usage	Specify the maximum amount of memory the Cisco Desktop IP Phone Agent Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Desktop Enterprise Service memory pool usage	Specify the maximum amount of memory pool the Cisco Desktop Enterprise Service can consume before an event is raised. The default is 5000 KB.
Monitor Cisco Desktop LDAP Monitor Service?	Select **Yes** to monitor the memory usage of Cisco Desktop LDAP Monitor Service. The default is Yes.
Threshold: Maximum Cisco Desktop LDAP Monitor Service memory usage	Specify the maximum amount of memory the Cisco Desktop LDAP Monitor Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Desktop LDAP Monitor Service memory pool usage	Specify the maximum amount of memory pool the Cisco Desktop LDAP Monitor Service can consume before an event is raised. The default is 5000 KB.
Monitor Cisco Desktop License and Resource Manager Service?	Select **Yes** to monitor the memory usage of Cisco Desktop License and Resource Manager Service. The default is Yes.
Threshold: Maximum Cisco Desktop License and Resource Manager Service memory usage	Specify the maximum amount of memory the Cisco Desktop License and Resource Manager Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Desktop License and Resource Manager Service memory pool usage	Specify the maximum amount of memory pool the Cisco Desktop License and Resource Manager Service can consume before an event is raised. The default is 5000 KB.
Monitor Cisco Desktop Recording and Statistics Service?	Select **Yes** to monitor the memory usage of Cisco Desktop Recording and Statistics Service. The default is Yes.
Threshold: Maximum Cisco Desktop Recording and Statistics Service memory usage	Specify the maximum amount of memory the Cisco Desktop Recording and Statistics Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Desktop Recording and Statistics Service memory pool usage	Specify the maximum amount of memory pool the Cisco Desktop Recording and Statistics Service can consume before an event is raised. The default is 5000 KB.
Monitor Cisco Desktop Recording Service?	Select **Yes** to monitor the memory usage of Cisco Desktop Recording Service. The default is Yes.
Threshold: Maximum Cisco Desktop Recording Service memory usage	Specify the maximum amount of memory the Cisco Desktop Recording Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Desktop Recording Service memory pool usage	Specify the maximum amount of memory pool the Cisco Desktop Recording Service can consume before an event is raised. The default is 5000 KB.
Monitor Cisco Desktop Sync Service?	Select **Yes** to monitor the memory usage of Cisco Desktop Sync Service. The default is Yes.

Parameter	How To Set It
Threshold: Maximum Cisco Desktop Sync Service memory usage	Specify the maximum amount of memory the Cisco Desktop Sync Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco Desktop Sync Service memory pool usage	Specify the maximum amount of memory pool the Cisco Desktop Sync Service can consume before an event is raised. The default is 5000 KB.
Monitor Cisco VoIP Monitor Service?	Select **Yes** to monitor the memory usage of Cisco VoIP Monitor Service. The default is Yes.
Threshold: Maximum Cisco VoIP Monitor Service memory usage	Specify the maximum amount of memory the Cisco VoIP Monitor Service can consume before an event is raised. The default is 200000 KB.
Threshold: Maximum Cisco VoIP Monitor Service memory pool usage	Specify the maximum amount of memory pool the Cisco VoIP Monitor Service can consume before an event is raised. The default is 5000 KB.

23.8 ICD_RestartService

Use this Knowledge Script to schedule a UCCX service to stop and then start after a specified interval. This script raises an event if a service should not be restarted, if a service fails to restart, if a service has a status of “Started,” if a service is missing, if a service stopped normally, or if no status information can be retrieved for a service. In addition, this script generates data streams for the number of successful service starts and stops.

23.8.1 Resource Object

Service child object

23.8.2 Default Schedule

By default, this script runs every five minutes.

23.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if service is down and should not be restarted?	Select **Yes** to raise an event when a monitored service is down and should not be restarted. The default is Yes.
Event severity when service is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service is down and should not be restarted. The default is 10.
Raise event if service fails to start?	Select **Yes** to raise an event when a monitored service fails to restart. The default is Yes.
Event severity when service fails to start	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service fails to restart. The default is 15.
Raise event if status of service is "Started"?	Select **Yes** to raise an event when a monitored service has a status of “Started.” The default is Yes.
Event severity when status of service is "Started"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service has a status of "Started". The default is 25.
Raise event if service is missing?	Select **Yes** to raise an event when a monitored service is missing. The default is Yes.
Event severity when service is missing	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service is missing. The default is 15.
Raise event if service is disabled?	Select **Yes** to raise an event when a monitored service has been disabled. The default is Yes.
Event severity when service is disabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service has been disabled. The default is 15.
Raise event if service is shut down normally?	Select **Yes** to raise an event when a monitored service has shut down normally. The default is Yes.

Parameter	How To Set It
Event severity when service is shut down normally	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service has shut down normally. The default is 25.
Raise event if unable to retrieve service status?	Select **Yes** to raise an event in which AppManager is unable to retrieve the status of a monitored service. The default is Yes.
Event severity when unable to retrieve service status	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager is unable to retrieve the status of a monitored service. The default is 5.
Data Collection	
Collect data?	Select **Yes** to collect data about any of the monitored services. The default is unselected.
Monitoring	
Version 3.x Services	
Restart Cisco CRA Engine?	Select **Yes** to restart Cisco CRA Engine. The default is Yes.
Restart Cisco AVVID Alarm?	Select **Yes** to restart Cisco AVVID Alarm. The default is Yes.
Restart Cisco Purging Scheduler?	Select **Yes** to restart Cisco Purging Scheduler. The default is Yes.
Restart Cisco CRA Servlet Engine?	Select **Yes** to restart Cisco CRA Servlet Engine. The default is Yes.
Restart Cisco Desktop Enterprise Service?	Select **Yes** to restart Cisco Desktop Enterprise Service. The default is Yes.
Restart Cisco Desktop RASCAL Service?	Select **Yes** to restart Cisco Desktop RASCAL Service. The default is Yes.
Restart Cisco Desktop Sync Service?	Select **Yes** to restart Cisco Desktop Sync Service. The default is Yes.
Restart Cisco Desktop TAI Service?	Select **Yes** to restart Cisco Desktop TAI Service. The default is Yes.
Restart Cisco Desktop VoIP Monitor Service?	Select **Yes** to restart Cisco Desktop VoIP Monitor Service. The default is Yes.
Version 4.x Services	
Restart Cisco CRS Node Manager?	Select **Yes** to restart Cisco CRS Node Manager. The default is Yes.
Restart Cisco AVVID Alarm?	Select **Yes** to restart Cisco AVVID Alarm. The default is Yes.
Restart Cisco Desktop Enterprise Service?	Select **Yes** to restart Cisco Desktop Enterprise Service. The default is Yes.
Restart Cisco Desktop IP Phone Agent Service?	Select **Yes** to restart Cisco Desktop IP Phone Agent Service. The default is Yes.
Restart Cisco Desktop LDAP Monitor Service?	Select **Yes** to restart Cisco Desktop LDAP Monitor Service. The default is Yes.
Restart Cisco Desktop License and Resource Manager Service?	Select **Yes** to restart Cisco Desktop License and Resource Manager Service. The default is Yes.

Parameter	How To Set It
Restart Cisco Desktop Recording and Statistics Service?	Select **Yes** to restart Cisco Desktop Recording and Statistics Service. The default is Yes.
Restart Cisco Desktop Recording Service?	Select **Yes** to restart Cisco Desktop Recording Service. The default is Yes.
Restart Cisco Desktop Sync Service?	Select **Yes** to restart Cisco Desktop Sync Service. The default is Yes.
Restart Cisco Desktop VoIP Monitor Service?	Select **Yes** to restart Cisco Desktop VoIP Monitor Service. The default is Yes.
Start down services?	Select **Yes** to start any monitored service that is down. The default is Yes.
Start dependent services? (6.0+)	Select **Yes** to start any dependent service that is down. The default is Yes. Applies only to versions 6.0 and above.
Service start timeout	Specify the maximum number of seconds that are allowed for a service to restart. If the specified time elapses and the service has not restarted, an event will be raised. The default is 30 seconds.
Restart service if shutdown is normal?	Select **Yes** to restart a service that has shut down normally. The default is Yes.
Wait N seconds before restarting service	Specify the number of seconds that should elapse before a service is restarted. The default is 10 seconds.

23.9 ICD_SystemUsage

Use this Knowledge Script to monitor the amount of CPU and memory that the Cisco CRA Engine process is using.

If the CPU usage (%) for the Cisco CRA Engine process or total CPU usage (%) exceeds a threshold, an event is raised. If memory pool usage (KB) for the Cisco CRA Engine process or total memory usage (KB) exceed their respective thresholds, an event is raised. Also, if data collection is enabled, data streams are generated for Cisco CRA Engine CPU usage, total CPU usage, Cisco CRA Engine memory pool usage, and total memory usage.

23.9.1 Resource Object

Cisco ICD parent object

23.9.2 Default Schedule

By default, this script runs every five minutes.

23.9.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if CPU usage exceeds the threshold?	Select **Yes** to raise an event when CPU usage exceeds the threshold you set. The default is Yes
Event severity when CPU utilization exceeds the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold you set. The default is 15.
Raise event if memory usage exceeds the threshold?	Select **Yes** to raise an event when memory usage exceeds the threshold you set. The default is Yes.
Event severity when memory usage exceeds the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which memory usage exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for CPU usage?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of CPU usage for the monitoring period. The default is unselected.
Collect data for memory usage	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the amount of memory usage, in KB, for the monitoring period. The default is unselected.
Monitoring	
Threshold: Maximum Cisco ICD Engine CPU usage	Specify the highest amount of CPU that the Cisco UCCX Engine can consume before an event is raised. The default is 65%.

Parameter	How To Set It
Threshold: Maximum total CPU usage	Specify the highest amount of CPU that the entire UCCX system can consume before an event is raised. The default is 80%.
Threshold: Maximum Cisco ICD Engine memory pool usage	Specify the highest amount of memory pool that the Cisco UCCX Engine can consume before an event is raised. The default is 65%.
Threshold: Maximum Cisco ICD Engine total memory usage	Specify the highest amount of memory that the Cisco UCCX Engine can consume before an event is raised. The default is 80%.

23.10 IIS_CpuHigh

Use this Knowledge Script to monitor CPU usage for IIS application processes. This script raises an event if a threshold is exceeded. In addition, this script generates a data stream for CPU usage (%).

23.10.1 Resource Object

IIS server object

23.10.2 Default Schedule

By default, this script runs every five minutes.

23.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event if CPU usage exceeds the threshold?	Select **y** to raise an event if CPU usage exceeds the threshold you set. The default is y.
Collect data?	Select **y** to collect data for charts and reports. When enabled, data collection returns the percentage of CPU usage for the monitoring period. The default is n.
Process names	Provide the names of the application processes you want to monitor. Separate multiple entries with commas. For example: `inetinfo,dllhost`. The default is inetinfo. **NOTE:** Do not append .exe to the process names.
Threshold - Maximum CPU usage	Specify the maximum percentage of CPU resources the selected process can consume before an event is raised. The default is 60%.
Event severity when CPU usage exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. The default is 15.

23.11 IIS_HealthCheck

Use this Knowledge Script to check IIS servers, Web site status, and the queue length for blocked I/O requests. If any server or Web site is not running, an event is raised. In addition, you can choose to automatically restart the IIS server or Web site. This script raises an event if the blocked I/O queue length is longer than the specified threshold.

This script monitors only Web sites (servers), not FTP sites, NNTP sites, or SMTP sites.

23.11.1 Resource Object

IIS server object

23.11.2 Default Schedule

By default, this script runs every five minutes.

23.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Auto-start monitored server(s)?	Select **y** to automatically restart down servers. The default is y.
Event severity when auto-start fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which monitored server fails to start. The default is 5.
Event severity when auto-start succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which a monitored server starts successfully. The default is 25.
Event severity when auto-start is set to "n"	Set the severity level, from 1 to 40, to indicate the importance of an event in which the server is down and the *Auto-start monitored servers?* parameter is set to n. The default is 18.
Event severity for blocked I/O requests	Set the event severity level, from 1 to 40, to indicate the importance of an event in which blocked I/O requests are in queue. The default is 5.
Threshold - Maximum blocked I/O requests	Specify the maximum number of blocked I/O requests that can be in the queue before an event is raised. The default is zero requests.
Monitor IIS server?	Select **y** to monitor the IIS server. The default is y.
Monitor FTP server?	Select **y** to monitor the FTP server. The default is n.

23.12 IIS_KillTopCPUProcs

Use this Knowledge Script to monitor the CPU usage for the IIS `dllhost` and `mtx` processes. This script raises an event if a threshold is exceeded. You can set this script to automatically stop a process that exceeds the CPU usage threshold.

23.12.1 Resource Object

IIS server object

23.12.2 Default Schedule

By default, this script runs every three minutes.

23.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event if kill is successful or unsuccessful?	Select **y** to raise an event if the stop process is successful or unsuccessful. The default is y.
Kill CPU-intensive processes?	Select **y** to automatically stop any process that exceeds the CPU usage threshold. The default is n.
Threshold - Maximum CPU usage allowed	Specify the maximum percentage of CPU the `dllhost` and `mtx` processes can consume before an event is raised. The default is 90%.
Event severity when CPU usage exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. The default is 10.
Event severity when kill fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which a process exceeds the threshold and AppManager cannot stop the process. The default is 10.
Event severity when kill succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which a process exceeds the threshold and AppManager has successfully stopped the process. The default is 20.

23.13 IIS_MemoryHigh

Use this Knowledge Script to monitor memory usage for selected IIS application processes. This script raises an event memory usage exceeds the threshold you set. In addition, this script generates a data stream for memory usage (%).

23.13.1 Resource Object

IIS server object

23.13.2 Default Schedule

By default, this script runs every five minutes.

23.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event if threshold exceeded?	Select **y** to raise an event when memory usage exceeds the threshold you set. The default is y.
Collect data?	Select **y** to collect data for charts and reports. When enabled, data collection returns the named process's memory usage during the monitoring interval. The default is n.
Process names	Provide the name of the application process you want to monitor. Use a comma to separate multiple entries — do not use spaces. For example: `inetinfo,dllhost`. The default is `inetinfo`. **NOTE:** Do not append .exe to the process names.
Threshold - Maximum memory usage	Specify the maximum amount of memory the selected process can consume before an event is raised. The default is 10000000 bytes.
Threshold - Maximum memory pool usage	Specify the maximum amount of memory pool the selected process can consume before an event is raised. The default is 5000000 bytes.
Event severity when threshold is exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which memory usage exceeds the threshold. The default is 15.

23.14 IIS_ServiceUpTime

Use this Knowledge Script to monitor the uptime for Web sites and services. This script raises an event if the amount of time the sites and services are running is less than the threshold you set. In addition, this script generates a data stream the length of time a service has been running.

23.14.1 Prerequisite

The server on which you run this script must be running IIS version 5 or later.

23.14.2 Resource Objects

IIS Web server or FTP server object

23.14.3 Default Schedule

By default, this script runs every one hour.

23.14.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event if uptime falls below threshold?	Select **y** to raise an event if uptime falls below the threshold. The default is y.
Collect data?	Select **y** to collect data for charts and reports. When enabled, data collection returns the number of seconds a service has been running during the monitoring interval. The default is n.
Threshold - Minimum uptime	Specify the minimum amount of time that discovered Web site/services and FTP sites/services are required to be running to prevent an event from being raised. The default is 10000 seconds.
Event severity when uptime falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which uptime falls below the threshold. The default is 5.

23.15 SQL_Accessibility

Use this Knowledge Script to monitor SQL Server and database accessibility. This script raises an event if a SQL Server or a specified database is not accessible. In addition, this script can generate data streams for database accessibility.

23.15.1 Resource Object

Cisco ICD SQL Server object

23.15.2 Default Schedule

By default, this script runs every hour.

23.15.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if SQL Server or specified database not accessible	Select **Yes** to raise an event if SQL Server or the specified database is not accessible. The default is *s*.
Event severity when SQL Server or specified database not accessible	Set the severity level, from 1 to 40, to indicate the importance of an event in which SQL Server or the database is not accessible. The default is 5.
Data Collection	
Collect data?	Select **Yes** to collect data for reports and graphs. If y selected, this script returns 100 if all specified databases are accessible, 50 if some of the specified databases are accessible and some are not, or 0 if none of the specified databases is accessible. The default is unselected.
Monitoring	
Response timeout before target inaccessible	Enter a timeout period in seconds. The timeout period is the number of seconds to wait for a response before retrying or determining the target database is inaccessible. The default is zero seconds. **NOTE:** When specifying a timeout, the Knowledge Script continues waiting until it receives a response or the timeout is reached. During this waiting period, other jobs are blocked from execution. Therefore, limit use of this parameter or keep the timeout period at a minimum for regular monitoring jobs. (When you are running this script to troubleshoot a particular problem and not as part of a regularly scheduled interval for ongoing maintenance, you can adjust this parameter to allow a longer time out period.)

Parameter	How To Set It
Number of retries before target inaccessible	Enter the number of times to retry connecting to the target database before determining the database is inaccessible. The default is zero retries. **NOTE:** When specifying this parameter the script continues waiting until it receives a response or has made the specified number of retry attempts. During this waiting period, other jobs are blocked from execution. Therefore, limit use of this parameter or keep retry attempts at a minimum for regular monitoring jobs. (When you are running this script to troubleshoot a particular problem and not as part of a regularly scheduled interval for ongoing maintenance, you can adjust this parameter to allow more retry attempts.)
SQL username	Enter the database name that you want to use to access SQL Server. The username you enter must have permission to access the database names for which you want to check accessibility. To use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Database name	Enter the database names for which you want to check access, separated by commas. For example, enter `master,pubs,tempdb`. If you leave this field blank, the script checks access to all databases. The default is master.

23.16 SQL_CPUUtil

Use this Knowledge Script to monitor the percentage of CPU resources used by the `sqlservr` and `sqlagent` processes. This script raises an event if the CPU usage exceeds the threshold you set. In addition, this script generates data streams for CPU usage (%).

23.16.1 Resource Object

Cisco ICD SQL Server object

23.16.2 Default Schedule

By default, this script runs every 15 minutes.

23.16.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if the SQL Server process exceeds the threshold?	Select **Yes** to raise an event if SQL Server CPU usage exceeds the threshold. The default is y.
Event severity when the SQL Server process exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which SQL Server CPU usage exceeds the threshold. The default is 8.
Raise event if the SQL Agent process exceeds the threshold?	Select **Yes** to raise an event if SQL Agent CPU usage exceeds the threshold. The default is y.
Event severity when SQL Agent process exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which SQL Agent CPU usage exceeds the threshold. The default is 8.
Data Collection	
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns process CPU usage for the monitoring period. The default is unselected.
Monitoring	
Threshold - Maximum CPU usage for SQL Server process	Specify the maximum amount of CPU that the SQL Server process can consume before an event is raised. The default is 10%.
Threshold - Maximum CPU usage for SQL Agent process	Specify the maximum amount of CPU that the SQL Agent process can consume before an event is raised. The default is 10%.

23.17 SQL_DataGrowthRate

Use this Knowledge Script to monitor the data growth and shrink rates for all SQL Server databases. Growth and shrink rates are calculated by taking the difference between the data space utilization from the current interval and the data space utilization from the last interval. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for growth and shrink rates.

23.17.1 Resource Object

Cisco ICD SQL Server database object

23.17.2 Default Schedule

By default, this script runs every hour.

23.17.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if data growth rate exceeds the threshold	Select **Yes** to raise an event if the data growth rate exceeds the threshold. The default is Yes.
Event severity when data growth rate exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data growth rate exceeds the threshold. The default is 5.
Raise event if data shrink rate exceeds the threshold	Select **Yes** to raise an event if the data shrink rate exceeds the threshold. The default is Yes.
Event severity when data shrink rate exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data shrink rate exceeds the threshold. The default is 5.
Data Collection	
Collect data?	Select **Yes** to collect data about growth and shrink rates for reports and graphs. The default is unselected.
Monitoring	
Dynamically enumerate at each interval	Select **Yes** to dynamically enumerate databases at each monitoring interval. The default is y. To dynamically enumerate a database means that each time it runs, AppManager automatically determines and reports on all existing databases. Information is returned even for databases that are not yet discovered.
Exclude these objects	Provide the names of objects you want to exclude from dynamic enumeration. You can exclude multiple objects, separated by commas with no spaces. For example, enter `master,model,mdb` **NOTE:** Ignore this parameter if you are not dynamically enumerating databases.

Parameter	How To Set It
Threshold - Maximum data growth rate	Specify the maximum percentage of data growth that is allowed between the last and current interval before an event is raised. Enter 0 to ignore this parameter. The default is 25%.
Threshold - Maximum data shrink rate	Specify the maximum percentage of data shrinkage that is allowed between the last and current intervals before an event is raised. Enter 0 to ignore this parameter. The default is 25%.
SQL username	Specify the database username account that you want to use to access SQL Server. You can use the "sa" account or other user login accounts that have been set up in the managed client's SQL Server. If you want to use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use. **NOTE:** If you are monitoring SQL Server 7, to use a `sysadmin` role account. Only members of the *sysadmin* role can retrieve file statistics on SQL Server 7.0.

23.18 SQL_DBGrowthRate

Use this Knowledge Script to monitor database growth and shrink rates. Growth and shrink rates are calculated by taking the difference between the database space utilization from the current interval and the database space utilization from the last interval. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for growth and shrink rates.

23.18.1 Resource Object

Cisco ICD SQL Server database object

23.18.2 Default Schedule

By default, this script runs every hour.

23.18.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if database growth rate exceeds the threshold?	Select **Yes** to raise an event if the database growth rate exceeds the threshold. The default is Yes.
Event severity when database growth rate exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the database growth rate exceeds the threshold. The default is 5.
Raise event if database shrink rate exceeds the threshold?	Select **Yes** to raise an event if the database shrink rate exceeds the threshold. The default is Yes.
Event severity when database shrink rate exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the database shrink rate exceeds the threshold. The default is 5.
Data Collection	
Collect data?	Select **Yes** to collect data about growth and shrink rates for reports and graphs. The default is Yes.
Monitoring	
Dynamically enumerate at each interval	Select **Yes** to dynamically enumerate databases at each monitoring interval. The default is y. To dynamically enumerate a database means that each time it runs, AppManager automatically determines and reports on all existing databases. Information will be returned even for databases that are not yet discovered in the TreeView pane.
Exclude these objects	Provide the names of objects you want to exclude from dynamic enumeration. You can exclude multiple objects, separated by commas with no spaces. For example, enter `master,model,mdb` **NOTE:** Ignore this parameter if you are not dynamically enumerating databases.

Parameter	How To Set It
Threshold - Maximum database growth rate	Specify the maximum percentage of database growth that is allowed between the last and current intervals before an event is raised. Enter 0 to ignore this parameter. The default is 25%.
Threshold - Maximum database shrink rate	Specify the maximum percentage of database shrinkage that is allowed between the last and current intervals before an event is raised. Enter 0 to ignore this parameter. The default is 25%.
SQL username	Specify the database username that you want to use to access SQL Server. You can use the "sa" account or other user login accounts that have been set up in the managed client's SQL Server. If you want to use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use. **NOTE:** If you are monitoring SQL Server 7, use a `sysadmin` role account. Only members of the `sysadmin` role can retrieve file statistics on SQL Server 7.0.
Update usage?	Select **Yes** to have SQL Server recalculate the space usage. The default is unselected.

23.19 SQL_MemUtil

Use this Knowledge Script to monitor the amount of memory that is used by the processes: `sqlservr` and `sqlagent` processes

If using SQL Server 7.0 or 2000, you can use this script to monitor total server memory usage, number of free buffers, and memory usage.

This script raises an event if the amount of memory used by SQL Server exceeds the threshold you set. In addition, this script can generate data streams for memory usage (%).

23.19.1 Resource Object

Cisco ICD SQL Server object

23.19.2 Default Schedule

By default, this script runs every 10 minutes.

23.19.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if SQL process memory usage exceeds the threshold?	Select **Yes** to raise an event if sqlagent memory usage exceeds the threshold you set. The default is Yes.
Event severity when SQL process memory usage exceeds the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which sqlagent memory usage exceeds the threshold. The default is 5.
Raise event if free buffer count falls below the threshold?	Select **Yes** to raise an event if the number of free buffers falls below the threshold you set. The default is Yes.
Event severity when free buffer count falls below the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of free buffers falls below the threshold. The default is 5.
Raise event if SQL Server memory usage exceeds the threshold?	Select **Yes** to raise an event if the sqlservr memory usage exceeds the threshold. The default is Yes.
Event severity when SQL Server memory usage exceeds the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which sqlservr memory usage exceeds the threshold. The default is 5.
Data Collection	
Collect data?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns sqlservr and sqlagent memory usage for the monitoring period. The default is n.

Parameter	How To Set It
Threshold - Maximum process memory usage	Specify the maximum amount of memory that can be consumed by the SQL process before an event is raised. The default is 50000000 bytes.
Threshold - Minimum free buffers available	Specify the minimum number of buffers that must be available to prevent an event from being raised. The default is 50 buffers.
Threshold - Maximum SQL Server memory usage	Specify the maximum amount of memory that can be in use by SQL Server and all related processes before an event is raised. The default is 30000000 bytes.

23.20 SQL_RestartServer

Use this Knowledge Script to restart a SQL server and stop dependent UCCX services. These services will automatically be restarted. This script raises an event if the server either successfully restarts or fails to restart.

23.20.1 Resource Object

Cisco ICD SQL Server object

23.20.2 Default Schedule

By default, this script runs once.

23.20.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Event Notification	
Raise event if stop fails?	Select **Yes** to raise an event if AppManager cannot stop the service. The default is Yes.
Event severity when stop fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot stop the service. The default is 5.
Raise event if start fails?	Select **Yes** to raise an event if AppManager cannot start the service. The default is Yes.
Event severity when start fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot start the service. The default is 5.
Raise event if status of service is unavailable?	Select **Yes** to raise an event if AppManager cannot determine the status of the service. The default is Yes.
Event severity when status of service is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot determine the status of the service. The default is 10.
Raise event if stop succeeds?	Select **Yes** to raise an event if AppManager successfully stops the service. The default is Yes.
Event severity when stop succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully stops the service. The default is 25.
Raise event if restart succeeds?	Select **Yes** to raise an event if AppManager successfully restarts the service. The default is Yes.
Event severity when restart succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully restarts the service. The default is 25.
Monitoring	
Wait N seconds before restarting service	Specify the number of seconds to wait after the server is stopped before attempting to restart the service. The default is 5 seconds.

23.21 Recommended Knowledge Script Group

The following Knowledge Scripts are members of the CiscoICD recommended Knowledge Script Group (KSG).

- CallStatistics
- CSQ_ServiceLevel
- ICD_HealthCheck
- ICD_SystemUsage
- SQL_DBGrowthRate

The parameters of all scripts in the KSG are set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab and run the CiscoICD group on a Unified Contact Center Express (UCCX) resource.

Run the KSG on only one cluster at a time. Running the KSG on multiple clusters all at once hinders the proxy agent's ability to spread out processing over time. You can monitor multiple clusters by running the KSG on the first cluster, and then repeating the process for each additional cluster.

The CiscoICD KSG provides a "best practices" usage of AppManager for monitoring your UCCX environment. You can use this KSG with AppManager monitoring policies. A monitoring policy, which enables you to efficiently and consistently monitor all the resources in your environment, uses a set of pre-configured Knowledge Scripts to automatically monitor resources as they appear in the TreeView. For more information, see "About Policy-Based Monitoring" in the AppManager Help.

A KSG is composed of a subset of a module's Knowledge Scripts. The script that belongs to a KSG is a different copy of the original script you access from the CiscoICD tab. If you modify a script that belongs to a KSG, the parameter settings of the original script in the CiscoICD tab are not affected.

When deployed as part of a KSG, a script's default script parameter settings may differ from when the script is deployed alone. The default settings of a script within a group depend on its monitoring purpose within the larger group, and on the intended monitoring scope of that group.

If you modify or remove a script associated with the CiscoICD KSG and want to restore it to its original form, you can reinstall the AppManager for Cisco Integrated Contact Distribution module on the repository computer or check in the appropriate script from the AppManager\qdb\kp\CiscoICD\RECOMMENDED_CiscoICD directory.

24 CiscoICM Knowledge Scripts

Cisco Intelligent Contact Management is now known as Cisco Unified Contact Center Enterprise (UCCE), but this module continues to use the CiscoICM prefix for its Knowledge Scripts. UCCE provides contact routing and call treatment across several geographically distributed call centers over an IP infrastructure.

AppManager Knowledge Scripts retrieve information from UCCE computers to help you better manage UCCE. You can use the retrieved information to identify when services are down, when events have been logged, and when performance-monitoring data exceeds thresholds.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and pressing **F1**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

NOTE: This release of the module no longer includes SQL and IIS Knowledge Scripts specific to this module. If you have a previous version of this module, these scripts remain in the QDB, but are no longer supported. Use the most recent Knowledge Scripts from the SQL and IIS modules to perform the same monitoring that the CiscoICM versions of those scripts did. NetIQ Corporation recommends you delete from your QDBs any CiscoICM_SQL_* and CiscoICM_IIS_* scripts to avoid confusion.

Knowledge Script	What It Does
ICM_AgentData	Monitors agent data from the UCCE database.
ICM_EventGetViaFilter	Returns a formatted text version of matching events from the UCCE database, not the Windows event log.
ICM_EventLog	Monitors event log entries from UCCE during the past n hours.
ICM_ProcessLog	Searches a log file for a particular regular expression.
ICM_RouteData	Monitors Route data from the UCCE database.
ICM_RoutingClientData	Monitors Routing Client data from the UCCE database.
ICM_ScheduledTargetDataLocal	Monitors Scheduled Target data from the UCCE local database.
ICM_ScriptData	Monitors Script data from the UCCE database.
ICM_ServiceData	Monitors Service data from the UCCE database.
ICM_ServiceDataLocal	Monitors Service data from the UCCE local database.
ICM_SkillGroupData	Monitors Skill Group data from the UCCE database.
ICM_SkillGroupDataLocal	Monitors Skill Group data from the UCCE local database.
Router_AgentsLoggedOn	Monitors the total number of agents currently logged on to a router.
Router_CallsInProgress	Monitors the total number of calls in progress for a router.
Router_CallsPerSec	Monitors the number of calls per second for a router.

Knowledge Script	What It Does
Recommended Knowledge Script Group	Performs essential monitoring of your UCCE environment.

24.1 ICM_AgentData

Use this Knowledge Script to monitor agent data from the UCCE database. A separate event or data stream is generated for each agent. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for each monitored metric.

24.1.1 Resource Object

CISCOICM_CentralDB

24.1.2 Default Schedule

By default, this script runs every 30 minutes.

This script is tied to a corresponding table in the SQL Server database on the UCCE server. UCCE writes data into this table at specified intervals. With this interval in mind, the default schedule for this script is set so as to gather data in real time. If you change the schedule, to either less or more frequently than the default, you will query the database more often than is necessary, or not often enough.

You should not change the default schedule for this script.

24.1.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
On first run, minutes to go back	Specify the number of minutes of previous activity through which the script will search the database. For instance, if you specify 15, the script will search through the most recent 15 minutes of activity. The default is 60 minutes. **NOTE:** Using a "minutes to go back" time that is larger than the default may cause this script to be CPU-intensive on its first run depending upon the number of database entries being retrieved from the UCCE server.

Parameter	How To Set It
On subsequent runs, query database for extended time range?	Select **Yes** to search the database beginning with records that have timestamps that fall within a time range based on twice the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:15 through 9:45. In other words, the query searches 30 minutes' worth of records beginning 60 minutes (twice the Schedule) prior to the time the job runs. Disable this option to search the database beginning with records that have timestamps that fall within a time range that is the same as the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:45 through 10:15. In other words, the query searches the most recent 30 minutes' worth of records. **Important** Select the option appropriate for your UCCE environment. In newer versions of UCCE, records are not inserted in the database until 30 minutes after the timestamp. Therefore, a record with a timestamp of 9:00 is not inserted into the database until 9:30. This Knowledge Script queries for records that have timestamps that fall within the time frame of the query. To capture records that undergo a 30-minute delay between timestamp and database insertion, select **Yes**.
Cisco ICM database username	Provide the database user login account that you want to use to access SQL Server. You can use the sa account or other user login accounts that have been set up in the managed client's SQL Server. Ensure the user has permission to access the database in read-only mode. Leave this parameter blank in order to use Windows authentication. To use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Threshold - Maximum agent logged-on time	Specify the maximum amount of time that agents can be logged on before an event is raised. The default is 1680 seconds.
Event severity when logged-on time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which logged-on time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for agent logged-on time?	Set to **y** to collect data about the amount of time that agents are logged on. The default is n.
Threshold - Maximum agent available time	Specify the maximum amount of time that agents can be available before an event is raised. The default is 1680 seconds.
Event severity when available time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which available time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for agent available time?	Set to **y** to collect data about the amount of time that agents are available. The default is n.
Threshold - Maximum agent not-ready time	Specify the maximum amount of time that agents can be in a Not Ready state before an event is raised. The default is 120 seconds.

Parameter	How To Set It
Event severity when not-ready time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which not-ready time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for agent not-ready time	Set to **y** to collect data about the amount of time that agents are in a Not Ready state. The default is n.

24.2 ICM_Alarms

This Knowledge Script is no longer supported.

To monitor SNMP traps, please use the AppManager for SNMP Traps module. To download the AppManager for SNMP Traps module, log into the AppManager Module Upgrades & Trials page.

24.3 ICM_EventGetViaFilter

Use this Knowledge Script to create a formatted text version of matching events. These events are from the UCCE database, not the Windows event log. This script raises separate events for each event found in the database.

24.3.1 Resource Object

CISCOICM_CentralDB

24.3.2 Default Schedule

By default, this script runs every 30 minutes.

24.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
On first run, minutes to go back	Set this parameter to determine which events are searched the first time you run the Knowledge Script job. The default is 30 minutes. Subsequent searches begin where the previous one finished. The following entries are valid: • **n** to search entries for the past n minutes (8 for the past 8 minutes, 50 for the past 50 minutes, etc.) • **0** to search no previous entries (search from the current time forward) **NOTE:** Using a "minutes to go back" time that is larger than the default may cause this script to be CPU-intensive on its first run depending upon the number of database entries being retrieved from the UCCE server.
Cisco ICM database username	Enter the database user login account that you want to use to access SQL Server. You can use the sa account or other user login accounts that have been set up in the managed client's SQL Server. Leave this parameter blank in order to use Windows authentication. If you want to use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Event severity for error message	Set the severity level, from 1 to 40, to indicate the importance of an event in which an error message is found in the UCCE database. The default is 10.
Event severity for warning message	Set the severity level, from 1 to 40, to indicate the importance of an event in which a warning message is found in the UCCE database. The default is 20.
Event severity for informational message	Set the severity level, from 1 to 40, to indicate the importance of an event in which an informational message is found in the UCCE database. The default is 30.

24.4 ICM_EventLog

Use this Knowledge Script to monitor event log entries from the UCCE database during the past *n* hours. This script raises an event if log entries are detected. In addition, this script generates data streams for log entries.

24.4.1 Resource Object

CISCOICM

24.4.2 Default Schedule

By default, this script runs every 10 minutes.

24.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event for log entries?	Set to **y** to raise an event when the log contains entries for which you have filtered. The default is y.
Collect data?	Set to **y** to collect data about log entries for charts and graphs. The default is n.
Separate data?	Set to **y** to separate events entries from different log files into different data streams. If set to **n**, all event entries matching your filtering criteria are placed in the same data stream and the data detail message may include event entries from multiple log sources. The default is n. For example, if you are monitoring both the System and Application logs, you may want to set this parameter to **y** so that events in the System log are tracked separately from events in the Application log.
Log source	Specify the event log you want to monitor. You can specify multiple event logs, separated by commas. For example: `System,Application`. The default is Application.
Type: Error	Set to **y** to monitor for error events. If you set to n, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for *Collect data?* The default is y.
Type: Warning	Set to **y** to monitor for warning events. If you set to n, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for *Collect data?* The default is y.
Type: Information	Set to **y** to monitor for information events. If you set to n, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for *Collect data?* The default is n.

Parameter	How To Set It
Type: Success Audit	Set to **y** to monitor for success audit events. If you set to n, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for *Collect data?* The default is n.
Type: Failure Audit	Set to **y** to monitor for failure audit events. If you set to n, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for *Collect data?* The default is n.
Instructions for filters: To limit the types of entries that raise events and the type of data that is collected, enter a search string that filters the following fields in the event log. The search string can contain criteria used to include entries, exclude entries, or both. • Separate include and exclude criteria with a colon (:). For example, `net:logon`. • Separate multiple include or exclude entries with commas. For example, `finance,sales:corp00,HQ`. • If you specify only include criteria, the colon is not necessary. For example, `SQL`. • If you specify only exclude criteria, start the search string with a colon. For example, `:defragmentation,cleanup`.	
Event source filter	Specify one or more text strings to look for; separate multiple strings with commas. If your valid text string includes a comma, replace the comma with a tilde. For example: `GeoTel ICR,Cisco Systems Inc.` The Knowledge Script will convert the tilde to a comma at runtime.
Event category filter	Specify one or more text strings to look for; separate multiple strings with commas.
Event ID filter	Specify a single event ID or a range of event IDs; separate multiple entries by commas. For example: `1094,1404-1463`
Event user filter	Specify a single or multiple user names to look for; separate multiple entries by commas. For example: `Pat,Chris,Alex`
Computer filter	Specify a single or multiple computer names to look for; separate multiple entries by commas. For example: `SHASTA,MARS`
Event description filter	Specify a detail description or keywords in the description. The string can contain spaces, underscores, and periods; separate multiple entries with commas. For example: `data loss during system failures,corrupt indices,Inter-Site Transport objects failed`
Maximum number of entries per event report	Specify the maximum number of Application log events that can be returned in each event report. For example, if this value is set to 30 and 67 Application log events are found, three event reports are raised: two reports containing 30 events and one report containing seven events. The default is 30. The Message column on the Events tab in the Operator Console displays the number of events in each event report, the type of log the events are from, and the event report batch number. The batch number is the sequential number of the event report. Batch numbers start at 1 for each Knowledge Script iteration.
Event severity for log entries	Set the event severity level, from 1 to 40, to indicate the importance of an event. You may want to adjust the severity depending on the types of events for which you are checking. The default is 15.

24.5 ICM_ProcessLog

The UCCE Event Management System (EMS) logs events from processes throughout the system and stores the event data in the central database.

The EMS also saves events from individual processes in per-process log files on the local computer. These files document events for a specific process running on a specific computer. Use this Knowledge Script to search a log file for a particular regular expression.

24.5.1 Prerequisite

The UCCE computer on which you run this script must be running Internet Explorer 5.5 or later.

24.5.2 Resource Object

CiscoICM_Process

24.5.3 Default Schedule

By default, this script runs every 30 minutes.

24.5.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event for log entries?	Set to **y** to raise an event if the log contains entries for which you have filtered. The default is y.
Collect data for log entries?	Set to **y** to collect data about log entries for reports and graphs. The default is n.
On first run, minutes to go back	Set this parameter to determine which events are searched the first time you run the Knowledge Script job. The default is 30 minutes. Subsequent searches begin where the previous one finished. The following entries are valid: • **n** to search entries for the past n minutes (8 for the past 8 minutes, 50 for the past 50 minutes, etc.) • **0** to search no previous entries (search from the current time forward) **NOTE:** Using a "minutes to go back" time that is larger than the default may cause this script to be CPU-intensive on its first run depending upon the number of database entries being retrieved from the UCCE server.
Filter (regular expression)	Enter the expression by which you want to filter the process log. The default is error|warning|failed|unexpected.

Parameter	How To Set It
Event severity when log entries present	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the log contains entries for which you have filtered. The default is 10.
Preceding lines to include	Enter the number of lines to include before the matching entry in the event text. The default is 2.
Following lines to include	Enter the number of lines to include after the matching entry in the event text. The default is 2.

24.6 ICM_RouteData

Use this Knowledge Script to monitor data from the Route_Half_Hour table in the UCCE database. This script raises an event if a threshold is exceeded. In addition, this script generates separate data streams for each agent.

24.6.1 Resource Object

CISCOICM_CentralDB

24.6.2 Default Schedule

By default, this script runs every 30 minutes.

This script is tied to a corresponding table in the SQL Server database on the UCCE server. UCCE writes data into this table at specified intervals. With this interval in mind, the default schedule for this script is set so as to gather data in real time. If you change the schedule, to either less or more frequently than the default, you will query the database more often than is necessary, or not often enough.

You should not change the default schedule for this script.

24.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
On first run, minutes to go back	Specify the number of minutes of previous activity through which the script will search the database.For instance, if you enter 15, the script will search through the last 15 minutes of activity. The default is 60. **NOTE:** Using a "minutes to go back" time that is larger than the default may cause this script to be CPU-intensive on its first run depending upon the number of database entries being retrieved from the UCCE server.

Parameter	How To Set It
On subsequent runs, query database for extended time range?	Select **Yes** to search the database beginning with records that have timestamps that fall within a time range based on twice the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:15 through 9:45. In other words, the query searches 30 minutes' worth of records beginning 60 minutes (twice the Schedule) prior to the time the job runs. Disable this option to search the database beginning with records that have timestamps that fall within a time range that is the same as the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:45 through 10:15. In other words, the query searches the most recent 30 minutes' worth of records. **Important** Select the option appropriate for your UCCE environment. In newer versions of UCCE, records are not inserted in the database until 30 minutes after the timestamp. Therefore, a record with a timestamp of 9:00 is not inserted into the database until 9:30. This Knowledge Script queries for records that have timestamps that fall within the time frame of the query. To capture records that undergo a 30-minute delay between timestamp and database insertion, select **Yes**.
Cisco ICM database username	Provide the database user login account that you want to use to access SQL Server. You can use the `sa` account or other user login accounts that have been set up in the managed client's SQL Server. Ensure the user has permission to access the database in read-only mode. Leave this parameter blank in order to use Windows authentication. If you want to use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Threshold - Maximum handled calls	Specify the maximum amount of calls that can be handled before an event is raised. The default is 200 calls.
Event severity when handled calls exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of handles calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for handled calls?	Set to **y** to collect data about handled calls for reports and graphs. The default is n.
Threshold - Service Level	Specify your UCCE Service Level threshold, which is the percentage of calls that are answered within the number of seconds you set as a goal for connecting a call with an agent. If the Service Level threshold is exceeded, an event is raised. The default is 20%.
Event severity when Service Level threshold is exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Service Level threshold is exceeded. Set to **0** if you want to ignore the event. The default is 20.
Collect data for Service Level?	Set to **y** to collect data about Service Level thresholds for reports and graphs. The default is n.

Parameter	How To Set It
Threshold - Maximum Service Level calls	Specify the maximum number of calls that can experience a Service Level event before an event is raised. The default is 100 calls. A Service Level event occurs when one of three things happens to a call: • It is answered within the Service Level threshold. • It is abandoned within the Service Level threshold. • It reaches the Service Level threshold without being answered or abandoned.
Event severity when Service Level calls exceed the threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of Service Level calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for Service Level calls?	Set to **y** to collect data about Service Level calls for reports and graphs. The default is n.
Threshold - Maximum call-delay time	Specify the maximum number of seconds that a call can wait to be answered before an event is raised. The default is 45 seconds.
Event severity when call delay exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which call delay time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for call delay time?	Set to **y** to collect data about call delay time for reports and graphs. The default is n.
Threshold - Maximum hold time	Specify the maximum number of seconds that a call can wait on hold before an event is raised. The default is 200 seconds.
Event severity when hold time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which hold time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for hold time?	Set to **y** to collect data about hold time for reports and graphs. The default is n.

24.7 ICM_RoutingClientData

Use this Knowledge Script to monitor data from the Routing_Client_Five_Minute table in the UCCE database. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for each routing client.

24.7.1 Resource Object

CISCOICM_CentralDB

24.7.2 Default Schedule

By default, this script runs every five minutes.

This script is tied to a corresponding table in the SQL Server database on the UCCE server. UCCE writes data into this table at specified intervals. With this interval in mind, the default schedule for this script is set so as to gather data in real time. If you change the schedule, to either less or more frequently than the default, you will query the database more often than is necessary, or not often enough.

You should not change the default schedule for this script.

24.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
On first run, minutes to go back	Specify the number of minutes of previous activity through which the script will search the database. For instance, if you enter 15, the script will search through the last 15 minutes of activity. The default is 10 minutes. **NOTE:** Using a "minutes to go back" time that is larger than the default may cause this script to be CPU-intensive on its first run depending upon the number of database entries being retrieved from the UCCE server.

Parameter	How To Set It
On subsequent runs, query database for extended time range?	Select **Yes** to search the database beginning with records that have timestamps that fall within a time range based on twice the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:15 through 9:45. In other words, the query searches 30 minutes' worth of records beginning 60 minutes (twice the Schedule) prior to the time the job runs. Disable this option to search the database beginning with records that have timestamps that fall within a time range that is the same as the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:45 through 10:15. In other words, the query searches the most recent 30 minutes' worth of records. **Important** Select the option appropriate for your UCCE environment. In newer versions of UCCE, records are not inserted in the database until 30 minutes after the timestamp. Therefore, a record with a timestamp of 9:00 is not inserted into the database until 9:30. This Knowledge Script queries for records that have timestamps that fall within the time frame of the query. To capture records that undergo a 30-minute delay between timestamp and database insertion, select **Yes**.
Cisco ICM database username	Provide the database user login account that you want to use to access SQL Server. You can use the sa account or other user login accounts that have been set up in the managed client's SQL Server. Ensure the user has permission to access the database in read-only mode. Leave this parameter blank in order to use Windows authentication. If you want to use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Threshold - Maximum errors	Specify the maximum number of errors that can occur before an event is raised. The default is 30 errors.
Event severity when errors exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of errors exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for errors?	Set to **y** to collect data about errors for reports and graphs. The default is n.
Threshold - Maximum timed-out calls	Specify the maximum number of calls that can timeout before an event is raised. The default is five calls.
Event severity when timed-out calls exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of timed-out calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for timed-out calls?	Set to **y** to collect data about timed-out calls for reports and graphs. The default is n.
Threshold - Maximum delay	Specify the maximum amount of delay that can occur before an event is raised. The default is 100 milliseconds.

Parameter	How To Set It
Event severity when delay exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which delay exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for maximum delay?	Set to **y** to collect data about maximum delay for reports and graphs. The default is n.
Threshold - Maximum discarded calls	Specify the maximum number of calls that can be discarded before an event is raised. The default is 5 calls.
Event severity when discarded calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of discarded calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for discarded calls	Set to **y** to collect data about discarded calls for reports and graphs. The default is n.

24.8 ICM_ScheduledTargetDataLocal

Use this Knowledge Script to monitor data from the Scheduled_Target_Real_Time table in the UCCE local database. This script raises an event if a threshold is exceeded. In addition, this script generates a separate data stream for each scheduled target. All data values reflect the current real-time value.

24.8.1 Resource Object

CISCOICM_LocalDB

24.8.2 Default Schedule

By default, this script runs every five minutes.

This script is tied to a corresponding table in the SQL Server database on the UCCE server. UCCE writes data into this table at specified intervals. With this interval in mind, the default schedule for this script is set so as to gather data in real time. If you change the schedule, to either less or more frequently than the default, you will query the database more often than is necessary, or not often enough.

You should not change the default schedule for this script.

24.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
On first run, minutes to go back	Specify the number of minutes of previous activity through which the script will search the database. For instance, if you enter 15, the script will search through the last 15 minutes of activity. The default is 5 minutes. **NOTE:** Using a "minutes to go back" time that is larger than the default may cause this script to be CPU-intensive on its first run depending upon the number of database entries being retrieved from the UCCE server.
Cisco ICM database username	Provide the database user login account that you want to use to access SQL Server. You can use the sa account or other user login accounts that have been set up in the managed client's SQL Server. Ensure the user has permission to access the database in read-only mode. Leave this parameter blank in order to use Windows authentication. If you want to use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Threshold - Maximum calls in progress	Specify the maximum number of calls that can be in progress before an event is raised. The default is 100 calls.
Event severity when in-progress calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-progress calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.

Parameter	How To Set It
Threshold - Minimum calls in progress	Enter the minimum number of calls that can be in progress before an event is raised. The default is 1 call.
Event severity when in-progress calls fall below the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-progress calls falls below the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for calls in progress?	Set to **y** to collect data about in-progress calls for reports and graphs. The default is n.
Threshold - Maximum queued router calls	Specify the maximum number of router calls that can be in queue before an event is raised. The default is 20 calls.
Event severity when queued router calls exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of queued router calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 28.
Collect data for queued router calls?	Set to **y** to collect data about queued router calls for reports and graphs. The default is n.

24.9 ICM_ScriptData

Use this Knowledge Script to monitor data from the Script_Five_Minute table in the UCCE database. This script raises an event if a threshold is exceeded. In addition, this script generates a separate data stream for each script.

24.9.1 Resource Object

CISCOICM_CentralDB

24.9.2 Default Schedule

By default, this script runs every five minutes.

This script is tied to a corresponding table in the SQL Server database on the UCCE server. UCCE writes data into this table at specified intervals. With this interval in mind, the default schedule for this script is set so as to gather data in real time. If you change the schedule, to either less or more frequently than the default, you will query the database more often than is necessary, or not often enough.

You should not change the default schedule for this script.

24.9.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
On first run, minutes to go back	Specify the number of minutes of previous activity through which the script will search the database. For instance, if you enter 15, the script will search through the last 15 minutes of activity. The default is 10 minutes. **NOTE:** Using a "minutes to go back" time that is larger than the default may cause this script to be CPU-intensive on its first run depending upon the number of database entries being retrieved from the UCCE server.

Parameter	How To Set It
On subsequent runs, query database for extended time range?	Select **Yes** to search the database beginning with records that have timestamps that fall within a time range based on twice the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:15 through 9:45. In other words, the query searches 30 minutes' worth of records beginning 60 minutes (twice the Schedule) prior to the time the job runs. Disable this option to search the database beginning with records that have timestamps that fall within a time range that is the same as the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:45 through 10:15. In other words, the query searches the most recent 30 minutes' worth of records. **Important** Select the option appropriate for your UCCE environment. In newer versions of UCCE, records are not inserted in the database until 30 minutes after the timestamp. Therefore, a record with a timestamp of 9:00 is not inserted into the database until 9:30. This Knowledge Script queries for records that have timestamps that fall within the time frame of the query. To capture records that undergo a 30-minute delay between timestamp and database insertion, select **Yes**.
Cisco ICM database username	Provide the database user login account that you want to use to access SQL Server. You can use the sa account or other user login accounts that have been set up in the managed client's SQL Server. Ensure the user has permission to access the database in read-only mode. Leave this parameter blank in order to use Windows authentication. If you want to use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Threshold - Maximum incoming calls	Specify the maximum number of calls that can be incoming before an event is raised. The default is 100 calls.
Event severity when incoming calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of incoming calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for incoming calls?	Set to **y** to collect data about incoming calls for reports and graphs. The default is n.
Threshold - Maximum routed calls	Specify the maximum number of calls that can be routed before an event is raised. The default is 100 calls.
Event severity when routed calls exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event. Set to **0** if you want to ignore the event. The default is 20.
Collect data for routed calls?	Set to **y** to collect data about routed calls for reports and graphs. The default is n.

24.10 ICM_ServiceData

Use this Knowledge Script to monitor data from the Service_Half_Hour table in the UCCE database. This script raises an event if a threshold is exceeded. In addition, this script generates a separate data stream for each service.

24.10.1 Resource Object

CISCOICM_CentralDB

24.10.2 Default Schedule

By default, this script runs every 30 minutes.

This script is tied to a corresponding table in the SQL Server database on the UCCE server. UCCE writes data into this table at specified intervals. With this interval in mind, the default schedule for this script is set so as to gather data in real time. If you change the schedule, to either less or more frequently than the default, you will either the database more often than is necessary, or not often enough.

You should not change the default schedule for this script.

24.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
On first run, minutes to go back	Specify the number of minutes of previous activity through which the script will search the database. For instance, if you enter 15, the script will search through the last 15 minutes of activity. The default is 60 minutes. **NOTE:** Using a "minutes to go back" time that is larger than the default may cause this script to be CPU-intensive on its first run depending upon the number of database entries being retrieved from the UCCE server.

Parameter	How To Set It
On subsequent runs, query database for extended time range?	Select **Yes** to search the database beginning with records that have timestamps that fall within a time range based on twice the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:15 through 9:45. In other words, the query searches 30 minutes' worth of records beginning 60 minutes (twice the Schedule) prior to the time the job runs. Disable this option to search the database beginning with records that have timestamps that fall within a time range that is the same as the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:45 through 10:15. In other words, the query searches the most recent 30 minutes' worth of records. **Important** Select the option appropriate for your UCCE environment. In newer versions of UCCE, records are not inserted in the database until 30 minutes after the timestamp. Therefore, a record with a timestamp of 9:00 is not inserted into the database until 9:30. This Knowledge Script queries for records that have timestamps that fall within the time frame of the query. To capture records that undergo a 30-minute delay between timestamp and database insertion, select **Yes**.
Cisco ICM database username	Provide the database user login account that you want to use to access SQL Server. You can use the sa account or other user login accounts that have been set up in the managed client's SQL Server. Ensure the user has permission to access the database in read-only mode. Leave this parameter blank in order to use Windows authentication. If you want to use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Threshold - Maximum outgoing calls	Specify the maximum number of calls that can be outgoing before an event is raised. The default is 25 calls.
Event severity when outgoing calls exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of outgoing calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for outgoing calls?	Set to **y** to collect data about outgoing calls for reports and graphs. The default is n.
Threshold - Maximum incoming calls	Specify the maximum number of calls that can be incoming before an event is raised. The default is 100 calls.
Event severity when incoming calls exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of incoming calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for incoming calls?	Set to **y** to collect data about incoming calls for reports and graphs. The default is n.
Threshold - Maximum handled calls	Specify the maximum number of calls that can be handled before an event is raised. The default is 100 calls.

Parameter	How To Set It
Event severity when handled calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of handled calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for handled calls?	Set to **y** to collect data about handled calls for reports and graphs. The default is n.
Threshold - Maximum abandoned calls	Specify the maximum number of calls that can be abandoned before an event is raised. The default is 5 calls.
Event severity when abandoned calls exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of abandoned calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for abandoned calls?	Set to **y** to collect data about abandoned calls for reports and graphs. The default is n.
Threshold - Maximum terminated calls	Specify the maximum number of calls that can be terminated before an event is raised. The default is 5 calls.
Event severity when terminated calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of terminated calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for terminated calls?	Set to **y** to collect data about terminated calls for reports and graphs. The default is n.
Threshold - Maximum average delay	Specify the maximum amount of average delay that can occur before an event is raised. The default is 15 milliseconds.
Event severity when average delay exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of average delay exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for average delay?	Set to **y** to collect data about average delay for reports and graphs. The default is n.
Threshold - Maximum average handling time	Specify the maximum average handling time that can occur before an event is raised. The default is 100 seconds.
Event severity when average handling time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which average handling time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for average handling time?	Set to **y** to collect data about average handling time for reports and graphs. The default is n.
Threshold - Maximum call delay time	Specify the longest call delay time that can occur before an event is raised. The default is 30 seconds.
Event severity when call delay time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which call delay time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for call delay time?	Set to **y** to collect data about call delay time for reports and graphs. The default is n.
Threshold - Maximum hold time	Specify the maximum amount of hold time that can occur before an event is raised. The default is 15 seconds.
Event severity when hold time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of hold time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.

Parameter	How To Set It
Collect data for hold time?	Set to **y** to collect data about hold time for reports and graphs. The default is n.

24.11 ICM_ServiceDataLocal

Use this Knowledge Script to monitor data from the Service_Real_Time table in the UCCE local database. This script raises an event if a threshold is exceeded. In addition, this script generates a separate data stream for each service. All data values reflect the current real-time value.

24.11.1 Resource Object

CISCOICM_LocalDB

24.11.2 Default Schedule

By default, this script runs every five minutes.

This script is tied to a corresponding table in the SQL Server database on the UCCE server. UCCE writes data into this table at specified intervals. With this interval in mind, the default schedule for this script is set so as to gather data in real time. If you change the schedule, to either less or more frequently than the default, you will query the database more often than is necessary, or not often enough.

You should not change the default schedule for this script.

24.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
On first run, minutes to go back	Specify the number of minutes of previous activity through which the script will search the database. For instance, if you enter 15, the script will search through the last 15 minutes of activity. The default is 5 minutes. **NOTE:** Using a "minutes to go back" time that is larger than the default may cause this script to be CPU-intensive on its first run depending upon the number of database entries being retrieved from the UCCE server.
Cisco ICM database username	Provide the database user login account that you want to use to access SQL Server. You can use the sa account or other user login accounts that have been set up in the managed client's SQL Server. Ensure the user has permission to access the database in read-only mode. Leave this parameter blank in order to use Windows authentication. If you want to use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Threshold - Maximum outgoing calls	Specify the maximum number of calls that can be outgoing before an event is raised. The default is 25 calls.
Event severity when outgoing calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of outgoing calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.

Parameter	How To Set It
Collect data for outgoing calls?	Set to **y** to collect data about outgoing calls for reports and graphs. The default is n.
Threshold - Maximum incoming calls	Specify the maximum number of calls that can be incoming before an event is raised. The default is 100 calls.
Event severity when incoming calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of incoming calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for incoming calls?	Set to **y** to collect data about incoming calls for reports and graphs. The default is n.
Threshold - Maximum handled calls	Specify the maximum number of calls that can be handled before an event is raised. The default is 100 calls.
Event severity when handled calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of handled calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for handled calls?	Set to **y** to collect data about handled calls for reports and graphs. The default is n.
Threshold - Maximum abandoned calls	Specify the maximum number of calls that can be abandoned before an event is raised. The default is 5 calls.
Event severity when abandoned calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of abandoned calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for abandoned calls?	Set to **y** to collect data about abandoned calls for reports and graphs. The default is n.
Threshold - Maximum terminated calls	Specify the maximum number of calls that can be terminated before an event is raised. The default is 5 calls.
Event severity when terminated calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of terminated calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for terminated calls?	Set to **y** to collect data about terminated calls for reports and graphs. The default is n.
Threshold - Maximum average delay	Specify the highest amount of average delay that can occur before an event is raised. The default is 15 milliseconds.
Event severity when average delay exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which average delay exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for average delay?	Set to **y** to collect data about average delay for reports and graphs. The default is n.
Threshold - Maximum average handling time	Specify the highest amount of average handling time that can occur before an event is raised. The default is 100 seconds.
Event severity when average handling time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average handling time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for average handling time?	Set to **y** to collect data about handling time for reports and graphs. The default is n.
Threshold - Maximum call delay time	Specify the highest amount of call delay time that can occur before an event is raised. The default is 30 seconds.

Parameter	How To Set It
Event severity when call delay time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which call delay time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for call delay time?	Set to **y** to collect data about call delay time for reports and graphs. The default is n.
Threshold - Maximum hold time	Specify the highest amount of hold time that can occur before an event is raised. The default is 15 minutes.
Event severity when hold time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which hold time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for hold time?	Set to **y** to collect data about hold time for reports and graphs. The default is n.

24.12 ICM_SkillGroupData

Use this Knowledge Script to monitor data from the Skill_Group_Five_Minute table in the UCCE database. This script raises an event if a threshold is exceeded. Configure thresholds for five-minute intervals regardless of how often the script runs. This script generates a separate data stream for each skill group.

24.12.1 Resource Object

CISCOICM_CentralDB

24.12.2 Default Schedule

By default, this script runs every five minutes.

This script is tied to a corresponding table in the SQL Server database on the UCCE server. UCCE writes data into this table at specified intervals. With this interval in mind, the default schedule for this script is set so as to gather data in real time. If you change the schedule, to either less or more frequently than the default, you will query the database more often than is necessary, or not often enough.

You should not change the default schedule for this script.

24.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
On first run, minutes to go back	Specify the number of minutes of previous activity through which the script will search the database. For instance, if you enter 15, the script will search through the last 15 minutes of activity. The default is 10 minutes. **NOTE:** Using a "minutes to go back" time that is larger than the default may cause this script to be CPU-intensive on its first run depending upon the number of database entries being retrieved from the UCCE server.

Parameter	How To Set It
On subsequent runs, query database for extended time range?	Select **Yes** to search the database beginning with records that have timestamps that fall within a time range based on twice the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:15 through 9:45. In other words, the query searches 30 minutes' worth of records beginning 60 minutes (twice the Schedule) prior to the time the job runs. Disable this option to search the database beginning with records that have timestamps that fall within a time range that is the same as the length of the schedule you set on the Schedule tab. For example, if you set the schedule to run every 30 minutes and the job runs at 10:15, the query searches database records with timestamps of 9:45 through 10:15. In other words, the query searches the most recent 30 minutes' worth of records. **Important** Select the option appropriate for your UCCE environment. In newer versions of UCCE, records are not inserted in the database until 30 minutes after the timestamp. Therefore, a record with a timestamp of 9:00 is not inserted into the database until 9:30. This Knowledge Script queries for records that have timestamps that fall within the time frame of the query. To capture records that undergo a 30-minute delay between timestamp and database insertion, select **Yes**.
Cisco ICM database username	Provide the database user login account that you want to use to access SQL Server. You can use the sa account or other user login accounts that have been set up in the managed client's SQL Server. Ensure the user has permission to access the database in read-only mode. Leave this parameter blank in order to use Windows authentication. If you want to use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Threshold - Maximum agents logged on	Specify the maximum number of agents that can be logged on before an event is raised. The default is 100 agents.
Event severity when logged-on agents exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of logged-on agents exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Threshold - Minimum agents logged on	Specify the minimum number of agents that can be logged on before an event is raised. The default is 1 agent.
Event severity when logged-on agents falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of logged-on agents falls below the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for logged-on agents?	Set to **y** to collect data about logged-on agents for reports and graphs. The default is n.
Threshold - Maximum time in Available state	Specify the maximum amount of time that agents can be in the Available state before an event is raised. The default is 20 seconds.
Event severity when time in Available state exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which time in the Available state exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.

Parameter	How To Set It
Collect data for time in Available state?	Set to **y** to collect data about Available state time for reports and graphs. The default is n.
Threshold - Maximum time in Not Ready state	Specify the maximum amount of time that agents can be in the Not Ready state before an event is raised. The default is 20.
Event severity when time in Not Ready state exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which time in the Not Ready state exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for time in Not Ready state?	Set to **y** to collect data about agents in Not Ready state for reports and graphs. The default is n.
Threshold - Maximum time in Talking state	Specify the maximum amount of time that agents can be in the Talking state before an event is raised. The default is 20 seconds.
Event severity when time in Talking state exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which time in the Talking state exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for time in Talking state?	Set to **y** to collect data about agents in Talking state for reports and graphs. The default is n.
Threshold - Maximum handled calls	Specify the maximum number of calls that can be handled before an event is raised. The default is 100 calls.
Event severity when handled calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of handled calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for handled calls?	Set to **y** to collect data about handled calls or reports and graphs. The default is n.
Threshold - Maximum average handling time	Specify the maximum amount of average handling time that can occur before an event is raised. The default is 30 seconds.
Event severity when average handling time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the average handling time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for average handling time?	Set to **y** to collect data about average handling time for reports and graphs. The default is n.

24.13 ICM_SkillGroupDataLocal

Run this Knowledge Script to monitor data from the Skill_Group_Real_Time table in the UCCE local database. This script raises an event if a threshold is exceeded. In addition, this script generates a separate data stream for each skill group. All data values reflect the current real-time value.

24.13.1 Resource Object

CISCOICM_LocalDB

24.13.2 Default Schedule

By default, this script runs every five minutes.

This script is tied to a corresponding table in the SQL Server database on the UCCE server. UCCE writes data into this table at specified intervals. With this interval in mind, the default schedule for this script is set so as to gather data in real time. If you change the schedule, to either less or more frequently than the default, you will either the database more often than is necessary, or not often enough.

You should not change the default schedule for this script.

24.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
On first run, minutes to go back	Specify the number of minutes of previous activity through which the script will search the database. For instance, if you enter 15, the script will search through the last 15 minutes of activity. The default is 5 minutes. **NOTE:** Using a "minutes to go back" time that is larger than the default may cause this script to be CPU-intensive on its first run depending upon the number of database entries being retrieved from the UCCE server.
Cisco ICM database username	Provide the database user login account that you want to use to access SQL Server. You can use the sa account or other user login accounts that have been set up in the managed client's SQL Server. Ensure the user has sufficient rights to access the database when the database is in read only mode. Leave this parameter blank in order to use Windows authentication. If you want to use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Threshold - Maximum agents logged on	Specify the maximum number of agents that can be logged on before an event is raised. The default is 100 agents.
Event severity when logged-on agents exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of logged-on agents exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.

Parameter	How To Set It
Collect data for logged-on agents?	Set to **y** to collect data about logged-on agents for reports and graphs. The default is n.
Threshold - Maximum time in Available state	Specify the maximum amount of time that agents can be in Available state before an event is raised. The default is 20 seconds.
Event severity when time in Available state exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which time in Available state exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for time in Available state?	Set to **y** to collect data about agents in Available state for reports and graphs. The default is n.
Threshold - Maximum time in Not Ready state	Specify the maximum amount of time that agents can be in the Not Ready state before an event is raised. The default is 20 seconds.
Event severity when time in Not Ready state exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which time in Not Ready state exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for time in Not Ready state?	Set to **y** to collect data about agents in Not Ready state for reports and graphs. The default is n.
Threshold - Maximum time in Talking state	Specify the maximum amount of time that agents can be in Talking state before an event is raised. The default is 20.
Event severity when time in Talking state exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which time in Talking state exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for time in Talking state?	Set to **y** to collect data about agents in Talking state for reports and graphs. The default is n.
Threshold - Maximum handled calls	Specify the maximum number of calls that can be handled before an event is raised. The default is 100 calls.
Event severity when handled calls exceed the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of handled calls exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for handled calls?	Set to **y** to collect data about handled calls for reports and graphs. The default is n.
Threshold - Maximum average handling time	Specify the maximum amount of average handling time that can occur before an event is raised. The default is 30 seconds.
Event severity when average handling time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which average handling time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for average handling time?	Set to **y** to collect data about average handling time for reports and graphs. The default is n.
Threshold - Maximum hold time	Specify the maximum amount of hold time that can occur before an event is raised. The default is 15 seconds.
Event severity when hold time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which hold time exceeds the threshold. Set to **0** if you want to ignore the event. The default is 20.
Collect data for hold time?	Set to **y** to collect data about hold time for reports and graphs. The default is n.

24.14 Router_AgentsLoggedOn

Use this Knowledge Script to monitor the total number of agents logged on to a Call Router. This script raises an event if the number of agents exceeds the threshold. In addition, this script generates data streams for the number of logged-on agents.

24.14.1 Resource Object

CISCOICM_Router

24.14.2 Default Schedule

By default, this script runs every five minutes.

24.14.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event if threshold is exceeded?	Set to **y** to raise an event if the number of logged-on agents exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data about logged-on agents for reports and graphs. The default is n.
Threshold - Maximum agents logged on	Specify the maximum number of agents that can be logged on before an event is raised. The default is 10 agents.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 25.

24.15 Router_CallsInProgress

Use this Knowledge Script to monitor the number of calls in progress for a Call Router. This script raises an event if the number of calls exceeds the threshold. In addition, this script generates data streams for in-progress calls.

24.15.1 Resource Object

CISCOICM_Router

24.15.2 Default Schedule

By default, this script runs every five minutes.

24.15.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event if threshold is exceeded?	Set to **y** to raise an event if the number of in-progress calls exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data about in-progress calls for reports and graphs. The default is n.
Threshold - Maximum calls in progress	Specify the maximum number of calls that can be in progress before an event is raised. The default is 10 calls.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 25.

24.16 Router_CallsPerSec

Use this Knowledge Script to monitor the number of in-progress calls per second for a Call Router. This script raises an event if the number of calls exceeds the threshold. In addition, this script generates data streams for per-second calls.

24.16.1 Resource Object

CISCOICM_Router

24.16.2 Default Schedule

By default, this script runs every five minutes.

24.16.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event if threshold is exceeded?	Set to **y** to raise an event if the number of calls per second exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data about per-second calls for reports and graphs. The default is n.
Threshold - Maximum in-progress calls per second	Specify the maximum number of in-progress calls that can occur per second before an event is raised. The default is 10 calls.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 25.

24.17 Recommended Knowledge Script Group

The following Knowledge Scripts are members of the CiscoICM Knowledge Script Group. You can find these scripts individually on the CiscoICM tab and in a group on the RECOMMENDED tab of the Operator Console.

- ICM_AgentData
- ICM_EventLog
- Router_AgentsLoggedOn
- Router_CallsInProgress

All scripts in the KSG have their parameters set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab and run the CiscoICM group on a Cisco UCCE resource.

The CiscoICM KSG enables a "best practices" usage of AppManager for monitoring your Cisco UCCE environment. You can use this KSG with AppManager monitoring policies. A monitoring policy, which enables you to efficiently and consistently monitor all the resources in your environment, uses a set of pre-configured Knowledge Scripts to automatically monitor resources as they appear in the TreeView.

A KSG is composed of a subset of a module's Knowledge Scripts. The script that belongs to a KSG is a different copy of the original script you access from the CiscoICM tab. If you modify a script that belongs to a KSG, the parameter settings of the original script in the CiscoICM tab are not affected.

In some cases, default script parameter settings are different when the script is deployed as part of a KSG, as opposed to when it is deployed alone. The default settings of a script within a group depend on its monitoring purpose within the larger group, and on the intended monitoring scope of that group.

If you modify or remove a script associated with the CiscoICM KSG and want to restore it to its original form, you can reinstall the AppManager for Cisco Intelligent Contact Management module on the repository computer or check in the appropriate script from the `AppManager\qdb\kp\CiscoICM` directory.

25 Cisco IVR Knowledge Scripts

AppManager provides the following Knowledge Scripts for monitoring Cisco IVR resources. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
IIS_CpuHigh	Monitors CPU usage for IIS processes.
IIS_HealthCheck	Monitors the queue length for blocked I/O requests and the up-and-down status of IIS services and Web sites.
IIS_KillTopCPUProcs	Monitors the CPU usage of the dllhost and MTX processes. Can automatically stop a process that exceeds the threshold.
IIS_MemoryHigh	Monitors memory usage and memory pool usage for IIS application processes.
IIS_RestartServer	Restarts an IIS server.
IIS_ServiceUpTime	Monitors Web sites and Web services uptime.
IVR_CpuHigh	Monitors the CPU resource consumption for IVR processes.
IVR_EventLog	Scans the Event Log for Cisco IVR errors and status events.
IVR_HealthCheck	Monitors the status of Cisco IVR services. Can automatically restarts any service that is down.
IVR_MemoryHigh	Monitors the memory consumption for IVR processes. If a process is not found, it assumes that the process is not running, and reports zero as the memory result.
IVR_RestartService	Schedules an IVR service to stop and then restart after a specified interval.
IVR_SystemUsage	Monitors the CPU usage and memory for the Cisco IVR process and for system processes.
Report_ServicesAvailability	Summarizes the average availability of IVR services.
Report_SystemUsage	Summarizes the average CPU and memory usage per IVR server.

25.1 IIS_CpuHigh

Use this Knowledge Script to monitor CPU usage for IIS application processes. This script raises an event if CPU usage exceeds the threshold you set. In addition, this script generates data streams for CPU usage.

25.1.1 Resource Object

CISCOIVR_IIST_Server

25.1.2 Default Schedule

By default, this script runs every five minutes.

25.1.3 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Raise event if CPU usage exceeds threshold?	Set to **y** to raise an event if the threshold is exceeded. The default is y.
Collect data for CPU usage?	Set to **y** to collect data about CPU usage for reports and graphs. The default is n.
Process names	Sepcify the names of the application processes you want to monitor. Separate multiple entries with commas. For example: `inetinfo,dllhost`. The default is inetinfo. **NOTE:** Do not append `.exe` to the process names.
Threshold - Maximum CPU usage	Specify the maximum percentage of CPU resources the selected process can use before an event is raised. The default is 60%.
Event severity when CPU usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event inwhich CPU usage exceeds the threshold you set. The default is 8.

25.2 IIS_HealthCheck

Use this Knowledge Script to check IIS servers, Web site status, and the queue length for blocked I/O requests. This script raises an event if any server or Web site is not running. In addition, you can choose to automatically restart the IIS server or Web site. This script also raises an event if the blocked I/O queue length is longer than the specified threshold.

This script monitors only Web sites (servers), not FTP sites, NNTP sites, or SMTP sites.

25.2.1 Resource Objects

- CISCOIVR_IIST_Server
- CISCOIVR_IIST_FTPSRV
- CISCOIVR_IIST_W3SRV
- CISCOIVR_IIST_WebInst

25.2.2 Default Schedule

By default, this script runs every five minutes.

25.2.3 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Auto-start monitored server(s)?	Set to **y** to automatically restart servers that are down. The default is y.
Event severity when auto-start fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which a server is down and AppManager cannot restart it. The default is 5.
Event severity when auto-start succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which a server was down and AppManager successfully restarted it. The default is 25.
Event severity when auto-start is set to "n"	Set the severity level, from 1 to 40, to indicate the importance of an event in which a server is down and AppManager has not been set to restart the service. The default is 18.
Event severity for blocked I/O requests	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 5.
Threshold - Maximum blocked I/O requests	Specify the maximum queue length for blocked I/O requests. The default is 0 requests.
Monitor IIS server?	Set to **y** to monitor the IIS server. The default is y.
Monitor FTP server?	Set to **y** to monitor the FTP server. The default is n.

25.3 IIS_KillTopCPUProcs

Use this Knowledge Script to monitor the CPU usage for the IIS `dllhost` and `mtx` processes. This script raises an event if one or both processes exceed the CPU usage threshold you set. You can set this script to automatically stop a process that exceeds the CPU usage threshold.

25.3.1 Resource Object

CISCOIVR_IIST_Server

25.3.2 Default Schedule

By default, this script runs every three minutes.

25.3.3 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Raise event if kill is successful or unsuccessful?	Set to **y** to raise an event when a process is successfully or unsuccessfully stopped. The default is y.
Kill CPU intensive processes?	Set to **y** to automatically stop any process that exceeds the threshold. The default is n.
Threshold - Maximum CPU usage	Specify the maximum percentage of CPU that can be used by the `dllhost` and `mtx` processes before an event is raised. The default is 90%.
Event severity when CPU usage exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold you set. The default is 10.
Event severity when kill fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot stop a process. The default is 10.
Event severity when kill succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully stops a process. The default is 20.

25.4 IIS_MemoryHigh

Use this Knowledge Script to monitor memory usage for IIS applications. This script raises an event if memory usage exceeds the threshold. In addition, this script generates data streams for memory usage.

25.4.1 Resource Object

CISCOIVR_IIST_Server

25.4.2 Default Schedule

By default, this script runs every five minutes.

25.4.3 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Raise event if threshold is exceeded? ?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data about memory usage for reports and graphs. The default is n.
Process names	Specify the names of the application processes you want to monitor. Use a comma to separate multiple entries — do not use spaces. For example: `inetinfo,dllhost`. The default is inetinfo. **NOTE:** Do not append .exe to the process names.
Threshold - Maximum memory usage	Specify the maximum amount of memory the selected process can use before an event is raised. The default is 10000000 bytes.
Threshold - Maximum memory pool usage	Specify the maximum amount of memory pool the selected process can use before an event is raised. The default is 5000000 bytes.
Event severity when threshold is exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 8.

25.5 IIS_RestartServer

Use this Knowledge Script to restart an IIS server. This script raises an event if the server either successfully restarts or fails to restart.

25.5.1 Resource Object

CISCOIVR_IIST_Server

25.5.2 Default Schedule

By default, this script runs once.

25.5.3 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Wait N seconds before restarting	Specify the number of seconds to wait after the server is stopped before attempting to automatically restart the server. The default is 5 seconds.
Event severity when stop fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot stop the server. The default is 5.
Event severity when restart fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot restart the server. The default is 5.
Event severity when status of server is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot determine the status of the server. The default is 10.
Event severity when stop succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully stops the server. The default is 25.
Event severity when restart succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully restarts the server. The default is 25.

25.6 IIS_ServiceUpTime

Use this Knowledge Script to monitor the uptime for Web sites and services. This script raises an event if the amount of time the sites and services are running is less than the threshold you set. In addition, this script generates data streams for uptime.

NOTE: This script supports IIS version 5 and later.

25.6.1 Resource Objects

- CISCOIVR_IIST_WebInst
- CISCOIVR_IIST_FTPInst

25.6.2 Default Schedule

By default, this script runs every hour.

25.6.3 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Raise event if uptime falls below threshold?	Set to **y** to raise an event when uptime falls below the threshold. The default is y.
Collect data?	Set to **y** to collect data for reports and graphs. If set to y, the script returns how long a service has been running. The default is n.
Threshold - Minimum uptime	Specify the minimum amount of time that discovered Web sites, Web services, FTP sites, and FTP services are required to be up during any interval to prevent an event from being raised. If the sites and services up time is less than this threshold, an event is raised. The default is 10000 seconds.
Event severity when uptime falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which uptime falls below the threshold. The default is 5.

25.7 IVR_CpuHigh

Use this Knowledge Script to monitor the CPU resource consumption for IVR processes. This script raises an event if CPU utilization exceeds the thresholds you set. The script monitors CPU usage for each IVR process and the total CPU usage for all processes. If a process is not found, the script assumes that the process is not running and reports zero as the CPU result.

25.7.1 Resource Object

CISCOIVR

25.7.2 Default Schedule

By default, this script runs every 15 minutes.

25.7.3 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Raise event if threshold is exceeded?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for graphs and reports. The default is n.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 15.
Threshold - Maximum CPU usage for Cisco Application/CRA/CRS Engine	Specify the maximum amount CPU that can be used by the Cisco Application/CRA/CRS Engine before an event is raised. Set to **0** if you do not want to monitor this process. The default is 20%.
Threshold - Maximum CPU usage for Cisco AVVID Alarm Service	Specify the maximum CPU usage for Cisco AVVID Alarm Service that can be detected before an event is raised. Set to **0** if you do not want to monitor this process. The default is 20%
Threshold - Maximum CPU usage for Cisco Syslog Collector	Specify the maximum CPU usage for Cisco Syslog Collector that can be detected before an event is raised. Set to **0** if you do not want to monitor this process. The default is 20%.

25.8 IVR_EventLog

Use this Knowledge Script to monitor the event log entries from Cisco IVR during the past *n* hours. This script raises an event if log entries are detected. In addition, this script generates datastreams for log entries.

25.8.1 Resource Object

CISCOIVR

25.8.2 Default Schedule

By default, this script runs every 10 minutes.

25.8.3 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Raise event for log entries?	Set to **y** to raise an event when the log contains entries for which you have filtered. The default is y.
Collect data?	Set to **y** to collect data about log entries for charts and graphs. The default is n.
Separate data?	Set to **y** to separate events entries from different log files into different data streams. If set to **n**, all event entries matching your filtering criteria are placed in the same data stream and the data detail message may include event entries from multiple log sources. The default is n. For example, if you are monitoring both the System and Application logs, you may want to set this parameter to **y** so that events in the System log are tracked separately from events in the Application log.
Log source	Specify the event log you want to monitor. Separate multiple entries by commas. For example: `System,Application`. The default is Application.
Events in past N hours	Enter the number of hours of log file entries through which the script will search for events that match the criteria you specify. For instance, if you enter 15, then the script will search through the last 15 hours of log file entries. If you enter **0** (which is the default), no past events are looked at during the first iteration of the Knowledge Script job. During subsequent iterations, the script will look through and filter only the new events that have been created in the Windows event log.
Type: Error	Set to y to monitor for error events. If you set to n, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for the Collect data? parameter. The default is y.

Parameter	How To Set It
Type: Warning	Set to y to monitor for warning events. If you set to n, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for the Collect data? parameter. The default is y.
Type: Information	Set to y to monitor for information events. If you set to n, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for the Collect data? parameter. The default is n.
Type: Success Audit	Set to y to monitor for success audit events. If you set to n, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for the Collect data? parameter. The default is n.
Type: Failure Audit	Set to y to monitor for failure audit events. If you set to n, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for the Collect data? parameter. The default is n.
Instructions for filters: To limit the types of entries that raise events and the type of data that is collected, enter a search string that filters the following fields in the event log. The search string can contain criteria used to include entries, exclude entries, or both. • Separate include and exclude criteria with a colon (:). For example, `net:logon`. • Separate multiple include or exclude entries with commas. For example, `finance,sales:corp00,HQ`. • If you are specifying only include criteria, the colon is not necessary. For example, `SQL`. • If you are specifying only exclude criteria, start the search string with a colon. For example, `:defragmentation,cleanup`.	
Event source filter	Specify one or more text strings to look for; separate multiple strings with commas. If your valid text string includes a comma, replace the comma with a tilde. For example: `Cisco Systems  Inc.  CRS` The Knowledge Script will convert the tilde to a comma at runtime.
Event category filter	Specify one or more text strings to look for; separate multiple strings with commas.
Event ID filter	Specify a single event ID or a range of event IDs; separate multiple entries by commas. For example: `1094,1404-1463`
Event user filter	Specify a single or multiple user names to look for; separate multiple entries by commas. For example: `Pat,Chris,Alex`
Computer filter	Specify a single or multiple computer names to look for; separate multiple entries by commas. For example: `SHASTA,MARS`
Event description filter	Specify a detail description or keywords in the description. The string can contain spaces, underscores, and periods; separate multiple entries with commas. For example: `data loss during system failures,corrupt indices,Inter-Site Transport objects failed`

Parameter	How To Set It
Threshold - Maximum number of entries per event report	Specify the maximum number of Application log events that can be returned in each event report. For example, if this value is set to 30 and 67 Application log events are found, then three event reports are raised: two reports containing 30 events and one report containing seven events. The default is 30. The Message column on the **Events** tab in the Operator Console displays the number of events in each event report, the type of log the events are from, and the event report batch number. The batch number is the sequential number of the event report. Batch numbers start at 1 for each Knowledge Script iteration.
Event severity for log entries	Set the event severity level, from 1 to 40, to indicate the importance of an event in which log entries are detected. You may want to adjust the severity depending on the types of events for which you are checking. The default is 15.

25.9 IVR_HealthCheck

Use this Knowledge Script to monitor Cisco IVR services. This script raises an event if any service is not running, and can automatically re-start any service that is not running. To make the most of the data collected by this script, run Report_ServicesAvailability.

25.9.1 Using Recommended Knowledge Scripts

This script is a member of the CiscoIVR Recommended Knowledge Script Group (KSG). As part of a KSG, these scripts have their parameters already set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab and then run the **CiscoIVR** group on a Cisco IVR resource.

- IVR_HealthCheck
- IVR_SystemUsage

25.9.2 Resource Object

CISCOIVR

25.9.3 Default Schedule

By default, this script runs every minute.

25.9.4 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Collect data?	Set to **y** to collect data for reports and graphs. The default is y.
Auto-start monitored services?	Set to **y** to auto-start any of the services that you choose to monitor. The default is y.
Event severity when auto-start fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and AppManager cannot restart it. The default is 5.
Event severity when auto-start succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service was down and AppManager successfully restarted it. The default is 25.
Event severity when auto-start is set to "n"	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and AppManager has not been set to restart the service. The default is 18.
Event severity when service does not exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored service does not exist. The default is 15.

Parameter	How To Set It
Monitor the Cisco Application/CRA/CRS Engine service?	Set to **y** to monitor the Cisco Application/CRA/CRS Engine service. The default is y.
Monitor the Cisco AVVID Alarm service?	Set to **y** to monitor the Cisco AVVID Alarm service. The default is y.
Monitor the Cisco Syslog Collector service?	Set to **y** to monitor the Cisco Syslog Collector service. The default is n.

25.10 IVR_MemoryHigh

Use this Knowledge Script to monitor the memory consumption for IVR processes. This script checks the memory used by each IVR process individually, and the total memory used by all processes. If a process is not found, the script assumes that the process is not running, and reports zero as the memory result.

This script raises an event if any value exceeds the threshold you set.

25.10.1 Resource Object

CISCOIVR

25.10.2 Default Schedule

By default, this script runs every five minutes.

25.10.3 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Raise event if threshold is exceeded?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for graphs and reports. The default is n.
Event severity when threshold is exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 15.
Monitor Cisco Application/CRA/CRS Engine memory usage?	Set to **y** to monitor the memory usage of the Cisco Application/CRA/CRS Engine. The default is y.
Threshold - Maximum memory usage for Cisco Application/CRA/CRS Engine	Specify the maximum amount of memory that can be used by the Cisco Application/CRA/CRS Engine before an event is raised. The default is 200000 KB.
Threshold - Maximum memory pool usage for Cisco Application/CRA/CRS Engine	Specify the maximum amount of memory pool that can be used by the Cisco Application/CRA/CRS Engine before an event is raised. The default is 5000 KB.
Monitor Cisco AVVID Alarm Service memory usage?	Set to **y** to monitor the memory usage of Cisco AVVID Alarm Service. The default is y.
Threshold - Maximum memory usage for Cisco AVVID Alarm Service	Specify the maximum amount of memory that can be used by the Cisco AVVID Alarm Service before an event is raised. The default is 200000 KB.
Threshold - Maximum memory pool usage for Cisco AVVID Alarm Service	Specify the maximum amount of memory pool that can be used by the Cisco AVVID Alarm Service before an event is raised. The default is 5000 KB.
Monitor Cisco Syslog Collector memory usage?	Set to **y** to monitor the memory usage of Cisco Syslog Collector. The default is y.
Threshold - Maximum memory usage for Cisco Syslog Collector	Specify the maximum amount of memory that can be used by the Cisco Syslog Collector before an event is raised. The default is 200000 KB.

Parameter	How To Set It
Threshold - Maximum memory pool usage for Cisco Syslog Collector	Specify the maximum amount of memory pool that can be used by the Cisco Syslog Collector before an event is raised. The default is 5000 KB.

25.11 IVR_RestartService

Use this Knowledge Script to schedule an IVR service to stop and then restart after a specified interval. This script raises an event when a stop or restart fails, when service status is unavailable, and when a stop or restart succeeds.

25.11.1 Resource Object

CISCOIVR

25.11.2 Default Schedule

By default, this script runs every hour.

25.11.3 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Collect data?	Set to **y** to collect data for graphs and reports. The default is n.
Wait N seconds before restarting	Specify the number of seconds that should elapse before the service is restarted. The default is 5 seconds.
Event severity when stop fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot stop the service. The default is 5.
Event severity when restart fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot restart the service. The default is 5.
Event severity when status of service is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot determine the status of the service. The default is 10.
Event severity when stop succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully stops the service. The default is 25.
Event severity when restart succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully restarts the service. The default is 25.
Restart Cisco Application/CRA/CRS Engine service?	Set to **y** to restart the Cisco Application/CRA/CRS Engine. The default is y.
Restart Cisco AVVID Alarm service?	Set to **y** to restart the Cisco AVVID Alarm. The default is n.
Restart Cisco Syslog Collector service?	Set to **y** to restart the Cisco Syslog Collector. The default is n.

25.12 IVR_SystemUsage

Use this Knowledge Script to monitor CPU usage and memory for the Cisco IVR process. This script raises an event if a threshold is exceeded. To make the most of the data collected by this script, run Report_SystemUsage.

25.12.1 Using Recommended Knowledge Scripts

This script is a member of the CiscoIVR Recommended Knowledge Script Group (KSG). As part of a KSG, these scripts have their parameters already set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab and then run the **CiscoIVR** group on a Cisco IVR resource.

- IVR_HealthCheck
- IVR_SystemUsage

25.12.2 Resource Object

CISCOIVR

25.12.3 Default Schedule

By default, this script runs every five minutes.

25.12.4 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Raise event if threshold is exceeded?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for reports and graphs. The default is y.
Event severity when threshold is exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 15.
Threshold - Maximum IVR server CPU usage	Specify the maximum amount of IVR CPU that can be in use before an event is raised. The default is 75%.
Threshold - Maximum total CPU usage	Specify the maximum amount of total CPU that can be in use before an event is raised. The default is 90%.
Threshold - Maximum IVR server memory usage	Specify the maximum amount of IVR memory that can be in use before an event is raised. The default is 75%.
Threshold - Maximum total memory usage	Specify the maximum amount of total memory that can be in use before an event is raised. The default is 90%.

25.13 Report_ServicesAvailability

Use this Knowledge Script to summarize the average availability of each IVR service within a time frame that you specify. This script uses the data collected by the IVR_HealthCheck script.

25.13.1 Using Recommended Knowledge Scripts

This script is a member of the CiscoIVR Recommended Knowledge Script Group (KSG). As part of a KSG, these scripts have their parameters already set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab and then run the **CiscoIVR_Report** group on a Report agent.

- Report_ServicesAvailability
- Report_SystemUsage

25.13.2 Resource Object

Report agent

25.13.3 Default Schedule

By default, this script runs once.

25.13.4 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Data Source	
Select data wizard	Select which computers to include in the report. You can select computers by category: View, Server Group, or Computer. The default is View.
Select Knowledge Script(s)	Select the Knowledge Scripts that you want to include in the report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Report Settings	
Decimal accuracy for % values	Specify the number of decimal places that you want to see in the values displayed in this report. The default is 3.
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table?	Set to **y** to include a table of data stream values in the report. The default is y.
Include chart?	Set to **y** to include a chart of data stream values in the report. The default is y.

Parameter	How To Set It
Select chart style	Define the graphic properties for the charts in your report. The default style is Bar.
Select output folder	Set parameters for the output folder. The default folder name is CiscoIVRServicesAvailability.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. The default is n. The job ID is helpful for making the correlation between a specific instance of a Report script and the corresponding report.
Select properties	Set the report properties as desired. The default report name is Cisco IVR Services Availability.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The default is n. The time stamp is made up of the date and time the report was generated. Adding a time stamp is useful for running consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event when report is successful?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Event severity when report succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successful. The default is 35.
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report fails. The default is 5.

25.14 Report_SystemUsage

Use this Knowledge Script to summarize the average CPU and memory usage per IVR server within a time frame that you specify. This script uses the data collected by the IVR_SystemUsage script.

25.14.1 Resource Object

Report agent

25.14.2 Default Schedule

By default, this script runs once.

25.14.3 Setting Parameter Values

Set the following parameters as necessary:

Parameter	How To Set It
Data Source	
Select data wizard	Select the computers that you want to include in the report. You can select computers by category: View, Server Group, or Computer. The default is View.
Select Knowledge Script(s)	Select the Knowledge Scripts that you want to include in the report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Charts	
Include % CPU chart?	Set to **y** to include a chart that details the CPU usage for the selected cluster. The default is y.
Include memory usage chart?	Set to **y** to include a chart that details the memory usage for the selected cluster. The default is y.
% CPU chart threshold	Specify the CPU percentage threshold to display on the charts in the report. The default is 0%.
Memory usage chart threshold	Specify the physical memory threshold to display on the charts in the report. The default is 0 KB.
Chart size	Select the size of the rendered chart. Choose from Large, Medium, and Small. The default is Medium.
Chart color scheme	Select a color scheme template. The default is NetIQ1.
Report Settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table?	Set to **y** to include a table of information in the report. The default is y.
Select output folder	Locate and select the output folder. The default folder name is CiscoIVRSystemUsage.

Parameter	How To Set It
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. The default is n. The job ID is helpful for making the correlation between a specific instance of a Report script and the corresponding report.
Select properties	Set the report properties as desired. The default report name is Cisco IVR System Usage.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The default is n. The time stamp is made up of the date and time the report was generated. Adding a time stamp is useful for running consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event when report is successful?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Event severity when report succeeds	Set the severity level, from 1 to 40, to indicate the importance of the event when the report is successful. The default is 35.
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of the event when the report contains no data. The default is 25.
Event severity when report fails	Set the severity level, from 1 to 40, to indicate the importance of the event when the report fails. The default is 5.

26 CiscoUnity Knowledge Scripts

Cisco Unity is a scalable and full-featured voice mail and unified messaging application. As an integral part of the Cisco AVVID (Architecture for Voice, Video and Integrated Data) environment, Cisco Unity works with Cisco CallManager to provide advanced capabilities that unify data and voice, ensuring a smooth transition to IP telephony.

AppManager Knowledge Scripts can help you better manage Cisco Unity resources. From within the Operator Console, you can select a Knowledge Script in the CiscoUnity tab of the Knowledge Script pane and press **F1** for complete details.

Knowledge Script	What It Does
CU_BackupAndRestoreStatus	Monitors the success or failure of the Cisco Disaster Recovery Tool (DiRT) Backup and Restore utility.
CU_CallActivity	Monitors the number of incoming and outgoing calls to the Unity server during an interval you specify.
CU_CpuHigh	Monitors the CPU resource consumption for Unity processes.
CU_CurrentDiskQueueLength	Monitors the number of requests outstanding on the disk.
CU_EventLog	Scans the Event Log for Cisco Unity errors and status events.
CU_FailoverStatus	Monitors whether failover or failback has occurred on the current server.
CU_HealthCheck	Monitors the status of Cisco Unity services. Can automatically restart any service that is down.
CU_LicenseCompliance	Monitors the number of Unified Messaging and/or Voice Mail licences and determines how many of those licenses are actively used.
CU_MemoryHigh	Monitors the memory consumption for Unity processes.
CU_MessageDeliveryFailure	Determines whether errors prohibited the Unity Message Repository (UMR) or the Message Transfer Agent (MTA) from successfully delivering all messages.
CU_MessageStoreAvailability	Monitors the number of offline message stores.
CU_MessageStoreLock	Monitors the number of tics it takes to acquire a Message Store Lock.
CU_NumberOfLogons	Monitors the number of active logons to Cisco Unity.
CU_PortStatus	Monitors whether a Unity port is unavailable and unable to handle further calls.
CU_ProcessorQueueLength	Monitors the number of processes in queue for the Processor.
CU_RestartService	Schedules a Unity service to stop and then restart after a specified interval.
CU_Silence	Monitors all of the silence performance counters for the Unity Manager Service in tenths of a second.

Knowledge Script	What It Does
CU_SystemUsage	Monitors the CPU usage and memory for the Cisco Unity Manager process and for system processes.
CU_TTSPortsInUse	Monitors the number of text-to-speech ports being used by callers.
CU_UMRServiceHung	Determines whether the AvUMRSyncSvr service is hung. This script is supported only for Cisco Unity version 3.0(x).
CU_VoicePortsInUse	Determines the number of voice ports currently in use on the Unity server.
IIS_CpuHigh	Monitors CPU usage for IIS processes.
IIS_HealthCheck	Monitors the queue length for blocked I/O requests and the up-and-down status of IIS services and Web sites.
IIS_KillTopCPUProcs	Monitors the CPU usage of the dllhost and MTX processes. Can automatically stop a process that exceeds the threshold.
IIS_MemoryHigh	Monitors memory usage and memory pool usage for IIS application processes.
IIS_RestartServer	Restarts an IIS server.
IIS_ServiceUpTime	Monitors Web sites and the uptime for Web services.
Report_PortUsage	Summarizes the number of Unity ports in use. This script uses the data collected by the CU_TTSPortsInUse and CU_VoicePortsInUse scripts.
Report_ServicesAvailability	Summarizes the average availability of Unity services.
Report_SystemUsage	Summarizes average CPU and memory usage per Unity server.
SQL_Accessibility	Monitors whether the SQL Server database is accessible.
SQL_CPUUtil	Monitors CPU usage for SQL Server processes.
SQL_DataGrowthRate	Monitors data growth and shrink rates for all SQL Server databases.
SQL_DBGrowthRate	Monitors database growth and shrink rates.
SQL_MemUtil	Monitors memory usage for SQL Server processes.
SQL_RestartServer	Restarts a SQL Server.
Recommended Knowledge Script Groups	Performs essential monitoring of your Cisco Unity environment.
Discovery_CiscoUnity	Discovers Cisco Unity resources and configuration information.

26.1 CU_BackupAndRestoreStatus

Use this Knowledge Script to monitor the success or failure of the Cisco Disaster Recovery Tool (DiRT) Backup and Restore utility.

You use the DiRT utility to back up Cisco Unity-specific data — including SQL databases, registry settings, greetings, recorded names, switch file configuration, routing rules, and subscriber passwords — and then restore the information onto the Cisco Unity unified messaging server.

This script raises an event if backup/restore succeeds or fails. In addition, this script generates data streams for successful backup/restore operations.

26.1.1 Resource Object

CiscoUnity

26.1.2 Default Schedule

By default, this script runs every 10 minutes.

26.1.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Collect data for successful backup/restore?	Set to **y** to collect data about a successful backup and restore. The default is n.
Raise event if backup/restore succeeds?	Set to **y** to raise an event when a backup or restore is successful. The default is y.
Event severity if backup/restore succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which a backup or restore is successful. The default is 25.
Raise event if backup/restore fails?	Set to **y** to raise an event when a backup or restore fails. The default is y.
Event severity if backup/restore fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which a backup or restore fails. The default is 5.

26.2 CU_CallActivity

Use this Knowledge Script to monitor incoming and outgoing calls to the Unity server. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for number and percentage of incoming calls, number and percentage of outgoing calls, number and percentage per second of incoming calls, and number and percentage per second of outgoing calls.

26.2.1 Resource Object

CiscoUnity

26.2.2 Default Schedule

By default, this script runs every five minutes.

26.2.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Collect data?	Set to **y** to collect data about incoming and outgoing calls for graphs and reports. The default is y.
Threshold type	Select whether you want to set a threshold based on a **Percentage** or a **Value**. The default is Percentage.
Monitor incoming calls?	Set to **y** to monitor incoming calls. The default is y.
Threshold - Maximum percentage of incoming calls	Specify the highest percentage of incoming calls that can occur before an event is raised. The default is 80%.
Threshold - Maximum number of incoming calls	Specify the highest number of incoming calls that can occur before an event is raised. The default is 18 calls.
Event severity if incoming calls exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage or number of incoming calls exceeds the threshold. The default is 15.
Monitor outgoing calls?	Set to **y** to monitor outgoing calls. The default is y.
Threshold - Maximum percentage of outgoing calls	Specify the highest percentage of outgoing calls that can occur before an event is raised. The default is 80%.
Threshold - Maximum number of outgoing calls	Specify the highest number of outgoing calls that can occur before an event is raised. The default is 18 calls.
Event severity if outgoing calls exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage or number of outgoing calls exceeds the threshold. The default is 15.
Monitor incoming calls per second?	Set to **y** to monitor incoming calls per second. The default is y.
Threshold - Maximum percentage of incoming calls per second	Specify the highest percentage of incoming calls that can occur per second before an event is raised. The default is 80%.

Parameter	How to Set It
Threshold - Maximum number of incoming calls per second	Specify the highest number of incoming calls that can occur per second before an event is raised. The default is 18 calls.
Event severity if incoming calls per second exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage or number of incoming calls per second exceeds the threshold. The default is 15.
Monitor outgoing calls per second?	Set to **y** to monitor outgoing calls per second. The default is y.
Threshold for percentage of outgoing calls per second	Specify the highest percentage of outgoing calls that can occur per second before an event is raised. The default is 80%.
Threshold for number of outgoing calls per second	Specify the highest number of outgoing calls that can occur per second before an event is raised. The default is 18 calls.
Event severity for outgoing calls per second	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage or number of incoming calls per second exceeds the threshold. The default is 15.

26.3 CU_CpuHigh

Use this Knowledge Script to monitor CPU usage for the following Unity processes:

- Unity Manager
- Secure Gateway
- Message Repository
- Directory Change Writer
- Active Directory Datastore
- Global Catalog Datastore
- Event Reporter
- Report Handler
- Exchange 5.5 Datastore
- Text-To-Speech
- Bridge Connector
- AvLic
- AvMMProxySvr
- AvMsgStoreMonitorSvr
- AvNotifierMgr
- AvSqlChangeWriter

This script raises an event if CPU usage exceeds the thresholds you set. The script generates data streams for CPU usage for each process individually and the total CPU usage for all processes. If a process is not found, the script assumes the process is not running, and reports zero for CPU usage.

26.3.1 Resource Object

CiscoUnity

26.3.2 Default Schedule

By default, this script runs every 15 minutes.

26.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event when CPU utilization exceeds threshold?	Set to **y** to raise an event when CPU usage exceeds a threshold. The default is y.
Collect data?	Set to **y** to collect data about CPU usage for graphs and charts. The default is n.
Event severity when CPU utilization exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds a threshold. The default is 8.
Threshold - Maximum CPU usage for ...	Specify the maximum amount of CPU usage that must be detected before an event is raised. Set to **0** if you do not want to monitor this process. The default is for Unity Manager is 80%. The default for all other services is 20%.

26.4 CU_CurrentDiskQueueLength

Use this Knowledge Script to monitor the number of requests outstanding on the disk. This script raises an event if a threshold is exceeded. In addition, this script generates a data stream for the number of requests in queue.

26.4.1 Resource Object

CiscoUnity

26.4.2 Default Schedule

By default, this script runs every 30 minutes.

26.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if requests in queue exceed threshold?	Set to **y** to raise event an event if the number of requests in queue exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for graphs and reports. The default is n.
Threshold - Maximum requests in queue	Specify the maximum number of requests that can be in the disk queue before an event is raised. The default is 10 requests.
Event severity if requests in queue exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of requests in queue exceeds the threshold. The default is 25.

26.5 CU_EventLog

Use this Knowledge Script to monitor the event log entries from Cisco Unity during the past *n* hours. This script raises an event when log entries are detected. In addition, this script generates data streams for those log entries.

26.5.1 Resource Object

CiscoUnity

26.5.2 Default Schedule

By default, this script runs every 10 minutes.

26.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event for log entries?	Set to **y** to raise an event when the log contains entries for which you have filtered. The default is y.
Collect data?	Set to **y** to collect data about log entries for charts and graphs. The default is n.
Separate data?	Set to **y** to separate events entries from different log files into different data streams. If set to **n**, all event entries matching your filtering criteria are placed in the same data stream and the data detail message may include event entries from multiple log sources. The default is n. For example, if you are monitoring both the System and Application logs, you may want to set this parameter to **y** so events in the System log are tracked separately from events in the Application log.
Log source	Specify the event log you want to monitor. You can specify multiple event logs, separated by commas. For example: `System,Application`. The default is Application.
Type: Error	Set to **y** to monitor for error events. If set to **n**, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for the *Collect data* parameter. The default is y.
Type: Warning	Set to **y** to monitor for warning events. If set to **n**, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for the *Collect data* parameter. The default is y.
Type: Information	Set to **y** to monitor for information events. If set to **n**, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for the *Collect data* parameter. The default is n.

Parameter	How to Set It
Type: Success Audit	Set to **y** to monitor for success audit events. If set to **n**, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for the *Collect data* parameter. The default is n.
Type: Failure Audit	Set to **y** to monitor for failure audit events. If set to **n**, this entry does not raise an event, is not returned in an event detail message, and is not collected as data if you specified y for the *Collect data* parameter. The default is n.
Instructions for filtering: To limit the types of entries that raise events and the type of data that is collected, enter a search string that filters the following fields in the event log. The search string can contain criteria used to include entries, exclude entries, or both. • Separate include and exclude criteria with a colon (:). For example, `net:logon`. • Separate multiple include or exclude entries with commas. For example, `finance,sales:corp00,HQ` • If you specify only include criteria, the colon is not necessary. For example, `SQL` • If you specify only exclude criteria, start the search string with a colon. For example, `:defragmentation,cleanup`	
Event source filter	Specify one or more text strings to look for; separate multiple strings with commas. For example: `NTDS KCC,NTDS General`
Event category filter	Specify one or more text strings to look for; separate multiple strings with commas.
Event ID filter	Specify a single event ID or a range of event IDs; separate multiple entries by commas. For example: `1094,1404-1463`
Event user filter	Specify a single or multiple user names to look for; separate multiple entries by commas. For example: `Pat,Chris,Alex`
Computer filter	Specify a single or multiple computer names to look for; separate multiple entries by commas. For example: `SHASTA,MARS`
Event description filter	Specify a detail description or keywords in the description. The string can contain spaces, underscores, and periods; separate multiple entries with commas. For example: `data loss during system failures,corrupt indices,Inter-Site Transport objects failed`
Maximum number of entries per event report	Specify the maximum number of Application log events that can be returned in each event report. For example, if this value is set to 30 and 67 Application log events are found, then three event reports are raised: two reports containing 30 events and one report containing seven events. The default is 30. The Message column on the Events tab in the Operator Console displays the number of events in each event report, the type of log the events are from, and the event report batch number. The batch number is the sequential number of the event report. Batch numbers start at 1 for each Knowledge Script iteration.
Event severity for log entries	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the log contains entries for which you have filtered. You may want to adjust the severity depending on the types of events for which you are checking. The default is 8.

26.6 CU_FailoverStatus

Use this Knowledge Script to determine whether failover or failback has occurred on the current server. The first time you run this script on a particular server, you can choose to raise an informational event indicating whether the current computer is the active computer. The word "Primary" or "Secondary" accompany each computer name in the event.

- **Failover**. A feature that provides simple redundancy, allowing voice messaging functions to continue if the Cisco Unity server fails or when you need to perform maintenance. A primary and secondary Unity server (failover pair) allow for continuous voice messaging functionality. When the status of the primary server changes from active to inactive, the secondary server takes over the tasks of the primary server.
- **Failback.** A feature that allows the secondary Unity server to shutdown down its functionality and allows the primary Unity server to take back the ability to answer calls.
- **Primary Unity server**. As the primary server of a failover pair, this server replicates all the appropriate Unity data to its backup counterpart (the secondary).
- **Secondary Unity server**. This server is basically an identical copy of the primary Unity server. The secondary server takes over for the primary server in the event of a failover.
- **AvCsNodeMgr.exe**. The Unity service responsible for determining whether failover or failback needs (or is scheduled) to occur.

The failover feature of Cisco Unity provides simple redundancy, allowing voice messaging functions to continue if the Cisco Unity server fails or when you need to perform maintenance. A primary and secondary Unity server (failover pair) allow for continuous voice messaging functionality. When the status of the primary server changes from active to inactive, the secondary server takes over the tasks of the primary server.

Use this script to monitor the status of failover and failback, which occurs when the primary server resumes its tasks.

To create a failover pair, set the *Create failover pair server group* parameter in the Discovery_CiscoUnity Knowledge Script to **y**. An Action Knowledge Script — AddComputerToServerGroup — runs by default and creates a server group composed of the two computers on which you run the Discovery script.

26.6.1 Resource Object

CiscoUnity

26.6.2 Default Schedule

By default, this script runs every minute.

26.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event when failover occurs?	Set to **y** to raise an event when failover occurs. A failover event message will indicate which computer is now the primary computer in the failover scenario. In addition, the event will indicate when the next failback is schedule to occur. The event indicates if failback is not scheduled. The default is y.
Event severity when failover occurs	Set the severity level, from 1 to 40, to indicate the importance of a failover event. The default is 15.
Raise event when failback occurs?	Set to **y** to raise an event when failback occurs. A failback event message will indicate which computer is now the primary computer in the failback scenario. The default is y.
Event severity when failback occurs	Set the severity level, from 1 to 40, to indicate the importance of a failback event. The default is 15.
Raise event for initial failover configuration and status?	Set to **y** to raise an informational event indicating the current configuration — Primary or Secondary — and status — active or inactive — of the Unity server. The default is y.
Collect data?	Set to **y** to collect data about failover status values (1 for active and 0 for inactive) for graphs and reports. The default is n.

26.7 CU_HealthCheck

Use this Knowledge Script to monitor the status of the following Cisco Unity services:

- Unity Manager
- Secure Gateway
- Message Repository
- Directory Change Writer
- Active Directory Store
- Global Catalog Datastore
- Event Reporter
- Report Handler
- Exchange 5.5 Datastore
- Text-To-Speech
- Bridge Connector
- Node Manager
- Licensing
- Media Master Proxy Server
- Message Store Monitor
- Notifier
- SQL Change Writer

This script raises an event if any service is not running. In addition, this script can automatically restart any service that is not running, as well as generate data streams for service status.

26.7.1 Resource Object

CiscoUnity

26.7.2 Default Schedule

By default, this script runs every minute.

26.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Collect data?	Set to **y** to collect data about service status for charts and graphs. The default is y.
Auto-start the monitored services?	Set to **y** to auto-start the services you choose to monitor. The default is y.
Event severity when auto-start fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which auto-start fails. The default is 5.
Event severity when auto-start succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which auto-start succeeds. The default is 25.
Event severity when auto-start is set to “n”	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and AppManager has not been set to restart the service. The default is 5.
Event severity when service doesn’t exist	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the service does not exist. The default is 25.
Monitor ..... service?	Set to **y** to monitor Unity services. The default for Unity Manager is y. The default for all other services is n.

26.8 CU_LicenseCompliance

Use this Knowledge Script to monitor the number of Unified Messaging and/or Voice Mail licences and determine how many of those licenses are actively used. This script raises an event a threshold is exceeded. In addition, this script generates data streams for number and percentage of licenses used.

NOTE: This script supports Cisco Unity version 4.0(3) and later.

26.8.1 Resource Object

CiscoUnity

26.8.2 Default Schedule

By default, this script runs every 24 hours.

26.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Collect data for licenses used?	Set to **y** to collect data about in-use licenses for reports and graphs. The default is n.
Threshold type	Select the type of threshold you want to set. Select **Percentage** to set a threshold for a percentage of in-use licenses. Select **Value** to set a threshold for a number of in-use licenses. The default is Percentage.
Threshold - Maximum percentage of licenses used	Specify the threshold for the highest percentage of licenses that can be in use before an event is raised. The default is 80%.
Threshold - Maximum number of licenses used	Specify the threshold for the highest number of licenses that can be in use before an event is raised. The default is 24 licenses.
Event severity if used licenses exceed threshold	Set the event notification level, from 1 to 40, to indicate the importance of an event in which the number or percentage of in-use licenses exceeds the threshold you set. The default is 15.

26.9 CU_MemoryHigh

Use this Knowledge Script to monitor memory usage for the following Unity processes:

- Unity Manager
- Secure Gateway
- Message Repository
- Directory Change Writer
- Active Directory Datastore
- Global Catalog Datastore
- Event Reporter
- Exchange 5.5 Datastore
- Text-To-Speech
- Bridge Connector
- Licensing Service
- Media Master Proxy Server
- Message Store Monitor
- Notifier
- SQL Change Writer

This script checks the memory used by each process individually and the total memory used by all processes. If a process is not found, the script assumes the process is not running, and reports zero as the memory result.

This script raises an event if a threshold is exceeded. In addition, this script generates data streams for memory usage for all monitored applications.

26.9.1 Resource Object

CiscoUnity

26.9.2 Default Schedule

By default, this script runs every five minutes.

26.9.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event when threshold exceeded?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for graphs and reports. The default is n.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 8.
Monitor Unity Manager memory usage?	Set to **y** to monitor the memory usage of Unity Manager. The default is y.
Threshold - Maximum memory usage for Unity Manager	Specify the maximum memory usage that can occur before an event is raised. The default is 200000 KB.
Threshold - Maximum memory pool usage for Unity Manager	Specify the maximum memory pool usage that can occur before an event is raised. The default is 5000 KB.
Monitor Secure Gateway memory usage	Set to **y** to monitor the memory usage of Secure Gateway. The default is y.
Threshold - Maximum memory usage for Secure Gateway	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB.
Threshold - Maximum memory pool usage for Secure Gateway	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Message Repository memory usage?	Set to **y** to monitor the memory usage of Message Repository. The default is y.
Threshold - Maximum memory usage for Message Repository	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB.
Threshold - Maximum memory pool usage for Message Repository	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Directory Change Writer memory usage?	Set to **y** to monitor the memory usage of Directory Change Writer. The default is y.
Threshold - Maximum memory usage for Directory Change Writer	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB.
Threshold - Maximum memory pool usage for Directory Change Writer	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Active Directory Datastore memory usage?	Set to **y** to monitor the memory usage of Active Directory Datastore. The default is y.
Threshold - Maximum memory usage for Active Directory Datastore	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB.
Threshold - Maximum memory pool usage for Active Directory Datastore	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Global Catalog Datastore memory usage?	Set to **y** to monitor the memory usage of Global Catalog Datastore. The default is y.
Threshold - Maximum memory usage for Global Catalog Datastore	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB.
Threshold - Maximum memory pool usage for Global Catalog Datastore	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Event Reporter memory usage?	Set to **y** to monitor the memory usage of Event Reporter. The default is y.
Threshold - Maximum memory usage for Event Reporter	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB.

Parameter	How to Set It
Threshold - Maximum memory pool usage for Event Reporter	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Report Handler memory usage?	Set to **y** to monitor the memory usage of Report Handler. The default is y.
Threshold - Maximum memory usage for Report Handler	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB.
Threshold - Maximum memory pool usage for Report Handler	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Exchange 5.5 Datastore memory usage?	Set to **y** to monitor the memory usage of Exchange 5.5 Datastore. The default is y.
Threshold - Maximum memory usage for Exchange 5.5 Datastore	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB.
Threshold - Maximum memory pool usage for Exchange 5.5 Datastore	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Text-To-Speech memory usage?	Set to **y** to monitor the memory usage of Text-To-Speech. The default is y.
Threshold - Maximum memory usage for Text-To-Speech	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB.
Threshold - Maximum memory pool usage for Text-To-Speech	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Bridge Connector memory usage?	Set to **y** to monitor the memory usage of the Bridge Connector. The default is y.
Threshold - Maximum memory usage for Bridge Connector	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB.
Threshold - Maximum memory pool usage for Bridge Connector	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Licensing Service memory usage?	Set to **y** to monitor the memory usage of the Licensing Service. The default is y.
Threshold - Maximum memory usage for the Licensing Service	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB.
Threshold - Maximum memory pool usage for the Licensing Service	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Media Master Proxy Server memory usage?	Set to **y** to monitor the memory usage of the Media Master Proxy Server. The default is y.
Threshold - Maximum memory usage for the Media Master Proxy Server	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB
Threshold - Maximum memory pool usage for the Media Master Proxy Server	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor Message Store Monitor memory usage?	Set to **y** to monitor the memory usage of the Message Store Monitor. The default is y.
Threshold - Maximum memory usage for the Message Store Monitor	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB
Threshold - Maximum memory pool usage for the Message Store Monitor	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.

Parameter	How to Set It
Monitor Notifier memory usage?	Set to **y** to monitor the memory usage of the Notifier. The default is y.
Threshold - Maximum memory usage for the Notifier	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB
Threshold - Maximum memory pool usage for the Notifier	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.
Monitor SQL Change Writer memory usage?	Set to **y** to monitor the memory usage of the SQL Change Writer. The default is y.
Threshold - Maximum memory usage for the SQL Change Writer	Specify the maximum memory usage that can occur before an event is raised. The default is 100000 KB
Threshold - Maximum memory pool usage for the SQL Change Writer	Specify the maximum memory pool usage that can occur before an event is raised. The default is 2500 KB.

26.10 CU_MessageDeliveryFailure

Use this Knowledge Script to determine whether errors prohibited the Unity Message Repository (UMR) or the Message Transfer Agent (MTA) from successfully delivering all messages. Messages not delivered successfully are stored locally on the Unity server. You can set this script to retrieve a count of the messages that are in storage awaiting delivery.

This script raises an event if messages are not delivered successfully. In addition, this script generates data streams for the number of unsuccessful deliveries for UMR and MTA.

NOTE: This script replaces CU_MTAFailures, which has been removed from the CiscoUnity category of Knowledge Scripts.

26.10.1 Resource Object

CiscoUnity

26.10.2 Default Schedule

By default, this script runs every 10 minutes.

26.10.3 Setting Parameter Values

Set the following parameters as needed

Parameter	How to Set It
Event Notification	
Raise event if MTA failure prevents message delivery	Set to **Yes** to raise an event if MTA messages are not delivered. The default is Yes.
Event severity if MTA failure prevents message delivery	Set the event notification level, from 1 to 40, to indicate the importance of an event in which MTA messages are not delivered. The default is 10.
Raise event if UMR failure prevents message delivery	Set to **Yes** to raise an event if UMR messages are not delivered. The default is Yes.
Event severity if UMR failure prevents message delivery	Set the event notification level, from 1 to 40, to indicate the importance of an event in which UMR messages are not delivered. The default is 10.
Data Collection	
Collect data for failed message deliveries due to MTA failure?	Set to **Yes** to collect data about undelivered MTA messages for reports and graphs.
Collect data for failed message deliveries due to UMR failure?	Set to **Yes** to collect data about undelivered UMR messages for reports and graphs.

26.11 CU_MessageStoreAvailability

Use this Knowledge Script to monitor the number of offline message stores. This script raises an event if a message store goes offline. In addition, this script generates data streams for the number of offline message stores.

NOTE: This script supports Cisco Unity versions 4.0(3) and later.

26.11.1 Resource Object

CiscoUnity

26.11.2 Default Schedule

By default, this script runs every 600 seconds.

26.11.3 Setting Parameter Values

Set the following parameters as needed

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the MessageStoreAvailability job fails. The default is 5.
Monitor Message Store Availability	
Event Notification	
Raise event if message store goes offline?	Set to **Yes** to raise an event if a message store goes offline. The default is Yes.
Event severity when message store goes offline	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a message store goes offline. The default is 5.
Data Collection	
Collect data for number of offline message stores?	Set to **Yes** to collect data about offline message store for reports and graphs. The default is unchecked.

26.12 CU_MessageStoreLock

Use this Knowledge Script to monitor the number of tics it takes to acquire a Message Store Lock. This script raises an event a threshold is exceeded. In addition, this script generates data streams for number of tics.

NOTE: This script does not support Cisco Unity versions 4.0(3) and later.

26.12.1 Resource Object

CiscoUnity

26.12.2 Default Schedule

By default, this script runs every 30 minutes.

26.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event when number of tics exceeds threshold?	Set to **y** to raise event if the number of tics required to acquire a Message Store Lock exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data about tics for charts and graphs. The default is n.
Threshold - Maximum number of tics to acquire a Message Store Lock	Specify the maximum number of tics it takes to acquire a Message Store Lock before an event is raised. The default is 4 tics.
Event severity when number of tics exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the threshold is exceeded. The default is 25.

26.13 CU_NumberOfLogons

Use this Knowledge Script to monitor the number of active subscriber sessions to Cisco Unity. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the number of active subscriber sessions.

26.13.1 Resource Object

CiscoUnity

26.13.2 Default Schedule

By default, this script runs every 30 minutes.

26.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if active subscriber sessions exceed threshold?	Set to **y** to raise event if the number of active subscriber sessions exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data about subscriber sessions for charts and graphs. The default is n.
Threshold - Maximum number of active subscriber sessions	Specify the maximum number of subscriber sessions that can be active before an event is raised. Enter a number appropriate for the server you are monitoring. The default is 20 sessions.
Event severity when active subscriber sessions exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of active subscriber sessions exceeds the threshold. The default is 25.

26.14 CU_PortStatus

Use this Knowledge Script to monitor whether a Unity port is unavailable and unable to handle further calls. This script raises an event if a port is unavailable. In addition, this script generates data streams for port availability.

26.14.1 Resource Object

CiscoUnity

26.14.2 Default Schedule

By default, this script runs every 10 minutes.

26.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if a port is unavailable?	Set to y to raise an event when a port is unavailable. The default is y.
Collect data?	Set to **y** to collect data about unavailable ports for charts and graphs. The default is n.
Event severity when a port is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which a port is unavailable. The default is 8.

26.15 CU_ProcessorQueueLength

Use this Knowledge Script to monitor the number of processes in queue for the processor. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for queue length.

26.15.1 Resource Object

CiscoUnity

26.15.2 Default Schedule

By default, this script runs every 30 minutes.

26.15.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if queue length exceeds threshold?	Set to **y** to raise event if the queue length exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data about queue length for charts and graphs. The default is n.
Threshold - Maximum number of processes in queue	Specify the maximum number of processes that can be in the queue before an event is raised. The default is 10 processes.
Event severity when queue length exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of processes in queue exceeds the threshold. The default is 25.

26.16 CU_RestartService

Use this Knowledge Script to schedule the following Unity services to stop and then restart after a specified interval:

- Unity Manager
- Secure Gateway
- Message Repository
- Directory Change Writer
- Active Directory Datastore
- Global Catalog Datastore
- Event Reporter
- Exchange 5.5 Datastore
- Text-To-Speech
- Bridge Connector
- Licensing Service
- Media Master Proxy Server
- Message Store Monitor
- Notifier
- SQL Change Writer

This script raises an event when a stop or restart fails, when service status is unavailable, and when a stop or restart succeeds. In addition, this script generates data streams for service status.

NOTE: This script does not support Cisco Unity versions 4.0(3) and later.

26.16.1 Resource Object

CiscoUnity

26.16.2 Default Schedule

By default, this script runs every hour.

26.16.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Collect data?	Set to **y** to collect data about service status for charts and graphs. The default is n.
Wait N seconds before restarting	Specify the number of seconds that should elapse before a service is restarted. The default is 5 seconds.
Event severity when stop fails	Set the event severity level, from 1 to 40,to indicate the importance of an event in which AppManager fails to stop a service. The default is 5.
Event severity when restart fails	Set the event severity level, from 1 to 40,to indicate the importance of an event in which AppManager fails to restart a service. The default is 5.
Event severity when status of service is unavailable	Set the event severity level, from 1 to 40,to indicate the importance of an event in which service status is unavailable. The default is 10.
Event severity when stop succeeds	Set the event severity level, from 1 to 40,to indicate the importance of an event in which AppManager successfully stops a service. The default is 25.
Event severity when restart succeeds	Set the event severity level, from 1 to 40,to indicate the importance of an event in which AppManager successfully restarts a service. The default is 25.
Restart ···. service?	Set to **y** to restart any of the listed Unity services. The default is n.
Unity 3.1-only Services	
Restart ... service?	Set to **y** to restart any of the listed 3.1 Unity services. The default is n.

26.17 CU_Silence

Use this Knowledge Script to monitor all of the silence performance counters for the Unity Manager Service in tenths of a second. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for silence length for all monitored performance counters.

NOTE: This script does not support Cisco Unity versions 4.0(3) and later.

26.17.1 Resource Object

CiscoUnity

26.17.2 Default Schedule

By default, this script runs every 30 minutes.

26.17.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if a counter exceeds its threshold?	Set to **y** to raise an event if any of the counters exceeds its threshold. The default is y.
Collect data?	Set to **y** to collect data about silence counters for charts and graphs. The default is n.
Threshold - Maximum time for any silence performance counter	Specify the maximum amount of time for any silence performance counter. An event is raised if the threshold is exceeded. The default is .04 seconds.
Threshold - Maximum time for Header silence	Specify the maximum amount of time for Header silence. An event is raised if the threshold is exceeded. The default is .04 seconds.
Threshold - Maximum time for Logon silence	Specify the maximum amount of time for Logon silence. An event is raised if the threshold is exceeded. The default is .04 seconds.
Threshold - Maximum time for Message Delete silence	Specify the maximum amount of time for Message Delete silence. An event is raised if the threshold is exceeded. The default is .04 seconds.
Threshold - Maximum time for Opening silence	Specify the maximum amount of time for Opening silence. An event is raised if the threshold is exceeded. The default is .04 seconds.
Threshold - Maximum time for Play Message silence	Specify the maximum amount of time for Play Message silence. An event is raised if the threshold is exceeded. The default is .04 seconds.
Threshold - Maximum time for Record silence	Specify the maximum amount of time for Record silence. An event is raised if the threshold is exceeded. The default is .04 seconds.
Event severity when a counter exceeds its threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 25.

26.18 CU_SystemUsage

Use this Knowledge Script to monitor CPU usage and memory for the Cisco Unity Process. This script raises an event if any threshold is exceeded. In addition, this script generates data streams for maximum and total CPU usage (%) and maximum and total memory usage (%).

To generate reports based on the data collected by this script, run Report_SystemUsage and Report_ServicesAvailability.

NOTE: On the Advanced tab, set the *Raise event if event condition occurs* parameter to 3 times within 3 job iterations to prevent the raising of events at peak usage.

26.18.1 Resource Object

CiscoUnity

26.18.2 Default Schedule

By default, this script runs every five minutes.

26.18.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event when threshold is exceeded?	Set to **y** to raise event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for reports and graphs. The default is y.
Event severity when threshold is exceeded	Set the severity level, from 1 to 40, to indicate the importance of the event. The default is 10.
Threshold - Maximum Unity CPU usage	Specify the maximum Unity CPU usage that must occur before an event is raised. The default is 65%.
Threshold - Maximum total CPU usage	Specify the maximum total CPU usage that must occur before an event is raised. The default is 80%.
Threshold - Maximum Unity memory usage	Specify the maximum Unity memory usage that must occur before an event is raised. The default is 65%.
Threshold - Maximum total memory usage	Specify the maximum total memory usage that must occur before an event is raised. The default is 80%.

26.19 CU_TTSPortsInUse

Use this Knowledge Script to monitor the number of Cisco Unity text-to-speech (TTS) ports that are in use. This script raises an event if a threshold is exceeded. A port is considered "in use" when a Unity subscriber is having his or her email read back over the phone.

This script generates data streams for number of ports in use.

Administrators can use this script to determine whether there are sufficient TTS port licenses and to gather usage statistics.

26.19.1 Resource Object

CISCOUNITY_TTSPorts

26.19.2 Default Schedule

By default, this script runs every five minutes.

26.19.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event when number of in-use TTS ports exceeds threshold?	Set to **y** to raise an event when the number of ports in use exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data about TTS ports for charts and graphs. The default is y. **NOTE:** If the status of the Unity server changes from "active" to "inactive," data collection for this script will stop. Data collection will resume when status changes back to "active."
Threshold - Maximum number of TTS ports in use	Specify the maximum number of TTS ports that can be in use before an event is raised. Enter a number appropriate for the server you are monitoring. The default is 4 ports.
Event severity when number of in-use TTS ports exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-use TTS ports exceeds the threshold. The default is 5.

26.20 CU_UMRServiceHung

Use this Knowledge Script to determine whether the AvUMRSyncSvr service is unresponsive. By default, this script always raises an event if AvUMRSyncSvr is unresponsive. In addition, you can choose to raise an event if AvUMRSyncSvr is *not* unresponsive.

UMR is the Unity Message Repository.

NOTE: This script supports Cisco Unity version 3.0(x) only.

26.20.1 Resource Object

CISCOUNITY

26.20.2 Default Schedule

By default, this script runs every 30 minutes.

26.20.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event when AvUMRSyncSvr service is not hung?	Set to **y** to raise an event if the AvUMRSyncSvr service is *not* unresponsive. The default is n.
Event severity when AvUMRSyncSvr service is hung	Set the severity level, from 1 to 40, to indicate the importance of an event in which the AvUMRSyncSvr service is unresponsive. The default is 8.

26.21 CU_VoicePortsInUse

Use this Knowledge Script to monitor the number of Cisco Unity voice ports that are in use. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for the number of voice ports in use.

Administrators can use this script to identify episodes of high usage, to determine whether there are sufficient voice port licenses on the Unity server, and to determine the availability of voice ports.

26.21.1 Resource Object

CISCOUNITY_Ports

26.21.2 Default Schedule

By default, this script runs every five minutes.

26.21.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if in-use voice ports exceed threshold?	Set to **y** to raise an event when the number of ports in use exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data about voice ports for charts and graphs. The default is y. **NOTE:** If the status of the Unity server changes from "active" to "inactive," data collection for this script will stop. Data collection will resume when status changes back to "active."
Threshold - Maximum voice ports in use	Specify the maximum number of voice ports that can be in use before an event is raised. Enter a value appropriate for the server you are monitoring. The default is 4 ports.
Event severity when in-use voice ports exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-use voice ports exceeds the threshold. The default is 5.

26.22 IIS_CpuHigh

Use this Knowledge Script to monitor CPU usage for IIS application processes. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for CPU usage (%) for each monitored process.

26.22.1 Resource Object

CISCOUNITY_IIST_Server

26.22.2 Default Schedule

By default, this script runs every five minutes.

26.22.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if CPU usage exceeds threshold?	Set to **y** to raise an event if CPU usage exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for reports and graphs. If enabled, data collection returns CPU usage for the specified process. The default is n.
Process names	Type the name of the processes you want to monitor. Separate multiple entries with commas. For example: `inetinfo,dllhost`. The default is inetinfo. **NOTE:** Do not append .exe to the process names.
Threshold - Maximum CPU usage	Specify the maximum percentage of CPU usage that can occur before an event is raised. The default is 60%.
Event severity when CPU usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. The default is 8.

26.23 IIS_HealthCheck

Use this Knowledge Script to check IIS servers, Web site status, and the queue length for blocked I/O requests. This script raises an event if any server or Web site is not running. In addition, you can choose to automatically restart the IIS server or Web site. This script also raises an event if the blocked I/O queue length is longer than the specified threshold.

NOTE: This script monitors only Web sites (servers), not FTP sites, NNTP sites, or SMTP sites.

26.23.1 Resource Objects

- CISCOUNITY_IIST_Server
- CISCOUNITY_IIST_FTPSRV
- CISCOUNITY_IIST_W3SRV
- CISCOUNITY_IIST_WebInst

26.23.2 Default Schedule

By default, this script runs every five minutes.

26.23.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Auto-start monitored server(s)?	Set to **y** to automatically restart down servers. The default is y.
Event severity when auto-start fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which auto-start fails. The default is 5.
Event severity when auto-start succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which auto-start succeeds. The default is 25.
Event severity when auto-start is set to "n"	Set the severity level, from 1 to 40, to indicate the importance of an event in which the server is down and AppManager has not been set to restart the service. The default is 18.
Event severity for blocked I/O requests	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Threshold - Maximum blocked I/O requests	Specify the maximum number of blocked I/O requests that can be in the queue before an event is raised. The default is 0 requests.
Monitor IIS server?	Set to **y** to monitor the IIS server. The default is y.
Monitor FTP server?	Set to **y** to monitor the FTP server. The default is n.

26.24 IIS_KillTopCPUProcs

Use this Knowledge Script to monitor the CPU usage for the IIS `dllhost` and `mtx` processes. This script raises an event if a threshold is exceeded. In addition, this script can automatically stop a process that exceeds the CPU usage threshold.

26.24.1 Resource Object

CISCOUNITY_IIST_Server

26.24.2 Default Schedule

By default, this script runs every three minutes.

26.24.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if kill is successful or unsuccessful?	Set to **y** to raise an event if the stop process is successful or unsuccessful. The default is y.
Kill CPU-intensive processes?	Set to **y** to automatically stop any process that exceeds the CPU usage threshold. The default is n.
Threshold - Maximum CPU usage allowed	Specify the maximum percentage of CPU usage allowed by the `dllhost` and `mtx` processes before an event is raised. The default is 90%.
Event severity when CPU usage exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. The default is 10.
Event severity when kill fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which a process is exceeding the threshold and AppManager cannot stop the process. The default is 10.
Event severity when kill succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which a process is exceeding the threshold and AppManager has successfully stopped the process. The default is 20.

26.25 IIS_MemoryHigh

Use this Knowledge Script to monitor the memory usage of specified processes. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for memory usage per process.

26.25.1 Resource Object

CISCOUNITY_IIST_Server

26.25.2 Default Schedule

By default, this script runs every three minutes.

26.25.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if threshold exceeded?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for reports and graphs. If enabled, data collection returns memory usage for the specified process. The default is n.
Process names	Enter the name of the application process to monitor. Use a comma to separate multiple entries — do not use spaces. For example: `inetinfo,dllhost`. The default is inetinfo. **NOTE:** Do not append .exe to the process names.
Threshold - Maximum memory usage	Specify the maximum amount of memory the selected process can use before an event is raised. The default is 10000000 bytes.
Threshold - Maximum memory pool usage	Specify the maximum amount of memory pool the selected process can use before an event is raised. The default is 5000000 bytes.
Event severity when threshold is exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 8.

26.26 IIS_RestartServer

Use this Knowledge Script to restart an IIS server. This script raises an event if the server successfully restarts or fails to restart.

26.26.1 Resource Object

CISCOUNITY_IIST_Server

26.26.2 Default Schedule

By default, this script runs once.

26.26.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Restart server?	Set to **y** to automatically restart a server that is down. The default is y.
Wait N seconds before restarting	Enter the number of seconds to wait after the server is stopped before attempting to automatically restart the server. The default is 5 seconds.
Event severity when stop fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the AppManager fails to stop the server. The default is 5.
Event severity when restart fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager fails to restart the server. The default is 5.
Event severity when status of service is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which the status of the service is unavailable. The default is 10.
Event severity when stop succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully stops the server. The default is 25.
Event severity when restart succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully restarts the server. The default is 25.

26.27 IIS_ServiceUpTime

Use this Knowledge Script to monitor the uptime for Web sites and services. This script raises an event if any value falls below the threshold. In addition, this script generates data streams for service uptime.

NOTE: This script runs on IIS version 5 and later.

26.27.1 Resource Objects

- CISCOUNITY_IIST_WebInst
- CISCOUNITY_IIST_FTPInst

26.27.2 Default Schedule

By default, this script runs every hour.

26.27.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if uptime falls below threshold?	Set to **y** to raise an event if uptime falls below the threshold. The default is y.
Collect data?	Set to **y** to collect data for reports and graphs. If enabled, data collection returns the length of time a service has been running. The default is n.
Threshold - Minimum uptime	Specify the minimum number of seconds that discovered Web sites and services and FTP sites and services are required to be up to prevent an event from being raised. If up time for sites and services is less than this threshold, an event is raised. The default is 10000 seconds.
Event severity when uptime falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which uptime falls below the threshold. The default is 5.

26.28 Report_PortUsage

Use this Knowledge Script to summarize the number of Unity ports in use for a given time frame. This script uses the data collected by the CU_TTSPortsInUse and CU_VoicePortsInUse scripts.

26.28.1 Resource Object

Report agent

26.28.2 Default Schedule

By default, this script runs once.

26.28.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Data Source	
Port type	Select the type of port for which you are running the report: TTS or Voice. The default is Voice.
Select data wizard	Select which computers to include in the report. You can select computers by category: View, Server Group, or Computer. The default is View.
Select Knowledge Script(s)	Select the Knowledge Scripts you want to include in the report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Select peak weekdays	Select the days of the week to include in your report. The default is Sunday through Saturday.
Aggregate by n minutes?	Specify the interval in minutes in which time-period data will be grouped. The default is 60 minutes.
Report Settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table?	Set to **y** to include a table of information in the report. The default is y.
Include chart?	Set to **y** to include a chart in the report. The default is y.
Select chart style	Define chart properties in the Chart Settings dialog box. The default style is Area.
Select output folder	Select the output folder. The default folder name is CiscoUnityVoicePortUsage.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. The default is n. The job ID helps correlate a specific instance of a Report script with the corresponding report.

Parameter	How to Set It
Select properties	Set report properties as desired. The default report name is Cisco Unity Voice Port Usage.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The default is n. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event when report succeeds?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Event severity when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is generated successfully. The default is 35.
Event severity for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5.

26.29 Report_ServicesAvailability

Use this Knowledge Script to summarize the average availability of Unity services within a time frame you specify. This script uses the data collected by the CU_HealthCheck script.

26.29.1 Resource Object

Report agent

26.29.2 Default Schedule

By default, this script runs once.

26.29.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Data Source	
Select data wizard	Select which computers to include in the report. You can select computers by category: View, Server Group, or Computer. The default is View.
Select Knowledge Script(s)	Select the Knowledge Scripts you want to include in the report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Report Settings	
Decimal accuracy for % values	Enter the number of decimal places you want to see in the values displayed in this report. The default is 3.
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table?	Set to **y** to include a table of data stream values in the report. The default is y.
Include chart?	Set to **y** to include a chart of data stream values in the report. The default is y.
Select chart style	Define the graphic properties for the charts in your report. The default style is Bar.
Select output folder	Set parameters for the output folder. The default folder name is CiscoUnityServicesAvailability.
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. The default is n. A job ID helps correlate a specific instance of a Report script with the corresponding report.
Select properties	Set report properties as desired. The default report name is Cisco Unity Services Availability.

Parameter	How to Set It
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The default is n. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event when report succeeds?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Event severity when report succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5.

26.30 Report_SystemUsage

Use this Knowledge Script to summarize the average CPU and memory usage within a time frame you specify. This script uses the data collected by the CU_SystemUsage script.

26.30.1 Resource Object

Report agent

26.30.2 Default Schedule

By default, this script runs once.

26.30.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Data Source	
Select data wizard	Select the computers you want to include in the report. You can select computers by category: View, Server Group, or Computer. The default is View.
Select Knowledge Script(s)	Select the Knowledge Scripts you want to include in the report.
Select time range	Select a **Specific** or **Sliding** date/time range from which the report should pull data. The default is Sliding.
Charts	
Include % CPU chart?	Set to **y** to include a chart that details the CPU usage for the selected cluster. The default is y.
Include memory usage chart?	Set to **y** to include a chart that details the memory usage for the selected cluster. The default is y.
% CPU chart threshold	Enter the CPU percentage threshold to display on the charts in the report. The default is 0%.
Memory usage chart threshold	Enter the physical memory threshold (in KB) to display on the charts in the report. The default is 0 KB.
Chart size	Select the size of the rendered chart. Choose from Large, Medium, and Small. The default is Medium.
Chart color scheme	Select a color scheme template. The default is NetIQ1.
Report Settings	
Include parameter help card?	Set to **y** to include a table in the report that lists parameter settings for the report script. The default is y.
Include table?	Set to **y** to include a table of information in the report. The default is y.
Select output folder	Locate and select the output folder. The default folder name is CiscoUnitySystemUsage.

Parameter	How to Set It
Add job ID to output folder name?	Set to **y** to append the job ID to the name of the output folder. The default is n. A job ID helps correlate a specific instance of a Report script with the corresponding report.
Select properties	Set report properties as desired. The default report name is Cisco Unity System Usage.
Add time stamp to title?	Set to **y** to append a time stamp to the title of the report, making each title unique. The default is n. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output.
Event Notification	
Raise event when report succeeds?	Set to **y** to raise an event when the report is successfully generated. The default is y.
Event severity when report succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity for report with no data	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity when report fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5.

26.31 SQL_Accessibility

Use this Knowledge Script to monitor SQL Server and database accessibility. This script raises an event if SQL Server or a specified database is not accessible. In addition, this script generates a data stream for database accessibility.

26.31.1 Resource Object

CISCOUNITY_SQLT_Server

26.31.2 Default Schedule

By default, this script runs every hour.

26.31.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Collect data?	Set to **y** to collect data for reports and graphs. If enabled, data collection returns 100 if all specified databases are accessible, 50 if some of the specified databases are accessible and some are not, or 0 if none of the specified databases is accessible. The default is n.
SQL login	Type the database username that provides access SQL Server. The username must have permission to access the database names for which you want to check accessibility. To use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Database name	Type the names of the databases to which you want to check access, separated by commas. For example, type `master,pubs,tempdb`. If you leave this field blank, the script checks access to all databases. The default is master.
Timeout	Specify the number of seconds to wait for a response before retrying or determining the database is inaccessible. The default is 0 seconds. **NOTE:** Keep in mind the Knowledge Script continues waiting until it receives a response or the timeout is reached. During this waiting period, other jobs are blocked from execution. Therefore, you should limit your use of this parameter or keep the time out period at a minimum for regular monitoring jobs. If you run this script to troubleshoot a particular problem and not as part of a regularly scheduled interval for ongoing maintenance, you may want to adjust this parameter to allow a longer time out period.

Parameter	How to Set It
Number of retries	Specify the number of times to retry connecting to the database before determining the database is inaccessible. The default is 0 retries. **NOTE:** Keep in mind the script continues waiting until it receives a response or has made the specified number of retry attempts. During this waiting period, other jobs are blocked from execution. Therefore, you should limit your use of this parameter or keep retry attempts at a minimum for regular monitoring jobs. If you run this script to troubleshoot a particular problem and not as part of a regularly scheduled interval for ongoing maintenance, you may want to adjust this parameter to allow more retry attempts.
Event severity if SQL Server or database inaccessible	Set the severity level, from 1 to 40, to indicate the importance of an event in which SQL Server or the database is not accessible. The default is 5.

26.32 SQL_CPUUtil

Use this Knowledge Script to monitor the percentage of CPU resources used by the `sqlservr` and `sqlagent` processes. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for CPU usage (%) for all monitored processes.

26.32.1 Resource Object

CISCOUNITY_SQLT_Server

26.32.2 Default Schedule

By default, this script runs every 15 minutes.

26.32.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if CPU usage exceeds threshold?	Set to **y** to raise an event if CPU usage exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for reports and graphs. If enabled, data collection returns information about the CPU resources used by SQL processes. The default is n.
Event severity when CPU usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. The default is 8.
Monitor the SQL Server process?	Set to **y** to monitor SQL Server. The default is y.
Threshold - Maximum CPU usage for SQL Server process	Specify the maximum amount of CPU resources that can be consumed by the SQL Server process before an event is raised. The default is 10%.
Monitor the SQL Agent process?	Set to **y** to monitor SQL Agent. The default is y.
Threshold - Maximum CPU usage for SQL Agent process	Specify the maximum amount of CPU resources that can be consumed by the SQL Agent process before an event is raised. The default is 10%.

26.33 SQL_DataGrowthRate

Use this Knowledge Script to monitor the data growth and shrink rates for all SQL Server databases. Growth and shrink rates are calculated by taking the difference of the data space utilization from the current interval from the data space utilization from the last interval. This script raises an event if growth and shrink rates exceed the thresholds you set. In addition, this script generates data streams for data growth and shrink rates for each monitored database.

26.33.1 Resource Objects

- CISCOUNITY_SQLT_DatabaseF
- CISCOUNITY_SQLT_DatabaseObj

26.33.2 Default Schedule

By default, this script runs every hour.

26.33.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Dynamically enumerate at each interval	Set to **y** to automatically count databases at each monitoring interval. The default is y.
Exclude these objects	Type the name of any object you want to exclude. You can exclude multiple objects, separated by commas with no spaces. For example, enter `master,model,mdb` **NOTE:** Ignore this parameter if you are not dynamically enumerating databases.
Raise event if threshold exceeded?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for reports and graphs. If enabled, data collection returns the data growth and shrink rates for each database. The default is n.
SQL login	Enter the database username that provides access to SQL Server. You can use the "sa" account or other user login account that has been set up in the managed client's SQL Server. To use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use. **NOTE:** If you are monitoring SQL Server 7, use a `sysadmin` role account. Only members of the `sysadmin` role can retrieve file statistics on SQL Server 7.0.
Threshold - Maximum growth rate	Specify the maximum percentage of data growth allowed between the last and current interval before an event is raised. Enter **0** to ignore this parameter. The default is 25%.

Parameter	How to Set It
Threshold - Maximum shrink rate	Specify the maximum percentage of data shrinkage allowed between the last and current interval before an event is raised. Enter **0** to ignore this parameter. The default is 25%.
Event severity when threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5.

26.34 SQL_DBGrowthRate

Use this Knowledge Script to monitor database growth and shrink rates. Growth and shrink rates are calculated by taking the difference between the database space utilization from the current interval and the database space utilization from the last interval. This script raises an event if a threshold is exceeded. In addition, this script generates data streams for database growth and shrink rates.

26.34.1 Resource Objects

- CISCOUNITY_SQLT_DatabaseF
- CISCOUNITY_SQLT_DatabaseObj

26.34.2 Default Schedule

By default, this script runs every hour.

26.34.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Dynamically enumerate at each interval	Set to **y** to automatically count databases at each monitoring interval. The default is y.
Exclude these objects	Enter the name of any object you want to exclude. You can exclude multiple objects, separated by commas with no spaces. For example, enter `master,model,mdb` **NOTE:** Ignore this parameter if you are not dynamically enumerating databases.
Raise event if threshold exceeded?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for reports and graphs. If enabled, data collection returns database growth and shrink rates. The default is y.
SQL login	Enter the database username that provides access to SQL Server. You can use the "sa" account or other user login account that has been set up in the managed client's SQL Server. To use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use. **NOTE:** If you are monitoring SQL Server 7, use a `sysadmin` role account. Only members of the `sysadmin` role can retrieve file statistics on SQL Server 7.0.
Update usage?	Set to **y** to have SQL Server recalculate the space usage. The default is n.
Threshold - Maximum growth rate	Enter the maximum percentage of data growth allowed between the last and current interval before an event is raised. Enter **0** to ignore this parameter. The default is 25%.

Parameter	How to Set It
Threshold - Maximum shrink rate	Enter the maximum percentage of data shrinkage allowed between the last and current interval before an event is raised. Enter **0** to ignore this parameter. The default is 25%.
Event severity when threshold exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5.

26.35 SQL_MemUtil

Use this Knowledge Script to monitor the amount of memory used by SQL Server processes. This script monitors the `sqlservr` and `sqlagent` processes.

If using SQL Server 7.0 or 2000, you can use this script to monitor total server memory usage, number of free buffers, and memory usage.

This script raises an event if a threshold is exceeded. In addition, this script generates data streams for memory usage for SQL Server processes.

26.35.1 Resource Object

CISCOUNITY_SQLT_Server

26.35.2 Default Schedule

By default, this script runs every 10 minutes.

26.35.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if threshold exceeded?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for reports and graphs. If enabled, data collection returns information about the amount of memory used by SQL Server. The default is n.
Threshold - Maximum process memory usage	Specify the maximum amount of memory that can be consumed by SQL Server before an event is raised. The default is 50000000 bytes.
Threshold - Maximum number of free buffers	Specify the maximum number of buffers that can be in use before an event is raised. The default is 50 buffers.
Threshold - Maximum SQL Server memory usage	Specify the maximum amount of memory that can be in use by SQL Server and all related processes before an event is raised. The default is 30000000 bytes.
Event severity when threshold exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5.

26.36 SQL_RestartServer

Use this Knowledge Script to restart SQL Server. This script raises an event if the server successfully restarts or fails to restart. In order to restart SQL services, this script will also stop dependent Unity services, such as `AvCsMgr` and `AvUMRSyncSvr`. This script automatically restarts any service that it stops.

26.36.1 Resource Object

CISCOUNITY_SQLT_Server

26.36.2 Default Schedule

By default, this script runs once.

26.36.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Wait N seconds before restarting	Enter the number of seconds to wait after the server is stopped before attempting to automatically restart the server. The default is 5 seconds.
Event severity when stop fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot stop the server. The default is 5.
Event severity when restart fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot restart the server. The default is 5.
Event severity when status of service is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot determine the status of the server. The default is 10.
Event severity when stop succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully stops the server. The default is 25.
Event severity when restart succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully restarts the server. The default is 25.

26.37 Recommended Knowledge Script Groups

The following Knowledge Scripts are members of the CiscoUnity recommended Knowledge Script Group. You can find these scripts individually on the CiscoUnity tab and in a group on the RECOMMENDED tab of the Operator Console.

- CU_HealthCheck
- CU_NumberOfLogons
- CU_Silence
- CU_SystemUsage
- CU_VoicePortsInUse

The following scripts are members of the CiscoUnity_Reports recommended KSG:

- Report_PortUsage.
- Report_ServicesAvailability.
- Report_SystemUsage.

All scripts in the KSGs have their parameters set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab and run the KSG on a Cisco Unity or Report resource.

The KSGs enable a “best practices” usage of AppManager for monitoring your Cisco Unity environment. You can use this KSG with AppManager monitoring policies. A monitoring policy, which enables you to efficiently and consistently monitor all the resources in your environment, uses a set of pre-configured Knowledge Scripts to automatically monitor resources as they appear in the TreeView.

A KSG is composed of a subset of a module’s Knowledge Scripts. The script that belongs to a KSG is a different copy of the original script you access from the CiscoUnity tab. If you modify a script that belongs to a KSG, the parameter settings of the original script in the CiscoUnity tab are not affected.

In some cases, default script parameter settings are different when the script is deployed as part of a KSG, as opposed to when it is deployed alone. The default settings of a script within a group depend on its monitoring purpose within the larger group, and on the intended monitoring scope of that group.

If you modify or remove a script associated with the CiscoUnity or CiscoUnity_Report KSG and want to restore it to its original form, you can reinstall AppManager for Cisco Unity on the repository computer or check in the appropriate script from the `AppManager\qdb\kp\CiscoUnity` directory.

26.38 Discovery_CiscoUnity

Use this Knowledge Script to discover Cisco Unity resources, including the TSP version, and ports.

26.38.1 Resource Object

NT_MachineFolder

26.38.2 Default Schedule

By default, this script runs once.

26.38.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event when discovery succeeds?	This script always raises an event when the discovery fails for any reason. In addition, you can set this parameter to **y** to raise an event when the job succeeds. The default is n.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discover fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery partially succeeds. The default is 15.
SQL username	If appropriate, enter your SQL username. Leave this field blank to use Windows Authentication. **NOTE:** If a SQL username is required, then you must configure the user name into AppManager Security Manager.
Create failover pair server group?	Set to **y** to create a server group composed of a failover pair (primary and secondary Unity servers). This server group is visible in the TreeView pane from the Master view only. The default is y.

27 Cisco Unity Connection Knowledge Scripts

AppManager for Cisco Unity Connection provides the following Knowledge Scripts for monitoring Cisco Unity Connection resources. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
AutoFailover	Monitors the Connection Server Role Manager logs for AutoFailover or AutoFailback events.
DRFStatus	Monitors the Cisco Unity Connection Disaster Recovery Framework (DRF) status.
GeneralCounter	Monitors a user-specified counter on a Unity Connection server.
ListUtil	Lists the counters, logs, and services on a Unity Connection server.
Logs	Monitors the user-specified Unity Connection server logs for matching text.
Numbe?FM MARKER [Cross-Ref] 20954: Heading1-Top: CU_NumberOfLogons?rofLogons	Monitors the number of active subscriber sessions for a Unity Connection server.
PortStatus	Monitors whether the Unity Connection server ports are available for use.
ServiceDown	Monitors the status of Unity Connection services.
SystemCPU	Monitors the percentage of CPU utilization for a Unity Connection server.
SystemMem	Monitors the physical and virtual memory utilization for a Unity Connection server.
VoicePortsinUse	Monitors the number of Unity Connection voice ports that are being used by callers.

27.1 AutoFailover

Use this Knowledge Script to monitor the Connection Server Role Manager logs for AutoFailover and AutoFailback events.

Cisco Unity Connection servers are a group of independent computers that work together to increase the availability of applications and services. If one of the cluster nodes fails, another node begins to provide service, and this process is called *failover*. Users experience minimum disruptions in service during a failover. A failover operation is followed by a *failback* operation, a process of returning the server to its original state. Any failover or failback event generates a set of logs.

This Knowledge Script helps you monitor the following failover or failback events:

- AutoFailoverSucceeded: Monitors the log entries that are created when automatic failover is successful.
- AutoFailoverFailedï£¡: Monitors the log entries that are created when automatic failover fails for any reason.
- AutoFailbackSucceededï£¡: Monitors the log entries that are created when automatic failback is successful.
- AutoFailbackFailed:ï£¡ Monitors the log entries that are created when automatic failback fails for any reason

This script raises an event if it finds the failover or failback events, or cannot read the logs for failover or failback events. In addition, this script generates data streams for the number of failover or failback events.

Resource Object

Cisco Unity Connection server

Default Schedule

By default, this script runs every **10 minutes**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the AutoFailover job fails. The default is 5.
Raise event if logs cannot be read?	Select **Yes** to raise an event if the script cannot read the failover or failback events in the logs. The default is Yes.

Description	How to Set It
Event severity when logs cannot be read	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the script cannot read the failover or failback events in the logs. The default is 5.
Raise event if lines are found?	Select **Yes** to raise an event if the script finds the failover or failback events in the log. The default is Yes.
Event severity when lines are found	Set the severity level, from 1 to 40, to indicate the importance of the event that is raised when the script finds the failover or failback events in the logs. The default is 15.
Raise event if no lines are found?	Select **Yes** to raise an event if the script does not find the failover or failback events in the logs. The default is unselected.
Event severity when no lines are found	Set the severity level, from 1 to 40, to indicate the importance of the event that is raised when the script does not find the failover or failback events in the logs. The default is 15.
Text to find	Select the failover or failback events that you want to monitor in the logs. You can choose from AutoFailoverSucceeded, AutoFailoverFailed, AutoFailbackSucceeded, and AutoFailbackFailed. The default is AutoFailoverSucceeded.
Log Name	Specify the name of the log to search for failover or failback events. The default log name is Connection Server Role Manager.
Scan entire log on first iteration?	Select **Yes** if you want to scan all entries in the failover or failback event logs during the first iteration of the Knowledge Script. The scanning depends on the number of hours specified in the *Previous hours to search for log* parameter. If you select Yes, this Knowledge Script scans the failover or failback events log for old failover or failback events during the first iteration, depending on the value specified in the *Previous hours to search for log* parameter. The default is Yes.
Previous hours to search for log	Specify how far back in the logs you want to search for failover or failback events during the first iteration of this script. For example, type 8 for the past 8 hours, 50 for the past 50 hours, and so on. By default, this Knowledge Script searches the logs from the previous 24 hours. You can specify a minimum of 1 hour and maximum of 100 hours.
Monitor Number of Lines Found	
Event Notification	
Raise event if number of lines found exceeds threshold?	Select **Yes** to raise an event if the number of failover or failback events exceeds the threshold. The default is Yes.
Threshold - Maximum number of lines found	Specify the maximum number of failover or failback events that the script may find between the last and current interval before it raises an event. The default is 0.
Event severity when number of lines found exceeds threshold	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the number of failover or failback events exceeds the threshold. The default is 10.
Data Collection	
Collect data for number of lines found	Select **Yes** to collect data for charts and reports for the number of failover or failback events. The default is unselected.

27.2 DRFStatus

Use this Knowledge Script to monitor the Cisco Unity Connection Disaster Recovery Framework (DRF) backup status. By default, this Knowledge Script monitors the DRF backup status since the last iteration. This script can monitor the previous days' backups on the first iteration by setting the *Number of previous days to monitor on first iteration* parameter to a non-zero value.

This script raises events if it does not find a backup status, finds any successful or failed backup status, or finds one or more failed backups. In addition, this script generates data streams for the number of failed backups since the last iteration and the total number of backups on the DRF backup server.

Resource Object

Cisco Unity Connection server

Default Schedule

By default, this script runs **daily**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the DRFStatus job fails unexpectedly. The default is 5.
Raise event if DRF status cannot be determined?	Select **Yes** to raise an event if the script cannot determine the DRF status for any reason. The default is Yes.
Event severity when DRF status cannot be determined	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the script cannot determine the DRF status. The default is 5.
Raise event if no backups found?	Select **Yes** to raise an event if the script does not find a DRF backup. The default is Yes.
Event severity when no backups found	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the script does not find the DRF backups. The default is 15.
Raise event if backups found?	Select **Yes** to raise an event if the script finds one or more DRF backups. The default is unselected.
Event severity when backups found	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the script finds one or more DRF backups. The default is 15.
Raise event if failed backups found?	Select **Yes** to raise an event if the script finds a failed DRF backup. The default is Yes.

Description	How to Set It
Event severity when failed backups found	Set the event severity level, from 1 to 40, to indicate the importance of the event that is raised when the script finds the failed DRF backups. The default is 15.
Number of previous days to monitor on first iteration	Specify the value between 0 and 999 to specify the number of previous days that you want to monitor the DRF backup status on the first iteration. The default is 0. If the value is set to 0, this Knowledge Script monitors the DRF backups from the previous 24 hours.
Monitor Number of Backups	
Event Notification	
Raise event if number of backups exceeds threshold?	Select **Yes** to raise an event if the number of DRF backups exceeds the threshold. The default is unselected.
Threshold - Maximum number of backups	Specify the maximum number of successful backups that can exist on the DRF backup server before the script raises an event. The default is 0.
Event severity when number of backups exceeds threshold	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the number of successful backups exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of backups?	Select **Yes** to collect data for charts and reports on the number of successful backups on the DRF backup server. The default is unselected.
Monitor Number of Failed Backups	
Data Collection	
Collect data for number of failed backups?	Select **Yes** to collect data for charts and reports on the number of failed backups since the previous iteration. The default is unselected.

27.3 GeneralCounter

Use this Knowledge Script to monitor a user-specified counter on a Unity Connection server.

This script raises events if it cannot obtain a counter, or the counter's value exceeds or falls below the threshold. In addition, this script generates data streams for the counter's value.

Resource Object

Cisco Unity Connection server

Default Schedule

By default, this script runs **once**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the GeneralCounter job fails. The default is 5.
Raise event if counter cannot be obtained?	Select **Yes** to raise an event if the script cannot obtain a counter for any reason. The default is Yes.
Event severity when counter cannot be obtained	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the script cannot obtain a counter. The default is 5.
Counter's full path	Specify the counter's path, entered as [CounterObject\CounterName] or [CounterObject(Instance)\CounterName]. For example, `System\Total Processes` or `Processor(_Total)\User Percentage`.
Name of counter to use in messages	Specify the name of the counter that you want to use in messages. Leave blank if you want to use the counter's path.
Counter units	Specify the counter unit as a percentage, KB, or number. The default setting is no unit.
Monitor Counter's Current Value	
Event Notification	
Raise event if threshold is crossed?	Select **Yes** to raise an event if the counter value exceeds or falls below the threshold. The default is Yes.
Minimum threshold	Select **Enable** to raise an event if the value of the counter falls below the minimum threshold. The default is Enable.
Threshold - Minimum counter's current value	Specify the minimum threshold value for the counter. The default is 0.

Description	How to Set It
Event severity when counter's current value falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of the event that is raised when the value of the counter falls below the minimum threshold. The default is 15.
Maximum threshold	Select **Enable** to raise an event if the value of the counter exceeds the maximum threshold. The default is Enable.
Threshold - Maximum counter's current value	Specify the maximum threshold value for the counter. The default is 0.
Event severity when counter's current value exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of the event that is raised when the value of the counter exceeds the maximum threshold. The default is 15.
Data Collection	
Collect data for counter's current value	Select **Yes** to collect data for charts and reports about the current value of the counter. The default is unselected.

27.4 ListUtil

Use this Knowledge Script to list the counters, logs, or services on a Cisco Unity Connection server. This script raises events if it obtains a list or cannot obtain a list.

Resource Object

Cisco Unity Connection server

Default Schedule

By default, this script runs **once**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the ListUtil job fails. The default is 5.
Raise event if list cannot be obtained?	Select **Yes** to raise an event if the script cannot obtain counters, logs, or services lists. The default is Yes.
Event severity when list cannot be obtained	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the script cannot obtain the selected list. The default is 5.
Raise event if list has been obtained?	Select Yes to raise an event if the script obtains the selected list.
Event severity when list has been obtained	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the script obtains the selected list. The default is 35.
Select list	Select the type of list you want to display. The options available are Counters, Logs, or Services. The default is Counters.

27.5 Logs

Use this Knowledge Script to search the user-defined Cisco Unity Connection logs for matching text. This Knowledge Script looks for lines with matching text in the user-specified logs.

This script raises an event if it cannot read the logs, finds matching lines, or does not find matching lines. This script also raises an event if the number of matching lines within the specified number of hours exceeds the threshold. In addition, this script generates data streams for the number of matching lines.

Resource Object

Cisco Unity Connection server

Default Schedule

By default, this script runs **once**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the Logs job fails. The default is 5.
Raise event if logs cannot be read?	Select **Yes** to raise an event if the script cannot read the logs.
Event severity when logs cannot be read	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the script cannot read the logs. The default is 5.
Raise event if matching lines are found?	Select **Yes** to raise an event if the script finds matching lines in the logs. The default is Yes.
Event severity when matching lines are found	Set the severity level, from 1 to 40, to indicate the importance of the event that is raised when the script finds the matching lines in the logs. The default is 15.
Raise event if no matching lines are found?	Select **Yes** to raise an event if the script does not find the matching lines in the logs. The default is unselected.
Event severity when no matching lines are found	Set the severity level, from 1 to 40, to indicate the importance of the event that is raised when the script does not find the matching lines in the logs. The default is 15.
Text to find	Specify a comma-separated list of regular expressions (as defined by Microsoft) to find in the specified Unity Connection log. The script raises an event when it finds one of more lines that match with one or more of the regular expressions.

Description	How to Set It
Log Name	Specify the name of the log to search for the regular expressions. The default log name is `Cisco Syslog Agent`.
Scan entire log on first iteration	Select **Yes** if you want to scan all entries in the user-specified Unity Connection log during the first iteration of the Knowledge Script. The scanning depends on the number of hours specified in the *Previous hours to search for log* parameter. If you select Yes, this Knowledge Script scans the user-specified Unity Connection log for matching lines during the first iteration, depending on the value specified in the *Previous hours to search for log* parameter. The default is selected.
Previous hours to search for log	Specify how far back in the logs you want to search for matching lines during the first iteration of this script. For example, type 8 for the past 8 hours, 50 for the past 50 hours, and so on. By default, this Knowledge Script searches the logs from the previous 24 hours. You can specify a minimum of 1 hour and a maximum of 100 hours.
Monitor Number of Lines Found	
Event Notification	
Raise event if number of lines found exceeds threshold?	Select **Yes** to raise an event if the number of lines that the script finds exceeds the threshold. The default is Yes.
Threshold - Maximum number of lines found	Specify the maximum number of new lines that can be found since the last iteration before the script raises an event. The default is 0.
Event severity when number of lines found exceeds threshold	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the number of matching lines exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of lines found	Select **Yes** to collect data for charts and reports on the number of matching lines. The default is unselected.

27.6 Numbe?FM MARKER [Cross-Ref] 20954: Heading1-Top: CU_NumberOfLogons?rofLogons

Use this Knowledge Script to monitor the number of active subscriber sessions on a Cisco Unity Connection server. This script raises an event if the maximum number of active subscriber sessions exceeds the threshold. In addition, this script generates data streams for the number of active subscriber sessions.ï£¡

Resource Object

Cisco Unity Connection server

Default Schedule

By default, this script runs every **10 minutes**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the NumberofLogons job fails. The default is 5.
Raise event if number of active subscriber sessions cannot be determined?	Select **Yes** to raise an event if the script cannot determine the number of active subscriber sessions. The default is Yes.
Event severity when number of active subscriber sessions cannot be determined	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the script cannot determine the number of active subscriber sessions. The default is 5.
Monitor the Number of Active Subscriber Sessions	
Event Notification	
Raise event if the number of active subscriber sessions exceeds threshold?	Select **Yes** to raise an event if the number of active subscriber sessions exceeds the threshold. The default is Yes.
Threshold - Maximum number of active subscriber sessions	Specify the maximum number of subscriber sessions that can be active before the script raises an event. Enter a number appropriate for the server you are monitoring. The default is 0.
Event severity when the number of active subscriber sessions exceeds threshold	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the number of active subscriber sessions exceeds the threshold. The default is 15.
Data Collection	

Description	How to Set It
Collect data?	Select **Yes** to collect data for charts and reports on the number of active subscriber sessions. The default is unselected.

27.7 PortStatus

Use this Knowledge Script to monitor the utilization of Cisco Unity Connection voice ports on a Cisco Unity Connection server on a per-port basis. This script raises an event if a voice port in use exceeds the specified percentage utilization during an iteration. In addition, this script generates data streams for voice port utilization.

Resource Object

Cisco Unity Connection server

Default Schedule

By default, this script runs every **10 minutes**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the PortStatus job fails. The default is 5.
Raise event if voice port utilization cannot be determined?	Select **Yes** to raise an event if the script cannot determine the voice port utilization of the Cisco Unity Connection server. The default is Yes.
Event severity when voice port utilization cannot be determined	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the script cannot determine the voice port utilization. The default is 5.
Exclude voice ports	List the voice ports, separated by commas, to exclude when the PortStatus job is running. By default, this script includes all the voice ports.
Monitor Voice Port Utilization	
Data Collection	
Collect data for voice port utilization	Select **Yes** to collect data for charts and reports on the voice port utilization. The default is unselected. The utilization data streams are expressed in seconds.
Event Notification	
Raise event if voice port utilization exceeds threshold?	Select **Yes** to raise an event if the maximum percentage of voice port utilization exceeds the threshold. The default is Yes.
Event severity when voice port utilization exceeds threshold	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the voice port utilization exceeds the threshold. The default is 15.

Description	How to Set It
Threshold - Maximum voice port percent utilization	Specify the maximum utilization percentage of a voice port before the script raises an event. The default is 80%. The utilization percentage is based on the elapsed time between job iterations.

27.8 ServiceDown

Use this Knowledge Script to monitor the status of Cisco Unity Connection services to determine if any service is down. This script raises an event if a service is not running. You can use exclusion lists to exclude any services, which will prevent the script from raising events when those services are not started. In addition, this script generates data streams for service availability.

Resource Objects

- Cisco Unity Connection server
- Cisco Unity Connection service

Default Schedule

The default interval for this script is every **10 minutes**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the ServiceDown job fails. The default is 5.
Raise event if service status cannot be obtained?	Select **Yes** to raise an event if the script cannot obtain the Cisco Unity Connection service status.
Event severity when service status cannot be obtained	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the script cannot obtain the Cisco Unity Connection service status. The default is 5.
Dynamically observe services	Select **Yes** to observe the Cisco Unity Connection services dynamically. The default is Yes. If this parameter is set to No, then this Knowledge Script monitors only the services on which you run the script. If this parameter is set to Yes, the Knowledge Script ignores the individual services on which you run the script and instead monitors all of the activated services on the servers. NetIQ Corporation recommends a setting of Yes, which allows you to monitor new services in future releases of Cisco Unity Connection, without modifying this Knowledge Script. **NOTE:** If you set this parameter to Yes, you must select a server in the Knowledge Script's **Object** tab. This Knowledge Script does nothing if you set this parameter to Yes and you do not select a server.

Description	How to Set It
Exclude services	List the Unity Connection services that you do not want to monitor. Separate multiple services with commas (no spaces).
Exclude reason codes	List the reason codes to ignore if a service is not running. If a service is not running due to one of the listed reasons, the script does not raise an event. Separate multiple reason codes with commas (no spaces).
Exclude services that are not activated	Select **Yes** to exclude Cisco Unity Connection services that are not activated. The default is Yes.
Monitor Service Availability	
Event Notification	
Raise event if service is down?	Select **Yes** to raise an event if a Cisco Unity Connection service is down. The default is Yes.
Event severity when service is down	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when a Unity Connection service is down. The default is 15.
Data Collection	
Collect data for service availability	Select **Yes** to collect data for charts and reports on the service availability. The default is **No**. In the data stream, 100 indicates that the service is running, and 0 indicates that the service is not running.

27.9 SystemCPU

Use this Knowledge Script to monitor the percentage of CPU utilization by the Cisco Unity Connection server. This script raises an event if it cannot determine the CPU utilization, or if the percentage of CPU utilization exceeds the threshold. In addition, this script generates data streams for the percentage of CPU utilization.

Resource Object

Cisco Unity Connection server

Default Schedule

The default interval for this script is every **10 minutes**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the SystemCPU job fails. The default is 5.
Raise event if CPU percent utilization cannot be determined?	Select **Yes** to raise an event if the script cannot determine the percentage of CPU utilization. The default is Yes.
Event severity when CPU percent utilization cannot be determined	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the script cannot determine the percentage of CPU utilization. The default is 5.
Monitor CPU Percent Utilization	
Event Notification	
Raise event if CPU percent utilization exceeds threshold?	Select **Yes** to raise an event if the percentage of CPU utilization exceeds the threshold. The default is Yes.
Threshold - Maximum CPU percent utilization	Specify the maximum CPU utilization that can occur before the script raises an event. The default is 90%.
Event severity when maximum CPU percent utilization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of the event when the percentage of CPU utilization exceeds the threshold. The default is 15.
Data Collection	
Collect data for maximum CPU percent utilization	Select **Yes** to collect data for charts and reports on the percentage of CPU utilization. The default is unselected.

27.10 SystemMem

Use this Knowledge Script to monitor the physical and virtual memory usage by the Cisco Unity Connection server. This script raises an event if it cannot determine the memory usage, or the physical or virtual memory usage exceeds a threshold. In addition, this script generates data streams for the physical and virtual memory usage.

Resource Object

Cisco Unity Connection server

Default Schedule

The default interval for this script is every **10 minutes**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the SystemMem job fails. The default is 5.
Raise event if system memory usage cannot be determined?	Select **Yes** to raise an event if the script cannot determine the system memory usage for a Cisco Unity Connection server. The default is Yes.
Event severity when system memory usage cannot be determined	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the script cannot determine the Cisco Unity Connection system memory usage. The default is 5.
Monitor Maximum Physical Memory Usage	
Event Notification	
Raise event if maximum physical memory usage exceeds threshold?	Select **Yes** to raise an event if the physical memory usage for a Cisco Unity Connection server exceeds the threshold. The default is Yes.
Threshold - Maximum physical memory usage	Specify the maximum physical memory usage that can occur before the script raises an event. The default is 90%.
Event severity when maximum physical memory usage exceeds threshold	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the physical memory usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for maximum physical memory usage	Select **Yes** to collect data for charts and reports on the physical memory usage. The default is unselected.
Monitor Maximum Virtual Memory Usage	
Event Notification	

Description	How to Set It
Raise event if maximum virtual memory usage exceeds threshold?	Select **Yes** to raise an event if the virtual memory utilization exceeds the threshold. The default is Yes.
Threshold - Maximum virtual memory usage	Specify the maximum virtual memory utilization that can occur before the script raises an event. The default is 90%.
Event severity when maximum virtual memory usage exceeds threshold	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the virtual memory utilization exceeds the threshold. The default is 15.
Data Collection	
Collect data for maximum virtual memory usage	Select **Yes** to collect data for charts and reports on the virtual memory utilization. The default is unselected.

27.11 VoicePortsinUse

Use this Knowledge Script to monitor the number of Cisco Unity Connection voice ports that are in use, the percentage of voice ports in use, and the number of voice ports that are locked. This script raises an event if the number of voice ports in use or voice ports locked exceeds a threshold. In addition, this script generates data streams for the number of voice ports in use and the number of voice ports that are locked.

You can use this script to identify episodes of high usage, and to determine whether there are sufficient voice port licenses on the Cisco Unity Connection server. In addition, you can use this script to determine the availability of voice ports, and to determine if are any ports cannot be used because they are locked.

Resource Object

Cisco Unity Connection server

Default Schedule

The default interval for this script is every **10 minutes**.

Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the VoicePortsinUse job fails. The default is 5.
Raise event if voice ports in use cannot be determined?	Select **Yes** to raise an event if the script cannot determine the voice ports of the Cisco Unity Connection server that are in use. The default is Yes.
Event severity when voice ports in use cannot be determined	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the script cannot determine the voice ports of the Cisco Unity Connection server that are in use. The default is 5.
Monitor Number of Voice Ports in Use	
Event Notification	
Raise event if number of voice ports in use exceeds threshold?	Select **Yes** to raise an event if the number of voice ports in use exceeds the threshold. The default is unselected.
Threshold - Maximum number of voice ports in use	Specify the maximum number of voice ports that can be in use before the script raises an event. The default is 0.
Event severity when number of voice ports in use exceeds threshold	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the number of voice ports that are in use exceeds the threshold. The default is 15.

Description	How to Set It
Data Collection	
Collect data for number of voice ports in use	Select **Yes** to collect data for charts and reports about the number of voice ports that are in use. The default is unselected.
Monitor Percentage Voice of Ports in Use	
Event Notification	
Raise event if percentage of voice ports in use exceeds threshold?	Select **Yes** to raise an event if the percentage of voice ports in use exceeds the threshold. The default is unselected.
Threshold - Maximum percentage of voice ports in use	Specify the maximum percentage of voice ports that can be in use before the script raises an event. The default is 80%.
Event severity when percentage of voice ports in use exceeds threshold	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the percentage of voice ports that are in use exceeds the threshold. The default is 15.
Data Collection	
Collect data for percentage of voice ports in use	Select **Yes** to collect data for charts and reports about the percentage of voice ports that are in use. The default is unselected.
Monitor Voice Ports Locked	
Event Notification	
Raise event if locked voice ports exceeds threshold?	Select **Yes** to raise an event if the number of voice ports that are locked exceeds the threshold. The default is Yes.
Threshold - Maximum locked voice ports	Specify the maximum number of voice ports that can be locked before the script raises an event. The default is 0.
Event severity when locked voice ports exceeds threshold	Set the severity level, from 1 to 40, to reflect the importance of the event that is raised when the number of voice ports that are locked exceeds the threshold. The default is 15.
Data Collection	
Collect data for locked voice ports	Select **Yes** to collect data for charts and reports about the number of voice ports that are locked. The default is unselected.

28 CiscoUE Knowledge Scripts

AppManager for Cisco Unity Express provides the following Knowledge Scripts for monitoring Unity Express resources. From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
BackupAndRestoreStatus	Monitors the status of Unity Express Backup and Restore operations.
DeviceUptime	Monitors the number of hours that a Unity Express device has been operational.
GDMStorageUsage	Monitors the storage usage of Unity Express general delivery mailboxes.
OrphanedMailboxes	Monitors the operational status of the Unity Express Watchdog process.
LicenseCompliance	Monitors the number or percentage of in-use voice mail licenses on a Unity Express device.
MessageActivity	Monitors the number of new, read, and deleted messages on a Unity Express device since the last reboot.
OrphanedMailboxes	Monitors for mailboxes on a Unity Express device that are not associated with an owner.
PortStatus	Monitors the registration status of all Unity Express ports for an associated Unified Communications Manager.
SubscriberStorageUsage	Monitors the storage usage of one or more Unity Express Subscriber mailboxes.
SystemUsage	Monitors the total CPU usage for a Unity Express device.
TotalStorageUsage	Monitor+s the total storage usage for a Unity Express device.
VoiceMailLogins	Monitors the number of failed and total voice mail login attempts for a Unity Express device.
VoiceMailSessionsInUse	Monitors concurrent voice mail sessions that are in use on a Unity Express device.
Recommended Knowledge Script Group	Performs essential monitoring of your Cisco Unity Express environment.

28.1 BackupAndRestoreStatus

Use this Knowledge Script to monitor the status of Unity Express Backup and Restore operations. If a new Backup or Restore operation is discovered, then this script raises an event that identifies the operation type, the operation's date/time stamp, and the results of the operation. In addition, this script generates a data stream for successful (1) or failed (0) Backup and Restore operations.

28.1.1 Resource Object

CiscoUE

28.1.2 Default Schedule

By default, this script runs every 24 hours.

28.1.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the BackupAndRestoreStatus job fails. The default is 5.
Monitor Backup/Restore Events	
Raise event if Backup/Restore succeeded?	Select **Yes** to raise an event if the Backup or Restore operation was successful. The default is Yes.
Event severity when Backup/Restore succeeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Backup or Restore operation was successful. The default is 25.
Raise event if Backup/Restore failed?	Select **Yes** to raise an event if the Backup or Restore operation failed. The default is Yes.
Event severity when Backup/Restore failed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Backup or Restore operation failed. The default is 5.
Monitor Backup/Restore Status	
Data Collection	
Collect data for Backup/Restore history?	Select **Yes** to collect data about the history of the Backup or Restore operation for charts and reports. The default is unselected.

28.2 DeviceUptime

Use this Knowledge Script to monitor the number of hours that a Unity Express device has been operational. This script raises an event if the device reboots. In addition, this script generates a data stream for the number of hours a device has been operational.

28.2.1 Resource Object

CiscoUE

28.2.2 Default Schedule

By default, this script runs every five minutes.

28.2.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the DeviceUptime job fails. The default is 5.
Monitor Unity Express Reboot Events	
Raise event if device reboots?	Select **Yes** to raise an event if the device reboots. The default is Yes.
Event severity when device reboots	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Unity Express device reboots. The default is 25.
Monitor Unity Express Device Uptime	
Data Collection	
Collect data for uptime?	Select **Yes** to collect data about device uptime for charts and reports. The default is Yes.

28.3 GDMStorageUsage

Use this Knowledge Script to monitor the storage usage of one or more Unity Express general delivery mailboxes. This script raises an event if the storage usage exceeds the threshold. In addition, this script generates data streams for the storage usage percentage of all monitored mailboxes.

28.3.1 Resource Object

CiscoUE General Delivery Mailboxes

28.3.2 Default Schedule

By default, this script runs every hour.

28.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the GDMStorageUsage job fails. The default is 5.
List of general delivery mailboxes to monitor	Provide a list of the owner names of the mailboxes that you want to monitor, separated by commas. If you want to monitor all mailboxes, leave this parameter blank.
Monitor General Delivery Mailbox Storage Usage	
Event Notification	
Raise event if storage usage exceeds threshold?	Select **Yes** to raise an event if the percentage of storage usage exceeds the threshold. The default is Yes.
Threshold - Maximum storage usage	Specify the maximum percentage of general delivery mailbox storage usage that can be detected before an event is raised. The default is 80%.
Event severity when storage usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of storage usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for storage usage?	Select **Yes** to collect data about storage usage for charts and reports. The default is Yes.

28.4 LicenseCompliance

Use this Knowledge Script to monitor the number or percentage of in-use voice mail licenses. This script raises an event if the number or percentage of in-use licenses exceeds the threshold. In addition, this script generates data streams for the total number of available licenses, the number of in-use licenses, and the percentage of in-use licenses.

28.4.1 Resource Object

CiscoUE

28.4.2 Default Schedule

By default, this script runs every 24 hours.

28.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the LicenseCompliance job fails. The default is 5.
Monitor Total Voice Mail Licenses Available	
Data Collection	
Collect data for total voice mail licenses available?	Select **Yes** to collect data about available voice mail licenses for charts and reports. The default is unselected.
Monitor Number of Voice Mail Licenses in Use	
Event Notification	
Raise event if number of voice mail licenses in use exceeds threshold?	Select **Yes** to raise an event if the number of in-use voice mail licenses exceeds the threshold. The default is unselected
Threshold - Maximum number of voice mail licenses in use	Specify the maximum number of voice mail licenses that can be in use before an event is raised. The default is 25 licenses.
Event severity when number of voice mail licenses in use exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-use voice mail licenses exceeds the threshold. The default is 5.
Data Collection	
Collect data for number of voice mail licenses in use	Select **Yes** to collect data about in-use voice mail licenses for charts and reports. The default is unselected.
Monitor Percent of Voice Mail Licenses in Use	
Event Notification	

Parameter	How to Set It
Raise event if percent of voice mail licenses in use exceeds threshold?	Select **Yes** to raise an event if the percentage of in-use voice mail licenses exceeds the threshold. The default is Yes.
Threshold - Maximum percent of voice mail licenses in use	Specify the maximum percentage of voice mail licenses that can be in use before an event is raised. The default is 80%.
Event severity when percent of voice mail licenses in use exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of in-use voice mail licenses exceeds the threshold. The default is 5.
Data Collection	
Collect data for percent of voice mail licenses in use	Select **Yes** to collect data about in-use voice mail licenses for charts and reports. The default is unselected.

28.5 MessageActivity

Use this Knowledge Script to monitor the number of new, read, and deleted messages on a Unity Express device since the last polling interval. This script raises an event if the number of messages exceeds the threshold. In addition, this script generates data streams for new, deleted, and read messages.

28.5.1 Resource Object

CiscoUE Mailbox Folder

28.5.2 Default Schedule

By default, this script runs every 10 minutes.

28.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the MessageActivity job fails. The default is 5.
Monitor New Messages	
Event Notification	
Raise event if new messages exceed threshold?	Select **Yes** to raise an event if the number of new messages exceeds the threshold. The default is Yes.
Threshold - Maximum new messages	Specify the maximum number of new messages that can be detected before an event is raised. The default is 100 messages.
Event severity when new messages exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of new messages exceeds the threshold. The default is 15.
Data Collection	
Collect data for new messages?	Select **Yes** to collect data about new messages for charts and reports. The default is unselected.
Monitor Read Messages	
Event Notification	
Raise event if read messages exceed threshold?	Select **Yes** to raise an event if the number of read messages exceeds the threshold. The default is Yes.
Threshold - Maximum read messages	Specify the maximum number of read messages that can be detected before an event is raised. The default is 100 messages.
Event severity when read messages exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of read messages exceeds the threshold. The default is 15.

Parameter	How to Set It
Data Collection	
Collect data for read messages?	Select **Yes** to collect data about read messages for charts and reports. The default is unselected.
Monitor Deleted Messages	
Event Notification	
Raise event if deleted messages exceed threshold?	Select **Yes** to raise an event if the number of deleted messages exceeds the threshold. The default is Yes.
Threshold - Maximum deleted messages	Specify the maximum number of deleted messages that can be detected before an event is raised. The default is 100 messages.
Event severity when deleted messages exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of deleted messages exceeds the threshold. The default is 25.
Data Collection	
Collect data for deleted messages?	Select **Yes** to collect data about deleted messages for charts and reports. The default is unselected.

28.6 OrphanedMailboxes

Use this Knowledge Script to identify mailboxes that are not associated with an owner. This script raises an event if an orphaned mailbox is found. In addition, this script generates data streams for the number of orphaned mailboxes.

28.6.1 Resource Object

CiscoUE Mailbox Folder

28.6.2 Default Schedule

By default, this script runs every 24 hours.

28.6.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the OrphanedMailboxes job fails. The default is 5.
Monitor Orphaned Mailboxes	
Event Notification	
Raise event if orphaned mailboxes are found?	Select **Yes** to raise an event if an orphaned mailbox is found. The default is Yes.
Event severity when orphaned mailboxes are found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which an orphaned mailbox is found. The default is 15.
Data Collection	
Collect data for orphaned mailboxes?	Select **Yes** to collect data about orphaned mailboxes for charts and reports. The default is unselected.

28.7 PortStatus

Use this Knowledge Script to monitor the registration status of all Unity Express CTI ports for an associated Unified Communications Manager. This script raises an event if the status of any port changes. In addition, this script generates a data stream for the percentage of registered ports.

28.7.1 Resource Object

CiscoUE

28.7.2 Default Schedule

By default, this script runs every five minutes.

28.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the PortStatus job fails. The default is 5.
Monitor Port Status Events	
Raise event if a port is not registered?	Select **Yes** to raise an event if a monitored port is not registered. The default is Yes.
Event severity when a port is not registered	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored port is not registered. The default is 5.
Raise event if an unregistered port becomes registered?	Select **Yes** to raise an event if the status of a monitored port changes from unregistered to registered. The default is Yes.
Event severity when an unregistered port becomes registered	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the status of a monitored port changes from unregistered to registered. The default is 25.
Monitor Percentage of Ports Registered	
Data Collection	
Collect data for percentage of ports registered?	Select **Yes** to collect data about registered ports for charts and reports. The default is unselected.

28.8 SubscriberStorageUsage

Use this Knowledge Script to monitor the storage usage of one or more Unity Express subscriber mailboxes. This script raises an event if the percentage of mailbox storage usage exceeds the threshold. In addition, this script generates data streams for the percentage of individual mailbox storage usage for all monitored mailboxes.

28.8.1 Resource Object

CiscoUE Subscriber Mailboxes

28.8.2 Default Schedule

By default, this script runs every hour.

28.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SubscriberStorageUsage job fails. The default is 5.
List of mailboxes to monitor	Enter a list of the owner names of the mailboxes that you want to monitor, separated by commas. To monitor all mailboxes, leave this parameter blank.
Monitor Subscriber Mailbox Storage Usage	
Event Notification	
Raise event if storage usage exceeds threshold?	Select **Yes** to raise an event if the percentage of Subscriber mailbox storage usage exceeds the threshold. The default is Yes.
Threshold - Maximum storage usage	Specify the maximum percentage of Subscriber mailbox storage usage that can be detected before an event is raised. The default is 80%.
Event severity when storage usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of Subscriber mailbox storage usage exceeds the threshold. The default is 15.
Data Collection	
Collect data for storage usage?	Select **Yes** to collect data about Subscriber storage usage for charts and reports. The default is Yes.

28.9 SystemUsage

Use this Knowledge Script to monitor total CPU usage for a Unity Express device. This script raises an event if CPU usage exceeds the threshold. In addition, this script generates a data stream for the percentage of total CPU usage.

28.9.1 Resource Object

CiscoUE

28.9.2 Default Schedule

By default, this script runs every five minutes.

28.9.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SystemUsage job fails. The default is 5.
Monitor Unity Express CPU Usage	
Event Notification	
Raise event if total CPU usage exceeds threshold?	Select **Yes** to raise an event if the total percentage of CPU usage exceeds the threshold. The default is Yes.
Event severity when total CPU usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage exceeds the threshold. The default is 10.
Threshold - Maximum total CPU usage	Specify the maximum percentage of CPU usage that can occur before an event is raised. The default is 80%.
Data Collection	
Collect data for total CPU usage?	Select **Yes** to collect data about CPU usage for charts and reports. The default is unselected.

28.10 TotalStorageUsage

Use this Knowledge Script to monitor the total storage usage for a Unity Express device. This script raises an event if the percentage of storage usage exceeds the threshold. In addition, this script generates data streams for the percentage of total storage usage.

28.10.1 Resource Object

CiscoUE Storage Capacity

28.10.2 Default Schedule

By default, this script runs every hour.

28.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the TotalStorageUsage job fails. The default is 5.
Monitor Total Storage Usage	
Event Notification	
Raise event if storage usage exceeds threshold?	Select **Yes** to raise an event if the percentage of storage usage exceeds the threshold. The default is Yes.
Threshold - Maximum storage usage	Specify the maximum percentage of storage usage that can occur before an event is raised. The default is 80%.
Event severity when storage usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of storage usage exceeds the threshold. The default is 5.
Data Collection	
Collect data for storage usage?	Select **Yes** to collect data about storage usage for charts and reports. The default is Yes.

28.11 VoiceMailLogins

Use this Knowledge Script to monitor the number of failed and total voice mail login attempts for a Unity Express device. This script raises an event if the number of failed attempts exceeds the threshold. In addition, this script generates data streams for total Web and phone login attempts, and for password and username failures on Web and phone login attempts.

28.11.1 Resource Object

CiscoUE

28.11.2 Default Schedule

By default, this script runs every hour.

28.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the VoiceMailLogins job fails. The default is 5.
Monitor Total Voice Mail Web Login Attempts	
Event Notification	
Raise event if login attempts exceed threshold?	Select **Yes** to raise an event if the number of Web login attempts exceeds the threshold. The default is Yes.
Threshold - Maximum login attempts	Specify the maximum number of Web logins that can be attempted before an event is raised. The default is 50 attempts.
Event severity when login attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of Web login attempts exceeds the threshold. The default is 15.
Data Collection	
Collect data for total voice mail Web login attempts?	Select **Yes** to collect data about Web login attempts for charts and reports. The default is unselected.
Monitor Total Voice Mail Phone Login Attempts	
Event Notification	
Raise event if login attempts exceed threshold?	Select **Yes** to raise an event if the number of phone login attempts exceeds the threshold. The default is Yes.
Threshold - Maximum login attempts	Specify the maximum number of phone logins that can be attempted before an event is raised. The default is 50 attempts.

Parameter	How to Set It
Event severity when login attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of phone login attempts exceeds the threshold. The default is 15.
Data Collection	
Collect data for total voice mail phone login attempts?	Select **Yes** to collect data about phone login attempts for charts and reports. The default is unselected.
Monitor Password Failures on Voice Mail Web Login Attempts	
Event Notification	
Raise event if failed attempts exceed threshold?	Select **Yes** to raise an event if the number of password failures on Web login attempts exceeds the threshold. The default is Yes.
Threshold - Maximum failed attempts	Specify the maximum number of password failures on Web login attempts that can occur before an event is raised. The default is 3 failures.
Event severity when failed attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of password failures on Web login attempts exceeds the threshold. The default is 5.
Data Collection	
Collect data for password failures on voice mail Web login attempts?	Select **Yes** to collect data about password failures on Web login attempts for charts and reports. The default is unselected.
Monitor Username Failures on Voice Mail Web Login Attempts	
Event Notification	
Raise event if failed attempts exceed threshold?	Select **Yes** to raise an event if the number of username failures on Web login attempts exceeds the threshold. The default is Yes.
Threshold - Maximum failed attempts	Specify the maximum number of username failures on Web login attempts that can occur before an event is raised. The default is 3 failures.
Event severity when failed attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of username failures on Web login attempts exceeds the threshold. The default is 5.
Data Collection	
Collect data for username failures on voice mail Web login attempts?	Select **Yes** to collect data about username failures on Web login attempts for charts and reports. The default is unselected.
Monitor Password Failures on Voice Mail Phone Login Attempts	
Event Notification	
Raise event if failed attempts exceed threshold?	Select **Yes** to raise an event if the number of password failures on phone login attempts exceeds the threshold. The default is Yes.
Threshold - Maximum failed attempts	Specify the maximum number of password failures on phone login attempts that can occur before an event is raised. The default is 3 failures.
Event severity when failed attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of password failures on phone login attempts exceeds the threshold. The default is 5.
Data Collection	
Collect data for password failures on voice mail phone login attempts?	Select **Yes** to collect data about password failures on phone login attempts for charts and reports. The default is unselected.
Monitor Username Failures on Voice Mail Phone Login Attempts	

Parameter	How to Set It
Event Notification	
Raise event if failed attempts exceed threshold?	Select **Yes** to raise an event if the number of username failures on phone login attempts exceeds the threshold. The default is Yes.
Threshold - Maximum failed attempts	Specify the maximum number of username failures on phone login attempts that can occur before an event is raised. The default is 3 failures.
Event severity when failed attempts exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of username failures on phone login attempts exceeds the threshold. The default is 5.
Data Collection	
Collect data for username failures on voice mail phone login attempts?	Select **Yes** to collect data about username failures on phone login attempts for charts and reports. The default is unselected.

28.12 VoiceMailSessionsInUse

Use this Knowledge Script to monitor concurrent voice mail sessions that are in use on a Unity Express device. This script raises an event if the number or percentage of sessions exceeds the threshold. In addition, this script generates data streams for maximum allowed sessions and for the number and percentage of in-use sessions.

28.12.1 Resource Object

CiscoUE Voicemail Ports

28.12.2 Default Schedule

By default, this script runs every five minutes.

28.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the VoiceMailSessionsInUse job fails. The default is 5.
Monitor Maximum Allowed Voice Mail Sessions	
Data Collection	
Collect data for maximum allowed voice mail sessions?	Select **Yes** to collect data about allowed voice mail sessions for charts and reports. The default is Yes.
Monitor Number of Voice Mail Sessions in Use	
Event Notification	
Raise event if number of voice mail sessions in use exceeds threshold?	Select **Yes** to raise an event if the number of in-use voice mail sessions exceeds the threshold. The default is unselected.
Threshold - Maximum number of voice mail sessions in use	Specify the maximum number of voice mail sessions that can be in use before an event is raised. The default is 6 sessions.
Event severity when number of voice mail sessions in use exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of in-use voice mail sessions exceeds the threshold. The default is 5.
Data Collection	
Collect data for number of voice mail sessions in use?	Select **Yes** to collect data about the number of in-use voice mail sessions for charts and reports. The default is Yes.
Monitor Percent of Voice Mail Sessions in Use	
Event Notification	

Parameter	How to Set It
Raise event if percent of voice mail sessions in use exceeds threshold?	Select **Yes** to raise an event if the percentage of in-use voice mail sessions exceeds the threshold. The default is Yes.
Threshold - Maximum percent of voice mail sessions in use	Specify the maximum percentage of voice mail sessions that can be in use before an event is raised. The default is 80%. **NOTE:** For a four-port Unity Express device, assigning a threshold of 80% results in an event being raised when all four ports are in use. When three out of four ports are in use, the percentage drops to 75.
Event severity when percent of voice mail sessions in use exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of in-use voice mail sessions exceeds the threshold. The default is 5.
Data Collection	
Collect data for percent voice mail sessions in use?	Select **Yes** to collect data about the percentage of in-use voice mail sessions for charts and reports. The default is Yes.

28.13 Recommended Knowledge Script Group

The following Knowledge Scripts are members of the CiscoUE recommended Knowledge Script Group. You can find these scripts individually on the CiscoUE tab and in a group on the RECOMMENDED tab of the Operator Console.

- DeviceUptime
- PortStatus
- SystemUsage
- TotalStorageUsage
- VoiceMailLogins
- VoiceMailSessionsInUse

NOTE: Cisco Unified Communications Manager Express routers do not provide the data the PortStatus script monitors. If you are running the Recommended KSG on a Unified Communications Manager Express router, remove the PortStatus script from the group. For more information, see PortStatus.

All scripts in the KSG have their parameters set to recommended values. To run all of the recommended scripts at one time, click the RECOMMENDED tab and run the KSG on a Cisco Unity Express resource.

The KSG enables a "best practices" usage of AppManager for monitoring your Cisco Unity Express environment. You can use this KSG with AppManager monitoring policies. A monitoring policy, which enables you to efficiently and consistently monitor all the resources in your environment, uses a set of pre-configured Knowledge Scripts to automatically monitor resources as they appear in the TreeView.

A KSG is composed of a subset of a module's Knowledge Scripts. The script that belongs to a KSG is a different copy of the original script you access from the CiscoUE tab. If you modify a script that belongs to a KSG, the parameter settings of the original script in the CiscoUE tab are not affected.

In some cases, default script parameter settings are different when the script is deployed as part of a KSG, as opposed to when it is deployed alone. The default settings of a script within a group depend on its monitoring purpose within the larger group, and on the intended monitoring scope of that group.

If you modify or remove a script associated with the CiscoUE KSG and want to restore it to its original form, you can reinstall AppManager for Cisco Unity Express on the repository computer or check in the appropriate script from the `AppManager\qdb\kp\CiscoUE` directory.

29 Citrix MetaFrame Knowledge Scripts

AppManager for Citrix MetaFrame (MFXP) provides the following Knowledge Scripts for monitoring servers that are running Citrix MetaFrame or Presentation Server.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
ApplicationUsersHigh	Monitors the number of users running an application across all sessions.
BytesTransferredPerUser	Monitors the number of bytes per user transferred between client computers and XenApp or Presentation Server.
DataCollectorChanged	Monitors whether a zone's data collector has changed since the last monitoring interval.
DefaultDataCollector	Identifies the default data collector for a XenApp or Presentation Server.
FarmUserLoad	Monitors the number of users connected to each XenApp or Presentation Server in a server farm.
ICAAvgLatencyHigh	Monitors the average latency of ICA sessions on XenApp or Presentation Server.
ICALatencyHigh	Monitors the most-recent measure of latency for ICA sessions on XenApp or Presentation Server.
LicenseInUseHigh	Monitors the percentage of licenses in use for Presentation Server 4.0 and later.
PublishedApplicationDetails	Searches for specified applications that are on the list of published applications for Citrix Server farms.
ServerFarmHealth	Monitors the health and availability of Citrix Server services in a designated server farm and monitors the farm for servers that are not responding.
ServerProcessesHigh	Monitors the number of processes on XenApp or Presentation Server across all sessions.
ServerProcessesResourceHigh	Monitors the use of CPU and memory resources by processes on XenApp or Presentation Server.
ServerSessionsHigh	Monitors the number of sessions on XenApp or Presentation Server.
SessionPerUser	Monitors the number of sessions on XenApp or Presentation Server that are open for each user.

Knowledge Script	What It Does
SessionState	Monitors the number of sessions matching specified states.
UserResourcesHigh	Monitors the use of CPU and memory resources by users connected to Citrix Presentation Server or XenApp server.

29.1 ApplicationUsersHigh

Use this Knowledge Script to monitor the number of users across all sessions running applications published on Citrix Presentation Server or XenApp server. If the number of users falls below the minimum threshold or exceeds the maximum threshold, an event is raised.

NOTE: To gather data about all sessions on a specific Citrix server in a Citrix farm, run this Knowledge Script on that individual server in the farm.

If you are monitoring multiple applications, separate events are raised for each application. The same thresholds apply to all applications.

29.1.1 Resource Objects

Citrix Presentation Server Applications object or individual applications

Citrix XenApp Applications object or individual applications

29.1.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if number of users exceeds or falls below threshold?	Select **Yes** to raise an event when the number of users running an application falls below the minimum threshold or exceeds the maximum threshold you set. The default is Yes.
Event severity when number of users exceeds or falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red event indicator).
Data Collection	
Collect data for number of users?	Select **Yes** to collect data for charts and reports. If enabled, returns information about the number of users running an application. The default is Yes.
Monitoring	
Threshold – Minimum number of users	Specify the minimum number of users across all sessions that can be running a published application before an event is raised. The value can range from 0 to 99999 users. The default is 5.
Threshold – Maximum number of users	Specify the maximum number of users across all sessions that can be running a published application before an event is raised. The default is 50.

29.2 BytesTransferredPerUser

Use this Knowledge Script to monitor the number of bytes per user transferred between client computers and the Citrix MetaFrame server or Citrix Presentation Server.

The number of bytes is calculated by taking the total of all bytes for all Independent Computing Architecture (ICA) sessions currently active for a user. For each user with one or more ICA protocol sessions on XenApp or Presentation Server, the sum of bytes transferred by all sessions associated with that user is compared to the threshold you set. If the number of bytes exceeds the threshold, an event is raised.

29.2.1 Resource Objects

Citrix Presentation Server object

Citrix XenApp object

29.2.2 Default Schedule

The default schedule is **Every 5 minutes**.

29.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if the total number of bytes transferred for a user exceeds threshold?	Select **Yes** to raise an event if the total bytes per user exceeds the threshold. The default is Yes.
Event severity when the total number of bytes transferred for a user exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the total bytes per user exceeds the threshold you set. The default is 5.
Data Collection	
Collect data for bytes transferred per user?	Select **Yes** to collect data for charts and reports. If enabled, returns information about the number of bytes per user transferred between ICA clients and XenApp or Presentation Server. The default is unselected.
Monitoring	
Threshold – Maximum bytes transferred per user	Specify the maximum number of bytes that can be transferred per user before an event is raised. The default is 10485760 bytes.

29.3 DataCollectorChanged

Use this Knowledge Script to determine whether the data collector for a Citrix XenApp server or Presentation Server zone has changed since the last time the script was run. If a change to the data collector for the selected zone is detected, an event is raised.

29.3.1 Resource Objects

Citrix Presentation Server Zones object or individual zones

Citrix XenApp Zones object or individual zones

29.3.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if a change to the data collector is detected?	Select **Yes** to raise an event if a change to the data collector for this server zone has occurred since the last monitoring interval. The default is Yes.
Event severity when a change is detected	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a change to the data collector occurs. The default is 5.
Data Collection	
Collect data for data collector changes?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns one of the following values: • **100** if the data collector has changed • **0** if the data collector has not changed The default is unselected.

29.4 DefaultDataCollector

Use this Knowledge Script to identify the default data collector for a specific Citrix XenApp server or Presentation Server under a Citrix farm, or to identify *all* available XenApp servers or Presentation Servers under a Citrix farm. The default data collector was called the *master browser* in versions prior to Citrix Presentation Server 4.0.

This script raises an event if the default data collector information is found, and the event message includes default data collector and zone information for the selected XenApp server or Presentation Server.

If you run this script on the Server Object, the event returns the zone name and the default data collector for all the servers that are discovered under Server Object. If you run this script on a particular server or set of servers, the event returns the zone name and default data collector for those servers only.

29.4.1 Resource Object

Citrix Presentation Server Servers object or individual servers

Citrix XenApp Servers object or individual servers

29.4.2 Default Schedule

By default, this script is only run once for each server.

29.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Event severity when default data collector information is found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the default data collector information is found. The default is 15.
Event severity when user is not a Citrix farm administrator	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the user is not a Citrix farm administrator. The default is 11.
Event severity when the job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event if the job fails unexpectedly. The default is 5.

29.5 FarmUserLoad

Use this Knowledge Script to monitor the number of users connected to each Citrix XenApp or Presentation Server in a server farm. You can set thresholds for the minimum and maximum number of users. An event is raised if the maximum threshold is exceeded or the minimum threshold is not met.

In addition, you can set thresholds based on a standard deviation, calculated from the number of users connected to each server in the farm since the first job iteration. The maximum and minimum thresholds for individual servers are defined by the number of standard deviations above or below the average number of users connected to all servers since the first iteration of the job.

If you use the standard deviation thresholds, the thresholds for the minimum and maximum numbers of users are ignored.

You can also specify servers in a farm that are to be excluded from monitoring by this Knowledge Script.

29.5.1 Resource Object

Citrix Presentation Server Farm object

Citrix XenApp Farm object

29.5.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if any threshold exceeded or not met?	Select **Yes** to raise an event if the number of standard deviations or the number of users exceeds or falls below one of the thresholds you set. The default is Yes.
Event severity when one of the thresholds is exceeded or is not met	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of standard deviations or the number of users exceeds or falls below a threshold. The default is 5.
Data Collection	
Collect data for number of users?	Select **Yes** to collect data for charts and reports. If enabled, returns the numbers of users connected to XenApp or Presentation Servers. The default is unselected.
Monitoring	
Type of threshold to use?	Select the type of threshold to use: • Standard Deviation • Minimum/Maximum The default is `Minimum/Maximum`.

Description	How to Set It
Standard Deviation Settings	
Threshold – Number of standard deviations below average	Specify the number of standard deviations below the average number of users connected to all servers in the farm. If the number of users of a particular server falls below this threshold, an event is raised. The default is 1.
Threshold – Number of standard deviations above average	Specify the number of standard deviations above the average number of users connected to all servers in the farm. If the number of users of a particular server exceeds this threshold, an event is raised. The default is 1.
Minimum/Maximum Settings	
Threshold – Minimum number of users	Specify the minimum number of users who must be connected to a server before an event is raised. The default is 10 users.
Threshold – Maximum number of users	Specify the maximum number of users who can be connected to a server before an event is raised. The default is 50 users.
Servers to exclude (comma-separated, no spaces)	Provide a list of server names, separated by commas and no spaces (for example, `MFServer1,MFServer2,MFServer3`). Servers specified in this parameter are not monitored by this Knowledge Script.

29.6 ICAAvgLatencyHigh

Use this Knowledge Script to monitor the average latency, in milliseconds, for Independent Computing Architecture (ICA) sessions on a Citrix Presentation Server or XenApp server. Latency refers to the delay between user input such as, mouse movement or keyboard strokes, and screen refresh.

Each time this Knowledge Script runs, it checks the average latency of each ICA session for the length of time the session has been open. If the average latency of any session exceeds the threshold you set, an event is raised.

Use the ICALatencyHigh Knowledge Script to monitor the most recently measured latency for each ICA session. If latency consistently exceeds the threshold you set, you can use the Citrix SpeedScreen Latency Reduction Manager to adjust your SpeedScreen settings.

29.6.1 Resource Objects

Citrix Presentation Server object

Citrix XenApp object

29.6.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if average latency exceeds threshold?	Select **Yes** to raise an event if the average latency for ICA sessions exceeds the threshold. The default is Yes.
Event severity when average latency exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which average latency exceeds the threshold you set. The default is 5.
Data Collection	
Collect data for average latency?	Select **Yes** to collect data for charts and reports. If enabled, returns the average latency of each ICA session for the length of time the session has been open. The default is unselected.
Monitoring	
Threshold – Maximum average latency of ICA sessions	Specify a maximum threshold, in milliseconds, for the average latency for any ICA session. The default is 30 milliseconds.

29.7 ICALatencyHigh

Use this Knowledge Script to monitor the most recent or current measure of latency for each Independent Computing Architecture (ICA) session on a Citrix MetaFrame server or Presentation Server. Latency refers to the delay between user input, such as mouse movement or keyboard strokes, and screen refresh.

If the most recent measure of latency for any ICA session exceeds the threshold you set, an event is raised.

Use the ICAAvgLatencyHigh Knowledge Script to monitor the average latency of all ICA sessions over time. If latency consistently exceeds the threshold you set, you can use the SpeedScreen Latency Reduction Manager to adjust your SpeedScreen settings.

29.7.1 Resource Objects

Citrix Presentation Server object

Citrix XenApp object

29.7.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if current latency exceeds threshold?	Select **Yes** to raise an event if the current latency for any ICA session exceeds the threshold. The default is Yes.
Event severity when current latency exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which latency exceeds the threshold you set. The default is 5.
Data Collection	
Collect data for current latency of ICA sessions?	Select **Yes** to collect data for charts and reports. If enabled, returns the most recent measure of latency for each ICA session. The default is unselected.
Monitoring	
Threshold – Maximum current latency of an ICA session	Specify the maximum latency amount (in milliseconds) any ICA session can have before an event is raised. The default is 30.

29.8 LicenseInUseHigh

Use this Knowledge Script to monitor the percentage of licenses in use for Citrix XenApp and Presentation Server. If the percentage of licenses in use exceeds the threshold you set, an event is raised.

Citrix XenApp and Presentation Server use a license server with license files that grant connection rights to a client. When a client connects to the server, one license is allocated. License servers can be shared by multiple server farms, and in such a case, a client can connect to either farm and consume only one license.

LicenseInUseHigh is cluster-aware. It monitors and collects data for active nodes, for all the available license types on the server. Even if you have two child jobs for LicenseInUseHigh, the script monitors and collects data for active nodes only. The LicenseInUseHigh job does not stop if the state of the cluster node changes, such as when the passive node of the cluster becomes active, or the active node becomes passive. In the event of a failover, LicenseInUseHigh monitors all the license types available on the server.

If data collection is enabled, this Knowledge Script returns the percentage of licenses in use compared to the total number of licenses available on the license server.

This Knowledge Script only monitors Citrix XenApp 5.0 and Citrix Presentation Server 4.5.

29.8.1 Resource Object

For clustered environments:

- Citrix Presentation server License object
- Citrix XenApp License object

For non-clustered environments:

- Citrix Presentation Server License object or individual license files
- Citrix XenApp License object or individual license files

29.8.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if percentage of licenses in use exceeds threshold?	Select **Yes** to raise an event if the percentage of licenses in use exceeds the threshold. The default is Yes.
Event severity when percentage of licenses in use exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of licenses in use exceeds the threshold. The default is 5.
Data Collection	

Description	How to Set It
Collect data for percentage of licenses in use?	Select **Yes** to collect data for charts and reports. If enabled, returns the percentage of licenses in use. The default is unselected.
Monitoring	
Threshold – Maximum percentage of licenses in use	Specify the maximum percentage of licenses that can be in use before an event is raised. The default is 80%.

29.9 PublishedApplicationDetails

This Knowledge Script searches for specified applications that are on the list of published applications for Citrix Server farms. This script raises an event that lists details about the published application or the list of applications, including the name of the farms and servers on which the application has been published.

29.9.1 Resource Objects

Citrix Presentation Server Farm object

Citrix XenApp Farm object

29.9.2 Default Schedule

By default, this script is only run once for each server.

29.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Applications to be verified in the published application list (comma-separated)	Type the name of the application or applications for which you want to determine is in the published application list. For more than one application, separate the application names with a comma, no space. This parameter supports the wild card characters "*" and "?" for published applications.
Event Notification	
Event severity when specified application details are found	Set the event severity level, from 1 to 40, to indicate the importance of the event raised when specific application details are found. The default is 15.
Event severity when user is not a Citrix farm administrator	Set the event severity level, from 1 to 40, to indicate the importance of the event raised when the user is not a Citrix Farm Administrator. The default is 11.
Event severity when the job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of the event in which this job fails unexpectedly. The default is 5.

29.10 ServerFarmHealth

Use this Knowledge Script to monitor a Citrix Presentation Server or XenApp server farm for unresponsive servers. You can set two thresholds for non-responding servers:

- The maximum number of servers that are unresponsive before a **warning** event is raised
- The maximum number of servers that are unresponsive before an **error** event is raised

This script raises an event if either threshold is exceeded. You can set severity levels for each event type.

You can also use this script to monitor the health and availability of the following services in a designated farm. The services in a designated farm must be running before you can collect data.

- Client Network
- Encryption
- Independent Management Architecture
- MFCOM (XenApp Management SDK)
- Licensing

Each service can display one of the following statuses:

- **Running** — The service is running.
- **Not running** — The service is not running.
- **SCM_Fail** — The service cannot establish a connection to the Service Control Manager (SCM), which monitors all Citrix Server services.
- **SRV_Fail** — The service establishes a connection to the Service Control Manager (SCM), but fails to establish a connection to the service.

29.10.1 Resource Objects

Citrix Presentation Server Farm object

Citrix XenApp Farm object

29.10.2 Default Schedule

The default schedule is **Every 10 minutes**.

29.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if number of servers not responding exceeds threshold?	Select **Yes** to raise an event if the number of unresponsive servers exceeds the thresholds you set. The default is Yes.

Description	How to Set It
Raise event to display the status of Citrix Server services in a farm?	Select **Yes** to raise an event to display the status of Citrix Server services in a designated farm. The default is Yes.
Warning event severity when the threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the warning threshold is exceeded. The default is 11.
Error event severity when the threshold is exceeded	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the error threshold is exceeded. The default is 5.
Event severity when the service is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Citrix Server service is down. The default is 5.
Data Collection	
Collect data for servers not responding?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of servers in the server farm that are down. If any servers are down, the data details include the names and IP addresses of servers that are unresponsive. The default is unselected.
Collect data for Citrix Server services in a farm?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of Citrix Server services in the farm that are down. The default is unselected.
Monitoring	
Servers to ignore	Provide a list of servers you do not want to monitor. Use commas with no spaces to separate server names in a list. For example, `MFServer1,MFServer2,MFServer3`. You can also click **Browse [...]** to use a network browser to select computer names.
Services to Ignore	
Ignore Client Network Service?	Select **Yes** to allow the script to ignore the Client Network Service during monitoring of the selected Citrix Server. The default is unselected. This option is useful when the Client Network Service is on a different server than the one you are monitoring. When this option is enabled, the ServerFarmHealth job does not raise an event if it cannot locate the Client Network Service.
Ignore Encryption Service?	Select **Yes** to allow the script to ignore the Encryption Service during monitoring of the selected Citrix Server. The default is unselected. This option is useful when the Encryption Service is on a different server than the one you are monitoring. When this option is enabled, the ServerFarmHealth job does not raise an event if it cannot locate the Encryption Service.

Description	How to Set It
Ignore Independent Management Architecture Service?	Select **Yes** to allow the script to ignore the Independent Management Architecture Service during monitoring of the selected Citrix Server. The default is unselected. This option is useful when the Independent Management Architecture Service is on a different server than the one you are monitoring. When this option is enabled, the ServerFarmHealth job does not raise an event if it cannot locate the Independent Management Architecture Service.
Ignore MFCom Service?	Select **Yes** to allow the script to ignore the MFCom Service during monitoring of the selected Citrix Server. The default is unselected. This option is useful when the MFCom Service is on a different server than the one you are monitoring. When this option is enabled, the ServerFarmHealth job does not raise an event if it cannot locate the MFCom Service.
Ignore Citrix Licensing Service?	Select **Yes** to allow the script to ignore the Citrix Licensing Service during monitoring of the selected Citrix Server. The default is unselected. This option is useful when the Citrix Licensing Service is on a different server than the one you are monitoring. When this option is enabled, the ServerFarmHealth job does not raise an event if it cannot locate the Citrix Licensing Service.
Warning event threshold – Maximum number of servers not responding	Specify the maximum number of servers that can be detected down before a warning event is raised. The default is 3 servers.
Error event threshold – Maximum number of servers not responding	Specify the maximum number of servers that can be detected down before an error event is raised. The default is 10 servers.

29.11 ServerProcessesHigh

Use this Knowledge Script to monitor the number of Citrix Presentation Server or XenApp processes across all sessions. If the number of server processes exceeds the specified threshold, an event is raised.

NOTE: To gather data about all sessions on a specific Citrix server in a Citrix farm, run this Knowledge Script on that individual server in the farm.

This script returns the number of processes generated by all sessions on XenApp or Presentation Server. The event detail message includes information about each process, such as process name, process state, process ID, and username.

Processes not generated by Independent Computing Architecture (ICA) sessions are not considered.

29.11.1 Resource Object

Citrix Presentation Server object

Citrix XenApp object

29.11.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if number of processes exceeds the threshold?	Select **Yes** to raise an event if the number of XenApp or Presentation Server processes across all sessions exceeds the specified threshold. The default is Yes.
Event severity when number of processes exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Data Collection	
Collect data for number of processes?	Select **Yes** to collect data for charts and reports. If enabled, returns the number of XenApp or Presentation Server processes across all sessions. The default is unselected.
Monitoring	
Threshold – Maximum processes on a server	Specify the maximum number of processes allowed on a server across all sessions before an event is raised. The default is 50 processes.

29.12 ServerProcessesResourceHigh

Use this Knowledge Script to monitor the use of CPU and memory resources by processes on Citrix Presentation Server or XenApp.

You can set thresholds for physical and virtual memory utilization and CPU utilization. If the use of resources by a process exceeds a threshold you set, an event is raised.

You can also set a script parameter to automatically terminate processes that exceed usage thresholds.

29.12.1 Resource Object

Citrix Presentation Server object

Citrix XenApp object

29.12.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if memory or CPU utilization exceeds threshold?	Select **Yes** to raise an event when the use of physical or virtual memory or CPU time exceeds the threshold you set. By default, events are enabled.
Event severity when memory or CPU utilization exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory or CPU utilization exceeds the threshold you set. The default is 5.
Data Collection	
Collect data for memory and CPU utilization?	Select **Yes** to collect data for charts and reports. If enabled, returns information about the use of physical and virtual memory (in KB) and CPU time (as a percentage). The default is unselected.
Monitoring	
Threshold – Maximum physical memory utilization	Specify the maximum amount of physical memory that can be used by any single XenApp or Presentation Server process before an event is raised. The default is 30720 KB.
Threshold – Maximum virtual memory utilization	Specify the maximum amount of virtual memory that can be used by any single XenApp or Presentation Server process before an event is raised. The default is 61440 KB.
Threshold – Maximum CPU utilization	Specify the maximum percentage of CPU time that can be used by any single XenApp or Presentation Server process before an event is raised. The default is 90%.

Description	How to Set It
Processes to monitor (comma-separated, no spaces)	Provide the names of the XenApp or Presentation Server processes you want to monitor. Separate multiple process names with commas and no spaces. For example, `Process1,Process2,Process3`. If no process names are entered, all processes are monitored. By default, all processes are monitored.
Terminate processes that exceed a threshold?	Select **Yes** to terminate any listed processes whose use of memory or CPU time exceeds the thresholds you set. The default is unselected.

29.13 ServerSessionsHigh

Use this Knowledge Script to monitor the number of sessions on Citrix XenApp or Presentation Server. If the number of sessions exceeds the threshold you set, an event is raised.

If data collection is enabled, this script returns the number of server sessions. The event detail message includes information about each session, such as session name, session ID, and username.

29.13.1 Resource Object

Citrix Presentation Server object

Citrix XenApp object

29.13.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if number of sessions exceeds threshold?	Select **Yes** to raise an event if the number of server sessions exceeds the threshold. The default is Yes.
Event severity when number of sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of sessions exceeds threshold. The default is 5.
Data Collection	
Collect data for number of sessions?	Select **Yes** to collect data for charts and reports. If enabled, returns the number of sessions, and information about each session. The default is unselected.
Monitoring	
Threshold – Maximum number of sessions on a server	Specify the maximum number of sessions allowed on a server before an event is raised. The default is 20 sessions.

29.14 SessionPerUser

Use this Knowledge Script to monitor the number of sessions on Citrix XenApp or Presentation Server open for each user. You can monitor individual servers or entire server farms. If the number of sessions per user exceeds the threshold you specify, an event is raised.

29.14.1 Resource Object

Citrix Presentation Server object

Citrix XenApp object

29.14.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event if number of sessions exceeds threshold?	Select **Yes** to raise an event if the number of user sessions exceeds the threshold you set. The default is Yes.
Event severity when number of sessions exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of sessions exceeds the threshold you set. The default is 5.
Data Collection	
Collect data?	Select **Yes** to collect data for charts and reports. If enabled, returns the number of sessions on XenApp or Presentation Server open for each user. The default is unselected.
Monitoring	
Threshold – Maximum number of sessions	Specify the maximum number of sessions on XenApp or Presentation Server that can be open for each user before an event is raised. The default is 5 sessions.
Monitor all servers in the farm?	Select **Yes** to monitor the number of sessions for all servers in a farm. The default is unselected.

29.15 SessionState

Use this Knowledge Script to monitor for Independent Computing Architecture (ICA) sessions that are in certain states. SessionState Knowledge Script can now monitor Citrix sessions per farm, generating event messages by farm name instead of server name.

If the number of sessions matching the states you select for monitoring falls below the minimum threshold or exceeds the maximum threshold you set, an event is raised.

SessionState obtains a list of all sessions from the Citrix XenApp API and loops through that list, looking at the state of each session. As an example, set the **Minimum threshold** to 2 and the **Maximum threshold** to 4. If this Knowledge Script finds two sessions in `LISTENING` state, and one in `ACTIVE` state, the number of sessions in `LISTENING` state is between the minimum and maximum thresholds, so the Knowledge Script will not raise an event for that state. The number of `ACTIVE` sessions has fallen below the minimum threshold, so the script raises an event for the `ACTIVE` state.

In a case like the one cited above, the Knowledge Script would not raise an event for any other session state, even if other states had fallen below the minimum threshold. It only raises events for a state if at least one session is in that particular state.

One use for this script is to track the number of active or idle XenApp or Presentation Server sessions.

29.15.1 Resource Object

Citrix Presentation Server object

Citrix XenApp object

29.15.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.15.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event when threshold exceeded or not met?	Select **Yes** to raise an event if the number of sessions matching a specified state exceeds or falls below the maximum or minimum threshold. The default is Yes.
Event severity when threshold exceeded or not met	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of sessions exceeds or falls below the threshold you set. The default is 5.
Data Collection	
Collect data for number of sessions in specified states?	Select **Yes** to collect data for charts and reports. If enabled, returns the number of sessions matching specified states. The default is unselected.

Description	How to Set It
Monitoring	
Threshold – Minimum number of sessions matching specified states	Specify the minimum number of sessions whose states must match the states you selected for monitoring before an event is raised. The default is 0 sessions (disabled).
Threshold – Maximum number of sessions matching specified states	Specify the maximum number of sessions whose states can match the states you selected for monitoring before an event is raised. The default is 5 sessions.
Session States to Monitor	
Session states that are monitored are as follows: • All session states • Active • Connected • Connecting • Disconnected • Down • Idle • Initializing • Listening • Resetting • Shadowing • Stale	Select **Yes** for each type of session state you want to monitor. By default, only **All session states** is set to Yes.

29.16 UserResourcesHigh

Use this Knowledge Script to monitor the utilization of CPU time and memory resources by users connected to XenApp or Presentation Server. You can select which users to monitor and set thresholds for physical or virtual memory utilization or CPU utilization.

Monitoring a user's processes occurs on a per-process basis. Resource utilization is only measured for the processes being used by the user selected for monitoring. However, the utilization metrics of different processes are not aggregated per user. All users on the server where you dropped the Knowledge Script are monitored by default.

If the percentage of CPU time or the amount of physical or virtual memory used by a process exceeds a threshold you set, an event is raised.

29.16.1 Resource Object

Citrix Presentation Server object

Citrix XenApp object

29.16.2 Default Schedule

The default schedule is **Every 30 minutes**.

29.16.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Raise event when CPU or memory utilization exceeds threshold?	Select **Yes** to raise an event when the use of CPU or memory resources by users connected to XenApp or Presentation Server exceeds any threshold you set. The default is Yes.
Event severity when CPU or memory utilization exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the CPU or memory utilization exceeds the threshold you set. The default is 5.
Data Collection	
Collect data for CPU and memory utilization?	Select **Yes** to collect data for charts and reports. If enabled, returns information about the use of CPU and memory resources by users connected to XenApp or Presentation Servers. The default is unselected.
Monitoring	
Threshold – Maximum physical memory utilization	Specify the maximum amount of physical memory that can be consumed by users connected to XenApp or Presentation Server before an event is raised. The default is 30720 KB.
Threshold – Maximum virtual memory utilization	Specify the maximum amount of virtual memory that can be consumed by users connected to XenApp or Presentation Server before an event is raised. The default is 61440 KB.

Description	How to Set It
Threshold – Maximum CPU utilization	Specify the maximum percentage of CPU time that can be consumed by users connected to XenApp or Presentation Server before an event is raised. The default is 90%.
Users to monitor (comma-separated, no spaces)	Provide the names of the users you want to monitor. Separate names in a list with commas and no spaces (for example, `User1,User2,User3`). If no names are entered, all users are monitored. By default, all users are monitored.

30 Dell OpenManage Knowledge Scripts

The AppManager for Dell OpenManage module provides the following Knowledge Scripts for monitoring Dell PowerEdge servers that run Dell OpenManage.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. In the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
AdapterSCSI	Monitors the status of the Adapter SCSI subsystem on Dell servers.
AmperageProbe	Monitors the amperage level for a Dell server.
ArrayLogicalDrive	Monitors the status of the array logical drives on Dell servers.
ArrayPhysicalDrive	Monitors the status of the array physical drives on Dell servers.
EventLog	Monitors the Dell Embedded Systems Management (ESM) Event Log for system hardware errors or events.
FanProbe	Monitors the status of individual fans.
HealthCheck	Monitors all Dell server-related services.
MemCheck	Monitors the global status of the Dell memory devices.
NICError	Monitors network interface transmission errors.
NICFail	Monitors the status of the network interface.
PowerRedundancy	Monitors the redundancy status of Dell power supplies.
PowerSupply	Monitors the status of the Dell power supplies.
Report_AmperageProbe	Generates a report about the amperage levels for Dell servers.
Report_ArrayLogicalDrives	Generates a report about the status of the array logical drives on Dell servers.
Report_ArrayPhysicalDrives	Generates a report about the status of the array physical drives on Dell servers.
Report_FanProbe	Generates a report about the status of individual fans.
Report_NICErrorRate	Generates a report about network interface transmission errors.
Report_TemperatureProbe	Generates a report about the Dell server's thermal environment.
Report_VoltageProbe	Generates a report about the voltage levels for Dell servers.
TempProbe	Monitors the Dell server's thermal environment.
VoltageProbe	Monitors the voltage level for a Dell server.

30.1 AdapterSCSI

Use this Knowledge Script to monitor the status of the Adapter SCSI subsystem on Dell servers. If the subsystem is not operational, an event is raised. The Dell server defines the characteristics of normal operation, degraded operation, and subsystem failure.

30.1.1 Resource Object

Adapter SCSI icon

30.1.2 Default Schedule

The default interval is **Every 10 minutes**.

30.1.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the SCSI subsystem is operating properly. • **50** if the SCSI operation has degraded. • **0** if the SCSI subsystem has failed. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community string you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`
Raise only one event if SNMP down?	Set to **y** to only raise a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Dell Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service or Dell Managed Node fails. The default is 10.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 30.
Event severity when SCSI subsystem critical condition	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SCSI subsystem is in critical condition. The default is 10.
Event severity when SCSI subsystem degraded condition	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SCSI subsystem is in a degraded condition. The default is 20.

30.2 AmperageProbe

Use this Knowledge Script to monitor the amperage level for a Dell server. This Knowledge Script raises an event if the amperage drops below or exceeds the normal operating threshold. The Dell server defines the amperage levels for normal and degraded operation.

30.2.1 Resource Object

Amperage icon

30.2.2 Default Schedule

The default interval is **Every 10 minutes**.

30.2.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the amperage at each monitoring interval. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community screen you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Raise only one event if SNMP down?	Set to **y** to raise only a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Dell Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which SNMP or Dell Managed Node fails. The default is 10.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 30.
Event severity when amperage exceeded normal threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the amperage exceeded the normal threshold. The default is 10.
Event severity when amperage degraded	Set the event severity, from 1 to 40, to indicate the importance of an event in which the amperage is at a level for degraded operation. The default is 20.
Event severity when amperage not known or not monitored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the amperage is not known or not monitored. The default is 30.

30.3 ArrayLogicalDrive

Use this Knowledge Script to monitor the status of the array logical drives on Dell servers. This Knowledge Script raises an event if the drive is not operational. The Dell server defines the characteristics of normal operation, degraded operation, and logical drive failure.

30.3.1 Resource Object

Array Logical Drive icon

30.3.2 Default Schedule

The default interval is **Every 10 minutes**.

30.3.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the array logical drive is operating properly. • **50** if drive operation has degraded. • **0** if the array logical drive has failed. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community screen you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Raise only one event if SNMP down?	Set to **y** to only raise a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Dell Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service or Dell Managed Node fails. The default is 10.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 30.
Event severity when array logical drive failed	Set the event severity, from 1 to 40, to indicate the importance of an event in which the array logical drive fails. The default is 10.
Event severity when array logical drive degraded	Set the event severity, from 1 to 40, to indicate the importance of an event in which the array logical drive is in a degraded condition. The default is 20.
Event severity when array logical drive rebuilding or recovering	Set the event severity, from 1 to 40, to indicate the importance of an event in which the array logical drive is rebuilding or recovering. The default is 25.
Event severity when array logical drive offline	Set the event severity, from 1 to 40, to indicate the importance of an event in which the array logical drive is offline. The default is 25.

30.4 ArrayPhysicalDrive

Use this Knowledge Script to monitor the status of the array physical drives on Dell servers. This Knowledge Script raises an event if the drive is not operational. The Dell server defines the characteristics of normal operation, degraded operation, and physical drive failure.

30.4.1 Resource Object

Array Physical Drive icon

30.4.2 Default Schedule

The default interval is **Every 10 minutes**.

30.4.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the array physical drive is operating properly. • **50** if drive operation has degraded. • **40** if the array physical drive is rebuilding or recovering. • **0** if the array physical drive has failed or has been removed. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community screen you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Raise only one event if SNMP down?	Set to **y** to raise only a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Dell Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service or Dell Managed Node fails. The default is 10.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 30.
Event severity when array physical drive failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the array physical drive fails. The default is 10.
Event severity when array physical drive degraded condition	Set the event severity, from 1 to 40, to indicate the importance of an event in which the array physical drive is in a degraded condition. The default is 20
Event severity when array physical drive removed	Set the event severity, from 1 to 40, to indicate the importance of an event in which the array physical drive has been removed. The default is 15.

Description	How To Set It
Event severity when array physical drive rebuilding or recovering	Set the event severity, from 1 to 40, to indicate the importance of an event in which the array physical drive is rebuilding or recovering. The default is 25.
Event severity when array physical drive offline	Set the event severity, from 1 to 40, to indicate the importance of an event in which the array physical drive is offline. The default is 25.

30.5 EventLog

Use this Knowledge Script to monitor the Dell Embedded Systems Management (ESM) Event Log for system hardware errors or events. This Knowledge Script raises an event for each new log entry since the previous iteration.

30.5.1 Resource Object

Dell Event Log

30.5.2 Default Schedule

The default interval is **Every 10 minutes**.

30.5.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community screen you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Raise only one event if SNMP down?	Set to **y** to raise only a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity when SNMP or Dell Server Agent failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service or Dell Server Agent failed. The default is 9.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 30.
Event severity when hardware events detected	Set the event severity, from 1 to 40, to indicate the importance of an event in which hardware events were detected. The default is 8.

30.6 FanProbe

Use this Knowledge Script to monitor the status of individual fans. This Knowledge Script raises an event for each fan being monitored that is not operating properly or if its status is unknown.

30.6.1 Resource Object

Dell Fan icon

30.6.2 Default Schedule

The default interval is **Every 10 minutes**.

30.6.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • The number of revolutions per minute (rpm) of the fan. • The status of the fan at each interval. If the fan status is monitored, the script returns a value of 1 if the fan is On, or a value of 0 if the fan is Off. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community screen you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Raise only one event if SNMP down?	Set to **y** to raise only a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Dell Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of on event in which the SNMP or Dell Managed Node failed. The default is 10.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of on event in which the SNMP service has been restored. The default is 30.
Event severity when fan critical	Set the event severity, from 1 to 40, to indicate the importance of on event in which the fan has a status of critical. The default is 10.
Event severity when fan degraded	Set the event severity, from 1 to 40, to indicate the importance of on event in which the fan is in a degraded status. The default is 20.
Event severity when fan not known or not monitored	Set the event severity, from 1 to 40, to indicate the importance of on event in which the status of the fan is not known or the fan is not monitored. The default is 20.

30.7 HealthCheck

Use this Knowledge Script to monitor all Dell server-related services. This Knowledge Script raises an event if any service is not running and automatically re-starts the stopped services. In addition, this Knowledge Script raises an event if SNMP is not operating or cannot get a MIB variable value.

30.7.1 Resource Objects

Dell server, any Dell Service icons

30.7.2 Default Schedule

The default interval is **Every 5 minutes**.

30.7.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Auto-start service?	Set to **y** to automatically restart the stopped services. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the status of Dell server-related services. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community screen you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Event severity when service down; restart failed	Set the event severity, from 1 to 40, to indicate the importance of an event in which a service is down and restart failed. The default is 5.
Event severity when service down; restart succeeded	Set the event severity, from 1 to 40, to indicate the importance of an event in which a service is down and restart succeeded. The default is 25.
Event severity when service down; do not restart	Set the event severity, from 1 to 40, to indicate the importance of an event in which a service is down and will not be restarted. The default is 18.
Event severity when service down or cannot get MIB value	Set the event severity, from 1 to 40, to indicate the importance of an event in which the service is down or cannot get the MIB variable value. The default is 5.

30.8 MemCheck

Use this Knowledge Script to monitor the global status of Dell memory devices. This Knowledge Script raises an event if any memory device is not operational. The Dell server defines the conditions for normal operation internally.

30.8.1 Resource Object

Memory Check icon

30.8.2 Default Schedule

The default interval is **Every 10 minutes**.

30.8.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns the status of memory devices at each monitoring interval: • **100** if memory devices are operating properly. • **50** if operation has degraded. • **0** if memory devices have failed. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community screen you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Raise only one event if SNMP down?	Set to **y** to raise only a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Dell Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service or Dell Managed Node failed. The default is 10.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 30.
Event severity when memory device failed	Set the event severity, from 1 to 40, to indicate the importance of an event in which the memory device failed. The default is 10.
Event severity when memory device degraded	Set the event severity, from 1 to 40, to indicate the importance of an event in which the memory device has a status of degraded. The default is 20.
Event severity when memory device not known or not monitored.	Set the event severity, from 1 to 40, to indicate the importance of an event in which the condition of the memory device is not known or not monitored. The default is 30.

30.9 NICError

Use this Knowledge Script to monitor network interface transmission errors. This Knowledge Script reports both input and output errors and compares them to respective thresholds. This Knowledge Script raises an event if the number of network interface errors per minute exceeds the set threshold.

30.9.1 Resource Object

Dell Network Interface icon

30.9.2 Default Schedule

The default interval is **Every 30 minutes**.

30.9.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the operational status of the network interface subsystem at each monitoring interval. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community screen you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Input errors per minute maximum threshold	Type a threshold for the maximum number of input errors per minute. The default is 2 errors per minute.
Output errors per minute maximum threshold	Type a threshold for the maximum number of output errors per minute. The default is 4 errors per minute.
Raise only one event if SNMP down?	Set to **y** to raise only a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Dell Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service or Dell Managed Node failed. The default is 9.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 30.
Event severity when input errors per minute exceeded threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which input errors per minute exceeded the threshold. The default is 10.
Event severity when output errors per minute exceeded threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which output errors per minute exceeded threshold. The default is 10.

30.10 NICFail

Use this Knowledge Script to monitor the status of the network interface. This Knowledge Script checks whether the network interface subsystem is down when the administrator has indicated it should be in the up state. The event detail message includes the time at which the interface was discovered as down.

30.10.1 Resource Object

Dell Network Interface icon

30.10.2 Default Schedule

The default interval is **Every 5 minutes**.

30.10.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community screen you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns the operational status of the network interface subsystem at each monitoring interval. The default is n.
Raise only one event if SNMP down?	Set to **y** to raise only a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service or Managed Node failed. The default is 9.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 30.
Event severity when network interface down	Set the event severity, from 1 to 40, to indicate the importance of an event in which the network interface is down. The default is 6

30.11 PowerRedundancy

Use this Knowledge Script to monitor the redundancy status of Dell power supplies. This Knowledge Script raises an event if power redundancy is not operational. The Dell server defines the characteristics of normal power redundancy, degraded redundancy, and redundancy failure.

30.11.1 Resource Object

Power Redundancy icon

30.11.2 Default Schedule

The default interval is **Every 10 minutes**.

30.11.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the redundant power supply is operating properly. • **50** if its operation has degraded. • **0** if the redundant power supply has failed. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community screen you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Raise only one event if SNMP down?	Set to **y** to raise only a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Dell Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service or Dell Managed Node failed. The default is 10.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 30.
Event severity when not redundant or status unknown	Set the event severity, from 1 to 40, to indicate the importance of an event in which the status of the power supply redundancy is not redundant or unknown. The default is 30.
Event severity when redundancy offline	Set the event severity, from 1 to 40, to indicate the importance of an event in which the status of the power supply redundancy is offline. The default is 20.
Event severity when redundancy degraded	Set the event severity, from 1 to 40, to indicate the importance of an event in which the status of the power supply redundancy is degraded. The default is 20.
Event severity when redundancy lost	Set the event severity, from 1 to 40, to indicate the importance of an event in which the status of the power supply redundancy is lost. The default is 10.

30.12 PowerSupply

Use this Knowledge Script to monitor the status of the Dell power supplies. This Knowledge Script raises an event if the power supply is not operational. The Dell server defines the status for normal, degraded, and failed operation.

30.12.1 Resource Object

Power Supply icon

30.12.2 Default Schedule

The default interval is **Every 10 minutes**.

30.12.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script returns: • **100** if the power supply is operating properly. • **50** if its operation has degraded. • **0** if the power supply has failed. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community string you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Raise only one event if SNMP down?	Set to **y** to raise only a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Dell Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service or Dell Managed Node failed. The default is 10.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 10.
Event severity when power supply failed	Set the event severity, from 1 to 40, to indicate the importance of an event in which the power supply failed. The default is 10.
Event severity when power supply degraded	Set the event severity, from 1 to 40, to indicate the importance of an event in which the power supply has a status of degraded. The default is 20.

30.13 Report_AmperageProbe

Use this Dell_Report script to generate a report about the amperage levels for Dell servers. You can use this report to make a statistical analysis of the data point values over the time range you define for the report.

The AmperageProbe Knowledge Script collects data for this report.

30.13.1 Resource Objects

Report agent

30.13.2 Default Schedule

The default schedule is **Run once**.

30.13.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Data source	
Select computers	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekdays	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How To Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report. • **Minimum**: The minimum value of data points for the time range of the report. • **Maximum**: The maximum value of data points for the time range of the report. • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report. • **Range**: The range of values in the data stream (maximum - minimum = range). • **StandardDeviation**: The measure of how widely values are dispersed from the mean. • **Sum**: The total value of data points for the time range of the report. • **Close**: The last value for the time range of the report. • **Change**: The difference between the first and last values for the time range of the report (close - open = change). • **Count**: The number of data points for the time range of the report.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted. • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right). • **Top%**: Chart only the top N% of selected data (sorted by default). • **Top N**: Chart only the top N of selected data (sorted by default). • **Bottom%**: Chart only the bottom N% of data (sorted by default). • **Bottom N**: Chart only the bottom N of selected data (sorted by default).
Percentage/count for top/bottom	Type a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column. • **Report Minimum**: The minimum value in a column. • **Report Maximum**: The maximum value in a column. • **Report Total**: The total of all values in a column. The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How To Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set properties for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set the miscellaneous report properties.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Event severity for report success	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity for report with no data	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity for report failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report failed to generate. The default is 5.

30.14 Report_ArrayLogicalDrives

Use this Dell_Report script to generate a report about the status of the array logical drives on Dell servers. You can use this report to make a statistical analysis of the data point values over the time range you define for the report.

The ArrayLogicalDrive Knowledge Script collects data for this report.

30.14.1 Resource Objects

Report agent

30.14.2 Default Schedule

The default schedule is **Run once**.

30.14.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Data source	
Select computers	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekdays	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How To Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report. • **Minimum**: The minimum value of data points for the time range of the report. • **Maximum**: The maximum value of data points for the time range of the report. • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report. • **Range**: The range of values in the data stream (maximum - minimum = range). • **StandardDeviation**: The measure of how widely values are dispersed from the mean. • **Sum**: The total value of data points for the time range of the report. • **Close**: The last value for the time range of the report. • **Change**: The difference between the first and last values for the time range of the report (close - open = change). • **Count**: The number of data points for the time range of the report.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted. • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right). • **Top%**: Chart only the top N% of selected data (sorted by default). • **Top N**: Chart only the top N of selected data (sorted by default). • **Bottom%**: Chart only the bottom N% of data (sorted by default). • **Bottom N**: Chart only the bottom N of selected data (sorted by default).
Percentage/count for top/bottom	Type a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column. • **Report Minimum**: The minimum value in a column. • **Report Maximum**: The maximum value in a column. • **Report Total**: The total of all values in a column. The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How To Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set properties for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set the miscellaneous report properties.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Event severity for report success	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity for report with no data	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity for report failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report failed to generate. The default is 5.

30.15 Report_ArrayPhysicalDrives

Use this Dell_Report script to generate a report about the status of the array physical drives on Dell servers. You can use this report to make a statistical analysis of the data point values over the time range you define for the report.

The ArrayPhysicalDrive Knowledge Script collects data for this report.

30.15.1 Resource Objects

Report agent

30.15.2 Default Schedule

The default schedule is **Run once**.

30.15.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Data source	
Select computers	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekdays	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How To Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report. • **Minimum**: The minimum value of data points for the time range of the report. • **Maximum**: The maximum value of data points for the time range of the report. • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report. • **Range**: The range of values in the data stream (maximum - minimum = range). • **StandardDeviation**: The measure of how widely values are dispersed from the mean. • **Sum**: The total value of data points for the time range of the report. • **Close**: The last value for the time range of the report. • **Change**: The difference between the first and last values for the time range of the report (close - open = change). • **Count**: The number of data points for the time range of the report.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted. • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right). • **Top%**: Chart only the top N% of selected data (sorted by default). • **Top N**: Chart only the top N of selected data (sorted by default). • **Bottom%**: Chart only the bottom N% of data (sorted by default). • **Bottom N**: Chart only the bottom N of selected data (sorted by default).
Percentage/count for top/bottom	Type a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column. • **Report Minimum**: The minimum value in a column. • **Report Maximum**: The maximum value in a column. • **Report Total**: The total of all values in a column. The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How To Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set properties for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set the miscellaneous report properties.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Event severity for report success	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity for report with no data	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity for report failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report failed to generate. The default is 5.

30.16 Report_FanProbe

Use this Dell_Report script to generate a report about the status of individual fans. You can use this report make a statistical analysis of the data point values over the time range you define for the report.

The FanProbe Knowledge Script collects data for this report.

30.16.1 Resource Objects

Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How To Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set properties for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set the miscellaneous report properties.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Event severity for report success	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity for report with no data	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity for report failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report failed to generate. The default is 5.

30.19 Report_VoltageProbe

Use this Dell_Report script to generate a report about the voltage levels for Dell servers. You can use this report to make a statistical analysis of the data point values over the time range you define for the report.

The VoltageProbe Knowledge Script collects data for this report.

30.19.1 Resource Objects

Report agent

30.19.2 Default Schedule

The default schedule is **Run once**.

30.19.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Data source	
Select computers	Select the computers for your report.
Select time range	Set a specific or sliding time range for data included in your report.
Select peak weekdays	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How To Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report. • **Minimum**: The minimum value of data points for the time range of the report. • **Maximum**: The maximum value of data points for the time range of the report. • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report. • **Range**: The range of values in the data stream (maximum - minimum = range). • **StandardDeviation**: The measure of how widely values are dispersed from the mean. • **Sum**: The total value of data points for the time range of the report. • **Close**: The last value for the time range of the report. • **Change**: The difference between the first and last values for the time range of the report (close - open = change). • **Count**: The number of data points for the time range of the report.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted. • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right). • **Top%**: Chart only the top N% of selected data (sorted by default). • **Top N**: Chart only the top N of selected data (sorted by default). • **Bottom%**: Chart only the bottom N% of data (sorted by default). • **Bottom N**: Chart only the bottom N of selected data (sorted by default).
Percentage/count for top/bottom	Type a number for either the percentage or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column. • **Report Minimum**: The minimum value in a column. • **Report Maximum**: The maximum value in a column. • **Report Total**: The total of all values in a column. The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How To Set It
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set properties for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set the miscellaneous report properties.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Event severity for report success	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Event severity for report with no data	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25.
Event severity for report failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the report failed to generate. The default is 5.

30.20 TempProbe

Use this Knowledge Script to monitor the Dell server's thermal environment. If any component is operating out of normal temperature range, this Knowledge Script generates a warning event. If any component overheats beyond an acceptable temperature range, this Knowledge Script raises a critical condition event.

30.20.1 Resource Object

Temperature icon

30.20.2 Default Schedule

The default interval is **Every 10 minutes**.

30.20.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the temperature (in degrees Celsius) at each monitoring interval. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community string you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Raise only one event if SNMP down?	Set to **y** to raise only a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Dell Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service or Dell Managed Node failed. The default is 10.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 30.
Event severity when temperature critical	Set the event severity, from 1 to 40, to indicate the importance of an event in which the temperature condition is critical. The default is 10.
Event severity when temperature warning	Set the event severity, from 1 to 40, to indicate the importance of an event in which the temperature condition is warning. The default is 20.
Event severity when temperature not known or not monitored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the temperature is not known or not monitored. The default is 30.

30.21 VoltageProbe

Use this Knowledge Script to monitor the voltage level for a Dell server. This Knowledge Script raises an event if the voltage drops below or exceeds the normal operating threshold. The Dell server defines the voltage levels for normal operation.

30.21.1 Resource Objects

Voltage icon

30.21.2 Default Schedule

The default interval is **Every 10 minutes**.

30.21.3 Setting Parameter Values

Set the following parameters as needed.

Description	How To Set It
Event?	Set to **y** to raise events. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If set to y, this Knowledge Script records the voltage (in volts) at each monitoring interval. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community string you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Raise only one event if SNMP down?	Set to **y** to raise only a single event rather than an event for each monitored object when the SNMP service is down. The default is y.
Event severity for SNMP or Dell Managed Node failure	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service or Dell Managed Node failed. The default is 10.
Event severity when SNMP restored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the SNMP service has been restored. The default is 30.
Event severity when voltage level exceed critical threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the voltage level exceeded the critical threshold. The default is 10.
Event severity when voltage level near critical threshold	Set the event severity, from 1 to 40, to indicate the importance of an event in which the voltage level is near the critical threshold. The default is 20.
Event severity when voltage not known or not monitored	Set the event severity, from 1 to 40, to indicate the importance of an event in which the voltage level is not known or not monitored. The default is 30.

31 Diag Knowledge Scripts

Most of the Knowledge Scripts for Diagnostic Console require no user interaction. These scripts are initiated on the selected AppManager server when you start AppManager Diagnostic Console. Do *not* change the parameter settings for these scripts — you will severely impact the data that Diagnostic Console collects.

The one exception to the rule is StartCollectionAD, for which you can choose to enable the collection of Active Directory object counts.

For more information, see the AppManager Diagnostic Console *User Guide*, which is available on the AppManager Documentation Web site: https://www.netiq.com/support/am/extended/documentation/default.asp.

Knowledge Script	What It Does
RetrieveData	Instructs the Diagnostic Console managed object to send all collected data back to the database.
StartCollectionAD	Instructs the Diagnostic Console managed object to collect data relating to Active Directory. In addition, enables or disables the collection of Active Directory object counts.
StartCollectionExchange	Instructs the Diagnostic Console managed object to collect data relating to Microsoft Exchange.
StartCollectionNT	Instructs the Diagnostic Console managed object to collect data relating to Microsoft Windows.

31.1 RetrieveData

The Knowledge Scripts for Diagnostic Console require no user interaction. This script is initiated on the selected AppManager server when you start AppManager Diagnostic Console.

RetrieveData tells the Diagnostic Console managed object to send all collected data back to the database.

Do *not* change the parameter settings for this script—you will severely impact the data that Diagnostic Console collects.

For more information, see the AppManager Diagnostic Console *User Guide*, which is available on the AppManager Documentation Web site:
https://www.netiq.com/support/am/extended/documentation/default.asp.

31.2 StartCollectionAD

StartCollectionAD tells the Diagnostic Console managed object to begin data collection on a domain controller for Diagnostic Console. In addition, you can choose to enable or disable the collection of Active Directory object counts. This Knowledge Script is initiated on the selected AppManager server when you start AppManager Diagnostic Console.

For more information, see the AppManager Diagnostic Console *User Guide*, which is available on the AppManager Documentation Web site:
https://www.netiq.com/support/am/extended/documentation/default.asp.

31.2.1 Setting Parameter Values

Set the following parameter as needed:

Parameter	How To Set It
Collect database object count	By default, this script collects Active Directory object counts and displays them in the Database plug-in view of Diagnostic Console and in the Database report. The collection of this data causes a small increase in the overall CPU usage of the LSASS process. The increased usage is necessary for calculating the various object counts. To avoid the increased LSASS CPU load, you can disable the collection of object counts by setting this parameter to No. **NOTE:** If you disable this parameter, the Object Counts table in the Database plug-in and Database report remains blank.

31.3 StartCollectionExchange

The Knowledge Scripts for Diagnostic Console require no user interaction. This script is initiated on the selected AppManager server when you start AppManager Diagnostic Console.

StartCollectionExchange tells the Diagnostic Console managed object to begin collecting data relating to Microsoft Exchange.

Do *not* change the parameter settings for this script—you will severely impact the data that Diagnostic Console collects.

For more information, see the AppManager Diagnostic Console *User Guide*, which is available on the AppManager Documentation Web site:
https://www.netiq.com/support/am/extended/documentation/default.asp.

31.4 StartCollectionNT

The Knowledge Scripts for Diagnostic Console require no user interaction. This script is initiated on the selected AppManager server when you start AppManager Diagnostic Console.

StartCollectionNT tells the Diagnostic Console managed object to begin collecting data relating to Microsoft Windows.

Do *not* change the parameter settings for this script—you will severely impact the data that Diagnostic Console collects.

For more information, see the AppManager Diagnostic Console *User Guide*, which is available on the AppManager Documentation Web site:
https://www.netiq.com/support/am/extended/documentation/default.asp.

32 Discovery Knowledge Scripts

The Discovery category provides Knowledge Scripts that discover information about your Microsoft Windows or UNIX operating environment and application-specific resource configuration. Each Discovery Knowledge Script has a specialized task, such as finding configuration details about the Windows operating system, the Microsoft Exchange Server, or the Microsoft SQL Server installed on the computer where you run the Knowledge Script.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. Or in the Operator Console, click any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
ActiveDS	Discovers Active Directory servers and objects for Microsoft Windows 2000, Windows Server 2003, and Windows Server 2008.
AD-RT	Discovers ResponseTime for Active Directory clients.
AdvancedAnalytics	Discovers configuration and resource information for NetIQ Advanced Analytics servers.
Agentless	Discovers resource information for remote computers that you want to monitor.
AMHealth	Discovers AppManager and Control Center resources installed on Windows servers.
AMHealthUNIX	Discovers AppManager resources installed on UNIX servers.
ApacheUNIX	Discovers the Apache resource and configuration information on UNIX servers.
AppAnalyzer	Discovers the AppAnalyzer Agent on an Exchange Server.
ARCserve	Discovers Computer Associates ARCserve servers and the services associated with them.
AvayaCM	Discovers Communication Manager resources and configuration information.
BackupExec	Discovers Symantec Backup Exec servers and the services associated with them.
BES	Discovers BlackBerry Enterprise Server v4.0 resource and configuration information.
BlackBerry	Discovers BlackBerry Enterprise Server resource and configuration information.
CallDataAnalysis	Discovers Call Data Analysis resource and configuration information.

Knowledge Script	What It Does
CIM	Discovers resources associated with Compaq Insight Management Agents on Compaq servers.
CiscoCallMgr	Discovers Cisco CallManager configuration and resources.
CiscoCM	Discovers a Cisco Unified CallManager cluster and its resources.
CiscoCM_4x	Discovers a Cisco CallManager 4.x cluster and its resources.
CiscoCME	Discovers Cisco CallManager Express configuration and resources, such as routers, switches, and gateways.
CiscoCNS_PerfE	Discovers the Cisco CNS Performance Engine (CNS-PerfE) and its configuration.
CiscoICD	Discovers Cisco ICD (Integrated Contact Distribution) configuration and resources.
CiscoICM	Discovers Cisco Intelligent Contact Management (ICM) configuration and resources.
CiscoICS	Discovers Cisco Integrated Communications System (ICS) configuration and resources.
CiscoIPTSecurity	Discovers security-related applications, such as Cisco Security Agent (CSA) and Symantec AntiVirus, on the Cisco IP telephony servers on which you installed the Cisco IP Telephony Security module.
CiscoIPTV	Discovers Cisco IP/TV configuration and resources.
CiscoIVR	Discovers Cisco Interactive Voice Response (IVR) configuration and resources.
CiscoPersonalAsst	Discovers Cisco Personal Assistant configuration and resources.
CiscoUC	Discovers Cisco Unity Connection resources.
CiscoUCM	Discovers configuration and resource information for Cisco Unified Communications servers and Cisco Universal Presence Server (CUPS) resources.
CiscoUE	Discovers Cisco Unity Express resources and configuration information.
CiscoUnity	Discovers Cisco Unity configuration and resources.
CiscoUnityBridge	Discovers Cisco Unity Bridge configuration and resources.
Cluster	Discovers clustered applications on physical computers and virtual machines.
Dell	Discovers resources associated with Dell OpenManage/HIP capability on Dell servers.
Domino	Discovers Lotus Domino server configuration and resources, including partitioned servers.
Exchange	Discovers Microsoft Exchange Server 5.5 (or earlier) and Exchange 2000/2003 configuration and resources.
Exchange2007	Discovers configuration and resources for Microsoft Exchange Server 2007, 2010, or 2013.
ExchangeDAG	Discovers the virtual object for a Microsoft Exchange Server 2010 database availability group (DAG).
Exchange-RT	Discovers ResponseTime for Exchange clients and servers.

Knowledge Script	What It Does
Hardware	Discovers Cisco UCS, Dell, HP, and IBM server configuration and resources for computers running Microsoft Windows operating systems.
HardwareUNIX	Discovers server configuration and resources for HP computers running Linux operating systems.
Hyper-V	Discovers CPU, memory, networks, and file systems installed on all Hyper-V hosts listed in a discovery input file.
IIS	Discovers Microsoft Internet Information Server (IIS) configuration and resources.
Lync	Discovers all known resources on a Microsoft Lync server.
MFXP	Discovers Citrix XenApp or Presentation Server resources and configuration information.
ModuleBuilder	Discovers configurations and resources for Module Builder
MOMReportAgent	Discovers the AppManager Reporting Agent. for MOM, which is installed with the XMP Report Module.
MQSeries	Discovers IBM MQSeries queues, queue managers, channels, and servers.
MSCS	Discovers Microsoft Cluster Server (MSCS) configuration and resources.
NetBackup	Discovers Symantec NetBackup configuration and resources on Windows servers.
NetBackupUNIX	Discovers Symantec NetBackup configuration and resources on UNIX servers.
NetfinityDir	Discovers IBM Netfinity Director configuration and resources.
NetWorker	Discovers Legato NetWorker servers and the services and other resources (such as backup groups and devices) associated with those servers.
Networks-RT	Discovers ResponseTime for Networks configuration and resources.
Networks-RTProxy	Discovers ResponseTime for Networks configuration and resources on remote computers (endpoints installed on UNIX computers and other places where a Windows-based AppManager agent and ResponseTime for Networks managed object are not installed).
NortelBCM	Discovers Nortel BCM (Business Communications Manager) configuration and resources.
NortelBCMx	Discovers the various components of a Nortel BCM installation for software version 4.0 and hardware models 50, 50a, 50e, 200, 400, and 1000.
NortelCC	Discovers Nortel Contact Center servers, databases, CDNs, DNISs, IVR queues, and IVR ports.
NortelCS	Discovers the various components of a Nortel CS1000 IP telephony system installation: Call Server, MGC, Signaling Server, NRS, MC32S, ECM, and VGMC.
NortelCS2x	Creates the Nortel CS2x supplemental database and configures the data collector services that collect data from Nortel CS2000 and CS2100 components.

Knowledge Script	What It Does
NT	Discovers Microsoft Windows configuration and resource information.
OCS	Discovers all known resources on a Microsoft OCS server.
Oracle	Discovers configuration and resource information for Oracle Database servers.
Oracle-RT	Discovers ResponseTime for Oracle Database configuration and resources.
OracleUNIX	Discovers configuration and resource information for Oracle system resources installed on UNIX and Linux computers.
PhoneQuality	Discovers a Phone Quality object on the computer that will be used for monitoring IP phones.
PowerVM	Discovers configuration and resource information for PowerVM servers.
ReportAgent	Discovers the NetIQ AppManager report agent and its data sources.
Security	Discovers Windows security resources on the computers in your network.
SharePoint	Discovers configuration and resource information for Microsoft SharePoint servers.
Siebel	Discovers Siebel eBusiness Application components and resources on Windows computers.
Siemens	Discovers Siemens ServerView configuration and resources.
SIPServer	Discovers a server that uses Session Initiation Protocol (SIP), and discovers resources for that server.
Snmp	Discovers SNMP devices on a network.
SNMPTraps	Discovers known devices that forward SNMP traps to a NetIQ Trap Receiver server.
SolarisZones	Discovers SolarisZones host resources: host attributes, zones, processing units, memory units, virtual network interface cards (VNICs), and ZFS pools.
SQL	Discovers Microsoft SQL Server configuration and resources.
SQL-RT	Discovers ResponseTime for Microsoft SQL Server clients and servers.
SQL Server	Discovers Microsoft SQL Server configuration and resources.
StreamingMedia-RT	Discovers Streaming-RT configuration and resources.
UNIX	Discovers AppManager UNIX agents on managed UNIX servers.
VirtualCenter	Discovers VMware vSphere resources.
VoIPQuality_CallPerf	Discovers the VoIP Quality-Call Performance managed object when the AppManager agent, the managed object, and the Performance Endpoint are on the same computer.
VoIPQuality_CallPerfProxy	Discovers the VoIP Quality-Call Performance Proxy managed object on computer that does not have the AppManager agent installed but does have a NetIQ Performance Endpoint.
VoIPQuality_CallSetup_H.323	Discovers the H.323 protocol configuration and resources.
VoIPQuality_CallSetup_SIP	Discovers the SIP protocol configuration and resources.

Knowledge Script	What It Does
VoIPQuality_CiscoSAA	Discovers the VoIP Quality-Cisco SAA managed object on a computer on which the Cisco SAA software is installed.
Web-RT	Discovers AppManager ResponseTime for Web resources, including Web sites, services, Web transactions, and related protocols.
WebLogicSvr	Discovers Oracle WebLogic Application Servers installed on Windows servers.
WebLogicSvrUNIX	Discovers Oracle WebLogic Application Servers installed on UNIX servers.
WebSphereAppSrv	Discovers WebSphere Application Servers and resources in the administrative domain.
WebSphereAppSrvUNIX	Discovers IBM WebSphere Application Servers and resources installed on UNIX servers.
WebSphereMQUNIX	Discovers IBM WebSphere MQ (formerly **MQSeries**) Servers on UNIX, including WebSphere MQ Server queues, queue managers, and channels.
Win-RT	Discovers AppManager ResponseTime for Windows resources. Verifies that a user domain, name, and password to be associated with the agent's Win-RT service have been entered in AppManager's Security Manager.
Win-RT7	Discovers settings for the ResponseTime 7.1 for Windows managed object and the ResponseTime for Windows service on Windows servers. It also verifies that the user domain, name, and password associated with the agent's ResponseTime for Windows service have been entered in AppManager Security Manager.
WMI	Discovers Microsoft Windows Management Instrumentation (WMI) server configuration and resources.
WS.NET	Discovers Web service resources and configuration for .NET on Windows computers.
WTS	Discovers Microsoft Windows Terminal Server configuration and resources. If Citrix MetaFrame is installed on a Windows Terminal Server, this Knowledge Script discovers MetaFrame resources as well.
XenApp	Discovers Citrix XenApp resources and configuration information.
XenDesktop	Discovers Citrix XenDesktop and XenApp components.

32.1 Discovering Application Resources

When you run a Discovery Knowledge Script on one or more computers, the Knowledge Script collects information about the resources (such as memory, CPU, physical disk space, etc.) on the selected computers and creates a view in the Operator Console for displaying these resources.

Once you have discovered an application's configuration on a computer, you can run additional application-specific Knowledge Scripts on that computer. For example, you need to run the NT Discovery Knowledge Script to get detailed information about the operating system on a computer before you can run any NT-specific Knowledge Scripts on that computer.

32.1.1 Rediscovering Application Resources

In most cases you discover applications by running an appropriate Discovery Knowledge Script with the schedule set to Run Once (which is the default). However, if you have frequent planned updates or other special circumstances, you may want to set an interval that corresponds to an application's update interval or change the default schedule to run multiple times.

This **rediscovery** process has some special characteristics that you should be aware of before you run a Discovery Knowledge Script on a previously discovered computer.

Rediscovering a computer enables you to update the configuration information stored in the AppManager repository and displayed in the Operator Console. If you rediscover a computer, there are three possible results:

- All of the same resource objects are discovered (nothing has been added or deleted)
- A new resource object is discovered (for example, maybe a new disk or disk partition has been added)
- A resource object that had been previously discovered is not discovered (for example, maybe a disk or disk partition has been removed)

32.1.2 Starting Jobs on Newly Discovered Objects

If all of the same resource objects are discovered, then the rediscovery has no impact on your AppManager jobs. However, if a new object is discovered and you have any jobs running against the folder under which the new object is added, the job does not automatically begin monitoring the new object.

To begin monitoring the new object, stop the job then drag and drop the Knowledge Script onto the folder to start a new job that includes the new object.

32.1.3 Stopping and Deleting Jobs on Obsolete Objects

If you know that a resource object has been removed, you should delete any existing jobs that run on the removed object before you run re-discovery. Otherwise rediscovery removes the object from the AppManager repository and the Operator Console, but any AppManager jobs that attempt to run against the object will return an error at each scheduled run.

To update the job with the correct object information:

- Stop and delete the existing job.
- Run the Discovery Knowledge Script to rediscover the objects.
- Drag and drop to start a new job that recognizes the current configuration.

32.2 Discovering Clustered Applications

When you add and discover clusters, you should only add real physical nodes to the TreeView. You should not add or discover virtual machines.

If you discover multiple nodes that are part of the same cluster, you may see what appear to be duplicate entries in the application view. For example, assume you have an Exchange Server cluster with the computers LOBO1 and LOBO2. Both of these computers are displayed in the Master view. After you run the Exchange discovery to discover the cluster, LOBO1 and LOBO2 display the resource object Exchange Server:LOSLOBOS_EXCH in the Master view. LOSLOBOS_EXCH represents the virtual server. For example:

```
Master
  LOBO1
     CPU
     Memory
     Disk
     Network
     Exchange Server:LOSLOBOS_EXCH
  LOBO2
     CPU
     Memory
     Disk
     Network
     Exchange Server:LOSLOBOS_EXCH
```

In the TreeView, the physical node LOBO1 is listed, along with all of its resource objects including the virtual Exchange Server. A similar list of resource objects is displayed for the physical node LOBO2.

If this is an active/passive Exchange Server cluster, after discovery in the Exchange view you would see two Exchange Server objects of Exchange Server:LOSLOBOS_EXCH that represent the virtual server LOSLOBOS_EXCH as viewed from the perspective of LOBO1 and LOBO2, respectively.

```
Exchange
  Exchange Server:LOSLOBOS_EXCH
  Exchange Server:LOSLOBOS_EXCH
```

The first instance represents the virtual server when it is owned by the physical node LOBO1 (that is, when LOBO1 is the active server), and the second instance represents the virtual server when it is owned by LOBO2.

If this is an active/active Exchange Server cluster, the Master view displays Exchange Server:LOBO_EXCH1 and Exchange Server:LOBO_EXCH2 under LOBO1, and EXCH Server:LOBO_EXCH1 and EXCH Server:LOBO_EXCH2 under LOBO2.

```
Master
  LOBO1
     ...
     Exchange Server:LOSLOBOS_EXCH1
     Exchange Server:LOSLOBOS_EXCH2
  LOBO2
     ...
     Exchange Server:LOSLOBOS_EXCH1
     Exchange Server:LOSLOBOS_EXCH2
```

In the Exchange view, you would see two Exchange Server:LOBO_EXCH1 objects and two Exchange Server:LOBO_EXCH2 objects. They represent the same two virtual Exchange Servers as viewed from

LOBO01 and LOBO02, respectively. This duplication can apply for any clustered application.When you discover clustered applications such as Exchange and SQL Server, the discovered objects use the virtual server name (for example, LOSLOBOS_EXCH and LOBO_EXCH1). When you run the MSCS discovery, the discovered objects use the physical node name. For example, using the physical nodes and virtual server names described in the previous example, after running Discovery_MSCS, the Master view displays something similar to:

```
Master
  LOBO1
     ...
     MSCS Server:LOBO1
  LOBO2
     ...
     MSCS Server:LOBO2
```

32.2.1 What to Do When Discovery Fails

There are several reasons why a discovery job may fail. Some of the most common reasons discovery fails include:

- Network communication problems.
- The target computer does not have the applicable application or support software installed.
- The managed object has not been installed on the target computer.
- Required services, such as the AppManager agent or SNMP are not running on the computer you are discovering.
- Server-specific services such as the HP Systems Insight Management Agent or Dell HIP are not running on the computer you are discovering.
- A different login or community name is required to run the discovery on the target computer.

In many of these cases, you may see a severity 15 event and the short message displayed in the Event tab of the List pane indicates that the discovery is not applicable. For example, the message may display "Not a CIM server." If you see this type of event, check the event detail message for more specific information about what caused the discovery to fail. For example, the detail message may tell you that the community string name used was invalid. You then need to re-run the discovery with the correct community string name.

If more specific information is not available to help you track down the problem:

- Check that the AppManager agent services, Client Resource Monitor and Client Communication Manager, are installed and running on the target computer. You can use the **Services** Control Panel or run the **NT_RemoteServiceDown** Knowledge Script on the management server and list the target computers in the Machine List.
- Use the troubleshooting tool NetIQ Corporation Diagnostic Utility or other tools, such as NT_ServiceDown to verify SNMP is installed, running, and can get MIB variable values, if required (for example, if you are trying to discover hardware).
- Check that the appropriate managed object DLL has been installed on the computer.
- Check whether you have an appropriate login or community name if that information is required (this is server-specific; most Discovery Knowledge Scripts do not require special permissions or login accounts).
- Verify the application or server type of the computer and whether the version you are discovering is supported.

32.3 ActiveDS

Use this Knowledge Script to discover Active Directory servers and resources for Microsoft Windows 2000, Windows Server 2003, and Windows Server 2008. You can display the server name and the roles for the server, such as FSMO and Global Catalog.

Because the number of network computer objects stored in the Active Directory tree can be large, you can limit the number of Domain Naming Context and Configuration Container objects that are discovered:

- Specify the container level depth for discovery. Only container levels that are within the specified level of the domain tree are discovered.
- Specify the number of child objects to discover within a container level
- Specify the particular classes of objects you want to include or exclude for discovery. The option of selecting the objects to include or exclude, however, depends on which version of AppManager you are using.
- Specify whether to limit discovery to domains that have a direct trust relationship to the domain where discovery is performed; to domains that are in the same forest; or to Active Directory domains (to exclude Windows NT computers from discovery, for example).

Depending on the version of the AppManager agent on the Active Directory server, you can specify the objects you want by excluding or including them.

If the agent version is:	You can:
AppManager agent v5.0 (or earlier)	Limit the objects that are discovered by **excluding** particular classes from discovery. If you exclude a particular class, all objects are excluded. You cannot exclude specific instances of objects from within a class.
AppManager agent v5.0.1 (or later)	Limit the objects that are discovered by **including** particular classes in discovery. If you include a particular class, all objects are included. You cannot include specific instances of objects from within a class.

32.3.1 Resource Objects

Windows Server 2003 and Windows Server 2008 Active Directory servers.

32.3.2 Default Schedule

By default, this script is only run once for each computer.

32.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	

Description	How to Set It
Raise event if job fails	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Discovery_ActiveDS job fails. The default is 35 (magenta event indicator).
Discover Active Directory server resources	
Discover objects Use these parameters to determine which classes of objects are included in discovery and to set depth limits on the number of tree levels to discover. See "Example of How This Knowledge Script Is Used" on page 1542 for more information.	
Classes to include	Specify the class names you want to discover. Use commas with no spaces to separate more than one class. Enter class names as they appear in the Active Directory schema definition. If you include a particular class, all objects are included. You cannot include specific instances of objects from within a class. AppManager does not force discovery of the following classes: • container • organizationalUnit • server • serversContainer • site To discover these classes, you must specifically enter their names in this parameter. Include the organizationalUnit class to enable the monitoring of organizational units with the following Knowledge Scripts: • AD_NumberofComputers • AD_NumberofGroups • AD_NumberofObjects • AD_NumberofPrintQueues • AD_NumberofUsers • AD_NumberofUsersLocked Include the server class to discover and use the AD_ReplicationCheckByUSN Knowledge Script. The default is none (no classes specified).

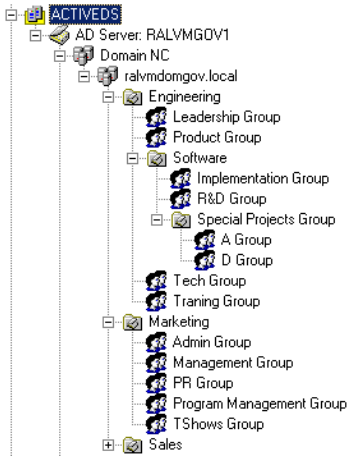
Description	How to Set It
Classes to exclude	Specify the names of classes you do not want to discover. This parameter is applicable only when running this script on an Active Directory server with Version 5.0 (or earlier) of the AppManager agent; this parameter is not applicable when running this script on an Active Directory server with Version 5.0.1 (or later) of the AppManager agent. Discovery information about Active Directory is required to run some AD Knowledge Scripts. Do not exclude the following classes: • container • computer • nTDSDSA • organizationalUnit • server • site • serversContainer Use commas with no spaces to separate the names of multiple classes. Specify class names as they appear in the Active Directory schema definition. The default is `user,group`. **NOTE:** If you exclude a particular class, all objects are excluded. You cannot exclude specific instances of objects from within a class.
Number of children per object	Specify the maximum number of child objects per container level to discover. Keep in mind that a child object can be another container. See "Example of How This Knowledge Script Is Used" on page 1542 for more information. Enter 0 to return all child objects for a container. The default is 5 child objects per container.
Number of levels deep to go in tree	Specify the maximum number of container levels deep in the domain object portion of the Active Directory tree to discover. To discover the child objects in a container, you must specify the level of the child object. See "Example of How This Knowledge Script Is Used" on page 1542 for more information. Enter 0 to return the complete tree structure. The default is 5 levels.
Discover domains and trusts?	Set to **Yes** to include the Domains and Trusts resource object in the Operator Console TreeView pane. If you enable this parameter, you can use the subsequent parameters to include or exclude types of domains from the Domains and Trusts resource object. The default is Yes.
Include only adjacent domains?	Set to **Yes** to limit discovery to domains that have a direct trust relationship to the servers where discovery is performed. By default, discovery is not limited to domains that have a direct trust relationship, and discovery walks transitive trusts within the forest.
Include only domains in forest?	Set to **Yes** to limit discovery to domains in the same forest as the servers where discovery is performed. The default is unchecked.
Include only Windows 2000 or later trusting domains?	Set to **Yes** to limit discovery to Active Directory domains that trust the domain of the server where discovery is performed (incoming trusts). Disable this parameter to include domains regardless of trust direction, including Windows NT domains and non-Windows domains. The default is Yes.

Description	How to Set It
Event Notification	
Raise event if discovery succeeds?	Set to **Yes** to raise an event if discovery succeeds. The default is unchecked.
Event severity when discovery succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery succeeds. The default is 25 (blue event indicator).
Raise event if discovery fails?	Set to **Yes** to raise an event if discovery fails. The default is Yes.
Event severity when discovery fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery fails. The default is 5 (red event indicator).
Raise event if discovery partially succeeds?	Set to **Yes** to raise an event if discovery returns some data but also generates warning messages. The default is Yes.
Event severity when discovery partially succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery returns some data but also generates warning messages. The default is 10 (red event indicator).
Raise event if discovery is not applicable?	Set to **Yes** to raise an event when discovery is not applicable. This type of failure usually occurs when the target computer does not have Active Directory installed or does not have the AppManager managed object for Active Directory. The default is Yes.
Event severity when discovery is not applicable	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery is not applicable. The default is 15 (yellow event indicator).
Debug	
Save the discovery results file?	Set to **Yes** to save the discovery results to a file. The file is written to the `NetIQ\temp\netiq_debug` directory. The default is unchecked.

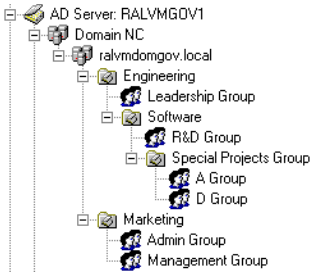
32.3.4 Example of How This Knowledge Script Is Used

When you discover Active Directory, the discovered Domain Naming Context and Configuration Container branches can potentially contain millions of objects. This script allows you to control the depth (in container levels) and width (in the number of child objects per container level) of the discovered branches. In addition, you can exclude all objects that belong to a specified class from discovery. By default, the Discovery_ActiveDS Knowledge Script discovers a minimal number of classes and objects. See ActiveDS for more information on the default settings and how to change them.

To illustrate how the these discovery parameters work, consider the following example. Assume the complete Domain NC tree has the following structure:



The container-level and children-per-object values are applicable to the containers and objects under `ralvmdomgov.local`. If the number of container levels is 0 (to discover all container levels) and the number of child objects per container level is 2, the discovery result might be similar to this:



To further control the number of objects returned, you can exclude particular classes. When you exclude a class, no instances of those objects are displayed. For example, if the "group" class is excluded from the discovery, the results of discovery might look something like this.

NOTE: The specific objects discovered when you use the *Number of children per object* and *Number of levels of the entire tree* parameters depends on how the ADSI enumerates the child objects.

32.4 AD-RT

Use this Knowledge Script to discover whether AppManager ResponseTime for Active Directory components are installed on a specific managed client. Drop this Knowledge Script on the managed client where you are performing discovery.

After successful discovery, a new object appears in the TreeView pane with a list of servers that support it. Also, a new AD-RT tab will appear in the Knowledge Script pane.

For information about using AppManager ResponseTime modules, see the corresponding AppManager ResponseTime *Management Guide*.

32.4.1 Resource Objects

Windows XP Professional, Windows 2000, or Windows NT.

32.4.2 Default Schedule

By default, this script is only run once for each computer.

32.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can select the **Yes** check box to raise an event when the job succeeds. By default, events are not raised on success.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is partially done**. This type of failure usually occurs when the target computer does not have all the prerequisites installed. The default is 10 (red event indicator).

32.5 AdvancedAnalytics

Use this Knowledge Script to discover NetIQ Advanced Analytics on the server. The script always raises an event if discovery fails. You can also enable the script to raise an event when discovery succeeds. Set the event severity levels to indicate the importance of each type of event.

32.5.1 Resource Object

Advanced Analytics server

32.5.2 Default Schedule

By default, this script is only run once for each server.

32.5.3 Setting Parameter Values

Set the following parameters as needed.

Description	How to Set It
Raise event if discovery succeeds?	Specify **y** to raise an event when this script successfully discovers Advanced Analytics resources. The default is n.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance when this script successfully discovers Advanced Analytics resources. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance when this script fails to discover Advanced Analytics resources. The default is 5.

32.6 Agentless

Use the Discovery_Agentless Knowledge Script to discover resource information for the remote computers that you want to monitor. You can either discover computers listed in a file or discover computers that are within a specified IP address range. NetIQ Corporation recommends that you must not run parallel discovery jobs. For reliable discovery of remote computes, run only one discovery job at any point of time.

If you delete or add a resource object, or if you make any other kind of change that might affect the monitoring of your resources, run the Discovery_Agentless Knowledge Script again to update your list of resource objects. Use the delta discovery feature in Control Center to run discovery on a schedule to more quickly detect changes to your environment.

NOTE: The discovery process might take considerable time depending on the network conditions and the number of remote computers you want to discover. For example, it might take approximately three hours to discover 500 computers.

If a remote computer is not discovered even after multiple retries, ensure the following:

- The remote computer is available for monitoring
- The credentials you specified in the Security Manager are correct
- Multiple entries of the remote computer is not listed in the monitoring client

---

32.6.1 Resource Objects

NT_MachineFolder

32.6.2 Default Schedule

By default, this script runs once for each computer.

32.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity if discovery job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the discovery job fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select whether to view event details in an **HTML Table** or in **Plain Text**. The default is HTML Table.
Discover Agentless Computers	

Description	How to Set It
Raise event if discovery succeeds?	Select **Yes** to raise an event if discovery succeeds in finding the remote computers. The default is Yes.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery succeeds in finding the remote computers. The default is 25.
Raise event if discovery is partial?	Select **Yes** to raise an event if the discovery process is partially successful. For example, if the discovery process was not able to discover some of the remote computers. The default is Yes.
Event severity when discovery is partial	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery is partially successful. The default is 15.
Raise event if discovery fails?	Select **Yes** to raise an event if discovery fails to find the remote computers. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery fails to find the remote computers. The default is 5.
Discovery Type	Select how you want to discover remote computers. You can use a comma-separated-value `(.csv)` file, or you can specify an IP address range for the computers you want to discover. The default discovery type is CSV file.
Discover computers listed in a file	
Full path to file containing list of computers to discover	Provide the path to a location on the agent computer or the UNC path that contains the `.csv` discovery input file containing the list of remote computers you want to discover.
Discover computers within an IP address range.	
IP address range of computer to discover	Specify the IP address range of the computers you want to discover. For example: 10.0.0.1-10.0.0.25
Sub-label configured in Security Manager	Specify the sub-label configured for this IP address range in the Security Manager.
Type of operating system on the computers to discover	Select the type of operating system for the computers you want to discover. You can choose Windows or UNIX. The default is Windows.

32.7 AMHealth

Use the Discovery_AMHealth Knowledge Script to discover AppManager and Control Center resources installed on Windows servers. This Knowledge Script returns information about successful and failed discoveries, and it raises events to notify you of errors.

Run the Discovery_AMHealth script on computers with the one or more of the following AppManager components: AppManager repository (QDB), management server, Cache Manager, Command Queue Service (CQS), deployment services, Windows AppManager agents, and Control Center repository (NQCCDB).

Discovery_AMHealth is not supported on a management server in a clustered environment. For more information about the setup of the AMHealth Module's AMHealth_QDBComponentsHealth Knowledge Script with a management server in a clustered environment, contact NetIQ Technical Support.

32.7.1 Configuring Security Manager for AM Health

If an agent is not installed on the QDB, and the NetIQ Client Resource Monitor (`netiqmc`) or Client Communication Manager (`netiqccm`) service accounts on the management server do not have sufficient rights to access the QDB, configure the NetIQ services with a Windows account that has access to the QDB. Otherwise, configure the Discovery_AMHealth Knowledge Script to use SQL authentication by typing a SQL user name in the *SQL Server login* parameter for Discovery_AMHealth.

If an agent is not installed on the Control Center repository (NQCCDB), and the `netiqmc` or `netiqccm` service accounts on the NetIQ Command Queue Server do not have sufficient rights to access the NQCCDB, configure the NetIQ service accounts with a Windows account that has access to the NQCCDB. Otherwise, configure the Discovery_AMHealth Knowledge Script to use SQL authentication.

If the service account does not have sufficient privileges before running the Discovery_AMHealth Knowledge Script, set up SQL authentication with AppManager Security Manager.

On the **Custom** tab in Security Manager, complete the following fields for the management server:

Field	Description
Label	`sql$<management server name>` For example, if your management server name is SERVER1TEST, you would type `sql$SERVER1TEST`.
Sub-label	SQL user name that exists in the QDB.
Value 1	Password for the user entered in the **Sub-Label** field.
Extended application support	Required field. Encrypts the user name and password in Security Manager.

When you want to discover the management server, type the SQL user name from step 6 of this procedure into the *SQL Server login* parameter of the Discovery_AMHealth Knowledge Script.

You can also use the AppManager Security Manager configuration listed above to monitor the health of a management server that is in an untrusted domain from your AppManager installation. Use a SQL Server user to allow the AM Health Knowledge Scripts on the management server in the untrusted domain to communicate with the QDB on the SQL Server. You cannot use Windows authentication, because the SQL Server will not be aware of any users that belong to the untrusted domain.

32.7.2 Resource Objects

Windows servers running AppManager

32.7.3 Default Schedule

By default, this script is only run once for each computer.

32.7.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise an event if discovery succeeds?	Select **Yes** to raise an event when discovery succeeds. The default is unselected.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which when the discovery succeeds. The default is 25.
Raise event if discovery fails?	Select **Yes** to raise an event when discovery fails. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the discovery fails. The default is 5.
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Discovery_AMHealth job itself fails. The default is 35.
SQL Server login	Specify the SQL user name required for access to the AppManager repository (QDB). Leave this field blank to use Windows NT authentication. **NOTE:** If you want to use a specific SQL Server login account, use Security Manager to update the AppManager repository with the SQL Server logins that you want to use. For more information, see "Configuring Security Manager for AM Health" on page 1548.

32.8 AMHealthUNIX

Use this Knowledge Script to discover AppManager resources installed on UNIX and Linux servers. This Knowledge Script returns information about successful, failed, and partial discoveries, and it raises events to notify you of errors.

32.8.1 Resource Objects

UNIX or Linux servers running AppManager

32.8.2 Default Schedule

By default, this script is only run once for each computer.

32.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if discovery succeeds?	Set to **y** to raise an event when discovery succeeds. The default is n.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance when the discovery fails. The default is 5.
Event severity when discovery partially succeeds.	Set the event severity level, from 1 to 40, to reflect the importance when the discovery partially succeeds. This type of situation usually occurs when the target computer does not have all the prerequisites installed. The default is 15.

32.9 ApacheUNIX

Use the Discovery_ApacheUNIX Knowledge Script to discover Apache Web Servers and IBM HTTP Servers installed on UNIX servers. This Knowledge Script returns information about successful, failed, and partial discoveries and raises events with user-specified severity to notify you of errors.

You can use this Knowledge Script to determine if and where Apache Web Servers and IBM HTTP Servers are installed in a UNIX network. Run this Knowledge Script periodically to detect new instances of Apache Web Servers and IBM HTTP Servers and to determine if existing servers have been uninstalled or taken offline.

You must run the UNIX agent using the root account to discover Apache Web Servers.

32.9.1 Resource Object

UNIX computer with Apache Web Server

32.9.2 Default Schedule

By default, this script is only run once for each computer.

32.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise an event for successful discovery? (y/n)	Set to y to raise an event when the Knowledge Script discovers an Apache Web Server or IBM HTTP Server. The default is y.
Event severity when discovery succeeds	Specify a severity level, from 1 to 40, for the event raised by successful discovery of an Apache Web Server or IBM HTTP Server. The default is 25.
Event severity when discovery fails	Specify a severity level, from 1 to 40, for the event raised by failure to discover an Apache Web Server or IBM HTTP Server. The default is 5.
Event severity when discovery is partially successful	Specify a severity level for the event raised when the Knowledge Script starts but does not run to completion. The default is 15.
Path for the Apache binary program (semicolon-separated, no spaces)	Use this variable to expedite the discovery process. Specify a directory path or list of paths separated by a semicolon. The Knowledge Script will limit its search for the Apache binary program to the paths you specify. The default is `/usr/local/apache2/bin/httpd`.
Path for the Apache configuration files (semicolon-separated, no spaces)	Use this variable to expedite the discovery process. Specify a directory path or list of paths separated by a semicolon. The Knowledge Script will limit its search for the Apache configuration files to the paths you specify. The default is `/usr/local/apache2/conf/httpd.conf`.
Path for the Apache management script (semicolon-separated, no spaces)	Use this variable to expedite the discovery process. Specify a directory path or list of paths separated by a semicolon and no spaces. The Knowledge Script only searches for the Apache management script, `apachectl`. The default is `/usr/local/apache2/bin/apachectl`.

32.10 AppAnalyzer

Use this Knowledge Script to discover the AppAnalyzer Agent.

32.10.1 Resource Objects

Any Exchange server hosting an AppAnalyzer Agent.

32.10.2 Default Schedule

By default, this script is only run once for each computer.

32.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery? (y/n)	Set to y to raise an event if the AppAnalyzer Agent is successfully discovered. The default is y.
Event severity when discovery...	Set the event severity level, from 1 through 40, to indicate the importance of the event when discovery: • **...succeeds**. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is partially done**. The Knowledge Script returns some data but also generates warning messages. The default is 10 (red event indicator). • **...is not applicable**. This type of failure usually occurs when the target computer does not have the AppAnalyzer Agent installed. The default is 15 (yellow event indicator).

32.11 ARCserve

Use this Knowledge Script to discover Computer Associates ARCserve servers and the services associated with them.

32.11.1 Resource Objects

ARCserve servers.

32.11.2 Default Schedule

By default, this script is only run once for each computer.

32.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25. • **...fails**. The default is 10. • **...is partially done**. Set the event severity level for a discovery that returns some data but also generates warning messages. The default is 20.

32.12 AvayaCM

Use the Discovery_AvayaCM Knowledge Script to discover Avaya Communication Manager configuration information and resources, including Switch Processing Elements (SPE), Enterprise Survivable Servers (ESS), Local Survivable Processors (LSP), H.248 media gateways, IP stations, attendant consoles, and remote office stations. You can also choose to discover NetIQ SNMP Trap Receiver.

32.12.1 Prerequisite

AppManager uses SNMP queries to access remote Communication Manager servers and to enable the functionality of NetIQ SNMP Trap Receiver. Before discovering Communication Manager resources, enter SNMP community string information into AppManager Security Manager.

32.12.1.1 Configuring Community Strings for Remote Communication Managers

Configure SNMP community string information for each Communication Manager you want to monitor. On the Custom tab in Security Manager, complete the following fields:

Field	Description
Label	`SNMP`
Sub-label	Indicate whether the community string information will be used for a single device or for all devices: • *For a single Communication Manager*, type <*`device IP address`* or *`hostname`*>. The address or hostname must match the address or hostname you provide in the parameters for the Discovery_AvayaCM Knowledge Script. • *For all Communication Managers*, type `default`.
Value 1	The appropriate read-only community string value, such as `private` or `public`.

32.12.1.2 Configuring Community Strings for Trap Receiver Functionality

Configure SNMP community string information for each Trap Receiver device that will send traps to the proxy agent computer. On the Custom tab in Security Manager, complete the following fields:

Field	Description
Label	`SNMPTrap`
Sub-label	Provide the IP address or hostname of the device on which Trap Receiver is installed. **NOTE:** If you have already run the Discovery_AvayaCM Knowledge Script, use the same IP address or hostname that is displayed for the AvayaCM object in the TreeView.
Value 1	Provide the community string name included in each trap sent by Trap Receiver, such as `private` or `public`.

32.12.2 Resource Object

Windows server

Only one computer can act as proxy for any given Communication Manager cluster. Therefore, run this script on only one computer at a time.

32.12.3 Default Schedule

By default, this script runs weekly, on Sunday at 2 PM.

32.12.4 Setting Parameter Values

Set the parameters on the Values tab as needed

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of the failure of the Discovery_AvayaCM job. The default is 5.
Set up supplemental database?	Select **Yes** to create the Avaya CM supplemental database, including the tables and stored procedures needed to store call detail records and phone deregistration information. The default is Yes.
Event severity when database setup fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Avaya CM supplemental database is not created. The default is 15. It is possible that the supplemental database was not created because the Discovery job ran on a computer on which SQL Server is not installed.

Parameter	How to Set It
Start pruning job on supplemental database?	**For all supported versions of SQL Server, except SQL Server 2005 Express**: Set to **Yes** to create a SQL job that deletes data from the supplemental database. The SQL job runs every night. Data is deleted from the supplemental database based on the value you specify in the *Number of days to keep call detail records* parameter. The default is Yes. **For SQL Server 2005 Express**: Set to **No**. The pruning job is not supported for SQL Server 2005 Express. **To manually delete data from the supplemental database**: 1. Run the following stored procedure from a command line: `osql -E -S <sql server> -n -d <database> -Q "exec dbo.Task_AvayaCM_Pruning"` where <`sql server`> is the name of the server that hosts the supplemental database, and where <`database`> is the name of the supplemental database. For example: `osql -E -S SuppDBAvaya -n -d AvayaCM_S8300-Cluster -Q "exec dbo.Task_AvayaCM_Pruning"` 2. Configure a Windows Scheduled Task to schedule pruning at an interval of your choosing. The process for configuring a Windows Scheduled Task varies according to your version of Microsoft Windows. Consult your Windows documentation for more information.
Number of days to keep call detail records	Specify the number of days' worth of CDRs to keep in the Avaya CM supplemental database. Data older than what you specify is discarded. The default is 7 days.
Local SQL Server Instance name	Specify the name of the local SQL Server instance (on the proxy computer) in which you want to create the new Avaya CM supplemental database. Leave this parameter blank to accept the default name.
Raise event if database setup succeeds?	Select **Yes** to raise an event if creation of the Avaya CM supplemental database is successful. The default is unselected.
Event severity when database setup succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Avaya CM supplemental database is created successfully. The default is 25.
SNMP	
Global SNMP Message timeout	Specify the number of seconds discovery should attempt an SNMP message request to an *individual* Communication Manager server before retrying the connection. The default is 120 seconds. The value you set here is the timeout value for *all* SNMP message requests for *all* AvayaCM Knowledge Script jobs.

Parameter	How to Set It
Global SNMP Task timeout	Specify the number of seconds discovery should attempt an SNMP retrieve request to an *individual* Communication Manager server before retrying the connection. The default is 3600 seconds. The value you set here is the timeout value for *all* SNMP retrieve requests for *all* AvayaCM Knowledge Script jobs.
Global SNMP retries	Specify the number of times discovery should attempt an SNMP connection to an individual Communication Manager before attempting an SNMP connection to the next Communication Manager in the list. The default is 4 retries. The value you set here will be the number of retries for *all* SNMP connections for *all* AvayaCM Knowledge Script jobs. **Hint** If you experience timeouts that appear to be caused by lost messages rather than CPU usage, increase the number of retries, which affects SNMP `GETNext` and `GETBulk` requests. For example, if CPU is stable and you have already increased the timeout value, but packet loss in the network is high and timeouts are still being experienced, you can increase the number of retries.
Enable use of SNMP GETBulk requests during discovery?	By default, this parameter is enabled, allowing the Discovery_AvayaCM Knowledge Script job to use SNMP `GETNext` and `GETBulk` requests to access Communication Manager MIBs. Disable this parameter to allow the script to use only `GETNEXT` requests. Not all MIB tables are extensive enough to need a `GETBulk` request. A `GETBulk` request is faster, but more CPU-intensive than a `GETNext` request.
Number of rows to request for each GETBulk operation	Specify the number of rows from the MIB table to return in a `GETBulk` request. The default is 10 rows. The number of rows determines how quickly MIB data is returned. If CPU usage is too high, you can reduce the number of rows per `GETBulk` request or disable the *Enable use of SNMP GETBulk requests during discovery?* parameter.
Interval to pause between GETBulk requests	Specify the number of milliseconds to wait between GETBulk requests. The default is 100 milliseconds. The delay can help manage CPU usage and speed of SNMP requests. For example, a one-row `GETBulk` with a 100-millisecond delay between requests executes slower and uses less CPU than a `GETNext` request.
Raise event if discovery succeeds?	Select **Yes** to raise an event if discovery succeeds in finding Communication Manager devices. The default is unselected.
Event severity when discovery succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery succeeds in finding Communication Manager devices. The default if 25.
Raise event if discovery fails?	Select **Yes** to raise an event if discovery fails to find some or all of your Communication Manager devices. The default is Yes.
Event severity when discovery fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery fails to find some or all of your Communication Manager devices. The default is 10.
Discover Avaya Communication Manager Servers	
Discovery timeout for all servers	Specify the number of minutes the script should attempt to discover *all* specified Communication Manager servers before stopping as unsuccessful. The maximum is 60 minutes. The default is 30 minutes.

Parameter	How to Set It
Maximum number of concurrent discoveries	Specify the maximum number of Communication Manager servers that can be queried for discovery at one time. No matter what value you enter, discovery is still performed for the entire list of devices that you specify in the following parameters. Setting this parameter to a low value throttles the number of SNMP requests performed at one time, but may increase the overall time it takes to discover a list of devices. The default is 10 concurrent discoveries.
Comma-separated list of active Communication Manager servers	Use this parameter if you know which Communication Manager servers you want to discover. Specify at least one IP address or hostname, using a comma to separate multiple items. For example: `10.0.1.1,10.0.1.7` You can enter IP addresses or hostnames, but you *must* enter the same IP address or hostname for which you configured SNMP community string information. If you configured a community string for a hostname, enter the *same* hostname; if you configured an IP address, enter the *same* IP address.

Comma-separated list of Communication Manager IP address pairs in a single NAT cluster	MSPs (Managed Service Providers) frequently maintain distributed customer networks in which NAT (Network Address Translation) is used to translate the IP address ranges that are monitored from a single NOC (Network Operations Center). The use of NAT prevents AppManager from recognizing the actual IP addresses of the servers in the remote cluster. If your AppManager agent is located on a server in the NOC, but the monitored devices are located in a cluster in the remote customer network, you need to provide AppManager with a list of the IP addresses of the remote monitored devices.
	
	Use this parameter to enable AppManager to recognize the IP addresses of the servers for a single remote Communication Manager cluster.
	
	Type a list of IP address pairs for the Communication Manager servers in a remote cluster. Use commas to separate the addresses. A pair consists of a server's NAT (external) IP address and its IP address inside the cluster. A Communication Manager cluster can contain three IP addresses: an active SPE virtual address, a primary physical address, and a secondary physical address. Each of these addresses must be represented by a pair in this parameter. A maximum of six IP addresses is allowed in this parameter.
	
	Use the following format:
	
	`externalactiveSPEvirtualaddress,`
	`internalactiveSPEvirtualaddress,`
	`externalprimaryphysicaladdress,`
	`internalprimaryphysicaladdress,`
	`externalsecondaryphysicaladdress,`
	`internalsecondaryphysicaladdress`
	
	In the following example, the 10.41* addresses are externally visible and the 172.16* addresses are visible only to the Communication Managers:
	
	`10.41.1.10,172.16.1.10,10.41.1.11,172.16.1.11,...`

Parameter	How to Set It

Full path to file with list of active Communication Manager servers	Instead of listing each server separately, you can specify the full path to a file on the proxy computer that contains a list of IP addresses or hostnames of Communication Manager servers.
	
	In the file, specify the servers on multiple lines and ensure that each line contains only one entry. For example:
	
	`AvayaCM01`
	`AvayaCM02`
	`AvayaCM10`
	
	You can enter IP addresses or hostnames, but you *must* enter the same IP address or hostname for which you configured SNMP community string information. If you configured a community string for a hostname, enter the *same* hostname in the list; if you configured an IP address, enter the *same* IP address in your list.

Discover Trap Receiver?	Select **Yes** to discover NetIQ SNMP Trap Receiver. The default is unselected.
Trap Receiver IP address	Specify the IP address of the computer on which Trap Receiver is installed. The default is `localhost`.
Trap Receiver TCP port	Specify the TCP port number through which Trap Receiver will communicate with AppManager. The default is port 2735.
Configure Trap Receiver for associated servers?	Select Yes to allow Trap Receiver to listen for traps coming from other servers such as SIP Enablement Services (SES) servers or Application Enablement Services (AES) servers. The default is unselected.
Comma-separated list of associated server IP addresses	Provide a comma-separated list of the IP addresses of other servers. If you enabled the *Configure Trap Receiver for associated servers?* parameter, then Trap Receiver will listen for traps coming from the servers you specify.

32.13 BackupExec

Use this Knowledge Script to discover Symantec Backup Exec servers and the services associated with them.

32.13.1 Resource Objects

Backup Exec servers.

32.13.2 Default Schedule

By default, this script is only run once for each computer.

32.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is not applicable**. This type of failure usually occurs when the target computer does not have Backup Exec installed. The default is 15 (yellow event indicator).

32.14 BES

Use this Knowledge Script to discover BlackBerry Enterprise Server (BES) 4.0 (and higher) configuration and resources.

For earlier versions of BlackBerry Enterprise Server, use the BlackBerry Knowledge Script.

32.14.1 Prerequisite

To discover BES resources and run BES Knowledge Scripts, you must configure your SNMP community string information in AppManager Security Manager.

Security Manager keeps community-string and password information secure and private. Instead of getting the information from a Knowledge Script parameter, the Knowledge Scripts get this information automatically and securely from Security Manager.

On the Custom tab in Security Manager, complete the following fields for every agent computer you want to monitor with AppManager for BlackBerry Enterprise Server:

Field	Description
Label	BESSNMP$<*name of BES server on which you installed the module*>
Sub-label	`community`
Value 1	Read-only community string, such as `private` or `public`

32.14.2 Resource Object

BlackBerry Enterprise Server 4.0.

32.14.3 Default Schedule

By default, this script is only run once for each computer.

32.14.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the event when monitoring fails. Default is 40 (magenta event indicator).

Parameter	How to Set It
Raise event if discovery succeeds?	Select the **Yes** check box to raise events when discovery succeeds. By default, events are enabled.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue event indicator).
Raise event if discovery fails?	Select the **Yes** check box to raise events when discovery fails. By default, events are enabled.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red event indicator).
Raise event if AppManager for BlackBerry Enterprise Server 4.0 managed object not installed?	Select the **Yes** check box to raise an event if the managed object for AppManager for BlackBerry Enterprise Server 4.0 is not installed on the selected computer(s). By default, events are enabled.
Event severity when AppManager for **BlackBerry Enterprise Server 4.0** managed object not installed	Set the event severity level, from 1 to 40, to indicate the importance of the event when the managed object cannot be found. The default is 15 (yellow event indicator).

32.15 BlackBerry

Use this Knowledge Script to discover BlackBerry Enterprise Server resource and configuration information.

32.15.1 Resource Objects

BlackBerry Enterprise Servers.

32.15.2 Default Schedule

By default, this script is only run once for each computer.

32.15.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery...	Set the event severity level, from 1 through 40, to indicate the importance of the event when discovery: • **...succeeds**. The default is 25. • **...fails**. The default is 5. • **...is partially done**. The Knowledge Script returns some data but also generates warning messages. The default is 10. • **...is not applicable**. This type of failure usually occurs when the target computer does not have the AppManager for Blackberry Enterprise Server component installed. The default is 15.

32.16 CallDataAnalysis

Use this Knowledge Script to identify Call Data Analysis resources for reporting on call detail records (CDRs).

This Knowledge Script creates the SQL Data Warehouse if one does not exist, or updates the Data Warehouse and associated security parameters if the warehouse has previously been created. Because this script accesses the Data Warehouse, you can supply a SQL username to use SQL authentication, or leave the parameter blank to use Windows authentication. The Data Warehouse provides the central view of the collected data, and has links to the Data Mart databases.

This script always raises an event if discovery fails. You can also enable events to notify you if discovery succeeds or if it is partially successful.

32.16.1 Resource Objects

NT_MachineFolder

32.16.2 Default Schedule

By default, this script runs once.

32.16.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
SQL Data Warehouse Access	
Data Warehouse SQL Server and instance name (leave blank for local server default instance)	Specify the SQL Server name and the instance name of the SQL Server hosting the Data Warehouse. You can leave this parameter blank to use the local server default instance. If you want the Data Warehouse to be on the local computer, but in a named instance, specify the full name of the SQL server and the instance name, such as `HOUSERVER22\INST2008`. If you put in only the instance name (`INST2008` in the above example), it will be interpreted as being the SQL server name and the process will fail.
Database name	Specify the name of the database for the Data Warehouse. The default is NQCDA_Warehouse.
SQL username (leave blank for Windows authentication)	Specify the SQL username required for access to the Data Warehouse computer. Leave this field blank to use Windows authentication. **NOTE:** To use a specific SQL Server login account, use AppManager Security Manager to update the AppManager repository with the SQL Server logins you want to use.
Event Notification	
Raise event if discovery succeeds?	Select **Yes** to raise an event when discovery is successful. The default is unselected. This Knowledge Script always raises an event when discovery fails.

Parameter	How to Set It
Event severity when discovery succeeds	Set the severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Raise event if discovery partially succeeds?	This Knowledge Script always raises an event when discovery fails. Select **Yes** to raise an event when discovery is partially successful. The default is Yes.
Event severity when discovery partially succeeds	Set the severity level, from 1 to 40, to reflect the importance of an event in which discovery partially succeeds. The default is 15.
Event severity when discovery fails	Set the severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.

32.17 CIM

Use this Knowledge Script to discover Hewlett-Packard Systems Insight Manager (SIM) configuration and resources. This Knowledge Script requires SNMP and the SIM Agent to be running on the computer you are discovering. If a required service is not found or is not running, the Discovery job fails with a "Not a CIM server" event.

Systems Insight Manager was formerly known as Compaq Insight Manager.

32.17.1 Resource Objects

CIM servers.

32.17.2 Default Schedule

By default, this script is only run once for each computer.

32.17.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
SNMP community string	Enter the SNMP community name to use. The default is the community name entered in the AppManager Security Manager or public if no community name has been entered.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is partially done**. Set the event severity level for a discovery that returns some data but also generates warning messages. The default is 10 (red event indicator). • **...is not applicable**. This type of failure usually occurs when the target computer does not have CIM installed. The default is 15 (yellow event indicator). **NOTE:** If required services, such as SNMP or the Compaq Insight Management Agent, are not running on the computer you are discovering, you may see a severity 15 event (Not a CIM server). If you see this type of event, see the detail message for more information about what caused discovery to fail.

Parameter	How to Set It
Discover only physical interfaces?	Select Yes to only discover interfaces that are associated with a NIC card. Microsoft Windows Server 2008 and Microsoft Windows Server 2008 R2 provide virtual interfaces, which are interfaces that are not associated with a NIC card. If you set this parameter to no, AppManager displays virtual as well as physical interfaces in the TreeView. However, CIM_NICFail and CIM_NICError Knowledge Scripts are only applicable to physical interfaces. If you attempt to run these Knowledge Scripts on virtual interfaces, the jobs will report errors. If you set this parameter to yes, the console TreeView pane shows extra objects as null or unidentified. The objects do not cause errors or problems with how the module works. Any time you change this parameter setting, you must recreate all CIM_NICFail and CIM_NICError jobs on Windows Server 2008 and Windows Server 2008 R2 computers. The default is yes, which results in no discovery of virtual interfaces.

32.18 CiscoCallMgr

Use this Knowledge Script to discover Cisco CallManager configuration and resources.

32.18.1 Prerequisite

Discover Windows resources on the server that you want to monitor before you discover CallManager resources. If you have not yet discovered Windows resources, run the NT discovery Knowledge Script.

32.18.2 Understanding stiBack Version Numbers

Discovery_CiscoCallMgr retrieves the stiBack version number from the registry. If no backup has ever been run, the version number in the registry contains a "0" as its third number, for example: 3.1.0.39. However, if you were to look at **Help > About** for the stiView applet, you would not see the "0." To continue the example, you would see 3.1.39. Once you run a backup, the version number in the registry will match the version number in **Help > About**. Then, the next time CallManager discovery runs, AppManager will display the same version number as **Help > About**.

32.18.3 Resource Object

Cisco CallManagers

32.18.4 Default Schedule

By default, this script runs once a week.

32.18.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if discovery succeeds?	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
SQL username (leave blank to use Windows authentication)	Provide the user login account required to access the CallManager SQL Server database. Leave this field blank to accept the default Cisco login account: `CiscoCCMCDR`. If you have changed the default password for `CiscoCCMCDR`, or want to use a different login account, configure the login and password using AppManager Security Manager before running this script. On the SQL tab of Security Manager, provide the IP address or hostname of the CallManager **SQL Server** computer, as well as the **SQL Login Name** and **SQL Login password**.

Parameter	How to Set It
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery returns some data but also generates warning messages. The default is 15.
Create cluster server group?	Set to **y** to arrange in a cluster all CallManagers in a server group. The cluster is visible in the Master view only. The default is y. By arranging your CallManagers in a cluster, you can simplify your monitoring process by running Knowledge Scripts on a cluster to monitor every CallManager in the cluster. The Discovery_CiscoCallMgr Knowledge Script groups CallManagers according to Publisher. A cluster consists of a Publisher and one or more Subscriber CallManagers. Only the Subscribers perform call processing. The Publisher handles administrative activities such as configuration. The following combinations represent the most common clusters: • **One Publisher and one Subscriber**. The Publisher server contains the TFTP server and any media resource applications. It also acts as the backup for the Subscriber. • **One Publisher and three Subscribers**. The Publisher server contains the TFTP server and any media resource applications. Two of the Subscribers are primary CallManagers. The remaining Subscriber is the backup for the two primaries. • **One Publisher, a TFTP server, and six Subscribers**. Either the Publisher or the TFTP server will contain the media resource applications. Four of the Subscribers are primary CallManagers. The remaining two are backups for the primaries. **NOTE:** For the Discovery script, the default action on the **Actions** tab is Action_AddComputerToServerGroup. When creating a server group, do *not* change this default selection.

32.19 CiscoCM

Use the Discovery_CiscoCM Knowledge Script to discover resource and configuration information for Cisco Unified Communications Manager clusters. The Cisco AXL Web service, the Tomcat service, and the SOAP API services must be active on all servers in the cluster. Only one computer can act as proxy agent for any given Unified Communications Manager cluster. Therefore, run Discovery_CiscoCM on only one Windows server at a time

32.19.1 Prerequisites

Configure your AXL password in AppManager Security Manager before discovering Unified CallManager resources.

Use the Cisco Administration Web site to configure the proxy agent computer as a billing server. This configuration allows Unified CallManager to push call detail records (CDRs) to the proxy agent computer.

32.19.1.1 Configuring AXL Passwords

AVVID XML Layer (AXL), a Cisco application programming interface, enables Unified Communications Manager to access the HTTP server. Configure the AXL password in AppManager Security Manager *before* running the Discovery_CiscoCM Knowledge Script. Complete the following fields in the Custom tab of Security Manager for the proxy agent computer.

Field	Description
Label	`CiscoCM_AXL`
Sub-label	Indicates whether the AXL information will be used for a single Communications Manager or for all Communications Manager. • *For a single Communications Manager*, provide the name of the Communications Manager server. • *For all Communications Managers*, type `default`.
Value 1	AXL user ID that has the authority to use the AXL API. In most cases, the Communications Manager Administrator user has this authority.
Value 2	AXL password that has the authority to use the AXL API. In most cases, the Communications Manager Administrator user has this authority.
Value 3	Use this field *only* if you used Cisco Unified Communications Manager Administration to change the number of the HTTPS port the proxy agent computer uses to connect to the Communications Manager server. Type the new secure port number. Leave this field blank to use the default port number: 8443.
Extended application support	Required field. Encrypts the AXL password in Security Manager.

32.19.2 Configuring the Proxy Agent Computer as a Billing Server

To allow the Unified Communications Manager server to send Call Detail Records (CDRs) to the proxy agent computer, configure the Unified Communications Manager server to recognize the proxy agent computer as a billing application server.

Use the Cisco Unified Communications Manager Administration Web site to configure the proxy agent computer as a billing server.

TIP: If the proxy agent computer does not receive CDRs after you complete the following procedure, ensure the FTP server is working. Verifying FTP functionality usually eliminates most problems. If the FTP server is working as expected, then verify network connectivity. Firewalls can prevent the Unified Communications Manager server from sending CDRs to the proxy agent computer.

To configure the billing server:

1. Navigate to the Administration Web site of your primary Unified Communications Manager server.
2. In the **Navigation** field, select **Cisco Unified CallManager Serviceability** and then click **Go**.
3. In the Serviceability window, click **CDR Management** on the Tools menu.
4. In the CDR Management window, click **Add new** and complete the following fields:

Field	Description
Host Name/IP Address	DNS hostname or IP address of the proxy agent computer, which must be configured as an FTP or sFTP server.
User Name	User name required to access the proxy agent computer. If you use sFTP, provide the user name you used when configuring the sFTP server.
Password	Password required to access the proxy agent computer. If you use sFTP, provide the password you used when configuring the sFTP server.
Protocol	Indicates whether to use **FTP** or **sFTP** to push CDRs to the proxy agent computer.
Directory Path	Location to which CDRs are pushed on the proxy agent computer. Do not type a full path. Instead, type a relative path based on the FTP publishing folder on the proxy agent computer, which is, by default, `c:\inetpub\ftproot`. The path must include the TreeView cluster name and a trailing backslash (\). For example, if the TreeView cluster name is "CiscoCM:CCM80-01-Cluster," then type `CCM80-01\`. Files will be written to the following folder on the proxy agent computer: `c:\inetpub\ftproot\CCM80-01` **Important** If you are running Unified Communications Manager 5.x, use forward slashes (/), not backslashes (\), in your file path. In version 5.x, backslashes cause a corruption of the Cisco database. Backslashes are acceptable in later versions of Communications Manager.

32.19.3 Resource Object

Windows server

Only one computer can act as proxy for any given CallManager cluster. Therefore, run this script on only one computer at a time.

32.19.4 Default Schedule

By default, this script runs once a week.

32.19.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Discovery_CiscoCM job fails. The default is 5.

Full path to file with list of primary CallManager servers	Specify the full path to a file on the proxy agent computer that contains a list of the DNS hostnames of the primary servers you want to monitor. The file should list the names on one or more lines. Separate multiple names in one line with a comma. For example,
	`primarycluster1,primarycluster2,primarycluster4`
	If you specify the names on multiple lines, ensure that each line contains only one entry. For example:
	`primarycluster1`
	`primarycluster2`
	`primarycluster4`
	Important
	• If DNS is not available in your environment, you can use IP addresses in this parameter.
	• After running the Discovery_CiscoCM job, note the name of the discovered cluster in the TreeView, which will look similar to the following example: `Proxy agent computer CiscoCM:`**`CCM80-01`**`-Cluster`
	• Even if you use IP addresses in this parameter, the text in bold, the *TreeView cluster name*, may look like a hostname.

Parameter	How to Set It
Comma-separated list of primary CallManager servers	If you do not have a file that contains a list of server names or addresses, you can use this parameter to type the DNS hostnames of the primary servers in the clusters that you want to monitor. Separate multiple names with a comma. For example: `primarycluster1,primarycluster2,primarycluster4` **Important** • If DNS is not available in your environment, you can use IP addresses in this parameter. • After running the Discovery_CiscoCM job, note the name of the discovered cluster in the TreeView, which will look similar to the following example: `Proxy agent computer CiscoCM:`**CCM80-01**`-Cluster` • Even if you use IP addresses in this parameter, the text in bold, the *TreeView cluster name*, may look like a hostname.

Comma-separated list of CallManager IP address pairs in a single NAT cluster	MSPs (Managed Service Providers) frequently maintain distributed customer networks in which NAT (Network Address Translation) is used to translate the IP address ranges that are monitored from a single NOC (Network Operations Center). The use of NAT prevents AppManager from recognizing the actual IP addresses of the servers in the remote cluster. If your AppManager agent is located on a server in the NOC, but the monitored devices are located in a cluster in the remote customer network, you need to provide a list of the IP addresses of the remote monitored devices.
	Use this parameter to enable AppManager to recognize the IP addresses of the servers for a single remote Communications Manager cluster.
	Type a list of IP address pairs for the Communications Manager servers in a remote cluster. Use commas to separate the addresses. A pair consists of a server's NAT (external) IP address and its IP address inside the cluster. The first address pair in the list must be that of the Communications Manager Publisher (also call the Primary Communications Manager), followed by address pairs for the Subscribers inside the remote cluster. Use the following format:
	`publisherexternaladdress,publisherinternaladdress, subscriberexternaladdress1,subscriberinternaladdress1, subscriberexternaladdress2,subscriberinternaladdress2`
	In the following example, the 10.41* addresses are externally visible and the 172.16* addresses are visible only to the Communications Manager servers:
	`10.41.1.10,172.16.1.10,10.41.1.11,172.16.1.11,...`

Raise event if discovery succeeds?	Select **Yes** to raise an event when discovery succeeds. The default is unselected.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery succeeds. The default is 25.
Raise event if discovery succeeds with warnings	Select **Yes** to raise an event if discovery returns some data but also generates warning messages. The default is Yes.
Event severity when discovery succeeds with warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discover generates warning messages. The default is 15.
Raise event if discovery fails?	Select **Yes** to raise an event if discovery fails. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery fails. The default is 5.

Parameter	How to Set It
Discovery Details	
Display FQDN in TreeView for discovered servers?	Select **Yes** to display CiscoCM servers in the TreeView using fully qualified domain names (FQDNs) instead of the host name after you run discovery. Selecting this option does not affect the name of the top-level CiscoCM cluster object. The default is unselected.
Discover Trap Receiver?	Select **Yes** to discover NetIQ SNMP Trap Receiver. The default is Yes.
Trap Receiver IP address	Specify the IP address of the computer on which Trap Receiver is installed. The default is `localhost`.
Trap Receiver TCP port	Specify the TCP port number through which Trap Receiver will communicate with AppManager. The default is port 2735.

32.20 CiscoCM_4x

Use the Knowledge Script to discover a CallManager 4.x cluster. You can then use the CiscoCM_4x Knowledge Scripts to monitor phone deregistration on CallManager 4.x clusters.

32.20.1 Prerequisites

- The proxy agent computer must be running SQL Server or MSDE in order to provide a local database in which to store the collected deregistration information.
- Configure the AXL user ID and password in AppManager Security Manager before discovering a CallManager 4.x cluster. For more information, see CiscoCM_4x.

32.20.2 Resource Object

NT_MachineFolder

Only one computer can act as proxy for any given CallManager cluster. Therefore, run this script on only one computer at a time.

32.20.3 Default Schedule

By default, this script runs once.

32.20.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Discovery_CiscoCM_4x job fails. The default is 5.

Full path to file with list of CallManager Publishers	Specify the full path to a file on the agent computer that contains a list of Publisher names or IP addresses. The file should contain the names or IP addresses on one or more lines. If you specify the names on one line, separate each item with a comma. For example,
	`10.0.1.1,10.0.1.254,10.0.4.1,10.0.4.254`
	If you specify the names on multiple lines, ensure that each line contains only one entry. For example:
	`primarycluster1`
	`primarycluster2`
	`primarycluster3`

Parameter	How to Set It
Comma-separated list of CallManager Publishers	If you do not have a file that contains a list of Publisher names or IP addresses, you can use this parameter to type the names or IP addresses of the CallManager Publisher in the clusters that you want to monitor. For example: `primarycluster1,primarycluster2,primarycluster4`
Raise event if discovery succeeds?	Set to **Yes** to raise an event when discovery succeeds. The default is unchecked.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery succeeds. The default is 25.
Raise event if discovery succeeds with warnings?	Set to **Yes** to raise an event if discovery returns some data but also generates warning messages. The default is Yes.
Event severity when discovery succeeds with warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discover generates warning messages. The default is 15.
Raise event if discovery fails?	Set to **Yes** to raise an event if discovery fails. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery fails. The default is 5.

32.21 CiscoCME

Use this Knowledge Script to discover Cisco CallManager Express (CME) resource and configuration information.

32.21.1 Prerequisites

Configure your AXL password and community string values in AppManager Security Manager.

32.21.1.1 AXL Password Configuration

AVVID XML Layer (AXL), a Cisco application programming interface (API), enables CallManager Express to access the CallManager Express HTTP server.

Most of the AXL information is configured in an IOS configuration mode called telephony-service. In order for the CiscoCME Knowledge Scripts to function properly, you should review and then take action on the following:

- `xmltest` cannot be configured on the CallManager Express router. This configuration keyword puts the AXL (AVVID XML Layer) into interactive test mode. If `xmltest` is configured, then the AXL queries that the CallManager Express Knowledge Scripts use will not work. Use the following IOS commands to disable `xmltest`:

  ```
  config t, telephony-service, no xmltest
  ```

- If the `xmlschema` keyword is configured on the CallManager Express router, then the CallManager Express Knowledge Scripts may not work properly. This configuration keyword specifies the location of the XML schema for AXL. By default, the Knowledge Scripts use the default schema location. If you change the keyword to something other than the default, then the Knowledge Scripts will not be able to identify the schema location.

If your AXL password information is the same for all CallManager Express devices, then complete the following procedure once. If your AXL password information is different for different devices, then complete the following procedure once for each different password.

NOTE: If, after running Discovery_CiscoCME, expected devices were not discovered, ensure you configured the correct AXL password. To do so, configure the AXL password again.

Complete the following fields in the Custom tab of Security Manager for the proxy agent computer.

Field	Description
Label	`CiscoCME`
Sub-label	Indicates whether the community string will be used for a single device or for all devices. • *For a single router*, provide the <*`device name`*>. • *For all routers*, type `default`.
Value 1	The AXL password that you configured using the `log password` IOS command on the router. If you did not configure an AXL password, enter the `Router privilege mode` password
Extended application support 3	Required field. Encrypts the AXL password in Security Manager.

32.21.1.2 SNMP Community String Configuration

To enable SNMP access of CallManager Express devices, configure the SNMP read-only community strings in AppManager Security Manager before discovering CallManager Express devices.

Complete the following fields in the Custom tab of Security Manager for the proxy agent computer.

Field	Description
Label	`NetworkDevice`
Sub-label	Indicates whether the community string will be used for a single device or for all devices. • *For a single device*, provide the <*`device IP address`*>. • *For all devices*, type `default`.
Value 1	The appropriate reade-only community string, such as `private` or `public`.
Value 3	Use this field *only* if you have used Cisco CallManager Administration to change the number of the HTTPS port the proxy agent computer uses to connect to the CallManager server. In the **Value 3** field, type the new secure port number. Leave this field blank to use the default port number: 8443.

32.21.2 Resource Object

You should only have one computer acting as a proxy for any given CallManager Express device. Therefore, drop this script on only one computer at a time.

32.21.3 Default Schedule

By default, this script is only run once for each server.

32.21.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Auto Discovery	
Default gateway router	Enter the IP network address of the gateway (router) to query during discovery. **NOTE:** Use this parameter if you're not certain of all the relevant subnets that should be scanned during discovery. If you enter an IP address here, AppManager will query the gateway for its routing tables and then attempt to discover every device in the tables.

Parameter	How to Set It
Maximum number of hops	Enter the maximum number of router hops that you want discover to make during auto-discovery. The default is one hop. Discovery considers the gateway router itself to be the first hop. Therefore, a **Maximum number of hops** setting of 1 means you'll only discover the networks directly connected to the gateway router, but no other routers. To discover more, enter a **Maximum number of hops** setting of at least 2.
List of devices	Use this parameter if you know which CallManager Express devices you want to discover. Enter a list of the devices whose resources you want to discover. You must specify at least one device. Use commas to separate the names in the list: `raldbellijm02,raldattixlm`. You can enter hostnames (if you use DNS in your environment) or IP addresses. **NOTE:** The AXL password and SNMP community string information for each of the devices that you list in this field must be entered into Security Manager before you can run this script.
List of device ranges	Enter a list of IP address ranges for the CallManager Express devices whose resources you want to discover. Spaces are invalid in the list; only numbers, dashes, periods, and commas are allowed. For example: `10.0.1.1-10.0.1.254,10.0.4.1-10.0.4.254`. **NOTE:** Limit the number of IP addresses in each range to no more than 256. To scan more than 256 IP addresses, break a range into multiple ranges, each with no more than 256 IP addresses.
Full path to file with list of devices	Instead of listing each device separately (in the previous parameter), you can specify the full path to a file on the agent computer that contains a list of hostnames or IP addresses. The file should contain the names on one or more lines. If you specify the devices on one line, separate each item with a comma. For example: `10.0.1.1-10.0.1.254,10.0.4.1-10.0.4.254`. If you specify the devices on multiple lines, ensure that each line contains only one entry. For example: • `SEP999999994002` • `SEP999999994000` • `SEP999999994004` **NOTE:** The AXL password and SNMP community string information for each of the network devices listed in the file must be entered into Security Manager before you can run this script.
Discovery Details	Use these parameters to limit discovery to certain types of devices, and to set a discovery timeout.

Parameter	How to Set It
Discover individual · · ·	This script automatically discovers interfaces, links, and ports when the following parameters are enabled (which is the default setting). **NOTE:** To improve console performance, disable the following parameters for any of the devices that you are not interested in monitoring. By not displaying these objects in the TreeView pane, you will significantly speed up discovery and improve the performance of the TreeView pane of the Operator Console. · · · interfaces? · · · LAN links? · · · WAN links? · · · frame relay links? · · · ATM links? · · · FXS ports? · · · FXO ports? · · · ISDN channels?
Discovery timeout	Enter the amount of time in minutes (no more than 60) that the script should attempt discovery before stopping and raising an unsuccessful discovery event. The default is 10 minutes.
Raise event when discovery succeeds?	This script always raises an event when discovery fails for any reason. In addition, you can enable this parameter to raise an event when discovery succeeds. The default is n.
Event severity when discovery · · ·	Set the event severity level, from 1 to 40, to reflect the importance when the job: • ... **succeeds**. If you set this script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25. • ... **fails**. The default is 5.

32.22 CiscoCNS_PerfE

Use this Knowledge Script to discover Cisco CNS Performance Engine (CNS-PerfE) resource and configuration information.

32.22.1 Prerequisite

Configure Security Manager with the password that is required for accessing the CNS-PerfE computer.

NOTE: The password to access the CNS-PerfE computer is the password used for the CNS bus (such as when sending the TIBCO messages to the CNS-PerfE). The default password is cisco. You can change this password using the Settings page of the CNS-PerfE Web Interface. For more information, refer to your CNS Performance Engine User Guide.

You *cannot* discover the Cisco CNS-PerfE managed object until you configure the password in Security Manager.

To configure the CNS-PerfE password:

1. From the Operator Console, click **Extensions > Security Manager**.
2. Expand the Computers branch and select the computer on which the Cisco CNS-PerfE managed object is installed.
3. Click the **Custom** tab.
4. Click **Add**. The Add Custom Entry dialog box is displayed.
5. In the **Label** field, enter `CNSPE`.
6. In the **Sub-label** field, enter <`hostname of Solaris machine`> or `default`.
7. In the **Value 1** field, enter <`CNS-PerfE password`>.
8. In the **Value 2** field, enter <ftp password>.
9. Click **Apply**.

32.22.2 Resource Objects

NT_MachineFolder

32.22.3 Default Schedule

By default, this script runs once for each server.

32.22.4 Setting Script Parameters

Set the following parameters as needed:

Parameter	How to Set It
Hostname or IP address	Enter the hostname or IP address of the Solaris or Linux computer where the Cisco CNS-PerfE is located. The information you enter here will appear in the TreeView pane to identify the Cisco CNS-PerfE computer. **NOTE:** Be sure to enter the information correctly. The Solaris or LINUX machine requires case sensitivity.
CNS-PerfE subject	Enter the TIBCO subject field information for which the Cisco CNS-PerfE is listening. Leave this parameter blank if you want to use the default: `cisco.mgmt.das.<CNS-PEhostname>`. **Notes** • You can confirm the subject field information by checking the CNS name shown on the CNS-PerfE Web interface home page. • If you configured a dotted-decimal IP address in the previous parameter, then you must specify the subject. You cannot leave this parameter blank.
Create default schedules?	Set to y to create default schedules that match the schedule defaults in the CiscoCNS Knowledge Scripts. If set to y, a Schedules folder will appear below the Cisco CNS-PerfE object in the TreeView pane.
Raise event if discovery succeeds?	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • ... **succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • ... **fails**. The default is 5 (red event indicator).

32.23 CiscoICD

Use this Knowledge Script to discover a computer where the Cisco ICD (Integrated Contact Distribution) managed object is installed. With successful discovery, the Cisco ICD object is created in the TreeView pane.

32.23.1 Resource Object

CiscoICD server

32.23.2 Default Schedule

By default, this script runs once every week.

32.23.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if discovery succeeds?	Set the event severity level, from 1 to 40, to indicate the importance of the event when discovery succeeds. The default is 25 (blue event indicator).
Event severity when discovery succeeds	Set the severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Raise event if discovery fails?	Select the **Yes** check box to raise an event when discovery fails. By default, events are enabled.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of the event when discovery fails. The default is 5.
Raise event if discovery partially succeeds?	Select the **Yes** check box to raise an event when discovery returns some data but also generates warning messages. By default, events are enabled.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the event when discovery partially succeeds, returning some information but also generating a warning message. The default is 15 (yellow event indicator).
Discovery	Use this parameter to specify the type of security authentication to use.
SQL username	If appropriate, enter your SQL username. Leave this field blank to use Windows Authentication. The default is blank. **NOTE:** If a SQL username is required, then you must configure the username in the AppManager Security Manager. For more information, see the *Installation Guide* for AppManager.

32.24 CiscoICM

Use this script to discover the Cisco ICM configuration and resources.

32.24.1 Prerequisite

Discover Windows resources on the server that you want to monitor before you discover ICM resources. If you have not yet discovered Windows resources, run the NT discovery script.

32.24.2 Resource Objects

Cisco ICM servers

32.24.3 Default Schedule

By default, this script is run weekly for each server.

32.24.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if discovery succeeds? (y/n)	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to **y** to raise an event when the job succeeds. The default is n.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery returns some data but also generates warning messages. The default is 15.
SQL User Name (leave blank to use Windows authentication)	If appropriate, provide your SQL user name. Leave this field blank to use Windows Authentication. Ensure the user has permission to access the database in read-only mode. If you want to use a specific SQL Server login account, use Security Manager to update the AppManager repository with the SQL Server login you want to use. For more information, see the *Installation Guide for AppManager*.
Central controller database detection	Select whether you want AppManager to automatically identify the Central Controller database or whether you want to enter the database name manually. AppManager can only detect the Central Controller database automatically if you installed the Central Controller on the Admin Workstation computer. The default is Automatic.
Name of server hosting central controller database	Enter the computer where the Central Controller database. You can enter a host name, IP address, or fully qualified domain name.
Name of central controller database	Enter the name of the Central Controller database.

32.25 CiscoICS

Use this Knowledge Script to discover Cisco ICS configuration and resources.

32.25.1 Prerequisite

Discover Windows resources on the server that you want to monitor before you discover ICS resources. If you have not yet discovered Windows resources, run the NT discovery script.

32.25.2 Resource Objects

Cisco ICS servers

32.25.3 Default Schedule

By default, this script is only run once for each server.

32.25.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event when discovery succeeds?	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • ...**succeeds**. If you enabled events when the job succeeds, set the event severity level for a successful discovery. • ...**fails**. The default is 5 (red event indicator). • ...**partially succeeds**. Set the event severity level for a discovery job that returns some data but also generates warning messages.

32.26 CiscoIPTSecurity

Use this Knowledge Script to discover security-related applications, such as Cisco Security Agent (CSA) and Symantec AntiVirus, on the Cisco IP telephony servers on which you installed the Cisco IP Telephony Security module.

32.26.1 Resource Object

NT_MachineFolder

32.26.2 Default Schedule

By default, this script runs weekly on Sunday.

32.26.3 Setting Script Parameters

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the discovery job fails. The default is 5.
Raise event if discovery succeeds?	Set to **Yes** to raise an event when discovery completes successfully. The default is unchecked.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery completes successfully. The default is 25.
Raise event if discovery fails?	Set to **Yes** to raise an event when discovery fails to complete. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery fails to complete. The default is 5.

32.27 CiscoIPTV

Use this Knowledge Script to discover the Cisco IP/TV resources and configuration on computers where the Cisco IP/TV managed object is already installed.

32.27.1 Prerequisite

Discover Windows resources on the server that you want to monitor before you discover IP/TV resources. If you have not yet discovered Windows resources, run the NT discovery script.

32.27.2 Resource Objects

Cisco IP/TV servers.

32.27.3 Default Schedule

By default, this script is only run once for each server.

32.27.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if discovery succeeds?	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: ...**succeeds**. If you enabled events when the job succeeds, set the event severity level for a successful discovery. ...**fails**. The default is 5 (red event indicator). ...**partially succeeds**. Set the event severity level for a discovery that returns some data but also generates warning messages.

32.28 CiscoIVR

Use this Knowledge Script to discover Cisco IVR resources and configuration.

32.28.1 Prerequisite

Discover Windows resources on the server that you want to monitor before you discover IVR resources. If you have not yet discovered Windows resources, run the NT discovery script.

32.28.2 Resource Objects

Cisco IVR servers.

32.28.3 Default Schedule

By default, this script is run weekly for each server.

32.28.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if discovery succeeds?	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery that returns some data but also generates warning messages.

32.29 CiscoPersonalAsst

Use this Knowledge Script to discover the Cisco Personal Assistant configuration and resources.

32.29.1 Prerequisite

Discover Windows resources on the server that you want to monitor before you discover Personal Assistant resources. If you have not yet discovered Windows resources, run the NT discovery script.

32.29.2 Resource Objects

Cisco Personal Assistant servers

32.29.3 Default Schedule

By default, this script is only run once for each server.

32.29.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if discovery succeeds?	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery that returns some data but also generates warning messages.

32.30 CiscoUC

Use the Discovery_CiscoUC Knowledge Script to discover Cisco Unity Connection resources. You need to either specify a list of primary Unity Connection servers, separated by a comma, or specify the complete path to a file that contains a list of primary servers. The Cisco AXL Web service, Tomcat service, and SOAP API services must be active on all the servers in the cluster.

32.30.1 Prerequisite

Configure your AXL password in AppManager Security Manager before discovering Cisco Unity Connection resources. For more information, see "Configuring AXL Passwords" on page 1590.

To access Cisco Unity Connection resources, save the HTTPS certificate to the trusted folder on the AppManager machine. For more information, see "Accessing Cisco Unity Connection Resources" on page 1590.

32.30.1.1 Configuring AXL Passwords

The Cisco Unified CM Serviceability APIs (SXML), a Cisco application programming interface, enable access to the Unity Connection server. Configure the password in AppManager Security Manager before running the Discovery_CiscoUC Knowledge Script. Complete the following fields in the Custom tab of Security Manager for the proxy agent computer.

Field	Description
Label	CiscoUC_AXL
Sub-label	Indicates whether the SXML information will be used for a single or for all Unity Connection servers. Specify one of the following locations: • For a single server, provide the IP address or host name of the server. • For all servers, type `default`.
Value 1	User ID that has the authority to use the API. In most cases, the Administrator user has this authority.
Value 2	Password associated with the user ID entered in *Value 1*.
Value 3	Use this field only if you used Cisco Unified Communications Manager Administration to change the number of the HTTPS port that the proxy agent computer uses to connect to the Communications Manager server. Type the new secure port number. Leave this field blank to use the default port number, 8443.
Extended application support	Required field. Encrypts the user name and password in Security Manager.

32.30.1.2 Accessing Cisco Unity Connection Resources

To access the Cisco Unity Connection resources, the browsers must be set up correctly on an administrator workstation. When you discover the Cisco Unity Connection resources, it might fail if the required HTTPS certificate is not saved to the trusted folder.

The system issues the certificate by using the host name. If you attempt to access a Web application by using the IP address, the Security Alert dialog box appears, even though you installed the certificate on the client.

Exporting the Certificate

This section describes how you can import the certificate from the Cisco Unity Connection website.

To export the certificate from the Cisco Unity Connection website:

1. Use Internet Explorer to browse to the Cisco Unity Connection Server. A security certificate alert page is displayed.
2. Click **Continue to this website (not recommended)**. The Cisco Unity Connection Administration Console is displayed.
3. Click **Certificate error**, which is to the right of the Address (URL) field, and then click **View Certificates**. The Certificate dialog box is displayed.
4. Click the **Details** tab, and then click **Copy to file** to open the Certificate Export Wizard.
5. Click **Next** twice.
6. Click **Browse** and browse to a location where you want to save the certificate, and then click **Save**.
7. Click **Next** and then click **Finish**.
8. Click **OK** twice.
9. Close the Cisco Unity Connection Administration Console.

Saving the Certificate to the Trusted Folder

This section describes how to save the certificate to the trusted folder.

To save the certificate to the trusted folder:

1. On the AppManager computer, open a Microsoft Management Console (mmc).
2. Select **File > Add/Remove Snap-in** to open the Add or Remove Snap-ins dialog box.
3. Click **Certificates** in the **Available snap-ins** list, and then click **Add**.
4. Select **Computer Account**, click **Next**, and then click **Finish**.
5. Click **OK** to close the Add or Remove Snap-ins dialog box.
6. Expand **Certificates** under **Console Root**, right-click **Trusted Root Certificate Authorities**, and then select **All Tasks > Import**.
7. Click **Browse** and browse to the location where you saved the certificate.
8. Select the certificate that you imported, and then click **Open**.
9. Click **Next**.
10. Click **Place All Certificates in the Following Store** and then click **Next**.
11. Click **Finish** and then click **OK**.

32.30.2 Resource Objects

Cisco Unity Connection servers

32.30.3 Default Schedule

By default, this script runs once a week for each server.

32.30.4 Setting Parameter Values

Set the **Values** tab parameters as needed:

Parameter	How to Set It
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the Discovery_CiscoUC job fails. The default is 5.
Full path to file with list of primary Unity Connection servers	Specify the full path to the file that has the list of primary Unity Connection servers through which you want to discover other Cisco Unity Connection objects.
Comma-separated list of primary Unity Connection servers.	Specify the name of the primary Unity Connection servers in the cluster, separated by commas, through which you want to discover other Cisco Unity Connection objects. For example: primarycluster1,primarycluster2,primarycluster4
Raise event if discovery succeeds?	Set to **Yes** to raise an event when the discovery job succeeds. The default is unselected.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the discovery job succeeds. The default is 25.
Raise event if discovery succeeds with warnings?	Set to **Yes** to raise an event when the discovery job succeeds with warnings. The default is Yes.
Event severity when discovery succeeds with warnings	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the discovery job succeeds with warnings. The default is 15.
Raise event if discovery fails?	Set to **Yes** to raise an event when the discovery job fails. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of the event that is raised when the discovery job fails. The default is 5.

32.31 CiscoUCM

Use the Discovery_CiscoUCM Knowledge Script to discover configuration and resource information for Cisco Unified Communications servers and Cisco Universal Presence Server (CUPS) resources. The Cisco AXL Web service, the Tomcat service, and the SOAP API services must be active on all servers in the cluster. Only one computer can act as proxy agent for any given Unified Communications server. Therefore, run Discovery_CiscoUCM on only one Windows server at a time.

Configure your AXL password in AppManager Security Manager before discovering Cisco Unified Communications servers and Cisco Universal Presence Server (CUPS) resources.

32.31.1 Configuring AXL Passwords in Security Manager

AVVID XML Layer (AXL), a Cisco application programming interface, enables the Unified Communications server to access the HTTP server. Configure the AXL password in AppManager Security Manager *before* running the Discovery_CiscoUCM Knowledge Script.

Complete the following fields in the **Custom** tab of Security Manager for the proxy agent computer.

Field	Description
Label	`CiscoCM_AXL`
Sub-label	Indicates whether the AXL information will be used for a single Unified Communications server or for all Unified Communications servers. • For a single Unified Communications server, provide the name of the Unified Communications server. • For all Unified Communications servers, type `default`.
Value 1	AXL user ID that has the authority to use the AXL API. In most cases, the Unified Communications server Administrator user has this authority.
Value 2	AXL password that has the authority to use the AXL API. In most cases, the Unified Communications server Administrator user has this authority.
Value 3	Use this field *only* if you used Cisco Unified Communications Manager Administration to change the number of the HTTPS port the proxy agent computer uses to connect to the Unified Communications server. Type the new secure port number. Leave this field blank to use the default port number, 8443.
Extended application support	Required field. Encrypts the AXL password in Security Manager.

32.31.2 Configuring a New User

By default, AppManager uses the `ccmadmin` account to access Unified Communications data. If you do not want to use the `ccmadmin` account, you can set up a new user in a new user group and then configure that group with read-only permission for AppManager. After configuring the new user group, configure the new information in AppManager Security Manager, and then run Discovery_CiscoUCM on the primary Unified Communications Manager server.

To allow AppManager to access Unified Communications server data, create a new user and assign the user to a new access control group.

To configure a new user:

1. Navigate to the Administration Web site of your primary Unified Communications server.
2. In the **Username** and **Password** fields, type your user name and password, and then click **Submit**.
3. From the Cisco Unified application Web page, select **Application User** from the User Management menu, and then click **Add New**.
4. In the **User ID** field, type `netiq`.
5. In the **Password** and **Confirm Password** fields, type a password for the new user and then click **Save**.
6. On the Cisco Unified application Web page, select **Access Control Group** from the User Management menu, and then click **Find**.
7. In the Search Results panel, click the **Copy** icon in the Standard CCM Read Only row.
8. In the Explorer User Prompt dialog box, type `NetIQ CUM Read Only` and then click **OK**.
9. Click **Add Application Users to Group** and then click **Find**.
10. Select **netiq** and then click **Add Selected**.
11. On the Cisco Unified application Web page, select **Access Control Group** from the User Management menu.
12. In the NetIQ CCM Read Only row, click the **Roles** icon.
13. Click **Assign Role to Group** and then click **Find**.
14. Select **Standard AXL API Access** and then click **Add Selected**.
15. On the Cisco Unified application Web page, confirm the NetIQ CCM Read Only group is assigned to the following roles:
    - Standard CCM Admin Users
    - Standard CCMADMIN Read Only
    - Standard SERVICEABILITY Read Only
    - Standard AXL API Access

32.31.3 Adding the New User in Security Manager

After you create a new user in a new access control group, add the new user name and password in AppManager Security Manager.

Complete the following fields in the **Custom** tab of Security Manager for the proxy agent computer.

Field	Description
Label	`CiscoCM_AXL`
Sub-label	Computer name of the primary Unified Communications server for which you created the new user and user group in "Configuring a New User" on page 1593.
Value 1	`netiq`
Value 2	Password you created for the new user in "Configuring a New User" on page 1593.
Extended application support	Required field to encrypt the new password in Security Manager.

32.31.4 Running Discovery_CiscoUCM

After you create a new user and configure the new user in Security Manager, run the Discovery_CiscoUCM Knowledge Script on the proxy agent computer.

In the *Comma-separated list of primary servers* parameter of the Discovery_CiscoUCM script, provide the host name of the primary server for which you created the new user and user group in "Configuring a New User" on page 1593.

By default, this script runs once a week on Sundays for each computer.

If you delete or add a resource object, or if you make any other kind of change that might affect the monitoring of your resources, run the Discovery_CiscoUCM Knowledge Script again to update your list of resource objects. In addition, if you are running this module on AppManager 8 or later, you can use the delta discovery feature in Control Center to run discovery on a schedule to more quickly detect changes to your environment.

Set the **Values** tab parameters as needed.

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Discovery_CiscoUCM job fails. The default is 5.

Full path to file with list of primary servers	Specify the full path to a file on the proxy agent computer that contains a list of the DNS hostnames or the IP addresses of the primary servers you want to monitor. List the names on one or more lines in the file, and separate multiple names in one line with a comma. For example,
	`primarycluster1,primarycluster2,primarycluster4`
	If you specify the names on multiple lines, ensure that each line contains only one entry. For example:
	`primarycluster1`
	`primarycluster2`
	`primarycluster4`
	Important
	• After running the Discovery_CiscoUCM job, note the name of the discovered cluster in the TreeView, which will look similar to the following example: `Proxy agent computer CiscoCM:`**`CCM80-01`**`-Cluster`

Comma-separated list of primary CiscoUCM servers	If you do not have a file that contains a list of server names or addresses, you can use this parameter to type the DNS hostnames or the IP addresses of the primary servers in the clusters that you want to monitor. Separate multiple names with a comma. For example: `primarycluster1,primarycluster2,primarycluster4` **Important** • After running the Discovery_CiscoUCM job, note the name of the discovered cluster in the TreeView, which will look similar to the following example: `Proxy agent computer CiscoCM:`**`CCM80-01`**`-Cluster`

Parameter	How to Set It

Comma-separated list of Communications IP address pairs in a single NAT cluster	MSPs (Managed Service Providers) frequently maintain distributed customer networks in which NAT (Network Address Translation) is used to translate the IP address ranges that are monitored from a single NOC (Network Operations Center). The use of NAT prevents AppManager from recognizing the actual IP addresses of the servers in the remote cluster. If your AppManager agent is located on a server in the NOC, but the monitored devices are located in a cluster in the remote customer network, you must provide a list of the IP addresses of the remote monitored devices.
	
	Use this parameter to enable AppManager to recognize the IP addresses of the servers for a single remote Communications Manager cluster.
	
	Type a list of IP address pairs for the Communications Manager servers in a remote cluster. Use commas to separate the addresses. A pair consists of a server's NAT (external) IP address and its IP address inside the cluster. The first address pair in the list must be that of the Communications Manager Publisher (also call the Primary Communications Manager), followed by address pairs for the Subscribers inside the remote cluster. Use the following format:
	
	`publisherexternaladdress,publisherinternaladdress,subscriberexterna`
	
	In the following example, the 10.41* addresses are externally visible and the 172.16* addresses are visible only to the Communications Manager servers:
	
	`10.41.1.10,172.16.1.10,10.41.1.11,172.16.1.11,...`

Raise event if discovery succeeds?	Select **Yes** to raise an event when discovery succeeds. The default is unselected.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery succeeds. The default is 25.
Raise event if discovery succeeds with warnings	Select **Yes** to raise an event if discovery returns some data but also generates warning messages. The default is Yes.
Event severity when discovery succeeds with warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discover generates warning messages. The default is 15.
Raise event if discovery fails?	Select **Yes** to raise an event if discovery fails. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery fails. The default is 5.

32.32 CiscoUE

Use this Knowledge Script to discover Cisco Unity Express resources and configuration information.

AppManager uses SNMP queries to remotely access Unity Express devices. However, it cannot communicate with the devices unless it has permission to do so. You can grant that permission by configuring the appropriate SNMP community string information into AppManager Security Manager.

32.32.1 Prerequisite

AppManager uses SNMP queries to remotely access Unity Express devices. However, it cannot communicate with the devices unless it has permission to do so. You can grant that permission by configuring the appropriate community string information into AppManager Security Manager.

For each Unity Express device that you want to monitor, the SNMP community string information *must* be entered into Security Manager before you can discover Unity Express resources.

In some cases, Unity Express can re-use the default community string that you may have already configured for the AppManager for Network Device module. Use the following table to determine which community string information you should enter:

If	And	Then
You have configured the community string for Network Device	The community string is the same for Unity Express	Do *not* re-enter the community string. AppManager can use the community string settings for Network Device.
You have *not* configured the community string for Network Device	The community string is the same for Unity Express	Use the following procedure to enter the community string for Network Device. AppManager can use the community string settings for Network Device.
You have *not* configured the community string for Network Device	The community string is *not* the same for Unity Express	Use the following procedure to enter the community strings for *both* Unity Express *and* Network Device.

In summary, you always need the community string information for AppManager for Network Device. If the community strings are different for the two modules, then you also need the community string information for Unity Express.

Complete the following fields in the Custom tab of Security Manager for the proxy agent computer.

Field	Description
Label	`CiscoUE` or `NetworkDevice`, as appropriate
Sub-label	For a single device on a particular proxy: • *For Cisco UE*, enter the <*device IP address*> • *For Network Device*, enter the <*hostname or device IP address*> For all devices on a particilar proxy, enter `default`.
Value 1	The appropriate read-only community string, such as `public` or `private`.
Value 2	AXL password that has the authority to use the AXL API. In most cases, the CallManager Administrator user has this authority.

32.32.2 Resource Object

Cisco Unity Express routers

32.32.3 Default Schedule

Discovery runs every Sunday at 3 A.M., but also runs immediately on the first iteration of the job.

32.32.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the discovery job fails. The default is 5.
Raise event if discovery succeeds?	Set to **Yes** to raise an event when the discovery process is successful. The default is unchecked.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery succeeds. The default is 25.
Raise event if discovery fails?	Set to **Yes** to raise an event when the discovery process fails to find some or all of your Unity Express resources. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery fails to find some or all of your Unity Express resources. The default is 10.
Discovery Details	
Discover individual ... ?	Set any of the Discovery Details parameters to **Yes** to discover the following components: • Interfaces • LAN links • WAN links • Frame relay links • ATM links • FXS ports • FXO ports • ISDN channels
Auto Discovery	
Default gateway router	Enter the IP network address of the gateway router to query during discovery. The router you want to query is the router that hosts the Unity Express device that you want to monitor. **NOTE:** Use this parameter if you're not certain of all the relevant subnets that should be scanned during discovery. If you enter an IP address here, AppManager will query the gateway for its routing tables and then attempt to discover every device in the tables.

Parameter	How to Set It
Maximum number of hops	Enter the maximum number of hops that you want discovery to make during auto-discovery. The default is one hop. Discovery considers the gateway router itself to be the first hop. Therefore, a **Maximum number of hops** setting of 1 means you'll only discover the networks directly connected to the gateway router, but no other routers. To discover more, enter a **Maximum number of hops** setting of at least 2.
Discover Unity Express Devices	
Discovery timeout	Enter the number of minutes (no more than 60) that the script should attempt discovery before stopping as an unsuccessful discovery. The default is 10 minutes.
Maximum number of concurrent discoveries	Specify the maximum number of Unity Express devices that can be queried for discovery at one time. No matter what value you enter, discovery is still performed for the entire list of devices that you specify in the following parameters. Setting this parameter to a low value throttles the number of SNMP requests performed at one time, but may increase the overall time it takes to discover a list of devices. The default is 10 concurrent discoveries.
List of IP telephony routers	Use this parameter if you know which IP telephony routers you want to discover, which are those routers that host Unity Express devices. Specify at least one router IP address or hostname, using a comma to separate multiple items: `10.0.1.1,10.0.1.7` You can enter IP addresses or hostnames, but you *must* enter the same IP address or hostname for which you configured SNMP community string information. If you configured a community string for a hostname, then enter the *same* hostname; if you configured an IP address, then enter the *same* IP address.
List of IP telephony router ranges	Enter a list of IP address ranges of the routers for which you want to discover resources. Spaces are invalid in the list; only numbers, dashes, periods, and commas are allowed. For example: `10.0.1.1-10.0.1.254,10.0.4.1-10.0.4.254` The routers you specify are those routers that host Unity Express devices. Their IP addresses *must* match the IP addresses for which you configured SNMP community string information. If you configured community strings for hostnames, then don't use this parameter. Use the following parameter or the preceding parameter. **NOTE:** Limit the number of IP addresses in each range to no more than 256. To scan more than 256 IP addresses, break a range into multiple ranges, each with no more than 256 IP addresses.

Parameter	How to Set It
Full path to file with list of IP telephony routers	Instead of listing each router separately, you can specify the full path to a file on the agent computer that contains a list of IP addresses or hostnames of routers that host Unity Express devices. The list should contain the names/addresses on one or more lines. If you specify the routers on one line, separate each item with a comma. For example: `10.0.1.1-10.0.1.254,10.0.4.1-10.0.4.254` If you specify the routers on multiple lines, ensure that each line contains only one entry. For example: • `routername01` • `routername02` • `routername10` You can enter IP addresses or hostnames, but you *must* enter the same IP address or hostname for which you configured SNMP community string information. If you configured a community string for a hostname, then enter the *same* hostname in the list; if you configured an IP address, then enter the *same* IP address in your list.
Comma-separated list of Unity Express and host router NAT-enabled IP address pairs	MSPs (Managed Service Providers) frequently maintain distributed customer networks in which NAT (Network Address Translation) is used to translate the IP address ranges that are monitored from a single NOC (Network Operations Center). The use of NAT prevents AppManager from recognizing the actual IP addresses of the remote Unity Express devices and host routers. If your AppManager agent is located on a server in the NOC, but the monitored devices are located in the remote customer network, you need to provide AppManager with a list of the IP addresses of the remote monitored devices. Use this parameter to enable AppManager to recognize the IP addresses of the remote Unity Express devices and host routers. Type a list of IP address pairs for the remote Unity Express devices and host routers. Use commas to separate the addresses. A pair consists of the externally visible IP address for a Unity Express device and the externally visible IP address of its host router. Use the following format: `UEexternaladdress1,hostrouterexternaladdress1, UEexteraladdress2,hostrouterexternaladdress2` The following example shows how the pairs look when you use IP addresses: 10.41.1.10,10.41.1.11,10.41.1.12,10.41.1.13

32.33 CiscoUnity

Use this Knowledge Script to discover Cisco Unity resources (including the TSP version) and ports.

32.33.1 Prerequisite

Discover Windows resources on the server that you want to monitor before you discover Unity resources. If you have not yet discovered Windows resources, run the NT Discovery Knowledge Script.

32.33.2 Resource Objects

Cisco Unity servers

32.33.3 Default Schedule

By default, this script is run weekly for each server.

32.33.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if discovery succeeds?	This script always raises an event when the discovery fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery that returns some data but also generates warning messages.
SQL username (leave blank to use Windows authentication)	If appropriate, enter your SQL username. Leave this field blank to use Windows Authentication. If you want to use a specific SQL Server login account, use Security Manager to update the AppManager repository with the SQL Server logins you want to use. For more information, see the *Installation Guide* for AppManager.
Create failover pair server group (in Master view)?	Set to y to create a server group composed of a failover pair (primary and secondary Unity servers). This server group is visible in the TreeView pane from the Master view only.

32.34 CiscoUnityBridge

Use this Knowledge Script to discover Cisco Unity Bridge configuration and resources. This script automatically raises an event when discovery is unsuccessful.

32.34.1 Prerequisite

Discover Windows resources on the server that you want to monitor before you discover Unity Bridge resources. If you have not yet discovered Windows resources, run the NT discovery script.

32.34.2 Resource Objects

Cisco Unity Bridge servers

32.34.3 Default Schedule

By default, this script is run once for each server.

32.34.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery that returns some data but also generates warning messages.

32.35 Cluster

Use this Knowledge Script to discover clustered applications on physical computers and virtual machines. This script also discovers the cluster alias and adds it as a top-level resource object. This script facilitates monitoring of clustered applications. It removes the need to run the SetResourceDependency Knowledge Script or run multiple jobs on each clustered node per instance of the application. Also, application failovers are not required to discover servers on each node.

Although virtual servers are viewed and monitored as objects, features such as pinging the physical computer are not available. Other settings such as maintenance mode, custom server properties and security information storage are not applicable for virtual servers.

32.35.1 Security Rights

To correctly discover and monitor a Microsoft cluster, this Knowledge Script requires local Administrator access to each node of the Microsoft cluster. To do this, run the `netiq` service as a domain user account and a member of the local Administrator group on each member of the cluster. Without this access, the discovery fails because it relies on the Microsoft Cluster API to properly access cluster resources.

32.35.2 Administering a Cluster

The Cluster Administrator can be used to administer a cluster, provided the account you are using has the required permissions and group memberships. The local Administrator account and local system account always have access to the cluster. You can use another account to administer a cluster with Cluster Administrator if the following requirements are true:

- The account has permission to administer the cluster. You must use Cluster Administrator to assign permissions, not Windows Group Administrator.
- The account is a domain account, which is a member of the local Administrators group.
- The account is a member of the local Administrators group on each node of the cluster.

The account can be a member of other groups, such as global groups, as long as it is a domain account.

The Discovery_Cluster script will only generate events if the *Raise event if condition occurs* option on the Advanced tab for the Discovery_Cluster script is set to raise an event one time within one job iteration.

By default, this Knowledge Script raises an event when discovery fails.

32.35.3 Prerequisite

Use the NT Knowledge Script to discover Microsoft Windows resources on the server you want to monitor before you discover clustered applications.

If you delete or add a resource object, or if you make any other kind of change that might affect the monitoring of your resources, run both the NT Knowledge Script and the Discovery_Cluster Knowledge Script again to update your list of resource objects. In addition, if you are running this module on AppManager 8 or higher, you can use the delta discovery feature in Control Center to run discovery on a schedule to more quickly detect changes to your environment.

32.35.4 Resource Objects

Microsoft Clustered Servers

32.35.5 Default Schedule

By default, this script is run once for each server.

32.35.6 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event when discovery succeeds?	This script always raises an event when the job fails for any reason. The default is n. In addition, you can set this parameter to **y** to raise an event when the Discovery_Cluster job succeeds in discovering clustered resources.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery returns some data but also generates warning messages. The default is 10.
Event severity when discovery is not applicable	Set the event severity level, from 1 to 40, to reflect the importance of an event when discovery is not applicable, such as a situation in which there are no clustered applications on the servers on which you run this script . The default is 15.

32.36 Dell

Use this Knowledge Script to discover Dell server configuration and resources. This Knowledge Script requires SNMP and the Dell OpenManage agent (Hardware Instrumentation Program or HIP) to be running on the computer you are discovering. If a required service is not found or is not running, the Discovery job fails with a "Not a Dell server" event.

32.36.1 Resource Object

Dell servers

32.36.2 Default Schedule

By default, this script is only run once for each computer.

32.36.3 Setting Parameter Values

Set the Values tab parameters as needed.

Description	How To Set It
Raise event if discovery succeeds?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Community	Provide the SNMP community string required to access OpenManage resources. Provide the same community string you configured in AppManager Security Manager. If you did not configure community string information in Security Manager, then provide the default community string of `public`.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25. • **...partially succeeds**. Set the event severity level for a discovery that returns some data but also generates warning messages. The default is 10. • **...fails**. The default is 5. • **...is not applicable**. Set the event severity level for a discovery that fails when the target computer does not have a Dell Server installed. The default is 15. **NOTE:** If the required services, such as SNMP or Dell OpenManage HIP are not running on the computer you are discovering, you might see a severity 15 event (Not a Dell server). If you see this type of event, see the detail message for more information about what caused the discovery to fail.

Description	How To Set It
Discover only physical interfaces?	Select Yes to only discover interfaces associated with the physical NIC cards that are on the target computer. Microsoft Windows Server 2008 and Microsoft Windows Server 2008 R2 provide virtual interfaces, which are interfaces that are not associated with a physical NIC card. Other software programs, such as VMware, also provide virtual interfaces to emulate NIC cards. If you do not select this parameter, AppManager discovers physical and virtual interfaces. The default is selected, which results in discovering only physical NIC cards and not discovering virtual interfaces.

32.37 Domino

Use this Knowledge Script to discover the configuration and databases associated with Lotus Domino Servers, including partitioned servers.

32.37.1 Resource Objects

Lotus Domino servers.

32.37.2 Default Schedule

By default, this script is only run once for each computer.

32.37.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Discovery Targets	
Database discovery level	Because a server can have hundreds of Domino databases, this parameter is used to control which databases are discovered. Select a level to determine which databases are discovered: • **Root**=Notes data directory databases and mailboxes. • **+Mail**=root functionality + root\mail databases and all mailboxes below root. • **All**=all databases and mailboxes root and below. • **User**=only the databases specified in the database list. The default is All.
Database names, including `.nsf` (when level=User)	If the database discovery level is set to **User**, enter the names of the specific databases you want to discover, separated by commas with no spaces. Each database name should be relative to the Notes data directory. For example: `MyData.nsf,mail\mymail.box`
Save the discovery results file?	Select **Yes** to save the discovery results file. The default is Yes.
Save as...	Enter the full path to the discovery results file. For example: `<HKLM\SOFTWARE\NetIQ\AppManager\4.0\InstallPath>\Discovery_<SERVER>.txt`
Event Notification	
Raise event when discovery succeeds?	Select **Yes** to raise an event when the job succeeds. The default is unselected.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue event indicator).

Parameter	How to Set It
Raise event when discovery fails?	Select **Yes** to raise an event when the Discovery_Domino job fails to discover Lotus Domino resources. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Discovery_Domino job fails to discover Lotus Domino resources. The default is 5 (red event indicator).
Raise event when discovery partially succeeds?	Select **Yes** to raise an event when discovery returns some data but also generates warning messages. The default is Yes.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery returns some data but also generates warning messages. The default is 10 (red event indicator).
Raise event when discovery not appropriate?	Select **Yes** to raise an event when discovery is not appropriate. This type of failure usually occurs when the target computer does not have Lotus Domino Server installed or does not have the AppManager for Lotus Domino module installed.
Event severity when discovery not appropriate	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery is not applicable. The default is 15 (yellow event indicator).

32.38 Exchange

Use this Knowledge Script to discover Microsoft Exchange Server 5.5 (or earlier) and Microsoft Exchange 2000/2003 configuration and resources.

In Exchange 2003 it is possible to change the location of the Exchange tracking logs through the Exchange System Manager. If you do that, you must rediscover the new log path, so always re-run discovery after changing the location of an Exchange tracking log.

NOTE: To discover and monitor Exchange 2000 Server or Exchange Server 2003, you must delegate Exchange View Only Administrator permission to the monitoring service Log On As account. The AppManager setup program does not delegate permission to the monitoring service Log On As account.

32.38.1 Resource Objects

Exchange Server 5.5 (or earlier), Exchange 2000 Server, Exchange Server 2003.

32.38.2 Default Schedule

By default, this script is only run once for each computer.

32.38.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event when discovery succeeds?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is partially done**. Set the event severity level for a discovery that returns some data but also generates warning messages. The default is 10 (red event indicator). • **...is not applicable**. This type of failure usually occurs when the target computer does not have Exchange Server installed. The default is 15 (yellow event indicator).

32.39 Exchange2007

Use this Knowledge Script to discover configuration and resources for Microsoft Exchange Server 2007, 2010, and 2013 in both clustered and non-clustered environments.

NOTE: If you delete a resource object or add a resource object, such as a Mailbox or Public Folder database, you will need to run the Discovery_Exchange2007 script again to update the remaining objects. This behavior occurs on DAG and Standalone Mailbox roles.

32.39.1 Resource Objects

- NT_MachineFolder
- NT_VIR_MachineFolder

32.39.2 Default Schedule

By default, this script runs once.

32.39.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Specify the severity level, from 1 to 40, to indicate the importance of an event in which the Discovery_Exchange2007 job fails. The default is 5.
Discovery	
Event Notification	
Raise event if discovery succeeds?	Select **Yes** to raise an event if discovery succeeds. The default is unselected.
Event severity when discovery succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery succeeds. The default is 25.
Raise event if discovery fails?	Select **Yes** to raise an event if discovery fails. The default is Yes.
Event severity when discovery fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery fails. The default is 5.
Raise event if discovery partially succeeds?	Select **Yes** to raise an event if discovery returns some data but also generates warning messages. The default is Yes.
Event severity when discovery partially succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery returns some data but also generates warning messages. The default is 10.

32.40 ExchangeDAG

Use this Knowledge Script to discover configuration and resources for a Microsoft Exchange Server 2010 Database Availability Group (DAG). Run Discovery_ExchangeDAG on an Exchange Server 2010 server to discover the virtual object for DAG. After you discover the virtual object, you must run the Exchange2007 Discovery Knowledge Script on the newly discovered object so you can discover the databases.

32.40.1 Resource Objects

- NT_MachineFolder
- NT_VIR_MachineFolder

32.40.2 Default Schedule

By default, this script runs once.

32.40.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Specify the severity level, from 1 to 40, to indicate the importance of an event in which the Discovery_ExchangeDAG job fails. The default is 5.
Discovery	
Event Notification	
Raise event if DAG discovery succeeds?	Select **Yes** to raise an event if DAG discovery succeeds. The default is unselected.
Event severity when DAG discovery succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which DAG discovery succeeds. The default is 25.
Raise event if DAG discovery fails?	Select **Yes** to raise an event if discovery fails. The default is Yes.
Event severity when DAG discovery fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery fails. The default is 5.

32.41 Exchange-RT

Use this Knowledge Script to discover if AppManager ResponseTime for Exchange components are available on a specific managed client. At the Operator Console, drag this Knowledge Script to the managed client on which you are performing discovery.

After successful discovery, a new thumbnail appears in the TreeView pane with a list of machines that support it. Also, a new Exchange-RT Knowledge Script pane will appear.

32.41.1 Resource Objects

Windows Server 2008, R2; Windows Server 2008 (32-bit or 64-bit), Windows Server 2003 (32-bit or 64-bit), Windows XP, or Windows 2000

32.41.2 Default Schedule

By default, this script is only run once for each computer.

32.41.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can select the **Yes** check box to raise an event when the job succeeds. By default, events are not raised on success.
Event severity when Discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is partially done**. This type of failure usually occurs when the target computer does not have all the prerequisites installed. The default is 10 (red event indicator).

32.42 Hardware

Use the Discovery_Hardware Knowledge Script to discover Cisco UCS, Dell, HP, and IBM server configuration and resources. Use this script on computers running a Microsoft Windows operating system. If you are running Linux, use the Discovery_HardwareUNIX script. This script raises events for successful, partial, and failed discoveries. You can also set severities to indicate the importance of each type of event.

To discover a server, you must configure the server information in AppManager Security Manager before you run the Discovery_Hardware Knowledge Script.

This module does not support discovery of mass storage devices on some Dell servers, including Dell PowerEdge 1850 and Dell PowerEdge 2850.

By default, the discovery job schedule is set to run once. In a dynamically changing environment, NetIQ Corporation recommends that you schedule the discovery job in regular intervals of not less than an hour.

Set the **Values** tab parameters as needed.

32.42.1 Resource Objects

Cisco UCS, Dell, HP, and IBM servers

32.42.2 Default Schedule

By default, this script runs once for each computer.

32.42.3 Setting Parameter Values

Set the Values tab parameters as needed.

Description	How to Set It
Discovery Parameters	
List of servers to discover	Specify the remote server or servers on which you want to discover hardware resources. Use commas with no spaces to separate the server names. For example: `Server01,Server02,Server03`

Full path to file with list of servers to discover	Specify the full path to the text file on the local server containing the server or list of servers on which you want to discover hardware resources. For example:
	`C:\<folder name>\<file name>`
	To list the servers in the file, do one of the following:
	• Use commas with no spaces to separate the servers. For example: `Server01,Server02,Server03`
	• List the servers on separate lines. For example:
	`Server01`
	`Server02`
	`Server03`

Description	How to Set It
Address range of servers to be discovered	Specify the address range of the servers on which you want to discover hardware resources. To discover a range of servers, you must also specify the same range in the **Sub-Label** field when you define the Hardware label in Security Manager. The range you specify in this Knowledge Script must match exactly the range you specified in Security Manager. You cannot specify a smaller range than you specified in Security Manager.
Event Details	
Event detail format	Specify how you want the event detail information formatted. Your options include: • HTML Table: Displays the information in an HTML-formatted table. • Plain Text: Displays the information in a table that uses plain text. The default is HTML Table.
Event Settings	
Raise event if discovery succeeds?	Select **Yes** to raise an event if the discovery process is successful. The default is Yes.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the discovery process is successful. The default is 25.
Raise event if discovery is partial?	Select **Yes** to raise an event if the discovery process is only partially successful. For example, if the discovery process was not able to detect the required resources for monitoring voltage levels. The default is Yes.
Event severity when discovery is partial	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a discovery returns some data but also generates warning messages. The default is 15.
Raise event if discovery fails?	Select **Yes** to raise an event if the discovery process fails. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the discovery process fails to discover hardware resources. The default is 5.
Event severity when unexpected error in Knowledge Script	Set the event severity level, from 1 to 40, to indicate the importance of an event in which when the script fails because of an unexpected error. The default is 5.

32.43 HardwareUNIX

Use the Discovery_HardwareUNIX Knowledge Script to discover server configuration and resources on HP or Dell computers, and raise an event if discovery fails. Use this script on computers running a Linux operating system. If you are running Microsoft Windows, use the Discovery_Hardware script. You can also choose to raise an event for successful or partial discovery and set severities to indicate the importance of each type of event.

If you are monitoring Dell equipment, install all OMSA components on the computer you are monitoring. You install these components using the `srvadmin-all` meta package.

If you are monitoring HP equipment, install the HP Array Configuration Utility CLI for Linux on the computer you are monitoring.

By default, the discovery job schedule is set to run once. In a dynamically changing environment, NetIQ Corporation recommends that you schedule the discovery job in regular intervals of not less than an hour.

32.43.1 Resource Objects

HP or Dell servers

32.43.2 Default Schedule

By default, this script runs once for each computer.

32.43.3 Setting Parameter Values

Set the Values tab parameters as needed.

Description	How to Set It
Event Settings	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5.
Raise event when AppManager fails to get metrics?	Set to yes to raise an event if AppManager cannot retrieve information from the hardware. The default is yes.
Event severity	Set the event severity level, from 1 to 40, to indicate the importance when AppManager cannot retrieve metrics. The default is 5.
Raise event when discovery succeeds?	By default, this Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to yes to raise an event when the job succeeds. The default is no.
Event severity	Set the event severity level, from 1 to 40, to indicate the importance when the job completes successfully. The default is 25.
Raise event when discovery partially succeeds?	Set to yes to raise an event if discovery cannot complete. This type of event usually indicates the operating environment on the target computer is not supported or not recognized. The default is yes.
Event severity	Set the event severity level, from 1 to 40, to reflect the importance when the job cannot complete. The default is 15.

32.44 Hyper-V

Before you run the Discovery_Hyper-V Knowledge Script, you must set up a text file in comma-separate value (CSV) format containing information about the Hyper-V host computers you want to discover and monitor.

32.44.1 Discovering Hyper-V Hosts Listed in the Input File

On the proxy agent computer, set up each line of the discovery input file by listing all the Hyper-V host computers you want to monitor in the following format: replaceable/

ComputerName, GroupName

where:

- *ComputerName*: List the NetBIOS, FQDN, or IP Address of the Hyper-V host computer in the first column of the file.
- *GroupName*: All Hyper-V host computers that use the same set of credentials can be grouped together and provided a common group name. List the group name to which the Hyper-V host computer belongs in the second column of the file.

Every Hyper-V host computer you want to monitor must have an entry on a separate row in this file. Save the file in CSV format. To run the Discovery_Hyper-V script, you need to provide the full path to this discovery input file in the *Full path to file containing list of hosts to discover* parameter in the **Discover Hyper-V** section of the Discovery_Hyper-V script.

32.44.2 Running the Discovery_Hyper-V Knowledge Script

Use the Discovery_Hyper-V Knowledge Script to discover all Hyper-V hosts listed in the discovery input file. For each discovered host, the script discovers CPU, memory, networks, and file systems installed on the host. The script also discovers all guest virtual machines created on the host, online or offline, and the amount of CPU, memory, networks, and file systems assigned to and used by each virtual machine.

Depending on network bandwidth, the configuration of your environment, and the number of Hyper-V hosts you want to discover, the discovery job might take several minutes. For maximum efficiency, place your proxy computer in the same network as your Hyper-V hosts.

If you delete or add a resource object, or if you make any other kind of change that might affect the monitoring of your resources, run the Discovery_Hyper-V Knowledge Script again to update your list of resource objects. In addition, you can use the delta discovery feature in Control Center to run discovery on a schedule to more quickly detect changes to your environment.

Set the **Values** tab parameters as needed.

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity if job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the discovery job fails unexpectedly. The default is 5.
Additional Settings	

Description	How to Set It
Event Details	
Event detail format	Select either **HTML Table** or **Plain Text** as the format for event detail. The default is HTML Table.
Event Settings	
Raise event if discovery succeeds?	Select **Yes** to raise an event in which this script successfully discovers Discovery resources. The default is Yes.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance when this script successfully discovers Discovery resources. The default is 25.
Raise event if discovery is partial?	Select **Yes** to raise an event in which this script successfully discovers Discovery resources. The default is Yes.
Event severity when discovery is partial	Set the event severity level, from 1 to 40, to reflect the importance when this script partially discovers Discovery resources. The default is 15.
Raise event if discovery fails?	Select **Yes** to raise an event in which this script fails to discover Discovery resources. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance when the script fails to discover Discovery resources. The default is 5.
Discover Hyper-V	
Discover local host as Hyper-V host?	Select **Yes** if you want to discover the agent machine itself as a Hyper-V host computer. The discovery succeeds if the agent machine where this module is installed is a Hyper-V server. The default is unselected. If you select **Yes** for this parameter, NetIQ Corporation recommends that you do *not* specify a file location in the *Full path to file containing list of hosts to discover* parameter.
Full path to file containing list of hosts to discover	Specify the location of the path that contains the list of Hyper-V hosts that you want to discover. Click the **Ellipsis** (...) button to navigate to the file. If you specify a file for this parameter, NetIQ Corporation recommends that you do *not* select **Yes** for the *Discover local host as Hyper-V host* parameter.
Discover virtual machines?	Select **Yes** to discover virtual machines on the Hyper-V host. The default is Yes.
Discover virtual machine details?	Select **Yes** to gather details about the virtual machines discovered by this script. The default is unselected. This parameter works in conjunction with the *Discover virtual machines?* parameter. If you set this parameter to Yes, then you must set the *Discover virtual machines?* parameter to Yes.

32.45 IIS

Use this Knowledge Script to discover Microsoft Internet Information Server (IIS) configurations and resources.phrase/

This Knowledge Script looks for the IIS managed object to make sure the necessary software has been installed to enable monitoring. Managed objects, DLLs or executables, provide resources to help the Knowledge Scripts perform jobs. Each Knowledge Script processes information from the managed object and sends that information to the managed client. The managed client generates event and data information and sends the information to the management server.

NOTE: This Knowledge Script cannot discover IIS sites whose names are longer than 128 characters.

32.45.1 Resource Objects

IIS servers

32.45.2 Default Schedule

By default, this script is only run once for each computer.

32.45.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to **y** to raise an event when the job succeeds. Default is n.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance when discovery is successful. The default is 21.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance when discovery fails. Discovery can fail if it finds no IIS instances, or no instances of the AppManager managed object. It also fails if it can find both IIS instances and the managed object, but there is nothing to discover (in the case that all services and sites have been deleted). Default is 5.

32.46 Lync

Use this Knowledge Script to discover all known resources on a Lync server. The script discovers Lync Enterprise and Standard editions, Mediation servers, and Edge servers. When AppManager discovers a Lync component, that component is displayed under the relevant server in the TreeView on the left side of the AppManager window.

NOTE: *Before running discovery*, ensure you have set up the proper user permissions on the various Lync servers and SQL servers you will be using. For more information, see quoteSetting up User Permissions for Lync/quote in the *NetIQ AppManager for Microsoft Lync Management Guide*.

32.46.1 Resource Objects

NT_MachineFolder

32.46.2 Default Schedule

The default interval for this script is weekly; the default is Sundays at 3 A.M.

32.46.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the discovery job fails. The default is 5.
Raise event if discovery succeeds?	Select **Yes** to raise an event when the discovery process is successful. The default is unchecked.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when discovery succeeds. The default is 25.
Raise event if discovery succeeds with warnings?	Select **Yes** to raise an event when the discovery process succeeds but generates some warnings. The default is Yes.
Event severity when discovery succeeds with warnings	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when discovery succeeds with warnings. The default is 15.
Raise event if discovery fails?	Select **Yes** to raise an event when the discovery process fails. The default is Yes.
Event severity when discovery fails	If you set this Knowledge Script to raise an event when the job fails, set the event severity level for a failed discovery. The default is 10.
Set up supplemental database?	Select **Yes** to set up Lync supplemental database to store call quality detail records (audio, video, and call sharing) on a server where SQL database exists. You need to configure the SQL server credentials in the Security Manager to create a supplemental database.

Description	How To Set It
Raise event if database setup succeeds?	Select **Yes** to raise an event if creation of the Lync supplemental database is successful. The default is unselected.
Event severity when database setup succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Lync supplemental database is created successfully. The default is 25.
Raise event if database setup fails?	Select **Yes** to raise an event if creation of the Lync supplemental database fails. The default is unselected.
Event severity when database setup fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Lync supplemental database is not created. The default is 15. It is possible that the supplemental database was not created because of one of the following reasons: • The Discovery job was run with the *Set up supplemental database* parameter selected on a computer other than a front-end pool server • The Discovery job was run on a computer with the *Set up supplemental database* parameter selected on which SQL Server is not installed • The Discovery job was run on a computer with the *Set up supplemental database* parameter selected where Lync supplemental database was already created
Start pruning job on supplemental database?	Select **Yes** to create a SQL job that deletes data from the supplemental database. The SQL job runs every night. The default is Yes. Data is deleted from the supplemental database based on the value you specify in the *Number of days to keep call detail records* parameter.
Number of days to keep call detail records	Specify the number of days' days' worth of call detail records to keep in the Lync supplemental database. Data older than what you specify is discarded. The default is 7 days. You can specify a maximum of 30 days.
SQL Server Information	
SQL Server \instance name	Specify the SQL Server name where you want to create the new Lync Server supplemental database along with the instance if any. If you specify both the SQL Server instance name for this parameter and the SQL Server database user name in the following parameter, these values must match the values you specified in the Security Manager. If this field is left blank, then the script uses the default SQL server on the agent computer to create the supplemental database in the Lync agent where you run the discovery or the Lync_SetupSupplementalDB script. If SQL database is not present on Lync agent, then the script fails to create the database. If you do not specify the instance name, the script creates the database in the default instance.
SQL database user name	Specify the user name for the SQL Server where you want to create the new Lync Server supplemental database. Leave this parameter blank to use Windows authentication instead of SQL authentication.

32.47 MFXP

Use this Knowledge Script to discover Citrix XenApp or Presentation Server resources and configuration information. The TreeView for this module now includes a reorganized set of objects that include Citrix XenApp or Presentation Server, License Servers, Licenses, Farms, and Servers, along with two additional Services: MFCom and CitrixLicensing.

AppManager for Citrix MetaFrame supports cluster discovery on all cluster nodes for the Citrix License Server component. If you run the Discovery Knowledge Script on both nodes of a cluster added to the Operator Console, the Discovery script only discovers the license server on the active node. The TreeView for cluster discovery displays the license types available on the License Server object for all active cluster nodes only.

32.47.1 Resource Objects

Windows machine objects

32.47.2 Default Schedule

By default, this script is only run once for each server.

32.47.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Discovery Details	
Discover applications (yes, no)?	Select **Yes** to discover applications on Citrix XenApp servers in addition to servers. If you select No, the job discovers the Applications folder, but it does not discover applications within the folder. The default is Yes.
Event Notification	
Raise event when discovery succeeds?	Select **Yes** to raise an event if the discovery process is successful. The default is unselected.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the discovery process is successful. The default is 21.
Event severity level when discovery partially succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a discovery returns some data but also generates warning messages. The default is 11.

32.48 ModuleBuilder

Use this Knowledge Script to discover all known components for your Module Builder application on your selected computer. When AppManager discovers a component for your application, that component displays as a discovered resource for management in AppManager.

32.48.1 Resource Object

Module Builder application

32.48.2 Default Schedule

The default setting for this script is to run once.

32.48.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Discovery Failure	
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the discovery job fails. The default is 5.
Partial Discovery	
Allow partial discovery?	Select **Yes** to allow a partial discovery, in which some objects were discovered successfully, but others could not be discovered.The event details for a partial discovery lists the items that were not discovered. The default is Yes.
Event severity when discovery partially succeeds	If you set this Knowledge Script to allow a partial discovery, set the event severity level for a partial discovery. The default is 15.
Successful Discovery	
Raise event if discovery fully succeeds?	Select **Yes** to raise an event when the discovery process fully succeeds, without any warnings. The default is unselected.
Event severity when discovery fully succeeds	If you set this Knowledge Script to raise an event when the job fails, set the event severity level for a failed discovery. The default is 25.
Log File	**NOTE:** This section lists any log files selected in the Log Files component of the Module Builder Editor. If you did not define log files for monitoring, this section will not appear in the Discovery Knowledge Script parameters.
[Log File Name]	The name of each log file selected in the ModuleBuilder Editor is listed in this section, with the following two parameters associated with that log file.
Create log file object if file is not present	In the ModuleBuilder Editor, the subject matter expert or the AppManager expert can set up conditions for a log file that currently does not exist. Select **Yes** to create the log file object even if the log file is not found during discovery. Unselect this option if you do not want to create the log file object if the log file is not found. If the discovery process does not find a specified log file, a partial discovery notification is created. The default is Yes.

Parameter	How To Set It
Log file path	Specify a new path for the location of the log file, as needed. You should modify this log file path on agent computers where the log file might be located in a different directory.

32.49 MOMReportAgent

Use this Knowledge Script to discover the AppManager Report Agent for MOM that is installed by the XMP Modules Report Module Setup program.

Raising an event when discovery of the Report Agent succeeds is optional. Events are always raised when discovery fails, or when there is partial discovery. Partial discovery occurs if a MOM database has not been updated with the stored procedures used by the Report Agent.

32.49.1 Resource Objects

Any Windows computer where you have installed an AppManager Report Agent for MOM.

32.49.2 Default Schedule

The default schedule is Run once.

32.49.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	Set to y to raise events. The default is n.
Severity level when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).
Severity level for partial discovery	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10 (red level indicator).

32.50 MQSeries

Use this Knowledge Script to discover IBM MQSeries queues, queue managers, channels, and servers.

32.50.1 Resource Objects

MQSeries servers.

32.50.2 Default Schedule

By default, this script is only run once for each computer.

32.50.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is not applicable**. This type of failure usually occurs when the target computer does not have MQSeries installed. The default is 15 (yellow event indicator).

32.51 MSCS

Use this Knowledge Script to discover Microsoft Cluster Server (MSCS) configuration and resources. You can run this Knowledge Script on any node in the cluster.

NOTE: You should only add and discover actual cluster nodes. You should not attempt to add or discover virtual servers.

32.51.1 Resource Objects

MSCS servers.

32.51.2 Default Schedule

By default, this script is only run once for each computer.

32.51.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is partially done**. Set the event severity level for a discovery that returns some data but also generates warning messages. The default is 10 (red event indicator). • **...is not applicable**. This type of failure usually occurs when the target computer does not have MSCS installed. The default is 15 (yellow event indicator).

32.51.4 Example of How this Knowledge Script Is Used

If you discover multiple nodes that are part of the same cluster, you may see what appear to be duplicate entries in the application view. For example, assume you have a SQL Server cluster with the computers `LOBO1` and `LOBO2`. Both of these computers are displayed in the Master view. After you run the SQL discovery to discover the cluster, `LOBO1` and `LOBO2` display the resource object `SQL Server:LOSLOBOS_SQL` in the Master view. `LOSLOBOS_SQL` represents the virtual server.

When you discover clustered applications such as Exchange and SQL Server, the discovered objects use the virtual server name (for example, LOSLOBOS_SQL). When you run the MSCS discovery, the discovered objects use the physical node name. For example, using the physical nodes and virtual server names described in this example, after running Discovery_MSCS, the Master view should display `MSCS Server:LOBO1` under `LOBO1`, and `MSCS Server:LOBO2` under `LOBO2`.

32.52 NetBackup

Use this Knowledge Script to discover Symantec NetBackup server resources and configuration information on Microsoft Windows computers.

32.52.1 Resource Objects

NetBackup servers.

32.52.2 Default Schedule

By default, this script is only run once for each computer.

32.52.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator).

32.53 NetBackupUNIX

Use this Knowledge Script to discover Symantec NetBackup resource and configuration information on UNIX servers.

32.53.1 Resource Objects

UNIX servers.

32.53.2 Default Schedule

By default, this script is only run once for each computer.

32.53.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise events when discovery succeeds? (y/n)	Select y to raise an event if the discovery job succeeds. This Knowledge Script raises an event even if the job fails for any reason. The default is n.
Search path for NetBackup programs	Type the path to the NetBackup program to direct the search for NetBackup resources. The default is `/usr/openv` (the default NetBackup installation path).
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. Set the severity level for a successful discovery and to raise an event when the job succeeds. The default is 25. • **...fails**. The default is 5. • **...partially succeeds**. Set the event severity level for a discovery that returns some data but also generates warning messages. The default is 15. • **...is not applicable**. This type of failure usually occurs when NetBackup is not installed on the target computer. The default is 15.

32.54 Netfinity

Use the Discovery_NetfinityDir Knowledge Script to discover the resource and configuration information of IBM Systems Director.

When the discovery process completes successfully, IBM Systems Director Knowledge Scripts appear in the **Netfinity** view of the Operator Console in the NetfinityDir tab of the Knowledge Script pane.

By default, this script is only run once for each computer. To ensure the best performance of this Knowledge Script, NetIQ Corporation recommends that you do not run this script more than once an hour.

32.54.1 Resource Objects

Netfinity Manager servers.

32.54.2 Default Schedule

By default, this script is only run once for each computer.

32.54.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Raise event when discovery is partial?	Specifies whether this Knowledge Script will raise an event when discovery only partially completes. The default is n.
SNMP community string	Enter the SNMP community name to use. The default is the community name entered in the AppManager Security Manager or public if no community name has been entered.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25. • **...is partially done**. Set the event severity level for a discovery that returns some data but also generates warning messages. The default is 15. • **...fails**. The default is 5. **NOTE:** If required services, such as SNMP and WMI, are not running on the computer you are discovering, you may see a severity 15 event. If you see this type of event, see the detail message for more information about what caused the discovery to fail.

32.55 NetfinityDir

Use this Knowledge Script to discover the resource and configuration information of IBM Systems Director.

When the discovery process completes successfully, IBM Systems Director Knowledge Scripts appear in the **Netfinity** view of the Operator Console in the NetfinityDir tab of the Knowledge Script pane.

32.55.1 Resource Objects

IBM Systems Director servers

32.55.2 Default Schedule

By default, this script is only run once for each computer. To ensure the best performance of this Knowledge Script, NetIQ Corporation recommends that you do not run this script more than once an hour.

32.55.3 Setting Parameter Values

Set the following parameters as needed.

Description	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
SNMP community string	Provide the SNMP community name of the IBM Systems Director server. The default is either the community name entered in AppManager Security Manager or *public* if no community name has been entered.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25. • **...is partially done**. Set the event severity level for a discovery that returns some data but also generates warning messages. The default is 15. • **...fails**. The default is 5. **NOTE:** If required services, such as SNMP and WMI, are not running on the computer you are discovering, you may see a severity 15 event. If you see this type of event, see the detail message for more information about what caused the discovery to fail.

32.56 NetworkDevice

Use this Knowledge Script to discover network resources such as routers, switches, and gateways using a proxy architecture and `SNMP GET` commands. On successful discovery, any or all of the following devices are displayed in the TreeView pane of the Operator Console:

- Chassis resources: CPU, memory, flash memory, backplane, power supplies, fans, temperature sensors, and voltage sensors
- IP subsystem
- Host resource
- Interfaces: IP address and queue
- WAN links, serial links, frame relay links, and ATM links
- NetIQ SNMP Trap Receiver. For more information, see the Help for the **NetworkDevice_SNMPTrap_Async** Knowledge Script.

Ensure that all devices you want to discover have unique names. AppManager cannot differentiate between two IP addresses that have the same value for the `sysName` object, which is a name for a managed node assigned by an administrator, usually the hostname. When two devices have the same `sysName` object, AppManager assumes the two devices are the same single device. The list of devices you can monitor will be inaccurate if you do not assign unique names to your devices.

32.56.1 Configuring SNMP Permissions for Network Devices

Before using this script, you must configure SNMP information in AppManager Security Manager for each network device you want to monitor. The type of information you configure varies according to the version of SNMP that is implemented on the network device. AppManager for Network Device supports SNMP version 1, 2, and 3. SNMP v2 and SNMP v2c are essentially equivalent. All instructions for v2 are applicable for v2c.

If you do not specify an SNMP version, then AppManager attempts to determine the version during the Discovery job. This process could be quite time consuming.

Configuring SNMP information provides AppManager the permissions it needs to access the MIBs (management information bases) on SNMP-enabled network devices.

32.56.1.1 Configuration for SNMP Versions 1 and 2

You need to configure community string and version information for each network device that is being monitored by each proxy computer.

Complete the following fields in the Custom tab of Security Manager for the proxy agent computer.

Field	Description
Label	`NetworkDevice`
Sub-label	Indicates whether the user name and context you are configuring will be used for a single device or for all devices. • *For a single device* on a particular proxy agent computer, enter <*`device name`*>. • *For all devices* on a particular proxy agent computer, enter `default`.

Field	Description
Value 1	The appropriate read-only community string value, such as `private` or `public`.
Value 3	• `v1` or `1` if the device supports SNMPv1. • `v2` or `2` if the device supports SNMPv2. If you do not specify either SNMP version, AppManager attempts to determine the version during the Discovery job. This process can be quite time consuming.

32.56.1.2 Configuration for SNMP Version 3

AppManager for Network Devices supports the following modes for SNMP version 3 (SNMP v3):

- No authentication; no privacy
- Authentication; no privacy
- Authentication and privacy

In addition, the module supports the following protocols for SNMP v3:

- MD5 (Message-Digest algorithm 5, an authentication protocol)
- SHA (Secure Hash Algorithm, an authentication protocol)
- DES (Data Encryption Standard, encryption protocol)

Your SNMP v3 implementation may support one or more combinations of mode and protocol. That combination dictates the type of information you configure in AppManager Security Manager: user name (or entity), context name, protocol name, and protocol passwords.

You need to configure SNMP v3 information for each network device that is being monitored by each proxy computer.

Complete the following fields in the Custom tab of Security Manager for the proxy agent computer.

Field	Description
Label	`NetworkDevice`
Sub-label	Indicates whether the user name and context you are configuring will be used for a single device or for all devices. • *For a single device* on a particular proxy agent computer, enter <*`device name`*>. • *For all devices* on a particular proxy agent computer, enter `default`.
Value 1	The appropriate read-only community string value, such as `private` or `public`. All SNMP v3 modes require an entry in the **Value 1** field.
Value 2	The name of a context associated with the user name or entity you entered in the Value 1 field. A context is a collection of SNMP information that is accessible by an entity. If possible, enter a context that provides access to all MIBS for a device. If the device does not support context, type an asterisk (*). All SNMP v3 modes require an entry in the **Value 2** field.

Field	Description
Value 3	The combination of protocol and password appropriate for the SNMP v3 mode you have implemented. • For *no authentication/no privacy mode*, leave the **Value 3** field blank. • For *authentication/no privacy mode*, enter `md5` or `sha` and the password for the protocol, separating each entry with a comma. For example, enter `md5,abcdef` • For *authentication/privacy mode*, enter `md5` or `sha` and the associated password, and then enter `des` and the associated password, separating each entry with a comma. For example, enter `sha,hijklm,des,nopqrs`

32.56.2 Resource Object

You should only have one computer acting as a proxy for any given network device. Therefore, run this script on only one computer at a time.

32.56.3 Default Schedule

By default, this script is only run once for each computer.

32.56.4 Setting Parameter Values

Set the **Values** tab parameters as necessary.

Parameter	How to Set It
Auto Discovery	
Default gateway router	Enter the IP network address of the gateway (router) to query during discovery. Note Use this parameter if you are not certain of all the relevant subnets that should be scanned during discovery. If you enter an IP address here, AppManager will query the gateway for its routing tables and then attempt to discover every device in the tables.
Maximum number of hops	Enter the maximum number of hops that you want discovery to make during auto-discovery. Discovery considers the gateway router itself to be the first hop. Therefore, a *Maximum number of hops* setting of 1 means you will discover only the networks directly connected to the gateway router, and no other routers.

Parameter	How to Set It
Walk subnets for layer-2 devices?	Set to n to discover all routers (Layer-3 devices) and all Cisco switches (Layer-2 devices), within the number of *Maximum number of hops* you have set, by means of routing tables and Cisco Discovery Protocol. Set to y to also discover all non-Cisco switches and other network devices, within the number of *Maximum number of hops* you have set, by means of a range discovery on all discovered subnets. **CAUTION:** Set this parameter to y only with the understanding that walking the subnets for Layer-2 devices is an extremely time- and resource-intensive undertaking that can have a negative impact on your network's performance.
List of network devices (comma-separated)	Specify a list of the network devices for which you want to discover resources. You must specify at least one network device. Use a comma to separate the names in the list. For example: `raldbellijm02,raldattixlm` You can enter hostnames or IP addresses. **NOTE:** The community string information for each device that you list in this field must be configured in AppManager Security Manager before you can run this script.
List of network device ranges (comma-separated)	Specify a list of IP address ranges for the network devices for which you want to discover resources. Spaces are invalid in the list. Only numbers, dashes, periods, and commas are allowed. For example: `10.0.1.1-10.0.1.254,10.0.4.1-10.0.4.254` Note Limit the number of IP addresses in each range to no more than 256. To scan more than 256 IP addresses, break a range into multiple ranges, each with no more than 256 IP addresses.
Full path to file with list of network devices	Instead of identifying each network device separately, you can specify the full path to a file on the agent computer that contains a device name on each line of the file. **NOTE:** The community string information for each of the network devices listed in the file must be entered into Security Manager before you can run this script.
Discovery Details	
Discover individual · · · · · · interfaces? · · · LAN links? · · · WAN links? · · · frame relay links? · · · ATM links? · · · FXS ports? · · · FXO ports? · · · ISDN channels?	This script will automatically discover interfaces, links, and ports when these parameters are set to **y** (which is the default setting). The default is y. Note To improve console performance, set these parameters to **n** for any device that you are not interested in monitoring. By not displaying these objects in the TreeView pane, you will significantly speed discovery and improve the performance of the TreeView pane of the Operator Console.

Parameter	How to Set It
Trap Receiver Discovery	
Discover Trap Receiver?	Set to **y** to discover NetIQ SNMP Trap Receiver. The default is y.
Trap Receiver IP address	Specify the IP address of the computer on which Trap Receiver is installed. The default is `localhost`.
Trap Receiver TCP port	Specify the TCP port number through which Trap Receiver will communicate with AppManager. The default is port 2735.
Discover IP addresses that belong to the same device?	Set to **y** to discover all IP addresses for a single device. The same device will appear in the TreeView once for each different associated IP address. Set to **n** to discover a device only once, regardless of the number of associated IP addresses. Note that the number of discovered devices directly affects the number of licenses required for the AppManager for Network Devices module. The default is n.
Discovery timeout	Enter the number of minutes that the script should attempt discovery before stopping as unsuccessful. The default is 10 minutes. The maximum is 60 minutes.
Raise event when discovery succeeds? (y/n)	This script always raises an event when discovery fails for any reason. In addition, you can set this parameter to y to raise an event when discovery succeeds.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.

32.57 NetWorker

Use this Knowledge Script to discover Legato NetWorker servers and the services and other resources (such as backup groups and devices) associated with those servers.

32.57.1 Resource Objects

Legato NetWorker server.

32.57.2 Default Schedule

By default, this script is only run once for each computer.

32.57.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is not applicable**. This type of failure usually occurs when the target computer does not have NetWorker installed. The default is 15 (yellow event indicator).

32.58 Networks-RT

Use this Knowledge Script to discover if AppManager ResponseTime for Networks components are available on a specific managed client. At the Operator Console, drag this Knowledge Script to the managed client on which you are performing discovery. This single Knowledge Script can discover either a Client (the default) or a Server.

After successful discovery, a new thumbnail appears in the TreeView pane with a list of servers that support it. Also, a new Networks-RT Knowledge Script pane will appear.

32.58.1 Resource Objects

Windows XP, Windows 2000, Windows NT or Windows Server 2003.

32.58.2 Default Schedule

By default, this script is only run once for each computer.

32.58.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event when discovery succeeds?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can select the **Yes** check box to raise an event when the job succeeds. By default, events are not raised on success.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator).

32.59 Networks-RTProxy

Use this Knowledge Script to discover remote computers, i.e. endpoints installed on UNIX computers and other places where a Windows-based AppManager agent and ResponseTime for Networks managed object cannot be installed, or where you don't want to install them. This Knowledge Script returns information about successful, failed and partial discoveries and raises events to notify you of errors.

This Knowledge Script discovers Network ResponseTime resources that will be used via a proxy computer. You may specify a list of computers separated by commas, or you may specify the name of a file that contains a computer name on each line of the file. The listed computers must be running the NetIQ Network Performance Endpoint version 4.5 or later.

You must specify at least one remote computer. You should only have one computer acting as a proxy for a given remote computer. Therefore, you may drop this Knowledge Script on only one computer at a time.

This Knowledge Script is similar to other AppManager Discovery Knowledge Scripts in that it discovers the resource objects on the computer where you run the discovery. with one important difference. However, this Knowledge Script also discovers the list of remote computers you specify in a configuration file. The computer where you run this Knowledge Script then becomes a proxy computer for contacting and monitoring the specified remote computers. By running this Knowledge script on a computer that will act as a proxy computer, you can monitor other computers that do not have the ResponseTime for Networks managed object or the AppManager agent installed.

NOTE: Each remote computer must only be monitored through one proxy computer. If you attempt to monitor a computer through multiple proxy computers, network connection tests may be executed multiple times, generating unneeded network traffic.

32.59.1 Resource Objects

Windows XP, Windows 2000, Windows NT or Windows Server 2003.

32.59.2 Default Schedule

By default, this script is only run once for each computer.

32.59.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
List of remote computers	Specify a comma-separated list of remote computers.

Local path to file with list of computers	Specify the local full path or click **...** and select the local file containing a list of computer names. The format of the file is a list of computer names, one on each line. For example:
	`AJAX.EUROPE.CORP`
	`ACHILLES.EUROPE.CORP`
	`ATHENA.EUROPE.CORP`
	The file must be accessible from the proxy computer.

Parameter	How to Set It
Additional list of remote computers (read from specified file)	This parameter only appears on the Web console and can be ignored.
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can select the **Yes** check box to raise an event when the job succeeds. By default, events are not raised on success.
Event severity when Discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator).

32.60 NortelBCM

Use this Knowledge Script to discover the Nortel BCM (Business Communications Manager) configuration information and resources.

32.60.1 Resource Objects

NT_MachineFolder

32.60.2 Default Schedule

By default, this script runs once.

32.60.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.

32.61 NortelBCMx

Use this Knowledge Script to discover Nortel BCM resource and configuration information for BCM software version 4.0 and hardware models 50, 50a, 50e, 200, 400, and 1000.

AppManager for Nortel BCMx provides limited support for SRG (Survivable Remote Gateway) mode and local mode with the Alarms, CallByCallLimits, ChassisUsage, HealthCheck, HuntGroupUsage, InterfaceHealth, LinkUtilization, PSTNFallback, SystemUptime, and SystemUsage Knowledge Scripts. For more information, see the Help for those scripts.

32.61.1 Username and Password Configuration

Do not use this script until you have configured your BCM user name and password into AppManager Security Manager. The discovery process will fail if it cannot access this vital information.

AppManager cannot communicate with the Nortel BCM CIM server unless it has permission to do so. You can grant that permission by configuring the appropriate user name and password into AppManager Security Manager. Without knowing the user name and password, the discovery process cannot locate your BCM.

To configure Security Manager:

1. From the AppManager Operator Console, click **Security Manager** on the Extensions menu.
2. In the Tree pane, select the proxy agent computer for which you want to configure the user name and password.
3. On the Custom tab, click **Add**.
4. In the **Label** field, type `NortelBCMx`.
5. In the **Sub-Label** field, type `default`.
6. In the **Value 1** field, type your `[user name]`.
7. In the **Value 2** field, type your `[password]`.
8. Select **Extended application support** to encrypt the password when it is stored in the repository.
9. Click **OK**.
10. Repeat steps 2-9 to add user names and passwords for each additional proxy agent computer.
11. When done, close Security Manager.

32.61.2 Resource Objects

NT_MachineFolder

32.61.3 Default Schedule

By default, this script runs once a week on Sunday at 3 A.M.

32.61.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which this Knowledge Script job fails. The default is 5.
Raise event if discovery succeeds?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to **Yes** to raise an event when the job succeeds. The default is unchecked.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds in finding Nortel BCMx resources. The default is 25.
Raise event if discovery fails?	Set to **Yes** to raise an event if discovery fails. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails to find Nortel BCMx resources. The default is 5.
Raise event if Nortel BCMx agent not installed?	Set to **Yes** to raise an event if the Nortel BCMx agent is not installed. The default is Yes.
Event severity when Nortel BCMx agent not installed	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the Nortel BCMx agent is not installed. The default is 15.
Discover Nortel BCMx Devices	
List of Nortel BCMx devices	Use this parameter if you have only a few Nortel BCMx devices to discover. Enter a list of the devices for which you want to discover resources. Use a comma to separate the names or IP addresses in the list. For example: `10.0.1.1,10.0.4.1`.
List of Nortel BCMx device ranges	Use this parameter if you have only a few ranges of Nortel BCMx devices to discover. Enter a list of IP address ranges (up to 256 addresses) of the devices for which you want to discover resources. Only numbers, dashes, periods, and commas are allowed in the list. Dashes define a range. For example: `10.0.1.1-10.0.1.50, 10.0.4.51-10.0.4.100`
Full path to file with list of Nortel BCMx devices	Instead of listing each Nortel BCMx device separately, you can specify the full path to a file on the agent computer that contains a device name on each line of the file.

32.62 NortelCC

Use this Knowledge Script to discover Nortel Contact Center servers and resources: applications, CDNs, databases, DNISs, IVR queues, and IVR ports.

32.62.1 Prerequisite

Before you can successfully discover Nortel Contact Server resources, configure AppManager Security Manager with the username and password that provide access to the Blue database.

Complete the following fields in the Custom tab of Security Manager for the SCCS computer.

Field	Description
Label	`NortelCC`
Sub-label	`DBLogin`
Value 1	`sysadmin`, which is the username that provides access to the Blue database. Some NortelCC installations may have other valid username/password combinations, but `sysadmin` will work on most systems.
Value 2	Password associated with the username specified in the **Value 1** field.
Value 3	Use this field *only* if you have used Cisco CallManager Administration to change the number of the HTTPS port the proxy agent computer uses to connect to the CallManager server. In the **Value 3** field, type the new secure port number. Leave this field blank to use the default port number: 8443.
Extended application support	Required field. Encrypts the password in Security Manager.

32.62.2 Resource Object

NT_MachineFolder

32.62.3 Default Schedule

By default, this script runs once every day.

32.62.4 Setting Script Parameters

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Discovery_NortelCC job fails. The default is 5.

Parameter	How to Set It
Discovery Failure Notification	
Raise event if SQL query fails?	Set to **Yes** to raise an event if the SQL query fails. The default is Yes. Discovery_NortelCC uses a SQL query to retrieve Nortel Contact Center configuration information from the Blue database.
Event severity when SQL query fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which the SQL query fails to discover database configuration information. The default is 15.
Raise event if Registry read fails?	Set to **Yes** to raise an event if AppManager cannot read the Registry to search for the Nortel CC ELAN and CLAN IP addresses. The default is Yes.
Event severity when Registry read fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which AppManager cannot read the Registry. The default is 5.
Raise event if discovery succeeds?	Set to **Yes** to raise an event when discovery succeeds. The default is Yes.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.

32.63 NortelCS

Use this Knowledge Script to discover the various components of a Nortel CS1000 IP telephony system installation: Call Server, Signaling Server, Media Gateway Controller, Network Routing Server, MC32S, Enterprise Common Manager, and Voice Gateway Media Card.

This script also discovers co-resident Call Servers, Signaling Servers, and Element Managers. When co-resident, these components are installed on a single processor.

For Nortel CS1000 version 6.0 environments, this script discovers Bandwidth Management Zone (BMZ) objects on the Call Server. For earlier versions of Nortel CS1000, BMZ objects are discovered on the Signaling Server..

NOTE: *Before running discovery*, ensure you have met all system requirements, which include the installation of several Nortel patches and identification of ELAN addresses for devices you want to monitor. Configuration needs vary depending on the version of Nortel CS1000 in use in your environment.

32.63.1 Prerequisite

To enable AppManager to use SNMP to access Nortel CS1000 devices, configure the SNMP community strings in AppManager Security Manager *before* you discover Nortel CS1000 devices.

Use the following procedure to configure your community strings for one or more variations:

- If your read-only community string information is the same for all Nortel CS1000 devices, complete the following procedure once, using the `default` **Sub-label**.
- If your read/write community string is the same for all Signaling Servers, MGMCs, MGCs, and MC32Ss, complete the following procedure once, using the `default write` **Sub-label**.
- If your read-only or read/write community string information is different for different devices, complete the following procedure once for each different community string, using the device's ELAN IP address as the **Sub-label**.

Complete the following fields in the Custom tab of Security Manager for the proxy agent computer.

Field	Description
Label	`NetworkDevice`
Sub-label	• For all devices that use the **same read-only** community string, enter `default`. Use the `default` sub-label for the read-only community string used on the greatest number of devices. • For all devices that use the **same read/write** community string, enter `default write`. Use the `default write` sub-label for all Signaling Server, VGMC, MGC, and MC32S devices that use the same read/write community string. • For a single device that uses a **unique read-only** community string, enter <*IP address*>, where <*IP address*> is the ELAN IP address of the Call Server, Media Gateway, NRS, or ECM device. • For a single device that uses a **unique read/write** community string, enter <*IP address*> `write`, where <*IP address*> is the ELAN IP address of the Signaling Server, VGMC, MGC, or MC32S device.

Field	Description
Value 1	• To monitor a Call Server, Media Gateway (Nortel CS1000 version 4.50 and earlier), Network Routing Server, or Enterprise Common Manager, enter your **configured read-only community string**. • To monitor a Signaling Server, VGMC, Media Gateway Controller, or MC32S, enter your **configured read/write community string**. The read/write community string provies SNMP access to the MIBs on these devices.

The following are examples:

- If you are monitoring multiple Signaling Servers that have the same read/write community string, type `default write` in the **Sub-label** field and type the read/write community string in the **Value 1** field.
- If you are monitoring a Call Server that has a unique read-only community string, type the ELAN IP address of the Call Server in the **Sub-label** field and type the read-only community string in the **Value 1** field.
- If you are monitoring a VGMC that has a unique read/write community string, type <`IP address write`> in the **Sub-label** field (where <*`IP address`*> is the ELAN IP address of the VGMC) and type the read/write community string in the **Value 1** field.

32.63.2 Resource Object

Windows server

One computer can act as proxy for multiple Nortel CS1000 systems. However, each system should have only one proxy. NetIQ Corporation does not recommend establishing multiple proxies per system.

32.63.3 Default Schedule

By default, this script runs weekly, on Sundays at 3 A.M. The default schedule allows the discovery process to run at a time that is probably less busy for your Call Server.

32.63.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Raise event if discovery fails?	Set to **Yes** to raise an event if discovery fails for any reason. The default is Yes.
Event severity if discovery fails	Set the event severity level, from 1 to 40, to reflect the importance when discovery fails. The default is 5.

Parameter	How to Set It
Raise event if discovery partially succeeds?	Set to **Yes** to raise an event if discovery is partially successful. A partially successful discovery is one in which, for example, AppManager can discover devices but cannot create an inventory report. Or one in which, for example, AppManager can discover all Signaling Servers, but not the Bandwidth Management Zones. The default is Yes.
Event severity if discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance when discovery is partially successful. The default is 15.
Raise event if discovery succeeds?	Set to **Yes** to raise an event if discovery succeeds. The default is unchecked.
Event severity if discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance when discovery succeeds. The default is 25.
Call Server	Provide the hostname or IP address of the Nortel CS1000 Call Server, such as `CS1000_CS`. Do not enter the IP address or hostname of the Call Server that is part of the Media Gateway. **Important** Provide *only* one Call Server hostname or IP address. Discovery is meant to discover only one Nortel CS environment.
List of NortelCS devices	Use this parameter if you know which Nortel CS1000 devices you want to discover. Type a list of the devices you want to discover. Use a comma to separate the names in the list; for example: `CS1000_VGMC,CS1000_SS`. You can type hostnames (if you use DNS in your environment) or ELAN IP addresses. **Notes** • Leave this field blank if you only want to discover the Call Server, which you identified in the previous parameter. • The community string information for each device you list in this field must be configured in Security Manager before you run this script.
List of NortelCS device ranges	Type a list of ELAN IP address ranges for the Nortel CS1000 devices you want to discover. Spaces are invalid in the list; only numbers, dashes, periods, and commas are allowed. For example: `10.0.1.1-10.0.1.254,10.0.4.1-10.0.4.254`. **Notes** • Leave this field blank if you only want to discover the Call Server, which you identified in the *Call Server* parameter. • Limit the number of IP addresses in each range to no more than 256. To scan more than 256 IP addresses, break a range into multiple ranges, each with no more than 256 IP addresses.
Full path to file with list of NortelCS devices	Instead of listing each Nortel CS1000 device separately, you can specify the full path to a file on the agent computer that contains a device name on each line of the file. **Notes** • Leave this field blank if you only want to discover the Call Server, which you identified in the *Call Server* parameter. • The community string information for each device listed in the file must be configured in Security Manager before you run this script.

Parameter	How to Set It
Discovery timeout	Specify the amount of time (no more than 60 minutes) the script should attempt discovery before stopping as an unsuccessful discovery. The default is 10 minutes.

Discover phones using the Call Server's Entity MIB?	Set to **Yes** to use the Entity MIB (management information base) to count IP phones for the inventory report. AppManager will perform an SNMP query of this Call Server MIB to retrieve the inventory results.
	
	This parameter is applicable **only** for Nortel CS1000 4.0 and later. Uncheck the box if you use Nortel CS1000 3.0.
	
	Important Issue the following Overlay 117 commands before running discovery.
	
	`LD 117`
	`INV MIDNIGHT SETS`
	`INV ENTITY SETS ON`

32.64 NortelCS2x

Use this Knowledge Script to create the Nortel CS2x supplemental database and to configure the services that collect data from Nortel CS2000 or CS2100 components:

- Integrated Element Management System (IEMS)
- Element Managers
- Centrex IP Call Managers (CICM)

The following is a brief summary of the architecture for AppManager for Nortel CS2x.

- Individual Element Managers and the Core and Billing Manager (CBM) send logs and OM Reports to the IEMS (Integrated Element Management System), which in turn sends the logs to the log collector service and the OM Reports to the OM file collector service over Telnet. The log collector service listens on port 8555. The OM file collector service listens on port 22.
- The CBM constructs end-of-call QoS Collector Application records from per-call information published by gateway controllers. It then uses sFTP to send these records to the QoS file collector service.
- The CICM Element Manager sends syslogs to the QoS syslog collector service.
- The NortelCS2x_CollectorHealth Knowledge Script verifies that all collectors are installed and contain data. And, by issuing commands stored in the CMD table in the supplemental database, the CollectorHealth script prompts the collector services to push their data to the supplemental database using Open Database Connectivity (ODBC).
- The NortelCS2x_CallActivity, NortelCS2x_CallFailures, NortelCS2x_CallQuality, NortelCS2x_LogQuery, NortelCS2x_OMQuery, NortelCS2x_PhoneInventory, and NortelCS2x_PhoneQuality Knowledge Scripts query the supplemental database for the information you specify.

32.64.1 Configuring Nortel CS2100 to Work with AppManager

The following table describes the configuration tasks that, when completed, allow the Nortel CS2100 switch to work with AppManager and the AppManager for Nortel CS2100 module.

Requirement	Description
Read-only login account (user name and password) to sFTP on the IEMS	• Contact your Nortel CS2100 administrator to create this account. For more information, see Nortel document NN10336-611: *Carrier VoIP: IEMS Administration and Security*. • Configure the read-only user name and password in AppManager Security Manager.

Requirement	Description
Set up log destination	On the IEMS (Integrated Element Management System), configure the proxy agent computer's IP address as a log destination. For more information, see Nortel document NN10334-911: *Integrated EMS Fault Management*. 1. At the IEMS, navigate to the Runtime Administration window. 2. In the tree pane, expand the **Categories** folder and select the **NTSTD** node. 3. In the **Manager Host** field, provide the proxy agent computer IP address. 4. In the **Office Identifier** field, provide the office identifier of the CS2100 switch. As a best practice, use the same identifier you use in the *Unique identifier of the switch to discover* parameter in the Discovery_NortelCS2x Knowledge Script. 5. Click **Add** and then click **Apply**. **Notes** • If the proxy agent computer is outside the firewall, configure the firewall address rather than the proxy agent computer address. • Ensure TCP port 8555 (the NTSTD port) is open on the firewall between the proxy agent computer and the IEMS.
Set up OM Report collection	• Set up an FTP dropbox server that supports both FTP and sFTP. • On the CBM (Core and Billing Manager), configure the FTP server as a "file transfer destination." For more information, see Nortel document NN10148-711: *Carrier VoIP: Nortel CS2000 Core Manager Performance Management*. • On the CBM, add the following OM Report groups to a report element: SITE, PM, LMSD, TRK, CP, SITE2, XPMOVLD. For more information, see Nortel document NN10148-711: *Carrier VoIP: Nortel CS2000 Core Manager Performance Management*.
Enable QoS reporting	Setup QoS collection at the GWC (gateway controller) Element Manager. For more information, see Nortel document NN10240-511: *Carrier VoIP: Nortel CICM Configuration*. 1. Access the CS2000 Management Tools application. 2. Expand the **Device Types** folder and select **Gateway Controller**. 3. In the Gateway Controllers panel, select the GWC you want to configure. 4. On the QoS Collectors tab, select **Enable QoS Collection**. 5. On the File menu, select **Save**.

Requirement	Description
Enable syslog delivery	Configure the proxy agent computer as the destination for the CICM syslogs. 1. Access the Centrex IP Client Manager and navigate to the Global Settings Modification page. 2. On the Global tab, provide the proxy agent computer IP address in the **Extended QoS server Ip Address** field. 3. In the **Extended QoS server port** field, provide the port number on the proxy agent computer that will listen for syslogs. Enter the same port number you use in the *Port number to receive QoS syslog messages on* parameter in the Discovery_NortelCS2x Knowledge Script. In the Discovery script, port 514 is the default port number. If port 514 is in use, select another port number and ensure you indicate the same port number in the Discovery script.
Enable delivery of voice quality alerts	Create a Voice Quality Monitoring (vqmon) profile on the CICM Element Manager. The vqmon profile allows AppManager to receive the alerts monitored by the NortelCS_CallAlert Knowledge Script. 1. Access the Centrex IP Client Manager and navigate to the vqmon Profiles page. 2. In the **Profile name** field, enter `netiq`. 3. Accept the **Default Value** for all other fields. 4. Click **save your changes to this profile**.

32.64.2 Prerequisites

Configure AppManager Security Manager with the user names and passwords of the CS2100 components you want to monitor.

For a remote supplemental database, prepare the remote computer for creation of the supplemental database.

32.64.2.1 Configuring CICM User Names and Passwords in Security Manager

The NortelCS2x_RetrieveConfigData Knowledge Script retrieves station configuration information from individual CICM Element Managers. Before running the RetrieveConfigData Knowledge Script, configure AppManager Security Manager with the user name and password of the CICM Element Manager. This information allows AppManager to access the configuration information in the Element Managers.

On the Custom tab in Security Manager, complete the following fields:

Field	Description
Label	`NortelCS2x_CICM-EM`
Sub-label	The name of the switch associated with the Element Manager. This is the same information you provide in the *Unique identifier of the switch to discover* parameter in the Discovery_NortelCS2x Knowledge Script. Or, type `default` if the user name and password apply to all switches.
Value 1	The Element Manager user name.

Field	Description
Value 2	The Element Manager password.
Extended application support	Encrypts the user name and password in Security Manager. Do not leave this option unselected.

32.64.2.2 Configuring sFTP User Names and Passwords in Security Manager

The OM file collector service and QoS file collector service receive data over secure FTP (sFTP). Before you run the Discovery_NortelCS2x Knowledge Script, configure AppManager Security Manager with the user name and password of the associated sFTP server.

On the Custom tab in Security Manager, complete the following fields:

Field	Description
Label	• For the OM file collector service, `NortelCS2x_OMFileCollector` • For the QoS file collector service, `NortelCS2x_QoSFileCollector`
Sub-label	The name of the switch associated with the sFTP server. This is the same information you provide in the *Unique identifier of the switch to discover* parameter in the Discovery_NortelCS2x Knowledge Script. Or, type `default` if the user name and password apply to all switches.
Value 1	The sFTP user name.
Value 2	The sFTP password.
Extended application support	Encrypts the user name and password in Security Manager. Do not leave this option unselected.

32.64.2.3 Configuring SQL Server User Names and Passwords in Security Manager

The Discovery_NortelCS2x and SetupSupplementalDB Knowledge Scripts require access to the SQL Server database on the remote computer on which you want to install the Nortel CS2x supplemental database. Before you run the Discovery or SetupSupplementalDB scripts, configure AppManager Security Manager with the user name and password of the remote SQL Server computer.

On the Custom tab in Security Manager, complete the following fields:

Field	Description
Label	`NortelCS2x_Database`
Sub-label	The unique, common name of the CS2x office that contains the remote computer on which you want to create the Nortel CS2x supplemental database. Use the same name you entered in the *Unique identifier of the switch to discover* parameter in the Discovery_NortelCS2x Knowledge Script. `Default` is an acceptable value for this parameter.

Field	Description
Value 1	The SQL Server user name for the remote computer on which you want to create the Nortel CS2x supplemental database.
Value 2	The SQL Server password associated with the user name you supplied in the Value 1 field.
Extended application support	Encrypts the user name and password in Security Manager. Do not leave this option unselected.

32.64.2.4 Configuring the Remote Supplemental Database Computer

Take the following steps to prepare a SQL Server computer for creation of the remote supplemental database.

To set up the remote SQL Server computer:

1. Use SQL Server Configuration Manager to disable dynamic ports.
2. Use SQL Server Configuration Manager to enable TCP/IP on the instance object where you want to create the remote supplemental database.
3. Use Microsoft SQL Server Management Studio to enable **SQL Server** and **Windows Authentication mode** on the instance object where you want to create the remote supplemental database.
4. Create a new SQL Server user name and password. Assign the new user both `sysadmin` and `processadmin` privileges.
5. In AppManager Security Manager, configure the new user name and password.

32.64.3 Resource Object

Nortel CS2x

Only one computer can act as proxy for any given Communication Server cluster. Therefore, run this script on only one computer at a time.

32.64.4 Default Schedule

By default, this script runs once.

32.64.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	

Parameter	How to Set It
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Discovery_NortelCS2x Knowledge Script job fails. The default is 5.
Raise event if discovery succeeds?	Select **Yes** to raise an event if the supplemental database is created and the collector services are configured. The default is Yes.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the supplemental database is created and the collector services are configured. The default is 25.
Raise event if discovery fails?	Select **Yes** to raise an event if the supplemental database is not created or the collector services are not configured. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the supplemental database is not created or the collector services are not configured. The default is 5.
Unique identifier of the switch to discover	Provide the unique, common name of the CS2100 office you want to discover. The common name is displayed in the logs created by the CS2100. As a best practice, the common name should match the office name in one of the following locations: • `LOG_OFFICE_ID` in the core table `OFCVAR` • `OFFICE_CLLI_NAME` • Office log name in the IEMS **NOTE:** Do not leave this field blank.
IP address of the IEMS	Provide the IP address of the IEMS you want to discover.
Supplemental Database Creation	
Set up supplemental database?	Select **Yes** to create the Nortel CS2x supplemental database, including the tables and stored procedures needed to store log files, OM Reports, call details, and QoS information. When the database is populated, you can monitor the data using the NortelCS2x_CallActivity, NortelCS2x_CallQuality, NortelCS2x_LogQuery, NortelCS2x_OMQuery, and NortelCS2x_PhoneQuality Knowledge Scripts. You can also create the supplemental database after you run the Discovery script. For more information, see the Help for the NortelCS2x_SetupSupplementalDB Knowledge Script.
Database Record Retention	
Number of days to keep supplemental database records	Specify the number of days you want to keep records in the Nortel CS2x supplemental database. Data older than that is discarded. The default is 14 days.
SQL Server Information	
SQL Server computer name	Specify the DNS name or IP address of the SQL Server computer on which you want to create the remote Nortel CS2x supplemental database. Leave this parameter blank to create the database on the computer on which you run this script. For either a remote or local supplemental database, configure the SQL Server user name and password in AppManager Security Manager.

Parameter	How to Set It
SQL Server instance name	Specify the name of the SQL Server instance on the computer in which you want to create the Nortel CS2x supplemental database. Leave this parameter blank to accept the default instance name.
Raise event if database setup succeeds?	Select **Yes** to raise an event if creation of the Nortel CS2x supplemental database is successful. The default is unselected.
Event severity when database setup succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the success of the creation of the Nortel CS2x supplemental database. The default is 25.
Configuration Data Retrieval	
Retrieve configuration data from IEMS?	Select **Yes** to retrieve station configuration information from individual CICM Element Managers and store it in the Nortel CS2x supplemental database, where it can be monitored by the NortelCS2x_PhoneInventory Knowledge Script. You can also retrieve station configuration information after you run the Discovery script. Use the NortelCS2x_RetrieveConfigData Knowledge Script.
Log Collector Service	
Configure log collector service?	Select **Yes** to create and start the log collector service on the proxy agent computer. The default is Yes. Element Managers push logs to the log collector service over Telnet. Associated Knowledge Scripts are NortelCS2x_CallFailures, NortelCS2x_LogQuery, and NortelCS2x_OMQuery.
Server address to receive log messages from	Specify the IP address of the Element Manager that will send logs. Leave this field blank if the address is that of the IEMS.
Port number to receive log messages from	Specify the port number on the proxy agent computer that will listen for logs. The default port number is 8555.
Time stamp offset for time zone differences on log messages	If your CS2100 office and proxy agent computer are in different time zones, use this parameter to adjust the time stamps on the logs sent by the CS2100. For example, if the time zone of your proxy agent computer is three hours *ahead* of the CS2100 that is sending logs, the difference in minutes is 180. So specify `180` in this parameter. If the time zone of your proxy agent computer is three hours *behind* that of your CS2100, specify `-180` in this parameter. **Note about Daylight Savings Time** You may need to manually adjust the time stamp offset at the Spring and Fall time change for Daylight Savings Time (DST). If your query Knowledge Script jobs (CallActivity, CallFailures, CallQuality, LogQuery, and OMQuery) return no data, but data has been collected and stored in the supplemental database, verify the time stamps in the data. If the time stamps have been affected by DST, rerun the Discovery script using a new time stamp offset value.
OM File Collector Service	
Configure OM file collector service?	Select **Yes** to create and start the OM file collector service on the proxy agent computer. The default is Yes. Element Managers send OM Reports to the IEMS, which in turn sends the OM Reports to the OM file collector service over sFTP. The associated Knowledge Script is NortelCS2x_CallActivity.

Parameter	How to Set It
Server address to receive sFTP OM Reports from	Specify the IP address of the Element Manager that will send OM Reports over sFTP. Leave this field blank if the address is that of the IEMS.
Port number to receive sFTP OM Reports from	Specify the port number on the proxy agent computer that will listen over sFTP for OM Reports. The default port number is 22.
Directory location at sFTP server to retrieve sFTP OM Reports from	Specify the name of the directory on the sFTP server from which to retrieve the OM Reports. **NOTE:** Do not leave this field blank.
Time stamp offset for time zone differences on sFTP OM Reports	If your CS2100 office and proxy agent computer are in different time zones, use this parameter to adjust the time stamps on the OM Reports sent by the CS2100. For example, if the time zone of your proxy agent computer is three hours *ahead* of the CS2100 that is sending OM Reports, the difference in minutes is 180. So specify `180` in this parameter. If the time zone of your proxy agent computer is three hours *behind* that of your CS2100, specify `-180` in this parameter. **Note about Daylight Savings Time** You may need to manually adjust the time stamp offset at the Spring and Fall time change for Daylight Savings Time (DST). If your query Knowledge Script jobs (CallActivity, CallFailures, CallQuality, LogQuery, and OMQuery) return no data, but data has been collected and stored in the supplemental database, verify the time stamps in the data. If the time stamps have been affected by DST, rerun the Discovery script using a new time stamp offset value.
QoS Syslog Collector Service	
Configure QoS syslog collector service?	Select **Yes** to create and start the QoS syslog collector service on the proxy agent computer. The default is Yes. The QoS syslog collector service receives end-of-call QoS syslogs from CICM Element Managers. The associated Knowledge Script is NortelCS2x_CallQuality.
Server address to receive QoS syslog reports from	Specify the IP address of the Element Manager that will send QoS syslog reports. Leave this field blank if the address is that of the IEMS.
Port number to receive QoS syslog reports on	Specify the port number on the proxy agent computer that will listen for syslogs reports. The default port number is 514.
Protocol used to receive QoS syslog messages	Specify the protocol over which the Element Manager will send syslogs to the collector service. Choose from **UDP** and **TCP**. The default is UDP.

Parameter	How to Set It
Time stamp offset for time zone differences on QoS syslog messages	If your CS2100 office and proxy agent computer are in different time zones, use this parameter to adjust the time stamps on the QoS records sent by the CS2100. For example, if the time zone of your proxy agent computer is three hours *ahead* of the CS2100 that is sending QoS records, the difference in minutes is 180. So specify `180` in this parameter. If the time zone of your proxy agent computer is three hours *behind* that of your CS2100, specify `-180` in this parameter. **Note about Daylight Savings Time** You may need to manually adjust the time stamp offset at the Spring and Fall time change for Daylight Savings Time (DST). If your query Knowledge Script jobs (CallActivity, CallFailures, CallQuality, LogQuery, and OMQuery) return no data, but data has been collected and stored in the supplemental database, verify the time stamps in the data. If the time stamps have been affected by DST, rerun the Discovery script using a new time stamp offset value.
QOS File Collector Service	
Configure QoS file collector service?	Select **Yes** to create and start the QoS file collector service on the proxy agent computer. The default is Yes. Element Managers send QoS files to the IEMS, which in turn sends the QoS files to the QoS file collector service over sFTP. The associated Knowledge Script is NortelCS2x_CallQuality.
Server address to receive QoS files from	Specify the IP address of the CBM that will send QoS files over sFTP. Leave this field blank if the address is that of the IEMS.
Port number to receive QoS files from	Specify the port number on the proxy agent computer that will listen over sFTP for QoS files. The default port number is 22.
Directory location at sFTP server to receive active QCA file	Specify the name of the directory on the sFTP server from which to retrieve the QoS Collector Application file containing the QoS data. **NOTE:** Do not leave this field blank.
Time stamp offset for time zone differences on sFTP QoS reports	If your CS2100 and proxy agent computer are in different time zones, use this parameter to adjust the time stamps on the QoS records sent by the CS2100. For example, if the time zone of your proxy agent computer is three hours *ahead* of the CS2100 that is sending QoS reports, the difference in minutes is 180. So specify `180` in this parameter. If the time zone of your proxy agent computer is three hours *behind* that of your CS2100, specify `-180` in this parameter. **Note about Daylight Savings Time** You may need to manually adjust the time stamp offset at the Spring and Fall time change for Daylight Savings Time (DST). If your query Knowledge Script jobs (CallActivity, CallFailures, CallQuality, LogQuery, and OMQuery) return no data, but data has been collected and stored in the supplemental database, verify the time stamps in the data. If the time stamps have been affected by DST, rerun the Discovery script using a new time stamp offset value.
CS2x UNISTIM Proxy Data Collector	
Configure UNISTIM Data Collector service?	

Parameter	How to Set It
Server address to forward CS2x UNISTIM to	
Port number to forward CS2x UNISTIM to	
Port number to receive CS2x UNISTIM on	

32.65 NT

Use this Knowledge Script to discover Microsoft Windows configuration and resource information, including related resources such as network services, printers, and .NET Common Language Runtime (CLR) objects.

Discover Windows resources before discovering clustered applications, if applicable in your environment. For more information, see Cluster.

This script discovers shared disks under the Cluster Alias object in the TreeView and local disks under regular Windows server objects.

To discover all shared disks in a Windows cluster and the shared mount points rooted from those shared disks under the Cluster Alias object in the Navigation pane or the TreeView, make sure that the NetIQ Client Resource Monitor service (`NetIQmc`) is running under an account whose user is a member of the domain of the computer. If the `NetIQmc` service is running under an account that is not a domain account but is a member of the local Administrators group on the agent, review the following procedures on the Securing a Remote WMI Connection page from Microsoft to ensure the Discovery_NT script can gather the required disk information:

- *To grant DCOM remote launch and activation permissions for a user or group*
- *To grant DCOM remote access permissions*

If you delete or add a resource object, or if you make any other kind of change that might affect the monitoring of your resources, run the Discovery_NT Knowledge Script again to update your list of resource objects. In addition, if you are running this module on AppManager 8 or higher, you can use the delta discovery feature in Control Center to run discovery on a schedule to more quickly detect changes to your environment.

32.65.1 Resource Objects

Windows 2000 Server or later

32.65.2 Default Schedule

By default, this script is only run once for each computer.

32.65.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. This script always raises an event when the job fails for any reason. The default is 10.
Raise event when discovery succeeds?	Set to **y** to raise an event when discovery succeeds. The default is n.

Parameter	How to Set It
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 35.
Discovery Options	
Discover accessible printers?	Set to **y** to discover accessible printers on the specified computer. Set to **n** to disable the discovery of all printers if you have a large number of printers for a single AppManager agent to prevent the discovery process from timing out while trying to discover all the printers. The default is n.
Discover .NET Common Language Runtime (CLR) objects?	Set to **y** to discover .NET Common Language Runtime (CLR) objects. If you select y and enable delta discovery, the delta discovery process might generate an excessive number of events that are not significant, because the list of applications that use CLR can change quite often. The default is n.

32.66 OCS

Use this Knowledge Script to discover all known resources on an OCS server. The script discovers OCS Enterprise and Standard editions, Media servers, and Edge servers. When AppManager discovers an OCS component, that component displays under the relevant server in the tree view on the left-hand side of the AppManager window.

NOTE: *Before running discovery*, ensure you have set up the proper user permissions on the various OCS servers and SQL servers you will be using. For more information, see "Setting up User Permissions for OCS" in the NetIQ AppManager for Microsoft OCS Management Guide.

32.66.1 Resource Objects

NT_MachineFolder

32.66.2 Default Schedule

The default interval for this script is weekly; the default is Sundays at 3 A.M.

32.66.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the discovery job fails. The default is 5.
Raise event if discovery succeeds?	Set to Yes to raise an event when the discovery process is successful. The default is unchecked.
Event severity when discovery succeeds	If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25.
Raise event if discovery succeeds with warnings?	Set to Yes to raise an event when the discovery process is succeeds, but generates some warnings. The default is Yes.
Event severity when discovery succeeds with warnings	If you set this Knowledge Script to raise an event when the job succeeds, but with warnings, set the event severity level for a successful discovery. The default is 15.
Raise event if discovery fails?	Set to Yes to raise an event when the discovery process fails. The default is Yes.
Event severity when discovery fails	If you set this Knowledge Script to raise an event when the job fails, set the event severity level for a failed discovery. The default is 10.

32.67 Oracle

Use the Discovery_Oracle Knowledge Script to discover configuration and resource information for AppManager servers.

Before running discovery for the first time, you must complete a series of post-installation procedures. For more information, see the Management Guide.

32.67.1 Resource Objects

Oracle servers.

32.67.2 Default Schedule

By default, this script is only run once for each computer.

Set the parameters on the Values tab as needed:

Description	How to Set It
Username	Specify the username for logging on to the Oracle server. The username must have permission to access Oracle on the target computer. Use Security Manager to specify which user accounts have access to specific computers. The default username is `system`.
Raise event if discovery succeeds?	This Knowledge Script always raises an event if the discovery job fails for any reason. In addition, you can set this parameter to y to raise an event if the job succeeds. The default is n.
Event severity when discovery succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery fails. The default is 5.
Event severity when discovery partially succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery returns some data but also generates warning messages. The default is 15.

32.68 Oracle-RT

Use this Knowledge Script to discover if AppManager ResponseTime for Oracle components are available on a specific managed client. At the Operator Console, drag this Knowledge Script to the managed client on which you are performing discovery.

After successful discovery, a new thumbnail appears in the TreeView pane with a list of computers on which you are performing discovery.

32.68.1 Resource Objects

Windows XP Professional, Windows 2000, or Windows NT.

32.68.2 Default Schedule

By default, this script is only run once for each computer.

32.68.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can select the **Yes** check box to raise an event when the job succeeds. By default, events are not raised on success.
Event severity when Discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **... fails**. The default is 5 (red event indicator). • **...is partially done**. This type of failure usually occurs when the target computer does not have all the prerequisites installed. The default is 10 (red event indicator).

32.69 OracleUNIX

Use the Discovery_OracleUNIX Knowledge Script to discover instances of Discovery.

To successfully discover Oracle configuration and resource information, you must use the AppManager Security Manager extension to specify the Oracle user, password, and the Oracle database instance names you want to monitor. Also, the account with which you run this script must have `SELECT` permissions for the following tables:

`DBA_DATA_FILES`

`DBA_SEGMENTS`

`DBA_TABLESPACES`

`DBA_USERS`

`V_$DATABASE`

`V_$INSTANCE`

`V_$VERSION`

For both Oracle RAC and non-RAC clustered environments, the database you monitor should be active on a node at the time you configure the Oracle module and when you run discovery on that node. The following instructions assume that you have already installed the UNIX agent on the host and the module on each node in the cluster.

To discover components on Oracle RAC clusters:

1. Ensure each node is active.
2. Run the netiq_oracle_configuration script and the Discovery_OracleUNIX Knowledge Script on each node.
3. Run the SetMonitoringOptions Knowledge Script on each node.

To discover components on non-RAC clusters:

1. Run the netiq_oracle_configuration script and the Discovery_OracleUNIX Knowledge Script to discover all available Oracle RDBMS resources on the active node.
2. Fail over the active node to the passive node.
3. Repeat step 1 for the currently active node.
4. Run the SetMonitoringOptions Knowledge Script on the nodes in the cluster.

32.69.1 Resource Objects

UNIX/Linux machine folder

32.69.2 Default Schedule

The default interval for this script is **Run Once**.

32.69.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Oracle Username	Enter the Discovery username used to access the target databases. If you run this script on more than one computer, configure each database with the same username. The default value is blank. **NOTE:** To use `SYSDBA` authentication, leave the **Oracle Username** parameter blank.
Discover instances not automatically started on system boot?	Select the **Yes** check box to discover Oracle instances not started by the `dbstart` utility upon system boot. This information is obtained from the `oratab` file. By default, these instances are discovered.
Raise event when discovery fails?	Select the **Yes** check box to raise an event when discovery fails. By default, events are enabled.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5.
Raise event when discovery partially succeeds?	Select the **Yes** check box to raise an event when discovery is partially successful. By default, events are enabled.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 30.
Raise event when discovery succeeds?	Select the **Yes** check box to raise an event when discovery succeeds. By default, the job does not raise events.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 40.

32.70 PhoneQuality

Use this Knowledge Script to discover a Phone Quality object on the computer that will be used for monitoring Cisco IP phones. This script always raises an event when the job fails for any reason.

When polling a phone to get device information, the managed object has a 20-second timeout period for each phone that it is attempting to contact. If you are rediscovering a lot of phones at one time, it may take quite a while if phones cannot be contacted.

32.70.1 Resource Object

NT_MachineFolder

32.70.2 Default Schedule

By default, this script is only run once for each server.

32.70.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the event severity level, from 1 to 40, to reflect the importance when the discovery job fails. The default is 5.
Update phone details for existing phones?	Set to **Yes** to poll device information from phones already in the TreeView pane. The default is Yes.
Raise event if discovery succeeds?	Set to **Yes** to raise an event if discovery is successful. The default is Yes.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance when discovery succeeds. The default is 25.
Raise event if discovery fails?	Set to **Yes** to raise an event if discovery fails. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance when discovery fails. The default is 5.
Raise event if phone details cannot be updated?	Set to **Yes** to raise an event if discovery encounters an error during when polling one or more phones for device information. The default is Yes.
Event severity when phone details cannot be updated	Set the event severity level, from 1 to 40, to reflect the importance when phone details cannot be updated. The default is 15.
Raise event if Phone Quality managed object not installed?	Set to **Yes** to raise an event when the Phone Quality managed object is not installed. The default is Yes.
Event severity when Phone Quality managed object not installed	Set the event severity level, from 1 to 40, to reflect the importance when the Phone Quality managed object is not installed at the time the discovery job is run. The default is 5.

32.71 PowerVM

Use this Knowledge Script to discover PowerVM server resources: managed systems, LPARs, CPU pools, physical volume groups, and physical volumes.

TIP: NetIQ recommends you discover a single IBM Hardware Management Console per Unix agent proxy monitoring server. Otherwise, event grouping and AppManager console event indicators may be inconsistent.

After you successfully run this Knowledge Script, you should see the new PowerVM Knowledge Script category in the Operator Console or Control Center. You are now ready to begin monitoring PowerVM servers.

32.71.1 Resource Objects

IBM PowerVM servers

32.71.2 Default Schedule

By default, this script runs once for each UNIX agent computer.

32.71.3 Setting Parameter Values

Set the **Values** tab parameters as needed:

Description	How to Set It
Monitor Host Settings	
Host name or IP address	IBM Hardware Management Console to monitor. The discovery job can only discover a single IBM Hardware Management Console at a time. Maximum length is 256 characters.
User name	Users name for logging on to the IBM Hardware Management Console. Maximum length is 256 characters.
Discovery Settings	
Event Settings	
Event severity when module error or job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which a module error occurs or the discovery job fails. The default is 5.
Raise event when discovery succeeds?	Select Yes to raise an event if the discovery job succeeds. The default is deselected.
Event severity	Select the severity level, from 1 to 40, to indicate the importance of an event in which the discovery job succeeds. The default is 25.
Raise event when discovery partially succeeds?	Select Yes to raise an event if the discovery job partially succeeds. The default is Yes.
Event severity	Select the severity level, from 1 to 40, to indicate the importance of an event in which the discovery job partially succeeds. The default is 15.
Discovery Options	

Description	How to Set It
Discover additional details of managed system?	Select Yes to discover additional details about the PowerVM managed system. The default is Yes. The default details discovered are: • Name • State • IP address • Maximum number of LPARs • Monitor host detail If Yes, the additional details discovered are: • Number of cores • Memory
Discover LPARs?	Select Yes to discover the PowerVM LPARs. The default is Yes.
Discover additional details of LPARs?	Select Yes to discover additional details about the PowerVM LPARs. The default is deselected. The default details discovered are: • Name • LPAR identifier • LPAR environment • Operating system version • Monitor host detail • Managed system If Yes, the additional details discovered are: • Maximum processing units • Number of CPUs • Maximum memory
Discover CPU Pools?	Select Yes to discover the PowerVM CPU resource pools. The default is Yes.
Discover additional details of CPU pools?	Select Yes to discover additional details about the PowerVM CPU resource pools. The default is deselected. The default details discovered are: • Name • Pool identifier • LPAR names • Monitor host detail • Managed system If Yes, the additional details discovered are: • Configurable processors
Discover physical volume group?	Select Yes to discover the PowerVM physical volume group. The default is Yes.
Discover physical volume?	Select Yes to discover the PowerVM physical volume. The default is Yes.

32.72 ReportAgent

Use this Knowledge Script to discover the NetIQ AppManager report agent and associated data sources.

There are some circumstances under which you must run the Discovery_ReportAgent Knowledge Script again:

- If you add a new data source (for example, Active Directory)
- If you install new applications for which AppManager provides application-specific reports (for example, if you install Oracle)

If you add a new data source, re-running Discovery_ReportAgent adds the data source as a child of the report agent, and displays the corresponding Report Knowledge Scripts in the Operator Console and Control Center.

If you install a new application (and discover it), re-running Discovery_ReportAgent adds the discovered application to the appropriate AppManager repository under the report agent, and displays the corresponding application-specific reports.

When you run Discovery_ReportAgent again, be sure to set the Knowledge Script to discover existing data sources. For example, if you previously discovered Active Directories, be sure to enable the *Discover Active Directories?* parameter. Failure to rediscover existing data sources will remove them from the report agent.

If you delete or add a resource object, or if you make any other kind of change that might affect the monitoring of your resources, run the Discovery_ReportAgent Knowledge Script again to update your list of resource objects. In addition, if you are running this module on AppManager 8 or higher, you can use the delta discovery feature in Control Center to run discovery on a schedule to more quickly detect changes to your environment.

32.72.1 Restrictions

This Knowledge Script is not supported in the Web Console.

You cannot use the Action_RunKS Knowledge Script to run Discovery_ReportAgent.

32.72.2 Resource Objects

Any computer with the AppManager report-enabled agent installed.

32.72.3 Default Schedule

By default, this script is only run once for each computer.

32.72.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Discovery Type	
Discover AppManager repository?	Set to **y** to discover the AppManager repository resource object. Successful discovery of this object allows you to render reports based on data in the AppManager repository. The default is y.
Discover Active Directories?	Set to **y** to discover Active Directory resource objects. Successful discovery of Active Directories allows you to render reports based on the data contained therein. The default is n.
Event Notification	
Raise event if discovery succeeds?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance for a successful discovery. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance when the discovery fails. The default is 5.
Event severity when discovery is partially done	Set the event severity level, from 1 to 40, to reflect the importance when a discovery returns some data but also generates warning messages. The default is 10.
Event severity when discovery is not applicable	Set the event severity level, from 1 to 40, to reflect the importance when the discovery is not applicable. This type of failure usually occurs when the target computer does not have the AppManager report agent installed. The default is 15.

32.73 Security

Use this Knowledge Script to discover Microsoft Windows Security configuration and resources and to perform the following tasks:

- Identify computers with Windows security auditing disabled

  Windows security auditing enables the operating system to record security-specific events in the Security event log. To ensure that you can monitor your network security, enable Windows security auditing on all computers in your network.

- Identify computer drives formatted with the FAT32 file system

  The FAT32 file system offers little to no security. NTFS provides the ability to assign permissions to files and folders, thus controlling access to the resources.

32.73.1 Resource Objects

Windows XP Professional, Windows 2000, or Windows NT computers.

32.73.2 Default Schedule

By default, this script is only run once for each computer.

32.73.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event for successful discovery? (y/n)	Set to y to raise an event if discovery completes successfully. The default is n.
Event severity when discovery...	Set the event severity level, from 1 through 40, to indicate the importance of the event when discovery: **...succeeds**. The default is 25 (blue event indicator). **...fails**. The default is 5 (red event indicator). **...is partially done**. The Knowledge Script returns some data but also generates warning messages. The default is 10 (red event indicator). **...is not applicable**. This type of failure usually occurs when the target computer does not have Microsoft Windows Security installed.The default is 15 (yellow event indicator).
Check Security Log for default settings	Set to y to check the security log for default settings. The default is y.

32.73.4 Handling Events

Events raised by this Knowledge Script indicate inadequate Security log settings, disabled auditing, or the presence of the File Allocation Table (FAT) and FAT32 file system.

If the Security log is not set to overwrite events, this log may fill quickly, causing you to miss possible important events. Enable this setting or instill procedures to clean up the log.

If the Security log is set with a maximum capacity of 512KB, consider increasing the log capacity. In many environments, 20MB is adequate.

If computers are discovered using the FAT or FAT32 file system, consider converting all such drives to the NT File System (NTFS).

FAT and FAT32 file systems are simple, interoperable, and easy to restore, but they do not provide any security. In contrast, NTFS provides the ability to assign permission to files and folders, thus controlling who has access to the resources.

If inadequate auditing is enabled, enable auditing. The following table shows the required minimum auditing level for monitored Windows NT computers:

Event category	Audit level
Logon and Logoff	Success, Failure
Restart, Shutdown, and System	Success
Security Policy Changes	Success
User and Group Management	Success, Failure

The following table shows the required minimum auditing level for monitored Windows 2000 and Windows XP Professional computers:

Event category	Audit level
Audit account management	Success, Failure
Audit logon events	Success, Failure
Audit policy change	Success
Audit system events	Success

32.74 SharePoint

Use this Knowledge Script to discover configuration and resource information for Sharepoint Servers. Discovery_SharePoint also tracks, displays, and provides various alerts about SharePoint services.

If you are running Microsoft SharePoint on multiple servers as part of your server farm, run Discovery_SharePoint on each server in the farm. Each server from the farm is displayed individually, not as a group, in the Control Center Navigation pane and the Operator Console TreeView.

To ensure the functionality of SharePoint Knowledge Scripts, enable SharePoint logging so that log files are created. For more information, see the Microsoft SharePoint documentation.

NOTE: Run this script on a scheduled basis to discover new SharePoint resources, such as Web applications.

32.74.1 Resource Objects

SharePoint servers

32.74.2 Default Schedule

By default, this script runs once for each computer.

32.74.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How To Set It
Raise event when the discovery succeeds?	Select **Yes** to raise an event if this script successfully discovers SharePoint resources. The default is unselected.
Event severity when the discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance when this script successfully discovers SharePoint resources. The default is 25.
Raise event when the discovery fails?	Select **Yes** to raise an event if this script does not successfully discover SharePoint resources. The default is Yes.
Event severity when the discovery fails	Set the event severity level, from 1 to 40, to reflect the importance when the script fails to discover SharePoint resources. The default is 5.
Raise event when the discovery partially succeeds?	Select **Yes** to raise an event if this script only partially discovers SharePoint resources. The default is Yes.
Event severity when the discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance when the script only partially discovers SharePoint resources. The default is 10.

32.75 Siebel

Use this Knowledge Script to discover Siebel eBusiness Application components on Windows computers. This Knowledge Script discovers Siebel Servers, Siebel Gateways, Siebel Web Extensions, and the Resonate Central Dispatch component.

32.75.1 Prerequisite

Add the computer with Siebel components to the Operator Console TreeView and store the Siebel Administrator user name and password in the AppManager repository with Security Manager.

The Administrator user name and password are required to start the srvrmgr command line utility.

Complete the following fields in the Custom tab of Security Manager for the Siebel computer.

Field	Description
Label	`SiebelUser`
Sub-label	`SiebelUser`
Value 1	Valid Siebel Administrator username to use on the selected computer.
Value 2	Password associated with the username you provided in the **Value 1** field.
Extended application support	Required field. Encrypts the username and password in Security Manager.

32.75.2 Resource Objects

Any Windows computer with a Siebel eBusiness Application component installed.

32.75.3 Default Schedule

By default, this script is only run once for each computer.

32.75.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Siebel enterprise name	Set the Siebel enterprise name.
Siebel enterprise gateway name	Set the hostname of the Siebel gateway.

Parameter	How to Set It
Siebel language	Select the language. You can choose one of the languages that is supported with your version of Siebel. The default is English (United States).
Siebel Server in Cluster Group	Select this checkbox if you have Siebel Servers in a cluster.
Siebel Server virtual host name	Set the virtual host name of the Siebel Server in a cluster.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **... succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **... fails**. The default is 5 (red event indicator). • **... is partially done**. Set the event severity level for a discovery that returns some data but also generates warning messages (for example, because AppManager for Siebel service could not be started, restarted, or it does not exist on the target computer). The default is 15 (yellow event indicator).

32.76 Siemens

Use this Knowledge Script to discover the resource and configuration information for Siemens PRIMERGY servers running Siemens ServerView. This Knowledge Script requires SNMP to be running on the computer you are discovering. If a required service is not found or is not running, the Discovery job fails with a "Not a Siemens Server" event.

NOTE: Because SNMP is not installed on Siemens servers by default, you may need to install it and restart the server before you can run this Knowledge Script successfully.

32.76.1 Resource Objects

Siemens servers

32.76.2 Default Schedule

By default, this script is only run once for each computer.

32.76.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if discovery succeeds?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
SNMP community string	Enter the SNMP community name to use. The default is the community name entered in the AppManager Security Manager or public if no community name has been entered.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...partially succeeds**. Set the event severity level for a discovery that returns some data but also generates warning messages. The default is 10 (red event indicator). • **...is not applicable**. This type of failure usually occurs when the target computer does not have Siemens ServerView installed. The default is 15 (yellow event indicator). Note If required services, such as SNMP, aren't running on the computer you are discovering, you may see a severity 15 event (Not a Siemens Server). If you see this type of event, see the detail message for more information about what caused the discovery to fail.

32.77 SIPServer

Use the Discovery_SIPServer Knowledge Script to discover a server that uses Session Initiation Protocol (SIP), such as Avaya Session Manager, and to discover resources for that server.

You can discover a SIP server either by SNMP query or by manual configuration.

- If you are using the **SNMP Query** option for the *Discovery method* parameter to discover SIP servers, specify a comma-separated list of SIP Server addresses, or you can specify the full path to a file containing a list of servers. All devices to be discovered must support RFC1213-MIB, including the `sysObjectID`, the `sysName`, and the `sysDesc` properties.
- If SNMP `get` operations cannot be performed against the SIP server itself, use the **Manual Configuration** option for the *Discovery method* parameter to specify the IP address, system name, and system type for the server. You can also include a description for the discovered server that will display in the TreeView object for that server.

In addition, you can use Discovery_SIPServer to create the supplemental database needed by the SIP server by selecting the *Set up supplemental database?* parameter. You can also set up a supplemental database by running SIPServer_SetupSupplementalDB Knowledge Script. Regardless of the method you use, when you set up the supplemental database, you also create the underlying tables and the stored procedures.

By default, this script runs **once a day**.

32.77.1 Configuring Security Manager with SNMP Credentials

AppManager uses SNMP queries to access remote SIP servers when you select **SNMP Query** for the *Discovery method* parameter in the Discovery_SIPServer Knowledge Script. Before discovering a SIP Server resource, configure SNMP community string information for each SIP server you want to monitor with AppManager Security Manager.

AppManager for SIP Server supports SNMP versions 2 and 3.

32.77.1.1 Configuration for SNMP Version 2

For SNMP v2 configuration, complete the following fields in the **Custom** tab of Security Manager for the proxy agent computer.

Field	Description
Label	`SIPServer` or `SNMP`
Sub-label	Indicate whether the community string information will be used for a single device or for all devices: • For a community string for a single device for a proxy agent computer, specify the device name for the community string. • For a community string for all devices for a proxy agent computer, type `default`.
Value 1	Specify the appropriate read-only community string value, such as `private` or `public`.

32.77.1.2 Configuration for SNMP Version 3

AppManager for SNMP supports the following modes for SNMP v3:

- No authentication; no privacy
- Authentication; no privacy
- Authentication and privacy

In addition, the module supports the following protocols for SNMP v3:

- MD5 (Message-Digest algorithm 5, an authentication protocol)
- SHA (Secure Hash Algorithm, an authentication protocol)
- DES (Data Encryption Standard, an encryption protocol)
- AES (Advanced Encryption Standard, an encryption protocol, 128-bit keys only)

Your SNMP v3 implementation may support one or more combinations of mode and protocol. That combination dictates the type of information you configure in AppManager Security Manager: user name (or entity), context name, protocol name, and protocol passwords.

Configure SNMP v3 information for each device that is being monitored by each proxy computer.

For SNMP v3 configuration, complete the following fields in the **Custom** tab of Security Manager for the proxy agent computer.

Field	Description
Label	`SIPServer` or `SNMP`
Sub-label	Indicate whether the SNMP credential string information will be used for a single device or for all devices: • For SNMP credentials for a single device for a proxy agent computer, specify the device name. • For SNMP credentials for all devices for a proxy agent computer, type `default`.
Value 1	Specify the SNMP user name, or *entity*, configured for the device. All SNMP v3 modes require an entry in this field.
Value 2	Specify the name of the context associated with the user name or entity entered in **Value 1**. A *context* is a collection of SNMP information that is accessible by an entity. If possible, enter a context that provides access to all MIBS for a device. If the device does not support context, or if the configuration does not require the use of a specific named context, type an asterisk (*) for a wildcard. All SNMP v3 modes require an entry in thisfield.
Value 3	Specify the combination of protocol and password appropriate for the SNMP v3 mode you have implemented. • For *no authentication/no privacy mode*, leave this field blank. • For *authentication/no privacy mode*, enter `md5` or `sha` and the password for the protocol, separating each entry with a comma. For example: `md5,abcdef` • For *authentication/privacy mode*, enter `md5` or `sha` and the associated password, and then enter `des` and the associated password, separating each entry with a comma. For example: `sha,hijklm,des,nopqrs`

32.77.2 Configuring Security Manager for Supplemental Database Setup

To avoid an error message when running the Discovery_SIPServer Knowledge Script after selecting the *Set up supplemental database?* parameter for a server requiring a SQL login and password, use AppManager Security Manager to store the SQL user name and password information for the SQL Server hosting the supplemental database.

If you create the supplemental database on a server that uses Windows authentication instead of SQL authentication, you do not need to create the Security Manager entry.

On the **Custom** tab in Security Manager, complete the following fields for each SQL Server you are using for this module:

Field	Description
Label	Specify the SQL Server name and the instance name of the SQL Server hosting the supplemental database. Use the following structure: `sql$`*`SQL Server Name\Instance Name`* For example: `sql$HOUSERVER2\DB1`
Sub-label	Specify the SQL Server user name.
Value 1	Specify the SQL Server password.
Extended application support	Required field. Select this option to encrypt the user name and password in Security Manager. Do not leave this option unselected.

32.77.3 Setting Parameter Values

Set the parameters on the Values tab as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Discovery_SIPServer job fails. The default is 5.
Raise event if discovery succeeds?	Select **Yes** to raise an event if discovery succeeds in finding a SIP server. The default is unselected.
Event severity when discovery succeeds	Set the severity level, from 1 to 40, to indicate the importance of an event in which this script succeeds in finding SIP Servers. The default is 25.
Raise event if discovery fails?	Select **Yes** to raise an event if discovery fails to find some or all of your SIP servers. The default is Yes.
Event severity when discovery fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which discovery fails to find some or all of your SIP servers. The default is 10.
Raise event if database setup succeeds?	Select **Yes** to raise an event if the creation of the supplemental database is successful. The default is unselected.

Parameter	How to Set It
Event severity when database setup succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the supplemental database is created successfully. The default is 25.
Raise event if database setup fails?	Select **Yes** to raise an event if creation of the supplemental database fails. The default is Yes.
Event severity when database setup fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the creation of the supplemental database fails. The default is 15.
Discover SIP Servers	
Discovery method	Specify the method you want to use to discover the SIP server. The default is SNMP Query. If you choose **SNMP Query**, you can specify the identity of the target server or servers using either a comma-separated list or a file listing each of the servers to discover. The devices in the list are queried using SNMP, and the system properties are used to create treeview objects for each system. With the SNMP Query option, configure all necessary SNMP community strings in AppManager Security Manager to enable access of remote SIP servers. For more information, see "Configuring Security Manager with SNMP Credentials" on page 1678. **Note** A device to be discovered must support RFC1213-MIB. If the device to be discovered does not support RFC1213, or if the device does not respond to SNMP queries for the RFC1213 properties listed, you need to use the manual discovery method. If you choose **Manual Configuration**, the script can only discover one SIP server per job. Use the parameters in the section of this script to populate the object details for the SIP server that this script discovers. The script does not send SNMP to the selected server.
SNMP Settings	
Comma-separated list of SIP servers	Specify the DNS name or IP address for the SIP servers you want to discover, using a comma to separate multiple items. For example: `10.0.1.1,10.0.1.7,10.0.1.100` Leave this parameter blank if you want to use the *Path to file with list of SIP servers* parameter to specify a file containing this information. **Note** If any of the servers are located behind a firewall using Network Address Translation, the proxy agent must be able to access the address listed here from the agent side of the firewall.

Parameter	How to Set It

Full path to file with list of SIP servers	Instead of listing each server separately in the previous parameter, you can specify the full path to a file on the agent that contains a list of DNS names or IP addresses of SIP servers.
	
	In the file, list the servers on multiple lines, and ensure that each line contains only one entry.
	
	For example:
	
	`10.0.1.1`
	
	`10.0.1.7`
	
	`10.0.1.100`
	
	The default location for this file is `/netiq/AppManager/bin/SIPServer`. If you save the file in this location, specify just the file name in this parameter.
	
	If you save the file in any other location, specify the full path name.

SNMP message timeout	Specify the number of seconds discovery should attempt an SNMP message request to an *individual* SIP Server server before retrying the connection. The minimum value is 10 seconds and the maximum is 2000 seconds. The default is 120 seconds. The value you set here is the timeout value for *all* SNMP message requests for *all* SIPServer Knowledge Script jobs.
SNMP task timeout	Specify the number of seconds discovery should attempt an SNMP retrieve request to an *individual* SIP Server server before retrying the connection. The minimum value is 900 seconds and the maximum is 999999 seconds. The default is 3600 seconds. The value you set here is the timeout value for *all* SNMP retrieve requests for *all* SIPServer Knowledge Script jobs.
SNMP retries	Specify the number of times discovery should attempt an SNMP connection to an individual SIP Server before attempting an SNMP connection to the next SIP Server in the list. The default is 4 attempts, and the maximum is 10 attempts. The value you set here will be the number of retries for *all* SNMP connections for *all* SIPServer Knowledge Script jobs.
System Properties for Manual Configuration	
SIP server IP address	Specify the IP address of the SIP server you want to discover. You cannot leave this parameter blank if you selected *Manual Configuration* for the parameter. The IP address you specify in this parameter becomes part of the SIPServer TreeView object name.
System type	Select the type of server you want to discover. This value displays in the SIP Server TreeView object for the server you discover. You cannot leave this parameter blank if you selected *Manual Configuration* for the parameter. You can choose Custom or AvayaSM.
System name	Specify the name of the instance you want to display for the SIP Server TreeView object for the server you discover. You cannot leave this parameter blank if you selected *Manual Configuration* for the *Discovery method* parameter.
System description	Specify the descriptive text you want to display for the SIP Server TreeView object for the server you discover. This parameter is optional.

Parameter	How to Set It
Discover SIP Quality Of Service Reporting Interface?	Select **Yes** to set up SIP quality of service report data collection. If you select Yes, the script creates an object in the TreeView for quality of service report data. The default is Yes.
SIP identity of collector	Specify the Uniform Resource Identifier (URI) where the proxy agent will accept SIP quality of service reports. If you leave this field blank, the discovery job raises an event, and the discovery fails. Format the URI using RFC 3261: `sip:`*`username`*`@`*`address`*`:`*`port`*`;transport=`*`transportType`* For example: `sip:collector@raldvap710.us.houqe.lab:5060;transport=udp` The *`username`* is any string using characters that are compliant with RFC 3261: A-Z, a-z, and &=+$,;?/ The *`address`* is where the SIP reports will be received. This value is the fully qualified domain name (FQDN) that will appear in the SIP message for phones using this SIP server. The *`port`* is the port number that will receive the SIP reports, and it should be should be a number between 1 to 65535. The *`transportType`* is the protocol used to receive SIP reports. This protocol is the transport type of the SIP trunk between the SIP server and the agent, not the transport type used by the phones themselves. The protocol must be TCP or UDP; TLS and SCTP are not supported.
Set up supplemental database?	Select **Yes** to create the supplemental database, including the tables and stored procedures needed to store call detail records and phone deregistration information. The default is unselected.

Parameter	How to Set It
Start pruning job on supplemental database?	**For all supported versions of SQL Server, except SQL Server Express versions**: Set to **Yes** to create a SQL job that deletes data from the supplemental database. The SQL job runs every night. Data is deleted from the supplemental database based on the value you specify in the *Number of days to keep call detail records* parameter. The default is Yes. **For SQL Server Express versionsemphasis**/: Set to **No**. The pruning job is not supported for SQL Server Express versions. **To manually delete data from the supplemental database**: 1. Run the following stored procedure from a command line: `osql -E -S <sql server> -n -d <database> -Q "exec dbo.Task_SIPServer_Pruning"` where <*sql server*> is the name of the server that hosts the supplemental database, and where <`database`> is the name of the supplemental database. For example: `osql -E -S SuppDBSIPServer -n -d SIPServer_S8300-Cluster -Q "exec dbo.Task_SIPServer_Pruning"` 2. Configure a Windows Scheduled Task to schedule pruning at an interval of your choosing. The process for configuring a Windows Scheduled Task varies according to your version of Microsoft Windows. For more information, consult your Windows documentation.
Number of days to keep call detail records	Specify the number of days' worth of CDRs to keep in the SIP Server supplemental database. Data older than what you specify is discarded. The minimum number of days is 1, and the maximum is 30. The default is 7 days.
SQL Server Information	
SQL Server instance name	Specify the instance name of the SQL Server where you want to create the new SIP Server supplemental database. If you specify both the SQL Server instance name for this parameter and the SQL Server database user name in the following parameter, these values must match the values you specified in "Configuring Security Manager for Supplemental Database Setup" on page 1679. Leave this parameter blank to use the default SQL server instance on the proxy agent computer.
SQL database user name	Specify the user name for the SQL Server where you want to create the new SIP Server supplemental database. Leave this parameter blank to use Windows authentication instead of SQL authentication.

32.78 Snmp

Use this Knowledge Script to discover SNMP-enabled devices running on a network. The AppManager agent on which AppManager for SNMP is installed acts as a proxy for discovering SNMP devices. This AppManager agent is referred to as the SNMP proxy agent.

AppManager for SNMP supports SNMP versions 1, 2, and 3. If you do not specify an SNMP version, then AppManager will attempt to determine the version during the Discovery job. This process could be quite time consuming.

In a successful discovery, the following details are discovered:

Object	Discovered Details
SNMP Proxy object	Agent Address – The hostname or IP address of the SNMP proxy agent.
SNMP Device object	• Device Address — The hostname or IP address under which the device was discovered. • SNMP Version – The SNMP version being used by the SNMP device. • System Name – The value of the SNMP attribute `sysName.0`. • Vendor – The name of the vendor that manufactured the device. • OID – System OID from `sysObjectID.0` that uniquely identifies the type of device. • Services – The network services supported by the device, as specified by `sysServices.0`. • Contact – The value of `sysContact.0`. • Location – The value of `sysLocation.0`.

Devices can only be discovered by providing a device list of hostnames, IP addresses or IP address ranges for the corresponding Discovery Knowledge Script parameters. There is no automatic discovery capability. The Discovery_Snmp script iteratively attempts to contact and retrieve the System MIB from each supplied hostname or IP address.

Because many SNMP devices (typically routers) have multiple IP addresses, some devices may be discovered multiple times. In these cases, the Discovery script automatically detects and removes the duplicates from the list of discovered devices. Any duplicates are shown in the AppManager TreeView pane under the IP address or hostname under which they were first discovered.

During discovery, various errors may occur with the supplied list of SNMP devices. Most commonly, these will be SNMP timeouts from devices failing to respond because they are down, because they are not running an SNMP agent, or because the community string supplied for the device is incorrect. Other common errors can be due to bad hostnames or SNMP Response errors.

Discovery can take anywhere from a few seconds to several minutes or hours. The time taken largely depends on how many SNMP timeouts occur. For example, if this script is configured with an **SNMP timeout** value of 5 seconds and 3 **SNMP retries**, it takes 20 seconds to determine that the device is not responding.

You can control the time it takes discovery to finish by limiting the use of IP address ranges, which are likely to contain many addresses that are not used or that do not correspond to SNMP devices, and to keep the SNMP timeout/retry values as small as is practical for the local network environment.

32.78.1 Prerequisite

Before using this script, configure AppManager Security Manager with the community string and version information for each device you want to discover.

The type of information you configure varies according to the version of SNMP implemented on the device. AppManager for SNMP supports SNMP versions 1, 2, and 3.

Configuring SNMP information allows AppManager to access the MIBs on SNMP-enabled devices.

If you do not explicitly configure SNMP information for AppManaager for SNMP, the Snmp Knowledge Scripts can search for and use community strings you may have already configured for use by the AppManager for Network Device module.

32.78.1.1 Configuration for SNMP Versions 1 and 2

Configure community string and version information for each device monitored by each proxy computer.

Complete the following fields in the Custom tab of Security Manager for the proxy agent computer.

Field	Description
Label	`SNMP`
Sub-label	Indicates whether the user name and context you are configuring will be used for a single device or for all devices. • *For a single device* on a particular proxy agent computer, enter <*`device name`*>. • *For all devices* on a particular proxy agent computer, enter `default`.
Value 1	The appropriate read-only community string value, such as `private` or `public`.
Value 3	• `v1` or `1` if the device supports SNMPv1. • `v2` or `2` if the device supports SNMPv2. If you do not specify either SNMP version, AppManager attempts to determine the version during the Discovery job. This process can be quite time consuming.

32.78.1.2 Configuration for SNMP Version 3

AppManager for SNMP supports the following modes for SNMP version 3 (SNMPv3):

- No authentication; no privacy
- Authentication; no privacy
- Authentication and privacy

In addition, the module supports the following protocols for SNMPv3:

- MD5 (Message-Digest algorithm 5, an authentication protocol)
- SHA (Secure Hash Algorithm, an authentication protocol)
- DES (Data Encryption Standard, encryption protocol)

Your SNMPv3 implementation may support one or more combinations of mode and protocol. That combination dictates the type of information you configure in AppManager Security Manager: user name (or entity), context name, protocol name, and protocol passwords.

You need to configure SNMPv3 information for each device monitored by each proxy computer.

Complete the following fields in the Custom tab of Security Manager for the proxy agent computer.

Field	Description
Label	`SNMP`
Sub-label	Indicates whether the user name and context you are configuring will be used for a single device or for all devices. • *For a single device* on a particular proxy agent computer, enter <*`device name`*>. • *For all devices* on a particular proxy agent computer, enter `default`.
Value 1	The appropriate read-only community string value, such as `private` or `public`. All SNMPv3 modes require an entry in the **Value 1** field.
Value 2	The name of a context associated with the user name or entity you entered in the Value 1 field. A context is a collection of SNMP information that is accessible by an entity. If possible, enter a context that provides access to all MIBS for a device. If the device does not support context, type an asterisk (*). All SNMPv3 modes require an entry in the **Value 2** field.
Value 3	The combination of protocol and password appropriate for the SNMPv3 mode you have implemented. • For *no authentication/no privacy mode*, leave the **Value 3** field blank. • For *authentication/no privacy mode*, enter `md5` or `sha` and the password for the protocol, separating each entry with a comma. For example, enter `md5,abcdef` • For *authentication/privacy mode*, enter `md5` or `sha` and the associated password, and then enter `des` and the associated password, separating each entry with a comma. For example, enter `sha,hijklm,des,nopqrs`

32.78.2 Resource Objects

NT_MachineFolder

32.78.3 Default Schedule

By default, this script runs once.

32.78.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Discovery Parameters	
List of SNMP devices	Supply a list of SNMP device hostnames or IP addresses. An attempt is made to discover each device listed. The default is `localhost`. **NOTE:** The SNMP information for each device you list in this field must be entered into Security Manager before you can run this script.
Address ranges of SNMP devices	Supply a list of IP address ranges. Each range must be in the format "`A.B.C.D-W.X.Y.Z`". For example, enter "`10.1.1.0-10.1.1.254`". Each address range may be no longer than 255 addresses, although they can span subnets. For example, "`10.1.1.250-10.1.2.30`" spans a subnet. The default is blank. **NOTE:** The SNMP information for each device in a range must be entered into Security Manager before you can run this script.
Full path to file with list of SNMP devices	Supply the full path to a file containing a list of individual IP addresses or hostnames. The file path supplied must be accessible from the SNMP proxy agent, not the AppManager Operator Console or repository computer. Device names may be separated by commas, blank characters or new lines. The default is blank. **NOTE:** The SNMP information for each device listed in the file must be entered into Security Manager before you can run this script.
Maximum number of devices to discover	Specify the maximum number of devices to be discovered. Discovery stops when this limit is reached, even if not all IP addresses and hostnames have been attempted. The default and maximum allowed value is 50.
SNMP port number	Specify the UDP port number to send the SNMP request at each SNMP device. The default is `161`.
SNMP retries	Specify the number of retries to attempt if a timeout occurs on an SNMP request. The default is 1 retry.
SNMP timeout	Specify the number of seconds to wait for a response before timing out an SNMP request. The default is 3 seconds.
Trap Receiver Discovery	
Discover Trap Receiver?	Set to **Yes** to discover NetIQ SNMP Trap Receiver. The default is Yes.
Trap Receiver IP address	Specify the IP address of the computer on which Trap Receiver is installed. The default is `localhost`.
Trap Receiver TCP port	Specify the TCP port number through which Trap Receiver will communicate with AppManager. The default is port 2735.
Event Notification	
Raise event if discovery succeeds?	Set to **Yes** to raise an event if discovery is completely successful. The details of the event contain the list of discovered devices.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery succeeds. The default is 25. Discovery is successful if all devices in the device list are discovered and no errors occur. The event message indicates any duplicate IP addresses or hostnames. Duplicates are not considered to be an error.

Parameter	How to Set It
Raise event if discovery partially succeeds?	Set to **Yes** to raise an event if discovery is partially successful. The details of the event contain the list of discovered devices and the discovery errors that occurred.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery partially succeeds. The default is 15. A partial discovery occurs if only some of the SNMP devices are discovered, or if the maximum device limit is reached. The event message indicates any duplicate IP addresses or hostnames. Duplicates are not considered errors.
Raise event if discovery fails?	Set to **Yes** to raise an event if no SNMP devices are discovered. The details of the event contain the discovery errors that occurred.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no SNMP devices are discovered. The default is 10.

32.79 SNMPTraps

Use the Discovery_SNMPTraps Knowledge Script to discover known devices that forward SNMP traps to a NetIQ Trap Receiver server. You can discover devices that generate traps that use SNMP version 1, 2, or 3.

This script creates trap source device objects in the Navigation pane or TreeView for devices that can be polled with SNMP as well as devices that cannot be polled with SNMP. The display name format of all trap source device objects created by this script use the following format:

`Trap Source:  Device Name [Device IP Address]`

For example:

`Trap Source:  MyRouter [10.22.120.67]`

You can specify one or more sets of mappings that pair a device name to an IP address, which enables you to customize how the list of discovered SNMP Traps device objects display in the Navigation pane or TreeView.By default, this script runs once. You can run each iteration of a Discovery_SNMPTraps job on just one NetIQ Trap Receiver server. If you have multiple trap receiver servers, run one Discovery_SNMPTraps job for each Trap Receiver server.

If you delete or add a resource object, or if you make any other kind of change that might affect the monitoring of your devices, run the Discovery_SNMPTraps Knowledge Script again to update your list of resource objects.

32.79.1 Prerequisite

Before running the Discovery_SNMPTraps script, configure AppManager Security Manager with the community string and version information for each device you want to monitor. Security Manager entries for SNMP v1 and v2 are optional, but SNMP v3 traps require a Security Manager entry.

If you already use other modules that monitor SNMP traps, such as AppManager for Avaya Communication Manager or AppManager for Network Devices, you can continue to use any existing SNMPTrap Security Manager entries.

The type of Security Manager information you configure varies according to the version of SNMP implemented on the device. AppManager for SNMP supports SNMP versions 1, 2, and 3.command/

32.79.1.1 Configuration for SNMP Versions 1 and 2

To set up Security Manager for SNMP v1 or SNMP v2 traps, complete the following fields on the **Custom** tab in Security Manager:

Field	Description
Label	`SNMPTraps` This script also supports Security Manager entries labeled `SNMPTrap`, which is a label used by other modules that you might have already installed, such as AppManager for Avaya Communication Manager or AppManager for Network Device,
Sub-label	Specify whether the community string is used for a single device or for all devices: • For a single device, list the IP address for the community string. • For all devices, enter `default`.

Field	Description
Value 1	Specify the community string for the device or devices.
Value 2	Leave this field blank.
Value 3	Leave this field blank.

32.79.1.2 Configuration for SNMP Version 3

AppManager for SNMP supports the following modes for SNMP version 3 (SNMP v3):

- No authentication; no privacy
- Authentication; no privacy
- Authentication and privacy

In addition, the module supports the following protocols for SNMP v3:

- MD5 (Message-Digest algorithm 5, an authentication protocol)
- SHA (Secure Hash Algorithm, an authentication protocol)
- DES (Data Encryption Standard, an encryption protocol)

Configure SNMP v3 information for each device monitored by each proxy computer.

If you plan to monitor SNMP v3 traps, install the NetIQ Trap Receiver and the AppManager agent on the *same* computer to prevent malicious users from gaining secure access to the information in these traps. The Discovery_SNMPTraps script notifies you if an SNMP v3 trap source device's corresponding NetIQ Trap Receiver IP address does not match the IP address of the AppManager agent monitoring it.

The Discovery_SNMPTraps script does not fully validate SNMP v3 credentials retrieved from Security Manager for a particular device or set of devices, and the script does not notify you if these credentials do not match. As a result, the Discovery_SNMPTraps script might miss some SNMP v3 traps if you do not enter the Security Manager credentials properly.

For SNMP v3 configuration, complete the following fields in the **Custom** tab of Security Manager for the proxy agent computer.

Field	Description
Label	`SNMPTraps` This script also supports Security Manager entries labeled `SNMPTrap`, which is a label used by other modules that you might have already installed, such as AppManager for Avaya Communication Manager or AppManager for Network Devices.
Sub-label	Specify the IP address, or enter `default` for all devices that do not have a specific IP address entry.
Value 1	Specify the SNMP user name, or *entity*, configured for the device. All SNMP v3 modes require an entry in this field.
Value 2	Specify the name of the context associated with the user name or entity entered in **Value 1**. A *context* is a collection of SNMP information that is accessible by an entity. If possible, enter a context that provides access to all MIBS for a device. If the device does not support context, type an asterisk (*). All SNMP v3 modes require an entry in thisfield.

Field	Description
Value 3	Specify the combination of protocol and password appropriate for the SNMP v3 mode you have implemented. • For *no authentication/no privacy mode*, leave this field blank. • For *authentication/no privacy mode*, enter `md5` or `sha` and the password for the protocol, separating each entry with a comma. For example, enter `md5,abcdef` • For *authentication/privacy mode*, enter `md5` or `sha` and the associated password, and then enter `des` and the associated password, separating each entry with a comma. For example, enter `sha,hijklm,des,nopqrs`

32.79.2 Setting Parameter Values

Set the **Values** tab parameters as needed.

Description	How to Set It
General Settings	
Job Failure Notification	
Event severity if discovery job fails unexpectedly	Set the event severity level, from 1 to 40, to reflect the importance when this script fails unexpectedly. The default is 5.
Event Details	
Event detail format	Select whether to view event details in an HTML table or in plain text. The default is HTML Table.
Additional Settings	
Tracing (for advanced users only)	**Note** Use the tracing settings in this section only with the help of NetIQ Technical Support.
Raise event with job execution log?	Select **Yes** to raise an event when the job execution log is created. The default is unselected.
Logging level	Select the logging level you want to monitor. The options are Off, Fatal, Error, Warn, Info, Debug, or All. Use these settings only with the help of Technical Support. The default is Warn.
Derive event severity from most severe event log entry?	Select **Yes** to calculate the event severity for the *Raise event with job execution log* parameter based on the most severe event log entry. The default is Yes.
Event severity (if automatic severity computation not selected above)	If you did not select **Yes** for the *Derive event severity from most severe event log entry* parameter, set the event severity level, from 1 to 40, to reflect the importance of the event raised with the creation of the job execution log.The default is 40.
Discover SNMP Trap Devices	
Raise event if discovery succeeds?	Select **Yes** to raise an event when this script successfully discovers devices that forward traps to trap receivers. The default is Yes.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance when this script successfully discovers devices that forward traps to trap receivers. The default is 25.

Description	How to Set It
Raise event if discovery fails?	Select **Yes** to raise an event when this script fails to discover devices that forward traps to trap receivers. The default is Yes.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance when the script fails to discover devices that forward traps to trap receivers. The default is 5.
Update the TreeView object name if the device name changed since the previous discovery?	Select **Yes** if you changed the name of a device after initially discovering it, and you want to update the name of the Navigation pane or TreeView object with the new name. The renamed device should have the same IP address, and after the script updates the Navigation pane or TreeView object with the new name, the script monitors the new object and stops monitoring the old object. The default is unselected. If you select No for this parameter, and you change the name of a device after initially discovering it, and then you run discovery again on the device, the script will not create a new Navigation pane or TreeView object. The new name of the device does not display in the Navigation pane or TreeView.
Name of the device to populate in the TreeView	Specify the name of the device that forwards traps to a trap receiver. Use this parameter and the *IP address of the device to populate in the Treeview* parameter if you only want to discover one device. If you want to discover multiple devices, use the *File containing a list of device name/IP address pairs to populate in the TreeView* parameter. This parameter only supports characters allowed in a hostname or fully qualified domain name (FQDN).
IP address of the device to populate in the TreeView	Specify the IP address for the device you want to monitor. This script does not support the discovery of devices that use IPv6 addresses.

File containing the list of device name/IP address pairs to populate in the TreeView	Specify the path to a text file containing a list of mappings that pair device names to IP addresses. This script does not support the discovery of devices that use IPv6 addresses.
	
	For example: `c:\DeviceList.txt`
	
	In the file, separate each mapping with a comma, no spaces, with each pair on a single line. All mappings must be formatted properly for the job to run successfully.For example:
	
	`Intuity,10.41.5.30`
	
	`AvayaOneX,10.41.5.20`
	
	Place the file in a location that is accessible by the account under which the `NetIQmc` service is running on the agent. This script supports UNC shares if the agent's parent account has authority to access the share.

Trap Receiver IP address	Specify the IP address for the NetIQ Trap Receiver (NTR) Server. This script does not support IPv6 addresses. The default is `localhost`.
Trap Receiver TCP port	Specify the TCP port for the NTR Server. The default is `2735`.

32.80 SolarisZones

Use this Knowledge Script to discover Solaris Zones host resources: host attributes, zones, processing units, memory units, virtual network interface cards (VNICs), and ZFS pools.

32.80.1 Prerequisites

- Before running the Discovery_SolarisZones Knowledge Script, ensure that you run the Discovery_UNIX Knowledge Script.
- To run the Discovery_SolarisZones Knowledge Script as a non-systemitemroot/systemitem user, you must add `/usr/bin/prctl` entry in the `/etc/uroot.cfg` file.

32.80.2 Resource Objects

UNIX_MachineFolder

32.80.3 Default Schedule

By default, this script is only run once for each computer.

32.80.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Discovery Settings	
Event Settings	
Event severity when module error or job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which a module error occurs or the discovery job fails. The default is 5.
Raise event if discovery succeeds?	Select **Yes** to raise an event if the discovery job succeeds. The default is unselected.
Event severity	Select the severity level, from 1 to 40, to indicate the importance of an event in which the discovery job succeeds. The default is 25.
Raise event if discovery succeeds partially?	Select **Yes** to raise an event if the discovery job partially succeeds. The default is Yes.
Event severity	Select the severity level, from 1 to 40, to indicate the importance of an event in which the discovery job partially succeeds. The default is 15.
Discovery Options	
Discover Processing Units?	Select **Yes** to discover the Solaris Zones Processing Units. The default is Yes.
Discover Memory Units?	Select **Yes** to discover Solaris Zones Memory Units. The default is Yes.

Description	How to Set It
Discover Virtual Network Interface Cards?	Select **Yes** to discover the Solaris Zones Virtual Network Interface Cards. The default is Yes. **NOTE:** VNIC feature is available only on Solaris 11.0 and later and therefore, the Discovery_SolarisZones discovers the VNICs only on Solaris 11 and later.
Discover ZFS Pools?	Select **Yes** to discover the Solaris Zones ZFS pools. The default is Yes.

NOTE: The Zone resources that are discovered are the Zones that are currently running and not the Zones that are configured on a host.

32.80.5 Attributes of Solaris Zones

When you run the Discovery_SolarisZones Knowledge Script, the script discovers several objects that have different attributes. This section provides information on the attributes of the Solaris Zones objects.

32.80.5.1 Solaris Zones Host

The Solaris Zones host object is the parent object for the zones and ZFS pool objects and the attributes of Solaris Zones Host objects are as follows:

- Name: Displays the host name. This is the output of the *`hostname`* command. For example, if the hostname is uxt2002, then the name is `SolarisZonesHost:uxt2002`.
- Solaris Version: Displays the attribute divided in to three comma-separated parts:
  - Solaris version
  - Release date
  - Update (if applicable)

  If the module is not able to get the Release date and Update, then these values are shown as `(na)`. For example, 10,8/11,U10 indicates that the Solaris version is 10, system release date is 8/11, and has update 10.
- Zone Count: Displays the number of configured zones in a host irrespective of their states.
- Architecture: Displays the architecture of the host. For example, if the host system has a SPARC processor, this attribute display `sun4v`.
- CPU Count: The number of CPUs on a host.
- Memory Size: Displays the memory, in MB, installed on the host.

32.80.5.2 Zones

In the object hierarchy, the Zones are within the host and displays all the zones that are in *running* state. However, the zones that are not in *running* state are not displayed in the tree. The processing unit and memory are the child objects of Zones. If any of the attributes are not available, then these values are shown as `(na)`.

The attributes of Zones objects are as follows:

- Name: Displays the zone name.
- Zone Path: Displays the path that contains the zone root.
- Brand: Displays the brand of the zone.
- Autoboot: Displays if autoboot for the zone is set or not.
- IP Type: Displays if the IP Type is *shared* or *exclusive*.
- CPU Shares: Displays the number of CPU shares that the zone is assigned to from the current pset.
- Scheduling Class: Displays the scheduling class that the zone belongs to.

32.80.5.3 Processing Unit

Processing Unit object is a collection of CPU-specific attributes of a Zone. If any of the attributes are not available, these values are displayed as `(na)`.

The attributes of processing unit are as follows:

- Name: Displays the string, *Processing Unit*.
- CPU Cap: Displays the configured CPU cap value of the zone.
- pset Name: Displays the name of the pset that is bound to the zone.
- Pool (Name, Mode): Displays the name of the pool and mode that the pset bound to the zone belongs to. Mode is *default*, *dedicated*, or *shared*. If the pools daemon is not running or if the module fails to get the pools daemon state, then the module considers that all the zones belong to the default pool.
- Percent Pool Share: Displays the relative zone CPU shares, in percent, compared to the number of zones belonging to a pool.

  For example, if there are two zones in a pool and the shares of `zone01` is 4 CPU and `zone02` is 2 CPU, then the Percent Pool Share of `zone01` is (4/(4+2))*100 = 66.67% and Percent Pool Share of `zone02` is (2/(4+2))*100 = 33.33%. This calculation is based on the *CPU Shares* attributes of the Zones.
- Min CPU: Displays the minimum number of CPUs that can be assigned to the pset bound to the zone.
- Current CPU: Displays the total number of CPUs that are active in the pset bound to the zone.
- Max CPU: Displays the maximum number of CPUs that can be assigned to the pset bound to the zone.

32.80.5.4 Memory

Memory object is a collection of memory specific attributes of a Zone. If any of the attributes are not available, these values are displayed as `(na)`.

The attributes of memory are as follows:

- Name: Displays the name, *Memory*.
- Max RSS: Displays the capped physical memory.
- Max Swap: Displays the maximum swap resource value of the zone.
- Max Locked Memory: Displays the maximum locked memory resource cap of the zone.

32.80.5.5 VNIC

VNIC object displays the VNICs that are configured and the VNICs that are bound to a zone. If any of the VNIC attributes are not available, then these values are shown as `(na)`.

The attributes of VNIC objects are as follows:

- Name: Displays the VNIC name.
- Over: Displays the datalink on which the VNIC was created.
- Speed: Displays the maximum speed, in megabits per second, of a VNIC.
- MAC Address: Displays the MAC address assigned to a VNIC.
- MAC Addrtype: Displays MAC address type of a VNIC.
- VID: Displays the VLAN ID assigned to a VNIC.

NOTE: The selection of VNIC in the Discovery_SolarisZones Knowledge Script is ignored on Solaris 10, because VNIC feature is not present in Oracle Solaris 10.

32.80.5.6 ZFS Pools

ZFS Pool object list the pools. If any of the attributes are not available, these values are displayed as `(na)`.

The attributes of memory are as follows:

- Name: Displays the ZFS Pool nameemphasis/.
- Pool Size: Displays the size of a pool.
- De-duplication: Displays the de-duplication rate. Solaris 10 does not support de-duplication. Therefore, this field displays the value as *(na)*.
- Alternate Root: Displays the alternate root for a pool.

32.81 SQL

Use this Knowledge Script to discover Microsoft SQL Server configuration and resources.

NOTE:

- To successfully discover a SQL Server instance, that instance must be running when you run the Discovery Knowledge Script.
- In SQL Server 2012, to run this Knowledge Script, the user account should have `sysadmin` and `public` role permissions granted.

32.81.1 Resource Objects

SQL Server computer.

32.81.2 Default Schedule

By default, this script is only run once for each computer.

32.81.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if discovery succeeds?	Set to y to raise an event if discovery succeeds. The default is n.
User name	Specify the Microsoft SQL Server user name. This field is optional.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery partially succeeds. The default is 10.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery is not applicable. The default is 15.

32.82 SQL-RT

Use this Knowledge Script to discover if AppManager ResponseTime for SQL components are available on a specific managed client. At the Operator Console, run this Knowledge Script on the managed client on which you are performing discovery.

After successful discovery, a new thumbnail appears in the TreeView pane with a list of computers on which you are performing discovery.

32.82.1 Resource Objects

Windows XP Professional, Windows 2000, or Windows NT.

32.82.2 Default Schedule

By default, this script is only run once for each computer.

32.82.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can select the **Yes** check box to raise an event when the job succeeds. By default, events are not raised on success.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is partially done**. This type of failure usually occurs when the target computer does not have all the prerequisites installed. The default is 10 (red event indicator).

32.83 SQL Server

Use this Knowledge Script to discover SQL Server configurations and resources. The Discovery_SQLServer script also tracks, displays, and provides various alerts about Discovery services. By default, this script runs once for each computer.

NOTE: To run this Knowledge Script, you need `public` and `read-only` SQL Server permission.

If you delete or add a resource object, or if you make any other kind of change that might affect the monitoring of your resources, run the Discovery_SQLServer Knowledge Script again to update your list of resource objects. In addition, if you are running this module on AppManager 8 or later, you can use the delta discovery feature in Control Center to run discovery on a schedule to more quickly detect changes to your environment.

When you run Discovery_SQLServer Knowledge Script, SQL Server Cluster Instances are discovered under SQL Server Virtual folder and SQL Server Instances (non-clustered) are discovered under NT machine folder. Therefore, you can monitor clustered instances only through the SQL Server Virtual folder.

32.83.1 Resource Objects

SQL Server Computer

32.83.2 Default Schedule

By default, this script is only run once for each computer.

32.83.3 Setting Parameters Value

Set the Values tab parameters as needed.

Description	How to Set It
Job Failure Notification	
Raise event if job fails unexpectedly	Select **Yes** to raise an event if discovery job fails unexpectedly. The default is Yes.
Event severity when job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event that is raised when the job fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select the format in which you want to display the event detail. You can select from *HTML Table* or *Plain Text*. The default is HTML Table.
Authentication	Select the authentication method that you want to use for SQL Server discovery. You can either select *Windows Authentication* or *SQL Server Authentication*. The default is Windows Authentication.

Description	How to Set It
Username	Specify the Windows or SQL Server user name that you want to use for SQL Server discovery. If you are a Windows user, specify the user name in the *DomainName\User* format. You can specify multiple users separated by commas. This field is optional. For more information on specifying user name, see quoteSpecifying the User Name in the Knowledge Script/quote section in the *Management Guide*
Exclude server list (comma-separated list)	Specify the list of SQL server instances that you do not want to discover, separated by commas.
Raise event if discovery succeeds?	Select **Yes** to raise an event if discovery succeeds. The default is Yes.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery is not applicable	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery is not applicable. The default is 15.
Raise event if discovery partially succeeds?	Select **Yes** to raise an event if discovery succeeds partially. The default is Yes
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery partially succeeds. The default is 15.
Raise event if discovery fails?	Select **Yes** to raise an event if discovery fails. The default is Yes
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.

32.84 StreamingMedia-RT

Use this Knowledge Script to discover the StreamingMedia-RT managed object on a resource in the TreeView pane of the Operator Console.

32.84.1 Resource Objects

Any Windows XP Professional, Windows Server 2003, Windows 2000 Server, or Windows NT Server.

32.84.2 Default Schedule

By default, this script is only run once for each computer.

32.84.3 Setting Parameter Values

Set the Values tab parameters as needed.

Parameter	How to Set It
Event for successful discovery?	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery succeeds	Set the severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.
Event severity when discovery is partially done	Set the severity level, from 1 to 40, to reflect the importance of an event in which discovery returns some data but also generates warning messages. The default is 10.

32.85 UNIX

Use the Discovery_UNIX Knowledge Script to discover UNIX agents on managed UNIX and Linux servers. This Knowledge Script discovers configuration and resource information for many types of UNIX and Linux operating environments and servers.

32.85.1 Resource Objects

UNIX computer icon.

32.85.2 Default Schedule

By default, this script is only run once for each computer.

32.85.3 Setting Parameter Values

Set the following parameters as needed::

Description	How to Set It
Raise event if discovery succeeds?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job is in one of the following states: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25. • **...fails**. The default is 5. • **...is partially done**. This type of event usually indicates the operating environment on the target computer is not supported or not recognized. The default is 15.
Discover printers?	Set this parameter to y if you want discovery to include printer resources. By default, printers are discovered.

32.86 VirtualCenter

Use the Discovery_VirtualCenter Knowledge Script to discover VMware vSphere resources. Run the script on vCenter servers and agent computers that can monitor vCenter. By default, this script is set to run once.

To ensure that this module can support large vSphere environments, the Discovery_VirtualCenter script generates delta discovery events itself instead of relying on the agent to generate delta discovery events. As a result, you should not enable the **Full** discovery option found on the **Discovery** tab in Control Center for this script. If you enable full discovery, the discovery process might fail for large environments, and the script might not discover many of the objects in the TreeView.

Performing a discovery of a large VMware deployment can be a resource-intensive process that might cause performance-related events in AppManager and console unresponsiveness until discovery is completed.

You can use the parameters under *Detailed object settings* to filter the number of resource objects and resource object details that are discovered, such as CPU, memory, network, and disk details. Filtering these objects will reduce the time and resources required for performing discovery. However, limiting the number of discovered objects also limits the Knowledge Script jobs you can run. For example, if you disable the *Discover datastores?* parameter, you cannot run the DataStoreUsage Knowledge Script, because no datastore objects get discovered.

You can also use the Discovery_VirtualCenter script to create exclusion lists for hosts and virtual machines (VMs) you do not wish to display in the TreeView. Any objects you exclude will be removed from the TreeView after you run discovery.

Virtual machines will not be discovered if the Discovery_VirtualCenter job is running while the virtual machines are being deployed from a template.

NOTE: This module does not support the use of a pipe character ("|") in the name of a virtual machine, host, cluster, datastore, resource pool, or other resource object. If a pipe character is present in a resource object name, such as `Test|machine`, the VMware vSphere Knowledge Scripts will not be able to monitor that object, nor will the scripts be able to monitor a collection of virtual machines containing that resource object.

32.86.1 Default Schedule

By default, this script is set to run **once**.

However, if you are using the VirtualCenter_Inventory Knowledge Script to monitor changes in hosts, virtual machines, and container objects (such as clusters, folders, datacenters, resource pools, and vApps), NetIQ Corporation recommends you run the Discovery_VirtualCenter script **once a day** during off-peak hours. Running Discovery_VirtualCenter on a daily basis ensures that the module updates objects (such as datastores and datastore clusters) that are not monitored by the Inventory script in the TreeView.

32.86.2 Setting Parameter Values

Set the parameters on the Values tab as needed:

Description	How to Set It
General Settings	
Job Failure Notification	

Description	How to Set It
Event severity if Discovery job fails unexpectedly	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Discovery job fails unexpectedly. The default is 5.
Additional Settings	
Event Details	
Event detail format	Select either **HTML Table** or **Plain Text** as the format for event detail. The default is HTML Table.
Raise event if Discovery succeeds?	Select **Yes** to raise an event if discovery succeeds in finding VMware vSphere resources. The default is Yes.
Event severity if Discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery succeeds in finding VMware vSphere resources. The default is 25.
Raise event if excluded objects not found?	Select Yes to raise an event if the objects you listed in the *Hosts to exclude* and the *Virtual machines to exclude* parameters were not found during the discovery process. The default is Yes.
Event severity if excluded objects not found?	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the objects you listed in the exclusion list were not found during the discovery process. The default is 15.
Raise event if Discovery fails?	Select **Yes** to raise an event if discovery fails to find VMware vSphere resources. The default is Yes.
Event severity if Discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which discovery fails to find VMware resources. The default is 5.
Discover vCenter	
Detailed object settings	
Discover datastores?	Select **Yes** to discover datastore objects. Disable this parameter to reduce the number of objects that are discovered. The default is Yes. **NOTE:** If you disable this parameter, you cannot run the VirtualCenter_DataStoreUsage Knowledge Script, because no datastore objects are discovered.
Discover cluster details?	Select **Yes** to discover cluster details. Disable this parameter to reduce the number of resource object details that are discovered. The default is Yes.
Discover resource pool details?	Select **Yes** to discover resource pool details. Disable this parameter to reduce the number of resource object details that are discovered. The default is Yes.

Description	How to Set It
Discover hosts?	Select **Yes** to discover hosts. Disable this parameter to reduce the number of resource object details that are discovered. The default is Yes. **NOTE:** If you disable this parameter, you cannot run the following Knowledge Scripts, because no virtual machine objects are discovered: • VirtualCenter_HostConnected • VirtualCenter_HostCPUUsage • VirtualCenter_HostDataStoreUsage • VirtualCenter_HostDiskIO • VirtualCenter_HostDiskTotalLatency • VirtualCenter_HostMemoryUsage • VirtualCenter_HostNetworkIO • VirtualCenter_HostUptime
Discover host details?	Select **Yes** to discover host details. Disable this parameter to reduce the number of resource object details that are discovered. The default is Yes. **NOTE:** If you select Yes for this parameter, but do not select Yes for the *Discover hosts?* parameter, AppManager will raise an error event stating that detailed object settings are mismatched.
Hosts to exclude (comma-separated)	List any hosts you do not wish to display in the AppManager for VMware vSphere TreeView. The asterisk (*) and (?) are acceptable wildcards. Separate multiple names with a comma, without any spaces. Creating an exclusion list like this can prove useful if you have two hosts co-located underneath a single vCenter server. A single VMware module discovery will discover *both* hosts, and this module will monitor them together as one environment. As a result, you cannot use monitoring policies on just one of the hosts unless you list the host or hosts you want to exclude.
Full path to file containing list of hosts to exclude	Provide the path to a location on the agent computer or the UNC path that contains the file with the list of hosts you want to exclude.
Discover vApps?	Select Yes to discover pre-built software solutions called virtual appliances, or vApps. Disable this parameter to reduce the number of resource object details that are discovered. The default is Yes.
Discover vApp details?	Select **Yes** to discover vApp details. Disable this parameter to reduce the number of resource object details that are discovered. The default is Yes. Note If you select Yes for this parameter, but do not select Yes for the *Discover vApps?* parameter, AppManager will raise an error event stating that detailed object settings are mismatched.

Description	How to Set It
Discover virtual machines?	Select **Yes** to discover virtual machine objects. Disable this parameter to reduce the number of objects that are discovered. The default is Yes. **NOTE:** If you disable this parameter, you cannot run the following Knowledge Scripts, because no virtual machine objects are discovered: • VirtualCenter_VmConnected • VirtualCenter_VmCPUUsage • VirtualCenter_VmDiskIO • VirtualCenter_VmDiskUsage • VirtualCenter_VmMemoryUsage • VirtualCenter_VmNetworkIO • VirtualCenter_VmPowerStatus • VirtualCenter_VmToolsStatus • VirtualCenter_VmUptime
Discover virtual machine details?	Select Yes to discover virtual machine details. Disable this parameter to reduce the number of resource object details that are discovered. The default is unselected. Note If you select Yes for this parameter, but do not select Yes for the *Discover virtual machines?* parameter, AppManager will raise an error event stating that detailed object settings are mismatched.
Discover virtual machine templates?	Select Yes to discover virtual machine templates and add them to the TreeView. NetIQ Corporation recommends that you leave this option unselected, because virtual machine templates do not contain any performance metrics. As a result, the discovered templates will always return zero values, which will prevent accurate reporting. **NOTE:** To discover virtual machine templates, you must also select Yes for the *Discover virtual machines?* parameter.
Virtual machines to exclude (comma separated)	List any virtual machines you do not wish to display in the AppManager for VMware vSphere TreeView. The asterisk (*) and (?) are acceptable wildcards. Separate multiple names with a comma, without any spaces. Creating an exclusion list like this can prove useful if you have two virtual machines co-located underneath a single vCenter server. A single VMware module discovery will discover *both* entities, and this module will monitor them together as one environment. As a result, you cannot use monitoring policies on just one of the virtual machines unless you list the virtual machine or machines you want to exclude.
Full path to file containing list of virtual machines to exclude	Provide the path to a location on the agent computer or the UNC path that contains the file with the list of virtual machines you want to exclude.

32.87 VoIPQuality_CallPerf

Use this Knowledge Script to discover the VoIP Quality-Call Performance managed object on a resource in the TreeView pane of the Operator Console.

32.87.1 Resource Objects

Any Windows XP Professional, Windows Server 2003, Windows 2000 Server, or Windows NT Server.

32.87.2 Default Schedule

By default, this script is only run once for each computer.

32.87.3 Setting Parameter Values

Set the Values tab parameters as needed.

Parameter	How to Set It
Event for successful discovery?	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.
Event severity when discovery is partially done	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery returns some data but also generates warning messages.

32.88 VoIPQuality_CallPerfProxy

Use this Knowledge Script to discover a Call Performance computer that does not have the AppManager agent installed but does have the NetIQ Performance Endpoint installed. Discovery is successful only if the managed object is able to communicate with the endpoint on the target computer. With successful discovery, the CallPerf Proxy object is created in the TreeView pane.

NOTE: You should only have one computer acting as a proxy for a given remote computer. Therefore, you may drop this script on only one computer at a time.

32.88.1 Resource Objects

Any Windows XP Professional, Windows Server 2003, Windows 2000 Server, or Windows NT Server.

32.88.2 Default Schedule

By default, this script is only run once for each computer.

32.88.3 Setting Parameter Values

Set the Values tab parameters as necessary.

Parameter	How to Set It
List of remote computers	Enter a list of the remote computers for which you want to discover Call Performance resources. You must specify at lease one remote computer. Use a comma to separate the names in the list: `raldbellijm02,raldattixlm`
Full path to file with list of computers	Instead of listing each remote computer separately, you can specify the full path to a file on the agent computer that contains a computer name on each line of the file.
Event for successful discovery?	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.

32.89 VoIPQuality_CallSetup_H.323

Use this Knowledge Script to discover configuration information and resources for the H.323 protocol.

32.89.1 Resource Objects

Windows XP Professional, Windows Server 2003, Windows 2000 Server, or Windows NT Server.

32.89.2 Default Schedule

By default, this script is only run once for each computer.

32.89.3 Setting Parameter Values

Set the Values tab parameters as needed.

Parameter	How to Set It
Event for successful discovery?	This script always raises an event when the discovery fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.

32.90 VoIPQuality_CallSetup_SIP

Use this Knowledge Script to discover the SIP (Session Initiation Protocol) managed object in the TreeView pane of the Operator Console.

32.90.1 Resource Objects

Any Windows XP Professional, Windows Server 2003, Windows 2000 Server, or Windows NT Server.

32.90.2 Default Schedule

By default, this script is only run once for each computer.

32.90.3 Setting Parameter Values

Set the Values tab parameters as needed.

Parameter	How to Set It
Event for successful discovery?	This script always raises an event when the discovery fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.

32.91 VoIPQuality_CiscoSAA

Use this Knowledge Script to discover a computer on which the Cisco SAA software is installed. You run this script on the computer that will be used as the proxy, or owner, for all of the routers on which the CiscoSAA software is installed. Because you should only have one computer acting as a proxy for any given set of routers, run this script on only one computer at a time.

Discovery is successful *only* if the managed object is able to communicate with the Cisco router on the target computer. If the discovery is successful, the Cisco SAA object is created in the TreeView pane.

32.91.1 Configuring Community String Information for Cisco SAA

If your community string information is the same for all Cisco SAA routers, complete the following procedure once. If your community string information is different for different routers, complete the following procedure once for each different community string.

You must update Security Manager before you can discover Cisco SAA resources.

Complete the following fields in the Custom tab of Security Manager for the proxy agent computer.

Field	Description
Label	`SAA`
Sub-label	Indicates whether the community string information will be used for a single router or for all routers. • *For a single router*, enter <*`router name`*>. • *For all routers using the selected computer as proxy*, enter <*`computer name`*>. • For all routers, enter `default`.
Value 1	Appropriate read/write community string value, such as `private` or `public`.

32.91.2 Resource Objects

Any Windows XP Professional, Windows Server 2003, Windows 2000 Server, or Windows NT Server.

32.91.3 Default Schedule

By default, this script is only run once for each computer.

32.91.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
List of remote computers	Enter a list of the remote computers for which you want to discover Cisco SAA resources. You must specify at least one remote computer. Use a comma to separate the names in the list: `raldbellijm02,raldattixlm`
Full path to file with list of computers	Instead of listing each remote computer separately, you can specify the full path to a file on the agent computer that contains a computer name on each line of the file. **NOTE:** The community string information for each of the computers that you list in this field must be entered into Security Manager before you can run this script.
Event for successful discovery?	This script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery succeeds. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance of an event in which discovery fails. The default is 5.

32.92 Web-RT

Use this Knowledge Script to discover the NetIQ AppManager for Web-RT managed object that monitors Web sites, services, Web transactions, and related protocols.

32.92.1 Resource Objects

Windows XP or later. For more information, see the AppManager Response Time for Web readme.

32.92.2 Default Schedule

The default interval is **Run once**.

32.92.3 Setting Parameter Values

Set the Values tab parameters as needed:

Description	How to Set It
Raise event if discovery succeeds?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can select the **Yes** check box to raise an event when the job succeeds. By default, an event is not raised.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to reflect the importance when the discovery is successful. The default is 25.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to reflect the importance when the discovery fails. The defalt is 5.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to reflect the importance when the discovery is partiallty successful. This type of failure usually occurs when the target computer does not have all the prerequisites installed. Default is 10.

32.93 WebLogicSvr

Use this Knowledge Script to discover WebLogic Server installed on Windows servers. This Knowledge Script returns information about successful, failed and partial discoveries and raises events (with user-specified severity) to notify you of errors.

This Knowledge Script may be used to determine if and where WebLogic Servers are installed in a Windows network. It is useful to run this Knowledge Script periodically to detect new instances of WebLogic Servers and to determine if existing servers have been uninstalled or taken offline.

For other Knowledge Scripts to gather the information they need, this Knowledge Script starts agents that can provide the information. One NetIQ WebLogic agent is started for each release of WebLogic that is discovered on the machine. For example, if releases 6.1 and 7.0 are both installed on the same machine, one NetIQ WebLogic agent will be started for release 6.1 and one NetIQ WebLogic agent will be started for release 7.0.

These agents can be disabled (and enabled) via the WebLogicSvr_NetIQAgent Knowledge Script.

32.93.1 Resource Objects

WebLogic Server, versions 6.0, 6.1, 7.0, and 8.1.

32.93.2 Default Schedule

By default, this script is only run once for each computer.

32.93.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	Set to y to raise an event when the Knowledge Script discovers a WebLogic Server. The default is y.
Event severity when Discovery succeeds	Specify a severity level for the event raised by successful discovery of a WebLogic Server. The default is 25.
Event severity when Discovery fails	Specify a severity level for the event raised by failure to discover a WebLogic Server. The default is 5.
Event severity when Discovery is partially done	Specify a severity level for the event raised when the Knowledge Script starts but does not run to completion. The default is 10.

Parameter	How to Set It
Administration Server hostname:port. Must match Security Manager entry.	Specify the hostname containing an Administration Server for the WebLogic domain and the port number on which the Administration Server is listening. The hostname and port must be separated by a colon. This should match the entry in the Security Manager. If you want to discover multiple servers during discovery and need to contact more than one Administration Server, multiple hostname/port combinations can be specified. Multiple hostname/port combinations will be separated by semi-colons. Ensure all combinations have been entered into Security Manager. For example: `localhost:80;storm:888;wilder:1333` The default is `localhost:7001`.
BEA home directory. Must contain the BEA `registry.xml` file.	Specify the home directory of your WebLogic Server installation. This directory should contain the `registry.xml` file. If you want to discover multiple installations of WebLogic during discovery, multiple directories can be specified. Multiple directories will be separated by semi-colons. For example: `c:\bea70;c:\bea81`. The default is `c:\bea`.
Directory in which to search for a Java Runtime Environment.	Specify a directory in which a Java Runtime Environment is installed. A 1.3 JRE or greater is required. A 1.4 JRE is required for WebLogic Server 8.1. Note that there is no default.
Port to use for NetIQ Web Logic Server agent.	Specify the port on which the NetIQ WebLogic agent receives requests. If multiple versions of WebLogic are to be discovered, each version will require a unique port. Multiple ports must be separated by semi-colons. For example: 2000;2001. The default is 2000.

32.94 WebLogicSvrUNIX

Use the Discovery_WebLogicSrvUNIX Knowledge Script to discover configuration and resource information for WebLogic servers. The Discovery_WebLogicSrvUNIX script also tracks, displays, and provides various alerts about WebLogic services.

Before you discover, if the UNIX agent is running under a non-root user account, perform the following steps:

1. Ensure that the account running the UNIX agent has permission access the WebLogic directories, for example, `registry.xml` file.
2. Add the following entries to the `/etc/uroot.cfg` file:

   ```
   /usr/sbin/lsof
   $NQMAGT_HOME/bin/lsof
   $NQMAGT_HOME /mo/bin/FindPidForPort.sh
   ```

3. Restart the agent.

32.94.1 Resource Object

WebLogic Server

32.94.2 Default Schedule

The default interval for this Knowledge Script is only once.

32.94.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event when discovery succeeds? (y/n)	Set to y to raise an event when the Knowledge Script discovers a WebLogic Server. The default is y.
Event severity when discovery succeeds	Specify a severity level for the event raised by successful discovery of a WebLogic Server. The default is 25.
Event severity when discovery fails	Specify a severity level for the event raised by failure to discover a WebLogic Server. The default is 5.
Event severity when discovery partially succeeds	Specify a severity level for the event raised when the Knowledge Script starts but does not run to completion. The default is 10.
Communication Channel (Clear Text/SSL)	Select the channel for communication with a WebLogic Server. The default communication channel is Clear Text.
Trusted Server CA Certificate (applicable if communication channel is SSL)	Specify the path for the trusted server CA certificate. **NOTE:** Specify the certificate path only if you select SSL for the **Communication Channel** parameter.

Administration Server hostname:port. Must match Security Manager entry	Specify the hostname containing an Administration Server for the WebLogic domain and the port number on which the Administration Server is listening. The hostname and port must be separated by a colon. If you are discovering multiple servers and need to contact more than one Administration Server, specify each hostname:port combination, separated by a semi-colon. Do not add spaces before or after the semicolon. For example: `localhost:80;storm:888;wilder:1333` The default is `localhost:7001`. **NOTE:** Ensure that all combinations are entered in Security Manager.
BEA home directory. Must contain the BEA registry.xml file	Specify the home directory of your WebLogic Server installation. This directory should contain the `registry.xml` file. If you are discovering multiple installations of WebLogic, specify each home directory, separated by a semi-colon. Do not add spaces before or after the semicolon. For example, `/usr/weblogic;/opt/web/weblogic`. The default is `/usr/`.
Directory to search for a Java Runtime Environment	Specify a directory in which a Java Runtime Environment is installed. Note that there is no default.
Port to use for NetIQ WebLogic Server agent.	Specify the port on which the NetIQ WebLogic agent receives requests. If you are discovering multiple versions of WebLogic, specify each version with a unique port, separated by semi-colons. For example: `2000;2001`. The default is 2000.

32.95 WebSphereAppSrv

Use this Knowledge Script to discover instances of the WebSphere Application Server. The Discovery Knowledge Script can be used to discover any or all of the application servers running on a computer. However, if multiple application servers (associated with either a single WebSphere installation, or multiple coexisting installations) are to be discovered on a single computer, they must all be discovered simultaneously, with a single execution of the Discovery script. This is because each time discovery is run, the discovered objects replace any existing discovered resources in the TreeView, so that if one instance is discovered and then a second instance is discovered, the resources associated with the instance discovered first will be lost.

For resources to be successfully discovered, each of the following requirements must be met. If any of these requirements are not met, discovery fails:

- The perfservlet Web application must be deployed and running on a server in the WebSphere domain. (The computer on which the perfservlet is deployed need not be the same as the computer being discovered, but it must be in the same WebSphere domain.) The perfservlet is included with WebSphere, and can be found in the `installableApps` directory. You will need to deploy the servlet and start it running before you can successfully execute this Discovery script. The perfservlet can be deployed easily by accepting all defaults when using the application deployment wizard.
- The perfservlet must be able to retrieve performance data for the application server(s) running on the node(s) being discovered. This implies that the application servers are running, and that performance monitoring has been enabled on the application servers. To discover all WebSphere resources, the monitoring levels for all modules should be set to High. (If you want to run most of the JVM Runtime Knowledge Scripts, the JVM Runtime monitoring levels should be set to Maximum, and the `-XrunpmiJvmpiProfiler` switch should be included as an argument to the Application Server JVM process.)
- The WebSphere installation must be found in one of the directories specified as a parameter to this script. You can specify the `WebSphere\AppServer` directory, or the `WebSphere` directory.

The Discovery script returns information about components of the WebSphere Application Server, such as the EJBs that are deployed on the server, the JDBC providers and data sources, installed Web applications and servlets, as well as other components. If new applications are deployed to the server, or other changes are made to the configuration of application server components, the Discovery Knowledge Script should be run again to pick up the changes. It is strongly recommended that the existing WebSphere Server resource object be deleted from the Operator Console TreeView before Discovery is performed again.

This Knowledge Script takes as a parameter the URL of the perfservlet Web application. This URL is relative to the computer being discovered, so the default URL, which points to `localhost`, will probably work on most single-host WebSphere deployments. However, in multi-node WebSphere deployments, the perfservlet normally runs on a single server in the domain. In such cases, you will need to change the value of this parameter to point to the proper location.

It is possible to run discovery against multiple computers at once, by dropping the Discovery script on a server group. However, all application servers being discovered concurrently must be members of the same WebSphere domain, with the same perfservlet URL providing performance data for each of the servers. If you run the Discovery script against more than one server, make sure you change the URL from `localhost` to the appropriate hostname, or each server will attempt to contact the perfservlet on the local computer.

If it is necessary to go through a proxy server to access the perfservlet URL, you will need to specify the proxy server (hostname or IP address) and the proxy server port number. In addition, if the proxy server requires a login and password, you will need to supply them here. If no proxy lies between the agent computer and the perfservlet, you can leave all four proxy fields blank.

NOTE: If you specify a proxy server, the perfservlet URL that you specify should not include a hostname of "localhost", because localhost will be interpreted by the proxy server, causing the proxy server to attempt to connect to itself. When using a proxy server, the perfservlet URL must specify the actual hostname of the computer being discovered.

If you specify a proxy server, it will be used when accessing the optional servlet URL specified in the HealthCheck Knowledge Script, as well as when accessing the perfservlet. You cannot specify a separate proxy, or no proxy, for the HealthCheck servlet.

As part of the discovery process, this Knowledge Script starts a persistent agent running on the discovered host. This agent must be running in order for most of the Knowledge Scripts to function. You must specify the port number where the agent should listen for requests. If you intend to run the RequestMetrics Knowledge Script, you must ensure that the same port number is specified for all the computers you discover. If you do not intend to use the RequestMetrics Knowledge Script, this restriction does not apply. However, you still must supply a valid (otherwise unused) TCP port number.

32.95.1 Resource Object

Windows Computer

32.95.2 Default Schedule

By default, this script is only run once per computer.

32.95.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if discovery succeeds? (y/n)	Set to y to raise an event when the Knowledge Script discovers a WebSphere Application Server. The default is n.
Event severity when discovery succeeds	Specify the severity level, from 1 to 40, to indicate the importance of the event raised by successful discovery of a WebSphere Application Server. The default is 35.
Event severity when discovery fails	Specify a severity level, from 1 to 40, to indicate the importance of the event raised by failure to discover a WebSphere Application Server. The default is 5.
Perfservlet URLs (semicolon-separated)	Specify one or more URLs of the perfservlet Web application. (Multiple URLs are normally needed only if both WebSphere 4 and WebSphere 5 nodes need to be discovered on the target host.) For the discovery process to succeed, the perfservlet must be running and able to provide performance data for application servers running on the target host. Separate multiple URLs with semicolons (;).
Directories to search for WebSphere home directory (semicolon-separated)	Specify the list of directories to search for the WebSphere Application Server home directory. Separate multiple directories with semicolons (;).

Parameter	How to Set It
TCP port for accepting requests	Specify the TCP port to be used by the agent when listening for requests. The same port must be specified for all computers on which the agent runs in order for the RequestMetrics Knowledge Script to function properly.
Proxy host	Specify the hostname or IP address of the machine on which the Web proxy server is running. Leave this field blank if no proxy server is in use.
Proxy port	Specify the port number to use when connecting to the proxy server. If you specify a proxy host, you must specify a port as well. If you are not using a proxy server, leave this field blank.
Proxy login	Specify the user name to use when logging into the proxy server. If the proxy server does not require authorization, or if a proxy server is not being used, leave this field blank.
Proxy password	Specify the password associated with the proxy login. If the proxy server does not require authentication, or if the login being used does not have an associated password, or if a proxy server is not being used, leave this field blank.

32.96 WebSphereAppSrvUNIX

Use the Discovery_WebSphereAppSrvUNIX Knowledge Script to discover instances of Discovery. When you run the discovery Knowledge Script, the agent must be running under the root account and the PMI monitoring level must be set to Extended.

NOTE: If a discovered Discovery object includes a colon (:) in the name, the Operator Console replaces the colon with a backslash (\). For example, if the object name is `Object: ws/WSSecureMap`, the object name is displayed as `Object\ ws/WSSecureMap`.

Use this script to discover any or all of the application servers running on a computer. However, if multiple application servers (associated with either a single AppManager installation, or multiple coexisting installations) are to be discovered on a single computer, they must all be discovered simultaneously, with a single execution of the discovery script. This is because each time discovery is run, the discovered resources are replaced, so that if one instance is discovered, and then a second instance is discovered, the resources associated with the instance discovered first will be lost.

This Knowledge Script takes as a parameter the URL of the Performance servlet Web application. This URL is relative to the computer being discovered, so the default URL, which points to localhost, will probably work on most single-host AppManager deployments. However, in multi-node AppManager deployments, the Performance servlet normally runs on a single server in the domain. In such cases, you will need to change the value of this parameter to point to the proper location.

You can run discovery against multiple computers at once by running the discovery script on a server group. However, all application servers being discovered concurrently must be members of the same Discovery domain, with the same Performance servlet URL providing performance data for each of the servers. If you run the discovery script against more than one server, make sure you change the URL from localhost to the appropriate hostname, or each server attempts to contact the Performance servlet on the local computer.

If you must use a proxy server to access the Performance servlet URL, you need to specify the proxy server host name or IP address, and the proxy server port number. If the proxy server requires a login and password, supply them here. If no proxy lies between the agent computer and the Performance servlet, leave all four proxy fields blank.

NOTE:

- If you specify a proxy server, the Performance servlet URL that you specify should not include a hostname of localhost, because localhost will be interpreted by the proxy server, causing the proxy server to attempt to connect to itself. When using a proxy server, the Performance servlet URL must specify the actual hostname of the computer being discovered.
- The proxy server you specify will be used when accessing the optional servlet URL specified in the HealthCheck Knowledge Script, as well as when accessing the Performance servlet. You cannot specify a separate proxy, or no proxy, for the HealthCheck servlet.

As part of the discovery process, this Knowledge Script:

- Starts a Java server on the discovered host that the AppManager managed object uses to communicate with Discovery.
- Specifies the port that the Java server uses to communicate with the managed object.

If you encounter problems with AppManager Knowledge Scripts collecting performance data, use the NetIQAgent Knowledge Script to stop and restart the Java server.

If you run the RequestMetrics Knowledge Script, ensure that the same port number is specified for all the computers you discover. If you do not intend to use the RequestMetrics Knowledge Script, this restriction does not apply. However, you still must supply a valid (otherwise unused) TCP port number.

32.96.1 Resource Object

UNIX Computer

32.96.2 Default Schedule

The default interval for this script is Run once.

32.96.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event for successful discovery? (y/n)	Set to **y** to raise an event when the script discovers Discovery. The default is n.
Event severity when Discovery succeeds	Specify a severity level for the event raised by successful discovery of Discovery. The default is 35.
Event severity when Discovery fails	Specify a severity level for the event raised by failure to discover Discovery. The default is 5.
Perfservlet URLs (semicolon-separated)	Specify one or more URLs of the Performance servlet Web application. Multiple URLs are normally needed only if both WebSphere 6.0 and WebSphere 6.1 nodes need to be discovered on the target host. For the discovery process to succeed, the Performance servlet must be running and able to provide performance data for application servers running on the target host.
Semicolon-separated list of directories to search for WebSphere home directory	Specify the list of directories to search for the AppManager home directory.
TCP port for accepting requests	Specify the TCP port that the Java server uses to communicate with the AppManager managed object. The same port must be specified for all computers on which the agent runs in order for the RequestMetrics Knowledge Script to function properly. The default TCP port is 4000.
Proxy host	Specify the host name or IP address of the computer on which the Web proxy server is running. If you do not use a proxy server, leave this field blank.
Proxy port	Specify the port number to use when connecting to the proxy server. If you specify a proxy host, you must specify a port as well. If you are not using a proxy server, leave this field blank.
Proxy login	Specify the username to use when logging into the proxy server. If the proxy server does not require authorization, or if you are not using a proxy server, leave this field blank.
Proxy password	Specify the password associated with the proxy login. If the proxy server does not require authentication, or if the login being used does not have an associated password, or if you are not using a proxy server, leave this field blank.

32.97 WebSphereMQUNIX

After you have installed all the NetIQ UNIX Agent on the AppManager Server, started the UNIX agent, and verified that your WebSphere MQ queues are running, run the WebSphereMQUNIX discovery script to discover AppManager resources. These resources include AppManager queues, queue managers, and channels.

To successfully discover AppManager on UNIX, the agent account must belong to the AppManager Server user group. The default AppManager Server user group is **mqm**.

32.97.1 Resource Objects

WebSphere MQUNIX Server.

32.97.2 Default Schedule

By default, this script is only run once for each computer.

32.97.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event when discovery succeeds?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to **y** to raise an event when the job succeeds. The default is n.
Path to Queue Managers	Enter the full path to the queue manager on the AppManager Server you want to discover. The default is: `/var/mqm/qmgrs`.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **... succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25. • **... fails**. The default is 5. • **... is partially done**. This type of failure usually occurs when the root user does not belong to the AppManager Server user group (by default this is **mqm**) or if there are multiple queues installed in different directories but one of the queues is not running. The default is 11.

32.98 Win-RT

Use this Knowledge Script to discover settings for the Win-RT managed object and the Win-RT service. This script will also verify that a user domain, name, and password to be associated with the agent's Win-RT service have been entered in the AppManager Security Manager.

This script returns information about successful and failed discoveries and raises events (with user-specified severity) to notify you of errors.

32.98.1 Prerequisite

The domain, name, and password of the account to be associated with the ResponseTime for Windows service is stored in AppManager Security Manager. This information is be stored on a per-agent basis. An event is raised if no Security Manager entry is found for a given agent.

Complete the following fields in the Custom tab of Security Manager for the Windows agent computer.

Field	Description
Label	`Win-RT`
Sub-label	`ServiceAccount`
Value 1	Service account domain name
Value 2	Service account name
Value 3	Service account password
Extended application support	Required field. Encrypts the information in Security Manager.

32.98.2 Resource Object

NT_MachineFolder

32.98.3 Default Schedule

The default interval for this script is Run once.

32.98.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job Failure Notification	
Event severity when job fails	Specify a severity level for the event raised when an error prevents the script from completing. The default is 5.

Parameter	How to Set It
Raise event with managed object trace results?	Set to **Yes** to raise an event containing the trace results from the managed object. Use the trace results for debugging purposes. The default is unchecked.
Event severity of managed object trace results?	Specify a severity level, from 1 to 40, to indicate the importance of an event raised with the trace results from the managed object. The default is 40.
Raise event if discovery successful?	Set to **Yes** to raise an event when the script discovers a Win-RT instance. The default is unchecked.
Event severity when discovery successful	Specify a severity level, from 1 to 40, to indicate the importance of an event in which the script discovers a Win-RT instance. The default is 25.
Raise event if discovery fails?	Set to **Yes** to raise an event when the script completes but does not discover a Win-RT instance. The default is checked (Yes).
Event severity when discovery fails	Specify a severity level, from 1 to 40, to indicate the importance of an event in which the script fails to discover a Win-RT instance. The default is 5.
Raise event if Win-RT managed object not installed?	Set to **Yes** to raise an event when the script completes but the Win-RT managed object is not found. The default is checked.
Event severity when Win-RT managed object not installed	Specify a severity level, from 1 to 40, to indicate the importance of an event in which the script determines the Win-RT managed object is not installed. The default is 5.

32.99 Win-RT7

Use this Knowledge Script to discover applications installed on systems with the Windows-RT managed object and the Windows-RT service. This script also verifies that the user domain, name, and password associated with the agent's Windows-RT service have been entered in AppManager Security Manager.

After you run the Discovery script on a server, any discovered applications display as individual objects under the Win-RT7 TreeView object.

32.99.1 Prerequisite

The domain, name, and password of the account to be associated with the Windows-RT service is stored in AppManager Security Manager. AppManager uses these credentials to unlock or login to a computer left in a locked state. AppManager Security Manager stores the information on a per-agent basis. AppManager raises an event if no Security Manager entry is found for an agent.

Complete the following fields in the Custom tab of Security Manager for the Windows agent computer.

Field	Description
Label	`Win-RT7`
Sub-label	`ServiceAccount`
Value 1	Service account domain name
Value 2	Service account name
Value 3	Service account password
Extended application support	Required field. Encrypts the information in Security Manager.

32.99.2 Resource Object

NT_MachineFolder

32.99.3 Default Schedule

By default, this script runs once.

32.99.4 Setting Parameter Values

Set the following parameters as needed

Description	How To Set It
General	
List of applications to discover, separated by commas	Provide the name of the application you want to discover. To discover more than one application, separate the application names with commas.

Description	How To Set It
Raise event if discovery succeeds?	Select this check box to raise an event when the application or applications listed above are successfully discovered. The default is selected.
Event severity when discovery succeeds	Specify a severity level, from 1 to 40, to indicate the importance of an event if discovery is successful. Default is 25.
Raise event if discovery fails?	Select this check box to raise an event when the application or applications listed above are not successfully discovered. The default is selected.
Event severity when discovery fails	Specify a severity level, from 1 to 40, to indicate the importance of an event if discovery is not successful. Default is 5.

32.100 WMI

Use this Knowledge Script to discover the Microsoft Windows Management Instrumentation (WMI) server configuration and resources.

32.100.1 Resource Objects

WMI server.

32.100.2 Default Schedule

By default, this script is only run once for each computer.

32.100.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Raise event if discovery succeeds?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is not applicable**. This type of failure usually occurs when the target computer does not have WMI installed. The default is 15 (yellow event indicator).

32.101 WS.NET

Use this Knowledge Script to automatically discover Web services for .NET resources and configuration information in the local IIS server.

If you installed the Web Services proxy software, Web services running on remote computers can also be discovered.

32.101.1 UDDI Discovery

If you are performing discovery for local services only, use the default settings for the **UDDI Discovery** parameters.

If you are performing discovery for UDDI v2 services, supply the **Inquiry URL** and leave the default settings for the other **UDDI Discovery** parameters.

If you are performing discovery for UDDI v3 services, you must supply the **Inquiry URL**, **Publish URL**, and the **Auth Token** username and password.

32.101.2 Resource Objects

Web services for .NET servers

32.101.3 Default Schedule

By default, this script is only run once for each server.

32.101.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event Notification	Use the following parameters to determine when events are raised.
Raise event if discovery succeeds?	Set to **Yes** to raise an event if discovery succeeds. By default, events are enabled.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue event indicator).
Raise event if discovery fails?	Set to **Yes** to raise an event if discovery fails. By default, events are enabled.
Event severity when discovery fails	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 10.
UDDI Discovery	Use the following parameters to specify UDDI v2.0 and v3.0 details and enable discovery of UDDI services.
Version	Set the UDDI version, 2.0 or 3.0, for discovering the Web services. The default is 3.0.

Parameter	How to Set It
Service filter	Enter a service name, or enter a part of the service name preceding or succeeding a wildcard character, to limit the discovery of Web services. The default filter is *.
Inquiry URL	Enter the uniform resource locator (URL) of the remote computer where UDDI Registry is been deployed. The default, to illustrate the correct syntax, is as follows: `http://server/registry/uddi/inquiry`
Publish URL	Enter the uniform resource locator (URL) of the server where the service is to be published. The default, to illustrate the correct syntax, is as follows: `http://server/registry/uddi/publish`
Auth Token	Use the following parameters to specify the authentication details of UDDI version 3.0 and above.
Username	Enter the username of the specific UDDI registry.
Password	Enter the password for the specific UDDI registry.

32.102 WTS

Use this Knowledge Script to discover Microsoft Windows Terminal Server configuration and resources. If you have Citrix MetaFrame installed on a Windows Terminal Server, you may want to run the MFXP Knowledge Script to discover MetaFrame resources as well.

32.102.1 Resource Objects

Windows Terminal server.

32.102.2 Default Schedule

By default, this script is only run once for each computer.

32.102.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
Event for successful discovery?	This Knowledge Script always raises an event when the job fails for any reason. In addition, you can set this parameter to y to raise an event when the job succeeds. The default is n.
Event severity when discovery...	Set the event severity level, from 1 to 40, to reflect the importance when the job: • **...succeeds**. If you set this Knowledge Script to raise an event when the job succeeds, set the event severity level for a successful discovery. The default is 25 (blue event indicator). • **...fails**. The default is 5 (red event indicator). • **...is partially done**. Set the event severity level for a discovery that returns some data but also generates warning messages. The default is 10 (red event indicator). • **...is not applicable**. This type of failure usually occurs when the target computer does not have WTS installed. The default is 15 (yellow event indicator).

32.103 XenApp

Use this Knowledge Script to discover Citrix XenApp resources and configuration information. The TreeView for this module now includes a reorganized set of objects that include Citrix XenApp or Presentation Server, License Servers, Licenses, Farms, and Servers, along with several additional services: MFCom, Citrix Licensing, Citrix XTE Server, Citrix Service Manager, Citrix Encryption Service, and Citrix IMA Service.

AppManager for Citrix XenApp supports cluster discovery on all cluster nodes for the Citrix License Server component. If you run the Discovery Knowledge Script on both nodes of a cluster added to the Operator Console, the Discovery script discovers the license server on both nodes, but the license types available on the license server object are not discovered. The TreeView for cluster discovery displays the license types available on the License Server object for non-cluster servers only.

32.103.1 Resource Objects

Windows machine objects

32.103.2 Default Schedule

By default, this script is only run once for each server.

32.103.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the discovery job fails. The default is 5.
Discovery details	
Discover applications (yes, no)?	Select **Yes** to discover applications on XenApp Application Servers in addition to servers. The default is yes.
Event Notification	
Raise event when discovery succeeds?	Select **Yes** to raise an event if the discovery process is successful. The default is unselected.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the discovery process is successful. The default is 21.
Event severity level when discovery partially succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a discovery returns some data but also generates warning messages. The default is 11.

32.104 XenDesktop

Use the Discovery_XenDesktop Knowledge Script to discover Citrix XenDesktop or XenApp components. This script always raises an event if discovery fails. You can also choose to raise an event if discovery succeeds.

Run the Discovery_XenDesktop script only on agent computers where the XenDesktop or XenApp Delivery Controller component is installed. To ensure the discovery script performs a complete discovery and discovers all Delivery Controller objects, set the permissions for the NetIQ AppManager Client Resource Monitor (NetIQmc) service to **Log On As the domain administrator**. If you do not log on as the domain administrator, discovery will not discover the following Delivery Controller objects: Machine Catalogs and Delivery Groups.

If you delete or add a resource object, or if you make any other kind of change that might affect the monitoring of your resources, run the Discovery_XenDesktop Knowledge Script again to update your list of resource objects. In addition, if you are running this module on AppManager 8 or later, you can use the delta discovery feature in Control Center to run discovery on a schedule to more quickly detect changes to your environment.

Set the parameters on the **Values** tab as needed:

Description	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the discovery job fails. The default is 5.
Discovery Options	
Discover individual applications?	Select **Yes** to discover individual applications on a XenDesktop or XenApp computer. The default is Yes. **NOTE:** If you have more than 250 applications, select **No** for this parameter, because AppManager only displays the first 250 applications in the Navigation pane or TreeView.
Event Notification	
Raise event if discovery succeeds?	Select **Yes** to raise an event if the discovery process is successful. The default is unselected.
Event severity when discovery succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the discovery process is successful. The default is 25.
Raise event if discovery partially succeeds?	Select **Yes** to raise an event if a discovery returns some data but also generates warning messages. The default is Yes.
Event severity when discovery partially succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a discovery returns some data but also generates warning messages. The default is 15.

33 Domino Knowledge Scripts

The Domino category provides Knowledge Scripts for monitoring Lotus Domino servers and Notes mail, including partitioned configurations.

From the Knowledge Script view of Control Center, you can access more information about any Knowledge Script by selecting it and clicking **Help**. In the Operator Console, select any Knowledge Script in the Knowledge Script pane and press **F1**.

Knowledge Script	What It Does
Connectivity	Monitors mail connectivity between Domino servers.
ConsoleCommand	Issues any Domino server console command.
CPUUtil	Monitors the percentage of CPU resources used by Domino processes.
DbACLChanged	Monitors changes to a database access control list (ACL).
DBCacheHit	Monitors the percentage of data that is read from the Domino database cache.
DBDocNumber	Tracks the number of documents in a Domino database.
DBReplicating	Monitors the rate of successful replications of a Domino database.
DBSizes	Monitors the size of Domino databases, individually or collectively.
DBWhiteSpace	Monitors the whitespace occupied by Domino databases.
GetStat	Monitors any Domino numerical statistics.
HTTPAccessStat	Monitors the number of HTTP access requests for a Domino server and the size of data transferred from the Domino server to a Web client.
InetPortCheck	Monitors the Internet protocol ports used by the Domino server (Internet task).
LogSniff	Checks the Domino log for specific messages or matching search strings.
MailThruput	Monitors the throughput rate of mail messages that are routed through the Domino server.
MemBusy	Monitors the total memory resources used by all Domino processes.
NetworkBusy	Monitors the data sent and received on every Domino network port.

Knowledge Script	What It Does
NotesMailStats	Monitors Notes Mail Server (Mail) statistics on Domino servers.
OldestDocInDB	Monitors the age of documents in a Domino database message queue.
OpenDBResponseTime	Monitors the amount of time required to open a Domino database.
ReplicationTime	Monitors the status of the most recent database replication between Domino servers.
Report_Connectivity	Generates a report about the connectivity and response time between Domino servers.
Report_DatabaseSize	Generates a report about the size of Domino databases.
Report_MailThroughputDeadMails	Generates a report about the number of dead mail messages stored on the Domino server.
Report_MailThruputDeliveredMail	Generates a report about the number of mail messages delivered to the local Domino server.
Report_MailThroughputFailureMail	Generates a report about the number of mail messages that the Domino server failed to deliver.
Report_MailThroughputPendingMails	Generates a report about the number of mail messages sent to the Domino that have yet to be forwarded to their destinations.
Report_MailThroughputRoutedMail	Generates a report about the number of mail messages sent to remote servers and delivered to the local server.
Report_ServerDown	Generates a report about the availability of the Domino server.
Report_ServerUpTime	Generates a report about the up and down time of Domino servers.
Report_TopNDatabases	Generates a report about the Domino databases that use the most disk space on the Domino server.
Report_UserSessions	Generates a report about the number of concurrent user sessions on the Domino server.
ServerAvailability	Monitors changes in the up/down status of a Domino server.
ServerDown	Checks whether a Domino server is down.
SMTPConnectivity	Monitors SMTP mail connectivity between a Domino server and one or more Internet domains.
TaskAvailability	Monitors the status of Domino, third-party, or user add-in tasks.
TaskDown	Monitors the status of Domino, third-party, and user add-in tasks.
TopNAccessDbs	Monitors the top “n” Domino databases that are most frequently accessed on a Domino server.
TopNDatabases	Monitors the Domino databases that use the most disk space on the Domino server.
TopNMailDatabases	Monitors the disk space used by the top user mail files and mail-in databases on the Domino server.
TopNUnUsedDBs	Monitors the size of databases that are not being used.
TopNUsers	Monitors the top “n” users that accessed the Domino server for the longest amount of time.

Knowledge Script	What It Does
UserSessions	Monitors the current number of user sessions open on the Domino server.

33.1 Connectivity

Use this Knowledge Script to determine whether e-mail can be delivered between Domino servers. This script also tracks the time it takes to receive a response to the test message. This script raises an event if connectivity is down, or if response time exceeds the threshold you specify.

Run this script on the top-level Domino folder in the Operator Console TreeView to test each server's connection to the other servers and to itself, verifying complete connectivity between all Domino servers. When you run this script on one server, the script checks whether the server can send an e-mail to itself and all servers specified on the server list parameter.

33.1.1 Example of Using this Script

To test connectivity, this Knowledge Script sends a test mail message to each server being tested using a local mail database set up for the computer running the job. If the test message is not delivered, the Knowledge Script raises an event to indicate that the server cannot send mail. If the test message delivered by the "sending" server does not get a reply from each "receiving" server within the reply interval you set, the Knowledge Script raises an event indicating connectivity is down.

Run this script on the top-level Domino folder to test each Domino server's connection to the other servers and to itself, verifying complete connectivity between all Domino servers. If you run this script on one server without specifying a destination list, the script simply checks whether the server can send an e-mail to itself in a loop-back fashion.

NOTE: To use this script, ensure that the Domino server creates the `netiq.nsf` database in the Domino databases. If you do not find `netiq.nsf` under Domino databases, load `nnetiq.exe` on the Domino server. This script uses a special mail-in database for receiving the test messages that verify connectivity.

33.1.2 Performing Periodic Maintenance

You should periodically log in to each Domino server's special NetIQ mail database and mailbox to perform housekeeping, such as removing old mail files. Depending on how frequently you run this script, consider performing these activities weekly or monthly.

33.1.3 Resource Objects

Domino server icon, Domino Server folder

33.1.4 Default Schedule

The default interval is once every hour.

If your Domino servers rely on a remote WAN or LAN service (such as RAS) or a dial-up modem that is not always connected, consider setting up server group folders to separate Domino servers into different groups. Then set the schedule interval for this script to run on each folder based on each group's connection schedule.

For example, consider creating one server group for your always-connected servers and a separate folder for offhours RAS connections and create two different sets of jobs with different schedules, frequently for

your connected network and once a day or based on the scheduled connection time for the remote access servers.

For more information about setting up server groups, see the *User Guide for AppManager*.

NOTE: You cannot choose the Run once schedule for this script, which requires at least two job iterations to return useful data.

33.1.5 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
List of Domino servers to test connectivity from this server	Provide a list of destination Domino servers for connectivity testing separated by commas. Specify at least one server. For example: `DEV01@LAB01,SALES@LAB02`
Threshold - Maximum response time	Specify the maximum number of seconds from the time the test message is sent out until a reply should be received. If a reply to the test message is not received within this interval, an event is raised. The default is 120 seconds.
Data Collection	
Collect data for connectivity (%) and response time (seconds)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns 100 if the connection is successful and 0 if the connection failed. The default is unselected.
Event Notification	
Raise event if response time exceeds threshold?	Select **Yes** to raise an event if the amount of response time exceeds the threshold you set. The default is Yes.
Event severity level when response time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of response time exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Consider using the ServerDown Knowledge Script to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable. The default is 5.

Description	How To Set It
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.2 ConsoleCommand

Use this Knowledge Script to issue any Domino server console command. This script raises an event if the command returns an output and displays the output of the command in the event details.

33.2.1 Resource Object

Domino server

33.2.2 Default Schedule

The default interval is every 30 minutes.

33.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Domino console command to execute	Specify the console command you want to execute. The default is `Show task`.
Data Collection	
Collect data for command success (%)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of successful commands. The default is unselected.
Event Notification	
Raise event to return command results?	Select **Yes** to raise an event to return command results. The default is Yes.
Event severity level for command results	Set the event severity level, from 1 to 40, to indicate the importance of an event in which command results are returned. The default is 25.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. You should use the ServerDown Knowledge Script to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is unavailable for other reasons such as a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is unavailable for other reasons.The default is 5.

Description	How To Set It
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.3 CPUUtil

Use this Knowledge Script to monitor the percentage of CPU resources used by Domino processes, including the Domino server and all additional task processes. This script raises an event if CPU usage exceeds the threshold you set.

33.3.1 Resource Object

Domino server

33.3.2 Default Schedule

The default interval is every 10 minutes.

NOTE: You cannot choose the Run once schedule for this script, which requires at least two job iterations to return useful data.

33.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Threshold - Maximum Domino CPU usage	Specify the maximum percentage of CPU that all Domino processes can use before an event is raised. The default is 70%.
Data Collection	
Collect data for Domino CPU usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns CPU usage as a percentage for the monitoring period. The default is unselected.
Event Notification	
Raise event if Domino CPU usage exceeds threshold?	Select **Yes** to raise an event if CPU usage for all Domino processes exceeds the threshold you set. The default is Yes.
Event severity level when Domino CPU usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which CPU usage for all Domino processes exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use the ServerDown Knowledge Script to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.

Description	How To Set It
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is unavailable for other reasons, such as a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.4 DbACLChanged

Use this Knowledge Script to monitor changes to a database access control list (ACL). This script raises an event if the ACL changed during the last number of minutes you specify.

33.4.1 Resource Object

Domino server

33.4.2 Default Schedule

The default interval is once every day.

33.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
List of databases to monitor	Specify the names of the databases you want to monitor, separating multiple names with commas. The default is the `names.nsf` database.
Number of previous minutes to check	Specify the number of previous minutes to check for changes to the ACL. The default is 60 minutes.
Monitor since last interval? (ignore 'Number of previous minutes to check')	Select **Yes** to check for the changes to the ACL that have been added since the last interval. If set to Yes, the value specified in the *Number of previous minutes to check* parameter is ignored. The default is unselected.
Data Collection	
Collect data for number of changed ACLs?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number changes that occurred in the ACL during the period you specified. The default is unselected.
Event Notification	
Raise event if database ACLs changed?	Select **Yes** to raise an event if a database ACL has been changed. The default is unselected.
Event severity level if database ACLs changed	Set the event severity level, from 1 to 40, to indicate the importance of an event in which changes to the ACL have occurred. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. You should use the ServerDown Knowledge Script to monitor server status. The default is Yes.

Description	How To Set It
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is unavailable for other reasons, such as a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.5 DBCacheHit

Use this Knowledge Script to monitor the percentage of data read from the Domino database cache. Because retrieving data from the database cache is typically faster and more efficient than accessing database tables directly, this script provides a good indicator of database performance.

33.5.1 Resource Object

Database folder (top-level)

33.5.2 Default Schedule

The default interval is every 30 minutes.

33.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Threshold - Minimum database cache hit rate	Specify the minimum percentage of data that should be read from the Domino database cache. Ideally, this percentage should be set relatively high, because the more frequently Domino uses the data cache, the better your database performance. This script raises an event when the percentage of cache data accessed falls below the threshold you set. The default is 50%.
Data Collection	
Collect data for database cache hit rate (%)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the rate at which the database cache was accessed during the monitoring period. The default is unselected.
Event Notification	
Raise event if database cache hit rate falls below threshold?	Select **Yes** to raise an event if the database cache access rate falls below the threshold you set. The default is Yes.
Event severity level when database cache hit rate falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the database cache access rate falls below the threshold you set. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. You should use the ServerDown Knowledge Script to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.

Description	How To Set It
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is unavailable for other reasons, such as a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.6 DBDocNumber

Use this Knowledge Script to monitor the number of documents in a Domino database. This script raises an event if the number of documents exceeds the threshold you set.

33.6.1 Resource Object

Domino server

33.6.2 Default Schedule

The default interval is once every day.

33.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Name of database to monitor	Specify the name of the database you want to monitor. The default is `log.nsf`.
View name or formula for monitored database	Specify the database view name or selection formula to use. The default is `SELECT FORM = ""Events""` to filter on event documents. To use a view name instead, type `VIEW = ""name""`.
Threshold - Maximum number of documents	Specify the maximum number of documents that can be in the database before an event is raised. The default is 1000 documents.
Data Collection	
Collect data for number of documents in database?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of documents in the database during the monitoring period. The default is unselected.
Event Notification	
Raise event if number of documents exceeds threshold?	Select **Yes** to raise an event if the number of documents in the database exceeds the threshold you set. The default is Yes.
Event severity level when number of documents exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of documents in the database exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. You should use the ServerDown Knowledge Script to monitor server status. The default is Yes.

Description	How To Set It
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is unavailable for other reasons, such as a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.7 DBReplicating

Use this Knowledge Script to monitor the rate of successful replications of a Domino database. This script raises an event if the percentage of successful replications falls below the threshold you set, or if statistics are not available.

33.7.1 Resource Object

Domino server

33.7.2 Default Schedule

The default interval is once every hour.

33.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Threshold - Minimum successful replication	Specify the minimum percentage of database replications that should be successful to prevent an event from being raised. The default is 75%.
Data Collection	
Collect data for successful replication (%)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of successful replications for the monitoring period. The default is unselected.
Event Notification	
Raise event if successful replication rate falls below threshold?	Select **Yes** to raise an event if the percentage of successful database replications falls below the threshold you set. The default is Yes.
Event severity level if successful replication rate falls below threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the percentage of successful replications falls below the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.

Description	How To Set It
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.8 DBSizes

Use this Knowledge Script to monitor the size of Domino databases. Run this script on an individual database to monitor the size of that database. Run this script on a database folder to monitor the size of each database in the folder and the total size of all databases together. This script raises an event if the individual database size or total database size exceeds the threshold you set.

33.8.1 Resource Objects

Database icons, Database folder

33.8.2 Default Schedule

The default interval is once every hour.

33.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Threshold - Maximum total databases size	Specify the maximum file size that all databases can attain before an event is raised. The default is 1000 MB.
Threshold - Maximum individual database size	Specify the maximum file size that individual databases can attain before an event is raised. The default is 50 MB.
Use file specification for the list of databases to monitor?	Select **Yes** to specify the list of databases you are monitoring.
Full path to files for each server with list of databases	Provide the full path to the file name that contains the database names you are monitoring. For example: `<HKLM\SOFTWARE\NetIQ\AppManager\4.0\InstallPath>\Discovery_<SERVER>.txt` **NOTE:** Each database name must be mentioned in a separate line in the text file.
Data Collection	
Collect data for total size of all databases (MB)?	Select **Yes** to collect the total file size for all databases you are monitoring. The default is unselected.
Collect data for size of each database (MB)?	Select **Yes** to collect the file size for each monitored database. The default is unselected.
Event Notification	
Raise event if total size of all databases exceeds threshold?	Select **Yes** to raise an event if the total size of all databases exceeds the threshold you set. The default is Yes.
Event severity level when total size of all databases exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the size of all databases exceeds the threshold. The default is 5.

Description	How To Set It
Raise event if size of individual databases exceeds threshold?	Select **Yes** to raise an event if the size of an individual database exceeds the threshold you set. The default is Yes.
Event severity level when size of individual databases exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the size of an individual databases exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.9 DBWhiteSpace

Use this Knowledge Script to monitor the whitespace occupied by Domino databases. Database whitespace is disk space that the operating system allots to Domino but which Domino does not use. This script raises an event if the amount of whitespace and percentage of whitespace exceed the thresholds you set. You can choose to automatically initiate database compaction.

33.9.1 Resource Objects

Database icons, Database folder

33.9.2 Default Schedule

The default interval is once every hour.

33.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Threshold - Maximum whitespace size	Specify the maximum amount of whitespace that a Domino database can occupy before an event is raised. The default is 50 MB.
Threshold - Maximum whitespace percentage	Specify the maximum percentage of whitespace that can be allocated to a Domino database before an event is raised. The default is 10%.
Use file specification for the list of databases to monitor?	Select **Yes** to specify a full path to the list of databases you want to monitor.
Full path to files for each server with list of databases	Provide the full path to the file that contains the database names you want to monitor. For example: `<HKLM\SOFTWARE\NetIQ\AppManager\4.0\InstallPath>\Discovery_<SERVER>.txt` **NOTE:** Mention each database name in a separate line in the text file.
Data Collection	
Collect data for whitespace size and percentage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the size (in MB) and percentage of whitespace. The default is unselected.
Event Notification	
Raise event if whitespace exceeds both size and percent thresholds?	Select **Yes** to raise an event if whitespace size and whitespace percentage exceed the thresholds you set. The default is Yes.
Event severity level when whitespace exceeds both size and percent thresholds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which whitespace size and percentage exceeds the thresholds. The default is 5.
Raise event if error occurs during database compaction?	Select **Yes** to raise an event if an error occurs during database compaction. The default is Yes.

Description	How To Set It
Event severity level when error occurs during database compaction	Set the event severity level, from 1 to 40, to indicate the importance of an event in which an error occurs during database compaction. The default is 5.
Operations	
Compact database if whitespace exceeds both size and percent thresholds?	Select **Yes** to automatically compact the database to free up disk space when whitespace exceeds both the size and percentage thresholds. The default is unselected.
Maximum wait time for all database compactions	Specify the maximum number of minutes this script waits for applicable database compactions to occur. If sufficient time is not allowed, only some of the database compactions may occur. For this reason, you can choose not to automatically compact databases. Instead, when events indicate you should implement compaction, run this script on individual databases.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.10 GetStat

Use this Knowledge Script to monitor Domino numerical statistics. You can specify a threshold value for any statistics you are monitoring. You cannot use this script to monitor statistics that return string or list data.

33.10.1 Resource Object

Domino server

33.10.2 Default Schedule

The default interval is once every hour.

33.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Domino statistic name to monitor	Provide the name of a Domino statistic that returns numerical data. For example `Server.Sessions.Dropped`. To get a list of statistics names, from a Domino client open the `events4.nsf` database and look under Names and Messages. Click **Statistic Names**. The default statistic is `Server.Tasks`.
Threshold - Maximum statistic value	Specify the maximum value that can be returned by a monitored statistic before an event is raised. The default is 1000.
Data Collection	
Collect data for numerical statistic value?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the value of the monitored statistic. The default is unselected.
Event Notification	
Raise event if statistic value exceeds threshold?	Select **Yes** to raise an event if a statistic value exceeds the threshold you set. The default is Yes.
Event severity level when statistic value exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the value of a monitored statistic exceeds the threshold. The default is 5.
Raise event if statistic not found?	Select **Yes** to raise an event if the statistic does not exist on the monitored server. The default is Yes.
Event severity level when statistic not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a statistic does not exist on the monitored server. The default is 25.
Cancel job if statistic not found?	Select **Yes** to cancel the Knowledge Script job if the statistic does not exist on the monitored server. The default is Yes.

Description	How To Set It
Event severity level when statistic not found and job canceled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the statistic cannot be found and the Knowledge Script job is canceled. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from the nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event if the data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.11 HTTPAccessStat

Use this Knowledge Script to monitor the number of HTTP access requests for a Domino server and the size of data transferred from the Domino server to a Web client. This script raises an event when either the number of HTTP requests or maximum file size exceeds the threshold values you specify.

To use this script, enable the Domino Web server log (`domlog.nsf`) database in the Domino server. For more information about enabling logs in the Domino server, see the Lotus Domino server documentation.

If the Domino server cannot locate `domlog.nsf`, it tries to locate any of the following log files:

```
access<mmddyyyy>.log
agent<mmddyyyy>.log
referrer<mmddyyyy>.log
```

where `mm` is the month the Domino server creates the log file, `dd` is the date the Domino server creates the log file, and `yyyy` is the year the Domino server creates the log file.

This script raises an event if log files cannot be located.

TIP: Domino often delays purging log file data until midnight, so run this script just after midnight.

33.11.1 Resource Object

Domino server

33.11.2 Default Schedule

The default interval is once every day.

33.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Number of previous hours to monitor	Specify the number of previous hours to monitor access requests. The default is 24 hours.
Threshold - Maximum number of HTTP requests	Specify the maximum number of HTTP requests that should be answered by the Domino server before an event is raised. The default is 10000 requests.
Threshold - Maximum amount of transferred data	Specify the maximum file size that transferred files can attain before an event is raised. The default is 1000 MB.
Data Collection	
Collect data for number of HTTP requests?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of HTTP requests during the monitoring period. The default is unselected.

Description	How To Set It
Collect data for amount of transferred data (MB)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the size of transferred files during the monitoring period. The default is unselected.
Event Notification	
Raise event if number of HTTP requests exceeds threshold?	Select **Yes** to raise an event if the number of HTTP requests exceeds the threshold you set. The default is Yes.
Event severity level when number of HTTP requests exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of HTTP requests exceeds the threshold. The default is 5.
Raise event if amount of transferred data exceeds threshold?	Select **Yes** to raise an event if the amount of transferred data exceeds the threshold you set. The default is Yes.
Event severity level when amount of transferred data exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of transferred data exceeds the threshold. The default is 25.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.12 InetPortCheck

Use this Knowledge Script to monitor the Internet protocol ports used by the Domino server (Internet task). You can specify which protocol ports to check. This script raises an event if a monitored port is enabled but inactive.

33.12.1 Resource Object

Domino server

33.12.2 Default Schedule

The default interval is every hour.

33.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Event Notification	
Raise event if the HTTP port is enabled but inactive?	Select **Yes** to check the HTTP server port. The default is Yes.
Raise event if the LDAP port is enabled but inactive?	Select **Yes** to check the LDAP server port. The default is Yes.
Raise event if the NNTP port is enabled but inactive?	Select **Yes** to check the NNTP server port. The default is Yes.
Raise event if the IMAP port is enabled but inactive?	Select **Yes** to check the IMAP server port. The default is Yes.
Raise event if the POP3 port is enabled but inactive?	Select **Yes** to check the POP3 server port. The default is Yes.
Event severity level when ports are enabled but inactive	Set the event severity level, from 1 to 40, to indicate the importance of an event in which ports are inactive. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.

Description	How To Set It
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.13 LogSniff

Use this Knowledge Script to monitor the Notes log database for specific messages or search strings. You enter the search strings to look for using two filter files: the **Include Description File** and the **Exclude Description File**. These files contain the search strings you want to include or exclude, respectively. The search strings can include regular expressions.

You can use just the Include filter file, just the Exclude filter file, or both. If you use both filter files, this script returns messages that contain any included search strings and do not contain any of the excluded search strings. This script raises an event if the number of matching messages found exceeds the threshold you set. This script returns the items that match the search criteria that are new since the last time the script ran.

NOTE: The Description Files must be available locally on the computer where this script runs.

33.13.1 Resource Object

Domino server

33.13.2 Default Schedule

The default interval is once every hour.

33.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Form name to monitor in log database	Provide the form name of the `Notes` log database you want to search. The script searches for messages in the log document of this type. The default form name is Events.
Full path to file containing include strings	Provide the full path to the file name that contains the search strings you want to include. For example: `C:\logsearch\include.txt`
Full path to file containing exclude strings	Provide the full path to the name of the file that contains the search strings you want to exclude. For example: `C:\logsearch\exclude.txt`
Search type to apply	Specify the search type that you want to apply to the strings in the file: • **Automatic** - Select this search type to let the system automatically include strings to compare from a file. • **Literals** - Select this search type when the string in the search file is the literal value that has to be compared. • **RegularExpression** - Select this search type when the string in the search file is a regular expression. By default, the default search type is Automatic.

Description	How To Set It
Previous 24-hour periods to search (for Run Once)	Normally, this script scans for log messages that are new since the last interval. If you schedule the script to Run Once, enter the number of previous days to scan the log for messages. The default is 1 Day.
Threshold - Maximum number of matching messages	Specify the maximum number of matching messages to collect before raising an event. The default is 100 matching items.
Data Collection	
Collect data for number of matching messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of matching messages in the log. The default is unselected.
Event Notification	
Raise event if number of matching messages exceeds threshold?	Select **Yes** to raise an event if the number of matching messages exceeds the threshold you set. The default is Yes.
Event severity level when number of matching messages exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of matching messages exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.14 MailThruput

Use this Knowledge Script to monitor the throughput rate of mail messages that are routed through the Domino server. This script monitors the number of routed, dead, and pending mail messages. This script raises an event if threshold values are exceeded.

Routed mail includes all of the mail messages sent to remote servers and all mail messages delivered to the local server. **Pending mail** messages are messages sent to the Domino server that have not yet been sent by the server to their destination.

When the Domino server cannot complete the delivery of mail and is not able to notify the sender of the mail delivery problem with an error message, the mail is stored on the server and flagged as **dead mail**.

33.14.1 Example of How This Script is Used

This script provides insight into the overall health of your mail delivery system by monitoring dead and pending mail as well as the number of successfully routed messages. In addition, you can use these thresholds and associated events to help you determine when to perform housekeeping tasks such as deleting old mail messages.

33.14.2 Resource Objects

Domino mail routers for Notes

33.14.3 Default Schedule

The default interval is every 30 minutes.

33.14.4 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Threshold - Maximum routed messages this interval	Specify the maximum number of mail messages that can be routed through the Domino server before an event is raised. Threshold applies to the sum of mail delivered to the server and mail transferred from the server to other destinations. The default is 1000 mail messages.
Threshold - Maximum total dead messages	Specify the maximum number of dead mail messages that can occur before an event is raised. The default is 10 messages.
Threshold - Maximum total waiting messages	Specify the maximum number of pending mail messages that can occur before an event is raised. The default is 100 messages.
Data Collection	
Collect data for dead messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of dead mail messages. The default is unselected.

Description	How To Set It
Collect data for pending messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of pending mail messages. The default is unselected.
Collect data for delivered messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of delivered mail messages. The default is unselected.
Collect data for routed messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of routed mail messages. The default is unselected.
Collect data for failed messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of failed mail messages. The default is unselected.
Event Notification	
Raise event if routed messages exceed threshold?	Select **Yes** to raise an event if the number of routed messages exceeds the threshold you set. The default is Yes.
Event severity level when routed messages exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of routed messages exceeds the threshold. The default is 5.
Raise event if dead messages exceed threshold?	Select **Yes** to raise an event if the number of dead messages exceeds the threshold you set. The default is Yes.
Event severity level when dead messages exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event if the number of dead messages exceeds the threshold. The default is 5.
Raise event if waiting messages exceed threshold?	Select **Yes** to raise an event if the number of waiting messages exceeds the threshold you set. The default is Yes.
Event severity level when waiting messages exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of waiting messages exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.

Description	How To Set It
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.15 MemBusy

Use this Knowledge Script to monitor the total memory resources used by all Domino processes. This script raises an event if the amount of memory used exceeds the threshold you set.

33.15.1 Resource Object

Domino server

33.15.2 Default Schedule

The default interval is every 30 minutes.

33.15.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Threshold - Maximum Domino memory usage	Specify the maximum amount of memory that can be used by all Domino processes before an event is raised. The default is 20000 KB.
Data Collection	
Collect data for Domino memory usage (KB)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of memory usage for all Domino processes. The default is unselected.
Event Notification	
Raise event if memory usage exceeds threshold?	Select **Yes** to raise an event if memory usage exceeds the threshold you set. The default is Yes.
Event severity level when memory usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which memory usage exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.

Description	How To Set It
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.16 NetworkBusy

Use this Knowledge Script to monitor the data sent and received on every Domino network port. This script raises an event if the amount of data sent and received on any Domino network port exceeds the thresholds you set.

33.16.1 Resource Object

Domino server

33.16.2 Default Schedule

The default interval is every 30 minutes.

NOTE: You cannot choose the Run once schedule for this script, which requires at least two job iterations to return useful data.

33.16.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Threshold - Maximum amount of data sent from any port	Specify the maximum amount of data that can be sent on a Domino network port before an event is raised. The default is 10000 KB.
Threshold - Maximum amount of data received from any port	Specify the maximum amount of data that can be received on a Domino network port before an event is raised. The default is 10000 KB.
Data Collection	
Collect data for total amount of data sent and received per port?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total amount of data sent and received per port during the monitoring period. The default is unselected.
Event Notification	
Raise event if amount of data sent or received exceeds threshold?	Select **Yes** to raise an event if amount of the amount of data sent or received exceeds the threshold you set. The default is Yes.
Event severity level when amount of data sent or received exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of data sent or received exceeds the threshold. The default is 5.
Raise event if data not found?	Select **Yes** to raise an event if no data is found. The default is Yes.
Event severity level when data not found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no data is found. The default is 25.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.

Description	How To Set It
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.17 NotesMailStats

Use this Knowledge Script to monitor Notes Mail Server statistics on Domino servers:

- Mail.Dead
- Mail.Waiting
- Mail.TransferFailure
- Mail.Delivered
- Mail.AverageDeliverTime
- Mail.TotalRouted
- Mail.TotalKBTransferred.

This script extracts values from these statistics and raises an event if a threshold is exceeded.

33.17.1 Resource Object

Domino server

33.17.2 Default Schedule

The default interval is once an hour.

33.17.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Threshold - Maximum dead mail messages	Specify the maximum number of dead mail messages (Mail.Dead) that can occur before an event is raised. The default is 1000 messages.
Threshold - Maximum waiting mail messages	Specify the maximum number of mail messages that can be waiting to be routed (Mail.Waiting) before an event is raised. The default is 1000 messages.
Threshold - Maximum failed transfer messages	Specify the maximum number of mail messages that the server can fail to route (Mail.TransferFailures) before an event is raised. The default is 1000 messages.
Threshold - Maximum delivered mail messages	Specify the maximum number of mail messages that can be delivered to mailboxes on the server (Mail.Delivered) before an event is raised. The default is 1000 messages.
Threshold - Maximum average message delivery time	Specify the maximum average time it can take to deliver a mail message (Mail.AverageDeliverTime) before an event is raised. The default is 1000 seconds.

Description	How To Set It
Threshold - Maximum routed mail messages	Specify the maximum number of mail messages that can be routed to or from other servers (Mail.TotalRouted) before an event is raised. The default is 1000 messages.
Threshold - Maximum total KB transferred	Specify the maximum number of bytes that can be transferred by the server for all mail messages (Mail.TotalKBTransferred) before an event is raised. The default is 1000 KB.
Data Collection	
Collect data for number of dead mail messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of dead mail (Mail.Dead) messages. The default is unselected.
Collect data for number of waiting mail messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of waiting mail messages (Mail.Waiting). The default is unselected.
Collect data for number of transfer failures?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of mail messages that failed to be transferred (Mail.TransferFailures). The default is unselected.
Collect data for number of delivered mail messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of delivered mail messages (Mail.Delivered). The default is unselected.
Collect data for average message delivery time?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the average delivery time (in seconds) for mail messages (Mail.AverageDeliverTime). The default is unselected.
Collect data for number of routed mail messages?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of routed mail messages (Mail.TotalRouted). The default is unselected.
Collect data for total KB transferred?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total amount (in KB) of transferred mail messages (Mail.TotalKBTransferred). The default is unselected.
Event Notification	
Raise event if dead mail exceeds threshold?	Select **Yes** to raise an event if the number of dead mail messages (Mail.Dead) exceeds the threshold. The default is Yes.
Event severity level when dead mail exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of dead messages exceeds the threshold. The default is 5.
Raise event if waiting mail exceeds threshold?	Select **Yes** to raise an event if the number of waiting messages (Mail.Waiting) exceeds the threshold. The default is Yes.
Event severity level when waiting mail exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of waiting messages exceeds the threshold. The default is 5.
Raise event if message transfer failures exceed threshold?	Select **Yes** to raise an event if the number of message transfer failures (Mail.TransferFailures) exceeds the threshold. The default is Yes.
Event severity level when message transfer failures exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of message transfer failures exceeds the threshold. The default is 5.
Raise event if delivered mail exceeds threshold?	Select **Yes** to raise an event if the number of delivered messages (Mail.Delivered) exceeds the threshold. The default is Yes.

Description	How To Set It
Event severity level when delivered mail exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of delivered messages exceeds the threshold. The default is 5.
Raise event if average mail delivery time exceeds threshold?	Select **Yes** to raise an event if average message delivery time (Mail.AverageDeliverTime) exceeds the threshold. The default is Yes.
Event severity level when average mail delivery time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which average message delivery time exceeds the threshold. The default is 5.
Raise event if routed mail exceeds threshold?	Select **Yes** to raise an event if the number of routed messages (Mail.TotalRouted) exceeds the threshold. The default is Yes.
Event severity level when routed mail exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of routed messages exceeds the threshold. The default is 5.
Raise event if total KB transferred exceeds threshold?	Select **Yes** to raise an event if the amount (in KB) of transferred messages (Mail.TotalKBTransferred) exceeds the threshold. The default is Yes.
Event severity level when total KB transferred exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of transferred messages exceeds the threshold. The default is 5.
Event severity level when no data available	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no mail statistics are available. The default is 25.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.

Description	How To Set It
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.18 OldestDocInDB

Use this Knowledge Script to monitor the age of documents in a Domino database message queue. You can specify a threshold age for documents in the queue. This script raises an event if a document is older than the threshold age you specified.

33.18.1 Resource Object

Domino server

33.18.2 Default Schedule

The default interval is once every day.

33.18.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Database to monitor	Provide the name of the database to monitor. The default is `netiq.nsf`. You can specify only one database name.
Threshold - Maximum document age	Specify the maximum age that a document can attain before an event is raised. In other words, indicate the longest amount of time a document can remain in the message queue. The default is 1000 seconds.
Data Collection	
Collect data for oldest document age (seconds)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the age of the oldest documents in the queue. The default is unselected.
Event Notification	
Raise event if document age exceeds threshold?	Select **Yes** to raise an event if the document age exceeds the threshold you set. The default is Yes.
Event severity level when document age exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event if the age of a document exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.

Description	How To Set It
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.19 OpenDBResponseTime

Use this Knowledge Script to monitor the amount of time required to open a Domino database (response time). You can set a threshold value in seconds for the amount of time required for a database to open. This script raises an event if the time to open a monitored database exceeds the response time you set.

33.19.1 Resource Object

Domino server

33.19.2 Default Schedule

The default interval is once every day.

33.19.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Databases to monitor	Specify the names of one or more databases to monitor, separated by commas. The default is `names.nsf:People`.
Threshold - Maximum response time	Specify the maximum amount of time it can take to open a Domino database before an event is raised. The default is 5 seconds.
Data Collection	
Collect data for response time (seconds)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of response time during the monitoring period. The default is unselected.
Event Notification	
Raise event if response time exceeds threshold?	Select **Yes** to raise an event if the amount of response time exceeds the threshold you set. The default is Yes.
Event severity level when response time exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of response time exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.

Description	How To Set It
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.20 ReplicationTime

Use this Knowledge Script to monitor the status of database replications between Domino servers, including the time used to complete replication and the name of the changed database. The detail message includes the total time taken for replication to complete. This script raises an event if replication does not complete successfully, and records the cause of the failure in the detail message.

Only replications initiated by the local Domino server are monitored. To monitor replications initiated by other servers, run this script on those servers instead.

NOTE: Turn on the local Replication Log to use this script.

33.20.1 Resource Object

Domino server

33.20.2 Default Schedule

The default interval is once every hour.

33.20.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Servers to which the local server initiates replication	Provide a list of Domino servers where replication takes place. Separate the server names by commas. Provide at least one server name. If a server is in a different Domino domain than the server running this script, include the domain name. For example: `DEV01,LAB01,SALES\LAB02`.
Threshold - Maximum replication time	Specify the maximum amount of time that replication can take before an event is raised. The default is 20 minutes.
Number of previous hours to monitor	Specify the number of previous hours to monitor for replications initiated by the local server. The default is 1 hour.
Data Collection	
Collect data for total replication time?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of replication time for the monitoring period. The default is unselected.
Event Notification	
Raise event if replication time exceeds threshold?	Select **Yes** to raise an event if the amount of replication time exceeds the threshold you set. The default is Yes.
Event severity level when replication time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of replication time exceeds the threshold. The default is 5.

Description	How To Set It
Raise event if no replication during period?	Select **Yes** to raise an event if no replication occurs during the monitoring period. The default is unselected.
Event severity level when no replication during period	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no replication occurs during the monitoring period. The default is 25.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data is unavailable for other reasons. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.21 Report_Connectivity

Use this Knowledge Script to generate a report about the connectivity and response time between Domino servers. This report uses data collected by the Connectivity Knowledge Script.

33.21.1 Resource Objects

Report agent

33.21.2 Default Schedule

The default schedule is Run once.

33.21.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Data Source	
Select computers	Select the computers to include in your report.
Select time range	Set a specific or sliding time range for data to include in your report.
Select peak weekdays	Select the days of the week to include in your report.
Data Settings	
Hours or percentage on chart	Select whether to illustrate availability by number of hours or by percentage.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value. Lowest to highest from front to back; highest to lowest from left to right • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a value for either the percentage or count defined in the previous parameter. For example, Top 10%, or Top 10. The default is 25.
Truncate top/bottom?	If set to yes, then the data table shows only the top or bottom N or %. For example, only the top 10%. Otherwise, the table shows all data. The default is no.
Report Settings	
Include parameter help table?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.

Description	How To Set It
Include data stream table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include data stream chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set properties for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties. The default report title is Domino Connectivity.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Raise event if report succeeds?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Severity level when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report has no data. The default is 25.
Severity level when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report cannot be generated. The default is 5.

33.22 Report_DatabaseSize

Use this Knowledge Script to generate a report about the size of Domino databases. Use this report to make a statistical analysis of the data point values, such as the average or maximum value over a specified period. This report uses data collected by the DBSizes Knowledge Script.

33.22.1 Resource Objects

Report agent

33.22.2 Default Schedule

The default schedule is Run once.

33.22.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Data Source	
Select computers	Select the computers to include in your report.
Select time range	Set a specific or sliding time range for data to include in your report.
Select peak weekdays	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data Settings	

Description	How To Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the period covered by the report • **Minimum**: The minimum value of data points for the period covered by the report • **Maximum**: The maximum value of data points for the period covered by the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the period covered by the report • **Range**: The range of values in the data stream (maximum - minimum = range) • **Standard Deviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the period covered by the report • **Close**: The last value for the period covered by the report • **Change**: The difference between the first and last values for the period covered by the report (close - open = change) • **Count**: The number of data points for the period covered by the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value. Lowest to highest from front to back; highest to lowest from left to right. • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a value for either the percentage or count defined in the previous parameter. For example, Top 10%, or Top 10. The default is 25.
Truncate top/bottom?	If set to yes, then the data table shows only the top or bottom N or %. For example, only the top 10%. Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to yes, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report Settings	
Include parameter help table?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include data stream table?	Set to **yes** to include a table of data stream values in the report. The default is yes.

Description	How To Set It
Include data stream chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set properties for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties. The default report title is Domino Mail Database Sizes MB.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Raise event if report succeeds?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Severity level when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report has no data. The default is 25.
Severity level when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report cannot be generated. The default is 5.

33.23 Report_MailThroughputDeadMails

Use this Knowledge Script to generate a report about the number of dead mail messages stored on the Domino server. Use this report to make a statistical analysis of the data point values, such as the average or maximum value over a specified period. This report uses data collected by the MailThruput Knowledge Script.

Report agent

33.28.2 Default Schedule

The default schedule is Run once.

33.28.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Data Source	
Select computers	Select the computers to include in your report.
Select time range	Set a specific or sliding time range for data to include in your report.
Select peak weekdays	Select the days of the week to include in your report.
Data Settings	
Hours or percentage on chart	Select whether to illustrate availability by number of hours or by percentage.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value. Lowest to highest from front to back; highest to lowest from left to right. • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a value for either the percentage or count defined in the previous parameter. For example, Top 10%, or Top 10. The default is 25.
Truncate top/bottom?	If set to yes, then the data table shows only the top or bottom N or %. For example, only the top 10%. Otherwise, the table shows all data. The default is no.
Report Settings	

Description	How To Set It
Include parameter help table?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include data stream table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include data stream chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set properties for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties. The default report title is Domino Server Down.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event Notification	
Raise event if report succeeds?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Severity level when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report has no data. The default is 25.
Severity level when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report cannot be generated. The default is 5.

33.29 Report_ServerUpTime

Use this Knowledge Script to generate a report detailing the up and down time of monitored Domino servers. Up and down times are shown in hours and minutes, as well as the percentage of the monitoring interval during which a computer is running or not running. For example, if during a 24-hour monitoring interval, the computer is running for 18 hours and not running for six hours, the up and down times are represented as:

- Up Time: 18 hours 0 minutes
- Down Time: 6 hours 0 minutes
- Up Time: 75%
- Down Time: 25%

This report uses data collected by the ServerAvailability Knowledge Script.

33.29.1 Resource Object

Report agent

33.29.2 Default Schedule

The default schedule is Run once.

33.29.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Data Source	
Select data streams	Select the data streams to include in your report. **NOTE:** It is recommended to choose “By Data Stream” for this parameter.
Select the style	Select the style for the first page of the report: • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** generates a report with all data on a single page
Select time range	Set a specific or sliding time range for data to include in your report.
Select peak weekdays	Select the days of the week to include in your report.
Aggregation interval	Select the period by which the data in your report is aggregated: • Hourly • Daily • Weekly
Report Settings	

Description	How To Set It
Include parameter help table?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include data stream table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include data stream chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set properties for the output folder.
Add job ID to output folder name?	Select **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties. The default report title is Domino Server Up Time.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Raise event if report succeeds?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Severity level when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report has no data. The default is 25.
Severity level when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report cannot be generated. The default is 5.

33.30 Report_TopNDatabases

Use this Knowledge Script to generate a report about the Domino databases that use the most disk space on the Domino server. This report uses data collected by the TopNDatabases Knowledge Script.

33.30.1 Resource Object

Report agent

33.30.2 Default Schedule

The default schedule is Run once.

33.30.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Data Source	
Select computers	Select the computers to include in your report.
Select time range	Set a specific or sliding time range for data to include in your report.
Report settings	
Include parameter help table?	Set to **Yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Select output folder	Set properties for the output folder.
Select properties	Set miscellaneous report properties. The default report title is Domino Top N Databases Information.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event Notification	
Raise event if report succeeds?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Severity level when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report has no data. The default is 25.
Severity level when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report cannot be generated. The default is 5.

33.31 Report_UserSessions

Use this Knowledge Script to generate a report about the number of concurrent user sessions on the Domino server. Use this report to make a statistical analysis of the data point values, such as the average or maximum value over a specified period. This report uses data collected by the UserSessions Knowledge Script.

33.31.1 Resource Object

Report agent

33.31.2 Default Schedule

The default schedule is Run once.

33.31.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Data Source	
Select computers	Select the computers to include in your report.
Select time range	Set a specific or sliding time range for data to include in your report.
Select peak weekdays	Select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data Settings	

Description	How To Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the period covered by the report • **Minimum**: The minimum value of data points for the period covered by the report • **Maximum**: The maximum value of data points for the period covered by the report • **Min/Avg/Max**: The minimum, average, and maximum values of data points for the period covered by the report • **Range**: The range of values in the data stream (maximum - minimum = range) • **Standard Deviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the period covered by the report • **Close**: The last value for the period covered by the report • **Change**: The difference between the first and last values for the period covered by the report (close - open = change) • **Count**: The number of data points for the period covered by the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value. Lowest to highest from front to back; highest to lowest from left to right. • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a value for either the percentage or count defined in the previous parameter. For example, Top 10%, or Top 10. The default is 25.
Truncate top/bottom?	If set to yes, then the data table shows only the top or bottom N or %. For example, only the top 10%. Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to yes, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help table?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.

Description	How To Set It
Include data stream table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include data stream chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Define the graphic properties of the charts in your report.
Select output folder	Set properties for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Set miscellaneous report properties. The default report title is Domino User Sessions.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event Notification	
Raise event if report succeeds?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level when report succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35.
Severity level when report has no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report has no data. The default is 25.
Severity level when report fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report cannot be generated. The default is 5.

33.32 ServerAvailability

Use this Knowledge Script to monitor changes in the up and down status of a Domino server. This script raises an event when the server is up or when the server is down.

This script collects the data used by the Report_ServerUpTime script. The data can be used by other Report scripts, as well.

33.32.1 Resource Object

Domino server

33.32.2 Default Schedule

The default interval is every 30 minutes.

33.32.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Data Collection	
Collect data for instance and overall availability (%)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of server availability during the monitoring period. The default is unselected.
Event Notification	
Event severity level when server is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a server is down. The default is 5.
Event severity level when server is up	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a server is up. The default is 15.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level if nnetiq task is unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data is otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is otherwise unavailable. The default is 5.

Description	How To Set It
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.

33.33 ServerDown

Use this Knowledge Script to determine whether a Domino server is down. This script raises an event if the server is down.

33.33.1 Resource Object

Domino server

33.33.2 Default Schedule

The default interval is every 30 minutes.

33.33.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Data Collection	
Collect data for availability (%)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns 100 if the server is up, 50 if the server is restarting, or 0 if the server s down. The default is unselected.
Event Notification	
Raise event if Domino server is down?	Select **Yes** to raise an event if the Domino server is down. The default is Yes.
Event severity level when server is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the Domino server is down. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is otherwise unavailable. The default is 5.

Description	How To Set It
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.34 SMTPConnectivity

Use this Knowledge Script to verify connectivity between a Domino server and one or more Internet domains. This script raises an event if connectivity is down.

To configure this script, you need to know the keyword strings that appear in a non-delivery report (NDR) subject and body when the domain is available (up) and, optionally, when the domain is unavailable (down).

A *non-delivery report* is a notice that a message was not delivered to the recipient. This script uses specified search criteria to determine the host status from the non-delivery report. A non-delivery report is created when:

- The test message was successfully sent to the host computer, but the user does not exist on the host computer. In this case, SMTP connectivity is available (up).
- The test message was unsuccessfully sent to the host computer, for example, because the host address is not available. In this case, connectivity to the host is not available (down).

NOTE: This script sends a test message to the abcdefg123 user at one or more specified domains, for example abcdefg123@netiq.com. In the likely event that the user does not exist on the host computer, an NDR is sent to the NetIQ mailbox.

33.34.1 Before Running this Knowledge Script

Before you begin, determine the SMTP host status from an NDR. The NDR must contain a text string in the subject line of the message that identifies the host status. Typically, the subject text in an NDR varies with each domain. After receiving an NDR, review the subject line of the message. The subject line must contain a keyword string that identifies the host status. For example, `user account inactive` indicates the host computer is available, but the user does not exist on the host computer. A subject such as `no route` indicates connectivity is down.

33.34.2 Understanding How Keyword Strings Work

AppManager compares the text in the subject of the NDR to the specified keyword strings for the host status parameters in the script.

The specified keyword strings must match the actual string that appears in the NDR, including spaces. AppManager searches the subject line from left to right. The search is not case-sensitive.

When specifying one or more host status parameters, note the following:

If a text string in the NDR matches* the keyword string specified for	AppManager reports the status as
Subject keywords when host is up	Up
Subject keywords when host is down	Down
Subject keywords when host is both up and down	Down

NOTE: By default, this script sends a test message to one or more specified domains using the abcdefg123 user name. This user name may appear in the NDR subject or body.

33.34.3 Performing Routine Maintenance

Periodically remove old messages from the Domino server's mailbox and the NetIQ mail database.

33.34.4 Resource Object

Domino server

33.34.5 Default Schedule

The default interval for this script is once every hour.

NOTE: You cannot choose the Run once schedule for this script, which requires at least two job iterations to return useful data.

33.34.6 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Internet domains to monitor	Specify the domain names that you want to check. If specifying more than one, the order in which you specify the Internet domains must correspond to the list of Subject and Body Keywords. Separate more than one entry with an "|"; do not use spaces. For example, `netiq.com|abc.com`. The default is `netiq.com`.
NDR subject phrase identifying host is up	Provide a keyword string that should appear in the NDR subject when the host is available (up). The default is `user account inactive`. **Notes** • If you do not specify a value for a parameter (the value is Null), the parameter always matches. To configure a parameter to never match, enter a "garbage" string that does not appear in the NDR. • If specifying a string for more than one Internet domain, the order in which you specify the keyword strings must correspond to the list of Internet domains. Separate more than one string with an "|"; do not use spaces.

Description	How To Set It
NDR subject phrase identifying host is down	Provide a keyword string that should appear in the NDR subject when the host is not available. The default is unselected `route`. **Notes** • If you do not specify a value for a parameter (the value is Null), the parameter always matches. To configure a parameter to never match, enter a “garbage” string that does not appear in the NDR. • If specifying a string for more than one Internet domain, the order in which you specify the keyword strings must correspond to the list of Internet domains. Separate more than one string with an "|"; do not use spaces.
Data Collection	
Collect data for connectivity (%)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of connectivity for the monitoring period. The default is unselected.
Event Notification	
Raise event if SMTP connectivity is down?	Select **Yes** to raise an event if SMTP connectivity is down. The default is Yes.
Event severity level when SMTP connectivity is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which SMTP connectivity is down. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task is unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is otherwise unavailable. The default is 5.
Collect data as ‘-1’ for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.

Description	How To Set It
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.35 TaskAvailability

Use this Knowledge Script to monitor the status of Domino, third-party, or user add-in tasks. This script raises an event when a task is down or when a task is up.

33.35.1 Resource Object

Domino server

33.35.2 Default Schedule

The default interval is every 30 minutes.

33.35.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Monitor Administration Process (AdminP)?	Select **Yes** to monitor the AdminP task. The default is unselected.
Monitor Agent Manager (AMgr)?	Select **Yes** to monitor the AMgr task. The default is unselected.
Monitor Billing (Billing)?	Select **Yes** to monitor the Billing task. The default is unselected.
Monitor Calendar Connector (Calconn)?	Select **Yes** to monitor the Calconn task. The default is unselected.
Monitor Cataloger (Catalog)?	Select **Yes** to monitor the Catalog task. The default is unselected.
Monitor Chronos (Chronos)?	Select **Yes** to monitor the Chronos task. The default is unselected.
Monitor Cluster Administration Process (Cladmin)?	Select **Yes** to monitor the Cladmin task. The default is unselected.
Monitor Cluster Database Directory Manager (Cldbdir)?	Select **Yes** to monitor the Cldbdir task. The default is unselected.
Monitor Cluster Replicator (Clrepl)?	Select **Yes** to monitor the Clrepl task. The default is unselected.
Monitor Database Compactor (Compact)?	Select **Yes** to monitor the Compact task. The default is unselected.
Monitor Database Fixup (Fixup)?	Select **Yes** to monitor the Fixup task. The default is unselected.
Monitor Designer (Design)?	Select **Yes** to monitor the Design task. The default is unselected.
Monitor DIIOP (DIIOP)?	Select **Yes** to monitor the DIIOP task. The default is unselected.
Monitor Directory Cataloger (Dircat)?	Select **Yes** to monitor the Dircat task. The default is unselected.
Monitor Domain Indexer (Domidx)?	Select **Yes** to monitor the Domidx task. The default is unselected.
Monitor Event Monitor (Event)?	Select **Yes** to monitor the Event task. The default is unselected.
Monitor HTTP Server (HTTP)?	Select **Yes** to monitor the HTTP task. The default is unselected.

Description	How To Set It
Monitor IMAP Server (IMAP)?	Select **Yes** to monitor the IMAP task. The default is unselected.
Monitor Indexer (Update)?	Select **Yes** to monitor the Update task. The default is unselected.
Monitor ISpy (ISpy)?	Select **Yes** to monitor the ISpy task. The default is unselected.
Monitor LDAP Server (LDAP)?	Select **Yes** to monitor the LDAP task. The default is unselected.
Monitor MTC (MTC)?	Select **Yes** to monitor the MTC task. The default is unselected.
Monitor NNTP Server (NNTP)?	Select **Yes** to monitor the NNTP task. The default is unselected.
Monitor Object Store Manager (Object)?	Select **Yes** to monitor the Object task. The default is unselected.
Monitor POP3 Server (POP3)?	Select **Yes** to monitor the POP3 task. The default is unselected.
Monitor Replicator (Replica)?	Select **Yes** to monitor the Replica task. The default is unselected.
Monitor Reporter (Report)?	Select **Yes** to monitor the Report task. The default is unselected.
Monitor Router (Router)?	Select **Yes** to monitor the Router task. The default is unselected.
Monitor Schedule Manager (Sched)?	Select **Yes** to monitor the Sched task. The default is unselected.
Monitor Statistic Collector (Collect)?	Select **Yes** to monitor the Collect task. The default is unselected.
Monitor Statistics (Statlog)?	Select **Yes** to monitor the Statlog task. The default is unselected.
Monitor Stats (Stats)?	Select **Yes** to monitor the Stats task. The default is unselected.
Monitor Web Retriever (Web)?	Select **Yes** to monitor the Web task. The default is unselected.

Third-party tasks to monitor	Specify the name of a third-party task you want to monitor and its corresponding `.exe` file name using the format `<task name>:<exe name>`. For example:
	`NetIQ:nnetiq.exe`
	To monitor more than one third-party task, use the symbol "|" (shift+backslash), without any spaces, to separate the task name and executable file name pairs. For example:
	`taskname1:exename1|taskname2:exename2`
	You can use up to 512 characters in the text string for this parameter.

Data Collection	
Collect data for instance and overall availability?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the availability of selected tasks for the monitoring period. The default is unselected.
Event Notification	
Event severity level when a monitored task is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored task is down. The default is 5.
Event severity level when a monitored task is up	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a monitored task is up. The default is 15.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.

Description	How To Set It
Event event severity level when nnetiq task is unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is otherwise unavailable. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.

33.36 TaskDown

Use this Knowledge Script to monitor the status of Domino tasks that were found during discovery. To monitor third-party and user add-in tasks, use the *Additional tasks to monitor* parameter. This script can automatically restart any Domino task, third-party task, or user add-in task that is down.

33.36.1 Resource Object

Domino task

33.36.2 Default Schedule

The default interval is every 30 minutes.

33.36.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Additional tasks to monitor	Provide the names of the third-party or user tasks you want monitor. Specify multiple tasks using the following format: `task1:display name1|task2:display name2` You can look up task names and display names using the `ShowTask` command in the Domino Console.
Data Collection	
Collect data for availability (%)?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the percentage of task availability for the monitoring period. The default is unselected.
Event Notification	
Raise event if task is down?	Select **Yes** to raise an event for each task that is down. The default is Yes.
Event severity level when auto-start is disabled	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the *Auto-start task(s) if found down?* parameter is disabled. The default is 18.
Event severity level when auto-start succeeds	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager successfully restarts a monitored task. The default is 25.
Event severity level when auto-start fails	Set the event severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot restart a monitored task. The default is 5.
Operations	
Auto-start tasks that are down?	Select **Yes** to automatically restart monitored tasks that are down. The default is Yes.

Description	How To Set It
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is otherwise unavailable. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.37 TopNAccessDbs

Use this Knowledge Script to monitor the top n Domino databases that are most frequently accessed on a Domino server. This script raises an event if the number of access requests exceeds the threshold you set.

The detail message includes the database name, the number of times the database was accessed, the database size, and the database whitespace for each top n database.

33.37.1 Resource Object

Domino server

33.37.2 Default Schedule

The default interval is once every day.

33.37.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Top “n” accessed databases to monitor	Specify the number of top databases you want to monitor. For example, to see the five databases that receive the most access requests, enter 5. The default is 10. Enter 0 to include all databases.
Number of previous hours to monitor	Specify the number of previous hours to monitor. The default is 24 hours.
Threshold - Maximum total requests during monitoring period	Specify the maximum number of access requests that can occur before an event is raised. The default is 1000 requests.
Data Collection	
Collect data for total access requests during monitoring period?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of access requests for the monitoring period. The default is unselected.
Event Notification	
Raise event if number of requests exceeds the threshold?	Select **Yes** to raise an event if the number of access requests exceeds the threshold you set. The default is Yes.
Event severity level when number of requests exceeds the threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of access requests exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.

Description	How To Set It
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is otherwise unavailable. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.38 TopNDatabases

Use this Knowledge Script to monitor the Domino databases that use the most disk space on the Domino server. This script raises an event if the amount of disk space used by any database exceeds the threshold you set.

33.38.1 Resource Object

Domino database folder

33.38.2 Default Schedule

The default interval is once every day.

33.38.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Top “n” databases to monitor	Specify the number of top “n” largest databases you want to monitor. For example to see the five databases that use the most disk space, enter 5. The default is 10. Enter 0 to include all databases.
Threshold - Maximum total database disk space usage	Specify the maximum amount of disk space that can be used for all databases before an event is raised. The default is 50 MB.
Data Collection	
Collect data for total database disk space usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total amount of disk space used during the monitoring period. The default is unselected.
Event Notification	
Raise event if disk space usage exceeds threshold?	Select **Yes** to raise an event if the total amount of disk space usage exceeds the threshold you set. The default is Yes.
Event severity level when disk space usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of disk space usage exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.

Description	How To Set It
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is otherwise unavailable. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.39 TopNMailDatabases

Use this Knowledge Script to monitor the disk space used by the top *n* user mail files and mail-in databases on the Domino server. This script raises an event if the disk space used exceeds the threshold you set.

33.39.1 Resource Objects

Mail icon

33.39.2 Default Schedule

The default interval is once every day.

33.39.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Top “n” mail databases to monitor	Specify the number of top “n” largest mail files and mail-in databases you want to monitor. For example to see the five mail databases that use the most disk space, enter 5. The default is 10. Enter 0 to include all databases.
Threshold - Maximum total mail database disk space usage	Specify the maximum amount of disk space that can be used for all mail databases before an event is raised. The default is 50 MB.
Data Collection	
Collect data for total mail database disk space usage?	Select **Yes** to collect data for charts and reports. if enabled, data collection returns the amount of mail database disk space usage for the monitoring period. The default is unselected.
Event Notification	
Raise event if disk space usage exceeds threshold?	Select **Yes** to raise an event if the total amount of mail database disk space usage exceeds the threshold you set. The default is Yes.
Event severity level when disk space usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the amount of mail database disk space usage exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.

Description	How To Set It
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is otherwise unavailable. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.40 TopNUnUsedDBs

Use this Knowledge Script to monitor the size of databases that are not being used. This script checks for databases that have not been accessed during the monitoring period. In addition, this script raises an event if the size of the unused databases exceeds the threshold you set.

33.40.1 Resource Object

Domino server

33.40.2 Default Schedule

The default interval is once every day.

33.40.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Top “n” least accessed databases to monitor	Specify the number of top unused databases you want to monitor. For example to see the five unused databases that use the most disk space, enter 5. The default is 10. Enter 0 to include all databases.
Number of previous hours to monitor	Specify the number of previous hours to monitor. The default is 24 hours.
Threshold - Maximum total database disk space usage	Specify the maximum amount of disk space that can be used by all unaccessed databases before an event is raised. The default is 1000 MB.
Data Collection	
Collect data for total database disk space usage?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the amount of disk space used by unaccessed databases for the monitoring period. The default is unselected.
Event Notification	
Raise event if disk space usage exceeds threshold?	Select **Yes** to raise an event if disk space usage exceeds the threshold you set. The default is Yes.
Event severity level when disk space usage exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which disk space usage exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.

Description	How To Set It
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is otherwise unavailable. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.41 TopNUsers

Use this Knowledge Script to monitor the top *n* users that accessed the Domino server for the longest amount of time. This script raises an event when the number of minutes the top *n* users accessed the server exceeds the threshold you set. The detail message displays the combined number of minutes over the threshold for the top *n* users.

33.41.1 Resource Object

Domino server

33.41.2 Default Schedule

The default interval is once every day.

33.41.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Top “n” user access times to monitor	Specify the number of top users you want to monitor. For example to see the five users who access the Domino server most, enter 5. The default is 10 users. Enter 0 to include all users.
Previous hours to search (for Run Once)	Normally, this script monitors since the last interval. If you schedule the script to Run Once, enter the number of previous hours to search. The default is 24 hours.
Threshold - Maximum total user access time during monitoring period	Specify the maximum amount of time users can access the Domino server before an event is raised. The default is 50 minutes.
Data Collection	
Collect data for total users access time during monitoring period?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the total number minutes users accessed the server during the monitoring period. The default is unselected.
Event Notification	
Raise event if total user access time exceeds threshold?	Select **Yes** to raise an event if the total user access time exceeds the threshold you set. The default is Yes.
Event severity level when user access time exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which total user access time exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.

Description	How To Set It
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is otherwise unavailable. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

33.42 UserSessions

Use this Knowledge Script to monitor the number of user sessions open on the Domino server. This script raises an event if the number of concurrent user sessions exceeds the threshold you set, which is an indication that the server is busy.

33.42.1 Resource Object

Domino server

33.42.2 Default Schedule

The default interval is every 30 minutes.

33.42.3 Setting Parameter Values

Set the following parameters as needed:

Description	How To Set It
Monitoring	
Threshold - Maximum number of concurrent user sessions	Specify the maximum number of concurrent user sessions that can be open on the server before an event is raised. The default is 50 users.
Data Collection	
Collect data for concurrent number of user sessions?	Select **Yes** to collect data for charts and reports. If enabled, data collection returns the number of concurrent user sessions for the monitoring period. The default is unselected.
Event Notification	
Raise event if user sessions exceed threshold?	Select **Yes** to raise an event if the number of concurrent user sessions exceeds the threshold you set. The default is Yes.
Event severity level when user sessions exceed threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of concurrent user sessions exceeds the threshold. The default is 5.
Data Acquisition Problems	
Raise event if nnetiq task unreachable?	Select **Yes** to raise an event if the nnetiq task is unavailable. Most monitoring data is gathered from this nnetiq task add-in to the Domino Server. Typically, the task is unavailable when the Domino Server is not running. Use ServerDown to monitor server status. The default is Yes.
Event severity level when nnetiq task unreachable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the nnetiq task is unavailable. The default is 25.
Raise event if data otherwise unavailable?	Select **Yes** to raise an event if the data is otherwise unavailable. Data can become unavailable because of a recent server restart, statistic values being reset, or data or other parsing errors. The default is Yes.

Description	How To Set It
Event severity level when data otherwise unavailable	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the data is otherwise unavailable. The default is 5.
Collect data as '-1' for data unavailable?	Select **Yes** to log a -1 data point during an interval when a normal data point value could not be obtained. If Yes, the resulting data points show values AND points where data was unavailable. Note that "average" and "minimum" data values are subsequently skewed. If unselected, the resulting data points show only valid data values, and it may not be obvious when the Domino Server was down or data was otherwise unavailable. **NOTE:** Function is applied to all Data Collection parameters. The default is unselected.
Threshold - Maximum wait time for server response	Specify the maximum number of seconds this script waits for a response from the Domino Server's nnetiq add-in task acknowledging a request for monitored data. This response time ensures that a "hung" Domino Server or nnetiq task will not "hang" this and other queued scripts. **NOTE:** Setting the value too low may result in timeout events being generated unnecessarily. The default is 60 seconds.

34 Exchange and Exchange2000 Knowledge Scripts

The Exchange and Exchange2000 categories provide the following Knowledge Scripts for monitoring Microsoft Exchange 2000 or Server 2003.

From the Knowledge Script view of Control Center, you can access more information about any Knowledge Script by selecting it and clicking **Help**. You can also click any Knowledge Script in the Knowledge Script pane of the Operator Console and press **F1**.

Knowledge Script	What It Does
CategorizerHealth	Monitors the health of Microsoft Message Categorizer.
CategorizerMessages	Monitors the message traffic of Microsoft Message Categorizer.
ClusterOwner	Determines the node ownership of an Exchange Virtual Server that is part of a cluster.
Connectivity	Monitors mail connectivity between Exchange servers.
ConnectorStatus	Monitors the up/down status of an Exchange connector.
DynSecsOldestMsgInMTAQueue	Reports how long, in seconds, the oldest message has been in the queue of MTA connections.
IMAP4Accesses	Monitors the total number of access operations for the IMAP4 server.
IMAP4Authenticate	Monitors the authentications of IMAP4 protocol stacks.
IMAP4Connections	Monitors the number of current IMAP4 connections and the total number of inbound and outbound connections.
InactiveMailboxes	Monitors the number of mailboxes that have not logged on to the Exchange server for a specified number of days.
InactivePublicFolders	Monitors the number of public folders that have not been accessed or modified for a specified number of days.
ISConnections	Monitors the number of information store connections.
ISLogFileSize	Monitors the size of Exchange log files in the MDBDATA and DSADATA directories on the Exchange server.
ISMailboxStoreAvgDlvryTime	Monitors mailbox store average delivery time to local recipients and storage providers.
ISMailboxStoreOpens	Monitors the rate of requests to the information store to open a mailbox store.
ISMailboxStoreSize	Monitors the disk space used by one or more mailbox stores.
ISPubStoreAvgDeliveryTime	Monitors public store average delivery time to local recipients and storage providers.

Knowledge Script	What It Does
ISPubStoreOpens	Monitors the rate of requests to the information store to open a public store.
ISPubStoreSize	Monitors the disk space used by one or more public stores.
LinkStatus	Monitors the status of all link queues for all X.400 and SMTP virtual servers, including the number, size, and elapsed time that messages reside in a link queue.
LogParser	Parses and queries a specified Exchange log file.
MailboxesOverStorageLimit	Monitors the number of mailboxes over the storage limit.
MailboxesWithoutStorageLimit	Monitors the number of mailboxes with no storage limitations.
MailboxStoreMountStatus	Monitors the mount status of one or more mailbox stores.
MsgAvgLocalDlvryTimeByIntrv	Monitors the average delivery time for local messages since the last time this script ran.
MsgsAvgLocalDeliveryTime	Monitors the average delivery time for local messages for specified days.
MsgsBetweenAdminGroups	Monitors the total number and size of messages transferred between Exchange Admin Groups during the specified number of days or from a specific start date to a specific end date.
MsgsBtwnAdmnGrpsByInterval	Monitors the total number and size of messages sent to an Admin Group or received from an admin group since the last time the Knowledge Script ran.
MsgsByServer	Monitors the number and size of messages transferred between a target Exchange server and all connected servers during the specified number of days or from a specific start date to a specific end date.
MsgsByServerByInterval	Monitors the number and size of messages transferred between a target Exchange server and all connected servers during the monitoring interval.
MsgsBySize	Monitors the number of messages in different size ranges over a specified number of days.
MsgsOfSystem	Monitors the load of directory and public folder replication messages between Exchange sites or Admin Groups.
MsgsOpenedByOWA	Monitors the number of messages opened by Outlook Web Access (OWA).
MsgsSentByOWA	Monitors the number of messages sent by Outlook Web Access (OWA).
MsgsSpecificDomainByInterval	Monitors the total number and size of messages transferred through an Internet Mail Connector (IMC) or SMTP service to and from a specific domain during the monitoring interval (delta value).
MsgsSpecificDomain	Monitors the total number and size of messages transferred through an Internet Mail Connector (IMC) or SMTP service to and from a specific domain during the specified number of days or from a specific start date to a specific end date.
MsgsThroughConnector	Monitors the total number and size of messages sent and received by one or more specified connectors on an Exchange site or routing group.
MsgsThroughSMTPService	Monitors SMTP messages for the past N days or a range of days.

Knowledge Script	What It Does
MsgsThruSMTPSvcByInterval	Monitors SMTP messages since the last time this script ran.
MsgsWithinAdminGroup	Monitors the total number and size of messages transferred between Exchange servers in the same Admin Group during the specified number of days or from a specific start date to a specific end date.
MsgsWthnAdmnGrpByInterval	Monitors the total number and size of messages transferred between Exchange servers in the same Admin Group since last time the Knowledge Script ran (a delta value).
MTAConnectionQueueLength	Monitors the queue length of all message transfer agent (MTA) connections.
NNTPConnections	Monitors connections to the Network News Transfer Protocol (NNTP) service.
NumberOfMailboxes	Monitors the total number of Exchange mailboxes.
PFAclChanges	Checks for changes in the access control lists for each folder in the public information store.
PFAclInfo	Monitors the access control list for each folder in the public information store.
PFInfo	Monitors the number and size of public folders, and the number of messages in the public folders.
PFReplicationByObj	Monitors public folder replication between Exchange servers by updating a test object.
POP3Accesses	Monitors the number of POP3 access operations.
POP3Authenticate	Monitors the authentications of POP3 protocol stacks.
POP3Connections	Monitors the number of current and total connections of POP3 service.
ProtocolVSStatus	Monitors the status of Exchange virtual servers.
PublicStoreMountStatus	Monitors the mount status of one or more public stores.
QueueStatus	Monitors the inbound and outbound message queue status of all X.400 and SMTP virtual servers, including the number, size, and elapsed time that messages reside in a message queue.
Report_Connectivity	Generates a report about the connectivity between Exchange servers.
Report_ISPrivateResourceSummary	Generates a report about the file space used by private information store folders and mailboxes.
Report_ISPublicResourceSummary	Generates a report about the file space used by public information store folders.
Report_ServerLoad	Generates a report about the rate at which messages are being sent and received and the rate at which RPC packets are being processed.
Report_ServerMessage	Generates a report about the total number of mail recipients, messages delivered, messages sent, messages submitted, and messages waiting to be delivered to the mailbox store and the public information stores.
Report_ServerUsers	Generates a report about the number of users connected to the information store.

Knowledge Script	What It Does
Report_TopNMailboxesInfo	Generates a report about the file space (in MB) used by the top private information store folders or mailboxes.
Report_TopNReceivers	Generates a report about which users received the most mail messages, and the total file size of messages received by the top users or by all users.
Report_TopNSenders	Generates a report about which users sent the most mail messages, and the total file size of messages sent by the top users or by all users.
ResponseTime	Checks the mail response time between Exchange servers.
ServerHealth	Monitors the percentage of time that all processors on the Exchange Server are busy and the percentage of elapsed time that the Exchange server process threads are used to execute instructions.
ServerHistory	Monitors the combined message count for the mailbox information and public information stores.
ServerLoad	Monitors the rate at which messages are being received and submitted per minute on the Exchange server.
ServerQueues	Monitors Exchange server queues, including the MTA work queue and the IS Private and the IS Public send and receive queues.
ServerTotalMsg	Monitors the total number of messages for an Exchange server.
ServerUsers	Monitors the number of users connected to the information store.
ServicesDown	Monitors the up and down status of Exchange services.
SMTPConnectivity	Verifies connectivity between an Exchange Server and one or more Internet domains by sending a message to a non-existent account and examining the non-delivery report (NDR).
SMTPConnectivityEx	Verifies connectivity between an Exchange Server and one or more Internet domains by examining the delivery report (DR) or the non-delivery report (NDR).
SRSServiceDown	Monitors the up and down status of the Site Replication Service.
TopNISMailboxRes	Monitors the file space used by the top private information store folders or mailboxes.
TopNISPublicRes	Monitors the file space used by the top public information store folders (public folders).
TopNReceivers	Monitors the total file size of mail messages received by the top users or all users.
TopNSenders	Monitors the total file size of mail messages sent by the top users or all users.

34.1 ADCAdditions

Use this Knowledge Script to monitor the rate at which the Exchange servers add the Exchange distribution list and non-distribution list objects to the Exchange Server Directory Service and Active Directory that are replicated through the Active Directory Connector (ADC).

During a monitoring interval, if the rate at which the distribution list or the non-distribution list objects are added and replicated exceeds the threshold you set, the Knowledge Script raises an event.

When changes are made to either the Exchange Directory service or the Active Directory that need to be replicated to the opposing Directory Service (for example, adding a mailbox under the Exchange Directory Service), this Knowledge Script increments the number of ADC additions. A large number of additions suggests that a new Connection Agreement was added, or that network connectivity has been re-established with a site that has (until now) been unavailable. A large number of additions can also indicate that someone has mistakenly created a new Connection Agreement that will duplicate information into the opposing Directory Service.

34.1.1 Resource Object

Any Windows computer with the Active Directory Connector

34.1.2 Default Schedule

The default interval for this Knowledge Script is **Every 30 minutes**.

34.1.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of distribution list or non-distribution list additions per second exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the rate of distribution list and non-distribution list additions, per second, that are replicated through the Active Directory Connector (ADC). The default is n.
Maximum threshold for additions	Specify the maximum number of distribution list and non-distribution list additions that can be replicated through the ADC, per second, during the monitoring interval. If the rate of additions exceeds the threshold, this script raises an event. The default value is 20 additions per second.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of replicated additions exceeds the threshold. The default severity level is 8 (red event indicator).

34.2 ADCImportErr

Use this Knowledge Script to monitor the rate at which errors are generated when the Active Directory Connector service imports Exchange Directory Service objects into Active Directory. A large number of import errors suggests that you have incorrectly configured the Connection Agreement (CA) or that there are other errors with the objects in question that could not be resolved.

This script raises an event if the rate at which errors are generated exceeds the threshold you set.

34.2.1 Resource Object

Any Windows computer with the Active Directory Connector

34.2.2 Default Schedule

The default interval for this Knowledge Script is **Every 30 minutes**.

34.2.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of import errors exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of import errors per second for an Active Directory Connector. The default is n.
Maximum threshold for errors	Enter a threshold value to specify the maximum the number of errors, per second, that can be created when the ADC service imports Exchange Directory Service objects into Active Directory during a monitoring interval. The default is 2 errors per second.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default severity level is 8 (red event indicator).

34.3 ADCServiceDown

Use this Knowledge Script to check the up and down status of the Active Directory Connector service. This script works in conjunction with the ServicesDown Knowledge Script to monitor the availability of replication services. This script raises an event if the ADC service is detected as down.

This script raises an event if the Active Directory Connector service is down. You can configure this script to automatically re-start the service if it is down.

34.3.1 Resource Object

Any Windows computer with the Active Directory Connector

34.3.2 Default Schedule

The default interval for this Knowledge Script is **Every 5 minutes**.

34.3.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns a value of 100 if the ADC service is up or a value of 0 if the service is down. The default value is n.
Automatically re-start service?	Set to **y** to automatically re-start the ADC service. The default value is y.
Event severity level for...	Set the event severity level, from 1 to 40, to indicate the importance of the following events: • **...service down and restart failed**. The default is 5 (red event indicator). • **...service down and restart successful**. The default is 25 (blue event indicator). • **...service down, do not restart**. The default is 18 (yellow event indicator).

34.4 CategorizerHealth

Use this Knowledge Script to monitor the health of Microsoft Message Categorizer, including the rate of:

- Address book lookup completions processed per second
- Address lookups dispatched to Active Directory per second
- Categorization completions per second
- LDAP search completions processed per second
- LDAP searches successfully dispatched per second
- Messages being submitted to the Message Categorizer per second

This script raises an event if a monitored value exceeds the threshold you set.

34.4.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003 SMTP Virtual Server

34.4.2 Default Schedule

The default interval is **Every hour**.

34.4.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the rate of: • Address book lookup completions processed per second • Address lookups dispatched to Active Directory per second • Categorization completions per second • Lightweight Directory Access Protocol (LDAP) search completions processed per second • LDAP searches successfully dispatched per second • Messages being submitted to the Message Categorizer per second The default is n.
Maximum threshold for the number of address lookup completions processed per second	Specify the maximum number of address lookup completions that can be processed per second before an event is raised. The default is 500.
Maximum threshold for the number of address lookups dispatched to the DS per second	Specify the maximum number of address lookups that can be dispatched to the Directory Service (DS) per second before an event is raised. The default is 500.

Description	How to Set It
Maximum threshold for the rate of categorizations completed	Specify the maximum number of categorizations that can be completed per second before an event is raised. The default is 500.
Maximum threshold for the rate of LDAP search completions processed/sec	Specify the maximum number of LDAP search completions that can be processed per second before an event is raised. The default is 500.
Maximum threshold for the rate of LDAP searches successfully dispatched/sec	Specify the maximum number of LDAP searches that can be successfully dispatched per second before an event is raised. The default is 500.
Maximum threshold for the rate that messages are being submitted to the categorizer	Specify the maximum number of messages per second that can be submitted to the Message Categorizer before an event is raised. The default is 500.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.5 CategorizerMessages

Use this Knowledge Script to monitor the message traffic of Microsoft Message Categorizer, including the number of messages in the following categories:

- Aborted during the monitoring interval
- Bifurcated during the monitoring interval
- Categorized during the monitoring interval
- Submitted during the monitoring interval
- In the Message Categorizer queue

This script raises an event if the number of messages in a category exceeds the threshold you set.

34.5.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003 SMTP Virtual Server

34.5.2 Default Schedule

The default interval is **Every hour**.

34.5.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of messages in a category exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of messages: • Aborted during the monitoring interval • Bifurcated during the monitoring interval • Categorized during the monitoring interval • Submitted during the monitoring interval • In the Message Categorizer queue The default is n.
Maximum threshold for the number of messages marked to be aborted by the categorizer	Specify the maximum number of messages that can be marked to be aborted before an event is raised. The default is 200.
Maximum threshold for the number of new messages created by the categorizer (bifurcation)	Specify the maximum number of new messages that can be created by the Message Categorizer (bifurcation) before an event is raised. The default is 200.

Description	How to Set It
Maximum threshold for the number of messages categorizer has submitted to queueing	Specify the maximum number of messages that can be submitted to queueing before an event is raised. The default is 200.
Maximum threshold for the number of messages submitted to the categorizer	Specify the maximum number of messages that can be submitted to the Message Categorizer before an event is raised. The default is 200.
Maximum threshold for the number of messages in the categorizer queue	Specify the maximum number of messages that can be in the Message Categorizer queue before an event is raised. The default is 200.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which the number of messages in a category exceeds the threshold you set. The default is 5 (red event indicator).

34.6 ClusterOwner

Use this Knowledge Script to determine whether an Exchange Server computer that is part of a cluster is the owner of the node. This script raises an event if the computer is not the current node owner. In addition, this script generates data streams for ownership status.

34.6.1 Resource Object

Microsoft Exchange 2000 Server or Exchange Server 2003

34.6.2 Default Schedule

The default interval for this script is Every 5 minutes

34.6.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Raise event if not node owner? (y/n)	Set to **y** to raise an event if the selected computer is in a cluster but is not the node owner. The default is n.
Collect data for ownership status? (y/n)	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following: • 100 - the computer is a cluster owner or the computer is not in a cluster • 0 - the computer is in a cluster but is not the cluster owner. The default is y.
Event severity when not node owner	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the selected computer is not the node owner. The default is 20.
Raise event when node is down? (y/n)	Set to **y** to raise an event if the selected node is down. The default is y.
Severity when the node is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the elected node is down. The default is 5.
Raise event when EVS is down? (y/n)	Set to **y** to raise an event if the selected EVS is down. The default is y.
Severity when the EVS is down	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the elected EVS is down. The default is 5.

34.7 Connectivity

Use this Knowledge Script to monitor mail connectivity between two or more Exchange 2000 or 2003 servers. This script cannot monitor more than one Exchange 2000 or 2003 virtual server.

This script determines whether e-mail can be delivered between Exchange servers and can help you diagnose mail delivery problems, such as problems with network connectivity, Exchange configuration, or Exchange services.

To monitor connectivity for a single Exchange server, use the AppManager ResponseTime for Microsoft Exchange module.

To test complete connectivity between Exchange servers in a non-cluster environment, run this script on the top-level Exchange folder in the Operator Console TreeView. Doing this causes the job to run on all Exchange servers and test each server's connection to the other servers and to itself, verifying complete connectivity between all Exchange servers.

You can also use this script to test connectivity between one server and a list of specified servers. To run this script on a group of Exchange servers, each server must have the same profile name.

If a failover occurs when this script job is running, the job restarts on the new node. It is normal for the job on the failed node to generate one or more error messages, depending on what the job was doing when the failover occurred.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information about setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.7.1 Resource Object

Microsoft Exchange 2000 Server or Exchange Server 2003, Exchange folder

34.7.2 Default Schedule

The default interval is **Every 15 minutes**. This interval is recommended if you are checking connectivity between Exchange servers in a connected network.

If your Exchange servers rely on a remote WAN or LAN service (such as RAS) or a dial-up modem that is not always connected, you can set up server group folders to separate Exchange servers into different groups, then set the schedule interval for this Knowledge Script to run on each folder based on each group's connection schedule.

For example, you can create one server group for your always-connected servers and a separate folder for offhours RAS connections. Further, you can create two sets of jobs with different schedules. The schedules can be frequent for your connected network and once a day for the remote access servers.

34.7.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a reply to a test message is not received within the specified time interval. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns a value of 100 if the connection between Exchange Servers is up or a value of 0 if the connection is down. The script also returns the response time in seconds for each successful connection between Exchange Servers and the time the connection was attempted. The default is y.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in the AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager. This is especially true if you are running this script as recommended on the top-level Exchange folder or Exchange server groups.
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in the AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager. This is especially true if you are running this script as recommended on the top-level Exchange folder or Exchange server groups.

List of remote servers to monitor	Specify the computer names, separated by commas using the following syntax to check connectivity between specific Exchange 2000 or 2003 servers:
	
	`<computer>(/O=<organization>/OU=<administrative group>)`
	
	Where:
	
	• *computer* specifies the name of the computer on which the Exchange server is installed
	• *organization* specifies the name of the Exchange organization to which the server belongs
	• *administrative group* specifies the name of the Exchange administrative group to which the server belongs
	
	Separate multiple server names with commas, for example:
	
	`2K3Server(/O=org/OU=site1),2KServer(/O=Org2/OU=AdminGrp2)`
	
	This parameter allows you to run this script on a specific Exchange server and check connectivity with other specified servers (1*N). If you leave this field blank, this script checks the connectivity for all servers included in the scope of the job (N*N).

Maximum threshold for a response (in seconds)	Specify the maximum number of seconds that can elapse from the time the test message is sent out until a reply is received. If a reply to the test message is not received within this interval, it is not considered a valid reply. This script raises an event if the threshold is exceeded. The default is 120 seconds.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the response time threshold is exceeded. The default is 5 (red event indicator).

34.7.4 Example of How this Script Is Used

To test connectivity, this script sends a test mail message to each of the Exchange Servers being tested, using the specific account set up for the computer running the job. If the test message is not delivered, the script raises an event to indicate that the server cannot send mail. If the test message delivered by the sending server does not get a reply from each of the receiving servers, the script raises an event indicating the connection with the servers that failed to reply is down. If the test message is delivered but the reply is not received within an acceptable response time, the script raises an event indicating the response time with the server is above the threshold.

34.7.5 Checking Connectivity for Multiple Servers

The AppManager agent uses a mailbox on the local Exchange server where it resides. When you start the script job, the AppManager agent on each server sends a message from its mailbox to each of the other Exchange servers to which you are testing connectivity. Each of the receiving Exchange servers sees the message, and responds back with delivery confirmation.

At the next monitoring interval, the Connectivity job checks to see if the local Exchange server has received mail from the remote servers yet. If a reply has been received, there is connectivity between the local and remote servers. If a reply is not received, the connection is broken and an event is raised.

Assume you have four Exchange servers (a,b,c,d). Each of these servers has a default Exchange client profile and its own unique mailbox. If you run the Connectivity Knowledge Script on these four Exchange servers (a,b,c,d) in the TreeView, the management server starts a job on each of these servers to test connectivity to the other servers and itself, which is essentially a client-to-server connectivity test.

- The job of Exchange server **a** tests connectivity to a,b,c,d
- The job of Exchange server **b** tests connectivity to a,b,c,d
- The job of Exchange server **c** tests connectivity to a,b,c,d
- The job of Exchange server **d** tests connectivity to a,b,c,d

Only Exchange servers on which you run the Connectivity Knowledge Script are included in the connectivity test.

Because connectivity is always tested server to server, it does not matter if the servers are in the same site or different sites. When you create the Connectivity job, you need to include all the servers you want tested in the scope of the job. However, you can use server groups to organize your Exchange servers into sites or use the top level Exchange folder to test connectivity across all sites depending on the range of connectivity testing you want to do. You can also de-select a server you do not want to include in a test using the Objects tab in the Knowledge Script Properties dialog box.

To illustrate these principles, consider an Exchange environment with five Exchange servers: Paris, Cabernet, Dynamo, Boston, and Nero. Each of these servers has a special Windows user account that (1) the `NetIQ Corporationmc` service runs as on that server, and (2) has an Exchange profile and associated mailbox for sending and receiving mail.

If you only run the Connectivity Knowledge Script on the server Paris and do not specify any Exchange servers in the Remote server list, the **netiq-Paris Exchange client** sends a test message from its own mailbox to the **Exchange server Paris** and receives a confirmation when the delivery is successful.

If you run the Connectivity Knowledge Script on the server group, or top level folder that includes Paris and the four other Exchange servers, each server sends a test message to itself and to each of the other Exchange servers in the group. When a delivery confirmation message is received back at each sending

server's mailbox within a reasonable period of time, the delivery was successful and connectivity is verified.

An Exchange profile must be associated with a Windows user account such as the `netiq_nt` user account. Although not required for this Knowledge Script, this user should generally be part of the Administrators group if you run other Knowledge Scripts such as ServicesDown to give the user account read, write, and execute permissions on the managed computer.

The Windows user account also needs Exchange Administrator privileges for permission to access to Exchange statistics, an Exchange profile (`netiq-Paris`), and a Mailbox alias (`netiq-Paris`) for sending and receiving mail.

The **mailbox alias** that the agent service `NetIQ Corporationmc` uses should be **unique** for each server. That is, each Exchange Server needs a unique mailbox alias for AppManager to use. Having separate mailboxes that physically reside on each server provides the best coverage for testing connectivity. In addition, using the `netiq-<computer_name>` convention for profiles and mailbox aliases helps you to verify that the test message is delivered to the proper recipients.

During installation, AppManager provides options for automatically creating and configuring profiles and mailbox aliases. If you select this option, the profiles and mailbox aliases are created and checked into the repository for you.

AppManager creates profiles and mailboxes for you even if you do not specify this option, but the information is not stored in the AppManager repository. You can use AppManager Security Manager to add the profile and mailbox names for each Exchange server after installation. You can also use AppManager Security Manager to update the AppManager repository when you change or manually create Exchange profiles and mailboxes.

34.7.6 Checking Connectivity from One Server to a Specified List

In addition to checking complete connectivity, a many-to-many relationship, you can use this Knowledge Script to check connections from a single Exchange server to a specified list of other Exchange servers. For example, assume you have the Exchange server **Paris** at your corporate headquarters. You may only be interested in checking its connectivity to the satellite Exchange servers **Dynamo** and **Cabernet** and not those servers' connectivity to each other.

To do this, you can run this Knowledge Script on Paris and specify `Dynamo,Cabernet` for the `Remote server list` parameter. The job then tests connectivity between Paris and Dynamo and Paris and Cabernet.

34.7.7 Interpreting Response Time Data

If you use this Knowledge Script to collect response time data for graphs and reports, you may notice a saw-tooth pattern of response times.

The peaks and valleys represent the response times found at each interval. The times along the bottom of the graph represent each time the Knowledge Script job ran and collected data.

This saw-tooth pattern is caused by a conflict between the interval set for running this Knowledge Script and a polling mechanism used internally by Exchange Server. Because Exchange is checking and responding internally to the test e-mail message **between job intervals**, the response times returned by the Knowledge Script become skewed.

To avoid this problem, set the interval for this Knowledge Script to some multiple of 56 seconds, for example, 112 and 224 seconds. Using an interval that synchronizes (as much as possible) the Knowledge

Script job and the internal mechanism gives you a more consistent and realistic view of the server's response time.

NOTE: If your primary interest is monitoring the response time between Exchange servers, you may want to use the ResponseTime Knowledge Script rather than the Connectivity Knowledge Script.

34.7.8 Performing Periodic Maintenance

Periodically log in to each Exchange server using the same Windows account set up for the `NetIQ Corporationmc` service to do some housekeeping. For example, periodically remove old mail messages (that are at least a couple of days old) from the **Inbox,** and permanently remove deleted mail from the **Deleted Item** box. Depending on how frequently you run this script, consider performing these activities weekly or monthly.

34.8 ConnectorStatus

Use this Knowledge Script to monitor the status of an Exchange 2000 or 2003 connector. This script raises an event if the connector is detected as down.

34.8.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.8.2 Default Schedule

The default interval is **Every hour**.

34.8.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a connector is down. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns 100 if the monitored connector is up, 0 if the connector is down. The default is n.
List of connectors to monitor (comma separated)	Specify the names of the connectors you want to monitor, separating multiple names with commas, or specify **ALL** to monitor all connectors on the computer. The default is ALL.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a connector is down. The default is 5 (red event indicator).

34.9 DynSecsOldestMsgInMTAQueue

Use this Knowledge Script to identify the ages, in seconds, of messages in MTA queues that exceed a specified threshold.

34.9.1 Resource Object

MTA Queue folder, if dynamically enumerating connections. If you are not enumerating connections dynamically, you can run this script on the MTA Queue folder or on individual queue objects, such as DS Queue, IMC Queue, Public IS Queue, Private IS Queue, Machine Queue, X400 Queue, MSMail Queue, and Directory Queue.

34.9.2 Default Schedule

The default interval is **Every hour**.

34.9.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Create event if old messages are found in a queue?	Set to **Yes** to raise an event if the age of messages in the MTA queue exceeds the threshold you set. The default is Yes.
Severity - Old messages found in queue	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the age of messages in the queue exceeds the threshold. The default is 15 (Yellow event indicator).
Severity - Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the DynSecsOldestMsgInMTAQueue job fails. The default is 5 (red event indicator).
Data Collection	
Collect message age data?	Set to **Yes** to collect data for charts and reports. When enabled, data collection returns the age of messages in the queue. The default is unchecked.
Monitoring	
Dynamically enumerate MTA queues	Set to **Yes** to enable dynamic enumeration of MTA queues. The default is Yes.
MTA queue exclude list	If needed, specify a comma-separated list of MTA queues that should not be monitored. For example: `microsoft public mdb,microsoft private mdb`.
Threshold - Age of messages in the queue	Specify the maximum age that messages in the queue can attain before an event is raised. The default is 1440 seconds.

34.10 DirReplicationByObj

This Knowledge Script monitors directory replication between Exchange servers by updating a test object on a local directory and checking the replica directory on one or more remote Exchange servers for the replicated object.

Before you run this Knowledge Script:

- Create a directory container on the local Exchange server for creating and updating the test object. The container must be at the same level or under the Recipients container.
- Make sure Microsoft Exchange has replicated the directory container to each remote Exchange server you want to test.

34.10.1 Resource Object

Exchange Server

34.10.2 Default Schedule

The default interval for this Knowledge Script is **Every 30 minutes**.

34.10.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when the number of testing objects that have not been replicated on a remote Exchange server exceed the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. The Knowledge Script reports the replication status of the testing object on each remote Exchange server. The default is n.
List of remote servers ("|" separated)	Enter a list of remote Exchange servers to check for the replicated test object. The Knowledge Script's test object will be replicated to the directory container replica on each Exchange server in this list. Enter more than one server name by separating each name with a "|". For example: `Server1|Server2` Each server in the list must have a replica of the directory container you created on the local Exchange server.
Container for testing object	Enter the name of the directory container on the local Exchange server that the Knowledge Script will use to create, update and check the test object. If you created the directory container at the same level as the Recipients container, the directory container name must start with a slash, for example "/testcontainer". If you created the directory container under the Recipients container, enter the directory container name, for example, "testcontainer", without a slash.

Description	How to Set It
Maximum threshold for unreplicated changes	Enter a threshold value to specify the maximum number of unreplicated changes between the local Exchange server and a remote Exchange server. If the number of unreplicated changes exceeds this threshold, the Knowledge Script raises an event. The default is 5 unreplicated changes.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red event indicator).

34.11 DSAccessViolations

Use this Knowledge Script to monitor the number of times that directory service write operations are refused for security reasons. Security violations are typically caused by unauthorized user accounts attempting to access and make changes to protected address books or distribution lists managed by the directory service. You can monitor the total number of access violations or the number of access violations in the monitoring interval.

This script helps you identify permission problems and is recommended for monitoring Exchange security.

34.11.1 Resource Object

Exchange Server

34.11.2 Default Schedule

The default interval for this Knowledge Script is **Every 30 minutes**.

34.11.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of access violations exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total number of Directory Service access violations or the number of Directory Service access violations in the interval (depending how you set the Compare to Previous Monitoring Interval parameter). The default is n.
Compare to previous monitoring interval?	Set to **y** to compare the number of Directory Service access violations in the current monitoring interval to the previous monitoring interval. If set to y, any graphs you create plot the comparison value rather than the total value. If set to n, the script monitors the total number of access violations. The default is n.
Maximum threshold for number of violations	Specify the maximum number of Directory Service access violations that can occur before an event is raised. The default is 100 access violations.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of access violations exceeds the threshold. The default is 5 (red event indicator).

34.12 IMAP4Accesses

Use this Knowledge Script to monitor the number of IMAP4 access operations. Access operations include SELECT, EXAMINE, APPEND, SUBSCRIBE, UNSUBSCRIBE, LIST and SUB operations. This script raises an event if the total number of IMAP4 access operations exceeds the threshold you specify.

34.12.1 Resource Object

IMAP4 Virtual Server

34.12.2 Default Schedule

The default interval is **Every hour**.

34.12.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of operations exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total number of IMAP4 access operations. The default is n.
Maximum threshold for number of IMAP4 access operations	Specify the maximum number of IMAP4 access operations that can occur before an event is raised. The default is 10000 access operations.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which the number of operations exceeds the threshold. The default is 5 (red event indicator).

34.13 IMAP4Authenticate

Use this Knowledge Script to monitor the authentication of IMAP4 protocols. This script raises an event if the rate of failure of total authentications exceeds the threshold you set.

34.13.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003, Protocols folder

34.13.2 Default Schedule

The default interval is **Every hour**.

34.13.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of authentication failures exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Number of authenticate commands received since startup • Number of authenticate commands per second • Number of authenticate command failures since startup The default is n.
Maximum threshold for number of authentication failures	Specify the maximum number of authentication failures that can occur before an event is raised. The default is 1000.
Consecutive number of times before an event	Specify the maximum number of consecutive times the threshold can be exceeded before this script raises an event. The default is 5 consecutive occurrences.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which the number of authentication failures exceeds the threshold. The default is 5 (red event indicator).

34.14 IMAP4Connections

Use this Knowledge Script to monitor the number of current IMAP4 connections and the total number of inbound and outbound IMAP4 connections since the IMAP4 service started. This script raises an event if the number of current or total connections exceeds the threshold you set.

34.14.1 Resource Object

IMAP4 Virtual Server

34.14.2 Default Schedule

The default interval is **Every hour**.

34.14.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default option is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Current connections • Total connections The default option is n.
Maximum threshold for current connections	Specify the maximum number of current IMAP4 connections that can occur before an event is raised. The default is 100 current connections.
Maximum threshold for total connections	Specify the maximum number of IMAP4 connections that can occur before an event is raised. The default is 1000 connections.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.15 InactiveMailboxes

Use this Knowledge Script to monitor the number of inactive Exchange mailboxes. An inactive mailbox is a mailbox that has not logged on to the Exchange server for a specified number of days. This script raises an event if the number of inactive mailboxes exceeds the threshold you set.

On a computer with more than one virtual server, the total number of inactive mailboxes is calculated as the total number of inactive mailboxes for all virtual servers on the computer.

If a failover occurs when this script job is running, the job restarts on the new node. It is normal for the job on the failed node to generate one or more error messages, depending on what it was doing when the failover occurred.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information about setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.15.1 Resource Object

Microsoft Exchange 2000 Server or Exchange Server 2003

34.15.2 Default Schedule

The default interval is **Every day**.

34.15.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of inactive mailboxes exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of inactive mailboxes. The default is n.
Inactive after N days	Specify the number of days to use as a measure of whether a mailbox is inactive. The default is 10 days.
Maximum threshold for number of inactive mailboxes	Specify the maximum number of mailboxes that can be inactive before an event is raised. The default is 300 inactive mailboxes.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.

Description	How to Set It
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of inactive mailboxes exceeds the threshold. The default is 5 (red event indicator).

34.16 InactivePublicFolders

Use this Knowledge Script to monitor the number of inactive Exchange public folders. An inactive folder is a public folder that has not been accessed or modified for a specified number of days. This script raises an event if the number of inactive public folders exceeds the threshold you set.

This script helps you manage infrequently accessed information resources that can, over time, consume valuable resources.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information about setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.16.1 Resource Object

Microsoft Exchange 2000 Server or Exchange Server 2003

34.16.2 Default Schedule

The default interval is **Every day**.

34.16.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of inactive public folders exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of inactive public folders. The default is n.
Inactive after N days	Specify the number of days to use as a measure of whether a public folder is inactive. The default is 10 days.
Maximum threshold for number of inactive folders	Specify the maximum number of public folders that can be inactive before an event is raised. The default is 300 inactive public folders.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.

Description	How to Set It
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of inactive public folders exceeds the threshold.The default is 5 (red event indicator).

34.17 ISDbSize

Use this Knowledge Script to monitor the file space used by any information store (IS Public or IS Private) object in the TreeView. The file space for an information store may include unused file space set aside for the database. The information store monitored depends on where you run this script. For example, to only monitor the file size used by the IS Private, run this script on the IS Private object. This script raises an event if an information store monitored exceeds the threshold you set.

NOTE: To use this script, ensure the AppManager agent services run as a Windows user account that has permission to backup files and directories. The account you use must also have Exchange Service Account Admin rights.

34.17.1 Resource Object

IS Public object, IS Private object

34.17.2 Default Schedule

The default interval for this Knowledge Script is **Every 5 minutes**.

34.17.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the size of the information store exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the file size (in MB) of the monitored information store. The default is n.
Maximum threshold for size of information store (MB)	Specify the maximum size the information store can attain before an event is raised. The default is 4000 MB.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in the AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through the Security Manager.
Mailbox alias for NetIQmc log on as account	Enter a mailbox alias name to use if you do not want to use the default mailbox alias names entered in the AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through the Security Manager.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the size of the information store exceeds the threshold. The default is 5 (red event indicator).

34.18 ISConnections

Use this Knowledge Script to monitor both the number of active connections and the total number of connections to the information store. This script raises an event if the number of either the active or the total connections is over the threshold for the specified consecutive number of intervals.

34.18.1 Resource Object

Information Store folder

34.18.2 Default Schedule

The default interval is **Every hour**.

34.18.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Total connections • Active connections The default is n.
Maximum threshold for total number of connections	Specify the maximum total number of connections to the information store that can occur before an event is raised. The default is 100 connections.
Maximum threshold for number of active connections	Specify the maximum number of information store connections that can be active before an event is raised. The default is 100 connections.
Consecutive number of times before an event	Specify the consecutive number of intervals during which the threshold for connections can be exceeded before the script raises an event. The default value is 5 consecutive intervals. Because connections can have periodic spikes, you can set this parameter to a higher value to filter out unnecessary events. For example, you can allow the number of active connections to exceed the threshold 3 to 4 times before an event is raised.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.19 ISLogFileSize

Use this Knowledge Script to monitor the size of transaction logs and the reserved transaction log files on Exchange 2000 Server or Exchange Server 2003. This script raises an event if the size of the transaction logs exceeds the threshold you set.

34.19.1 Resource Object

Microsoft Exchange 2000 Server or Exchange Server 2003

34.19.2 Default Schedule

The default interval is **Every five minutes**.

34.19.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the size of the transaction logs exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the log file size in MB. The default is n.
Maximum threshold for log file size (MB)	Specify the maximum size the transaction logs can attain before an event is raised. The default is 400 MB.
Logs you want to monitor	Specify one of the following values to specify the log you want: • **EDB** specifies transaction log. • **RES** specifies reserved transaction log. • **ALL** specifies both logs listed above. The default, ALL, monitors all logs for the Exchange version.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the size of the transaction logs exceeds the threshold. The default is 5 (red event indicator).

34.20 ISMailboxStoreAvgDlvryTime

Use this Knowledge Script to monitor the average time between the submission of a message to a mailbox store and the subsequent delivery of the message to local recipients (on the same server) or to other storage providers. This script reports the average delivery time for the last ten messages. This script raises an event if the average delivery time to local recipients or other storage providers exceeds the thresholds you set.

This script helps you manage the performance of mailbox stores.

34.20.1 Resource Object

Information Store folder, Mailbox Store object

34.20.2 Default Schedule

The default interval is **Every 3600 seconds**.

34.20.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the average delivery time to other storage providers, and the average local delivery time for the mailbox store. The default is n.
Maximum threshold for the rate at which messages are delivered locally	Specify the maximum rate at which messages can be delivered locally before an event is raised. The default is 500 deliveries per second.
Maximum threshold for the rate that requests to open folders are submitted to the information store.	Specify the maximum rate at which requests to open folders can be submitted before an event is raised. The default is 500 submissions per second.
Maximum threshold for the rate that requests to open messages are submitted to the information store.	Specify the maximum rate at which requests to open messages can be submitted before an event is raised. The default is 500 submissions per second.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.21 ISMailboxStoreOpens

Use this Knowledge Script to monitor the number of requests per second submitted to the information store to open a mailbox store. If the rate of requests to open a mailbox store increases, it may indicate increased demand on the Exchange 2000 server or increased user activity. This script raises an event if the number of requests per second exceeds the threshold you set.

34.21.1 Resource Object

Information Store folder, Mailbox Store object

34.21.2 Default Schedule

The default interval is **Every hour**.

34.21.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of mailbox open requests received per second. The default is n.
Maximum threshold for number of folder requests	Specify the maximum rate at which folder requests can be submitted before an event is raised. The default is 100 requests per second.
Maximum threshold for number of message requests	Specify the maximum rate at which message requests can be submitted before an event is raised. The default is 100 requests per second.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.22 ISMailboxStoreSize

Use this Knowledge Script to monitor the disk space used by a mailbox store. This script raises an event if the size of a monitored mailbox store, a Microsoft Access Database (MDB) file, exceeds the threshold you set.

34.22.1 Resource Object

Information Store folder, Mailbox Store object

34.22.2 Default Schedule

The default interval is **Every five minutes**.

34.22.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the size of a mailbox store exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the file size, in megabytes, of the specified mailbox store. The default is n.
Maximum threshold for size of mailbox store (MB)	Specify the maximum size a mailbox store can attain before an event is raised. The default is 4000 MB.
MDB files to monitor (EDB, Stream, or ALL)	Specify the mailbox store files you want to monitor: • **EDB** monitors regular message data. • **Stream** monitors streaming message data. • **ALL** monitors regular and streaming message data. The default is ALL.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which the size of mailbox store exceeds the threshold. The default is 5 (red event indicator).

34.23 ISPubStoreAvgDeliveryTime

Use this Knowledge Script to monitor the average time between the submission of a message to a public store and the subsequent delivery of the message to local recipients (on the same server) or other storage providers. This script reports the average delivery time for the last ten messages. This script raises an event if the average delivery time to local recipients or other storage providers exceeds the thresholds you set.

This script helps you manage the performance of public stores.

34.23.1 Resource Object

Information Store folder, Public Store object

34.23.2 Default Schedule

The default interval is **Every hour**.

34.23.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the average local delivery time and the average delivery time to other providers for the public store. The default is n.
Maximum threshold for average delivery time to local recipients	Specify the maximum average delivery time to local recipients that can occur before an event is raised. The default is 500 seconds.
Maximum threshold for average delivery time to storage providers	Specify the average delivery time to other storage providers that can occur before an event is raised. The default is 500 seconds.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.24 ISPubStoreOpens

Use this Knowledge Script to monitor the number of requests per second submitted to the information store to open a public store. If the rate of requests to open a public store increases, it may indicate increased demand on the Exchange 2000 server or increased user activity. This script raises an event if the number of requests per second exceeds the threshold you set.

34.24.1 Resource Object

Information Store folder, Public Store object

34.24.2 Default Schedule

The default interval is **Every hour**.

34.24.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of folders opened per second. The default is n.
Maximum threshold for number of folder requests	Specify the maximum rate at which requests to open folders can be submitted before an event is raised. The default is 100 requests per second.
Maximum threshold for number of message requests	Specify the maximum rate at which requests to open messages can be submitted before an event is raised. The default is 100 requests per second.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.25 ISPubStoreSize

Use this Knowledge Script to monitor the disk space used by any public store in the TreeView. This script raises an event if a monitored public store, a Microsoft Access Database (MDB) file, exceeds the threshold you set.

34.25.1 Resource Object

Information Store folder, Public Store object

34.25.2 Default Schedule

The default interval is **Every five minutes**.

34.25.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the size of a public store exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the size, in megabytes, of the public store. The default is n.
Maximum threshold for size public store (MB)	Specify the maximum size a public store can attain before an event is raised. The default is 4000 MB.
MDB files you want to monitor (EDB, Stream, or ALL)	Specify the public store files you want to monitor: • **EDB** monitors regular message data. • **Stream** monitors streaming message data. • **ALL** monitors regular and streaming message data. The default is ALL.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which the size of a public store exceeds the threshold. The default is 5 (red event indicator).

34.26 ISPrivAvgDeliveryTime

Use this Knowledge Script to monitor the average time between the submission of a message to the private information store and the subsequent delivery of the message to local recipients (on the same server) or other storage providers. This script reports the average delivery time for the last 10 messages. This script raises an event if the average delivery time to local recipients or other storage providers exceeds the thresholds you set.

This script helps you manage the performance of the information store.

34.26.1 Resource Object

Exchange Server

34.26.2 Default Schedule

The default interval for this Knowledge Script is **Every 30 minutes**.

34.26.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if average delivery time exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, the script returns the average delivery time to local recipients and to the MTA from the private information store. The default is n.
Threshold for average local delivery time	Specify the highest average amount of time that delivery to local recipients can take before an event is raised. The default is 500 seconds.
Threshold for average remote delivery time	Specify the highest average amount of time that delivery to other storage providers can take before an event is raised. The default is 500 seconds.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which average deliver time exceeds the threshold. The default is 5 (red event indicator).

34.27 ISPubAvgDeliveryTime

Use this Knowledge Script to monitor the average time between the submission of a message to the public information store and the subsequent delivery of the message to local recipients (on the same server) or other storage providers. This script reports the average delivery time for the last ten messages. This script raises an event if the average delivery time to local recipients or other storage providers exceeds the thresholds you set.

This script helps you manage the performance of the information store.

34.27.1 Resource Object

Exchange Server

34.27.2 Default Schedule

The default interval for this Knowledge Script is **Every 30 minutes**.

34.27.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if average delivery time exceeds the thresholds you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the average delivery time to local recipients and to the MTA from the public information store. The default is n.
Threshold for average local delivery time	Specify the highest average amount of time that delivery to local recipients can take before an event is raised. The default is 500 seconds.
Threshold for average remote delivery time	Specify the highest average amount of time that delivery to other storage providers can take before an event is raised. The default is 500 seconds.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which average delivery time exceeds the threshold. The default is 5 (red event indicator).

34.28 ISSize

Use this Knowledge Script to monitor the disk space used by an information store (IS) object. The information store object that is monitored depends on where you run this script. For example, to only monitor the file size used by the private information store, run this script on the private information store object on an Exchange Server. This script raises an event if the size of an information store exceeds the threshold you set.

34.28.1 Resource Object

Public or Private Information Store object

34.28.2 Default Schedule

The default interval for this Knowledge Script is **Every 5 minutes**.

34.28.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the size of the information store exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the file size of the monitored information store. The default is n.
Maximum threshold for file size	Specify the maximum size that an information store can attain before an event is raised. The default is 4000 MB.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the size of the information store exceeds the threshold. The default is 5 (red event indicator).

34.29 LinkStatus

Use this Knowledge Script to monitor the status of all link queues for all X.400 and SMTP virtual servers, including the number, size, and elapsed time for messages that reside in a link queue. This script monitors the link queue status at each monitoring interval and gives you a "snapshot" of the link queue status.

In Exchange 2000 or Exchange Server 2003, messages with the same next-destination server are transferred into the same queue. This queue is known as a *link queue*. Messages reside in the link queue until an active connection is made with the next-destination server, and that server agrees to process the messages.

NOTE: Although system queues are always visible, link queues may disappear after all messages have been sent to the next-destination server. The link queue will appear again when new messages are queued.

34.29.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.29.2 Default Schedule

The default interval is **Once a day**.

34.29.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Specify a protocol (X400, SMTP, or ALL)	Specify the protocol you want to monitor (not case-sensitive): • **X400** monitors the X.400 protocol. • **SMTP** monitors the SMTP protocol. • **ALL** monitors both X.400 and SMTP protocols. The default is ALL.
Collect total number of messages, link size and elapsed time of links?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total number of messages, link size, and elapsed time that messages reside in a link queue. The default is n. Use the parameters that follow to monitor or change the default event thresholds for the total number of messages, link size, or elapsed time that messages reside in a link queue.
Collect data for number of messages in links?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of messages in a link queue. The default is n.
Maximum threshold for number of messages in links	Specify the maximum number of messages that can be in a link queue before an event is raised. The default is 1000.
Event for number of messages in links?	Set to **y** to raise an event when the server exceeds the threshold for number of messages. The default is y.

Description	How to Set It
Event severity: Number of messages in links	Set the event severity level, from 1 to 40, to specify the importance of an event in which the number of messages in the link queue exceeds the threshold. The default is 5 (red event indicator).
Collect data for size of links?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the size of a link queue. The default is n.
Maximum threshold for size of links	Specify the maximum size a link queue can attain before an event is raised. The default is 100 MB.
Event for size of links?	Set to **y** to raise an event if the size of a link queue exceeds the threshold. The default is y.
Event severity: Size of links	Set the event severity level, from 1 to 40, to specify the importance of an event in which the size of a link queue exceeds the threshold. The default is 5 (red event indicator).
Collect data for elapsed time in links?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the oldest messages in a link queue. The default is n.
Maximum threshold for elapsed time in links	Specify the maximum amount of time that a message can remain in a link queue before an event is raised. The default is 1000 seconds.
Event for elapsed time in links?	Set to **y** to raise an event if a message exceeds the threshold for elapsed time in a link queue. The default is y.
Event severity: Elapsed time in links	Set the event severity level, from 1 to 40, to specify the importance of an event in which a message exceeds the threshold for elapsed time in a link queue. The default is 5 (red event indicator).

34.30 LogParser

Use this Knowledge Script to execute a query against Exchange log files and return those results in an event message or in a data stream. This script invokes Microsoft Log Parser, which uses Structured Query Language (SQL) to process Exchange log files. Microsoft Log Parser executes your query on the Exchange logs on the monitored Exchange server.

You build your query statement using Query Builder, which you access from the *Launch Query Builder* parameter on the Values tab. For more information, see "Using Query Builder" on page 1880.

This script raises an event if the number of matches to your query exceeds the threshold you set.

You can save the results of the query to a comma-separated values (.csv) file in a location you specify on the monitored Exchange server.

34.30.1 Prerequisite

Microsoft Log Parser version 2.2 installed on the monitored Exchange server and on each console computer where you will use Query Builder. You can download Microsoft Log Parser from the Microsoft Download Center.

34.30.2 Resource Object

Exchange 2000 or Exchange Server 2003

34.30.3 Default Schedule

The default interval for this Knowledge Script is **Run Once**.

34.30.4 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event Notification	
Create event if matches are found?	Set to **Yes** to raise an event if the number of matches to your query exceeds the value you set for the *Threshold for matching lines* parameter. The default is Yes.
Severity - Matches found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of matches to your query exceeds the threshold you set. The default is 15.
Maximum number of records to display	Specify the maximum number of records to display in the event's Messages tab. If *Collect data?* is set to Yes, then this value also controls the number of records displayed in the data detail. The default is 25.

Description	How to Set It
Threshold for matching lines	Specify the maximum number of matching lines that a query can return before an event is raised. The default is 0.
Create event if no matches are found?	Set to **Yes** to raise an event if no matches to your query are returned. The default is unchecked.
Severity - No matches found	Set the event severity level, from 1 to 40, to indicate the importance of an event in which no matches to your query are returned. The default is 20.
Severity - Job failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the LogParser job fails. The default is 5. **NOTE:** Invalid SQL syntax in your query statement can cause the LogParser job to fail. The event detail message will identify the failure.
Data Collection	
Collect data?	Set to **Yes** to collect data for charts and reports. If enabled, data collection returns one data stream based on the parsed result set. The default is unchecked. Each data point in a data stream contains the number of matched rows for that iteration of the script. The data detail contains a list of the records that matched your query, based on the value you set in the *Maximum number of records to display* parameter.
Monitoring	
File names (can use wildcards * and ?)	Specify the full path of the monitored log file name. You can specify multiple log file names, separated by a comma. For example: `C:\Exchange\20070915.log, C:\Exchange\20070916.log` You can also use the wild characters ***** and **?** to specify multiple log file names. Wild cards will return collective results from the log files. For example: `C:\Exchange\*.log, C:\Exchange\Server\*.log, C:\Exchange\2007????.log` If you specify only the Exchange log file name, the query parses the file from the default tracking path of the Exchange Server. **NOTE:** The selected path must be on the monitoring Exchange server.
Query building process	Select the way you want to build your query in the Query Builder dialog box: • Select **Manual** to type your own SQL query statement in the Query Builder dialog box. • Select **Query tool** to use the interactive elements (such as lists and check boxes) of the Query Builder dialog box to build your SQL query statement. The default is Query tool.
Launch Query Builder	Click **Browse [...]** to open the Query Builder dialog box and build your query. For more information, see "Using Query Builder" on page 1880.
Scan entire file at each iteration?	Set to **Yes** to scan the entire log file at every iteration of the Knowledge Script job. The default is unchecked. If this option is not selected, the first iteration of the Knowledge Script job places a marker at the end of the log file. During a subsequent iteration, the script scans the log file from the marked point and processes new log entries only.

Description	How to Set It
Save query results to a file?	Set to **Yes** to save the entire results of your query to a .csv file. Use the *Full path to results file* parameter to indicate where you want to save the results file. The default is unchecked.
Full path to results file	Specify the full path to the location in which you want to save the results .csv file. The default location is `C:\Program Files\NetIQ\Temp\`.

34.30.5 Using Query Builder

Query Builder is a component of the LogParser Knowledge Script that allows you to build complex SQL queries manually or with the help of the Query tool. Use Query Builder to construct your query before running LogParser.

34.30.5.1 Building a Query with the Query Tool

You can simplify the process of building a SQL query by choosing **Query tool** in the *Query building process* parameter in the LogParser Knowledge Script, and then clicking **Browse [...]** in the *Launch Query Builder* parameter.

NOTE:

- Microsoft Log Parser version 2.2 must be installed on the monitored Exchange server and on each console computer where you will use Query Builder.
- For examples of building a query with the Query tool, see "Using the Query Tool - Example 1" on page 1882 and "Using the Query Tool - Example 2" on page 1883.

To build a query using the Query tool in Query Builder:

1. Build your SQL query in Query Builder according to the field descriptions in the table below.
2. When you have finished building your query, click **OK**. Query Builder returns your query statement to the LogParser Knowledge Script.

Field	Description
Type of Log	Query Builder uses the W3C Log File format. You cannot change the selection.
Sample Log File	Click **Browse** to select a log file that is an *example* of the log file you want to query. You can use the built-in sample file, which ships with AppManager for Exchange 2000 or 2003 and is installed by default on your local system at `C:\Program Files\NetIQ\AppManager\bin\SampleExchLogFile.log`. Query Builder uses the column names in the sample log file to populate the contents of the Column List field.

Field	Description
Log File Path on Server	Specify the full path to the location of the Exchange log you want to query. This field is disabled when the **Auto Detect Log File Path** option is enabled. To manually specify a log location, you must first enable **Auto Detect Log File Path**. The path is displayed in the Query Statement section as the “From” statement in your query. For example: `From C:\program Files\exchsrvr\LabServer.log` **Tip** If you want to run the LogParser script on several Exchange servers, and the path to the Exchange log is the same for each server, you can use the `{Server Name}` variable in the file path. By default, the names of Exchange logs contain the name of the server. Therefore, when searching for your Exchange log, AppManager replaces the variable with the name of the server on which you run the LogParser script. For example, type `C:\Program Files\exchsrvr\{Server Name}.log`
Auto Detect Log File Path	This option is the preferred method for identifying the Exchange log to query. Select to automatically detect the location of the Exchange log on the monitored Exchange server. The LogParser Knowledge Script determines the Exchange log directory based on the configuration of the Exchange server. Your selection is displayed in the Query Statement field as the “From” statement in your query. For example: `From {Auto Detect}\*.log`
Column List	Contains a list of the columns in the sample log file. Select the columns that you want to use in your query. Your selections are displayed in the **Columns** field in the Criteria section and in the Query Statement field as the “Select” statement of your query. For example: `Select client-ip,Client-hostname,message-subject` For more information about what each column contains, see “Understanding Log File Columns” on page 1885.
Criteria	Use the fields in this section to customize your query. Your selections are displayed in the Query Statement section.
Show	Select to include the associated column in your query statement. Clear to remove the associated column from your query statement. Although the column is removed from the statement, it is not removed from the Criteria section.
Columns	This field is automatically populated by your selections in the **Column List** field. Your selections are displayed in the Query Statement section as the “Select” statement in your query. For example: `Select total-bytes` **Tip** You can click in a blank field in this column to select a column name to include in the query. This feature is helpful if you want to set multiple conditions on the same column: select the same column name in two or more fields and then customize each row for each separate set of query operators and keywords.
Group By	Allows you to perform aggregate functions, such as SUM, for selected column values, rather than for the entire column. Select the function you want to perform: • Sum • Count • Max • Min • Avg Your selection is displayed in the Query Statement section as part of the “Select” statement in your query. For example: `Select Avg(total-bytes)`

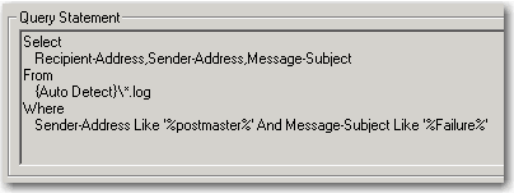
Field	Description
Rename To	Provide a new name for the column to display in the results. This feature allows you to display an alternative column name in the query results. The new name is displayed in the Query Statement section as part of the “Select” statement in your query. For example: `Select Avg(total-bytes) As Average Total Bytes`
Sort Type	Select **Ascending** or **Descending** to sort the results for the associated column name. Your selection is displayed in the Query Statement section as part of the “Order By” statement in your query. For example: `Order By Date Asc`
Grouping	Select to group query results by the associated column name. Your selection is displayed in the Query Statement section as part of the “Group By” statement in your query. For example: `Group By Date`
Operator	Select a method for filtering log entries based on one or more conditions. • **>** finds log entries that are greater than the specified condition. • **<** finds log entries that are less than the specified condition. • **=** finds log entries that match the specified condition. • **>=** finds log entries that are greater than or match the specified condition. • **<=** finds log entries that are less than or match the specified condition. • **NOT** finds log entries that *do not* match the specified condition. • **LIKE** allows you to use wildcards to find log entries for the specified condition. – Use the % wildcard to match a text string of any length – Use the _ wildcard to match a single character Your selection is displayed in the Query Statement section as part of the “Where” statement in your query. For example: `Where Date = 20080925`
Condition	Type the value you want to compare for the associated column. Your selection is displayed in the Query Statement section as part of the “Where” statement in your query. For example: `Where Date = 20080925` If you selected **LIKE** in the **Operator** field, use the wildcard along with your value in the **Condition** field. **NOTE:** If the associated column supports the “String” type, rather than an “Integer,” a “Timestamp,” or a “Real” type, enclose your condition text in single quotes, for example: `‘production-server’.`
Remove	Click to remove the associated column from your query statement *and* from the Criteria section. This action also clears the column name in the **Column List** field.
Query Statement	As you select information in the fields in Query Builder, the Query Statement section reflects the selections you make in SQL query syntax. You cannot change information directly in the Query Statement section. Yyou must do so by changing your selections in the Criteria section. **Tip** If a query statement you build with Query Builder is not as complex as you need it to be, you can copy the contents of the Query Statement section and use the manual query option. From there, you can manually complete your query. For more information, see “Building a Query Manually” on page 1884.

Using the Query Tool - Example 1

In the following example, use the Query Tool to build a query that will look for Exchange log entries for which the recipient has received email messages that contain the word “Failure” in the message subject and were sent from the postmaster. Depending on your threshold and data collection selections, the LogParser Knowledge Script event message and data details return the column entries that match the conditions you set.

To build query example 1:

1. Accept the default values for the **Type of Log** and **Sample Log File** fields.
2. Select **Auto Detect Log File Path**.
3. In the **Column List** field, select **Recipient-Address**, **Sender-Address**, and **Message-Subject**.
4. In the **Operator** field for the Sender-Address column, select **LIKE**.
5. In the **Condition** field for the Sender-Address column, type `'%postmaster%'`.
6. In the **Operator** field for the Message-Subject column, select **LIKE**.
7. In the **Condition** field for the Message-Subject column, type `'%Failure%'`. The Query Statement field contains the following query statement:



8. Click **OK**.

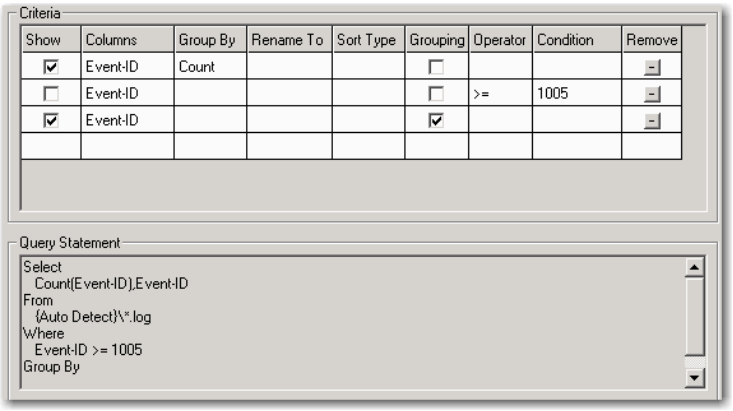
Using the Query Tool - Example 2

In the following example, you use the Query Tool to build a query that uses multiple instances of the same column.

The purpose of this query is to return a count of all Event ID values greater than or equal to 1005 and group them by Event ID value.

To build query example 2:

1. Accept the default values for the **Type of Log** and **Sample Log File** fields.
2. Select **Auto Detect Log File Path**.
3. In the **Column List** field, select **Event-ID**. A row for the Event-ID column is displayed in the **Criteria** field.
4. In the blank row below the Event-ID row, click in the **Columns** field and select **Event-ID** to create a second row for the Event-ID column.
5. Repeat step 4 to create a third row for the Event-ID column.
6. Note that for all rows, **Show** is selected. Clear **Show** for the second, or middle, row to remove it from the Select statement.
7. In the first row, select **Count** in the **Group By** field.
8. In the second row, the row for which **Show** is cleared, select **>=** (greater than or equal to) in the **Operator** field and type `1005` in the **Condition** field.
9. In the third row, select **Grouping**. Your completed query should look like this:



10. Click **OK**.

The LogParser Knowledge Script event message and data details return the count of Event-ID values greater than or equal to 1005 grouped by the Event-ID value, as illustrated in the following picture.

Log Parser Query Result

COUNT(ALL Event-ID)	Event-ID
831	1019
1097	1025
1097	1024
1097	1033
962	1034
133	1030
135	1036
135	1023
135	1028
132	1021
2	1027
652	1020
652	1031

34.30.5.2 Building a Query Manually

You can manually build a SQL query by choosing **Manual** in the *Query building process* parameter in the LogParser Knowledge Script, and then clicking **Browse [...]** in the *Launch Query Builder* parameter.

To build a query manually in Query Builder:

1. Build your query in Query Builder according to the field descriptions. If you do not have Microsoft Log Parser 2.2 installed, only the **Query Statement** field is displayed in the dialog box.

Field	Descriptions
Type of Log	Query Builder uses the W3C Log File format. You cannot change this selection.
Sample Log File	Click **Browse** to select a log file that is an *example* of the log file you actually want to query. You can use the built-in sample file, which ships with AppManager for Exchange 2000 or 2003 and is installed by default on your local system at `C:\Program Files\NetIQ\AppManager\bin\SampleExchLogFile.log`.
Column List	Contains a list of the columns in the sample log file. Refer to these column names when building your query statement. For more information about what each column contains, see "Understanding Log File Columns" on page 1885.

Field	Descriptions
Query Statement	Using standard SQL query syntax, type your query statement. For more information, see “Building a Query Manually” on page 1884.

2. When you have finished building your query, click **OK**. Query Builder returns the query statement to the LogParser Knowledge Script.

Manually Building a Query - Example

The Query Builder Query tool does not support expressions such as “In.” To use the “In” condition, you must manually build a query. The following example details the process of building a query that parses the Exchange log for specified Event IDs. The LogParser Knowledge Script event message and data details return the column entries that match the conditions you set.

To build the manual query example:

1. In the **Query Statement** field, type the following Select statement to identify the columns you want to include in your query.

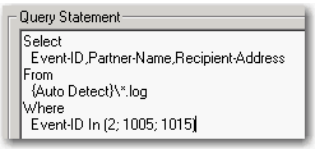
   ```
   Select Event-ID,Partner-Name,Recipient-Address
   ```

2. To enable AppManager to automatically find the Exchange log you want to parse, type `From {Auto Detect}\*.log`.

3. Type the following Where statement to identify the Event IDs you want to find in the Exchange log.

   ```
   Where Event-ID In (2; 1005; 1015)
   ```

   The completed query statement looks similar to the following:



4. Click **OK**.

34.30.6 Understanding Log File Columns

Use the information provided in this section to build queries for the LogParser Knowledge Script, which supports Exchange log file formats. The following table provides the Microsoft descriptions for the column names in Exchange log files:

Column Name	Type	Description
Date	STRING	The date of the event.
Time	STRING	The Greenwich mean time of the event.
client-ip	STRING	The IP of connecting client.
Client-hostname	STRING	The hostname of connecting client.

Column Name	Type	Description
Partner-Name	STRING	The name of the messaging service that the message is handed off to. In Exchange 2000, the service can be: SMTP, X400, MAPI, IMAP4, POP3, STORE. This is essentially the same as Exchange Server 5.5, but in Exchange 2000, there are more possibilities for this field.
Server-hostname	STRING	The hostname of the server that makes the log entry.
server-IP	STRING	The IP address of the server that makes the log entry.
Recipient-Address	STRING	The message recipient (SMTP or X.400 address).
EventID	INTEGER	An integer value corresponding to the Event Type of the logged actions such as sent, received, delete, retrieve.
MSGID	INTEGER	The message ID.
Priority	INTEGER	The priority level, represented by -1 if low, 0 if normal, 1 if high.
Recipient-Report-Status	INTEGER	A number representing the result of an attempt to deliver a report to the recipient: 0 if delivered, 1 if not delivered. This is used only for non-delivery reports (NDRs) and delivery reports (DRs). On other events, it is blank.
total-bytes	INTEGER	The message size in bytes.
Number-Recipients	INTEGER	The total number of recipients.
Origination-Time	STRING	The delivery time (in seconds) representing the time it takes to deliver the message. This is determined from the difference between the timestamp and time encoded in Message ID. This is only valid for messages within the Exchange organization (all versions). There is no requirement to decode other product message IDs such as Sendmail.
Encryption	INTEGER	The encryption level (For the primary body part: 0 if there is no encryption, 1 if signed, 2 if encrypted. This is per message, not per recipient).
service-Version	STRING	The version of the service making the log entry.
Linked-MSGID	STRING	If there is a MSGID from another service, it is given here to link the message across services.
Message-Subject	STRING	The subject of the message, truncated to 256 bytes.
Sender-Address	STRING	The primary address of the originating mailbox, if known. This could be SMTP, X.400, or Distinguished Name (DN), depending on the transport.

34.31 MailboxesOverStorageLimit

Use this Knowledge Script to monitor the number of mailboxes over the storage limit. This script provides useful report data to help you manage Exchange mailboxes.

On a computer with more than one virtual server, the total number of mailboxes over the storage limit is calculated as the total number of mailboxes over the storage limit for all virtual servers on the computer.

If a failover occurs when this script job is running, the job restarts on the new node. It is normal for the job on the failed node to generate one or more error messages, depending on what it was doing when the failover occurred.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.31.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.31.2 Default Schedule

The default interval is **Every day**.

34.31.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of mailboxes over the storage limit exceed the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total number of mailboxes that exceed the storage limit. The default is n.
Maximum threshold for number of mailboxes	Specify the maximum number of mailboxes that can exceed their storage limit before an event is raised. The default is 300 mailboxes.
Exchange profile for NetIQ Corporationmc log on as account	Enter a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.

Description	How to Set It
Mailbox alias for NetIQ Corporationmc log on as account	Enter a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default value is 5 (red event indicator).

34.32 MailboxesWithoutStorageLimit

Use this Knowledge Script to monitor the number of mailboxes with no storage limitation. This script provides useful report data to help you manage Exchange mailboxes.

On a computer with more than one virtual server, the total number of mailboxes without a storage limit is calculated as the total number of mailboxes without a storage limit for all virtual servers on the computer.

If a failover occurs when this script job is running, the job restarts on the new node. It is normal for the job on the failed node to generate one or more error messages, depending on what it was doing when the failover occurred.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.32.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.32.2 Default Schedule

The default interval is **Every day**.

34.32.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of mailboxes with no storage limitation exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of mailboxes with no storage limit. The default is n.
Maximum threshold for number of mailboxes	Specify the maximum number of mailboxes that can have no storage limit before an event is raised. The default is 300 mailboxes.
Exchange profile for NetIQ Corporationmc log on as account	Enter a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.

Description	How to Set It
Mailbox alias for NetIQ Corporationmc log on as account	Enter a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of mailboxes with no storage limit exceeds the threshold. The default value is 5 (red event indicator).

34.33 MsgsBetweenSites

Use this Knowledge Script to monitor the total number and size of messages transferred between Exchange sites during the specified number of days or from a specific start date to a specific end date.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `tracking.log`. The shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share. If you install Exchange server on a Microsoft cluster, make sure the network share exists on all cluster nodes.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. The UTC standard is equivalent to Greenwich Mean Time (GMT). This script also uses GMT and does not adjust for your time zone. Depending on your time zone, the number of days (in local time) may not represent the corresponding number of GMT hours. For example, if you monitor the previous day's messages (Count messages from past N days is set to 1), and your time zone is GMT -08:00 (Pacific Time), running the Knowledge Script job at 09:00 will monitor only 16 hours of the day's Exchange server log recorded in GMT. If your time zone is GMT, your results will be accurate.

34.33.1 Resource Object

Exchange Server

34.33.2 Default Schedule

The default interval for this Knowledge Script is **Every day**.

34.33.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Number of mail messages received from other sites • Size of messages received in KB • Number of mail messages sent to other sites • Size of messages sent in KB The default is n.
Maximum threshold for number of received mail messages	Specify the maximum number of messages that can be received from remote sites before an event is raised. The default is 300 messages.
Maximum threshold for number of sent mail messages	Specify the maximum number of messages that can be sent from this site to other sites before an event is raised. The default is 300 messages.

Description	How to Set It
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.
Count messages from past N days	Specify the number of previous days (including today) to track back for the message count. For example, to find the number of messages transferred in the past week, enter 7. The default is 3 days. To set a specific start date and end date, leave this field blank. If you set a start and end date, this parameter is ignored.
Start date	Specify a start date for beginning the message count. Use the YYYY/MM/DD format. If you do not specify a Start and End Date, the specified value for the *Count messages from past N days* is used.
End date	Specify a end date for the message count. Use the YYYY/MM/DD format. If you do not specify a Start and End Date, the specified value for the *Count messages from past N days* is used.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.34 MsgsBetweenSitesByInterval

Use this Knowledge Script to monitor the number and size of messages sent to an Exchange site or received from an Exchange site during the monitoring interval.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `tracking.log`. The `tracking.log` share must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the `tracking.log` share. If you install Exchange server on a Microsoft cluster, make sure the network share `tracking.log` exists on all cluster nodes.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

34.34.1 Resource Object

Exchange Server

34.34.2 Default Schedule

The default interval for this Knowledge Script is **Every day**.

34.34.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns data collected during the monitoring interval for: • Number of mail messages received from other sites • Size of messages received in KB • Number of mail messages sent to other sites • Size of messages sent in KB The default is n.
Maximum threshold for number of received mail messages	Specify the maximum number of messages that can be received from remote sites before an event is raised. The default is 300 messages.
Maximum threshold for number of sent mail messages	Specify the maximum number of messages that can be sent from this site to other sites before an event is raised. The default is 300 messages.
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.35 MailboxStoreMountStatus

Use this Knowledge Script to monitor the mount status of one or more mailbox stores. When a mailbox store is unmounted, the Exchange Server cannot store information in it or read information from it.

34.35.1 Resource Object

Information Store folder, Mailbox Store object

34.35.2 Default Schedule

The default interval is **Every hour**.

34.35.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a mailbox store is unmounted. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns 100 if the mailbox store is mounted, 0 if the mailbox store is unmounted. The default option is n.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a mailbox store is unmounted. The default is 5 (red event indicator).

34.36 MsgAvgLocalDlvryTimeByIntrv

Use this Knowledge Script to monitor the average delivery time for local messages since the last time the script ran.

Tracking logs are implemented using the network share `<servername>.log`. This shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

34.36.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.36.2 Default Schedule

The default interval is **Every 15 minutes**.

34.36.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if average delivery time exceeds the threshold. The default is y.
Collect averages data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the average delivery time since the last time the script ran. The default is n.
Collect totals data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total number of messages and the total elapsed deliver time from which the average was derived. The default is n.
Maximum threshold for the average local delivery time.	Specify the highest average amount of time that it can take for local messages to be delivered before an event is raised. The default is 300 seconds.
Date format in message tracking log	Set this to be the same as the date format you are using in your message tracking log. The default is YYYY-MM-DD.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which average delivery time exceeds the threshold you set. The default is 5 (red event indicator).

34.37 MsgsAvgLocalDeliveryTime

Use this Knowledge Script to monitor the average delivery time for local messages for specified days. You can specify the interval to be a number of past days or start and stop dates.

Either interval specification looks at entries in the message tracking logs for the indicated days. If *Past N days to average messages* is 1, it looks at all the entries in today's log, since midnight, when it started, regardless of what time of day it is now. If *Past N days to average messages* is 2, it also examines the log from the day before that (all 24 hours of it).

Tracking logs are implemented using the network share `<servername>.log`. This shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share.

This script reports 0 messages transferred if you delete or disable the tracking logs.

34.37.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.37.2 Default Schedule

The default interval is **Every day**.

34.37.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if average delivery time exceeds the threshold you set. The default is y.
Collect averages data?	Set to **y** to collect data for charts and reports. If enabled data collection returns the average delivery time over the monitoring interval. The default is n.
Collect totals data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total number of messages and the total elapsed deliver time from which the average was derived. The default is n.
Maximum threshold for the average local delivery time.	Specify the maximum average delivery time that can have occurred since the last time this script was run. The default is 120 seconds.
Past N days to average messages	Specify the number of days over which to calculate the average delivery time. This value is ignored if you specify start and end dates. The default is 3 days.
Start date (YYYY/MM/DD)	Specify the start date for averaging delivery times.
End date (YYYY/MM/DD)	Specify the end date for averaging delivery times.
Date format in message tracking log	Set this to be the same as the date format you are using in your message tracking log. The default format is YYYY-MM-DD.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which local delivery time exceeds the threshold. The default is 5 (red event indicator).

34.38 MsgsBetweenAdminGroups

Use this Knowledge Script to monitor the total number and size of messages transferred between Exchange Admin Groups during the specified number of days or between specific start and end dates.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `<servername>.log`. This shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. The UTC standard is equivalent to Greenwich Mean Time (GMT). This Knowledge Script also uses GMT and does not adjust for your time zone. Depending on your time zone, the number of days in local time may not represent the corresponding number of GMT hours. For example, if you monitor the previous day's messages (Count messages from past N days is set to 1), and your time zone is GMT -08:00 (Pacific Time), running the Knowledge Script job at 09:00 will monitor only 16 hours of the day's Exchange server log recorded in GMT. If your time zone is GMT, your results will be accurate.

34.38.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.38.2 Default Schedule

The default interval is **Every day**.

34.38.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Number of e-mail messages received from other Admin Groups. If this Knowledge Script cannot identify the Admin Group to which the sender belongs, the data detail message indicates the "Admin Group of <sender>". • Size of messages received in KB. • Number of e-mail messages sent to other Admin Groups. If this Knowledge Script cannot identify the Admin Group to which the recipient belongs, the data detail message indicates the "Admin Group of <recipient>". • Size of messages sent in KB. The default is n.

Description	How to Set It
Maximum threshold for number of received mail messages	Specify the maximum number of messages that can be received from remote Admin Groups before an event is raised. The default is 300 messages.
Maximum threshold for number of sent mail messages	Specify the maximum number of messages that can be sent from this Admin Group to other Admin Groups before an event is raised. The default value is 300 messages.
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.
Count messages from past N days	Specify the number of previous days (including today) to track back for the message count. For example, to find the number of messages transferred in the past week, enter 7. The default value is 3 days. To set a specific start date and end date, leave this field blank. If you set a start and end date, this parameter is ignored.
Start date (YYYY/MM/DD)	Specify a start date for beginning the message count. If you do not specify a Start and End Date, the value for *Count messages from past N days* is used.
End date (YYYY/MM/DD)	Specify the end date for the message count. If you do not specify a Start and End Date, the value for *Count messages from past N days* is used.
Refresh server info at each interval?	Set to **y** to generate a table showing the Microsoft Exchange 2000 or Exchange Server 2003 servers and the admin groups to which they belong. In large organizations with hundred of servers, creating this table may take a while. Therefore, this parameter allows you to decide whether to create the table every time the script runs. If the customer environment is pretty static, there is little need to create the table. On the other hand, if the customer environment is very dynamic and the servers are moved across different admin groups quite often, then it is preferable to set this parameter to **y**. The default is n.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.39 MsgsBtwnAdmnGrpsByInterval

Use this Knowledge Script to monitor the number and size of messages sent to an Exchange Admin Group or received from an Exchange Admin Group during the monitoring interval.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `<servername>.log`. This shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

34.39.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.39.2 Default Schedule

The default interval is **Every day**.

34.39.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns data collected during the monitoring interval: • Number of mail messages received from other Admin Groups. If this Knowledge Script cannot identify the Admin Group to which the sender belongs, the data detail message indicates the "Admin Group of <sender>". • Size of messages received in KB • Number of mail messages sent to other Admin Groups. If this Knowledge Script cannot identify the Admin Group to which the recipient belongs, the data detail message indicates the "Admin Group of <recipient>". • Size of messages sent in KB The default is n.
Maximum threshold for number of received mail messages	Specify the maximum number of messages that can be received from remote Admin Groups before an event is raised. The default is 300 messages.
Maximum threshold for number of sent mail messages	Specify the maximum number of messages that can be sent from this Admin Group to other Admin Groups before an event is raised. The default is 300 messages.
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.

Description	How to Set It
Refresh server info at each interval?	Set to **y** to generate a table showing the Microsoft Exchange 2000 or Exchange Server 2003 servers and the admin groups to which they belong. In large organizations with hundred of servers, creating this table may take a while. Therefore, this parameter allows you to decide whether to create the table every time the script runs. If the customer environment is pretty static, there is little need to create the table. On the other hand, if the customer environment is very dynamic and the servers are moved across different admin groups quite often, then it is preferable to set this parameter to **y**. The default is n.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.40 MsgsByServer

Use this Knowledge Script to monitor the number and size of messages transferred between a target Exchange Server and all connected servers during a specified number of days or from a specific start date to a specific end date.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `<servername>.log` in Exchange 2000 or Exchange Server 2003 and `tracking.log` in earlier versions. The shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share. If you install Exchange server on a Microsoft cluster, make sure the network share exists on all cluster nodes.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. The UTC standard is equivalent to Greenwich Mean Time (GMT). This script also uses GMT and does not adjust for your time zone. Depending on your time zone, the number of days (in local time) may not represent the corresponding number of GMT hours. For example, if you monitor the previous day's messages (Count messages from past N days is set to 1), and your time zone is GMT -08:00 (Pacific Time), running the Knowledge Script job at 09:00 will monitor only 16 hours of the day's Exchange server log recorded in GMT. If your time zone is GMT, your results will be accurate.

34.40.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.40.2 Default Schedule

The default interval is **Every day**.

34.40.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Size (KB) of messages sent • Number of messages sent • Size (KB) of messages received • Number of messages received The default is n.
Maximum threshold for number of received mail messages	Specify the maximum number of messages that can be received from remote server before an event is raised. The default is 300 messages.

Description	How to Set It
Maximum threshold for number of sent mail messages	Specify the maximum number of messages that can be sent from this server to other servers before an event is raised. The default is 300 messages.
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.
Count messages from past N days	Enter the number of previous days (including today) to track back for the message count. For example, to find the number of messages transferred in the past week, enter 7. The default is 3 days. To set a specific start date and end date, leave this field blank. If you set a start and end date, this parameter is ignored.
Start date	Specify a start date for beginning the message count. Use the YYYY/MM/DD format.
End date	Specify a end date for the message count. Use the YYYY/MM/DD format.
Refresh server info at each interval (Exchange 2000 or Exchange 2003 only)?	Specify whether this script should dynamically create a table that describes which Exchange servers belong to which admin groups at each interval. In large organizations, creating this table can take a significant period of time. Therefore, decide whether to create the table every time the script runs based on the characteristics of your Exchange environment: • If your environment tends to remain static with few (if any) changes, you should not need to create the table and can set this parameter to **n**. • If your environment tends to be dynamic, with servers often moved from one admin group to another, you should set this parameter to **y**. The default is n.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.41 MsgsByServerByInterval

Use this Knowledge Script to monitor the number and size of messages transferred between a target Exchange Server and all connected servers during the monitoring interval.

In the parameters described below, the term "messages received" refers to the messages that the target Exchange Server received. "Messages sent" refers to the messages that the target Exchange Server sent to all connected Exchange Servers.

To use this script, you must enable the Tracking logs. Tracking logs are implemented using the network share `<servername>.log` in Exchange 2000 or Exchange Server 2003 and `tracking.log` in earlier versions. The shared directory must exist on the target computer for this script to work properly. By default, the Exchange Server installation program sets up the share. If you install Exchange Server on a Microsoft cluster, make sure the network share exists on all cluster nodes.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

34.41.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.41.2 Default Schedule

The default interval is **Every day**.

34.41.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns data collected during the monitoring interval: • Size (KB) of messages sent • Number of messages sent • Size (KB) of messages received • Number of messages received The default is n.
Maximum threshold for number of received mail messages	Specify the maximum number of messages the target Exchange server can receive before an event is raised. The default is 300 messages.
Maximum threshold for number of sent mail messages	Specify the maximum number of messages that can be sent from the target Exchange Server to connected Exchange Servers before an event is raised. The default is 300 messages.
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.

Description	How to Set It
Refresh server info at each interval (Exchange 2000 only)?	Specify whether this script should dynamically create a table that describes which Exchange 2000 or Exchange Server 2003 servers belong to which admin groups at each interval. In large organizations, creating this table can take a significant period of time. Therefore, decide whether to create the table every time the script runs based on the characteristics of your Exchange 2000 or Exchange Server 2003 environment: • If your environment tends to remain static with few (if any) changes, you should not need to create the table and can set this parameter to **n**. • If your environment tends to be dynamic, with servers often moved from one admin group to another, you should set this parameter to **y**. The default is n.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.42 MsgsBySize

Use this Knowledge Script to monitor the number of messages transferred in different size ranges over a specified number of days or from a specific start date to a specific end date. This script checks the size of messages sent and received during a specified period and tracks the number of messages by size.

This script provides useful report data to help you monitor message traffic on a daily or weekly basis.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `<servername>.log` in Microsoft Exchange 2000 or Exchange Server 2003 and `tracking.log` in earlier versions. The shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share. If you install Exchange server on a Microsoft cluster, make sure the network share exists on all cluster nodes.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. The UTC standard is equivalent to Greenwich Mean Time (GMT). This Knowledge Script also uses GMT and does not adjust for your time zone. Depending on your time zone, the number of days (in local time) may not represent the corresponding number of GMT hours. For example, if you monitor the previous day's messages (Count messages from past N days is set to 1), and your time zone is GMT -08:00 (Pacific Time), running the Knowledge Script job at 09:00 will monitor only 16 hours of the day's Exchange server log recorded in GMT. If your time zone is GMT, your results will be accurate.

34.42.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.42.2 Default Schedule

The default interval is **Every day**.

34.42.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Range for message size (comma separated)	Specify the size ranges for tracking messages, specified in KB, separated by commas. For example, if you set the range to `10,50,100`, information is returned for the number of messages from 0-10 KB, 10-50 KB, 50-100 KB, and 100+ KB. The default range is 1,2,10,50,100,500.
Collect data for local messages (delivered)?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of locally delivered mail messages in each size category. The default is y.
Collect data for remote messages (received)?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of mail messages received from a non-local mailbox in each size category. The default is y.

Description	How to Set It
Collect data for remote messages (sent)?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of mail messages sent to a non-local mailbox in each size category. The default is y.
Count messages from past N days	Specify the number of previous days (including today) to track back for the message count. For example, to find the number of messages transferred in the past week, enter 7. The default value is 8 days. To set a specific start date and end date, leave this field blank. If you set a Start Date and End Date, this parameter is ignored.
Start date	Enter a start date for beginning the message count. Use the YYYY/MM/DD format.
End date	Enter an end date for the message count. Use the YYYY/MM/DD format.

34.43 MsgsOfSystem

Use this Knowledge Script to monitor the load of public folder replication messages between Microsoft Exchange sites and Microsoft Exchange 2000 or Exchange Server 2003 Admin Groups.

To replicate public folder information between sites or Admin Groups, Microsoft Exchange sends system messages. This script monitors the number and size of the Exchange system messages:

- Sent from the public information store to public information store on another Exchange site or Admin Group.
- Received by the public information store from the public information store on another Exchange site or Admin Group.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `<servername>.log` in Exchange 2000 or Exchange Server 2003 and `tracking.log` in earlier versions. The shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share. If you install Exchange server on a Microsoft cluster, make sure the network share exists on all cluster nodes.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. The UTC standard is equivalent to Greenwich Mean Time (GMT). This Knowledge Script also uses GMT and does not adjust for your time zone. Depending on your time zone, the number of days (in local time) may not represent the corresponding number of GMT hours.

For example, if you monitor the previous day's messages (*Count messages from past N days* is set to **1**), and your time zone is GMT -08:00 (Pacific Time), running the Knowledge Script job at 09:00 will monitor only 16 hours of the day's Exchange server log recorded in GMT. If your time zone is GMT, your results will be accurate.

34.43.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.43.2 Default Schedule

The default interval is **Every day**.

34.43.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number or size of any kind of system messages exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number and size of inbound and outbound messages for public folder and directory replication. The default is n.

Description	How to Set It
Maximum threshold for number of system messages	Specify the maximum number of system messages that can be sent or received by the public information store before an event is raised. The default is 3000 messages.
Maximum threshold for size of system messages	Specify the maximum size (in KB) for system messages sent or received by the public information store. An event is raised if messages exceed this size The default is 3000 KB.
Count messages from past N days	Specify the number of previous days (including today) to track back for the message count. For example, to find the number of messages transferred in the past week, enter 7. The default value is 3 days. To set a specific start date and end date, leave this field blank. If you set a Start Date and End Date, this parameter is ignored.
Start date	Specify a start date for beginning the message count. Use the MM/DD/YY format.
End date	Specify an end date for the message count. Use the MM/DD/YY format.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.44 MsgsOpenedByOWA

Use this Knowledge Script to monitor the number of messages opened by Outlook Web Access (OWA). This script raises an event if the number of opened messages exceeds the threshold you set.

34.44.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.44.2 Default Schedule

The default interval is **Every 30 minutes**.

34.44.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of messages opened by OWA exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the difference between the number of messages opened by OWA during the current monitoring interval and the number of messages opened during the previous monitoring interval. The default is n.
Compare to previous monitoring interval?	Set to **y** to compare the number of messages opened by OWA during the current monitoring interval with the number of messages opened by OWA during the previous monitoring interval. The default is y. **NOTE:** If set to n, data collection returns *only* the number of messages opened by OWA during the current monitoring interval.
Maximum threshold for the number of messages	Specify the maximum number of messages that OWA can open before an event is raised. The default is 99 messages.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which the number of opened messages exceeds the threshold. The default is 5 (red event indicator).

34.45 MsgsSentByOWA

Use this Knowledge Script to monitor the number of messages sent by Outlook Web Access (OWA). This script raises an event if the number of messages sent exceeds the threshold you set.

34.45.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.45.2 Default Schedule

The default interval is **Every 30 minutes**.

34.45.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of messages sent by OWA exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the difference between the number of messages sent by OWA during the current monitoring interval and the number of messages sent during the previous monitoring interval. The default is n.
Compare to previous monitoring interval?	Set to **y** to compare the number of messages sent by OWA during the current monitoring interval with the number of messages sent by OWA during the previous monitoring interval. The default is y. **NOTE:** If set to n, data collection returns *only* the number of messages sent by OWA during the current monitoring interval.
Maximum threshold for the number of messages	Specify the maximum number of messages that OWA can send before an event is raised. The default is 99 messages.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which the number of sent messages exceeds the threshold. The default is 5 (red event indicator).

34.46 MsgsSpecificDomain

Use this Knowledge Script to monitor the total number and size of messages transferred through an Internet Mail Connector (IMC) to and from a specific domain during a specified number of days or from a specific start date to a specific end date. In Exchange 2000 and Exchange Server 2003, the IMC has been replaced by the SMTP service.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `<servername>.log` in Exchange 2000 or Exchange Server 2003 and `tracking.log` in earlier versions. The shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share. If you install Exchange server on a Microsoft cluster, make sure the network share exists on all cluster nodes.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. The UTC standard is equivalent to Greenwich Mean Time (GMT). This Knowledge Script also uses GMT and does not adjust for your time zone. Depending on your time zone, the number of days (in local time) may not represent the corresponding number of GMT hours. For example, if you monitor the previous day's messages (Count messages from past N days is set to 1), and your time zone is GMT -08:00 (Pacific Time), running the Knowledge Script job at 09:00 will monitor only 16 hours of the day's Exchange server log recorded in GMT. If your time zone is GMT, your results will be accurate.

34.46.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.46.2 Default Schedule

The default interval is **Every day**.

34.46.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Number of messages received from the specified domain(s) • Size of messages received from the specified domain(s) in KB • Number of messages sent to the specified domain(s) • Size of messages sent to the specified domain(s) in KB The default is n.
Maximum threshold for number of received messages	Specify the maximum number of messages that can be received from the specified domain before an event is raised. The default is 300 messages.

Description	How to Set It
Maximum threshold for number of sent messages	Specify the maximum number of messages that can be sent from this site to the specified domain before an event is raised. The default is 300 messages.
List of domain names (comma separated)	Provide the name of the domain you want to monitor. You can enter multiple domain names separated by commas. For example: `microsoft.com,netiq.com`
Count messages from past N days	Specify the number of previous days (including today) to track back for the message count. For example, to find the number of messages transferred in the past week, enter 7. The default value is 3 days. If you set a start and end date, this parameter is ignored.
Start date	Specify a start date for beginning the message count. Use the YYYY/MM/DD format.
End date	Specify an end date for the message count. Use the YYYY/MM/DD format.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.46.4 Example of How This Script is Used

You can use this Knowledge Script to check the number and size of mail messages from a specific Internet domain. For example, to check the number of messages to and from NetIQ Corporation Corporation in the last 30 days, you would enter netiq.com for the Domain name parameter and 30 for the *Count messages from past N days* parameter.

34.47 MsgsSpecificDomainByInterval

Use this Knowledge Script to monitor the total number and size of messages transferred through an Internet Mail Connector (IMC) to and from a specific domain during the monitoring interval. In Microsoft Exchange 2000 and Exchange Server 2003, the IMC has been replaced by the SMTP service.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `<servername>.log` in Exchange 2000 or Exchange Server 2003 and `tracking.log` in earlier versions. The shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share. If you install Exchange server on a Microsoft cluster, make sure the network share exists on all cluster nodes.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

34.47.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.47.2 Default Schedule

The default interval is **Every day**.

34.47.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following data collected during the monitoring interval: • Size (KB) of messages sent to other domains • Number of messages sent to other domains • Size (KB) of messages received from other domains • Number of messages received from other domains The default is n.
Maximum threshold for number of received messages	Specify the maximum number of messages that can be received from remote domains before an event is raised. The default is 300 messages.
Maximum threshold for number of sent messages	Specify the maximum number of messages that can be sent to other domains before an event is raised. The default is 300 messages.
List of domain names (comma separated)	Provide the name of the domain you want to monitor. You can enter multiple domain names separated by commas. For example: `microsoft.com,netiq.com`
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default value is 5 (red event indicator).

34.48 MsgsThroughConnector

This Knowledge Script monitors the total number and size of messages sent and received by one or more specified connectors on an Exchange site or router group during a specified number of days or from a specific start date to a specific end date. For Microsoft Exchange 2000 or Exchange Server 2003, this script monitors connectors to external mail systems only.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `<servername>.log` in Exchange 2000 or Exchange Server 2003 and `tracking.log` in earlier versions. The shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share. If you install Exchange server on a Microsoft cluster, ensure the network share exists on all cluster nodes.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. The UTC standard is equivalent to Greenwich Mean Time (GMT). This script also uses GMT and does not adjust for your time zone. Depending on your time zone, the number of days (in local time) may not represent the corresponding number of GMT hours. For example, if you monitor the previous day's messages (Count messages from past N days is set to 1), and your time zone is GMT -08:00 (Pacific Time), running the Knowledge Script job at 09:00 will monitor only 16 hours of the day's Exchange server log recorded in GMT. If your time zone is GMT, your results will be accurate.

34.48.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.48.2 Default Schedule

The default interval is **Every day**.

34.48.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number or size of messages sent from or received by monitored connectors exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Size (KB) of messages received by connectors • Number of messages received by connectors • Size (KB) of messages sent by connectors • Number of messages sent by connectors The default is n.

Description	How to Set It
Maximum threshold for number of received messages	Specify the maximum number of messages that can be received by monitored connectors before an event is raised. The default is 300 messages.
Maximum threshold for number of sent messages	Specify the maximum number of messages that can be sent to monitored connectors before an event is raised. The default is 300 messages.
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.
Count messages from past N days	Specify the number of previous days (including today) to track back for the message count. For example, to find the number of messages transferred in the past week, enter 7. The default value is 3 days. To set a specific start date and end date, leave this field blank. If you set a Start Date and End Date, this parameter is ignored.
List of connectors (comma separated)	Provide a list of connector names, separated by commas. The connector name is not case-sensitive. If you leave the connector list blank, this script returns data for all connectors. You cannot enter a single letter to get data for all connectors starting with that letter. You must enter the exact name of the connector. It may be easier to leave this parameter blank and check the data detail for the connectors of interest.
Start date	Specify a start date for beginning the message count. Use the YYYY/MM/DD format.
End date	Specify an end date for beginning the message count. Use the YYYY/MM/DD format.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.49 MsgsThroughIMC

Use this Knowledge Script to monitor the total number and size of messages sent and received by an Internet Mail Connector (IMC) during the specified number of days or from a specific start date to a specific end date.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `tracking.log`. The `tracking.log` share must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the `tracking.log` share. If you install Exchange server on a Microsoft cluster, make sure the network share `tracking.log` exists on all cluster nodes.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. The UTC standard is equivalent to Greenwich Mean Time (GMT). This Knowledge Script also uses GMT and does not adjust for your time zone. Depending on your time zone, the number of days (in local time) may not represent the corresponding number of GMT hours. For example, if you monitor the previous day's messages (Count messages from past N days is set to 1), and your time zone is GMT -08:00 (Pacific Time), running the Knowledge Script job at 09:00 will monitor only 16 hours of the day's Exchange server log recorded in GMT. If your time zone is GMT, your results will be accurate.

34.49.1 Resource Object

Exchange Server

34.49.2 Default Schedule

The default interval for this Knowledge Script is **Every day**.

34.49.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Number of mail messages received through IMC • Size of mail messages received through IMC (KB) • Number of mail messages sent through IMC • Size of mail messages sent through IMC (KB) The default is n.
Maximum threshold for number of received mail messages	Specify the maximum number of messages that can be received through IMC from remote sites before an event is raised. The default is 300 messages.

Description	How to Set It
Maximum threshold for number of sent mail messages	Specify the maximum number of messages that can be sent from this site through IMC to other sites before an event is raised. The default is 300 messages.
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.
Count messages from past N days	Specify the number of previous days (including today) to track back for the message count. For example, to find the number of messages transferred in the past week, enter 7. The default is 3 days. If you set a start and end date, this parameter is ignored.
Start date	Specify a start date for beginning the message count. Use the YYYY/MM/DD format.
End date	Specify a end date for the message count. Use the YYYY/MM/DD format.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.50 MsgsThroughIMCByInterval

Use this Knowledge Script to monitor the total number and size of messages sent and received by an Internet Mail Connector (IMC) during the monitoring interval.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `tracking.log`. The `tracking.log` share must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the `tracking.log` share. If you install Exchange server on a Microsoft cluster, make sure the network share `tracking.log` exists on all cluster nodes.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

34.50.1 Resource Object

Exchange Server

34.50.2 Default Schedule

The default interval for this Knowledge Script is **Every day**.

34.50.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following data collected during the monitoring interval: • Size (KB) of messages sent through IMC • Number of messages sent through IMC • Size (KB) of messages received through IMC • Number of messages received through IMC The default is n.
Maximum threshold for number of received messages	Specify the maximum number of messages that can be received through IMC before an event is raised. The default is 300 messages.
Maximum threshold for number of sent messages	Specify the maximum number of messages that can be sent through IMC before an event is raised. The default is 300 messages.
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.51 MsgsThroughSMTPService

Use this Knowledge Script to monitor the size and number of messages through the SMTP Service for the specified days. You can specify the interval to be a number of past days or start and stop dates.

Either interval specification looks at entries in the message tracking logs for the indicated days. If *Past N days to average messages* is 1, it looks at all the entries in today's log, since midnight, when it started, regardless of what time of day it is now. If *Past N days to average messages* is 2 it also examines the log from the day before that (all 24 hours of it).

Tracking logs are implemented using the network share `<servername>.log`. This shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

34.51.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.51.2 Default Schedule

The default interval is **Every 15 minutes**.

34.51.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of SMTP messages sent and received. The default is n.
Maximum threshold for number of received mail messages	Specify the maximum number of SMTP messages that can be received before an event is raised. The default is 300.
Maximum threshold for number of sent mail messages	Specify the maximum number of SMTP messages that can be sent before an event is raised. The default is 300.
Include Exchange system messages?	Set to **y** to include Exchange system messages. The default option is n.
Past N days to average messages	Specify the number of days over which to monitor SMTP messages. This value is ignored if you specify start and end dates. The default value is 3 days.
Start date (YYYY/MM/DD)	Specify the start date for monitoring SMTP messages.
End date (YYYY/MM/DD)	Specify the end date for monitoring SMTP messages.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.52 MsgsThruSMTPSvcByInterval

Use this Knowledge Script to monitor the size and number of messages through the SMTP Service during the monitoring interval. The monitoring interval is since the last time the script ran.

Tracking logs are implemented using the network share `<servername>.log`. This shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

34.52.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.52.2 Default Schedule

The default interval is **Every 15 minutes**.

34.52.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of SMTP messages sent and received. The default is n.
Maximum threshold for number of received mail messages	Specify the maximum number of SMTP messages that can be received before an event is raised. The default is 300.
Maximum threshold for number of sent mail messages	Specify the maximum number of SMTP messages that can be sent before an event is raised. The default is 300.
Include Exchange system messages?	Set to **y** to include Exchange system messages. The default is n.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.53 MsgsWithinAdminGroup

Use this Knowledge Script to monitor the total number and size of messages transferred between Exchange servers in the same Admin Group during the specified number of days or from a specific start date to a specific end date.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `<servername>.log`. This shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. The UTC standard is equivalent to Greenwich Mean Time (GMT). This script also uses GMT and does not adjust for your time zone. Depending on your time zone, the number of days (in local time) may not represent the corresponding number of GMT hours. For example, if you monitor the previous day's messages (Count messages from past N days is set to 1), and your time zone is GMT -08:00 (Pacific Time), running the Knowledge Script job at 09:00 will monitor only 16 hours of the day's Exchange server log recorded in GMT. If your time zone is GMT, your results will be accurate.

34.53.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.53.2 Default Schedule

The default interval is **Every day**.

34.53.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when a threshold is exceeded. The default option is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of received and sent messages. The default is n.
Maximum threshold for number of received messages	Specify the maximum number of messages that can be received from other Exchange servers within the Admin Group before an event is raised. The default is 300 messages.
Maximum threshold for number of sent messages	Specify the maximum number of messages that can be sent from this Exchange server to other Exchange servers in the same Admin Group before an event is raised. The default is 300 messages.
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default option is n.

Description	How to Set It
Count messages from past N days	Specify the number of previous days (including today) to track back for the message count. For example, to find the number of messages transferred in the past week, enter 7. The default value is 3 days. If you set a start and end date, the number of previous days parameter is ignored.
Start date (YYYY/MM/DD)	Specify a start date for beginning the message count.
End date (YYYY/MM/DD)	Specify an end date for stopping the message count.
Refresh server info at each interval?	Set to **y** to generate a table showing the Exchange 2000 or Exchange Server 2003 servers and the admin groups to which they belong. In large organizations with hundred of servers, creating this table may take a while. Therefore, this parameter allows you to decide whether to create the table every time the script runs. If the customer environment is pretty static, there is little need to create the table. On the other hand, if the customer environment is very dynamic and the servers are frequently moved across different admin groups, then it is preferable to set this parameter to **y**. The default is n.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.54 MsgsWthnAdmnGrpByInterval

Use this Knowledge Script to monitor the total number and size of messages sent and received between Exchange servers in the same Admin Group since last time the Knowledge Script ran (a delta value).

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `<servername>.log`. This shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share.

This script reports 0 messages transferred if you delete the tracking logs or do not enable them.

34.54.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.54.2 Default Schedule

The default interval is **Every day**.

34.54.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following data collected during the monitoring interval: • Size (KB) of messages sent within this Admin Group • Number of messages sent within this Admin Group • Size (KB) of messages received within this Admin Group • Number of messages received within this Admin Group The default is n.
Maximum threshold for number of received messages	Specify the maximum number of messages that can be received by this server from other Exchange servers within this Admin Group before an event is raised. The default is 300 messages.
Maximum threshold for number of sent messages	Specify the maximum number of messages that can be sent from other Exchange servers within this Admin Group to this server before an event is raised. The default is 300 messages.
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.
Refresh server info at each interval?	Set to **y** to generate a table showing the Exchange servers and the Admin Groups to which they belong. In large organizations with hundred of servers, creating this table may take a while. Therefore, this parameter allows you to decide whether to create the table every time the script runs. If your environment is pretty static, there is little need to create the table. On the other hand, if your environment is very dynamic and the servers are moved frequently across different Admin Groups, then it is preferable to set this parameter to **y**. The default is n.

Description	How to Set It
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which the number of received or sent messages exceeds the threshold. The default is 5 (red event indicator).

34.55 MsgsWithinSite

Use this Knowledge Script to monitor the total number and size of messages transferred between Exchange servers in the same site during the specified number of days or from a specific start date to a specific end date.

To use this script, you must enable the tracking logs.

The Exchange server implements tracking logs using the network share `tracking.log`. The `tracking.log` share must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the `tracking.log` share. If you install Exchange server on a Microsoft cluster, make sure the network share `tracking.log` exists on all cluster nodes.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. The UTC standard is equivalent to Greenwich Mean Time (GMT). This Knowledge Script also uses GMT and does not adjust for your time zone. Depending on your time zone, the number of days (in local time) may not represent the corresponding number of GMT hours. For example, if you monitor the previous day's messages (Count messages from past N days is set to 1), and your time zone is GMT -08:00 (Pacific Time), running the Knowledge Script job at 09:00 will monitor only 16 hours of the day's Exchange server log recorded in GMT. If your time zone is GMT, your results will be accurate.

34.55.1 Resource Object

Exchange Server

34.55.2 Default Schedule

The default interval for this Knowledge Script is **Every day**.

34.55.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following data collected during the monitoring interval: • Size (KB) of messages sent within this site • Number of messages sent within this site • Size (KB) of messages received within this site • Number of messages received within this site The default is n.
Maximum threshold for number of received messages	Specify the maximum number of messages that can be received by this server from other Exchange servers before an event is raised. The default is 300 messages.

Description	How to Set It
Maximum threshold for number of sent messages	Specify the maximum number of messages that can be sent to this server from other Exchange servers before an event is raised. The default is 300 messages.
Include Exchange system messages?	Set to **y** to include system messages in the message count. The default is n.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.56 MTAConnectionQueueLength

Use this Knowledge Script to monitor the queue length of all message transfer agent (MTA) connections, including the MTAs to other servers in the site, public and private information stores, and any installed connectors (such as X.400 Connectors). If the server is a replication bridgehead, the MTA will also have a queue to the directory on its server.

You specify the maximum number of queued inbound and outbound messages, the maximum number of queued recipients, and the number of consecutive times the threshold can be exceeded before raising an event. This script raises an event if the number of queued inbound messages, queued outbound messages, or queued recipients exceeds the threshold you set.

34.56.1 Resource Object

Information Store folder

34.56.2 Default Schedule

The default interval is **Every hour**.

34.56.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the queue length for an MTA connection exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the queue length for each MTA connection. The default is n.
Maximum threshold for number of inbound messages	Specify the maximum number of inbound messages that can be queued before an event is raised. The default is 10000 messages.
Maximum threshold for number of outbound messages	Specify the maximum number of outbound messages that can be queued before an event is raised. The default is 10000 messages.
Maximum threshold for total number of messages	Specify the maximum total number of messages that can be queued before an event is raised The default is 100 messages.
Maximum threshold for number queued recipients	Specify the maximum number of recipients that can be queued before an event is raised. The default is 100 recipients.
List of MTA connection queues to monitor	Provide the names of the MTA connection queues to monitor (case-sensitive) in a comma-separated list or specify **ALL** to monitor all MTA connection queues. The default is ALL.
Consecutive number of times before an event	Specify the consecutive number of intervals the threshold for queued messages or recipients can be exceeded before the Knowledge Script raises an event. The default is 5 consecutive intervals. Because queued messages or queued recipients can have periodic spikes, you may want to set this parameter to a higher value to filter out unnecessary events. For example, you may want to allow the number of queued messages to exceed the threshold 3 to 4 times before you are alerted.

Description	How to Set It
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.57 MTAQueueLength

Use this Knowledge Script to discover and monitor the queue length of all message transfer agent (MTA) connections, including the MTAs to other servers in the site, public and private information stores, and any installed connectors, such as Site Connectors, X.400 Connectors, Internet Mail Connectors and MS Mail Connectors. If the server is a replication bridgehead, the MTA will also have a queue to the directory on its server.

You can set this script to discover new MTA queues dynamically each time it runs, regardless of whether or not the queues were discovered initially by running the Exchange Discovery Knowledge Script. Discovering MTA connections dynamically is useful because the MTA message queues can change day-to-day.

NOTE: Although this script discovers queues each time it runs, the new queues are not reflected in the TreeView pane.

You can monitor and generate events for the queue length of individual MTA connections, the total queue length for all MTA connections, or both.

34.57.1 Resource Object

MTA Queue folder, if dynamically enumerating connections. If you are not enumerating connections dynamically, you can run this Knowledge Script on the MTA Queue folder or individual queue objects, such as DS Queue, IMC Queue, Public IS Queue, Private IS Queue, Machine Queue, X400 Queue, and MSMail Queue.

34.57.2 Default Schedule

The default interval for this Knowledge Script is **Every hour**.

34.57.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Dynamically enumerate at each interval?	Set to **y** to dynamically enumerate MTA connections at each monitoring interval. The default is y.
List of objects to exclude (comma separated)	Provide the name of any object you want to exclude from monitoring. You can exclude multiple objects, separated by commas with no spaces. For example: `microsoft public mdb,microsoft private mdb` **NOTE:** If you are not dynamically enumerating connections, this parameter is ignored.
Raise an event if any connection exceeds the threshold?	Set to **y** to raise an event if the number of messages in queue for any MTA connection exceeds the threshold. The default is y.
Queue length threshold for an individual connection	Specify the maximum number of messages that can be in queue for each MTA connection before an event is raised. The default is 100 messages.

Description	How to Set It
Raise an event if all connections exceed the threshold?	Set to **y** to raise an event if the number of messages in queue for all MTA connections exceed the threshold for all connections. The default is y.
Queue length threshold for all connections	Specify the maximum number of messages that can be in queue for all MTA connections before an event is raised. The default is 500 messages.
Collect data for all connections?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total queue length for all MTA connections and the queue length for each individual MTA connection. The default is n.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.57.4 Example of How this Script is Used

You can use this Knowledge Script to determine the mail throughput of your system. For example, if the bandwidth of the connection between your mail servers is inadequate, the mail queue length will increase, and the mail delivery time may exceed a reasonably acceptable duration.

34.58 NNTPConnections

Use this Knowledge Script to monitor the total number of inbound and outbound connections to the Network News Transfer Protocol (NNTP) service. This script raises an event if the number of connections exceeds the threshold you set.

34.58.1 Resource Object

NNTP Virtual Server

34.58.2 Default Schedule

The default interval is **Every hour**.

34.58.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Total connections • Current connections • Total SSL connections • Total outbound connections The default is n.
Maximum threshold for total number of NNTP connections	Specify the maximum number of inbound and outbound NNTP connections that can have occurred since the server was last started. This script raises an event if the number of connections exceeds this threshold. The default is 500 connections.
Maximum threshold for number of outbound NNTP connections	Specify the maximum number of outbound NNTP connections that can have occurred since the NNTP server was last started. This script raises an event if the number of connections exceeds this threshold. The default is 1000 connections.
Maximum threshold for number of current NNTP connections	Specify the maximum number of concurrent NNTP connections that can occur before an event is raised. The default is 100 connections.
Maximum threshold for number of SSL connections	Specify the maximum number of SSL connections that can occur before an event is raised. The default is 1000 connections.
Consecutive number of times before an event	Specify the maximum number of consecutive times that each connection threshold can be exceeded before an event is raised. For example, if this parameter is set to 3 and the number of SSL connections exceeds the threshold each time the job runs, this script raises an event the third time the job runs. The default is 5 consecutive occurrences.

Description	How to Set It
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.59 NumberOfMailboxes

Use this Knowledge Script to monitor the total number of Exchange mailboxes. This script raises an event if the number of mailboxes exceeds the threshold you set.

On a computer with more than one virtual server, the total number of mailboxes is calculated as the total number of mailboxes for all virtual servers on the computer.

If a failover occurs when this script job is running, the job restarts on the new node. It is normal for the job on the failed node to generate one or more error messages, depending on what it was doing when the failover occurred.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.59.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.59.2 Default Schedule

The default interval is **Every day**.

34.59.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of mailboxes on the Exchange server exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total number of mailboxes found. The default is n.
Maximum threshold for number of mailboxes	Specify the maximum number of mailboxes that can be on an Exchange server before an event is raised. The default is 300 mailboxes.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.

Description	How to Set It
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mailbox alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of mailboxes exceeds the threshold. The default is 5 (red event indicator).

34.60 PFAclChanges

This Knowledge Script checks for changes in the access control lists for each folder in the public information store. This script raises an event if the script cannot collect information for a public folder.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.60.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.60.2 Default Schedule

The default interval is **Every day**.

34.60.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of access control list changes exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of changes to a public folder's access control list. The default is n.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Maximum threshold for number of ACL changes	Specify the maximum number of changes to the public folder's access control list that can occur before an event is raised. The default is 0 (zero).
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default value is 5 (red event indicator).

34.61 PFAclInfo

This Knowledge Script collects data about the access control list for each folder in the public information store. This script raises an event if the script cannot collect data about a public information store.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.61.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.61.2 Default Schedule

The default interval is **Every day**.

34.61.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which data cannot be collected. The default is 5 (red event indicator).

34.62 PFInfo

This Knowledge Script monitors the number and size of public folders, and the number of messages in the public folders. You can set the data collection level to configure the level of collected public folder data. For more information, see "Setting the Level of Data Collection" on page 1938.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.62.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.62.2 Default Schedule

The default interval is **Every day**.

34.62.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of public folders, the total size of all public folders, or the number of messages in all public folders exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following information, depending on the level of data detail you specify: • Number of public folders • Total size for all public folders (KB) • Number of messages stored in public folders For more information, see "Setting the Level of Data Collection" on page 1938. The default is n.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.

Description	How to Set It
Maximum threshold for number of public folders	Specify the maximum number of public folders that can exist before an event is raised. The default is 100 public folders.
Maximum threshold for size of file space (MB)	Specify the maximum size public folders can attain before an event is raised. The default is 300 MB.
Maximum threshold for number of messages	Specify the maximum number of messages that public folders can contain before an event is raised. The default is 30000 messages.
Character to separate data detail columns	Provide a character to use to separate the columns in the detail data. The default character is "|". If you change this parameter to Null, a Tab character is specified.
Detail level (1-3) for data collection	Specify a value (1, 2, or 3) to specify the level of data collection. The default value is 3. For more information, see "Setting the Level of Data Collection" on page 1938.
Range of message size	Monitor the number of messages in a range of sizes by specifying each size range in a comma-separated list. Specify the message size in kilobytes (KB). For example, if you enter "100,500,1000", this script returns the number of messages that are: • Less than 100 KB • Between 100 KB and 500 KB • Between 500 KB and 1000 KB • Greater than 1000 KB The default is "100,500,1000,2000".
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.62.4 Setting the Level of Data Collection

If you set the *Detail level (1-3) for data collection* parameter to **1**, the script returns the following information:

- Name of the public folder
- Size of messages in the public folder
- Number of messages in the public folder
- Path of the public folder
- Creation time of the public folder
- Last modification time of the public folder
- Last access time of the public folder
- Number of attachments in the public folder
- Number of messages in the public folder which have attachments
- Number of owners of the public folder

If you set the *Detail level (1-3) for data collection* parameter to **2**, the script returns the all of the information in level 1, plus the following additional information:

- Oldest message creation time
- Oldest message modification time

- Newest message creation time
- Newest message modification time

If you set the **Detail level (1-3) for data collection** to **3**, the script returns the all of the information in levels 1 and 2, plus the number of messages in user-defined size ranges. For example, the number of messages that are between one and ten KB.

34.63 PFReplicationByObj

This Knowledge Script monitors public folder replication between Exchange servers by updating a test object on a local public folder and checking the replica folder on one or more remote Exchange servers for the replicated object.

Before you run this script:

- Create a public folder on the local Exchange server for creating and updating the test object.
- Configure this public folder to be hosted by the remote Exchange servers you want to test.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.63.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.63.2 Default Schedule

The default interval is **Every 30 minutes**.

34.63.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of unreplicated test objects on a remote Exchange server exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the replication status of the test object on each remote Exchange server. The default is n.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.

Description	How to Set It

List of remote servers to host test object	Specify a list of remote Exchange servers that host a replica of the test object on the local Exchange server. Use the following syntax:
	`{<computer>}(/O=<{organization>}/OU={<administrative group>}`
	Where:
	• *computer* specifies the name of the computer on which the Exchange server is installed
	• *organization* specifies the name of the Exchange organization to which the server belongs
	• *administrative group* specifies the name of the Exchange administrative group to which the server belongs
	Separate more than one server name using "|", for example:
	`Server1(/O=Org1/OU=AdminGrp1)|Server2(/O=Org2/OU=AdminGrp2)`

Local public folder to maintain test object	Specify the name of the local public folder that the Knowledge Script uses to create and update the test object. The folder name must start with "\". For example, to specify a public folder named "aaa", enter "\aaa". The default is "\".
Maximum threshold for number of unreplicated changes	Specify the maximum number of unreplicated changes that can occur between the local public folder and a public folder on a remote Exchange server. This script raises an event if the number of unreplicated changes exceeds the threshold. The default is 5 unreplicated changes.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of unreplicated changes exceeds the threshold. The default is 5 (red event indicator).

34.64 POP3Accesses

Use this Knowledge Script to monitor the number of POP3 access operations. The POP3 access operations include `LAST`, `STAT`, `LIST`, `DEL`, `NOOP`, and `RSET` operations. This script raises an event if the total number of POP3 access operations exceeds the threshold you set.

34.64.1 Resource Object

POP3 Virtual Server

34.64.2 Default Schedule

The default interval is **Every hour**.

34.64.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of POP3 access operations exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled data collection returns the number of POP3 access operations. The default is n.
Maximum threshold for number of POP3 access operations	Specify the maximum number of POP3 access operations that can occur before an event is raised. The default is 10000 access operations.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.65 POP3Authenticate

Use this Knowledge Script to monitor the authentication of POP3 protocols. This script raises an event if the rate of failure of total authentications exceeds the threshold.

34.65.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003, Protocols folder

34.65.2 Default Schedule

The default interval is **Every hour**.

34.65.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of authentication failures exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Number of authenticate commands received since startup • Number of authenticate commands per second • Number of authenticate command failures since startup The default is n.
Maximum threshold for number of authentication failures	Specify the maximum number of authentication failures that can have occurred since startup. This script raises an event if the number of failures exceeds this threshold. The default is 1000.
Consecutive number of times before an event	Specify the maximum number of consecutive times the threshold can be exceeded before this script raises an event. The default is 5 consecutive occurrences.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.66 POP3Connections

Use this Knowledge Script to monitor the number of current and total connections to the POP3 service. You specify the maximum number of current and total connections and the number of consecutive times the threshold can be exceeded before raising an event. This script raises an event if the current or the total connections exceed the threshold for the specified consecutive number of intervals.

34.66.1 Resource Object

POP3 Virtual Server

34.66.2 Default Schedule

The default interval is **Every hour**.

34.66.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns: • Total connections • Current connections The default is n.
Maximum threshold for total number of connections	Specify the maximum number of POP3 connections that can have occurred since the POP3 server was last started. This script raises an event if the number of connections exceeds this threshold. The default is 1000 connections.
Maximum threshold for number of current POP3 connections	Specify the maximum number of POP3 connections that can occur during the current monitoring interval. This script raises an event if the number of connections exceeds the threshold. The default is 100 connections.
Consecutive number of times before an event	Specify the consecutive number of intervals the threshold for connections can be exceeded before raising an event. The default is 5 consecutive intervals. Because connections can have periodic spikes, you can set this parameter to a higher value to filter out unnecessary events. For example, you can allow the number of current connections to exceed the threshold 3 to 4 times before an event is raised.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.67 ProtocolVSStatus

Use this Knowledge Script to monitor the status of HTTP, NNTP, POP3, IMAP4, and SMTP virtual servers. This script attempts to restart a virtual server that is detected as down.

34.67.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.67.2 Default Schedule

The default interval is **Every hour**.

34.67.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Automatically restart service?	Set to **y** to automatically restart a service that is down. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns 100 if a monitored virtual server is up, 0 if a monitored virtual server is down. The default is n.
Event?	Set to **y** to raise an event if a service is down and restart fails or succeeds, or you do not want to restart. The default is y.
Severity: Failed to restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and AppManager fails to restart the service. The default is 5 (red event indicator).
Severity: Successful restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and AppManager successfully restarts the service. The default is 25 (blue event indicator).
Severity: Do not restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and you do not want AppManager to restart the service. The default value is 18 (yellow event indicator).

34.68 PublicStoreMountStatus

Use this Knowledge Script to monitor the mount status of one or more public stores. When a public store is unmounted, the Exchange Server cannot store information in it or read information from it.

34.68.1 Resource Object

Information Store folder, Public Store object

34.68.2 Default Schedule

The default interval is **Every hour**.

34.68.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a public store is unmounted. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns 100 if the public store is mounted, 0 if the public folder store is unmounted. The default is n.
Event severity	Set the event notification level, from 1 to 40, to indicate the importance of an event in which a public store is unmounted. The default is 5 (red event indicator).

34.69 QueueStatus

Use this Knowledge Script to monitor the inbound and outbound message queue status of all X.400 and SMTP virtual servers, including the number, size, and elapsed time for messages that reside in a message queue. This script raises an event if the number, size, or elapsed time exceeds the threshold you set.

34.69.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.69.2 Default Schedule

The default interval is **Once a day**.

34.69.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Specify a protocol (X400, SMTP, or ALL)	Select one of the following to specify the protocols to monitor (not case-sensitive): • **X400** monitors the X.400 protocol. • **SMTP** monitors the SMTP protocol. • **ALL** monitors both X.400 and SMTP protocols. The default is ALL.
Collect total number of messages, queue sizes and elapsed time of queues?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total number of messages, queue size, and elapsed time of inbound and outbound message queues. The default is n.
Collect data for number of messages in queues?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of messages in a message queue. The default is n.
Threshold - Maximum for number of messages in queues	Specify the maximum number of messages that can be in a queue before an event is raised. The default is 1000.
Event for number of messages in queues?	Set to **y** to raise an event when the number of messages in queue exceeds the threshold. The default is y.
Event severity: Number of messages in queues	Set the event severity level, from 1 to 40, to specify the importance of an event in which the number of messages in queue exceeds the threshold. The default is 5.
Collect data for size of queues?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the size of a message queue. The default is n.
Threshold - Maximum for size of queues	Specify the maximum size a queue can attain before an event is raised. The default is 100 MB.
Event for size of queues?	Set to **y** to raise an event when the size of a message queue exceeds the threshold. The default is y.

Description	How to Set It
Event severity: Size of queues	Set the event severity level, from 1 to 40, to specify the importance of an event in which the size of a message queue exceeds the threshold. The default is 5.
Collect data for elapsed time in queues?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the oldest messages in a message queue. The default is n.
Threshold - Maximum for elapsed time in queues	Specify the maximum number of seconds a message can remain in queue before an event is raised. The default is 1000.
Event for elapsed time in queues?	Set to **y** to raise an event when a message spends too long in a queue. The default is y.
Event severity: Elapsed time in queues	Set the event severity level, from 1 to 40, to specify the importance of an event in which a message spends too long in a queue. The default is 5.

34.70 Report_Connectivity

Use this Knowledge Script to generate a report about the connectivity between Exchange 2000 Server and Exchange Server 2003. This report uses data collected by the Connectivity Knowledge Script.

34.70.1 Resource Object

Report Agent

34.70.2 Default Schedule

The default schedule is **Run once**.

34.70.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse [...]** to select the computers for your report.
Select time range	Click **Browse [...]** to set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse [...]** to select the days of the week to include in your report.
Data settings	
Hours or percentage on chart	Select whether to illustrate availability by **Hours** or by **Percentage**.
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.

Description	How to Set It
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse [...]** to define the graphic properties of the charts in your report.
Select output folder	Click **Browse [...]** to set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Click **Browse [...]** to set the report properties as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a report contains no data. The default is 25 (blue level indicator).
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

34.71 Report_InformationStoreSize

Use this Exchange_Report script to generate a report about the size of Exchange information stores. This report lets you aggregate the data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the Exchange_ISSize Knowledge Script.

34.71.1 Resource Object

Report Agent

34.71.2 Default Schedule

The default schedule for this Knowledge Script is **Run once**.

34.71.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (For example, each page shows the value of the *NT_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** generates a report with all data on a single page
Select time range	Click the **Browse [...]** button to open the time browser. Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click the **Browse [...]** button to select the days of the week to include in your report.
Aggregation by	Select the aggregation method for the data in your report: • Minute • Hour • Day
Aggregation interval	Select the interval by which the data in your report is aggregated. Possible values range from 1 to 90.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the aggregation interval (for example, the average value for 1 Hour) • **Minimum**: The minimum value of data points for the aggregation interval • **Maximum**: The maximum value of data points for the aggregation interval • **Count**: The number of data points for the aggregation interval • **Sum**: The total value of data points for the aggregation interval • **3Sigma**: The average + (3 * standard deviation) and average - (3 * standard deviation) • **Std**: The standard deviation • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval • **Open**: The first value for the aggregation interval • **Close**: the last value for the aggregation interval
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter help card?	Set to **yes** to include a card in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click the **Browse [...]** button to open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click the **Browse [...]** button to set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. This is helpful to make the correlation between a specific instance of a Report Script and the corresponding report. The default is no.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box. Set the properties parameters as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. It is useful to add a time stamp to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).

Description	How to Set It
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

34.72 Report_ISPrivateResourceSummary

Use this Knowledge Script to generate a report about the file space used by private information store folders and mailboxes. This report allows you to make a statistical analysis of the data point values over the time range you define for the report. This report uses data collected by the TopNISMailboxRes Knowledge Script.

34.72.1 Resource Object

Report Agent

34.72.2 Default Schedule

The default schedule is **Run once**.

34.72.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse [...]** to select the computers for your report.
Select time range	Click **Browse [...]** to set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse [...]** to select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report • **Minimum**: The minimum value of data points for the time range of the report • **Maximum**: The maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report • **Range**: The range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time range of the report • **Close**: The last value for the time range of the report • **Change**: The difference between the first and last values for the time range of the report (close - open = change) • **Count**: The number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse [...]** to define the graphic properties of the charts in your report.
Select output folder	Click **Browse [...]** to set parameters for the output folder.

Description	How to Set It
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Click **Browse [...]** to set the report properties as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25 (blue level indicator).
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

34.73 Report_ISPublicResourceSummary

Use this Knowledge Script to generate a report about the file space used by public information store folders. This report allows you to make a statistical analysis of the data point values over the time range you define for the report. This report uses data collected by the TopNISPublicRes Knowledge Script.

34.73.1 Resource Object

Report Agent

34.73.2 Default Schedule

The default schedule is **Run once**.

34.73.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse [...]** to select the computers for your report.
Select time range	Click **Browse [...]** to set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse [...]** to select the days of the week to include in your report.
Select the style	Select the style for the report: • **By computer** shows one value for each computer you selected. • **By legend** shows one value for each different legend (the legend is a truncated form of the data stream legend visible in the Operator Console). • **By computer and legend** shows one value for each unique legend from each computer.
Data settings	

Description	How to Set It
Statistics to show	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the time range of the report • **Minimum**: The minimum value of data points for the time range of the report • **Maximum**: The maximum value of data points for the time range of the report • **Min**/**Avg**/**Max**: The minimum, average, and maximum values of data points for the time range of the report • **Range**: The range of values in the data stream (maximum - minimum = range) • **StandardDeviation**: The measure of how widely values are dispersed from the mean • **Sum**: The total value of data points for the time range of the report • **Close**: The last value for the time range of the report • **Change**: The difference between the first and last values for the time range of the report (close - open = change) • **Count**: The number of data points for the time range of the report
Select sorting/display option	Select whether data is sorted, or the method of display: • **No sort**: Data is not sorted • **Sort**: Data is sorted by value (lowest to highest from front to back; highest to lowest from left to right) • **Top %**: Chart only the top N % of selected data (sorted by default) • **Top N**: Chart only the top N of selected data (sorted by default) • **Bottom %**: Chart only the bottom N % of data (sorted by default) • **Bottom N**: Chart only the bottom N of selected data (sorted by default)
Percentage/count for top/bottom	Specify a number for either the percent or count defined in the previous parameter (for example, Top 10%, or Top 10). The default is 25.
Truncate top/bottom?	If set to **yes**, then the data table shows only the top or bottom N or % (for example, only the top 10%). Otherwise, the table shows all data. The default is no.
Show totals on the table?	If set to **yes**, then additional calculations are made for each column of numbers in a table, and the following values are listed at the end of the table: • **Report Average**: An average of all values in a column • **Report Minimum**: The minimum value in a column • **Report Maximum**: The maximum value in a column • **Report Total**: The total of all values in a column The default is no.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse [...]** to define the graphic properties of the charts in your report.
Select output folder	Click **Browse [...]** to set parameters for the output folder.

Description	How to Set It
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Click **Browse [...]** to set the report properties as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25 (blue level indicator).
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

34.74 Report_MessageBetweenSites

Use this Exchange_Report script to generate a report about the total number of messages transferred between Exchange sites. This report lets you aggregate the data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the Exchange_MsgsBetweenSites Knowledge Script.

34.74.1 Resource Object

Report Agent > AM Repositories > *AppManager repository*

34.74.2 Default Schedule

The default schedule for this Knowledge Script is **Run once**.

34.74.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (For example, each page shows the value of the *NT_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** generates a report with all data on a single page
Select time range	Click the **Browse [...]** button to open the time browser. Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click the **Browse [...]** button to select the days of the week to include in your report.
Aggregation by	Select the aggregation method for the data in your report: • Minute • Hour • Day
Aggregation interval	Select the interval by which the data in your report is aggregated. Possible values range from 1 to 90.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the aggregation interval (for example, the average value for 1 Hour) • **Minimum**: The minimum value of data points for the aggregation interval • **Maximum**: The maximum value of data points for the aggregation interval • **Count**: The number of data points for the aggregation interval • **Sum**: The total value of data points for the aggregation interval • **3Sigma**: The average + (3 * standard deviation) and average - (3 * standard deviation) • **Std**: The standard deviation • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval • **Open**: The first value for the aggregation interval • **Close**: the last value for the aggregation interval
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter help card?	Set to **yes** to include a card in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click the **Browse [...]** button to open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click the **Browse [...]** button to set parameters for the output folder.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box. Set the properties parameters as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. It is useful to add a time stamp to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

34.75 Report_MessageBetweenSitesKB

Use this Exchange_Report script to generate a report about the total size (in KB) of messages transferred between Exchange sites. This report lets you aggregate the data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the Exchange_MsgsBetweenSites Knowledge Script.

34.75.1 Resource Object

Report Agent > AM Repositories > *AppManager repository*

34.75.2 Default Schedule

The default schedule for this Knowledge Script is **Run once**.

34.75.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (For example, each page shows the value of the *NT_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** generates a report with all data on a single page
Select time range	Click the **Browse [...]** button to open the time browser. Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click the **Browse [...]** button to select the days of the week to include in your report.
Aggregation by	Select the aggregation method for the data in your report: • Minute • Hour • Day
Aggregation interval	Select the interval by which the data in your report is aggregated. Possible values range from 1 to 90.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the aggregation interval (for example, the average value for 1 Hour) • **Minimum**: The minimum value of data points for the aggregation interval • **Maximum**: The maximum value of data points for the aggregation interval • **Count**: The number of data points for the aggregation interval • **Sum**: The total value of data points for the aggregation interval • **3Sigma**: The average + (3 * standard deviation) and average - (3 * standard deviation) • **Std**: The standard deviation • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval • **Open**: The first value for the aggregation interval • **Close**: the last value for the aggregation interval
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter help card?	Set to **yes** to include a card in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click the **Browse [...]** button to open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click the **Browse [...]** button to set parameters for the output folder.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box. Set the properties parameters as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. It is useful to add a time stamp to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

34.76 Report_MessageFromOtherSites

Use this Exchange_Report script to generate a report about the number and size of messages sent to an Exchange site. This report lets you aggregate the data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the Exchange_MsgsBetweenSites Knowledge Script.

34.76.1 Resource Object

Report Agent > AM Repositories > *AppManager repository*

34.76.2 Default Schedule

The default schedule for this Knowledge Script is **Run once**.

34.76.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (For example, each page shows the value of the *NT_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** generates a report with all data on a single page
Select time range	Click the **Browse [...]** button to open the time browser. Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click the **Browse [...]** button to select the days of the week to include in your report.
Aggregation by	Select the aggregation method for the data in your report: • Minute • Hour • Day
Aggregation interval	Select the interval by which the data in your report is aggregated. Possible values range from 1 to 90.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the aggregation interval (for example, the average value for 1 Hour) • **Minimum**: The minimum value of data points for the aggregation interval • **Maximum**: The maximum value of data points for the aggregation interval • **Count**: The number of data points for the aggregation interval • **Sum**: The total value of data points for the aggregation interval • **3Sigma**: The average + (3 * standard deviation) and average - (3 * standard deviation) • **Std**: The standard deviation • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval • **Open**: The first value for the aggregation interval • **Close**: the last value for the aggregation interval
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter help card?	Set to **yes** to include a card in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click the **Browse [...]** button to open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click the **Browse [...]** button to set parameters for the output folder.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box. Set the properties parameters as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. It is useful to add a time stamp to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

34.77 Report_MessageToOtherSites

Use this Exchange_Report script to generate a report about the number and size of messages sent from an Exchange site. This report lets you aggregate the data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the Exchange_MsgsBetweenSites Knowledge Script.

34.77.1 Resource Object

Report Agent > AM Repositories > *AppManager repository*

34.77.2 Default Schedule

The default schedule for this Knowledge Script is **Run once**.

34.77.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (For example, each page shows the value of the *NT_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** generates a report with all data on a single page
Select time range	Click the **Browse [...]** button to open the time browser. Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click the **Browse [...]** button to select the days of the week to include in your report.
Aggregation by	Select the aggregation method for the data in your report: • Minute • Hour • Day
Aggregation interval	Select the interval by which the data in your report is aggregated. Possible values range from 1 to 90.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the aggregation interval (for example, the average value for 1 Hour) • **Minimum**: The minimum value of data points for the aggregation interval • **Maximum**: The maximum value of data points for the aggregation interval • **Count**: The number of data points for the aggregation interval • **Sum**: The total value of data points for the aggregation interval • **3Sigma**: The average + (3 * standard deviation) and average - (3 * standard deviation) • **Std**: The standard deviation • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval • **Open**: The first value for the aggregation interval • **Close**: the last value for the aggregation interval
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter help card?	Set to **yes** to include a card in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click the **Browse [...]** button to open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click the **Browse [...]** button to set parameters for the output folder.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box. Set the properties parameters as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. It is useful to add a time stamp to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

34.78 Report_ServerIMCTraffic

Use this Exchange_Report script to generate a report about the number of inbound and outbound messages handled by the Internet Mail Connector (IMC). This report lets you aggregate the data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the Exchange_ServerIMCTraffic Knowledge Script.

34.78.1 Resource Object

Report Agent > AM Repositories > *AppManager repository*

34.78.2 Default Schedule

The default schedule for this Knowledge Script is **Run once**.

34.78.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	Use the following parameters to select the data for your report.
Select computer(s)	Click the **Browse [...]** button to start the data wizard. Use the data wizard to select the computers for your report.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (For example, each page shows the value of the *NT_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** generates a report with all data on a single page
Select time range	Click the **Browse [...]** button to open the time browser. Set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click the **Browse [...]** button to select the days of the week to include in your report.
Aggregation by	Select the aggregation method for the data in your report: • Minute • Hour • Day

Description	How to Set It
Aggregation interval	Select the interval by which the data in your report is aggregated. Possible values range from 1 to 90.
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the aggregation interval (for example, the average value for 1 Hour) • **Minimum**: The minimum value of data points for the aggregation interval • **Maximum**: The maximum value of data points for the aggregation interval • **Count**: The number of data points for the aggregation interval • **Sum**: The total value of data points for the aggregation interval • **3Sigma**: The average + (3 * standard deviation) and average - (3 * standard deviation) • **Std**: The standard deviation • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval • **Open**: The first value for the aggregation interval • **Close**: the last value for the aggregation interval
Report settings	Use the following parameters to define the graphical presentation of data, the folder where the report is generated, and properties that identify the report.
Include parameter help card?	Set to **yes** to include a card in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click the **Browse [...]** button to open the Chart Settings dialog box. Define the graphic properties of the charts in your report.
Select output folder	Click the **Browse [...]** button to set parameters for the output folder.
Select properties	Click the **Browse [...]** button to open the Report Properties dialog box. Set the properties parameters as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. It is useful to add a time stamp to run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	Use the following parameters to raise events associated with generating the report, and to set severity levels for those events.
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 25 (blue level indicator).
Severity level for report failure.	Set the event severity level, from 1 to 40, to indicate the importance of the event. The default is 5 (red level indicator).

34.79 Report_ServerLoad

Use this Knowledge Script to generate a report about the rate at which the Exchange server sends and receives messages and the rate at which the Exchange server processes the RPC packets. This report lets you aggregate the data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the ServerLoad Knowledge Script.

34.79.1 Resource Object

Report Agent

34.79.2 Default Schedule

The default schedule is **Run once**.

34.79.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse [...]** to select the computers for your report.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (For example, each page shows the value of the *NT_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** generates a report with all data on a single page
Select time range	Click **Browse [...]** to set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse [...]** to select the days of the week to include in your report.
Aggregation by	Select the aggregation method for the data in your report: • Minute • Hour • Day
Aggregation interval	Select the interval by which the data in your report is aggregated. Possible values range from 1 to 90.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the aggregation interval (for example, the average value for 1 Hour) • **Minimum**: The minimum value of data points for the aggregation interval • **Maximum**: The maximum value of data points for the aggregation interval • **Count**: The number of data points for the aggregation interval • **Sum**: The total value of data points for the aggregation interval • **3Sigma**: The average + (3 * standard deviation) and average - (3 * standard deviation) • **Std**: The standard deviation • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval • **Open**: The first value for the aggregation interval • **Close**: the last value for the aggregation interval
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse [...]** to define the graphic properties of the charts in your report.
Select output folder	Click **Browse [...]** to set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Click **Browse [...]** to set report properties as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25 (blue level indicator).
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

34.80 Report_ServerMessage

Use this Knowledge Script to generate a report about the total number of mail recipients, messages delivered, messages sent, messages submitted, the mailbox store, and the public information store. This report lets you aggregate the data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the ServerTotalMsg Knowledge Script.

34.80.1 Resource Object

Report Agent

34.80.2 Default Schedule

The default schedule is **Run once**.

34.80.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse [...]** to select the computers for your report.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (For example, each page shows the value of the *NT_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** generates a report with all data on a single page
Select time range	Click **Browse [...]** to set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse [...]** to select the days of the week to include in your report.
Aggregation by	Select the aggregation method for the data in your report: • Minute • Hour • Day
Aggregation interval	Select the interval by which the data in your report is aggregated. Possible values range from 1 to 90.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the aggregation interval (for example, the average value for 1 Hour) • **Minimum**: The minimum value of data points for the aggregation interval • **Maximum**: The maximum value of data points for the aggregation interval • **Count**: The number of data points for the aggregation interval • **Sum**: The total value of data points for the aggregation interval • **3Sigma**: The average + (3 * standard deviation) and average - (3 * standard deviation) • **Std**: The standard deviation • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval • **Open**: The first value for the aggregation interval • **Close**: the last value for the aggregation interval
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse [...]** to define the graphic properties of the charts in your report.
Select output folder	Click **Browse [...]** to set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Click **Browse [...]** to set report parameters as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25 (blue level indicator).
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

34.81 Report_ServerUsers

Use this Knowledge Script to generate a report about the number of users connected to the information store. This report lets you aggregate the data by time period (minute, hour, or day) and calculate statistics for each period (for example, the average value per hour).

This report uses data collected by the ServerUsers Knowledge Script.

34.81.1 Resource Object

Report Agent

34.81.2 Default Schedule

The default schedule is **Run once**.

34.81.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse [...]** to select the computers for your report.
Select the style	Select the style for the first page of the report: • **By computer** provides links to pages showing the data collected from individual computers (each page shows all the data streams collected from a single computer) • **By data stream** provides links to pages showing a side-by-side comparison of values for the same data stream collected from different computers (For example, each page shows the value of the *NT_CpuResource-All Threads(#)* data stream from each computer) • **By computer and data stream** provides links to pages showing a single data stream collected from a computer • **All data streams on one page** generates a report with all data on a single page
Select time range	Click **Browse [...]** to set a specific or sliding time range for data included in your report.
Select peak weekday(s)	Click **Browse [...]** to select the days of the week to include in your report.
Aggregation by	Select the aggregation method for the data in your report: • Minute • Hour • Day
Aggregation interval	Select the interval by which the data in your report is aggregated. Possible values range from 1 to 90.

Description	How to Set It
Statistics to show per period	Select a statistical method by which to display data in the report: • **Average**: The average value of data points for the aggregation interval (for example, the average value for 1 Hour) • **Minimum**: The minimum value of data points for the aggregation interval • **Maximum**: The maximum value of data points for the aggregation interval • **Count**: The number of data points for the aggregation interval • **Sum**: The total value of data points for the aggregation interval • **3Sigma**: The average + (3 * standard deviation) and average - (3 * standard deviation) • **Std**: The standard deviation • **Box**: Lower fence, 25% point, median, 75% point, and upper fence for the aggregation interval • **Open**: The first value for the aggregation interval • **Close**: the last value for the aggregation interval
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Include table?	Set to **yes** to include a table of data stream values in the report. The default is yes.
Include chart?	Set to **yes** to include a chart of data stream values in the report. The default is yes.
Select chart style	Click **Browse [...]** to define the graphic properties of the charts in your report.
Select output folder	Click **Browse [...]** to set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Click **Browse [...]** to set report parameters as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25 (blue level indicator).
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

34.82 Report_TopNMailboxesInfo

Use this Knowledge Script to generate a report about the file space (in MB) used by the top private information store folders or mailboxes.

This report uses data collected by the TopNISMailboxRes Knowledge Script.

34.82.1 Resource Object

Report Agent

34.82.2 Default Schedule

The default schedule is **Run once**.

34.82.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse [...]** to select the computers for your report.
Select time range	Click **Browse [...]** to set a specific or sliding time range for data included in your report.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Select output folder	Click **Browse [...]** to set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Click **Browse [...]** to set report properties as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.

Description	How to Set It
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25 (blue level indicator).
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

34.83 Report_TopNReceivers

Use this Knowledge Script to generate a report about which users received the most mail messages, and the total file size of messages received by the top users or by all users.

This report uses data collected by the TopNReceivers Knowledge Script.

34.83.1 Resource Object

Report Agent

34.83.2 Default Schedule

The default schedule is **Run once**.

34.83.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse [...]** to select the computers for your report.
Select time range	Click **Browse [...]** to set a specific or sliding time range for data included in your report.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Select output folder	Click **Browse [...]** to set parameters for the output folder.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Select properties	Click **Browse [...]** to set report properties as desired.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.

Description	How to Set It
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25 (blue level indicator).
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

34.84 Report_TopNSenders

Use this Knowledge Script to generate a report about which users sent the most mail messages, and the total file size of messages sent by the top users or by all users.

This report uses data collected by the TopNSenders Knowledge Script.

34.84.1 Resource Object

Report Agent

34.84.2 Default Schedule

The default schedule is **Run once**.

34.84.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Data source	
Select computer(s)	Click **Browse [...]** to select the computers for your report.
Select time range	Click **Browse [...]** to set a specific or sliding time range for data included in your report.
Report settings	
Include parameter help card?	Set to **yes** to include a table in the report that lists parameter settings for the report script. The default is yes.
Select output folder	Click **Browse [...]** to set parameters for the output folder.
Select properties	Click **Browse [...]** to set the properties parameters as desired.
Add job ID to output folder name?	Set to **yes** to append the job ID to the name of the output folder. A job ID helps you correlate a specific instance of a Report Script with the corresponding report. The default is no.
Add time stamp to title?	Set to **yes** to append a time stamp to the title of the report, making each title unique. The time stamp is made up of the date and time the report was generated. A time stamp lets you run consecutive iterations of the same report without overwriting previous output. The default is no.
Event notification	
Event for report success?	Set to **yes** to raise an event when the report is successfully generated. The default is yes.

Description	How to Set It
Severity level for report success	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is successfully generated. The default is 35 (magenta level indicator).
Severity level for report with no data	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report contains no data. The default is 25 (blue level indicator).
Severity level for report failure	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the report is not generated. The default is 5 (red level indicator).

34.85 ResponseTime

Use this Knowledge Script to check the mail response time between two or more Exchange 2000 servers or Exchange Server 2003 servers. This script cannot monitor more than one Exchange 2000 or Exchange Server 2003 virtual server.

If you only have one Exchange server, do not use this script. If you only have one Exchange server, this script incorrectly reports that the Exchange Server is down. To monitor response time for a single Exchange server, use the AppManager ResponseTime for Microsoft Exchange module.

This script determines if e-mail is delivered and the time it takes for the message to be delivered. In addition, this script raises an event if a reply to the test message is not received within the response time threshold you set.

To run this script on a group of Exchange servers, each server must have the same profile name.

If a failover occurs when this script job is running, the job restarts on the new node. It is normal for the job on the failed node to generate one or more error messages, depending on what it was doing when the failover occurred.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.85.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.85.2 Default Schedule

The default interval is **Every 15 minutes**, which is appropriate if you are monitoring Exchange servers in a connected network.

If your Exchange servers rely on a remote WAN or LAN service (such as RAS) or a dial-up modem that is not always connected, you can set up server group folders to separate Exchange servers into different groups. Then you can set the schedule interval for this script to run on each folder based on each group's connection schedule.

For example, you can create one server group for your always-connected servers and a separate folder for offhours RAS connections and create two different sets of jobs with different schedules (frequently for your connected network and once a day or based on the scheduled connection time for the remote access servers). For information about setting up server groups, see the *User Guide for AppManager*.

34.85.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the response time threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the response time in seconds for each Exchange server. The default is y.
Exchange profile for NetIQmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager. This is especially true if you are running this script on the top-level Exchange folder or Exchange server groups.
Mailbox alias for NetIQmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager. This is especially true if you are running this script on the top-level Exchange folder or Exchange server groups.
Maximum threshold for response (in seconds)	Specify the maximum number of seconds that can elapse from the time the test message is sent out until a reply should be received. The default response time is 120 seconds.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event which the response time threshold is exceeded. The default value is 5 (red event indicator).

34.85.4 Example of How This Script is Used

To measure response time, this Knowledge Script sends a test mail message to each of Exchange servers being tested, using the profile and mailbox alias name set up for the computer running the job using AppManager Security Manager or the parameters specified in this script. After the test message is delivered by the "sending" server, each of the "receiving" servers responds with a reply. The response time is the time it takes for the "sending" server to receive this reply from the mail recipient.

For example, assume you run this script on a server group folder with the Exchange servers Paris, Cabernet, Dynamo, Boston, and Nero. The **netiq-Paris** Exchange client on Paris sends a message to Cabernet, Dynamo, Boston, and Nero. If Cabernet (**netiq-Cabernet**) responds and Paris receives the reply 60 seconds later, the response time from Paris to Cabernet is 60 seconds.

Simultaneously, the **netiq-Cabernet** Exchange client on Cabernet is sending test messages to Paris, Dynamo, Boston, and Nero. If the reply from Paris (**netiq-Paris**) is received 90 seconds after delivery, then the response time from Cabernet to Paris is 90 seconds.

Although this example focuses on the communication and response time between Paris and Cabernet, the same send-and-reply operations are taking place for all of the servers in the group.

34.85.5 Locale Considerations

This Knowledge Script asks Exchange to send a delivery-receipt message when the test e-mail is delivered to the recipient. In the English version of AppManager, this script looks for a delivery-receipt e-mail whose subject line is "Delivered."

If the recipient uses an Exchange server configured with a different locale, the subject line of the response is the word "Delivered" translated into that locale's language.

The English version of AppManager does not recognize a non-English response and, likewise, the Japanese version of AppManager does not recognize a non-Japanese response.

34.86 ServerHealth

Use this Knowledge Script to monitor the health of the Exchange server. This script monitors the percentage of time that all processors on the Exchange server are busy and the percentage of elapsed time that the Exchange server process threads are used to execute instructions. In addition, this script raises an event if a monitored value exceeds the threshold you set.

This script tracks the following performance objects:

Object	Counter	Instance
Processor	% Processor Time	_Total
Process	% Processor Time	inetinfo
Process	% Processor Time	EMSMTA
Process	% Processor Time	STORE
Process	% Processor Time	MAD
Memory	Pages/sec	

34.86.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.86.2 Default Schedule

The default interval is **Every 30 minutes**.

34.86.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns either the current value or the delta value for each monitored performance counter. The default is n.
Compare to previous monitoring interval?	Set to **y** to compare the data collected in the current monitoring interval to the previous monitoring interval. If set to y, any graphs you create plot the comparison value rather than the total value. If set to y, the data collected and the thresholds you set can be positive or negative. The default is n.
Maximum threshold for total processor usage	Specify the maximum percentage of time that all the processors on the system can be busy executing non-idle threads. This value can be viewed as the fraction of the time spent doing useful work. On a multi-processor system, if all processors are always busy this is 100%, if all processors are 50% busy this is 50% and if 25%of the processors are 100% busy, this is 25%. The default is 99%.

Description	How to Set It
Maximum threshold for processor usage by Exchange services	Specify the maximum percentage of elapsed processor time that all of the threads the Exchange server processes can use to execute instructions. Code executed to handle certain hardware interrupts or trap conditions may be counted. The default is 10%.
Maximum threshold for total memory pages per second	Specify the maximum number of pages that can be read from the disk or written to the disk to resolve memory references. This value is the sum of pages input/sec and pages output/sec and includes paging traffic on behalf of the system Cache to access file data for applications and pages to and from non-cached, mapped memory files. The default is 200 memory pages per second. **Tip** This is the primary counter to observe if you are concerned about excessive memory pressure (thrashing), and the excessive paging that may result.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.87 ServerHistory

Use this Knowledge Script to monitor the complete message history for an Exchange server. This script monitors the combined message count for the mailbox stores and public information stores.

This script raises an event if the number of messages exceeds the threshold you set.

34.87.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.87.2 Default Schedule

The default interval is **Every 30 minutes**.

34.87.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following data: • Number of recipients that have received a message (message recipients delivered - private information or mailbox store). • Number of messages delivered (messages delivered - private information or mailbox store). • Number of messages sent (messages sent - private information or mailbox store). • Number of messages submitted (messages submitted - public information store). • Number of recipients that have received messages (message recipients delivered - public information store). • Number of messages sent (messages sent - public information store). • Number of Exchange users • MTA work queue length. The default is n.

Description	How to Set It
Maximum threshold for number of messages	Specify the total number of messages that can have occurred since startup before an event is raised. The default is 10000 messages. To track messages, this script monitors the following: Mailbox information store: • Total number of recipients that have received a message since startup (message recipients delivered). • Total number of messages delivered to all recipients since startup (messages delivered). • Total number of messages sent to other storage providers via Message Transfer Agent (MTA) since startup (messages sent). • Total number of messages submitted by clients since startup (messages submitted). Public information store: • Total number of recipients that have received a message since startup (message recipients delivered). • Total number of messages sent to other storage providers via MTA since startup (messages sent).
Maximum threshold for number of users	Specify the maximum number of users that can be connected to the private and public information store or mailbox store and public information store before an event is raised. The default is 500 users.
Maximum threshold for number of messages in work queue	Specify the maximum number of outstanding messages that can be in the work queue before an event is raised. Messages in the work queue have not yet been processed to completion by the MTA. The default is 5 messages.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.88 ServerIMCFailedConnections

Use this Knowledge Script to monitor the total number of SMTP connections the Internet Mail Connector (IMC) or Internet Mail Service has attempted to other hosts that failed since the IMC or Internet Mail Service was started.

NOTE: Depending on the version of Exchange you are monitoring, the Exchange Internet Mail Connector component may be referred to as the Internet Mail Service.

This script helps you monitor the performance of your Exchange configuration and overall Internet connectivity.

34.88.1 Resource Object

IMC Queue

34.88.2 Default Schedule

The default interval for this Knowledge Script is **Every 30 minutes**.

34.88.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when the number of failed SMTP connections exceeds the threshold you set. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the total number of failed SMTP connections. The default is n.
Maximum threshold for failed SMTP connections	Specify the maximum number of SMTP connections that can fail before an event is raised. The default is 100 failed connections.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of failed SMTP connection exceeds the threshold. The default is 5 (red event indicator).

34.89 ServerIMCNDR

Use this Knowledge Script to monitor the Internet Mail Connector (IMC) or Internet Mail Service non-delivery reports (NDRs). When a server or gateway is unable to deliver a mail message, it sends an NDR to the originator of the message. This script raises an event if the total number of NDRs exceeds the threshold you set.

NOTE: Depending on the version of Exchange you are monitoring, the Exchange Internet Mail Connector component may be referred to as the Internet Mail Service.

34.89.1 Resource Object

IMC Queue

34.89.2 Default Schedule

The default interval for this Knowledge Script is **Every 30 minutes**.

34.89.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when the server exceeds a threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following information: • The total number of inbound NDRs • The total number of outbound NDRs The default is n.
Maximum threshold for NDRs from inbound messages	Specify the maximum number of NDRs for inbound messages that can occur before an event is raised. The default is 10.
Maximum threshold for NDRs from outbound messages	Specify the maximum number of NDRs for outbound messages that can occur before an event is raised. The default is 10.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.90 ServerIMCQueue

Use this Knowledge Script to monitor Internet Mail Connector (IMC) or Internet Mail Service queues. You can set thresholds for inbound and outbound queues. This script raises an event if a queue exceeds the threshold you set.

NOTE: Depending on the version of Exchange you are monitoring, the Exchange Internet Mail Connector component may be referred to as the Internet Mail Service.

34.90.1 Resource Object

IMC Queue

34.90.2 Default Schedule

The default interval for this Knowledge Script is **Every 5 minutes**.

34.90.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following information: • The total number of inbound messages in the Internet mail queue • The total number of outbound messages in the Internet mail queue • The total number of inbound messages in the Exchange mail queue • The total number of outbound messages in the Exchange mail queue The default is n.
Maximum threshold for number of Queued Inbound messages	Specify the maximum number of messages that can be received from the Internet before an event is raised. The default is 10.
Maximum threshold for number of Queued MTS-IN messages	Specify the maximum number of messages that can be awaiting final delivery before an event is raised. The default is 10.
Maximum threshold for number of Queued MTS-OUT messages	Specify the maximum number of messages that can be waiting to be converted to Internet Mail format before an event is raised. The default is 10.
Maximum threshold for number of Queued Outbound messages	Specify the maximum number of messages that can be queued for delivery to the Internet before an event is raised. The default is 10.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.91 ServerIMCStatistics

Use this Knowledge Script to monitor Internet Mail Connector (IMC) or Internet Mail Service statistics on an Exchange Server. Use this script to monitor and summarize at a high level the amount of Internet e-mail your organization sends and receives.

NOTE: Depending on the version of Exchange you are monitoring, the Exchange Internet Mail Connector component may be referred to as the Internet Mail Service.

This script tracks the total number of Internet messages delivered to the Exchange server (inbound messages) and the total number of Internet messages delivered to external destinations (outbound messages). This script raises an event if the number of inbound or outbound messages exceeds the threshold you set.

34.91.1 Resource Object

IMC Queue

34.91.2 Default Schedule

The default interval for this Knowledge Script is **Every hour**.

34.91.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns either the total number of inbound and outbound messages or the difference in the number of inbound and outbound messages during the monitoring period, depending how you set the *Compare to previous monitoring interval* parameter. The default is n.
Compare to previous monitoring interval?	Set to **y** to compare the data collected in the current monitoring interval to the previous monitoring interval. If set to y, any graphs you create plot the comparison value rather than the total value. If set to y, the data collected and the thresholds you set can be positive or negative. The default is n.
Maximum threshold for total inbound messages	Specify the maximum number of Internet messages that can be inbound before an event is raised. The default is 5000.
Maximum threshold for total outbound messages	Specify the maximum number of outbound messages that can be delivered before an event is raised. The default is 5000.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.92 ServerIMCTraffic

Use this Knowledge Script to monitor the Internet Mail Connector (IMC) or Internet Mail Service traffic. This script raises an event if the number of inbound or outbound messages exceeds the threshold you set.

NOTE: Depending on the version of Exchange you are monitoring, the Exchange Internet Mail Connector component may be referred to as the Internet Mail Service.

34.92.1 Resource Object

IMC Queue

34.92.2 Default Schedule

The default interval for this Knowledge Script is **Every hour**.

34.92.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following information: • Number of messages entering MTS-IN after conversion from Internet mail format and awaiting delivery by MS Exchange Server • Number of messages entering MTS-OUT after conversion to Internet mail format • Number of messages leaving MTS-OUT to be delivered by the Internet mail connector • Number of connections inbound from the Internet connector • Number of connections outbound to the Internet connector The default is n.
Maximum threshold for messages entering MTS-IN	Specify the maximum number of messages that can enter the MTS-IN folder before an event is raised. The default is 50.
Maximum threshold for messages entering MTS-OUT	Specify the maximum number of messages that can enter the Internet Mail Connector's MTS-OUT folder before an event is raised. The default is 50.
Maximum threshold for messages leaving MTS-OUT	Specify the maximum number of messages that can enter the outbound queue before an event is raised. The default is 50.
Maximum threshold for inbound connections	Specify the maximum number of SMTP connections to the Internet Mail Connector that can be established by other SMTP hosts before an event is raised. The default is 50.

Description	How to Set It
Maximum threshold for outbound connections	Specify the maximum number of SMTP connections that the Internet Mail Connector can establish to other SMTP hosts before an event is raised. The default is 50.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.93 ServerLoad

Use this Knowledge Script to monitor the load on the Exchange server. This script tracks the rate at which the Exchange server receives and submits messages per minute. This script also monitors the rate at which the Exchange server processes the RPC packets. This script raises an event if a threshold is exceeded.

34.93.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.93.2 Default Schedule

The default interval is **Every 30 minutes**.

34.93.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following load information: • Rate of messages delivered per minute • Rate of messages submitted per minute • Rate of delivery for RPC packets per second **NOTE:** The specific data streams you see will depend on the version of Exchange you are monitoring. The default is n.
Threshold for delivered private messages per minute	Specify the maximum rate at which recipients can receive private messages before an event is raised. The default is 500 per minute.
Threshold for submitted private messages per minute	Specify the maximum rate at which private messages can be submitted by clients before an event is raised. The default is 500 per minute.
Threshold for delivered public messages per minute	Specify the maximum rate at which recipients can receive public messages before an event is raised. The default is 500 per minute.
Threshold for submitted public messages per minute	Specify the maximum rate at which public messages can be submitted by clients before an event is raised. The default is 500 per minute.
Threshold for adjacent MTA associations	Specify the maximum number of open associations that this MTA can have to other MTAs before an event raised. The default is 100.
Threshold for processed RPC packets per second	Specify the maximum rate at which RPC packets can be processed before an event is raised. The default is 500 per second.
Threshold for address book browse operations per second	Specify the maximum rate at which address book clients can perform browse operation before an event is raised. The default is 150 per second.

Description	How to Set It
Threshold for address book read operations per second	Specify the maximum rate at which address book clients can perform read operations before an event is raised. The default is 100 per second.
Threshold for extended directory service read operations per second	Specify the maximum rate at which extended directory service clients can perform read operations before an event is raised. The default is 50 per second.
Threshold for directory service replication updates per second	Specify the maximum rate at which replication updates can be applied by the local directory service before an event is raised. The replication rate indicates how much replication activity is occurring on the server. The default is 50 per second.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.94 ServerQueues

Use this Knowledge Script to monitor Exchange server queues, including the MTA work queue and the IS Private and IS Public send and receive queues. This script raises an event if a queue exceeds the threshold you set.

34.94.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.94.2 Default Schedule

The default interval is **Every 30 minutes**.

34.94.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the queue length for each queue monitored. The default is n.
Threshold for number of messages in MTA work queue	Specify the maximum number of outstanding messages that can be in the work queue before an event is raised. The work queue contains messages not yet processed to completion by the MTA. The default is 20 messages.
Threshold for number of private messages in send queue	Specify the maximum number of private messages that can be in the send queue before an event is raised. The default is 20 messages.
Threshold for number of public messages in send queue	Specify the maximum number of public messages that can be in the send queue before an event is raised. The default is 20 messages.
Threshold for number of private messages in receive queue	Specify the maximum number of private messages that can be in the receive queue before an event is raised. The default is 20 messages.
Threshold for number of public messages in receive queue	Specify the maximum number of public messages that can be in the receive queue before an event is raised. The default is 20 messages.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.95 ServerTotalMsg

Use this Knowledge Script to monitor the total number of messages for an Exchange server. You can set separate thresholds for the total number of mail recipients, the number of messages delivered, the number of messages sent, the number of messages submitted, and the number of messages waiting to be delivered for the mailbox store and public information store. This script raises an event if the server exceeds a threshold.

34.95.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.95.2 Default Schedule

The default interval is **Every 24 hours**.

34.95.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the following information: • Number of recipients to whom messages were delivered • Number of messages delivered • Number of messages sent • Number of messages submitted • Number of messages still outstanding The default is n.
Maximum threshold for private message recipients	Specify the maximum number of recipients that can receive private messages before an event is raised. The default is 800.
Maximum threshold for private delivered messages	Specify the maximum number of private messages that can be delivered to all recipients before an event is raised. The default is 800. This parameter is applicable for the mailbox store on Exchange 2000 Server.
Maximum threshold for private sent messages	Specify the maximum number of private messages that can be sent to other storage providers by Message Transfer Agent (MTA). This script raises an event if the number of messages exceeds the threshold. The default is 800. This parameter is applicable for the mailbox store on Exchange 2000 Server.

Description	How to Set It
Maximum threshold for private submitted messages	Specify the maximum number of private messages that can be submitted by clients before an event is raised. The default is 800. This parameter is applicable for the mailbox store on Exchange 2000 Server.
Maximum threshold for private outstanding messages	Specify the maximum number of private messages that can be waiting for delivery before an event is raised. The default is 800. This parameter is applicable for the mailbox store on Exchange 2000 Server.
Maximum threshold for public message recipients	Specify the maximum number of recipients that can receive public messages before an event is raised. The default is 800.
Maximum threshold for public sent messages	Specify the maximum number of public messages that can be sent to other storage providers by Message Transfer Agent (MTA). This script raises an event if the number of messages exceeds the threshold. The default is 800.
Maximum threshold for public submitted messages	Specify the maximum number of public messages that can be submitted before an event is raised. The default is 800.
Maximum threshold for public outstanding messages	Specify the maximum number of public messages that can be waiting for delivery before an event is raised. The default is 800.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.96 ServerUsers

Use this Knowledge Script to monitor the number of users connected to the information store. This script raises an event if the number of users exceeds the threshold you set.

34.96.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.96.2 Default Schedule

The default interval is **Every hour**.

34.96.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if the number of user connections exceeds the threshold. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of user connections. The default is n.
Maximum threshold for number of connected users	Specify the maximum number of users that can be connected to the information store before an event is raised. The default is 500 users.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the number of user connections exceeds the threshold. The default is 5 (red event indicator).

34.97 ServicesDown

Use this Knowledge Script to monitor the up and down status of Exchange services. This script checks services using the known order of dependency, which is managed by the Windows service controller. If any service is detected as down, this script can automatically attempt to restart the service and any dependent services.

NOTE: In Exchange Server 2003, the Exchange Event Service stops automatically if it does not have any work to do. If you are using the ServicesDown Knowledge Script to monitor this service, you get an event every time this service shuts down. If this script is set to restart it, you may get an event every time the script runs if the service continues to stop itself.

34.97.1 Resource Object

Exchange 2000 Server or Exchange Server 2003, Exchange Services folder.

34.97.2 Default Schedule

The default interval is **Every 5 minutes**.

34.97.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Automatically re-start service?	Set to **y** to automatically restart down services. The default is y.
Severity: Failed to restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and AppManager could not restart the service. The default is 5 (red event indicator).
Severity: Successful restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and AppManager restarted the service. The default is 25 (blue event indicator).
Severity: Do not restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a service is down and you do not want to restart the service. The default is 18 (yellow event indicator).
Check MSExchangeCCMC?	Set to **y** to check the Exchange Connector for Lotus cc:Mail. The default is n.
Check MSExchangeChat?	Set to **y** to check the Microsoft Exchange Chat service. The default is n.
Check MSExchangeCOCO?	Set to **y** to check the Exchange Connectivity Controller. The default is n.
Check MSExchangeDX?	Set to **y** to check the Exchange Directory Synchronization service. The default is y.
Check MSExchangeES?	Set to **y** to check the Exchange Event Service. The default is n.
Check MSExchangeFB?	Set to **y** to check the Exchange Schedule and Free/Busy Connector service. The default is n.

Description	How to Set It
Check MSExchangeGWRtr?	Set to **y** to check the Microsoft Exchange Router for Novell GroupWise. The default is n.
Check MSExchangeIS?	Set to **y** to check the Exchange Information Store service. The default is y.
Check MSExchangeKMS?	Set to y to check the Exchange Key Management Server service. The default is n.
Check MSExchangeMSMI?	Set to **y** to check the MS Mail Connector Interchange service. The default is n.
Check MSExchangeMTA?	Set to **y** to check the Exchange Message Transfer Agent service. The default is y.
Check MSExchangePCMTA?	Set to **y** to check the MS Mail Connector (PC) MTA service. The default is n.
Check MSExchangeSA?	Set to **y** to check the Exchange System Attendant. The default is y.
Check MSExchangeWEB?	Set to **y** to check the Exchange Web Component. The default is y.
Check MSExchangeDS?	Set to **y** to check the Exchange Directory service. The default is y.
Check MSExchangeIMC?	Set to **y** to check the Exchange Internet Mail Connector service. The default is n.
Check MSExchangeSRS?	Set to **y** to check the Site Replication Service. The default is y.
List of services (comma separated)	Specify any additional services you want to monitor. Separate the names by commas with no spaces.

34.98 SMTPConnectivity

Use this Knowledge Script to verify connectivity between an Exchange Server and one or more Internet domains through an SMTP gateway. The script verifies connectivity by sending a message to a non-existent user account and examining the resulting non-delivery report (NDR).

NOTE: Receiving no report is interpreted as a connectivity failure. If you do not allow NDRs, for example, for security reasons, try using the SMTPConnectivityExKnowledge Script, which allows you to send a message to an existing account and examine a delivery report (DR).

If you are checking the domain `netiq.com`, this script sends a test message to `a++++@netiq.com`. This is presumed to be a non-existent account. When the message cannot be delivered to the recipient, the Internet Mail Service sends an NDR to the Exchange mailbox associated with the AppManager agent to indicate the failure. This script scans the subject and body of the NDR for strings that indicate the status of the SMTP gateway host:

- If the test message is delivered to the SMTP host, the NDR says that the user does not exist, but indicates that there is connectivity between Exchange and the SMTP gateway.
- If the test message generates an NDR because it fails to reach the SMTP host, indicates that there is no connectivity between Exchange and the SMTP gateway.

Therefore, to configure this script, you need to know the strings that appear in an NDR subject and body when the domain you are checking is available or unavailable.

If a failover occurs when this script job is running, the job restarts on the new node. It is normal for the job on the failed node to generate one or more error messages, depending on what it was doing when the failover occurred.

To use this Knowledge Script effectively, perform the following before running this script:

1. Verify that your Exchange Server uses the Internet Mail Connector or Internet Mail Service to connect to the Internet through an SMTP gateway.
2. Verify how long it takes the gateway to forward NDRs to the mailbox associated with the AppManager agent service account. If the AppManager agent mailbox does not receive NDRs before the next time it runs, it is considered a connectivity failure.
3. As a test, send an e-mail message to an invalid user account on a valid domain, for example, `a++++@netiq.com`, and see how long it takes for the NDR to come back. If the NDR does not come back before this Knowledge Script runs again, it is interpreted as a domain connectivity failure.
4. If the AppManager agent mailbox successfully receives the NDR, check the subject line and message body for the text strings that indicate the status of the SMTP server. The subject and body text in an NDR can vary for each domain, but typically you can determine the status of the host by checking for the following information:
   - Check the subject line for the keyword string indicating that the test message was not delivered. For example, `Undeliverable` indicates that either the host is unavailable, or the user does not exist, but you cannot tell which until you check the body.
   - Check the body of the message for the same indications. A text string such as `Destination server for this recipient could not be found` indicates no connectivity. A string such as `e-mail account does not exist` means that there is connectivity, even though there is no such account.

   If the subject and the body of the NDR do not help you to determine text strings to use for checking the availability of the SMTP host, try sending a test message to another domain.

5. Repeat this test message when the host is down.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.98.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.98.2 Default Schedule

The default interval is **Every 15 minutes**.

34.98.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event for connectivity status. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns a value of 100 if the connection between the Exchange Server and Internet domain is up or a value of 0 if the connection is down during the interval. The detail message includes the name of each Exchange Server and domain connection checked. When there is connectivity, this script also collects the response time in seconds. The default is y.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange Server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange Server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.

Description	How to Set It
List of domains	Specify the domain names that you want to check. If specifying more than one, the Subject and Body Keywords are matched to all of them. Use a pipe character (|) to separate multiple strings. For example: `netiq.com|abc.com` The default domain is netiq.com.
Subject keywords when ...	Provide a keyword string found in the subject line of the NDR message that indicates whether the host status is up or down. • **... host is up**. Enter a keyword string that appears in the subject line of the NDR when mail delivery fails but the host is available. The default is `Undeliverable`. • **... host is down**. Enter a keyword string that appears in the subject line of the NDR when mail delivery fails because the host is not available. The default is `Undeliverable`. If specifying a string for more than one Internet domain, the order in which you specify the keyword strings must correspond to the list of Internet domains. Use a pipe character (|) to separate multiple strings. **NOTE:** Depending on your environment, you may need to set keyword strings for both the subject line and the message body to determine the availability of the host server. For more information, see "Understanding How Keyword Strings Work" on page 2006. If you do not specify a value for a parameter, the parameter always matches. If you do not want to use a particular parameter to determine connectivity, you can enter a "garbage" string that does not appear in the NDR.
Body keywords when ...	Provide a keyword string found in the body of the NDR message that indicates whether the host status is up or down. • **... host is up**. Enter a keyword string that appears in the message body of the NDR when mail delivery fails but the host is available. The default is `e-mail account does not exist`. • **... host is down**. Enter a keyword string that appears in the message body of the NDR when mail delivery fails because the host is not available. The default is `destination server for this recipient could not be found`. If specifying a string for more than one Internet domain, the order in which you specify the keyword strings must correspond to the list of Internet domains. Use a pipe character (|) to separate multiple strings. **NOTE:** Depending on your environment, you may need to set keyword strings for both the subject line and the message body to determine the availability of the host server. For more information, see "Understanding How Keyword Strings Work" on page 2006. If you do not specify a value for a parameter, the parameter always matches. If you do not want to use a particular parameter to determine connectivity, you can enter a "garbage" string that does not appear in the NDR.
Maximum threshold for a response	Specify the maximum number of seconds in which you expect to get a response. If a response takes longer than this number of seconds, this script raises an event. The default is 120 seconds.

Description	How to Set It
Description file on managed client	Set to **y** to use the keyword strings specified in a file on the managed client to describe the host status. If this parameter is set to y, the subject and body keywords are ignored. The default is n. For more information, see "Understanding How Description Files Work" on page 2007.

Description file name	Provide the full path to the file on the agent computer that contains the description file. For example:
	
	`C:\temp\msgsample.txt`
	
	To use the specified description file, you must set the Description file on managed client parameter to y.
	
	The default is `C:\temp\aa.txt`.
	
	You can use the UNC format to specify the path. For example:
	
	`\\ENG\appdev\mylog.txt`
	
	Tip You can only specify one file name for any job instance. To monitor multiple files, create separate Knowledge Script jobs.

Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event. The default is 5 (red event indicator).

34.98.4 Understanding How Keyword Strings Work

AppManager compares the text in the subject and message body of the NDR to the Subject and Body keyword strings you specify. As the script runs, it searches the subject and body of the NDR from left to right for a string that matches the string you have specified, including any spaces. The search is not case-sensitive, however, so you can specify the keyword strings in upper, lower, or mixed case.

For NDRs that substitute the SMTP address or host name in the message body, you can simplify the keyword string by using the following:

- `%%` substitutes the SMTP address. For example, if the body of an NDR contains `User a++++@netiq.com does not exist`, you can search for this string by specifying `User %% does not exist`.
- `##` substitutes the host name. For example, if the body of an NDR contains `Host abc.com does not exist`, you can search for this string by specifying `Host ## does not exist`.

If you specify keyword strings for multiple parameters, AppManager uses rules of precedence to determine the status of the host computer. If the script finds a match to the keyword string you specify for either Subject keywords when host is down, Body keywords when host is down, or both, the script reports the host as unavailable, even if there is also a match for the Subject keywords when host is up, Body keywords when host is up, or both. In general, the only time the script reports the host available is if:

- The report subject line contains no matches to the "Subject keywords when host is down" keyword string, and...
- The report body contains no matches to the "Body keywords when host is down" keyword string, and...
- The report contains matches for both the "Subject keywords when host is up" keyword string and "Body keywords when host is up" keyword string.

If you do not specify a text string for a parameter, the parameter is always considered a match. To configure a parameter to never match, enter a "garbage" text string that does not appear anywhere in the NDR.

34.98.5 Using Keyword Strings to Determine Availability

To configure this Knowledge Script, you must provide specific strings that indicate whether a domain host is available for mail delivery. To do this, you must be familiar with the content of delivery reports (DRs) and NDRs and how to select an appropriate string for which to search.

You can configure this script to identify the host status using the following keyword strings:

Parameter	What to Specify
Subject keywords when host is up	Undeliverable
Subject keywords when host is down	Mail System Error - Returned Mail
Body keywords when host is up	The recipient name is not recognized
Body keywords when host is down	Host netiq.com not found

34.98.6 Understanding How Description Files Work

You can configure this Knowledge Script to use keyword strings specified in the Values tab of the Knowledge Script Properties dialog box or a *description file* on the agent computer.

A description file resides on the agent computer and specifies the keyword strings for one or more Internet domains. If you are monitoring more than one Internet domain, you can use a description file instead of entering keyword strings in the Values tab in the Knowledge Script properties.

If you are using SMTPConnectivity, the account `a++++` is automatically added to the domain name for the test.

If you are using SMTPConnectivityEx, you must specify the account name, such as `a++++@abc.com` or `testaccount@def.com`.

The following parameters are used in the description file to determine the host status. You can specify these parameters at the beginning of the file (followed by a list of domain accounts) or after a single domain name:

- **UpSubject**. Type a keyword string that appears in the report subject line when the host is available.
- **DownSubject**. Type a keyword string that appears in the report subject line when the host is not available.
- **UpBody**. Type a keyword string that appears in the body of the report when the host is available.
- **DownBody**. Enter a keyword string that appears in the body of the report when the host is not available.

NOTE: If you do not specify a parameter, the parameter definition from the previous domain is used, if one was specified.

Here is a sample description file for **SMTPConnectivity** that uses the same Subject and Body keywords to check the `NetIQ Corporation` and `ABC` Internet domains:

```
UpSubject = "undelivered report"
DownSubject = "undelivered report"
UpBody = "user not found"
DownBody = "host not found"
[netiq.com]
[abc.com]
```

Here is a sample description file for SMTPConnectivityEx that describes three Internet domains. Note the use of the account names when using this script. The first domain (`netiq.com`) uses different keywords than the second domain (`abc.com`). The third domain (`def.com`) reuses the Subject and Body keywords from the second domain:

```
[a++++@netiq.com]
UpSubject = "undelivered report"
DownSubject = "undelivered report"
UpBody = "user not found"
DownBody = "host not found"

[testaccount@abc.com]
UpSubject = "delivery complete"
DownSubject = "non-delivered report"
UpBody = "delivery complete"
DownBody = "host unavailable"

[testaccouunt@def.com]
```

34.98.7 Checking Connectivity for Multiple Domains

To monitor more than one Internet domain and specify the host status parameters in the Values tab of the Knowledge Script properties dialog box, use only the specified keyword strings for each domain. The order in which you specify the keyword strings must correspond to the order in which you list the Internet domains, and you must use the pipe character (`|`) to separate the strings.

To monitor more than one Internet domain and specify the host status parameters in a description file rather than as a text string for each parameter, use the parameter definition for the previous domain. For more information, see "Understanding How Description Files Work" on page 2007.

34.99 SMTPConnectivityEx

Use this Knowledge Script to verify connectivity between an Exchange Server and one or more accounts at various Internet domains through an SMTP gateway. It does this by sending a message to a user account (either real or non-existent) and examining the resulting delivery report (DR) or non-delivery report (NDR).

This script scans the subject and body of the report for specific strings that indicate the status of the SMTP gateway host:

- If the test message is sent successfully to the SMTP host, and the message generates either a DR or an NDR, it indicates that the SMTP host is available and there is connectivity between Exchange and the SMTP gateway.
- If the test message generates an NDR because it fails to reach the SMTP host, it indicates that there is no connectivity between Exchange and the SMTP gateway.

Therefore, to configure this script, you need to know the strings that appear in the DR and NDR subject and body that indicate the delivery status.

If no report is received, it is interpreted as a connectivity failure.

If a failover occurs when this script job is running, the job restarts on the new node. It is normal for the job on the failed node to generate one or more error messages, depending on what it was doing when the failover occurred.

To use this Knowledge Script effectively, do the following before running this script:

1. Verify that your Exchange Server uses the Internet Mail Connector or Internet Mail Service to connect to the Internet through an SMTP gateway.
2. Verify the gateway forwards DRs to the mailbox associated with the AppManager agent service account as soon as they are received. If the AppManager agent mailbox does not receive DRs immediately, AppManager cannot accurately report the status of the SMTP host or the connectivity between the Exchange Server and the SMTP gateway.
3. If you do not allow NDRs, set up a user account for this script to use and ensure it sends a DR for successful deliveries.
4. As a test, send an e-mail message to both valid and invalid accounts on a valid domain and see how long it takes for the report to come back. If the report does not come back before the next time the script runs, it is interpreted as a connectivity failure.
5. If the AppManager agent mailbox successfully receives the DR, check the subject line and message body for the text strings that indicate the status of the SMTP server. The subject and body text in a DR can vary for each domain, but typically you can determine the status of the host by checking for the following information:
   - Check the subject line for a keyword string that indicates whether the test message was delivered. For example, `Delivered` means that the host is available, and the user exists. `Undeliverable` means either the host is unavailable, or the user does not exist, but you cannot tell which until you check the body. For each domain, identify the keywords that indicate the status of the server in the subject line.
   - Check the body of the message for a keyword string that indicates whether the test message was delivered. For example `Was delivered`. A text string such as `Destination server for this recipient could not be found` indicates no connectivity. A string such as `e-mail account does not exist` means that there is connectivity, even though there is no such account.

If the subject and the body of the DR do not help you to determine text strings to use for checking the availability of the SMTP host, try sending a test message to another domain.

6. To generate an NDR that indicates the host is down, send the test message when the domain is not available.

NOTE: This script requires the Exchange MO services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.99.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.99.2 Default Schedule

The default interval is **Every 15 minutes**.

34.99.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event for connectivity status. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns a value of 100 if the connection between the Exchange Server and Internet domain is up or a value of 0 if the connection is down during the interval. The detail message includes the name of each Exchange Server and domain connection checked. When there is connectivity, this Knowledge Script also collects the response time in seconds. The default is y.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange Server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange Server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.

Description	How to Set It
Target domain account(s)	Specify the accounts at the domain names that you want to check. If specifying more than one, the order in which you specify the Internet domains must correspond to the list of Subject and Body Keywords. Use a pipe character (|) to separate multiple strings. For example: `a++++@abc.com|b++++@abc.com|a++++@xyz.com` The default domain account is a++++@netiq.com.
Subject keywords when ...	Provide a keyword string found in the subject line of the NDR message that indicates whether the host status is up or down. • **... host is up**. Enter a keyword string that appears in the subject line of the NDR when mail delivery fails but the host is available. The default is `Undeliverable`. • **... host is down**. Enter a keyword string that appears in the subject line of the NDR when mail delivery fails because the host is not available. The default keyword is `Undeliverable`. If specifying a string for more than one Internet domain, the order in which you specify the keyword strings must correspond to the list of Internet domains. Use a pipe character (|) to separate multiple strings. **NOTE:** Depending on your environment, you may need to set keyword strings for both the subject line and the message body to determine the availability of the host server. For more information, see "Understanding How Keyword Strings Work" on page 2006. If you do not specify a value for a parameter, the parameter always matches. If you do not want to use a particular parameter to determine connectivity, you can enter a "garbage" string that does not appear in the NDR.
Body keywords when ...	Provide a keyword string found in the body of the NDR message that indicates whether the host status is up or down. • **... host is up**. Enter a keyword string that appears in the message body of the NDR when mail delivery fails but the host is available. The default message is `e-mail account does not exist`. • **... host is down**. Enter a keyword string that appears in the message body of the NDR when mail delivery fails because the host is not available. The default message is `destination server for this recipient could not be found`. If specifying a string for more than one Internet domain, the order in which you specify the keyword strings must correspond to the list of Internet domains. Use a pipe character (|) to separate multiple strings. **NOTE:** Depending on your environment, you may need to set keyword strings for both the subject line and the message body to determine the availability of the host server. For more information, see "Understanding How Keyword Strings Work" on page 2006. If you do not specify a value for a parameter, the parameter always matches. If you do not want to use a particular parameter to determine connectivity, you can enter a "garbage" string that does not appear in the NDR.

Description	How to Set It
Maximum threshold for a response	Specify the maximum number of seconds in which you expect to get a response. If a response takes longer than this number of seconds, this script raises an event. The default is 120 seconds.
Description file on managed client	Set to **y** to use the keyword strings specified in a file on the managed client to describe the host status. If this parameter is set to y, the subject and body keywords are ignored. The default is n. For more information, see "Understanding How Description Files Work" on page 2007.

Description file name	Provide the full path to the file on the agent computer that contains the description file. For example:
	
	`C:\temp\msgsample.txt`
	
	To use the specified description file, you must set the Description file on managed client parameter to y.
	
	The default file name is `C:\temp\aa.txt`.
	
	You can use the UNC format to specify the path. For example:
	
	`\\ENG\appdev\mylog.txt`
	
	Tip You can only specify one file name for any job instance. To monitor multiple files, create separate Knowledge Script jobs.

Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event. The default is 5 (red event indicator).

34.100 SRSServiceDown

Use this Knowledge Script to monitor the status of the Site Replication Service (SRS). This script attempts to restart a service that is detected as down.

34.100.1 Resource Object

Microsoft Exchange 2000 or Exchange Server 2003

34.100.2 Default Schedule

The default interval is **Every five minutes**.

34.100.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns 100 if the SRS service is running, 0 if the service is not running. The default is n.
Automatically re-start service?	Set to **y** to automatically restart the SRS service if it is down.
Event severity: Failed to restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SRS service is down and AppManager cannot restart the service. The default is 5 (red event indicator).
Event severity: Successful restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SRS service is down and AppManager restarted the service. The default is 25 (blue event indicator).
Event severity: Do not restart	Set the event severity level, from 1 to 40, to indicate the importance of an event in which the SRS service is down and you do not want to restart the service. The default is 18 (yellow event indicator).

34.101 TopNISMailboxRes

Use this Knowledge Script to monitor the file space used by the top private information store folders or mailboxes. This script raises an event if the file space for a specified number of mailboxes or folders exceeds the threshold you set.

If a failover occurs while this Knowledge Script job is running, the job restarts on the new node. It is normal for the job on the failed node to generate one or more error messages, depending on what it was doing when the failover occurred.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.101.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.101.2 Default Schedule

The default interval is **Every 24 hours**.

34.101.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns information about the file space (in MB) used by the top *n* number of folders or mailboxes combined. The default is n.
Monitor the top N mailboxes	Specify the number of top mailboxes you want to monitor. For example, to see the five mailboxes that use the most file space, enter 5. The default is 10. Enter 0 to include all mailboxes.
Maximum threshold for file space size (MB)	Specify the maximum file space size that private information store mailboxes can have before an event is raised. The default is 300 MB.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.

Description	How to Set It
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Character to separate fields in detail message	Provide a character or string of characters to separate each field of data in the event detail message and graph data details. The default character, Null, specifies a Tab character which represents a fixed column width defined within the Knowledge Script.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.102 TopNISPublicRes

Use this Knowledge Script to monitor the file space used by the top public information store folders (public folders). This script raises an event if the file space for a specified number of public folders exceeds the threshold you set.

NOTE: This script requires the AppManager agent services to run as a Windows user account with an associated Exchange profile and mailbox. For more information on setting up Exchange mailboxes and profiles, see your Exchange documentation. If you have configured the agent services to run under a Windows user account and provided mailbox and profile information through the setup program or AppManager Security Manager, you can leave the following two parameters blank when you run this script:

- Exchange profile for `NetIQmc` log on as account
- Mailbox alias for `NetIQmc` log on as account

34.102.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.102.2 Default Schedule

The default interval is **Every 24 hours**.

34.102.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event if a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns information about the total file space used by the top *n* number of folders. The default is n.
Monitor top N folders	Specify the number of top public folders you want to monitor. For example, to see the five folders that use the most file space, enter 5. The default value is 10. Enter 0 to include all public folders.
Maximum threshold for file space size (MB)	Specify the maximum file space size that public information store folders can have before an event is raised. The default is 300 MB.
Exchange profile for NetIQ Corporationmc log on as account	Provide a profile name to use if you do not want to use the default profile names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.
Mailbox alias for NetIQ Corporationmc log on as account	Provide a mailbox alias name to use if you do not want to use the default mail alias names entered in AppManager Security Manager for each Exchange server. **Tip** In most environments, leave this field blank to use the defaults set through AppManager Security Manager.

Description	How to Set It
Character to separate fields in detail message	Provide a character or string of characters to separate each field of data in the event detail message and graph data details. The default character, Null, specifies a Tab character which represents a fixed column width defined within the Knowledge Script.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.103 TopNReceivers

Use this Knowledge Script to monitor which users received the most mail messages and the total file size of mail messages received by the top users or all users. You can specify the number of top users and the tracking period for when mail messages have been received.

To use this script, you must enable tracking logs. Tracking logs are implemented using the network share `<servername>.log` in Exchange 2000 or Exchange Server 2003 and `tracking.log` in earlier versions. The shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share. If you install Exchange server on a Microsoft cluster, make sure the network share exists on all cluster nodes.

This script reports 0 messages received if you delete the tracking logs or do not enable them.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. This script adjusts for your time zone.

34.103.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.103.2 Default Schedule

The default interval is **Every 24 hours**.

34.103.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of mail messages received by the top *n* number of users. The default option is n. **Hint** To collect data to display in the Report_TopNReceivers report, also enable data detail archiving: 1. On the **Advanced** tab, ensure the **Do not archive data detail** option is not selected. 2. Click **OK**.
Detail level (0-2) for event detail message	Specify the level of information that you want to include in the event detail message. The default is 0 which includes the total file size of all messages received by a user. Additional information is available by specifying a detail level: • **0** monitors total file size of messages • **1** monitors the number of messages • **2** monitors file size and number of messages. The default is 2.

Description	How to Set It
Maximum threshold for total file size (MB)	Specify the maximum file size that all messages can have before an event is raised. The default is 300 MB.
Maximum threshold for total number of messages	Specify maximum number of messages that can exist before an event is raised. The default is 1000 messages.
Monitor top N receivers	Specify the number of top users you want to monitor. For example, to see the five users who have received the most e-mail in the period, enter 5. The default value is 3.
Count past N days (including today)	Specify the number of days to use as a tracking period. The default value is 5 (the past 4 days plus today). If you set this value higher than the actual number of daily tracking logs available, the value is reset to the actual number of daily logs. For example, if you set the value to 8 but there are only 5 daily logs available, the value is changed to 5.
Character to separate fields in detail message	Provide a character or string of characters to separate each field of data in the event detail message and graph data details. The default character, Null, specifies a Tab character which represents a fixed column width defined within the Knowledge Script.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

34.104 TopNSenders

Use this Knowledge Script to monitor which users sent the most mail messages recently. This script monitors the total file size of mail messages sent by the top users or all users. You can specify the number of top users and the tracking period for when mail messages have been sent.

To use this script, you must enable the tracking logs. Tracking logs are implemented using the network share `<servername>.log` in Exchange 2000 or Exchange Server 2003 and `tracking.log` in earlier versions. The shared directory must exist on the target computer for this script to work properly. By default, the Exchange server installation program sets up the share. If you install Exchange server on a Microsoft cluster, make sure the network share exists on all cluster nodes.

This script reports 0 messages sent if you delete the tracking logs or do not enable them.

NOTE: Daily Exchange server logs begin and end at midnight using Coordinated Universal Time (UTC) rather than local time. This script adjusts for your time zone.

34.104.1 Resource Object

Exchange 2000 Server or Exchange Server 2003

34.104.2 Default Schedule

The default interval is **Every 24 hours**.

34.104.3 Setting Parameter Values

Set the following parameters as needed:

Description	How to Set It
Event?	Set to **y** to raise an event when a threshold is exceeded. The default is y.
Collect data?	Set to **y** to collect data for charts and reports. If enabled, data collection returns the number of mail messages sent by the top *n* number of users. The default option is n. **Hint** To collect data to display in the Report_TopNSenders report, also enable data detail archiving: 1. On the **Advanced** tab, ensure the **Do not archive data detail** option is not selected. 2. Click **OK**.
Detail level (0-2) for event detail message	Specify the level of information that you want included in the event detail message. The default specifies the total file size of all messages sent by a user. Additional information is available by specifying a detail level: • **0** monitors total file size of messages • **1** monitors the number of messages • **2** monitors file size and number of messages. The default value is 2.

Description	How to Set It
Maximum threshold for total file size	Specify the maximum size that sent files can attain before an event is raised. The default is 300 MB.
Maximum threshold for total number of messages	Specify the maximum number of messages that can be sent before an event is raised. The default is 1000 messages.
Monitor top N senders	Specify the number of top users you want to monitor. For example, to see the five users who have sent the most e-mail in the period, enter 5. The default value is 3.
Count past N days (including today)	Specify the number of days to use as a tracking period. The default value is 5 (the past 4 days plus today). If you set this value higher than the actual number of daily tracking logs available, the value is reset to the actual number of daily logs. For example, if you set the value to 8 but there are only 5 daily logs available, the value is changed to 5.
Character to separate fields in detail message	Specify a character or string of characters to separate each field of data in the event detail message and graph data details. The default character, Null, specifies a Tab character which represents a fixed column width defined within the Knowledge Script.
Event severity level	Set the event severity level, from 1 to 40, to indicate the importance of an event in which a threshold is exceeded. The default is 5 (red event indicator).

35 Exchange 2007 Knowledge Scripts

AppManager for Exchange Server provides Knowledge Scripts for monitoring Microsoft Exchange Server 2007, 2010, and 2013.

The **Exchange Server 2007** Knowledge Scripts supports Microsoft Exchange Server 2007 resources installed in *non-clustered* environments and the following *clustered* environments:

- *Cluster continuous replication* (CCR) combines the log shipping and replay functionality in Exchange Server 2007 with the failover functionality in the Microsoft cluster service. CCR is a solution that can be deployed with no single point of failure in a single datacenter or between two datacenters.
- *Single copy clusters* (SCC), known as shared storage clusters in previous versions of Exchange Server, are present in Exchange Server 2007.

In a clustered environment, AppManager raises error events if failover occurs while jobs are running. These error events are expected results of the failover process and can be safely ignored.

A subset of the Knowledge Scripts support Microsoft Exchange Server 2010 and 2013 resources installed in a database availability group (DAG). A DAG is a set of up to 16 Microsoft Exchange Server 2010 or 2013 Mailbox servers that provides automatic database-level recovery from a database, server, or network failure. Exchange Server 2010 and 2013 do not use storage groups.

NOTE: You should review the permissions required for different roles in the before you run the Knowledge Scripts.

From the Knowledge Script view of Control Center, you can access more information about any NetIQ-supported Knowledge Script by selecting it and clicking **Help**. Or in the Operator Console, click any Knowledge Script in the Knowledge Script pane and press F1.

Knowledge Script	What It Does
All_BestPracticesAnalyzer	Monitors the Windows event log for errors and warnings raised by the Exchange Best Practices Analyzer.
All_ClockSynchronization	Monitors the synchronization of clocks for one or more Domain Controllers.
All_EventLog	Monitors the Windows Application event log for errors and warning events related to Exchange Server 2007, 2010, or 2013.
All_ServiceStatus	Monitors the status of Exchange Server 2007, 2010, and 2013 services.
CAS_Activity	Monitors Client Access server services and functions.
CAS_Connectivity	Monitors connectivity for Client Access server services on Exchange Server 2007 and 2010: ActiveSync, Outlook Web Access, Outlook Web services, and the Autodiscover service.

Knowledge Script	What It Does
CAS_OABAvailability	Monitors whether offline address books can be downloaded.
CAS_PublicFolderAvailability	Monitors the accessibility of public folders on the Client Access server.
ETS_ExternalMail	Monitors e-mail sent to and from your Exchange environment.
ETS_MessageHygiene	Monitors message hygiene functions for the Edge Transport server.
HTS_Connectivity	Monitors the connectivity with a Mailbox server, and monitors the time of the last synchronization with the Edge Transport server.
HTS_SafetyNet	Monitors the Safety Net availability in Exchange Server 2013. It replaces the Transport Dumpster Knowledge script available for Exchange Server 2007 and 2010.
HTS_SendersAndRecipients	Measures number of messages in a mailbox and total message size for senders and recipients.
HTS_TransportDumpster	Monitors Transport Dumpster activity, availability, and the number of items in the Transport Dumpster.
MBS_ClientActivity	Monitors Exchange Server 2013 Mailbox server services and functions.
MBS_ClientConnectivity	Monitors connectivity for Mailbox server services on Exchange Server 2013: ActiveSync, Outlook Web services, and the Autodiscover service.
MBS_ClusterOwner	Determines whether an Exchange Server is the owner of the node and whether the CMS is down. This script only runs on servers with Exchange Server 2007.
MBS_DatabaseStateChange	Monitors changes in the state of mailbox databases on an Exchange Server. States include active, passive, suspended, removed, or unmounted.
MBS_DatabaseStatus	Monitors Exchange Server 2007, 2010, and 2013 mailbox databases for size of online maintenance window, defragmentation time, free log space, free file space, and number of mailboxes.
MBS_MailboxAccessibility	Monitors the ability of the Mailbox server to access individual mailboxes.
MBS_MailboxUsage	Measures the size of mailboxes by the number of messages in the mailbox or by total message size in MB.
MBS_MailFlow	Sends test e-mail to local or remote Mailbox servers.
MBS_MessagingRecordsMgmt	Monitors message management tasks such as deleting, journaling, moving, and retention.
MBS_PublicFolderUsage	Measures the size of public folders by the number of messages in the folders or by total message size in MB.
MBS_Replication	Monitors replication status and performance for a Mailbox server.
Transport_BackPressure	Monitors the status of back pressure for the Hub Transport server.
Transport_ConnectorStatus	Monitors the status of send, receive, foreign, and delivery agent connectors on Exchange Servers.
Transport_QueueStatus	Monitors the status of queues on the Hub Transport server: submission queue, mailbox delivery queue, remote delivery queue, poison message queue, and unreachable destination queue.
UMS_CallActivity	Monitors call activity on the Unified Messaging server: voice, fax, play on phone, auto attendant, subscriber access, prompt editing.

Knowledge Script	What It Does
UMS_Connectivity	Monitors connectivity to Hub Transport servers, Mailbox servers, Active Directory, and Unified Messaging-enabled mailboxes.
UMS_Failures	Monitors failures related to redirected calls, disconnected calls, and access to Active Directory, the Hub Transport server, and the Mailbox server.
UMS_Performance	Monitors the performance of the Unified Messaging server: user response latency, operation response time, queued messages for call answering, queued OCS user notifications, and calls disconnected while playing audio hourglass tones.
Recommended Knowledge Script Group	Performs essential monitoring of your Exchange Server 2007, 2010, or 2013 environment.

35.1 All_BestPracticesAnalyzer

Use this Knowledge Script to monitor the Windows event log for errors and warnings whose source is BPA (Exchange Best Practices Analyzer). This script raises an event if the Knowledge Script job fails or the event log contains error and warning messages.

If you are not running the BPA, you can use this script to execute the BPA each time the script runs. If you set the *Execute Best Practices Analyzer during job?* parameter to **Yes**, AppManager runs the BPA at each iteration of the Knowledge Script job. AppManager then stops the BPA and analyzes the event log for errors and warnings raised by the BPA.

NOTE:

- This script may raise duplicate events on computers where multiple Exchange Server 2007 and 2010 roles are installed. These duplicate events are raised because the BPA populates the event log with errors and warnings for *each role* when the error or warning is applicable for the entire Exchange Server 2007 or 2010 organization.
- This script is not applicable for Exchange Server 2013.
- Most BPA events do not indicate which role they are associated with. Therefore, this script raises events that are not associated with a role. However, the AppManager event messages include the text of the BPA event, which should help you determine which role is affected.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.1.1 Running the ExBPAcmd.exe Tool Manually

The BPA must be running so that it can submit any errors or warnings to the event log. This script will not work if you are not running the BPA and do not enable the *Execute Best Practices Analyzer during job?* parameter.

If you do not enable this script to launch the BPA, then run the `ExBPAcmd.exe` tool manually to monitor the Windows Event Log for errors and warnings.

To run the ExBPAcmd.exe tool manually:

1. Open the Exchange Management Shell.
2. Run the following command:

   ```
   $exBPAoutput = . "C:\Program Files\Microsoft\Exchange Server\Bin\ExBPAcmd.exe"
   -p Events:Enable -r "5,$role,$scan_type,Server=<ExchangeServerName>"
   ```

   where `$role` is one of the following values enclosed in quotation marks (" "): `Mailbox`, `Gateway`, `Bridgehead`, `ClientAccess`, `ClusterMailbox`

   where `$scan_type` is one of the following values enclosed in quotation marks (" "): `Health`, `ConnectivityTask`, `Ex2007Readiness`, `Perf`, `Permissions`

   where `<ExchangeServerName>` is the name of the Exchange server where you want to run the `ExBPAcmd.exe` tool.
3. Run the following command to display the output of the `ExBPAcmd.exe` tool:

   ```
   Write-Host $exBPAoutput
   ```

   These commands enable the event log register.

35.1.2 Prerequisites

Before running this script, ensure that the following permissions and memberships exist.

Component	Required Permissions and Memberships
Account running the AppManager agent service (netiqmc)	• Membership in the Builtin\Administrators group on the Active Directory server • Membership in the local Administrators group on the local computer • Delegation for at least Exchange View-Only permissions
Exchange Best Practice Analyzer tool (for all Exchange Server roles)	• Designation as the Domain Administrator, or membership in the Builtin\Administrators group on the Active Directory server, for enumerating the Active Directory information and calling the Microsoft Windows Management Instrumentation (WMI) providers on the domain controller and global catalog servers • Membership in the Local Administrators group on each Exchange server for calling the WMI providers and accessing the registry and the metabase • Delegation for at least Exchange View-Only Permissions on the Exchange organization

35.1.3 Resource Object

Exchange_Server

35.1.4 Default Schedule

By default, this script runs every one hour.

35.1.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the All_BestPracticesAnalyzer job fails. The default is 5.
Analyze Exchange Server 2007/2010 Best Practices	
Execute Best Practices Analyzer during job?	Select **Yes** to allow AppManager to launch the BPA using a command-line execution of `ExBPACmd.exe` at each iteration of this script. If you are already running the BPA, then clear this option. The BPA *must* be running so that it can submit any errors or warnings to the event log. The default is Yes.

Parameter	How to Set It
Type of scan to execute	Select the type of scan the BPA should perform: • **Connectivity Test**. To scan network connections and permissions for the selected Exchange server. • **Exchange 2007 Readiness Check**. To assess your organization's readiness for Exchange Server 2007. • **Health Check**. To perform a full scan, checking for errors, warnings, and configuration information. This option is selected by default. • **Permission Check**. To ensure that your Exchange Server 2007 deployment has the proper credentials as defined by your organization.
Event Notification	
Comma-separated list of event IDs to ignore	Provide a list of error and warning ID numbers that this script should ignore when scanning the event log. Separate the numbers with a comma.
Raise event for errors found in Windows Event Log?	Select **Yes** to raise an event when the event log contains error messages raised by the BPA. The default is Yes.
Event severity when errors found in the Windows Event Log	Set the severity level, from 1 to 40, to indicate the importance of an event in which the event log contains error messages. The default is 5.
Raise event for warnings found in Windows Event Log?	Select **Yes** to raise an event when the event log contains warning messages raised by the BPA. The default is Yes.
Event severity for warnings found in the Windows Event Log	Set the severity level, from 1 to 40, to indicate the importance of an event in which the event log contains warning messages raised by the BPA. The default is 15.

35.2 All_ClockSynchronization

Use this Knowledge Script to monitor the synchronization of clocks for one or more Domain Controllers. This script raises an event if the number of seconds of difference between clocks exceeds the threshold you set.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.2.1 Resource Object

Exchange_Server

35.2.2 Default Schedule

By default, this script runs every 15 minutes.

35.2.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the All_ClockSynchronization job fails. The default is 5.
Monitor Clock Synchronization with Domain Controller	
Comma-separated list of Domain Controllers to test	Use this parameter to limit the number of Domain Controller (DC) clocks that are tested for synchronization with the clock on the server running the ClockSynchronization Knowledge Script. Provide a list of fully qualified hostnames, separating multiple names by commas. Leave this parameter blank to test all DC clocks in your organization.
Event Notification	
Raise event if clocks are not synchronized?	Select **Yes** to raise an event if the clock on the server running the ClockSynchronization Knowledge Script is not synchronized with the clock on the DC. The default is Yes.
Threshold - Maximum clock difference	Set the maximum number of seconds that the server clock can be out of sync with the DC. For example, setting the threshold to 2 indicates that it is acceptable for the clock to be two seconds faster or slower than the clock on the DC. The default is 10 seconds. If you want the server clock to be in sync with the DC clock, set this parameter to 0.
Event severity when clock difference exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the clock synchronization offset exceeds the threshold you set. The default is 25.

35.3 All_EventLog

Use this Knowledge Script to monitor the Windows Application event log for errors and warnings that contain the word **exchange**. This script raises an event if event log entries match your search criteria. You can filter your search by event ID, event category, and event source.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.3.1 Resource Object

Exchange_Server

35.3.2 Default Schedule

By default, this script runs every 15 minutes.

35.3.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the All_EventLog job fails. The default is 5.
Monitor Windows Event Log	
Event Notification	
Comma-separated list of event sources to ignore	Provide a list of event sources that this script should ignore when scanning the Application event log. Separate the source names with a comma. Event sources are computers whose names are displayed in the Source column of the event log.
Comma-separated list of event categories to ignore	Provide a list of event categories that this script should ignore when scanning the Application event log. Separate the category names with a comma.
Comma-separated list of event IDs to ignore	Provide a list of error and warning ID numbers that this script should ignore when scanning the Application event log. Separate the numbers with a comma.
Raise event if Exchange error events are found?	Select **Yes** to raise an event if the Application event log contains error events that match your search criteria. The default is Yes.
Event severity when Exchange error events are found	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Application event log contains error events. The default is 10.
Raise event if Exchange warning events are found?	Select **Yes** to raise an event if the Application event log contains warning events that match your search criteria. The default is Yes.
Event severity when Exchange warning events are found	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Application event log contains warning events. The default is 20.

35.4 All_ServiceStatus

Use this Knowledge Script to monitor the status of Exchange Server 2007, 2010, and 2013 services. This script raises an event when services are not running and when stopped services fail to start.

This script monitors and restarts the following Exchange Server 2007, 2010, and 2013 services:

Mailbox Server Role Services		
Monitoring	Active Directory Topology	Information Store
Mailbox Assistants	Mail Submission	Replication Service
System Attendant	Search Indexer	Service Host
Transport Log Search	Search (Exchange)	Server Extension for Windows Server Backup
Client Access Server Role Services		
Service Host	Active Directory Topology	File Distribution
Hub Transport Server Role Services		
Active Directory Topology	EdgeSync	Transport
Transport Log Search		
Edge Transport Server Role Services		
ADAM	Credential Service	Transport
Anti-SPAM Update	Monitoring	Transport Log Search
Unified Messaging Server Role Services		
Active Directory Topology	File Distribution	Monitoring
Unified Messaging	Speech Engine	

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.4.1 Resource Objects

- Exchange2007_Services
- Exchange2007_Service
- Exchange2010_Services
- Exchange2010_Service
- Exchange2013_Services
- Exchange2013_Service

35.4.2 Default Schedule

By default, this script runs every 15 minutes.

35.4.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the All_ServiceStatus job fails. The default is 5.
Monitor Status of Exchange 2007/2010/2013 Services	
Services to be Monitored	
Monitor services configured to start automatically?	Select **Yes** to monitor Exchange Server 2007, 2010, and 2013 services that are configured to start automatically. The default is Yes. When you enable this parameter, the All_ServiceStatus job does not raise events for services that are configured to start manually, nor does it start manual services that are not running.
Monitor services configured to start manually?	Select **Yes** to monitor Exchange Server 2007, 2010, or 2013 services that are configured to start manually. The default is No. When enabled, the All_ServiceStatus job does not raise events for services that are configured to start automatically.
Event Notification	
Raise event if Exchange 2007/2010/2013 services are not running?	Select **Yes** to raise an event if at least one Exchange Server service is not running. The default is Yes. When you enable this parameter, the All_ServiceStatus job raises events only for those services you selected in the **Services to be Monitored** parameters.
Event severity when services are not running	Set the severity level, from 1 to 40, to indicate the importance of an event in which at least one Exchange Server service is not running. The default is 10.
Start services not currently running?	Select **Yes** to start Exchange Server 2007, 2010, or 2013 services that are not running. The default is Yes. When you enable this parameter, the All_ServiceStatus job starts only those services you selected in the **Services to be Monitored** parameters.
Threshold - Timeout for service startup	Set the number of seconds that AppManager should wait for Exchange Server 2007, 2010, or 2013 services to restart before raising an event. The default is 60 seconds.
Raise event if stopped services fail to start?	Select **Yes** to raise an event if AppManager cannot start Exchange Server services that are not running. The default is Yes.
Event severity when stopped services fail to start	Set the severity level, from 1 to 40, to indicate the importance of an event in which Exchange Server services fail to start after the specified timeout period. The default is 5.

35.5 CAS_Activity

Use this Knowledge Script to monitor Client Access server (CAS) services and functions:

- Availability Service activity
- ActiveSync response time and request rate
- Outlook Web Access response time, search time, login rate, and login failures
- Outlook Web Services request rate and current connections
- IMAP4 (Internet Message Access protocol) processing time, current connections, and active SSL connections
- POP3 (Post Office Protocol) processing time, login rate, current connections, and active SSL connections

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

NOTE: This Knowledge Script is available only for Exchange Server 2007 and 2010. For Exchange Server 2013, see "MBS_ClientActivity" on page 2064.

35.5.1 Resource Objects

- Exchange2007_ClientAccessServer
- Exchange2010_ClientAccessServer

35.5.2 Default Schedule

By default, this script runs every 15 minutes.

35.5.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to set it
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CAS_Activity job fails. The default is 5.
Monitor Availability Service Activity	
Event Notification	
Raise event if response time for free/busy requests exceeds threshold?	Select **Yes** to raise an event if the response time for free or busy requests to Microsoft Outlook exceeds the threshold you set. The default is Yes.

Parameter	How to set it
Threshold - Maximum free/busy request response time	Set the maximum length of time that Microsoft Outlook can take to respond to free/busy requests before an event is raised. The default is 5000 milliseconds.
Event severity when response time for free/busy requests exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the response time for free/busy requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for free/busy request response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the length of response time during the monitoring interval. The default is No.
Monitor ActiveSync Activity	
Monitor ActiveSync Response Time	
Event Notification	
Raise event if ActiveSync response time exceeds threshold?	Select **Yes** to raise an event if the response time for ActiveSync exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time	Set the maximum length of time that ActiveSync can take to respond to requests before an event is raised. The default is 100 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which ActiveSync response time exceeds the threshold. The default is 15.
Data Collection	
Collect data for response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the length of response time during the monitoring interval. The default is No.
Monitor ActiveSync Request Rate	
Event Notification	
Raise event if ActiveSync request rate exceeds threshold?	Select **Yes** to raise an event if the rate of synchronization requests to ActiveSync exceeds the threshold you set. The default is Yes.
Threshold - Maximum request rate	Set the maximum number of requests that can occur per second before an event is raised. The default is 10 synchronization requests per second.
Event severity when request rate exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ActiveSync request rate exceeds the threshold. The default is 15.
Data Collection	
Collect data for request rate?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the rate of synchronization requests during the monitoring interval. The default is No.
Monitor Outlook Web Access Activity	
Monitor Outlook Web Access Response Time	

Parameter	How to set it
Event Notification	
Raise event if Outlook Web Access response time exceeds threshold?	Select **Yes** to raise an event if the response time for Outlook Web Access (OWA) exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time	Set the maximum amount of time that it can take for OWA to respond to requests before an event is raised. The default is 100 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which OWA response time exceeds the threshold. The default is 15.
Data Collection	
Collect data for response time?	Select **Yes** to collect .data for charts and reports. When enabled, data collection returns the length of response time during the monitoring interval. The default is No.
Monitor Outlook Web Access Search Time	
Event Notification	
Raise event if Outlook Web Access search time exceeds threshold?	Select **Yes** to raise an event if Outlook Web Access (OWA) search time exceeds the threshold. The default is Yes. The OWA search feature allows users to find items in a mailbox.
Threshold - Maximum search time	Set the maximum length of time that OWA can spend performing a search before an event is raised. The default is 100 milliseconds.
Event severity when search time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which OWA search time exceeds the threshold. The default is 15.
Data Collection	
Collect data for search time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the length of search time during the monitoring interval. The default is No.
Monitor Outlook Web Access Login Rate	
Event Notification	
Raise event if login rate exceeds threshold?	Select **Yes** to raise an event if the rate at which users log in to Outlook Web Access (OWA) exceeds the threshold. The default is Yes.
Threshold - Maximum login rate	Set the maximum rate at which users can log in to OWA before an event is raised. The default is 10 logins per second.
Event severity when login rate exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the rate at which users log in to OWA exceeds the threshold. The default is 15.
Data Collection	
Collect data for login rate?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the OWA log in rate for the monitoring interval. The default is No.

Parameter	How to set it
Monitor Outlook Web Access Login Failures	
Event Notification	
Raise event if login failures exceed threshold?	Select **Yes** to raise an event if the failures for logging in to Outlook Web Access (OWA), expressed as a percentage of all login attempts, exceed the threshold. The default is Yes.
Threshold - Maximum percentage of login failures	Set the maximum percentage of OWA login failures that can occur before an event is raised. The default is 10%.
Event severity when login failures exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which percentage of OWA login failures exceeds the threshold. The default is 15.
Data Collection	
Collect data for login failures?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of OWA login failures for the monitoring interval. The default is No.
Monitor Outlook Web Services Activity	
Monitor Outlook Web Services Request Rate	
Event Notification	
Raise event if Outlook Web Services request rate exceeds threshold?	Select **Yes** to raise an event if the rate of requests to Outlook Web Services exceeds the threshold you set. The default is Yes.
Threshold - Maximum request rate	Set the maximum number of requests that can occur per second before an event is raised. The default is 10 requests per second.
Event severity when request rate exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the rate of requests to Outlook Web Services exceeds the threshold. The default is 15.
Data Collection	
Collect data for request rate?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the rate of requests during the monitoring interval. The default is No.
Monitor Outlook Web Services Current Connections	
Event Notification	
Raise event if number of current connections exceeds threshold?	Select **Yes** to raise an event if the number of connections established with Outlook Web Services exceeds the threshold you set. The default is Yes. By knowing the number of current connections, you can determine user load for Outlook Web Services
Threshold - Maximum number of current connections	Set the maximum number of connections to Outlook Web Services that can be established before an event is raised. The default is 25 connections.

Parameter	How to set it
Event severity when number of current connections exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of connections established with Outlook Web Services exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of current connections?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of connections established during the monitoring interval. The default is No.
Monitor IMAP4 Activity	
Monitor IMAP4 Command Processing Time	
Event Notification	
Raise event if command processing time exceeds threshold?	Select **Yes** to raise an event if the amount of processing time for IMAP4 commands exceeds the threshold you set. The default is Yes.
Threshold - Maximum command processing time	Set the maximum amount of time that can be spent processing IMAP4 commands before an event is raised. The default is 100 milliseconds.
Event severity when command processing time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the amount of processing time for IMAP4 commands exceeds the threshold. The default is 15.
Data Collection	
Collect data for command processing time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the amount of processing time spent during the monitoring interval. The default is No.
Monitor IMAP4 Connections Rate	
Event Notification	
Raise event if connections rate exceeds threshold?	Select **Yes** to raise an event if the number of IMAP4 connections to your Exchange server exceeds the threshold you set. The default is Yes.
Threshold - Maximum connections rate	Set the maximum number of IMAP4 connection requests that can occur per second before an event is raised. The default is 10 connections per second.
Event severity when connections rate exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of IMAP4 connection requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for connections rate?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of IMAP4 connection requests for the monitoring intervals. The default is No.
Monitor IMAP4 Current Connections	
Event Notification	

Parameter	How to set it
Raise event if number of current connections exceeds threshold?	Select **Yes** to raise an event if the number of current IMAP4 connections to your Exchange server exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of current connections	Set the maximum number of IMAP4 connections that can be established before an event is raised. The default is 10 connections.
Event severity when number of current connections exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of IMAP4 connections exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of current connections?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of IMAP4 connections established during the monitoring interval. The default is No.
Monitor IMAP4 Active SSL Connections	
Event Notification	
Raise event if number of active SSL connections exceeds threshold?	Select **Yes** to raise an event if the number of current IMAP4 connections to your Exchange server over SSL (Secure Sockets Layer) exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of active SSL connections	Set the maximum number of IMAP4 connections that can be established over SSL before an event is raised. The default is 50 connections.
Event severity when number of active SSL connections exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of IMAP4 SSL connections exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of active SSL connections?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of IMAP4 SSL connections established during the monitoring interval. The default is No.
Monitor POP3 Activity	
Monitor POP3 Command Processing Time	
Event Notification	
Raise event if command processing time exceeds threshold?	Select **Yes** to raise an event if the amount of processing time for POP3 commands exceeds the threshold you set. The default is Yes.
Threshold - Maximum command processing time	Set the maximum amount of time that can be spent processing POP3 commands before an event is raised. The default is 10 milliseconds.
Event severity when command processing time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the amount of processing time for POP3 commands exceeds the threshold. The default is 15.
Data Collection	

Parameter	How to set it
Collect data for command processing time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the amount of processing time spent during the monitoring interval. The default is No.
Monitor POP3 Connections Rate	
Event Notification	
Raise event if connections rate exceeds threshold?	Select **Yes** to raise an event if the number of POP3 connections to your Exchange server exceeds the threshold you set. The default is Yes.
Threshold - Maximum connections rate	Set the maximum number of POP3 connection requests that can occur per second before an event is raised. The default is 10 connections per second.
Event severity when connections rate exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of POP3 connection requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for connections rate?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of POP3 connection requests for the monitoring intervals. The default is No.
Monitor Current POP3 Current Connections	
Event Notification	
Raise event if number of current connections exceeds threshold?	Select **Yes** to raise an event if the number of current POP3 connections to your Exchange server exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of current connections	Set the maximum number of POP3 connections that can be established before an event is raised. The default is 10 connections.
Event severity when number of current connections exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of POP3 connections that are currently established exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of current connections?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of POP3 connections established during the monitoring interval. The default is No.
Monitor POP3 Active SSL Connections	
Event Notification	
Raise event if number of active SSL connections exceeds threshold?	Select **Yes** to raise an event if the number of current POP3 connections to your Exchange server over SSL (Secure Sockets Layer) exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of active SSL connections	Set the maximum number of POP3 connections that can be established over SSL before an event is raised. The default is 25 connections.

Parameter	How to set it
Event severity when number of active SSL connections exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of POP3 SSL connections exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of active SSL connections	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of POP3 SSL connections established during the monitoring interval. The default is No.

35.6 CAS_Connectivity

Use this Knowledge Script to monitor the connectivity of Client Access server (CAS) services on Exchange Server 2007 and 2010: ActiveSync, Outlook Web Access, Outlook Web services, and the Autodiscover service. This script raises an event when a connectivity test fails and when response time exceeds the threshold you set.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

NOTE: This Knowledge Script is available only for Exchange Server 2007 and 2010. For Exchange Server 2013, see "MBS_ClientConnectivity" on page 2071.

35.6.1 Configuring Security Manager to Test Outlook Web Access Connectivity

Before you can run the CAS_Connectivity Knowledge Script to test Outlook Web Access connectivity using a custom URL, you need to configure Security Manager for the Client Access server where the job will run. You do not need to configure Security Manager if you are using an internal or external URL.

To configure AppManager Security Manager to test connectivity:

1. On the Extensions menu in the Operator Console, click **Security Manager**.
2. Select the Client Access server you want to test.
3. On the Custom tab, click **Add**.
4. In the Label field, type **Exchange2007**.
5. In the Sub-label field, type **MailboxCredentials**
6. In the Value 1 field, specify the mailbox name, which is also referred to as the user account, to be used in the test.
7. In the Value 2 field, specify the password for the mailbox.
8. Leave the Value 3 field blank.
9. Select **Extended application support** to encrypt the password when it is stored in the repository.
10. Click **OK**.
11. Click **Apply** to save the Security Manager settings.

35.6.2 Running CAS_Connectivity on a Client Access Server

When you run the CAS_Connectivity Knowledge Script on a Client Access server, the script automatically creates a CAS test user mailbox on each Mailbox server in the Exchange deployment if those mailboxes do not already exist. In an Exchange deployment containing Exchange 2007 and Exchange 2010 servers, if you run the CAS_Connectivity script on an Exchange 2010 Client Access Server, the script will not be able to create the mailboxes on Exchange 2007 Mailbox Servers, and AppManager raises an error event about the problem. This is due to the issue that Microsoft does not support creating mailboxes across different version types. To resolve, you must manually create the CAS test user mailboxes on the Exchange 2007 Mailbox Servers.

To create CAS test user mailboxes on an Exchange 2007 Mailbox Server:

1. Log in to one of the Exchange 2007 Mailbox Servers and open the Exchange Management Shell.
2. Change directories to the `Scripts` directory under the Microsoft Exchange installation directory.
3. Run the following command: `Get-MailboxServer | .\New-TestCasConnectivityUser.ps1`.
4. Follow the on-screen instructions to create the CAS test user mailbox on each Mailbox server.

35.6.3 Resource Objects

- Exchange2007_ClientAccessServer
- Exchange2010_ClientAccessServer

35.6.4 Default Schedule

By default, this script runs every 30 minutes.

35.6.5 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Communicate only with Exchange Servers in the local domain?	Select **Yes** to test only Exchange Servers in the same domain as the server on which you run the CAS_Connectivity job. When this option is unselected, certain tests for the Client Access server attempt to contact *all* Mailbox servers in your organization. These tests will fail if the Exchange accounts in one domain do not have access to other domains. Leave this option unselected if you specify a Mailbox server in the *Mailbox server to be used for connectivity tests* parameter.
Ignore these Mailbox servers when testing CAS to MBS communications	Provide a comma-separated list of the hostnames of the Mailbox servers that you want to exclude from connectivity testing between the Client Access server and the Mailbox server. Leave this option blank if you specify a Mailbox server in the *Mailbox server to be used for connectivity tests* parameter.
Mailbox server to be used for connectivity tests	By default, the CAS_Connectivity job tests connectivity to all Mailbox servers. Use this parameter to enable testing to one Mailbox server. Enter the hostname of the computer that hosts the Mailbox server with which you want to check connectivity. The hostname need not be fully qualified unless DNS lookup does not resolve the simple name. If you monitor Outlook web access connectivity and specify a custom URL, that custom URL will be used to test Outlook web access connectivity instead of this mailbox server.
Job failure event notification	

Parameter	How to Set It
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CAS_Connectivity job fails. The default is 5.
Monitor ActiveSync Connectivity	
Event Notification	
Raise event if ActiveSync connectivity test fails?	Select **Yes** to raise an event if AppManager cannot check connectivity to ActiveSync. The default is Yes.
Event severity when ActiveSync connectivity test fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot check connectivity to ActiveSync. The default is 5.
Raise event if response time exceeds threshold?	Select **Yes** to raise an event if the amount of time it takes to connect to ActiveSync exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time for connectivity test	Set how long AppManager should wait for connectivity with ActiveSync before raising an event. The default is 10000 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the time it takes to connect to ActiveSync exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for ActiveSync response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average response time for connecting to ActiveSync. The default is No.
Monitor Outlook Web Access Connectivity	
Allow unsecure (http) communication?	Select **Yes** if you want to allow unsecure communication using `http` instead of `https` when testing the Web access connectivity. The default is No.
URL type to be used for connectivity test	Select whether you want to use an internal URL, an external URL, or a custom URL for the connectivity test. If you select a custom URL, configure the credentials in Security Manager before you run a job. The default type is Internal.
Custom URL to be used for connectivity test	Specify the URL you want to use for the connectivity test. The default is blank.
Event Notification	
Raise event if Outlook Web Access connectivity test fails?	Select **Yes** to raise an event if AppManager cannot check connectivity to Outlook Web Access (OWA). The default is Yes.
Event severity when Outlook Web Access connectivity test fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot check connectivity to OWA. The default is 5.
Raise event if response time exceeds threshold?	Select **Yes** to raise an event if the amount of time it takes to connect to Outlook Web Access exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time for connectivity test	Set how long AppManager should wait to confirm connectivity with OWA before raising an event. The default is 10000 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the time it takes to connect to OWA exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for Outlook Web Access response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average response time for connecting to OWA. The default is No.

Parameter	How to Set It
Monitor Outlook Web Services Connectivity	
Use SSL (HTTPS) for connectivity test?	Select **Yes** to use Secure Socket Layer (SSL) to test connectivity to Outlook Web services. The default is No. If you select **Yes**, AppManager will use only SSL to test connectivity. If you clear the option, AppManager will first use SSL to test connectivity. If that attempt fails, AppManager will then try to test connectivity without using SSL.
Event Notification	
Raise event if Outlook Web services connectivity test fails?	Select **Yes** to raise an event if AppManager cannot check connectivity to Outlook Web services. The default is Yes.
Event severity when Outlook Web services connectivity test fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot check connectivity to Outlook Web services. The default is 5.
Raise event if response time exceeds threshold?	Select **Yes** to raise an event if the amount of time it takes to connect to Outlook Web services exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time for connectivity test	Set how long AppManager should wait to confirm connectivity with Outlook Web services before raising an event. The default is 10000 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the time taken for testing connectivity to Outlook Web services exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for Outlook Web services response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average response time for connecting to Outlook Web services. The default is No.
Monitor Autodiscover Service Connectivity	
Event Notification	
Raise event if Autodiscover service connectivity test fails?	Select **Yes** to raise an event if AppManager cannot check connectivity to the Autodiscover service. The default is Yes. The Autodiscover service allows Outlook 2007 clients and mobile devices to be recognized when they connect to the Client Access server.
Event severity when Autodiscover service connectivity test fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot check connectivity to the Autodiscover service. The default is 5.
Raise event if response time exceeds threshold?	Select **Yes** to raise an event if the amount of time it takes to connect to the Autodiscover service exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time for connectivity test	Set how long AppManager should wait to confirm connectivity with the Autodiscover service before raising an event. The default is 10000 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the time taken for testing connectivity to the Autodiscover service exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for Autodiscover service response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average response time for connecting to the Autodiscover service. The default is No.

35.7 CAS_OABAvailability

Use this Knowledge Script to monitor the availability of offline address books (OABs) for a Client Access server. This script raises an event if OABs cannot be downloaded.

This Knowledge Script monitors the offline address books only if they are hosted in a virtual directory. If they are in a public folder, this Knowledge Script does not monitor those.

NOTE: This script is currently not supported for use with Exchange Server 2013.

35.7.1 Resource Objects

- Exchang2007_ClientAccessServer
- Exchange2010_ClientAccessServer

35.7.2 Default Schedule

By default, this script runs every 15 minutes.

35.7.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Communicate only with Exchange Servers in the local domain?	Select **Yes** to test only Exchange Servers in the same domain as the server on which you run the CAS_OABAvailability job. When this option is unselected, certain tests for the Client Access server attempt to contact *all* Mailbox servers in your organization. These tests will fail if the Exchange accounts in one domain do not have access to other domains. Leave this option unselected if you specify a Mailbox server in the *Mailbox server hosting offline address books to be accessed* parameter.
Ignore these Mailbox servers when testing CAS to MBS communications	Provide a comma-separated list of the host names of the Mailbox servers that you want to exclude from availability testing between the Client Access server and the Mailbox server. Leave this option blank if you specify a Mailbox server in the *Mailbox server hosting offline address books to be accessed* parameter.
Mailbox server hosting offline address books to be accessed	By default, the OABAvailability job tests connectivity to all Mailbox servers. Use this parameter to enable testing to one Mailbox server. Enter the hostname of the Mailbox server computer that hosts the OABs you want to monitor. The hostname need not be fully qualified unless DNS lookup does not resolve the simple name.
Job failure event notification	

Parameter	How to Set It
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the OABAvailability job fails. The default is 5.
Monitor Offline Address Book Availability	
Event Notification	
Raise event if offline address books cannot be downloaded?	Select **Yes** to raise an event if the Client Access server's offline address books cannot be downloaded. The default is Yes.
Event severity when offline address books cannot be downloaded	Set the severity level, from 1 to 40, to indicate the importance of an event in which offline address books cannot be downloaded. The default is 5.

35.8 CAS_PublicFolderAvailability

Use this Knowledge Script to monitor the accessibility of public folders on a Client Access server. This script raises an event when public folders are inaccessible.

35.8.1 Resource Objects

- Exchange2007_ClientAccessServer
- Exchange2010_ClientAccessServer
- Exchange2013_ClientAccessServer

35.8.2 Default Schedule

By default, this script runs every 15 minutes.

35.8.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Communicate only with Exchange Servers in the local domain?	Select **Yes** to test only Exchange Servers in the same domain as the server on which you run the CAS_PublicFolderAvailability job. When this option is unselected, certain tests for the Client Access server attempt to contact *all* Mailbox servers in your organization. These tests will fail if the Exchange accounts in one domain do not have access to other domains. Leave this option unselected if you specify a Mailbox server in the *Mailbox server hosting public folders to be accessed* parameter.
Ignore these Mailbox servers when testing CAS to MBS communications	Provide a comma-separated list of the hostnames of the Mailbox servers that you want to exclude from availability testing between the Client Access server and the Mailbox server. Leave this option blank if you specify a Mailbox server in the *Mailbox server hosting public folders to be accessed* parameter.
Mailbox server hosting public folders to be accessed	By default, the CAS_PublicFolderAvailability job tests connectivity to all Mailbox servers. Use this parameter to enable testing to one Mailbox server. Enter the hostname of the Mailbox server computer that hosts the public folders you want to monitor. The hostname need not be fully qualified unless DNS lookup does not resolve the simple name.
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CAS_PublicFolderAvailability job fails. The default is 5.
Monitor Public Folder Availability	
Event Notification	

Parameter	How to Set It
Raise event if public folders are inaccessible?	Select **Yes** to raise an event if the public folders on the Client Access server are inaccessible. The default is Yes.
Event severity when public folders are inaccessible	Set the severity level, from 1 to 40, to indicate the importance of an event in which public folders on the Client Access server are inaccessible. The default is 5.

35.9 ETS_ExternalMail

Use this Knowledge Script to monitor e-mail sent to and from your Exchange environment. This script raises an event when average mail volume for recipients, recipient domains, senders, and sending domains exceeds the threshold you set. You select whether mail volume is measured by number of messages or total size of messages in MB.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.9.1 Resource Objects

- Exchange2007_EdgeTransportServer
- Exchange2010_EdgeTransportServer

35.9.2 Default Schedule

By default, this script runs daily.

35.9.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Measure mail volume by message count or total message size	Select how this script measures the volume of mail sent to and from your Exchange environment. Choose from **Message count** or **Total message size**. Total message size is measured in MB.
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ETS_ExternalMail job fails. The default is 5.
Monitor Recipient Domains of Outgoing Mail	
Number of top recipient domains of outgoing mail	Set the top *n* recipient domains to be monitored for average mail volume. The default is 10 domains, the minimum is 0, and the maximum is 2147483647. To monitor all recipient domains for average mail volume, enter 0.
Event Notification	
Raise event if average mail volume for top recipient domains exceeds threshold?	Select **Yes** to raise an event if the average mail volume for the top *n* recipient domains exceeds the threshold you set. The default is Yes.
Threshold - Maximum average mail volume for top recipient domains	Set the maximum value that average mail volume can attain before an event is raised. The default is 1000.
Event severity when average mail volume for top recipient domains exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which average mail volume for the top *n* recipient domains exceeds the threshold. The default is 15.

Parameter	How to Set It
Data Collection	
Collect data for average mail volume for top recipient domains?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average mail volume for the top *n* recipient domains during the monitoring interval. The default is Yes.
Monitor Sending Domains of Incoming Mail	
Number of top sending domains of incoming mail	Set the top *n* sending domains to be monitored for average mail volume. The default is 10 domains, the minimum is 0, and the maximum is 2147483647. To monitor all domains for average mail volume, enter 0.
Event Notification	
Raise event if average mail volume for top sending domains exceeds threshold?	Select **Yes** to raise an event if the average mail volume for the top *n* sending domains exceeds the threshold you set. The default is Yes.
Threshold - Maximum average mail volume for top sending domains	Set the maximum value that average mail volume can attain before an event is raised. The default is 1000.
Event severity when average mail volume for top sending domains exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which average mail volume for the top *n* sending domains exceeds the threshold. The default is 15.
Data Collection	
Collect data for average mail volume for top sending domains?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average mail volume for the top *n* sending domains during the monitoring interval. The default is Yes.
Monitor Senders of Outgoing Mail	
Number of top senders of outgoing mail	Set the top *n* senders of mail to be monitored for average mail volume. The default is 10 senders, the minimum is 0, and the maximum is 2147483647. To monitor all senders for average mail volume, enter 0.
Event Notification	
Raise event if average mail volume for top senders of outgoing mail exceeds threshold?	Select **Yes** to raise an event if the average mail volume for the top *n* senders of mail exceeds the threshold you set. The default is Yes.
Threshold - Maximum average mail volume for top senders of outgoing mail	Set the maximum value that average mail volume can attain before an event is raised. The default is 1000.
Event severity when average mail volume for top senders of outgoing mail exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which average mail volume for the top *n* senders of mail exceeds the threshold. The default is 15.
Data Collection	
Collect data for average mail volume for top senders of outgoing mail?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average mail volume for the top *n* senders of mail during the monitoring interval. The default is Yes.
Monitor Recipients of Incoming Mail	

Parameter	How to Set It
Number of top recipients of incoming mail	Set the top *n* recipients of mail to be monitored for average mail volume. The default is 10 recipients, the minimum is 0, and the maximum is 2147483647. To monitor all recipients for average mail volume, enter 0.
Event Notification	
Raise event if average mail volume for top recipients of incoming mail exceeds threshold?	Select **Yes** to raise an event if the average mail volume for the top *n* recipients of mail exceeds the threshold you set. The default is Yes.
Threshold - Maximum average mail volume for top recipients of incoming mail	Set the maximum value that average mail volume can attain before an event is raised. The default is 1000.
Event severity when average mail volume for top recipients of incoming mail exceeds threshold	Set the event severity level, from 1 to 40, to indicate the importance of an event in which average mail volume for the top *n* recipients of mail exceeds the threshold. The default is 15.
Data Collection	
Collect data for average mail volume for top recipients of incoming mail?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average mail volume for the top *n* recipients of mail during the monitoring interval. The default is Yes.

35.10 ETS_MessageHygiene

Use this Knowledge Script to monitor Edge Transport server message hygiene functions: whether the anti-spam update service is running, the total number of messages that have been filtered as spam, and the number of messages that have been filtered as spam from any one user. You determine which content filter to monitor.

35.10.1 Resource Objects

- Exchange2007_EdgeTransportServer
- Exchange2010_EdgeTransportServer

35.10.2 Default Schedule

By default, this script runs every hour.

35.10.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ETS_MessageHygiene job fails. The default is 5.
Monitor Anti-Spam Update Service	
Event Notification	
Raise event if anti-spam update service is not running?	Select **Yes** to raise an event if the anti-spam update service is not running. The default is Yes. The anti-spam update service provides daily updates to your content filter.
Event severity when anti-spam update service is not running	Set the severity level, from 1 to 40, to indicate the importance of an event in which the anti-spam update service is not running. The default is 15.
Start anti-spam update service if not running?	Select **Yes** to start the anti-spam update service if it is not running.The default is Yes.
Threshold - Timeout for anti-spam update service to start	Set the number of seconds that AppManager should wait for the anti-spam update service to start before raising an event. The default is 60 seconds.
Raise event if anti-spam update service fails to start?	Select **Yes** to raise an event if AppManager cannot start the anti-spam update service. The default is Yes.
Event severity when anti-spam update service fail to start	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot start the anti-spam service. The default is 5.
Monitor Total Messages Filtered	

Parameter	How to Set It
Include only those messages filtered for these reasons	Provide a comma-separated list of the names of the content filters whose activity you want to monitor. The names do not need to be case-sensitive. One of the many fields in a message is a field titled “Reason.” The content of the Reason field is the filter name you provide in this parameter. Possible filter names are `SCLAtORAboveDeleteThreshold`, `ACLAtOrAboveRejectThreshold`, `BlockListProvide`, and `LocalBlockList`. To monitor all messages, leave this parameter blank. **NOTE:** Quotation marks (“) are not supported in this field. This script returns an error if you enter quotation marks as part of a content filter name.
Event Notification	
Raise event if number of filtered messages exceeds threshold?	Select **Yes** to raise an event if the number of filtered messages from all users exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of filtered messages	Set the maximum number of messages that can be filtered for the reason you specified in *Include only those messages filtered for these reasons*. AppManager raises an event if the number of messages exceeds the threshold. The default is 1000.
Event severity when number of filtered messages exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of filtered messages exceeds the threshold. The default is 5.
Data Collection	
Collect data for number of filtered messages?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of messages filtered for the reason you specified in *Include only those messages filtered for these reasons*. The default is No.
Monitor Worst Offenders	
Include only those messages filtered for these reasons	Provide a comma-separated list of the names of the content filters whose activity you want to monitor. The names in the list do not need to be case-sensitive. One of the many fields in a message is a field titled “Reason.” The content of the Reason field is the filter name you provide in this parameter. To monitor all messages, leave this parameter blank. **NOTE:** Quotation marks (“) are not supported in this field. This script returns an error if you enter quotation marks as part of a content filter name.
Maximum number of worst offenders to display	Set the maximum number of worst-offending users to include in an event. These offenders will have sent e-mail that has been filtered as spam for the reasons you indicated in *Include only those messages filtered for these reasons*. The default is 10.
Event Notification	
Raise event if number of filtered messages received from a user exceeds threshold?	Select **Yes** to raise an event if the number of filtered messages from any one user exceeds the threshold you set. The default is Yes.
Threshold – Maximum number of filtered messages received from a user	Set the maximum number of messages that can be filtered for the reason you specified in *Include only those messages filtered for this reason*. AppManager raises an event if the number of messages from one user exceeds the threshold. The default is 100.

Parameter	How to Set It
Event severity when number of filtered messages received from a user exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of filtered messages from any one user exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of filtered messages received from worst offenders?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of filtered messages that fit the following criteria: • The messages were filtered for the reasons you specified in *Include only those messages filtered for these reasons*. • The messages were sent from the top *n* worst offending senders. You determine the value of *n* in *Maximum* n*umber of worst offenders to display.* The default is No.

35.11 HTS_Connectivity

Use this Knowledge Script to monitor the connectivity with a Mailbox server and to monitor the time of the last synchronization with the Edge Transport server. This script raises an event if a threshold is exceeded.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.11.1 Resource Objects

- Exchange2007_HubTransportServer
- Exchange2010_HubTransportServer
- Exchange2013_HubTransportServer

35.11.2 Default Schedule

By default, this script runs every 15 minutes.

35.11.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Communicate only with Exchange Servers in the local domain?	Select **Yes** to test only Exchange Servers in the same domain as the server on which you run the HTS_Connectivity job. When this option is unselected, the tests attempt to contact *all* Mailbox servers in your organization. These tests will fail if the Exchange accounts in one domain do not have access to other domains.
Ignore these Mailbox servers when testing HTS to MBS communications	Provide a comma-separated list of the hostnames of the Mailbox servers that you want to exclude from availability testing between the Hub Transport server and the Mailbox server.
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the HTS_Connectivity job fails. The default is 5.
Monitor Mailbox Server Communication	
Event Notification	
Raise event if unable to communicate with a Mailbox server?	Select **Yes** to raise an event when the Hub Transport server cannot communicate with a Mailbox database on the Mailbox server. The default is Yes. The Hub Transport server transports e-mail to and from the Mailbox server. Therefore, ensuring uninterrupted communication is vital to the health of your Exchange Server 2007, 2010, or 2013 environment.

Parameter	How to Set It
Threshold - Maximum number of seconds to wait before timing out	Set the maximum length of time the Hub Transport server should attempt to contact the Mailbox server before timing out and raising an event. The default is 15 seconds.
Event severity when unable to communicate with a Mailbox server	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Hub Transport server cannot communicate with a Mailbox database on the Mailbox server. The default is 5.
Monitor Edge Synchronization	
Event Notification	
Raise event if this Hub Transport server is not subscribed to any Edge Transport servers?	Select **Yes** to raise an event if the Hub Transport server you are monitoring is not subscribed to an Edge Transport server. AppManager cannot monitor synchronization if the Hub Transport server is not subscribed to the Edge Transport server. Disable this parameter if you will not monitor synchronization with the Edge Transport server. Subscription to the Edge Transport server is not required for AppManager to monitor Mailbox server communication or connector availability. The default is Yes.
Event severity when this Hub Transport server is not subscribed to any Edge Transport servers	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Hub Transport server is not subscribed to an Edge Transport server. The default is 15.
Raise event if time of last Edge synchronization exceeds threshold?	Select **Yes** to raise an event if synchronization between the Edge Transport server and the Hub Transport server has not occurred within the last *n* minutes. The default is Yes. Use the *Threshold - Maximum number of minutes since last Edge synchronization* parameter to determine the value of *n*.
Threshold - Maximum number of minutes since last Edge synchronization	Set the maximum number of minutes that can elapse since the last synchronization before an event is raised. The default is 30 minutes.
Event severity when time of last Edge synchronization exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of minutes since the last synchronization exceeds the threshold you set. The default is 15.

35.12 HTS_SafetyNet

Use this Knowledge Script to monitor the Safety Net availability in Exchange Server 2013. It replaces the HTS_TransportDumpster Knowledge script available for Exchange Server 2007 and 2010. You can use this Knowledge Script to monitor Safety Net activities like, average safety net resubmit request time span, resubmit latency average time, resubmit request count, safety net resubmission count, safety net resubmission request count, shadow safety net resubmission count, and shadow safety net resubmission request count.

NOTE: This Knowledge Script runs only on servers with Exchange Server 2013.

35.12.1 Resource Objects

- Exchange2013_HubTransportServer

35.12.2 Default Schedule

By default, this script runs every 15 minutes.

35.12.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the HTS_SafetyNet job fails. The default is 5.
Monitor Safety Net Availability	
Event Notification	
Raise event if Safety Net is unavailable?	Select **Yes** to raise an event if the Safety Net cannot be accessed. The default is Yes.
Event severity when Safety Net is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Safety Net cannot be accessed. The default is 5.
Monitor Safety Net Activity	
Data Collection	
Collect data for average Safety Net resubmit request time span?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average time span of resubmit request of all e-mail messages in Safety Net during the monitoring interval. The default is No.
Collect data for resubmit latency average time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average response time of resubmit requests of e-mail messages in the Safety Net during the monitoring period. The default is No.

Parameter	How to Set It
Collect data for resubmit request count?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the resubmit request count of e-mail messages in the Safety Net during the monitoring interval. The default is No.
Collect data for Safety Net resubmission count?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total resubmission count of e-mail messages in the Safety Net during the monitoring interval. The default is No.
Collect data for Safety Net resubmission request count?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total resubmission request count of e-mail messages in the Safety Net during the monitoring interval. The default is No
Collect data for Shadow Safety Net resubmission count?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total resubmission count of e-mail messages in the shadow Safety Net during the monitoring interval. The default is No
Collect data for Shadow Safety Net resubmission request count?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total resubmission request count of e-mail messages in the shadow Safety Net during the monitoring interval. The default is No

35.13 HTS_SendersAndRecipients

Use this Knowledge Script to measure average and individual e-mail volume for senders and recipients. This script raises an event if the number of messages or the total size in MB of all messages exceeds the threshold you set.

35.13.1 Resource Objects

- Exchange2007_HubTransportServer
- Exchange2010_HubTransportServer
- Exchange2013_HubTransportServer

35.13.2 Default Schedule

By default, this script runs every one hour.

35.13.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Measure mail volume by message count or total message size	Select how this script measures the volume of mail sent to and from your Exchange environment. Choose from **Message count** or **Total message size**. Total message size is measured in MB. The default is Message count.
Comma-separated list of senders and recipients to ignore	Provide a list of e-mail addresses that this script should ignore when measuring e-mail volume. Separate multiple addresses with a comma.
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the HTS_SendersAndRecipients job fails. The default is 5.
Monitor Recipients of Internal Mail	
Monitor Average Mail Volume for Recipients of Internal Mail	
Number of top recipients to monitor for average volume	Set the top *n* e-mail recipients whose average internal mail volume you want to monitor. The default is 10 recipients, the minimum is 0, and the maximum is 2147483647. To monitor all recipients for average volume, enter 0.
Event Notification	
Raise event if average volume for top recipients of internal mail exceeds threshold?	Select **Yes** to raise an event if the average mail volume for the top *n* recipients exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum average volume for top recipients of internal mail	Set the maximum value that average mail volume can attain before an event is raised. The default is 250. Use the *Measure mail volume by message count or total message size* parameter to indicate whether the threshold is in number of messages or Megabytes of message.
Event severity when average volume for top recipients of internal mail exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which average mail volume for the top *n* recipients exceeds the threshold. The default is 15.
Data Collection	
Collect data for average volume of top recipients of internal mail?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average mail volume for the top *n* recipients during the monitoring interval. The default is Yes.
Monitor Individual Mail Volume for Recipients of Internal Mail	
Number of top recipients to monitor for individual volume	Set the top *n* e-mail recipients whose individual internal mail volume you want to monitor. The default is 10 recipients, the minimum is 0, and the maximum is 2147483647. To monitor all recipients for individual volume, enter 0.
Event Notification	
Raise event if mail volume for top individual recipients exceeds threshold?	Select **Yes** to raise an event if the individual mail volume for the top *n* recipients exceeds the threshold you set. The default is Yes.
Threshold - Maximum mail volume for individual recipients	Set the maximum value that individual mail volume can attain before an event is raised. The default is 250. Use the *Measure mail volume by message count or total message size* parameter to indicate whether the threshold is in number of messages or Megabytes of message.
Event severity when mail volume for individual recipients exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which individual mail volume for the top *n* recipients exceeds the threshold. The default is 15.
Data Collection	
Collect data for mail volume for individual recipients?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the individual mail volume for the top *n* recipients during the monitoring interval. The default is No.
Monitor Senders of Internal Mail	
Monitor Average Mail Volume for Senders of Internal Mail	
Number of top senders to monitor for average volume	Set the top *n* e-mail senders whose average internal mail volume you want to monitor. The default is 10 senders, the minimum is 0, and the maximum is 2147483647. To monitor all senders for average volume, enter 0.
Event Notification	
Raise event if average volume for top senders of internal mail exceeds threshold?	Select **Yes** to raise an event if the average mail volume for the top *n* senders exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum average volume for top senders of internal mail	Set the maximum value that average mail volume can attain before an event is raised. The default is 50. Use the *Measure mail volume by message count or total message size* parameter to indicate whether the threshold is in number of messages or Megabytes of message.
Event severity when average volume for top senders of internal mail exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which average mail volume for the top *n* senders exceeds the threshold. The default is 15.
Data Collection	
Collect data for average volume of top senders of internal mail?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average mail volume for the top *n* senders during the monitoring interval. The default is Yes.
Monitor Individual Mail Volume for Senders of Internal Mail	
Number of top senders to monitor for individual volume	Set the top *n* e-mail senders whose individual internal mail volume you want to monitor. The default is 10 senders, the minimum is 0, and the maximum is 2147483647. To monitor all senders for individual volume, enter 0.
Event Notification	
Raise event if mail volume for top individual senders exceeds threshold?	Select **Yes** to raise an event if the individual mail volume for the top *n* senders exceeds the threshold you set. The default is Yes.
Threshold - Maximum mail volume for individual senders	Set the maximum value that individual mail volume can attain before an event is raised. The default is 50. Use the *Measure mail volume by message count or total message size* parameter to indicate whether the threshold is in number of messages or Megabytes of message.
Event severity when mail volume for individual senders exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which individual mail volume for the top *n* senders exceeds the threshold. The default is 15.
Data Collection	
Collect data for mail volume for individual senders?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the individual mail volume for the top *n* senders during the monitoring interval. The default is No.

35.14 HTS_TransportDumpster

Use this Knowledge Script to monitor Transport Dumpster availability, the number and size of items in the Transport Dumpster, and activity:

- Rate at which items are inserted into the Transport Dumpster
- Rate at which items are deleted from the Transport Dumpster
- Number of items redelivered by the Transport Dumpster

The Transport Dumpster is a container in which recently delivered e-mail is stored. It allows the Hub Transport server to defer the deletion of e-mail so that it can redeliver e-mail after an unscheduled outage.

NOTE: This Knowledge Script is available only for Exchange Server 2007 and 2010. For Exchange Server 2013, see "HTS_SafetyNet" on page 2057.

35.14.1 Resource Objects

- Exchange2007_HubTransportServer
- Exchange2010_HubTransportServer

35.14.2 Default Schedule

By default, this script runs every 15 minutes.

35.14.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the HTS_TransportDumpster job fails. The default is 5.
Monitor Transport Dumpster Availability	
Event Notification	
Raise event if Transport Dumpster is unavailable?	Select **Yes** to raise an event if the Transport Dumpster cannot be accessed. The default is Yes.
Event severity when Transport Dumpster is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Transport Dumpster cannot be accessed. The default is 5.
Monitor Size of Transport Dumpster	
Data Collection	
Collect data for number of items in Transport Dumpster?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of e-mail messages in the Transport Dumpster during the monitoring interval. The default is No.

Parameter	How to Set It
Collect data for total size of items currently in Transport Dumpster?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the size of all e-mail messages in MB in the Transport Dumpster during the monitoring interval. The default is No.
Monitor Transport Dumpster Activity	
Data Collection	
Collect data for item insertion rate?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the rate at which e-mail messages were inserted in the Transport Dumpster during the monitoring interval. The default is No.
Collect data for item deletion rate?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the rate at which e-mail messages were deleted from the Transport Dumpster during the monitoring interval. The default is No.
Collect data for item redelivery count?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the rate at which e-mail messages were redelivered from the Transport Dumpster during the monitoring interval. The default is No.

35.15 MBS_ClientActivity

In Exchange Server 2013, the performance counters for Client Access Server (CAS) activity is available only from Mailbox Server. Use this Knowledge Script to monitor Exchange Server 2013 Mailbox server services and functions:

- Availability Service activity
- ActiveSync response time and request rate
- Outlook Web Access response time, search time, login rate, and login failures
- Outlook Web Services request rate and current connections
- IMAP4 (Internet Message Access protocol) processing time, current connections, and active SSL connections
- POP3 (Post Office Protocol) processing time, login rate, current connections, and active SSL connections

NOTE: This Knowledge script only runs on servers with Exchange Server 2013. This script replaces the CAS_Activity Knowledge script available for Exchange Server 2007 and 2010.

35.15.1 Resource Objects

- Exchange2013_MailboxServer

35.15.2 Default Schedule

By default, this script runs every 15 minutes.

35.15.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MBS_ClientActivity job fails. The default is 5.
Monitor Availability Service Activity	
Event Notification	
Raise event if response time for free/busy requests exceeds threshold?	Select **Yes** to raise an event if the response time for free and busy requests to Microsoft Outlook exceeds the threshold you set. The default is Yes. The Availability Service monitors free/busy requests.
Threshold - Maximum free/busy request response time	Set the maximum length of time that Microsoft Outlook can take to respond to free/busy requests before an event is raised. The default is 5000 milliseconds.

Parameter	How to Set It
Event severity when response time for free/busy requests exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the response time for free/busy requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for free/busy request response time?	Select **Yes** to collect data for charts and reports on the response time for free/busy requests. When enabled, data collection returns the length of response time during the monitoring interval. The default is No.
Monitor ActiveSync Activity	
Monitor ActiveSync Response Time	
Event Notification	
Raise event if ActiveSync response time exceeds threshold?	Select **Yes** to raise an event if the response time for ActiveSync exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time	Set the maximum length of time that ActiveSync can take to respond to requests before an event is raised. The default is 100 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which ActiveSync response time exceeds the threshold. The default is 15.
Data Collection	
Collect data for response time?	Select **Yes** to collect data for charts and reports on ActiveSync response time. When enabled, data collection returns the length of response time during the monitoring interval. The default is No.
Monitor ActiveSync Request Rate	
Event Notification	
Raise event if ActiveSync request rate exceeds threshold?	Select **Yes** to raise an event if the rate of synchronization requests to ActiveSync exceeds the threshold you set. The default is Yes.
Threshold - Maximum request rate	Set the maximum number of requests that can occur per second before an event is raised. The default is 10 synchronization requests per second.
Event severity when request rate exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the ActiveSync request rate exceeds the threshold. The default is 15.
Data Collection	
Collect data for request rate?	Select **Yes** to collect data for charts and reports on ActiveSync request time. When enabled, data collection returns the rate of synchronization requests during the monitoring interval. The default is No.
Monitor Outlook Web Access Activity	
Monitor Outlook Web Access Response Time	
Event Notification	
Raise event if Outlook Web Access response time exceeds threshold?	Select **Yes** to raise an event if the response time for Outlook Web Access (OWA) exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time	Set the maximum amount of time that it can take for OWA to respond to requests before an event is raised. The default is 100 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which OWA response time exceeds the threshold. The default is 15.

Parameter	How to Set It
Data Collection	
Collect data for response time?	Select **Yes** to collect data for charts and reports on the response time of OWA. When enabled, data collection returns the length of response time during the monitoring interval. The default is No.
Monitor Outlook Web Access Search Time	
Event Notification	
Raise event if Outlook Web Access search time exceeds threshold?	Select **Yes** to raise an event if Outlook Web Access (OWA) search time exceeds the threshold. The default is Yes. The OWA search feature allows users to find items in a mailbox.
Threshold - Maximum search time	Set the maximum length of time that OWA can spend performing a search before an event is raised. The default is 100 milliseconds.
Event severity when search time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which OWA search time exceeds the threshold. The default is 15.
Data Collection	
Collect data for search time?	Select **Yes** to collect data for charts and reports on Outlook Web Access (OWA) search time. When enabled, data collection returns the length of search time during the monitoring interval. The default is No.
Monitor Outlook Web Access Login Rate	
Event Notification	
Raise event if login rate exceeds threshold?	Select **Yes** to raise an event if the rate at which users log in to Outlook Web Access (OWA) exceeds the threshold. The default is Yes.
Threshold - Maximum login rate	Set the maximum rate at which users can log in to OWA before an event is raised. The default is 10 logins per second.
Event severity when login rate exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the rate at which users log in to OWA exceeds the threshold. The default is 15.
Data Collection	
Collect data for login rate?	Select **Yes** to collect data for charts and reports on the rate at which users log in to OWA. When enabled, data collection returns the OWA log in rate for the monitoring interval. The default is No.
Monitor Outlook Web Access Login Failures	
Event Notification	
Raise event if login failures exceed threshold?	Select **Yes** to raise an event if the failures for logging in to Outlook Web Access (OWA), expressed as a percentage of all login attempts, exceed the threshold. The default is Yes.
Threshold - Maximum percentage of login failures	Set the maximum percentage of OWA login failures that can occur before an event is raised. The default is 10%.
Event severity when login failures exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which percentage of OWA login failures exceeds the threshold. The default is 15.
Data Collection	
Collect data for login failures?	Select **Yes** to collect data for charts and reports on the percentage of OWA login failures. When enabled, data collection returns the percentage of OWA login failures for the monitoring interval. The default is No.

Parameter	How to Set It
Monitor Outlook Web Services Activity	
Monitor Outlook Web Services Request Rate	
Event Notification	
Raise event if Outlook Web Services request rate exceeds threshold?	Select **Yes** to raise an event if the rate of requests to Outlook Web Services exceeds the threshold you set. The default is Yes.
Threshold - Maximum request rate	Set the maximum number of requests that can occur per second before an event is raised. The default is 10 requests per second.
Event severity when request rate exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the rate of requests to Outlook Web Services exceeds the threshold. The default is 15.
Data Collection	
Collect data for request rate?	Select **Yes** to collect data for charts and reports on the rate of requests to Outlook Web Services. When enabled, data collection returns the rate of requests during the monitoring interval. The default is No.
Monitor Outlook Web Services Current Connections	
Event Notification	
Raise event if number of current connections exceeds threshold?	Select **Yes** to raise an event if the number of connections established with Outlook Web Services exceeds the threshold you set. The default is Yes. By knowing the number of current connections, you can determine user load for Outlook Web Services.
Threshold - Maximum number of current connections	Set the maximum number of connections to Outlook Web Services that can be established before an event is raised. The default is 25 connections.
Event severity when number of current connections exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of connections established with Outlook Web Services exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of current connections?	Select **Yes** to collect data for charts and reports on the number of connections established with Outlook Web Services. When enabled, data collection returns the number of connections established during the monitoring interval. The default is No.
Monitor IMAP4 Activity	
Monitor IMAP4 Command Processing Time	
Event Notification	
Raise event if command processing time exceeds threshold?	Select **Yes** to raise an event if the amount of processing time for IMAP4 commands exceeds the threshold you set. The default is Yes.
Threshold - Maximum command processing time	Set the maximum amount of time that can be spent processing IMAP4 commands before an event is raised. The default is 100 milliseconds.
Event severity when command processing time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the amount of processing time for IMAP4 commands exceeds the threshold. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for command processing time?	Select **Yes** to collect data for charts and reports on the amount of processing time for IMAP4 commands. When enabled, data collection returns the amount of processing time spent during the monitoring interval. The default is No.
Monitor IMAP4 Connections Rate	
Event Notification	
Raise event if connections rate exceeds threshold?	Select **Yes** to raise an event if the number of IMAP4 connections to your Exchange server exceeds the threshold you set. The default is Yes.
Threshold - Maximum connections rate	Set the maximum number of IMAP4 connection requests that can occur per second before an event is raised. The default is 10 connections per second.
Event severity when connections rate exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of IMAP4 connection requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for connections rate?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of IMAP4 connection requests for the monitoring intervals. The default is No.
Monitor IMAP4 Current Connections	
Event Notification	
Raise event if number of current connections exceeds threshold?	Select **Yes** to raise an event if the number of current IMAP4 connections to your Exchange server exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of current connections	Set the maximum number of IMAP4 connections that can be established before an event is raised. The default is 10 connections.
Event severity when number of current connections exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of IMAP4 connections exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of current connections?	Select **Yes** to collect data for charts and reports on number of IMAP4 connections established. When enabled, data collection returns the number of IMAP4 connections established during the monitoring interval. The default is No.
Monitor IMAP4 Active SSL Connections	
Event Notification	
Raise event if number of active SSL connections exceeds threshold?	Select **Yes** to raise an event if the number of current IMAP4 connections to your Exchange server over SSL (Secure Sockets Layer) exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of active SSL connections	Set the maximum number of IMAP4 connections that can be established over SSL before an event is raised. The default is 50 connections.
Event severity when number of active SSL connections exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of IMAP4 SSL connections exceeds the threshold. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for number of active SSL connections?	Select **Yes** to collect data for charts and reports on the IMAP4 connections that can be established over SSL. When enabled, data collection returns the number of IMAP4 SSL connections established during the monitoring interval. The default is No.
Monitor POP3 Activity	
Monitor POP3 Command Processing Time	
Event Notification	
Raise event if command processing time exceeds threshold?	Select **Yes** to raise an event if the amount of processing time for POP3 commands exceeds the threshold you set. The default is Yes.
Threshold - Maximum command processing time	Set the maximum amount of time that can be spent processing POP3 commands before an event is raised. The default is 10 milliseconds.
Event severity when command processing time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the amount of processing time for POP3 commands exceeds the threshold. The default is 15.
Data Collection	
Collect data for command processing time?	Select **Yes** to collect data for charts and reports on the processing time for POP3 commands. When enabled, data collection returns the amount of processing time spent during the monitoring interval. The default is No.
Monitor POP3 Connections Rate	
Event Notification	
Raise event if connections rate exceeds threshold?	Select **Yes** to raise an event if the number of POP3 connections to your Exchange server exceeds the threshold you set. The default is Yes.
Threshold - Maximum connections rate	Set the maximum number of POP3 connection requests that can occur per second before an event is raised. The default is 10 connections per second.
Event severity when connections rate exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of POP3 connection requests exceeds the threshold. The default is 15.
Data Collection	
Collect data for connections rate?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of POP3 connection requests for the monitoring intervals. The default is No.
Monitor Current POP3 Current Connections	
Event Notification	
Raise event if number of current connections exceeds threshold?	Select **Yes** to raise an event if the number of current POP3 connections to your Exchange server exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of current connections	Set the maximum number of POP3 connections that can be established before an event is raised. The default is 10 connections.
Event severity when number of current connections exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of POP3 connections that are currently established exceeds the threshold. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for number of current connections?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of POP3 connections established during the monitoring interval. The default is No.
Monitor POP3 Active SSL Connections	
Event Notification	
Raise event if number of active SSL connections exceeds threshold?	Select **Yes** to raise an event if the number of current POP3 connections to your Exchange server over SSL (Secure Sockets Layer) exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of active SSL connections	Set the maximum number of POP3 connections that can be established over SSL before an event is raised. The default is 25 connections.
Event severity when number of active SSL connections exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of POP3 SSL connections exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of active SSL connections?	Select **Yes** to collect data for charts and reports on POP3 SSL connections. When enabled, data collection returns the number of POP3 SSL connections established during the monitoring interval. The default is No.

35.16 MBS_ClientConnectivity

Use this Knowledge Script to monitor the connectivity of Mailbox server (MBS) services on Exchange Server 2013: ActiveSync, Outlook Web services, and the Autodiscover service. This script raises an event when a connectivity test fails and when response time exceeds the threshold you set.

NOTE: This Knowledge Script runs only on servers with Exchange Server 2013.

35.16.1 Running MBS_ClientConnectivity on a Mailbox Server

When you run the MBS_ClientConnectivity Knowledge Script on a Mailbox server, the script automatically creates a test user mailbox on each Mailbox server in the Exchange deployment if those mailboxes do not already exist.

You can also manually create the test user mailboxes on the Exchange 2013 Mailbox Servers.

To create test user mailboxes on an Exchange 2013 Mailbox Server:

1. Log in to one of the Exchange 2013 Mailbox Servers and open the Exchange Management Shell.
2. Change directories to the `Scripts` directory under the Microsoft Exchange installation directory.
3. Run the following command: `Get-MailboxServer | .\New-TestCasConnectivityUser.ps1`.
4. Follow the on-screen instructions to create the test user mailbox on each Mailbox server.

35.16.2 Resource Objects

- Exchange2013_MailboxServer

35.16.3 Default Schedule

By default, this script runs every 30 minutes.

35.16.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MBS_ClientConnectivity job fails. The default is 5.
Monitor ActiveSync Connectivity	

Parameter	How to Set It
ActiveSync URL to be used in connectivity test	Specify the URL for the ActiveSync that is used to monitor the connectivity in the following format: `https://localhost:<port>/Microsoft-Server-ActiveSync`.
Event Notification	
Raise event if ActiveSync connectivity test fails?	Select **Yes** to raise an event if AppManager cannot check connectivity to ActiveSync. The default is Yes.
Event severity when ActiveSync connectivity test fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot check connectivity to ActiveSync. The default is 5.
Raise event if response time exceeds threshold?	Select **Yes** to raise an event if the amount of time it takes to connect to ActiveSync exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time for connectivity test	Set how long AppManager should wait for connectivity with ActiveSync before raising an event. The default is 10000 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the time it takes to connect to ActiveSync exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for ActiveSync response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average response time for connecting to ActiveSync. The default is No.
Monitor Outlook Web Services Connectivity	
Event Notification	
Raise event if Outlook Web services connectivity test fails?	Select **Yes** to raise an event if AppManager cannot check connectivity to Outlook Web services. The default is Yes.
Event severity when Outlook Web services connectivity test fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot check connectivity to Outlook Web services. The default is 5.
Raise event if response time exceeds threshold?	Select **Yes** to raise an event if the amount of time it takes to connect to Outlook Web services exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time for connectivity test	Set how long AppManager should wait to confirm connectivity with Outlook Web services before raising an event. The default is 10000 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the time taken for testing connectivity to Outlook Web services exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for Outlook Web services response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average response time for connecting to Outlook Web services. The default is No.
Monitor Autodiscover Service Connectivity	
Event Notification	
Raise event if Autodiscover service connectivity test fails?	Select **Yes** to raise an event if AppManager cannot check connectivity to the Autodiscover service. The default is Yes. The Autodiscover service allows Outlook clients and mobile devices to be recognized when they connect to the Mailbox server.

Parameter	How to Set It
Event severity when Autodiscover service connectivity test fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which AppManager cannot check connectivity to the Autodiscover service. The default is 5.
Raise event if response time exceeds threshold?	Select **Yes** to raise an event if the amount of time it takes to connect to the Autodiscover service exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time for connectivity test	Set how long AppManager should wait to confirm connectivity with the Autodiscover service before raising an event. The default is 10000 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the time taken for testing connectivity to the Autodiscover service exceeds the threshold that you set. The default is 15.
Data Collection	
Collect data for Autodiscover service response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average response time for connecting to the Autodiscover service. The default is No.

35.17 MBS_ClusterOwner

Use this Knowledge Script to determine whether an Exchange Server is the owner of a node. This script raises an event if the selected server is not the node owner and if the selected Clustered Mailbox Server (CMS) is down.

NOTE: This script only runs on servers with Exchange Server 2007.

35.17.1 Resource Object

Exchange2007_MailboxServer

35.17.2 Default Schedule

By default, this script runs every five minutes.

35.17.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MBS_ClusterOwner job fails. The default is 5.
Monitor Node Ownership	
Raise event if not node owner?	Select **Yes** to raise an event if the selected Exchange Server is not the owner of its node. The default is No.
Event severity when not node owner	Set the severity level, from 1 to 40, to indicate the importance of an event in which the selected Exchange Server is not the owner of the node. The default is 20.
Data Collection	
Collect data for ownership status?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns “0” when the server is not the node owner and “100” if the server is the node owner. The default is Yes.
Monitor Node State	
Event Notification	
Raise event when node is down?	Select **Yes** to raise an event if the node in which the Exchange Server resides is down. The default is Yes.
Event severity when node is down	Set the severity level, from 1 to 40, to indicate the importance of an event in which the node in which the Exchange Server resides is down. The default is 5.
Raise event if CMS is down?	Select **Yes** to raise an event if the Clustered Mailbox Server (CMS) on which the Exchange Server resides is down. The default is Yes.

Parameter	How to Set It
Event severity when CMS is down	Set the severity level, from 1 to 40, to indicate the importance of an event in which the CMS on which the Exchange Server resides is down. The default is 5.

35.18 MBS_DatabaseStateChange

Use this Knowledge Script to monitor changes in the database state, such as active, passive, or suspended, of the mailbox databases on an Exchange Server in a database availability group (DAG) or an Exchange Virtual Server (EVS). This script raises an event if a database is in a specified state, or moves into a specified state.

A job executed on a database in an Exchange Server 2010 DAG causes the job to run on all servers in the DAG. However, only the server that currently owns the database monitors that database.

NOTE:

- Exchange Server 2010 and 2013 do not use storage groups.
- If you run the MBS_DataBaseStateChange Knowledge Script on an Exchange 2007 server, you can only use the database mount parameters found under the **Monitor Database Mount State** heading on the Values tab. If you run the script on an Exchange 2010 or 2013 server, you can use all the parameters on the Values tab.

35.18.1 Resource Objects

- Exchange2007_MailboxServer
- Exchange2007_Store_Database
- Exchange2007_Store_PFDatabase
- Exchange2010_MailboxServer
- Exchange2010_Store_Database
- Exchange2010_Store_PFDatabase
- Exchange2010_DAG_Databases
- Exchange2013_MailboxServer
- Exchange2013_Store_Database
- Exchange2013_Store_PFDatabase
- Exchange2013_DAG_Databases

35.18.2 Default Schedule

By default, this script runs every 15 minutes.

35.18.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	

Parameter	How to Set It
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MBS_DatabaseStateChange job fails. The default is 5.
Monitor Database Mount State	
Event Notification	
Raise event if database is unmounted?	Select **Yes** to raise an event if a database is unmounted. When a database is unmounted, the Exchange Server cannot store information in it or read information from it. The default is Yes.
Raise event only when database first becomes unmounted?	Select **Yes** to raise an event only when the database first becomes unmounted. The default is Yes.
Event severity when database is or becomes unmounted	Set the severity level, from 1 to 40, to indicate the importance of an event in which the database is or becomes unmounted. The default is 5.
Data Collection	
Collect data for database mount state?	Click **Yes** to collect data for charts and reports. When enabled, data collection returns the mount status for each monitored mailbox and public folder database. A mounted mailbox or database has a value of 100, while an umounted mailbox or database has a value of 0. The default is No.
Automatically mount database if it is currently unmounted?	Select **Yes** to automatically mount a database that is currently unmounted. The default is No.
Raise event if database is successfully remounted?	Select **Yes** to raise an event when the database has been successfully remounted. The default is No.
Event severity when database is successfully remounted	Set the severity level, from 1 to 40, to indicate the importance of an event in which the database has been successfully remounted. The default is 25.
Raise event if database fails to mount?	Select **Yes** to raise an event if the database you want to automatically mount fails to mount. The default is no.
Event severity when database fails to mount	Set the severity level, from 1 to 40, to indicate the importance of an event in which the database you want to automatically mount fails to mount. The default is 5.
Monitor Database Copy State	
Event Notification	
Raise event if database copy is suspended?	Select **Yes** to raise an event if the process of copying a database is suspended. The default is Yes.
Raise event only when database first becomes suspended?	Select **Yes** to raise an event only when the database first becomes suspended. The default is Yes.
Event severity when database is or becomes suspended	Set the severity level, from 1 to 40, to indicate the importance of an event in which the database is or becomes suspended. The default is 15.
Raise event if database copy is removed from server?	Select **Yes** to raise an event if a copy of the database is removed. The default is Yes.
Event severity when database copy is removed from the server.	Set the severity level, from 1 to 40, to indicate the importance of an event in which the database is removed from the server. The default is 15.
Monitor Database Active/Passive State	

Parameter	How to Set It
Event Notification - Database Instances	
Raise event if database is passive?	Select **Yes** to raise an event if a database is passive. The default is Yes.
Raise event only when database first becomes passive?	Select **Yes** to raise an event only when the database first becomes passive. The default is Yes.
Event severity when database is or becomes passive	Set the severity level, from 1 to 40, to indicate the importance of an event in which the database is or becomes passive. The default is 25.
Raise event if database is active?	Select **Yes** to raise an event if a database is active. The default is Yes.
Raise event only when database first becomes active?	Select **Yes** to raise an event only when the database first becomes active. The default is Yes.
Event severity when database is or becomes active	Set the severity level, from 1 to 40, to indicate the importance of an event in which the database is or becomes active. The default is 25.
Event Notification - Database Collection	
Raise event if more than N databases are active?	Select **Yes** to raise an event if more than the specified number of databases are active. The default is Yes.
Raise event only when more than N databases become active?	Select **Yes** to raise an event only when more than the specified number of databases become active. The default is Yes.
Event severity when more than N databases are or become active	Set the severity level, from 1 to 40, to indicate the importance of an event in which more than the specified number of databases are or become active. The default is 15.
Threshold - Maximum number of active databases	Set the highest number of databases that can be active before an event is raised. The default is 3.
Raise event if less than N databases are active?	Select **Yes** to raise an event if less than the specified number of databases are active. The default is Yes.
Raise event only when less than N databases become active?	Select **Yes** to raise an event only when less than the specified number of databases become active. The default is Yes.
Event severity when less than N databases are or become active	Set the severity level, from 1 to 40, to indicate the importance of an event in which less than the specified number of databases are or become active. The default is 15.
Threshold - Minimum number of active databases	Set the lowest number of databases that can be active before an event is raised. The default is 1.

35.19 MBS_DatabaseStatus

Use this Knowledge Script to monitor mailbox databases for the size of online maintenance window, defragmentation time, free log space, free file space, and number of mailboxes. This script raises an event if a monitored value exceeds or falls below the threshold you set. In addition, this script generates data streams for number of mailboxes in a mailbox database and number of mailboxes in a storage group.

A job executed on a database in an Exchange Server 2010 and 2013 DAG cause the job to run on all servers in the DAG. However, only the server that currently owns the database monitors that database.

NOTE: Exchange Server 2010 and 2013 do not use storage groups.

35.19.1 Prerequisite

To run this Knowledge Script on clustered servers, run the AppManager agent as a domain account with Administrator privileges.

35.19.2 Resource Objects

- Exchange2007_Store_Group
- Exchange2007_Store_Database
- Exchange2007_MailboxServer
- Exchange2007_Store_PFDatabase
- Exchange2010_MailboxServer
- Exchange2010_Store_Database
- Exchange2010_Store_PFDatabase
- Exchange2010_DAG_Databases
- Exchange2013_MailboxServer
- Exchange2013_Store_Database
- Exchange2013_Store_PeFDatabas
- Exchange2013_DAG_Databases

35.19.3 Default Schedule

By default, this script runs every 15 minutes.

35.19.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MBS_DatabaseStatus job fails. The default is 5.
Monitor Database Defragmentation	
Monitor Size of Online Maintenance Window	
Event Notification	
Raise event if online maintenance window is too small or too large?	Select **Yes** to raise an event if online defragmentation occurs too often or not often enough. The default is Yes. You want to ensure that defragmentation of Exchange database occurs often enough, but not too often. Microsoft recommends every 14 days. If you find that defragmentation takes less time, you can shorten your maintenance window. This script compares the values of two Performance Counters to determine whether the size of the maintenance window should be changed: • Online Defrag Pages Freed/Sec • Online Defrag Pages Read/Sec If the read-to-freed ratio is greater than 100:1, then this script raises an event indicating that the size of the maintenance window is too large and should be reduced. If the read-to-freed ratio is less than 50:1, then this script raises an event indicating that the size of the maintenance window is too small and should be increased.
Event severity when online maintenance window is too small or too large	Set the severity level, from 1 to 40, to indicate the importance of an event in which the maintenance window is too small or too large. The default is 15.
Monitor Defragmentation Time	
Event Notification	
Raise event if time to defragment database exceeds threshold?	Select **Yes** to raise an event if the amount of time it takes to defragment a database exceeds the threshold you set. The default is Yes.
Threshold - Maximum database defragmentation time	Set the maximum length of time allowed for defragmentation before an event is raised. The default is 10 hours.
Event severity when time to defragment database exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the time it takes to defragment a database exceeds the threshold. The default is 15.
Monitor Disk Space	
Event Notification	
Raise event if free space for database files falls below threshold?	Select **Yes** to raise an event if the amount of disk space available for database files falls below the threshold you set. The default is Yes.
Threshold - Minimum free disk space for database files	Set the minimum amount of disk space that must be available for database files to prevent an event from being raised. The default is 1024 MB.
Event severity when free disk space for database files falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the amount of disk space available for database files falls below the threshold. The default is 5.

Parameter	How to Set It
Raise event if free space for log files falls below threshold?	Select **Yes** to raise an event if the amount of disk space available for log files falls below the threshold you set. The default is Yes.
Threshold - Minimum free disk space for log files	Set the minimum amount of disk space that must be available for log files to prevent an event from being raised. The default is 1024 MB.
Event severity when free disk space for log files falls below threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the amount of disk space available for log files falls below the threshold. The default is 5.
Monitor Mailbox Count	
Monitor Number of Mailboxes Per Storage Group (Exchange 2007 only)	
Event Notification	
Raise event if number of mailboxes in a storage group exceeds threshold?	Select **Yes** to raise an event if the number of mailboxes in a storage group exceeds the threshold you set. The default is Yes. A storage group is a logical container only for Exchange Server 2007 databases and their associated system and transaction log files. Exchange Server 2010 and 2013 do not use storage groups.
Threshold - Maximum number of mailboxes in a storage group	Set the maximum number of mailboxes that can be in a storage group before an event is raised. The default is 2500 mailboxes.
Event severity when number of mailboxes in a storage group exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of mailboxes in a storage group exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of mailboxes in each storage group?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of mailboxes in a storage group during the monitoring period. The default is No.
Monitor Number of Mailboxes Per Mailbox Database	
Event Notification	
Raise event if number of mailboxes in a mailbox database exceeds threshold?	Select **Yes** to raise an event if the number of mailboxes in a database exceeds the threshold you set. The default is Yes. A database stores data, data definitions, indexes, checksums, flags, and other information associated with user mailboxes or public folders.
Threshold - Maximum number of mailboxes in a mailbox database	Set the maximum number of mailboxes that can be in a database before an event is raised. The default is 1000 mailboxes.
Event severity when number of mailboxes in a mailbox database exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of mailboxes in a database exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of mailboxes in each mailbox database?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of mailboxes in a database during the monitoring period. The default is No.
Monitor Disk Activity and Usage	
Data Collection	

Parameter	How to Set It
Collect data for percentage of elapsed time that the disk was busy servicing read and write requests?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of time that was spent servicing disk reads and disk writes during the monitoring period. The default is No.
Collect data for percentage of elapsed time that the disk was busy servicing read requests?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of time that was spent servicing disk reads during the monitoring period. The default is No.
Collect data for percentage of elapsed time that the disk was busy servicing write requests?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of time that was spent servicing disk writes during the monitoring period. The default is No.
Collect data for average number of both read and write requests that were queued for the disk during the sample interval?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of read and write requests queued for servicing during the monitoring period. The default is No.

35.20 MBS_MailboxAccessibility

Use this Knowledge Script to monitor whether the Mailbox server can access specified mailboxes. This script raises an event if the time it takes to connect to a mailbox exceeds the threshold you set.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.20.1 Resource Objects

- Exchange2007_MailboxServer
- Exchange2007_Store_Group
- Exchange2007_Store_Database
- Exchange2010_MailboxServer
- Exchange2013_MailboxServer

35.20.2 Default Schedule

By default, this script runs every 15 minutes.

35.20.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MBS_MailboxAccessibility job fails. The default is 5.
Monitor Mailbox Accessibility	
Name of mailbox to be accessed	Provide the name of the mailbox or the mailbox's SMTP address. For example, a mailbox name, `symadmin`, or an SMTP address, `symadmin@golden.local`.
Event Notification	
Raise event if the mailbox cannot be accessed?	Select **Yes** to raise an event if the Mailbox server cannot access the specified mailbox. The default is Yes. A mailbox is inaccessible when it does not exist.
Event severity when the mailbox cannot be accessed	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Mailbox server cannot access the specified mailbox. The default is 5.
Raise event if response time for accessing the mailbox exceeds threshold?	Select **Yes** to raise an event if the amount of time it takes to connect to the specified mailbox exceeds the threshold you set. The default is Yes.

Parameter	How to Set It
Threshold - Maximum response time for accessing the mailbox	Set the maximum length of time that the Mailbox server should wait to connect with the specified mailbox before raising an event. The default is 1000 milliseconds. The minimum is 1 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the time it takes to access the specified mailbox exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for mailbox access response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the response time for mailbox access during the monitoring period. The default is No.

35.21 MBS_MailboxUsage

Use this Knowledge Script to measure the size of mailboxes by either the number of messages in the mailbox, or by total message size in MB. You can monitor average mailbox size and individual mailbox size for the top *n* mailboxes. This script raises an event if average mailbox size and individual mailbox size exceed the threshold you set.

A job executed on a database in an Exchange Server 2010 and 2013 DAG cause the job to run on all servers in the DAG. However, only the server that currently owns the database monitors that database.

35.21.1 Resource Objects

- Exchange2007_MailboxServer
- Exchange2007_Store_Group
- Exchange2007_Store_Database
- Exchange2010_MailboxServer
- Exchange2010_Store_Database
- Exchange2010_DAG_Databases
- Exchange2013_MailboxServer
- Exchange2013_Store_Database
- Exchange2013_DAG_Databases

35.21.2 Default Schedule

By default, this script runs every hour.

35.21.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Measure mailbox size in MB or by number of messages	Select how you want to measure the size of mailboxes: • Choose **Message count** to measure the size of mailboxes by the number of messages in the mailboxes • Choose **Total message size** to measure the size of all messages in the mailboxes in MB. The default is Total message size.
Comma-separated list of mailboxes to ignore	Provide a list of mailbox display names that this script should ignore when measuring mailbox size. Separate the names with a comma. **NOTE:** Ensure you provide the mailbox display name, not the mailbox alias.

Parameter	How to Set It
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MBS_MailboxUsage job fails. The default is 5.
Monitor Average Mailbox Size	
Number of largest mailboxes to be averaged	Set the top *n* mailboxes whose average size you want to monitor. The default is 10 mailboxes, the minimum is 0, and the maximum is 2147483647
Event Notification	
Raise event if average mailbox size exceeds threshold?	Select **Yes** to raise an event if the average size of the top *n* mailboxes exceeds the threshold you set. The default is Yes. Use the *Number of largest mailboxes to be averaged* parameter to determine the value of *n*. AppManager uses Exchange cmdlets to determine the largest mailboxes, based on number and size of mailboxes and messages.
Threshold – Maximum average mailbox size in MB or by number of messages	Set the maximum average size that the top *n* mailboxes can attain before an event is raised. The default is 100. The average is based on either the total number of messages in the top *n* mailboxes, or the total size in MB of the top *n* mailboxes, depending on your selection in the *Measure mailbox size by total message size or message count* parameter.
Event severity when average mailbox size exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the average size of the top *n* mailboxes exceeds the threshold. The default is 5.
Data Collection	
Collect data for average mailbox size?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns one of the following data streams: • Average number of messages in *n* largest mailboxes • Average size in MB of the *n* largest mailboxes The default is No.
Monitor Individual Mailbox Size	
Number of largest mailboxes to be monitored	Set the top *n* mailboxes whose individual size you want to monitor. The default is 10 mailboxes, the minimum is 0, and the maximum is 2147483647.
Event Notification	
Raise event if individual mailbox size exceeds threshold?	Select **Yes** to raise an event if the size of any one of the top *n* mailboxes exceeds the threshold you set. The default is Yes. Use the *Number of largest mailboxes to be monitored* parameter to determine the value of *n*. AppManager uses Exchange cmdlets to determine the largest mailboxes, based on number and size of mailboxes and messages.
Threshold - Maximum individual mailbox size in MB or by number of messages	Set the maximum size that any one of the top *n* mailboxes can attain before an event is raised. The default is 250. The size is based on either the total number of messages in the top *n* mailboxes, or the total size in MB of the top *n* mailboxes, depending on your selection in the *Measure mailbox size by message count or total message size* parameter.

Parameter	How to Set It
Event severity when individual mailbox size exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the size of any one of the top *n* mailboxes exceeds the threshold. The default is 5.
Data Collection	
Collect data for individual mailbox size?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the following data streams: • Number of messages in each of the *n* largest mailboxes • Size in MB of each of the *n* largest mailboxes Use the *Number of largest mailboxes to be monitored* parameter to determine the value of *n*. The default is No.

35.22 MBS_MailFlow

Use this Knowledge Script to test the flow of mail by sending test e-mail to local or remote Mailbox servers. This script raises an event if the test fails or if response time exceeds the threshold you set.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.22.1 Resource Objects

- Exchange2007_MailboxServer
- Exchange2010_MailboxServer
- Exchange2013_MailboxServer

35.22.2 Default Schedule

By default, this script runs every 15 minutes.

35.22.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MBS_MailFlow job fails. The default is 5.
Monitor Mail Flow	
Comma-separated list of target Mailbox servers	Provide the hostnames or IP addresses of the Mailbox servers to which you want to send test e-mail. Separate the names or addresses with a comma.
Comma-separated list of recipient e-mail addresses	Provide the e-mail addresses to which you want to send test e-mail. Separate the addresses with a comma.
Event Notification	
Raise event if mail flow test fails?	Select **Yes** to raise an event if test mail cannot be sent to the selected Mailbox servers. The default is Yes.
Event severity when mail flow test fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which test mail cannot be sent to the selected Mailbox servers. The default is 5.
Raise event if response time exceeds threshold?	Select **Yes** to raise an event if the elapsed time to send mail to the Mailbox servers exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time for mail flow test	Set the maximum number of milliseconds that can elapse while sending mail to the selected Mailbox servers before an event is raised. The default is 10,000 milliseconds.

Parameter	How to Set It
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which response time exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for mail flow response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the response time for the mail flow tests during the monitoring period. The default is No.

35.23 MBS_MessagingRecordsMgmt

Use this Knowledge Script to monitor Messaging Records Management (MRM) tasks such as deleting, journaling, moving, and retention, and to monitor the Windows Event log for MRM-related events. This script raises an event if a threshold is exceeded.

35.23.1 Resource Objects

- Exchange2007_MailboxServer
- Exchange2010_MailboxServer
- Exchange2013_MailboxServer

35.23.2 Default Schedule

By default, this script runs every 15 minutes.

35.23.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MBS_MessagingRecordsManagement job fails. The default is 5.
Monitor Messaging Records Management	
Monitor Messages Deleted But Recoverable	
Event Notification	
Raise event if number of messages deleted but recoverable exceeds threshold?	Select **Yes** to raise an event if the number of deleted, but recoverable, messages exceeds the threshold you set. The default is Yes. Exchange can recover messages that users have deleted from their Deleted Items folders. You can use Exchange System Manager to define how many days a deleted message stays in the mailbox store before being permanently deleted.
Event severity when number of messages deleted but recoverable exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of recoverable messages exceeds the threshold you set. The default is 15.
Threshold - Maximum number of messages deleted but recoverable	Set the maximum number of recoverable messages that can be in the mailbox store before an event is raised. The default is 1000 messages.
Data Collection	
Collect data for number of messages deleted but recoverable?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of recoverable messages deleted during the monitoring interval. The default is Yes.

Parameter	How to Set It
Monitor Messages Permanently Deleted	
Event Notification	
Raise event if number of messages permanently deleted exceeds threshold?	Select **Yes** to raise an event if the number of permanently deleted messages exceeds the threshold you set. The default is Yes. You can use Exchange System Manager to define how many days a deleted message stays in the mailbox store before being permanently deleted.
Event severity when number of messages permanently deleted exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of permanently deleted messages exceeds the threshold you set. The default is 15.
Threshold - Maximum number of messages permanently deleted	Set the maximum number of messages that can be permanently deleted before an event is raised. The default is 1000 messages.
Data Collection	
Collect data for number of messages permanently deleted?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of messages permanently deleted during the monitoring interval. The default is Yes.
Monitor Messages Journaled	
Event Notification	
Raise event if number of messages journaled exceeds threshold?	Select **Yes** to raise an event if the number of journaled, or archived, messages exceeds the threshold you set. The default is Yes. The Exchange Journaling feature allows users to archive all incoming and outgoing e-mail for a specific mailbox store.
Event severity when number of messages journaled exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of archived messages exceeds the threshold you set. The default is 15.
Threshold - Maximum number of messages journaled	Set the maximum number of messages that can be archived before an event is raised. The default is 1000 messages.
Data Collection	
Collect data for number of messages journaled?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of messages journaled during the monitoring interval. The default is Yes.
Monitor Messages Moved	
Event Notification	
Raise event if number of messages moved exceeds threshold?	Select **Yes** to raise an event if the number of messages moved from one managed folder to another exceeds the threshold you set. The default is Yes.
Event severity when number of messages moved exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of moved messages exceeds the threshold you set. The default is 15.
Threshold - Maximum number of messages moved	Set the maximum number of messages that can be moved before an event is raised. The default is 1000 messages.
Data Collection	
Collect data for number of messages moved?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of messages moved during the monitoring interval. The default is Yes.

Parameter	How to Set It
Monitor Messages Past Retention	
Event Notification	
Raise event if number of messages marked as past retention date exceeds threshold?	Select **Yes** to raise an event if the number of deleted messages that have passed their retention date exceeds the threshold you set. The default is Yes. Use Exchange System Manager to define how many days a deleted message stays in the mailbox store.
Event severity when number of messages marked as past retention date exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of expired messages exceeds the threshold you set. The default is 15.
Threshold - Maximum number of messages marked as past retention date	Set the maximum number of messages that can have passed their retention date before an event is raised. The default is 1000 messages.
Data Collection	
Collect data for number of messages marked as past retention date?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of messages that expired during the monitoring interval. The default is Yes.
Monitor Windows Event Log for Messaging Records Management Events	
Event Notification	
Comma-separated list of event sources to ignore	Provide a list of event sources that this script should ignore when scanning the Windows Event log. Separate the source names with a comma. Event sources are computers whose names are displayed in the Source column of the event log.
Comma-separated list of event categories to ignore	Provide a list of event categories that this script should ignore when scanning the Windows Event log. Separate the category names with a comma.
Comma-separated list of event IDs to ignore	Provide a list of error and warning ID numbers that this script should ignore when scanning the Windows Event log. Separate the numbers with a comma.
Raise event if MRM error events are found?	Select **Yes** to raise an event if MRM error events are found in the Windows Event Log. The default is Yes.
Event severity when MRM error events are found	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Windows Event Log contains MRM error events. The default is 10.
Raise event if MRM warning events are found?	Select **Yes** to raise an event if MRM warning events are found in the Windows Event Log. The default is Yes.
Event severity when MRM warning events are found	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Windows Event Log contains MRM warning events. The default is 20.

35.24 MBS_PublicFolderUsage

Use this Knowledge Script to measure the size of public folders by the number of messages in the folders or by total message size in MB. You can monitor average folder size and individual folder size for the top *n* folders. This script raises an event if average folder size and individual folder size exceed the threshold you set.

35.24.1 Resource Objects

- Exchange2007_Store_Group
- Exchange2007_Store_PFDatabase
- Exchange2010_Store_PFDatabase
- Exchange2013_Store_PFDatabase

35.24.2 Default Schedule

By default, this script runs every one hour.

35.24.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Measure public folder size by message count or total message size	Select how you want to measure the size of public folders: • Choose **Message count** to measure the size of folders by the number of messages in the mailboxes. • Choose **Total message size** to measure the size of all messages in the folders in MB. The default is Total message size.
Comma-separated list of public folders to ignore	Provide a list of public folder names that this script should ignore when measuring folder size. Separate the names with a comma.
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MBS_PublicFolderUsage job fails. The default is 5.
Monitor Average Public Folder Size	
Number of largest public folders to be averaged	Set the top *n* public folders whose average size you want to monitor. The default is 10 folders.
Event Notification	

Parameter	How to Set It
Raise event if average public folder size exceeds threshold?	Select **Yes** to raise an event if the average size of the top *n* public folders exceeds the threshold you set. The default is Yes. Use the *Number of largest public folders to be averaged* parameter to determine the value of *n*. AppManager uses Exchange cmdlets to determine the largest public folders, based on number and size of folders and messages.
Threshold - Maximum average public folder size	Set the maximum average size that the top *n* public folders can attain before an event is raised. The default is 25. The average is based on either the total number of messages in the top *n* folders, or the total size in MB of the top *n* folders, depending on your selection in the *Measure public folder size by message count or total message size* parameter.
Event severity when average public folder size exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the average size of the top *n* public folders exceeds the threshold. The default is 5.
Data Collection	
Collect data for average public folder size?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns one of the following data streams: • Average number of messages in *n* largest public folders • Average size (MB) of the *n* largest public folders The default is No.
Monitor Individual Public Folder Size	
Number of largest public folders to be monitored	Set the top *n* public folders whose individual size you want to monitor. The default is 10 folders.
Event Notification	
Raise event if individual public folder size exceeds threshold?	Select **Yes** to raise an event if the size of any one of the top *n* public folders exceeds the threshold you set. The default is Yes. Use the *Number of largest public folders to be monitored* parameter to determine the value of *n*. AppManager uses Exchange cmdlets to determine the largest public folders, based on number and size of folders and messages.
Threshold - Maximum individual public folder size	Set the maximum size that any one of the top *n* public folders can attain before an event is raised. The default is 100. The size is based on either the total number of messages in the top *n* public folders, or the total size in MB of the top *n* public folders, depending on your selection in the *Measure public folder size by message count or total message size* parameter.
Event severity when individual public folder size exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the size of any one of the top *n* public folders exceeds the threshold. The default is 5.
Data Collection	

Parameter	How to Set It
Collect data for individual public folder size?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the following data streams: • Number of messages in each of the *n* largest public folders • Size (MB) of each of the *n* largest public folders Use the *Number of largest public folders to be monitored* parameter to determine the value of *n*. The default is No.

35.25 MBS_Replication

Use this Knowledge Script to monitor replication status and performance for a Mailbox server. This script raises an event when a threshold is exceeded and generates data streams for the following metrics:

- Replication latency
- Number of pending replication transactions
- Replication rate
- Number of replications in the copy and replay queues

This script also monitors the availability of the File Share Witness, a requirement for using the cluster continuous replication (CCR) functionality in Exchange Server 2007. CCR enables the continuous and asynchronous updating of a second copy of a database with the changes that have been made to the active copy of the database. The File Share Witness is a file share that is external to a cluster and helps determine the status of the cluster.

35.25.1 Prerequisite

The AppManager agent (`netiqmc` service) must have permission to access the File Share Witness folder to collect data for File Share Witness usage on a two-node CCR cluster.

35.25.2 Resource Objects

- Exchange2007_MailboxServer
- Exchange2010_MailboxServer
- Exchange2013_MailboxServer

35.25.3 Default Schedule

By default, this script runs every 15 minutes.

35.25.4 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Communicate only with Exchange servers in the local domain?	Select **Yes** to test only Exchange servers in the same domain as the server on which you run the MBS_Replication job. The default is No. When this option is unselected, the job attempts to contact *all* Exchange Servers in your organization. These attempts will fail if the Exchange accounts in one domain do not have access to other domains.
Job failure event notification	

Parameter	How to Set It
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the MBS_Replication job fails. The default is 5.
Monitor Replication Agent	
Event Notification	
Raise event if replication agent is not running?	Select **Yes** to raise an event if the replication agent is not running. The default is Yes.
Event severity when replication agent is not running	Set the severity level, from 1 to 40, to indicate the importance of an event in which the replication agent is not running. The default is 5.
Start replication agent if not running?	Select **Yes** to start the replication agent if it is not running. The default is Yes.
Threshold - Maximum timeout for starting replication agent	Set the maximum length of time the script can attempt to start the replication agent before timing out and raising an event. The default is 60 seconds.
Raise event if replication agent fails to start?	Select **Yes** to raise an event if the script cannot start the replication agent. The default is Yes.
Event severity when replication agent fails to start	Set the severity level, from 1 to 40, to indicate the importance of an event in which the script cannot start the replication agent. The default is 5.
Monitor Replication Copy Status	
Event Notification	
Raise event if replication is unhealthy?	Select **Yes** to raise an event if replication is unhealthy. The default is Yes. This script uses the `Get-StorageGroupCopyStatus` cmdlet to determine the status, or health, of the replication function. If the status is `Failed` or `Not Supported`, then replication is considered unhealthy. Replication is also considered unhealthy if the number of transactions in the copy queue or the replay queue exceeds the threshold you set.
Threshold - Maximum length of copy queue	Set the maximum number of transactions that can be waiting in the copy queue before an event is raised. The default is 3 transactions.
Threshold - Maximum length of replay queue	Set the maximum number of transactions that can be waiting in the replay queue before an event is raised. The default is 20 transactions.
Event severity when replication is unhealthy	Set the severity level, from 1 to 40, to indicate the importance of an event in which replication is determined to be unhealthy. The default is 5.
Data Collection	
Collect data for copy queue length?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of replication transactions in the copy queue for the monitoring period. The default is No.
Collect data for replay queue length?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of replication transactions in the replay queue for the monitoring period. The default is No.
Monitor File Share Witness	
Raise event if File Share Witness is unavailable?	Select **Yes** to raise an event if the File Share Witness is unavailable. The default is Yes.
Event severity when File Share Witness is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which the File Share Witness is unavailable. The default is 15.
Monitor File Share Witness Usage on Two-node CCR Setup	
Data Collection	

Parameter	How to Set It
Collect data for File Share Witness usage on two-node CCR setup?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the percentage of usage for the File Share Witness in a two-node cluster continuous replication environment. The default is No.
Monitor Replication Latency	
Event Notification	

Raise event if replication latency exceeds threshold?	Select **Yes** to raise an event if replication latency exceeds the threshold you set. The default is Yes.
	When this parameter is set to **Yes**, the Extended ESE performance counters in the registry are enabled. The following updates are made automatically in the registry values:
	`HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\ESE\Performance`
	`Value Name:  Show Advanced Counters`
	`Data Type:  REG_DWORD`
	`Value:  1`

Threshold – Maximum replication latency	Set the maximum number of milliseconds allowed for replication latency before an event is raised. The default is 20000 milliseconds.
Event severity when replication latency exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which replication latency exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for replication latency?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the total latency for the monitoring period. The default is No.
Monitor Replication Rate	
Event Notification	
Raise event if replication rate exceeds threshold?	Select **Yes** to raise an event if the replication rate exceeds the threshold you set. The default is Yes.
Threshold – Maximum replication rate	Set the maximum number of replications allowed per minute before an event is raised. The default is 10000 transactions.
Event severity when replication rate threshold exceeded	Set the severity level, from 1 to 40, to indicate the importance of an event in which the replication rate exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for replication rate?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the replication rate for the monitoring period. The default is No.
Monitor Pending Replication Transactions	
Event Notification	
Raise event if pending replication transactions exceed threshold?	Select **Yes** to raise an event if the number of transactions waiting to be replicated exceeds the threshold you set. The default is Yes.
Threshold – Maximum number of pending replication transactions	Set the maximum number of transactions that can be awaiting replication before an event is raised. The default is 500 transactions.
Event severity when pending replication transactions exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of transactions waiting to be replicated exceeds the threshold you set. The default is 15.
Data Collection	

Parameter	How to Set It
Collect data for pending replication transactions?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of pending replication transactions for the monitoring period. The default is No.

35.26 Transport_BackPressure

Use this Knowledge Script to monitor the status of back pressure for the Hub Transport server.

Back pressure monitors system resources, such as available disk space and available memory, on computers that have the Hub Transport server role or Edge Transport server role installed. If resource usage exceeds a certain level, the Exchange server stops accepting new connections and messages, but may continue to deliver existing messages. When resource usage returns to a normal level, the Exchange server accepts new connections and messages.

This script raises events for three levels of resource usage:

- **Normal**. No back pressure is applied to the server: new connections and messages are accepted.
- **Medium**. The resource is slightly overused. Limited back pressure is applied to the server: incoming mail from the authoritative domain is allowed, but new connections and messages from other sources are rejected.
- **High**. The resource is severely overused. Full back pressure is applied to the server: all message flow stops, and all new connections and messages are rejected.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.26.1 Resource Objects

- Exchange2007_HubTransportServer
- Exchange2007_EdgeTransportServer
- Exchange2010_HubTransportServer
- Exchange2010_EdgeTransportServer
- Exchange2013_HubTransportServer

35.26.2 Default Schedule

By default, this script runs every five minutes.

35.26.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Transport_BackPressure job fails. The default is 5.
Monitor Back Pressure Status	

Parameter	How to Set It
Event Notification	
Raise event if back pressure is high?	Select **Yes** to raise an event if resource usage is at a high level. The default is Yes.
Event severity when back pressure is high	Set the severity level, from 1 to 40, to indicate the importance of an event in which resource usage is at a high level. The default is 5.
Raise event if back pressure is medium?	Select **Yes** to raise an event if resource usage is at a medium level. The default is Yes.
Event severity when back pressure is medium	Set the severity level, from 1 to 40, to indicate the importance of an event in which resource usage is at a medium level. The default is 10.

35.27 Transport_ConnectorStatus

Use this Knowledge Script to monitor the status of send, receive, foreign, and delivery agent connectors on Exchange Servers. This script raises an event if any of the connector is disabled or an SMTP-based receive connector is not responding to SMTP requests.

NOTE: The delivery agent connectors are not applicable on Exchange Server 2007.

35.27.1 Resource Objects

- Exchange2007_HubTransportServer
- Exchange2007_EdgeTransportServer
- Exchange2010_HubTransportServer
- Exchange2010_EdgeTransportServer
- Exchange2013_ClientAccessServer
- Exchange2013_HubTransportServer

35.27.2 Default Schedule

By default, this script runs every 15 minutes.

35.27.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Transport_ConnectorStatus job fails. The default is 5.
Monitor Connectors	
Monitor Receive Connectors	
Event Notification	
Raise event if any receive connector is disabled	Select **Yes** to raise an event if any of the connector to receive messages on Exchange Server is disabled. The default is Yes. The receive connectors receive e-mail from a Mailbox server or from the Internet when an Edge role is not set up in the Exchange environment.
Comma-separated list of receive connectors to ignore	Specify a list of receive connectors separated by a comma, in the `<hostname>\<connectorname>` format that you want to exclude from monitoring.

Parameter	How to Set It
Event severity when any receive connector is disabled	Set the severity level, from 1 to 40, to indicate the importance of an event in which a connector to receive messages on Exchange Server is disabled. The default is 5.
Raise event if an enabled receive connector does not respond to SMTP requests?	Select **Yes** to raise an event if a receive connector is unable to respond to SMTP requests. The default is Yes.
Event severity when a receive connector does not respond to SMTP requests	Set the severity level, from 1 to 40, to indicate the importance of an event in which a receive connector is unable to respond to SMTP requests. The default is 5.
Monitor Send Connectors	
Event Notification	
Raise event if any send connector is disabled	Select **Yes** to raise an event if a connector to send messages from Exchange Server is disabled. The default is Yes. The send connectors send e-mail to the mailbox of the intended recipient or to the Edge Transport server for delivery to another domain.
Comma-separated list of send connectors to ignore	Specify a list of send connector names, separated by a comma, that you want to exclude from monitoring.
Event severity when any send connector is disabled	Set the severity level, from 1 to 40, to indicate the importance of an event in which a connector to send messages from Exchange Server is disabled. The default is 5.
Monitor Foreign Connectors	
Raise event if any foreign connector is disabled?	Select **Yes** to raise an event if a foreign connector is disabled. The default is Yes. The foreign connectors move e-mail to a server within the organization that does not communicate using SMTP.
Comma-separated list of foreign connectors to ignore	Specify a list of foreign connector names, separated by a comma, that you want to exclude from monitoring.
Event severity when any foreign connector is disabled	Set the severity level, from 1 to 40, to indicate the importance of an event in which a foreign connector is disabled. The default is 5.
Monitor Delivery Agent Connectors	
Raise event if any delivery agent connector is disabled?	Select **Yes** to raise an event if a delivery agent connector is disabled. The default is Yes.
Comma-separated list of delivery agent connectors to ignore	Specify a list of delivery agent connector names, separated by a comma, that you want to exclude from monitoring.
Event severity when any delivery agent connector is disabled	Set the severity level, from 1 to 40, to indicate the importance of an event in which a delivery agent connector is disabled. The default is 5.

35.28 Transport_QueueStatus

Use this Knowledge Script to monitor the number of messages in Hub Transport server queues:

- **Submission queue**, which contains messages waiting to be categorized and routed to a delivery queue.
- **Mailbox delivery queue**, which contains messages awaiting delivery to mailboxes on a Mailbox server that is located in the same site as the Hub Transport server.
- **Remote delivery queue**, which contains messages awaiting delivery to mailboxes outside the Active Directory site in which the Hub Transport server is located.
- **Poison message queue**, which is a quarantine destination for messages identified as potentially fatal to your Exchange Server 2007, 2010, or 2013 environment.
- **Unreachable destination queue**, which contains messages that cannot be routed to their destinations.

This script raises an event if the length of a queue or the change in the length of a queue exceeds the threshold you set.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.28.1 Resource Objects

- Exchange2007_Queue
- Exchange2007_EdgeTransportServer
- Exchange2007_HubTransportServer
- Exchange2010_Queue
- Exchange2010_EdgeTransportServer
- Exchange2010_HubTransportServer
- Exchange2013_Queue
- Exchange2013_HubTransportServer

35.28.2 Default Schedule

By default, this script runs every 15 minutes.

35.28.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	

Parameter	How to Set It
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the Transport_QueueStatus job fails. The default is 5.
Monitor Submission Queue	
Event Notification	
Raise event if number of queued messages exceeds threshold?	Select **Yes** to raise an event if the number of messages in the submission queue exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of messages in queue	Set the maximum number of messages that can be waiting in the submission queue before an event is raised. The default is 100 messages.
Event severity when number of messages in queue exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of messages in the submission queue exceeds the threshold you set. The default is 15.
Raise event if increase in queued messages exceeds threshold?	Select **Yes** to raise an event if the percentage of increase in the number of messages in the submission queue exceeds the threshold. The script measures the rate of increase since the last iteration of the job. The default is No.
Threshold - Maximum percent increase in queued messages since last job iteration	Set the maximum acceptable percentage of increase in queue size since the last job iteration. AppManager raises an event if the percentage of increase exceeds this value. The default is 50%.
Event severity when increase in queued messages exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of increase in the number of messages in the submission queue exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of messages in the submission queue?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of messages in the submission queue during the monitoring interval. The default is No.
Monitor Mailbox Delivery Queue	
Event Notification	
Raise event if number of queued messages exceeds threshold?	Select **Yes** to raise an event if the number of messages in the mailbox delivery queue exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of messages in queue	Set the maximum number of messages that can be waiting in the mailbox delivery queue before an event is raised. The default is 250 messages.
Event severity when number of messages in queue exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of messages in the mailbox delivery queue exceeds the threshold you set. The default is 15.
Raise event if increase in queued messages exceeds threshold?	Select **Yes** to raise an event if the percentage of increase in the number of messages in the mailbox delivery queue exceeds the threshold. The script measures the rate of increase since the last iteration of the job. The default is No.
Threshold - Maximum percent increase in queued messages since last job iteration	Set the maximum acceptable percentage of increase in queue size since the last job iteration. AppManager raises an event if the percentage of increase exceeds this value. The default is 50%.

Parameter	How to Set It
Event severity when increase in queued messages exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of increase in the number of messages in the mailbox delivery queue exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of messages in the mailbox delivery queue?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of messages in the mailbox delivery queue during the monitoring interval. The default is No.
Monitor Remote Delivery Queue	
Event Notification	
Raise event if number of queued messages exceeds threshold?	Select **Yes** to raise an event if the number of messages in the remote delivery queue exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of messages in queue	Set the maximum number of messages that can be waiting in the remote delivery queue before an event is raised. The default is 250 messages.
Event severity when number of messages in queue exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of messages in the remote delivery queue exceeds the threshold you set. The default is 15.
Raise event if increase in queued messages exceeds threshold?	Select **Yes** to raise an event if the percentage of increase in the number of messages in the remote delivery queue exceeds the threshold. The script measures the rate of increase since the last iteration of the job. The default is No.
Threshold - Maximum percent increase in queued messages since last job iteration	Set the maximum acceptable percentage of increase in queue size since the last job iteration. AppManager raises an event if the percentage of increase exceeds this value. The default is 50%.
Event severity when increase in queued messages exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of increase in the number of messages in the remote delivery queue exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of messages in the remote delivery queue?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of messages in the remote delivery queue during the monitoring interval. The default is No.
Monitor Poison Message Queue	
Event Notification	
Raise event if number of queued messages exceeds threshold?	Select **Yes** to raise an event if the number of messages in the poison message queue exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of messages in queue	Set the maximum number of messages that can be waiting in the poison message queue before an event is raised. The default is 0 (zero) messages.
Event severity when number of messages in queue exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of messages in the poison message queue exceeds the threshold you set. The default is 15.
Raise event if increase in queued messages exceeds threshold?	Select **Yes** to raise an event if the percentage of increase in the number of messages in the poison message queue exceeds the threshold. The script measures the rate of increase since the last iteration of the job. The default is No.

Parameter	How to Set It
Threshold - Maximum percent increase in queued messages since last job iteration	Set the maximum acceptable percentage of increase in queue size since the last job iteration. AppManager raises an event if the percentage of increase exceeds this value. The default is 50%.
Event severity when increase in queued messages exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of increase in the number of messages in the poison message queue exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of messages in the poison message queue?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of messages in the poison message queue during the monitoring interval. The default is No.
Monitor Unreachable Destination Queue	
Event Notification	
Raise event if number of queued messages exceeds threshold?	Select **Yes** to raise an event if the number of messages in the unreachable destination queue exceeds the threshold you set. The default is Yes.
Threshold - Maximum number of messages in queue	Set the maximum number of messages that can be waiting in the unreachable destination queue before an event is raised. The default is 100 messages.
Event severity when number of messages in queue exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of messages in the unreachable destination queue exceeds the threshold you set. The default is 15.
Raise event if increase in queued messages exceeds threshold?	Select **Yes** to raise an event if the percentage of increase in the number of messages in the unreachable destination queue exceeds the threshold. The script measures the rate of increase since the last iteration of the job. The default is No.
Threshold - Maximum percent increase in queued messages since last job iteration	Set the maximum acceptable percentage of increase in queue size since the last job iteration. AppManager raises an event if the percentage of increase exceeds this value. The default is 50%.
Event severity when increase in queued messages exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the percentage of increase in the number of messages in the unreachable destination queue exceeds the threshold. The default is 15.
Data Collection	
Collect data for number of messages in the unreachable queue?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of messages in the unreachable destination queue during the monitoring interval. The default is No.

35.29 UMS_CallActivity

Use this Knowledge Script to monitor call activity on a Unified Messaging server. This script raises an event if a threshold is exceeded and generates data streams for the following types of calls:

- Active voice calls
- Active fax calls
- Active play-on-phone calls
- Active auto-attendant calls
- Active subscriber-access calls
- Active prompt-editing calls

35.29.1 Resource Objects

- Exchange2007_UnifiedMessagingServer
- Exchange2010_UnifiedMessagingServer
- Exchange2013_UnifiedMessagingServer

35.29.2 Default Schedule

By default, this script runs every 15 minutes.

35.29.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the UMS_CallActivity job fails. The default is 5.
Monitor Voice Calls	
Event Notification	
Raise event if number of active voice calls exceeds threshold?	Select **Yes** to raise an event if the number of active voice calls exceeds the threshold you set. The default is Yes. Active voice calls are calls that are currently connected to the Unified Messaging server.
Threshold - Maximum number of active voice calls	Set the maximum number of calls that can be simultaneously connected to the Unified Messaging server before an event is raised. The default is 100 calls.
Event severity when number of active voice calls exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of active voice calls exceeds the threshold. The default is 5.

Parameter	How to Set It
Data Collection	
Collect data for number of active voice calls?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of voice calls that were active during the monitoring period. The default is No.
Monitor Fax Calls	
Event Notification	
Raise event if number of active fax calls exceeds threshold?	Select **Yes** to raise an event if the number of active fax calls exceeds the threshold you set. The default is Yes. Voice calls become fax calls after a fax tone is detected.
Threshold - Maximum number of active fax calls	Set the maximum number of fax calls that can be simultaneously connected to the Unified Messaging server before an event is raised. The default is 100 calls.
Event severity when number of active fax calls exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of active fax calls exceeds the threshold. The default is 5.
Data Collection	
Collect data for number of active fax calls?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of fax calls that were active during the monitoring period. The default is No.
Monitor Play On Phone Calls	
Event Notification	
Raise event if number of active play on phone calls exceeds threshold?	Select **Yes** to raise an event if the number of active play-on-phone calls exceeds the threshold you set. The default is Yes. The Exchange Server 2007 Unified Messaging play-on-phone feature enables users to access voice mail messages on the telephone rather than on their computer speakers. Active play-on-phone calls are outbound calls initiated to play back messages.
Threshold - Maximum number of active play on phone calls	Set the maximum number of play-on-phone calls that can be simultaneously active before an event is raised. The default is 100 calls.
Event severity when number of active play on phone calls exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of active play-on-phone calls exceeds the threshold. The default is 5.
Data Collection	
Collect data for number of active play on phone calls?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of play-on-phone calls that were active during the monitoring period. The default is No.
Monitor Auto Attendant Calls	
Event Notification	
Raise event if number of active auto attendant calls exceeds threshold?	Select **Yes** to raise an event if the number of active auto-attendant calls exceeds the threshold you set. The default is Yes. The Unified Messaging auto attendant is a set of voice prompts or .wav files played to callers in place of a human operator when they call into your organization. Active auto-attendant calls are calls that are currently connected to the Unified Messaging server by the auto attendant.

Parameter	How to Set It
Threshold - Maximum number of active auto attendant calls	Set the maximum number of auto-attendant calls that can be simultaneously active before an event is raised. The default is 100 calls.
Event severity when number of active auto attendant calls exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of active auto-attendant calls exceeds the threshold. The default is 5.
Data Collection	
Collect data for number of active auto attendant calls?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of auto-attendant calls that were active during the monitoring period. The default is No.
Monitor Subscriber Access Calls	
Event Notification	
Raise event if number of active subscriber access calls exceeds threshold?	Select **Yes** to raise an event if the number of active subscriber-access calls exceeds the threshold you set. The default is Yes. Subscriber access is used by users to access their individual mailboxes to retrieve e-mail, voice messages, contacts, and calendaring information. Active subscriber-access calls are logged-on subscribers who are currently connected to the Unified Messaging server.
Threshold - Maximum number of active subscriber access calls	Set the maximum number of subscriber-access calls that can be simultaneously active before an event is raised. The default is 100 calls.
Event severity when number of active subscriber access calls exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of active subscriber-access calls exceeds the threshold. The default is 5.
Data Collection	
Collect data for number of active subscriber access calls?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of subscriber-access calls that were active during the monitoring period. The default is No.
Monitor Prompt Editing Calls	
Event Notification	
Raise event if number of active prompt editing calls exceeds threshold?	Select **Yes** to raise an event if the number of active prompt-editing calls exceeds the threshold you set. The default is Yes. Active prompt-editing calls are logged-on users who are editing custom prompts, such as voice-mail greetings.
Threshold - Maximum number of active prompt editing calls	Set the maximum number of prompt-editing calls that can be simultaneously active before an event is raised. The default is 100 calls.
Event severity when number of active prompt editing calls exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of active prompt-editing calls exceeds the threshold. The default is 5.
Data Collection	
Collect data for number of active prompt editing calls?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of prompt-editing calls that were active during the monitoring period. The default is No.

35.30 UMS_Connectivity

Use this Knowledge Script to monitor connectivity to Hub Transport servers, Mailbox servers, Active Directory, and mailboxes enabled for Unified Messaging (UM). This script raises an event if a connectivity test fails or if response time exceeds the threshold you set.

A mailbox that is enabled for UM can receive e-mail, voicemail, and fax messages.

NOTE: On Exchange Server 2013, you must drop this script only on the Mailbox server that hosts the Mailbox user that will be used for the test. This script displays an error if you drop this script on any other Mailbox Server that does not host the Mailbox user.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.30.1 Resource Objects

- Exchange2007_UnifiedMessagingServer
- Exchange2010_UnifiedMessagingServer
- Exchange2013_UnifiedMessagingServer

35.30.2 Default Schedule

By default, this script runs every 15 minutes.

35.30.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the UMS_Connectivity job fails. The default is 5.
Monitor UM-Enabled Mailbox Accessibility	
Dial plan to use to connect to the UM-enabled mailbox	Identify the dial plan to use to connect to the mailbox you want to monitor.
Phone extension of UM-enabled mailbox to use for accessibility test	Provide the extension number of the mailbox you want to monitor.
PIN of UM-enabled mailbox to use for accessibility test	Provide the Personal Identification Number (PIN) required to access the mailbox you want to monitor.
Event Notification	

Parameter	How to Set It
Raise event if UM-enabled mailbox cannot be accessed?	Select **Yes** to raise an event if the specified mailbox cannot be tested for connectivity. The default is Yes.
Event severity when UM-enabled mailbox cannot be accessed	Set the severity level, from 1 to 40, to indicate the importance of an event in which the specified mailbox is unavailable for testing. The default is 5.
Raise event if response time exceeds threshold?	Select **Yes** to raise an event if the time to connect to the mailbox exceeds the threshold you set. The default is Yes.
Threshold - Maximum response time	Set the maximum number of seconds that AppManager should wait to connect with the mailbox before raising an event. The default is 10000 milliseconds.
Event severity when response time exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which response time exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for response time?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the length of response time during the monitoring period. The default is No.
Monitor Mailbox Server Connectivity	
Event Notification	
Raise event if Mailbox servers are unavailable?	Select **Yes** to raise an event if Mailbox servers cannot be tested for connectivity. The default is Yes.
Event severity when Mailbox servers are unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which Mailbox servers are unavailable for testing. The default is 5.
Monitor Hub Transport Server Connectivity	
Event Notification	
Raise event if Hub Transport servers are unavailable?	Select **Yes** to raise an event if Hub Transport servers cannot be tested for connectivity. The default is Yes.
Event severity when Hub Transport servers are unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which Hub Transport servers are unavailable for testing. The default is 5.
Monitor Mailbox Server Connectivity	
Event Notification	
Raise event if Mailbox servers are unavailable?	Select **Yes** to raise an event if Mailbox servers cannot be tested for connectivity. The default is Yes.
Event severity when Mailbox servers are unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which Mailbox servers are unavailable for testing. The default is 5.
Monitor Active Directory Connectivity	
Event Notification	
Raise event if Active Directory is unavailable?	Select **Yes** to raise an event if Active Directory cannot be tested for connectivity. The default is Yes.
Event severity when Active Directory is unavailable	Set the severity level, from 1 to 40, to indicate the importance of an event in which Active Directory is unavailable for testing. The default is 5.

35.31 UMS_Failures

Use this Knowledge Script to monitor failures of the Unified Messaging server related to redirected calls, disconnected calls, and access to Active Directory, the Hub Transport server, and the Mailbox server. This script raises an event if a threshold is exceeded.

This script is a member of the Exchange2007 recommended Knowledge Script Group. For more information, see "Recommended Knowledge Script Group" on page 2119.

35.31.1 Resource Objects

- Exchange2007_UnifiedMessagingServer
- Exchange2010_UnifiedMessagingServer
- Exchange2013_UnifiedMessagingServer

35.31.2 Default Schedule

By default, this script runs every 15 minutes.

35.31.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the UMS_Failures job fails. The default is 5.
Monitor Calls Disconnected Due to Internal Errors	
Event Notification	
Raise event if calls disconnected due to internal errors exceed threshold?	Select **Yes** to raise an event if the number of calls disconnected due to internal errors exceeds the threshold you set. The default is Yes. This script uses the value of the `Calls Disconnected on Irrecoverable Internal Error` performance counter, which is the number of calls that were disconnected after an internal system error occurred.
Threshold - Maximum number of calls disconnected due to internal errors	Set the maximum number of calls that can be disconnected due to an internal error before an event is raised. The default is 900 calls.
Event severity when calls disconnected due to internal errors exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of calls disconnected due to internal errors exceeds the threshold you set. The default is 5.
Data Collection	

Parameter	How to Set It
Collect data for calls disconnected due to internal errors	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls disconnected due to internal errors during the monitoring period. The default is No.
Monitor Calls Disconnected Due to External Errors	
Event Notification	
Raise event if calls disconnected due to external errors exceed threshold?	Select **Yes** to raise an event if the number of calls disconnected due to external errors exceeds the threshold you set. The default is Yes. This script uses the value of the `Calls Disconnected by UM on Irrecoverable External Error` performance counter, which is the total number of calls that have been disconnected after an irrecoverable external error occurred.
Threshold - Maximum number of calls disconnected due to external errors	Set the maximum number of calls that can be disconnected due to an external error before an event is raised. The default is 900 calls.
Event severity when calls disconnected due to external errors exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of calls disconnected due to external errors exceeds the threshold you set. The default is 5.
Data Collection	
Collect data for calls disconnected due to external errors?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of calls disconnected due to external errors during the monitoring period. The default is No.
Monitor Failures to Redirect Calls	
Event Notification	
Raise event if failures to redirect calls exceed threshold?	Select **Yes** to raise an event if the number of failed attempts to redirect calls exceeds the threshold you set. The default is Yes. This script uses the value of the `Failed to Redirect Call` performance counter, which is the number of times the Unified Messaging service did not redirect calls to a Unified Messaging worker process.
Threshold - Maximum number of failures to redirect calls	Set the maximum number of calls that can fail to be redirected before an event is raised. The default is 900 calls.
Event severity when failures to redirect calls exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of failed attempts to redirect calls exceeds the threshold you set. The default is 5.
Data Collection	
Collect data for failures to redirect calls?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of attempts to redirect calls that failed during the monitoring period. The default is No.
Monitor Mailbox Server Access Failures	
Event Notification	
Raise event if Mailbox server access failures exceed threshold?	Select **Yes** to raise an event if the number of failed attempts to access the Mailbox server exceeds the threshold you set. The default is Yes. This script uses the value of the `Mailbox Server Access Failures` performance counter, which is the number of times the Unified Messaging system did not access a Mailbox server.

Parameter	How to Set It
Threshold - Maximum number of Mailbox server access failures	Set the maximum number of attempts that can fail to access the Mailbox server before an event is raised. The default is 900 attempts.
Event severity when Mailbox server access failures exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of failed attempts to access the Mailbox server exceeds the threshold you set. The default is 5.
Data Collection	
Collect data for Mailbox server access failures?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of attempts to access the Mailbox server that failed during the monitoring period. The default is No.
Monitor Hub Transport Server Access Failures	
Event Notification	
Raise event if Hub Transport server access failures exceed threshold?	Select **Yes** to raise an event if the number of failed attempts to access the Hub Transport server exceeds the threshold you set. The default is Yes. This script uses the value of the `Hub Transport Access Failures` performance counter, which is the number of times that attempts to access a Hub Transport server failed. This number increases only if all Hub Transport servers are unavailable.
Threshold - Maximum number of Hub Transport server access failures	Set the maximum number of attempts that can fail to access the Hub Transport server before an event is raised. The default is 900 attempts.
Event severity when Hub Transport server access failures exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of failed attempts to access the Hub Transport server exceeds the threshold you set. The default is 5.
Data Collection	
Collect data for number of Hub Transport server access failures?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of attempts to access the Hub Transport server that failed during the monitoring period. The default is No.
Monitor Active Directory Access Failures	
Event Notification	
Raise event if Active Directory access failures exceed threshold?	Select **Yes** to raise an event if the number of failed attempts to access Active Directory exceeds the threshold you set. The default is Yes. This script uses the value of the `Directory Access Failures` performance counter, which is the number of times that attempts to access Active Directory failed.
Threshold - Maximum number of Active Directory access failures	Set the maximum number of attempts that can fail to access Active Directory before an event is raised. The default is 900 attempts.
Event severity when Active Directory access failures exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of failed attempts to access Active Directory exceeds the threshold you set. The default is 5.
Data Collection	
Collect data for Active Directory access failures?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of attempts to access Active Directory that failed during the monitoring period. The default is No.

35.32 UMS_Performance

Use this Knowledge Script to monitor the performance of the Unified Messaging server: user response latency, operation response time, queued messages for call answering, queued OCS user notifications, and calls disconnected while playing audio hourglass tones. This script raises an event if a monitored value exceeds the threshold you set. In addition, this script generates data streams for monitored values.

35.32.1 Resource Objects

- Exchange2007_UnifiedMessagingServer
- Exchange2010_UnifiedMessagingServer
- Exchange2013_UnifiedMessagingServer

35.32.2 Default Schedule

By default, this script runs every 15 minutes.

35.32.3 Setting Parameter Values

Set the following parameters as needed:

Parameter	How to Set It
General Settings	
Job failure event notification	
Event severity when job fails	Set the severity level, from 1 to 40, to indicate the importance of an event in which the UMS_Performance job fails. The default is 5.
Monitor User Response Latency	
Event Notification	
Raise event if user response latency exceeds threshold?	Select **Yes** to raise an event if the amount of time it takes for the system to respond to a user's request exceeds the threshold you set. The default is Yes. This script uses the value of the `User Response Latency` performance counter, which is the average response time, in milliseconds, for the system to respond to a user request. This average is calculated over the last 25 calls.
Threshold - Maximum user response latency	Set the maximum length of time it can take to respond to a user request before an event is raised. The default is 1 millisecond.
Event severity when user response latency exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which user response time exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for user response latency?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the average user response latency value for the monitoring period. The default is No.
Monitor Operations Response Time	

Parameter	How to Set It
Event Notification	
Raise event if percentage of operations exceeds threshold?	Select **Yes** to raise an event if Unified Messaging operations it takes a Unified Messaging operation to complete a transaction exceeds the threshold you set. The default is Yes. This script uses the `MSExchangeUMPerformance` category of performance counters.
Operations response time	Set a response time, between 2 and 6 seconds. Operations with a response time greater than this value are considered for the *Threshold - Maximum percentage of operations that exceed response time* parameter. The default is 6 seconds. The response time is the number of seconds it takes a Unified Messaging operation to complete, during which a caller is waiting for a response.
Threshold - Maximum percentage of operations that exceed the selected response time	Set the maximum percentage of operations that can exceed the response time you specify in *Operations response time*. This script raises an event if the percentage is greater than the threshold value you specify here. The default is 1%.
Event severity when percentage of operations exceeds threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which operation response time exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for percentage of operations that exceeds threshold?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns operation response time for the monitoring period. The default is No.
Monitor Call Answer Queued Messages	
Event Notification	
Raise event if call answer queued messages exceed threshold?	Select **Yes** to raise an event if the number of messages in queue to be answered exceeds the threshold you set. The default is Yes. This script uses the `Call Answer Queued Messages` performance counter, which is the number of messages created and not yet submitted for delivery.
Threshold - Maximum call answer queued messages	Set the maximum number of messages that can be in queue to be answered before an event is raised. The default is 50 messages.
Event severity when call answer queued messages exceed threshold	Set the severity level, from 1 to 40, to indicate the importance of an event in which the number of messages in queue to be answered exceeds the threshold you set. The default is 15.
Data Collection	
Collect data for call answer queued messages?	Select **Yes** to collect data for charts and reports. When enabled, data collection returns the number of messages in queue to be answered for the monitoring period. The default is No.
Monitor Queued OCS User Event Notifications	
Event Notification	

Parameter	How to Set It
