About this Book and the Library

The *Installation and Configuration Guide* provides conceptual information about the NetIQ CloudAccess (CloudAccess) and NetIQ MobileAccess (MobileAccess) products. This book contains configuration information for the appliance and for the SaaS applications.

NOTE: Many of the topics in this guide are applicable to both CloudAccess and MobileAccess users. However, certain features of the CloudAccess product are not included with the MobileAccess license. Those product features that are visible to MobileAccess users, but are licensed only to CloudAccess users, are clearly marked in this guide.

Intended Audience

This book provides information for individuals responsible for deploying and configuring the appliance, managing identity sources, and configuring application connectors.

Other Information in the Library

The library provides the following information resources:

Connectors Guide

Provides conceptual and procedural information for configuring and managing application connectors.

Help

Provides context-sensitive information and step-by-step guidance for common tasks, as well as definitions for fields in windows of the administration console.

About NetIQ Corporation

We are a global, enterprise software company, with a focus on the three persistent challenges in your environment: Change, complexity and risk—and how we can help you control them.

Our Viewpoint

Adapting to change and managing complexity and risk are nothing new

In fact, of all the challenges you face, these are perhaps the most prominent variables that deny you the control you need to securely measure, monitor, and manage your physical, virtual, and cloud computing environments.

Enabling critical business services, better and faster

We believe that providing as much control as possible to IT organizations is the only way to enable timelier and cost effective delivery of services. Persistent pressures like change and complexity will only continue to increase as organizations continue to change and the technologies needed to manage them become inherently more complex.

Our Philosophy

Selling intelligent solutions, not just software

In order to provide reliable control, we first make sure we understand the real-world scenarios in which IT organizations like yours operate—day in and day out. That's the only way we can develop practical, intelligent IT solutions that successfully yield proven, measurable results. And that's so much more rewarding than simply selling software.

Driving your success is our passion

We place your success at the heart of how we do business. From product inception to deployment, we understand that you need IT solutions that work well and integrate seamlessly with your existing investments; you need ongoing support and training post-deployment; and you need someone that is truly easy to work with—for a change. Ultimately, when you succeed, we all succeed.

Our Solutions

- ♦ Identity & Access Governance
- ♦ Access Management
- ♦ Security Management
- ♦ Systems & Application Management
- ♦ Workload Management
- ♦ Service Management

Contacting Sales Support

For questions about products, pricing, and capabilities, contact your local partner. If you cannot contact your partner, contact our Sales Support team.

Worldwide:	www.netiq.com/about_netiq/officelocations.asp
United States and Canada:	1-888-323-6768
Email:	info@netiq.com
Website:	www.netiq.com

Contacting Technical Support

For specific product issues, contact our Technical Support team.

Worldwide:	www.netiq.com/support/contactinfo.asp
North and South America:	1-713-418-5555
Europe, Middle East, and Africa:	+353 (0) 91-782 677

Contacting Documentation Support

Our goal is to provide documentation that meets your needs. The documentation for this product is available on the NetIQ website in HTML and PDF formats on a page that does not require you to log in. If you have suggestions for documentation improvements, click **comment on this topic** at the bottom of any page in the HTML version of the documentation posted at www.netiq.com/documentation. You can also email Documentation-Feedback@netiq.com. We value your input and look forward to hearing from you.

Contacting the Online User Community

NetIQ Communities, the NetIQ online community, is a collaborative network connecting you to your peers and NetIQ experts. By providing more immediate information, useful links to helpful resources, and access to NetIQ experts, NetIQ Communities helps ensure you are mastering the knowledge you need to realize the full potential of IT investments upon which you rely. For more information, visit community.netiq.com.

About this Book and the Library	3
About NetIQ Corporation	5
1 Overview of CloudAccess	11
1.1 The Problem of Securing Resources	11
1.2 The Solution That CloudAccess Provides	13
1.3 How CloudAccess Works	14
1.4 Understanding Product Licensing	15
2 Installing the Appliance	17
2.1 Installation and Configuration Checklist	17
2.2 Product Requirements	18
2.3 Appliance Installation Worksheet	20
2.4 Deploying the Appliance	21
2.5 Upgrading Your Environment	22
2.6 Initializing the Appliance	22
3 Configuring the Appliance	25
3.1 Getting Started	25
3.2 Registering the Appliance	26
3.3 Configuring Networking Options and Certificates	26
3.3.1 Configuring the Forward Proxy	27
3.3.2 Configuring the Second Network Interface	27
3.3.3 A Sample Network Configuration	28
3.3.4 Configuring the Routing Table	28
3.3.5 Changing the Certificates on the Appliance	29
3.4 Configuring Clustering	29
3.4.1 Advantages of Clustering	30
3.4.2 Adding Nodes to the Cluster	30
3.4.3 Promoting a Node to Master	30
3.4.4 Removing a Node from the Cluster	31
3.4.5 Configuring an L4 Switch for Clustering	32
3.5 Configuring an L4 Switch for Email Proxy	32
3.5.1 Configuring the SMTP Protocol Handler	33
3.5.2 Configuring the POP Protocol Handler	33
3.5.3 Configuring the IMAP Protocol Handler	34
4 Configuring Roles Management	35
4.1 Understanding CloudAccess Role Types	35
4.2 Assigning Roles to Users	36
5 Configuring Identity Sources	37
5.1 Active Directory Requirements	37
5.2 eDirectory Requirements	38
5.3 JDBC Requirements	39

5.3.1	Meeting the Requirements	39
5.3.2	Obtaining the Script Files	39
5.3.3	Populating the Required Columns	40
5.3.4	Dataflow Information	41
5.4	Changing the Initial Identity Source Configuration	44
5.5	Configuring Self-Service Registration and Password Management	45
5.5.1	Enabling a Self-Service User Store	45
5.5.2	Using SSUS as an Authentication Source for an Application	46
5.5.3	Using the Self-Service User Registration and Password Management Services	47
5.5.4	Providing Helpdesk Services for Self-Registered Users	48
5.5.5	Configuring SAML 2.0 Inbound Identity Sources	49
5.6	Changing the Default Behavior of the Connectors for LDAP Identity Sources	50
5.6.1	Customizing Import Options	50
5.6.2	Customizing Attribute Mappings	51
5.6.3	Understanding the Relaxed User Matching Option	52
5.7	Configuring Additional Identity Sources	52

6 Configuring Authentication Methods 53

6.1	Configuring Integrated Windows Authentication with Kerberos	53
6.1.1	Configuring the Kerberos User in Active Directory	53
6.1.2	Configuring the Appliance to Use Integrated Windows Authentication with Kerberos	54
6.1.3	Configuring User Browsers	55
6.2	Configuring Google reCAPTCHA	55
6.2.1	Requirements for reCAPTCHA	55
6.2.2	Configuring Intrusion Detection for Failed Logins	56
6.2.3	Configuring a Google reCAPTCHA Account	57
6.2.4	Configuring the reCAPTCHA Tool	57
6.3	Configuring the TOTP Tool for Two-Factor Authentication Using Google Authenticator	58
6.3.1	Configuring the TOTP Tool	58
6.3.2	Registering a Mobile Device with the TOTP Tool for OTP Generation	59
6.3.3	Using Two-Factor Authentication at Login	61
6.3.4	Resetting a Device (Unregistering a Device)	61
6.4	Configuring the Advanced Authentication Tool for Two-Factor Authentication Using NetIQ Advanced Authentication Framework	62
6.4.1	Requirements for Advanced Authentication	63
6.4.2	Configuring the Advanced Authentication Tool	63
6.5	Configuring FIDO for Two-Factor Authentication	64
6.5.1	Requirements for FIDO	64
6.5.2	Configuring the FIDO Tool	64
6.6	Configuring the Authentication Filter to Set Session-Based Identity Information for a User	65

7 Configuring Mobile Access for Users 67

7.1	Introduction to Mobile Access	67
7.2	Installing and Configuring the MobileAccess Appliance	68
7.3	Configuring the MobileAccess Tool on the Appliance	68
7.4	Replacing the Default Certificate on the Appliance	69
7.4.1	Generating a Self-Signed Certificate	69
7.4.2	Installing a Self-Signed Certificate on the Mobile Device	70
7.5	Helping Users Register Their Mobile Devices	70
7.5.1	Registering iOS Devices	70
7.5.2	Registering Android Devices	71
7.6	Understanding the MobileAccess PIN	72
7.7	Unregistering Mobile Devices	72

8	Configuring Connectors	75
9	Mapping Authorizations	77
9.1	Supported Roles and Authorizations	77
9.2	Prerequisites	78
9.3	Loading Authorizations	78
9.4	Reloading Authorizations	78
9.5	Mapping Authorizations	79
9.6	Understanding Google Apps Mappings	80
9.7	A Mapping Example	80
9.8	Approving Requests	81
10	Reporting	83
10.1	Using Google Analytics as an External Dashboard	83
10.2	Integrating with Sentinel Log Manager	84
10.3	Configuring CloudAccess to Forward Events to a Syslog Server	84
11	Configuring the End User Experience	85
11.1	Configuring Email Clients	85
11.2	Configuring End User Browsers for Kerberos Authentication	86
11.3	Customizing Branding on User-Facing Pages	86
11.4	Configuring User Session Timeouts	88
12	Maintenance Tasks	89
12.1	Changing the Cluster Password	89
12.2	Changing the IP Address	89
12.3	Changing the Public DNS Name or NTP Server Settings, or Uploading New Certificates	90
12.4	Updating the Appliance	90
12.5	Shutting Down or Rebooting a Node	91
12.6	Recovering from a Disaster	91
13	Troubleshooting CloudAccess	93
13.1	Troubleshooting the Appliance Initialization	93
13.2	Displaying Health	93
13.3	Using Troubleshooting Tools	94
13.4	Troubleshooting Different States	96
13.4.1	Master Node Health	96
13.4.2	Front Panel of the Node	96
13.4.3	Top of the Node	97
13.4.4	Identity Source	97
13.4.5	Applications	98
13.4.6	Tools	99
13.5	Understanding Support for International Characters	100
13.6	Troubleshooting Networking Issues	100
13.7	Troubleshooting Provisioning Issues	102
13.7.1	Capturing Logs for Provisioning Issues	102
13.7.2	Understanding the Result of Actions Performed on Users and Groups	103
13.7.3	Users No Longer See Private Appmarks	104
13.7.4	Active Directory LDAP Search Treats Extended Characters and Normal Characters the Same	104

13.8	Troubleshooting Policy Mapping Issues	104
13.8.1	No Connectors Appear on the Policy Mapping Page	104
13.8.2	CloudAccess Does Not Reconcile Pending Approvals with Changes to Policy Mappings	104
13.8.3	Using Multiple Browsers or Browser Windows Can Result in Duplicate Mappings	105
13.9	Troubleshooting Mobile Device Issues	105
13.9.1	Safari on Mobile Devices Cannot Access the Login Page After You Enable the MobileAccess Tool	105
13.9.2	Device Registration Issues	105
13.10	Troubleshooting CloudAccess Login Failures	105
13.11	Troubleshooting Authentications or Single Sign-On Issues	106
13.12	Troubleshooting Connector Issues	106
13.13	Troubleshooting JDBC Identity Source Issues	106

A Performing Advanced Branding 109

A.2	//Standard Login Page	110
A.3	//Second Factor Authentication Login Pages	110
A.4	//Landing Page (Home Page after Login)	110
A.5	//Logout Page	110

1 Overview of CloudAccess

CloudAccess is a virtual appliance that enables you to provide secure access to resources that your organization controls for many different types of users.

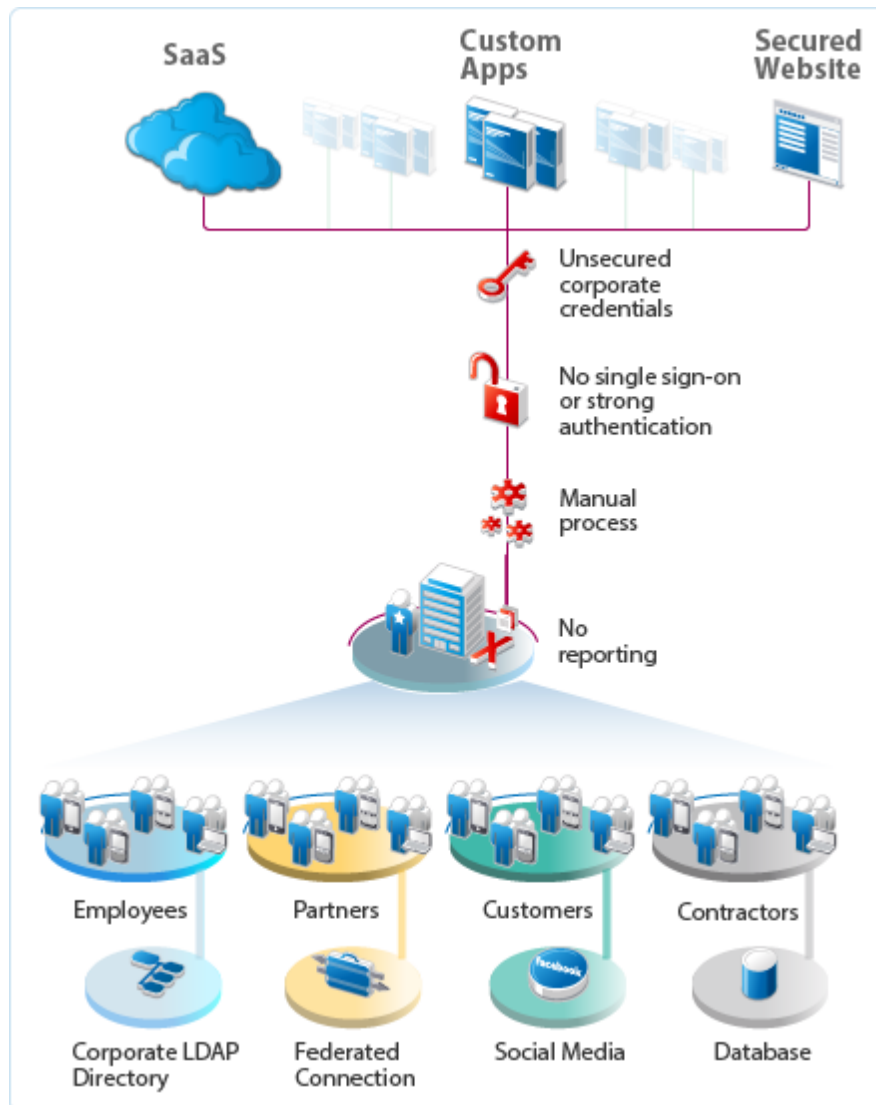

- ♦ [Section 1.1, “The Problem of Securing Resources,” on page 11](#)
- ♦ [Section 1.2, “The Solution That CloudAccess Provides,” on page 13](#)
- ♦ [Section 1.3, “How CloudAccess Works,” on page 14](#)
- ♦ [Section 1.4, “Understanding Product Licensing,” on page 15](#)

1.1 The Problem of Securing Resources

As a corporation, government office, educational institution, or other type of organization, you might have many different types of users who want access to resources you control. Some of those resources might be internal and some might be Software as a Service (SaaS) applications.

This situation presents many different complex problems for your organization. The following image depicts some of the problems you might face.

Figure 1-1 Problems Securing Resources

Common problems include the following:

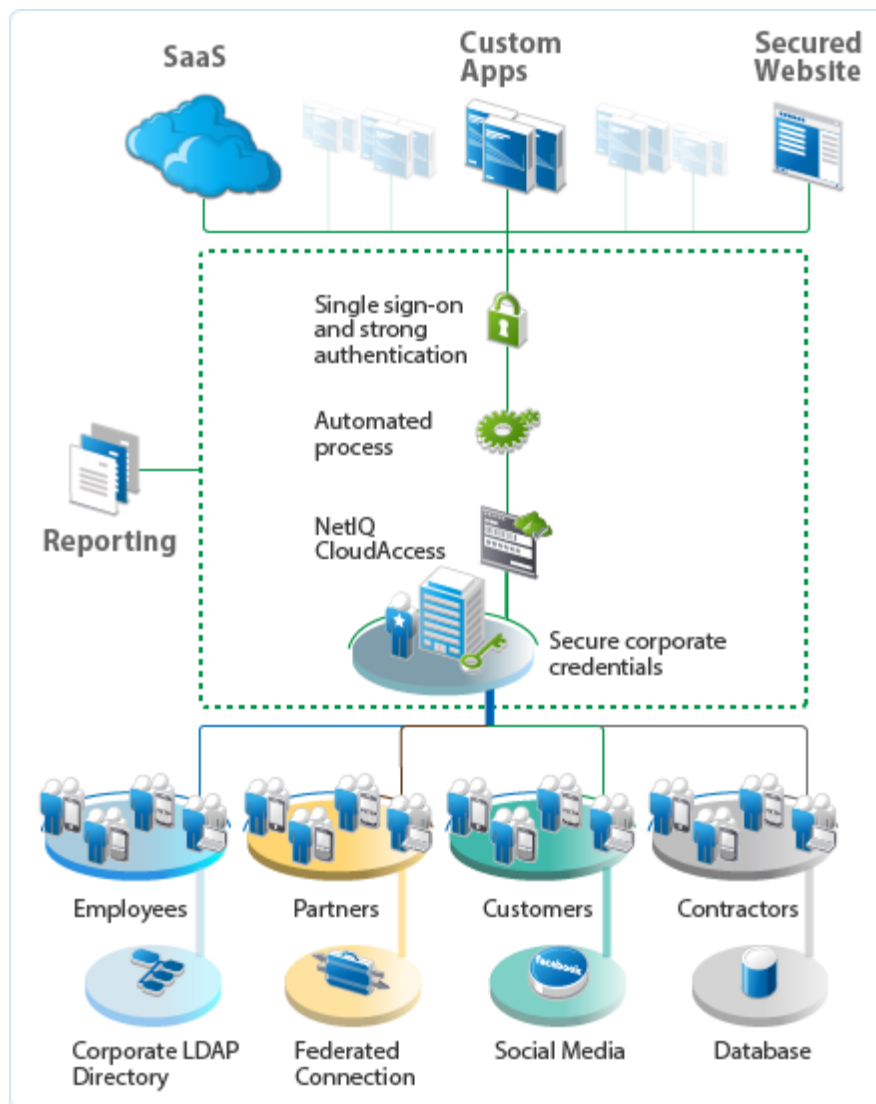

- ♦ Different types of users request access to resources you control.
- ♦ Different types of users require different access levels to resources. For example, your customers would like to use an existing social media account to access your rewards program.
- ♦ Users must wait for the IT department to create accounts in the SaaS applications. It is a manual process whether the IT department creates the account or the user creates the account.
- ♦ Users bypass the IT department and create their own accounts in the SaaS applications.
- ♦ Users must remember separate passwords for each application, and often use their corporate credentials.
- ♦ Administrators receive no compliance reports of user activity in the SaaS application.

1.2 The Solution That CloudAccess Provides

CloudAccess provides a simple, easy-to-deploy appliance that offers a means of providing secure access to resources using a single sign-on account for your users. In addition, CloudAccess enables customers to use their existing social media accounts to access a rewards program.

The following graphic shows how CloudAccess solves the complex problems you face in securing resources for your organization.

Figure 1-2 CloudAccess Solution

CloudAccess provides the following benefits:

- ♦ The ability to manage many different types of users from many different sources
- ♦ An automated process to provision user accounts to the SaaS applications
- ♦ Secure single sign-on to the SaaS applications inside or outside of the organization
- ♦ Compliance reporting of the users' activities in the resources you provide

1.3 How CloudAccess Works

CloudAccess is a virtual appliance that you deploy to your existing IT infrastructure. Here is how CloudAccess works for you:

- ♦ **Identity Sources:** You define different identity sources from which you pull user account information for the appliance to use. CloudAccess allows you to define the following types of identity sources:
 - ♦ LDAP directories
 - ♦ Database
 - ♦ Self-Service users
 - ♦ Federated connections using SAML 2.0 Inbound authentications
 - ♦ Social media accounts
- ♦ **Authentication Methods:** You define different authentication methods for users to use when accessing the secure resources. Some of the methods include:
 - ♦ One-time-password using Google Authenticator
 - ♦ FIDO
 - ♦ Integrated Windows Authentication with Kerberos
 - ♦ Google reCAPTCHA
 - ♦ NetIQ Advanced Authentication Framework
- ♦ **Connectors:** You configure connectors for the resources you want to secure. Some of the connectors automatically provision user accounts from the identity sources to the connected systems, and some of the connectors simply allow for a secure connection.

NOTE: Whether you have a CloudAccess license or a MobileAccess-only license determines the application connectors you are entitled to use. For more information, see [Section 1.4, “Understanding Product Licensing,” on page 15](#).

- ♦ **Provisioning:** CloudAccess allows you to map roles (groups) in an identity source, such as Active Directory or eDirectory, to account authorizations in the SaaS applications. CloudAccess leverages group management in the identity source to automatically create and manage the associated user accounts in the SaaS application.

NOTE: CloudAccess cannot provision users from any social media accounts, or SAML 2.0 Inbound authentications. These are not full users in CloudAccess and cannot be provisioned.

- ♦ **Customers Using Same Account:** CloudAccess also gives you the ability to allow users to use their existing social media accounts to gain access to resources such as a rewards program. These users are different from your corporate users and CloudAccess cannot provision these users.
- ♦ **Secure Single Sign-on:** CloudAccess authenticates users against identity sources and provides single sign-on to the SaaS applications and other resources based on the users' entitlements. CloudAccess then authenticates each user to the SaaS application using a user name and a 20-character randomly generated password that is stored only on the appliance. The user name and corporate password never leave the appliance. In addition, the user never knows the password to access the resource without going through CloudAccess.
- ♦ **Enabling Mobile Devices:** CloudAccess provides an app that enables supported mobile devices to securely access the secured resources.

- ♦ **Reporting:** CloudAccess provides reports on the usage of the SaaS applications to help enforce corporate policies and prove compliance.

1.4 Understanding Product Licensing

If you purchased a full CloudAccess license, your license includes all of the MobileAccess features. For more information about enabling and configuring MobileAccess, see [Chapter 7, “Configuring Mobile Access for Users,”](#) on page 67.

If you purchased MobileAccess without CloudAccess, your license entitles you to a 90-day trial of CloudAccess. At the end of that period, you are expected to purchase the appropriate license for CloudAccess or discontinue use of the CloudAccess features. Your MobileAccess license entitles you to use the following:

- ♦ All administrative features related to mobile device management
- ♦ All options on the Identity Sources palette
- ♦ All options on the Tools palette
- ♦ Three connectors on the Applications palette: the connector for NetIQ Access Manager, the Bookmarks connector, and the Simple Proxy connector

Under the MobileAccess license, you may not use any other embedded connectors (such as the connector for Salesforce or the connector for Google Apps) or import any other connectors (such as the connector for WebEx or custom connectors created with the Access Connector Toolkit).

MobileAccess-only customers can upgrade to a full CloudAccess license at any time. For more information about pricing, contact the NetIQ Sales Support team. For licensing purposes, you can upgrade to a full CloudAccess license by adding a single CloudAccess appliance to an existing MobileAccess cluster. However, if you want all nodes in the cluster to display the CloudAccess product name, you must manually replace each MobileAccess node with a CloudAccess node.

2 Installing the Appliance

CloudAccess and MobileAccess are both installed as a virtual appliance using files that you download, extract, and deploy into your IT environment. Whether you have a MobileAccess-only license or a full CloudAccess license, you need to install the virtual appliance only once (in a non-clustered environment).

- ♦ [Section 2.1, “Installation and Configuration Checklist,” on page 17](#)
- ♦ [Section 2.2, “Product Requirements,” on page 18](#)
- ♦ [Section 2.3, “Appliance Installation Worksheet,” on page 20](#)
- ♦ [Section 2.4, “Deploying the Appliance,” on page 21](#)
- ♦ [Section 2.5, “Upgrading Your Environment,” on page 22](#)
- ♦ [Section 2.6, “Initializing the Appliance,” on page 22](#)

2.1 Installation and Configuration Checklist

Before you begin installing and configuring your appliance, review the following checklist to ensure that you perform steps in the appropriate order.

Table 2-1 *Installation and Configuration Checklist*

<input type="checkbox"/>	Steps	For more information, see...
<input type="checkbox"/>	1. Verify that your environment meets all prerequisites.	Section 2.2, “Product Requirements,” on page 18
<input type="checkbox"/>	2. Verify that your identity source meets all requirements.	<ul style="list-style-type: none">♦ Section 5.1, “Active Directory Requirements,” on page 37♦ Section 5.2, “eDirectory Requirements,” on page 38♦ Section 5.3, “JDBC Requirements,” on page 39
<input type="checkbox"/>	3. Gather the information you need to install and configure the appliance.	Section 2.3, “Appliance Installation Worksheet,” on page 20
<input type="checkbox"/>	4. Install the appliance.	Section 2.4, “Deploying the Appliance,” on page 21
<input type="checkbox"/>	5. Initialize the appliance.	Section 2.6, “Initializing the Appliance,” on page 22
<input type="checkbox"/>	6. Configure the appliance.	Chapter 3, “Configuring the Appliance,” on page 25

<input type="checkbox"/>	Steps	For more information, see...
<input type="checkbox"/>	7. Verify identity source user attributes.	<ul style="list-style-type: none"> ♦ Section 5.1, “Active Directory Requirements,” on page 37 ♦ Section 5.2, “eDirectory Requirements,” on page 38 ♦ Section 5.3, “JDBC Requirements,” on page 39
<input type="checkbox"/>	8. (Optional) Configure additional identity sources.	Chapter 5, “Configuring Identity Sources,” on page 37
<input type="checkbox"/>	9. Configure authentication methods.	Chapter 6, “Configuring Authentication Methods,” on page 53
<input type="checkbox"/>	10. Configure the MobileAccess tool on the appliance.	Section 7.3, “Configuring the MobileAccess Tool on the Appliance,” on page 68
<input type="checkbox"/>	11. Replace the default certificate on the appliance.	Section 7.4, “Replacing the Default Certificate on the Appliance,” on page 69
<input type="checkbox"/>	12. (Conditional) Install a self-signed or non-public certificate on the mobile device.	Section 7.4.2, “Installing a Self-Signed Certificate on the Mobile Device,” on page 70
<input type="checkbox"/>	13. Determine which applications users need to be able to access from mobile devices.	
<input type="checkbox"/>	14. Configure the appropriate connectors to enable user access to applications.	“Configuring Connectors” in the <i>NetIQ CloudAccess Connectors Guide</i>
<input type="checkbox"/>	15. (Optional) Obtain or create custom icons in .png format to represent your appmarked applications.	Section 11.3, “Customizing Branding on User-Facing Pages,” on page 86
<input type="checkbox"/>	16. Configure appmarks for the applications.	“Configuring Appmarks for Connectors” in the <i>NetIQ CloudAccess Connectors Guide</i>
<input type="checkbox"/>	17. (Conditional) Map any non-public appmarks to the appropriate groups in the identity source.	“Configuring Appmarks for Connectors” in the <i>NetIQ CloudAccess Connectors Guide</i>
<input type="checkbox"/>	18. (Conditional) If you have configured provisioning connectors, such as Google Apps, map authorizations for the SaaS applications.	Chapter 9, “Mapping Authorizations,” on page 77
<input type="checkbox"/>	19. (Users) Install the MobileAccess app on their mobile devices and register their mobile devices with the appliance.	Section 7.5, “Helping Users Register Their Mobile Devices,” on page 70

2.2 Product Requirements

Use the information in the following table to verify that your environment meets all requirements before you deploy the appliance.

Table 2-2 Product Requirements

Components	Requirements
Supported Virtual Environments	<p>The appliance requires one of the following virtual environments:</p> <ul style="list-style-type: none"> ♦ Hyper-V on Microsoft Windows Server 2012 R2 ♦ VMware vSphere and vSphere Hypervisor 6.0 ♦ VMware vSphere and vSphere Hypervisor 5.5
Virtual System Guest Requirements	<p>Minimum hardware requirements for each appliance node in the cluster:</p> <ul style="list-style-type: none"> ♦ 60 GB disk space ♦ 2 cores ♦ 8 GB RAM <p>The appliance can be a heavy consumer of CPU, disk I/O, and network bandwidth. Performance can be adversely affected by other virtual machines with similar operational requirements deployed on the same host server.</p> <p>As a best practice, ensure that you group or separate virtual machines on hosts and data stores to avoid resource conflicts for CPU, disk I/O, and network bandwidth. You can do this manually as you deploy virtual machines, or use affinity and anti-affinity rules if they are available in your virtual environment.</p>
Cluster	<p>Supported cluster configuration:</p> <ul style="list-style-type: none"> ♦ The cluster can have up to five nodes. ♦ For optimal performance, each node should reside in the same IP subnet. <p>NOTE: The L4 switch must be configured with the publicly resolvable DNS of the cluster before you initialize the appliance.</p>
Identity Sources	<p>Supported identity sources for users:</p> <ul style="list-style-type: none"> ♦ Microsoft Active Directory LDAP on Windows Server 2012 R2 or 2008 R2 ♦ NetIQ eDirectory LDAP 8.8.8 ♦ Microsoft SQL Server 2014 or 2008 ♦ Oracle Database 12c or 11.1 <p>For more information, see Chapter 5, “Configuring Identity Sources,” on page 37.</p>
Client Workstations	<p>Administration: Supported workstations for administration tasks:</p> <p>NOTE: Administration tasks are not supported on mobile devices.</p> <ul style="list-style-type: none"> ♦ Microsoft Windows 10.x, 8.1, or 7.1 (no touch screens) ♦ Apple OS X (latest version) <p>Users: Supported workstations for users:</p> <ul style="list-style-type: none"> ♦ Microsoft Windows 10.x, 8.1, or 7.1 ♦ Apple OS X (latest version) ♦ Chromebooks (latest version)

Components	Requirements
Mobile Devices	<p>Administration: Not supported on mobile devices.</p> <p>Users:</p> <p>Supported iOS mobile devices for users:</p> <ul style="list-style-type: none"> ♦ iPhone with iOS 8.x or 9.x or later ♦ iPad or iPad mini with iOS 8.x or 9.x or later <p>Supported Android mobile devices for users:</p> <ul style="list-style-type: none"> ♦ Android phones and tablets with KitKat 4.4 or Lollipop 5.x
Browsers	<p>Administration: Supported browsers for administration tasks:</p> <ul style="list-style-type: none"> ♦ Mozilla Firefox (latest version) on a supported workstation ♦ Google Chrome (latest version) on a supported workstation ♦ Microsoft Internet Explorer 11 on a supported workstation ♦ Apple Safari (latest version) on a supported workstation <p>NOTE: You must disable pop-up blockers to access the administration console. If you experience any issues with a supported browser, ensure that you have the latest version of the browser installed, or try another supported browser. Administering the appliance with Internet Explorer might be slower than with other supported browsers.</p> <p>Users: Supported browsers for users:</p> <ul style="list-style-type: none"> ♦ Mozilla Firefox (latest version) ♦ Google Chrome (latest version) ♦ Microsoft Internet Explorer 11 ♦ Apple Safari (latest version)
Email Clients	<p>For email proxy, CloudAccess supports IMAP, POP3, and SMTP across a variety of desktop and mobile email clients. For example, Windows Live Mail 2011 and the latest version of the Apple Mail Client on iPad or iPhone with iOS 8.x or later.</p> <p>NOTE: The email ports in the CloudAccess cluster cannot be changed. It might be necessary to adjust the mail protocol or port configuration on the email clients to connect to the email proxy.</p>
DNS	<p>CloudAccess requires that all appliance nodes, administration workstations, end-user workstations, mobile devices, and identity sources be able to resolve the public DNS name of the appliance.</p> <p>NOTE: The L4 switch must be configured with the publicly resolvable DNS of the cluster before you initialize the appliance.</p>
SaaS Application Requirements	<p>Each SaaS application has different requirements. For more information about the requirements for each SaaS application, see the NetIQ CloudAccess Connectors Guide.</p>

2.3 Appliance Installation Worksheet

Use the following worksheet to gather the required information to install and configure the appliance.

Table 2-3 Appliance Installation Worksheet

Component	<input type="checkbox"/>	Gather the following information:
Networking Information		
	<input type="checkbox"/>	Publicly resolvable DNS name for the appliance
	<input type="checkbox"/>	NTP server
	<input type="checkbox"/>	DNS server, subnet mask, and gateway
	<input type="checkbox"/>	(Recommended) An SSL certificate signed by a well-known certificate authority (CA)
Identity Sources		
	<input type="checkbox"/>	IP address or DNS name of the server or database that contains the users
	<input type="checkbox"/>	Context of the users (Only for Active Directory and eDirectory)
	<input type="checkbox"/>	Name and password of a user account with the proper rights to the users

2.4 Deploying the Appliance

Whether you are deploying CloudAccess or MobileAccess, the appliance is an Open Virtualization Format (OVF) virtual appliance. You must deploy the appliance to your VMware or Hyper-V server.

The appliance must obtain an IP address through DHCP or have an assigned static IP address. NetIQ provides two different OVF files for each appliance, to accommodate DHCP and non-DHCP environments:

- ♦ **DHCP environment:** Use the *.ovf file for environments that have a DHCP server.
- ♦ **Non-DHCP environment:** Use the *-vcenter.ovf file for environments that do not have a DHCP server and need to use a static IP address.

To deploy the appliance in a VMware environment:

- 1 Download the appropriate file from the [NetIQ Downloads web page \(https://dl.netiq.com/\)](https://dl.netiq.com/).
- 2 (Conditional) If you are using Windows, extract the VMware image to access the available OVF file.
- 3 (Conditional) If you are using Linux, use the following command to extract the image:

```
tar -zxvf vmware_image.tar.gz
```
- 4 (Conditional) If you have a DHCP server in your environment, deploy the *.ovf file to a specific ESXi host. For more information, see the VMware documentation.

- 5 (Conditional) If you do not have a DHCP server in your environment:
 - 5a Deploy the `*-vcenter.ovf` file to a VMware vCenter Server, using either the command line tool `ovftool` or the VMware vSphere client.
 - 5b Configure the appliance properties, ensuring that you change the `use_dhcp` property to false. Other required properties include the static IP address, subnet mask, default gateway, DNS server, and NTP server name.

TIP: If you deploy the appliance using the `ovftool`, you can configure the appliance properties from the command line and auto-start the VM so you do not have to use the vSphere client to configure the properties before starting the VM.

- 6 Power on the appliance, then proceed to [Section 2.6, “Initializing the Appliance,” on page 22](#).

The initial boot configures the appliance. This process could take between five and twenty minutes to complete. When the appliance is ready, it displays a welcome message with the initialization URL `https://appliance_ip_address/appliance/Init.html`.

NOTE: Whether you have a MobileAccess-only license or a full CloudAccess license, you need to install only one virtual appliance to access all features. The CloudAccess appliance includes all MobileAccess features.

2.5 Upgrading Your Environment

If you are currently running CloudAccess or MobileAccess 2.2.1 Hotfix 4 (2.2.1-14) in your environment, you can use the update channel to upgrade to CloudAccess 2.3. For more information, see [Section 12.4, “Updating the Appliance,” on page 90](#).

2.6 Initializing the Appliance

After you have deployed the appliance, you must initialize it. For more information, see the following video: [NetIQ CloudAccess: Initializing the Appliance \(https://www.youtube.com/watch?v=eUHLkAzxKH0\)](https://www.youtube.com/watch?v=eUHLkAzxKH0). You can also use the “Appliance Installation Worksheet” on page 20 to make sure you have the required information before you begin.

- 1 Verify that your environment meets all requirements listed in [Section 2.2, “Product Requirements,” on page 18](#).
- 2 From a supported browser, access the initialization web interface at the URL displayed on the appliance screen after it is deployed.

For example: `https://appliance_ip_address/appliance/Init.html`

IMPORTANT: This URL is case-sensitive, so ensure that you enter the non-variable portions of the URL exactly as illustrated in the example above.

- 3 Follow the prompts in the initialization wizard to provide the information needed to initialize the appliance.
- 4 Click **Finish**.

A successfully initialized appliance automatically redirects the browser to the administration console login page at `https://appliance_dns_name/appliance/index.html`.

- 5 Log in with the Admin user name specified in **Step 3 - Cluster Information**. The password is the user's password in the identity source.
- 6 Proceed with [Chapter 3, "Configuring the Appliance,"](#) on page 25.

You can change the initialization settings at any time if needed. Enter `https://appliance_dns_or_IP_address/appliance/Init.html` in a browser to access the initialization settings page. After the appliance has been initialized for the first time, the next time you access the `Init.html` page, CloudAccess prompts you for the appliance password.

Whenever you make changes to the appliance, click **Apply** and wait for the appliance to finish applying your changes. Do not attempt to perform any other administration tasks in the console until the gears have stopped spinning on the appliance icon.

IMPORTANT: The initial import of a large number of users (for example, 20,000 or more) from the identity source can take several hours, and the administration console does not currently provide a warning to administrators before beginning the process. During the user import process, the health status in the console might report the following warnings on and off: `Driver seems unresponsive | Provisioning | bis_AD_a4uLn | Driver seems unresponsive`.

If you have a large number of users in your environment, ensure that you allow several hours for the provisioning process to complete. After users are added, performance of other administration tasks in the console improves considerably.

3 Configuring the Appliance

After you have installed and initialized the appliance, you can configure the appliance to communicate with the SaaS applications. For more information about initializing the appliance, see [Section 2.6, “Initializing the Appliance,” on page 22](#).

- ♦ [Section 3.1, “Getting Started,” on page 25](#)
- ♦ [Section 3.2, “Registering the Appliance,” on page 26](#)
- ♦ [Section 3.3, “Configuring Networking Options and Certificates,” on page 26](#)
- ♦ [Section 3.4, “Configuring Clustering,” on page 29](#)
- ♦ [Section 3.5, “Configuring an L4 Switch for Email Proxy,” on page 32](#)

3.1 Getting Started

After you initialize the appliance, the browser automatically redirects you to the administration console at https://appliance_dns_name/appliance/index.html. If the initialization does not automatically redirect you, you can open the page manually to complete the appliance configuration.

To access the administration console:

- 1 In a supported browser, enter https://appliance_dns_name/appliance/index.html.
- 2 Log in as the administrator of the appliance.

These credentials are the cluster administrator user name specified during the initialization process and its identity source user password.

IMPORTANT: The first time you log in, the appliance displays the Admin page and might display user count activity on the **Users** bar as users in the search contexts from the identity source are imported and activated. Ensure that this process completes before you configure any application connectors.

Before you begin any configuration tasks, you should register your appliance. For more information, see [Section 3.2, “Registering the Appliance,” on page 26](#).

After you register the appliance, use the icons at the top of the Admin page to access the other administration pages:

- ♦ **Roles:** Configure roles for different users within CloudAccess. For more information, see [Section 4.2, “Assigning Roles to Users,” on page 36](#).
- ♦ **Policy:** Map roles (groups) from the identity source to authorizations for the SaaS applications. For more information, see [Chapter 9, “Mapping Authorizations,” on page 77](#).
- ♦ **Approval:** Approve or deny authorizations for the SaaS applications. This icon appears only if you have mapped roles to authorizations and selected the option to require approval for accounts, and there are accounts waiting for approval. For more information, see [Section 9.8, “Approving Requests,” on page 81](#).
- ♦ **Reports:** Report on user activities to the SaaS applications. For more information, see [Chapter 10, “Reporting,” on page 83](#).

- ♦ **Devices:** View and manage registered mobile devices. For more information, see [Section 7.7, “Unregistering Mobile Devices,” on page 72.](#)

If your session times out or you log out, the next time you log in to the appliance, CloudAccess displays the page that you last accessed. Admin sessions time out by default after 10 minutes of inactivity, and this setting is not configurable. However, you can adjust the timeout setting for user sessions. For more information, see [Section 11.4, “Configuring User Session Timeouts,” on page 88.](#)

3.2 Registering the Appliance

CloudAccess provides a 30-day trial period. If you do not register the appliance within 30 days after installation, the appliance stops working. The bomb icon on the Admin page displays how many days are left in the trial period.

For the purpose of meeting licensing requirements, when you register a single appliance, the cluster as a whole is considered to be registered. However, to use the [Customer Center](#) update channel to download and install software updates, you must register each node in the cluster separately. The bomb icon remains on the Admin page if there are nodes in the cluster that have not yet been registered for channel updates. For more information about the update channel, see [Section 12.4, “Updating the Appliance,” on page 90.](#)

To register your appliance:

- 1 Log in to your Customer Center at <https://www.netiq.com/customercenter> (<https://www.netiq.com/customercenter>).
- 2 Click **My Products > Products**, then click **CloudAccess**.
- 3 Click the right arrow on the line next to the product to open a details page.
- 4 Select the **Activation Code** value and copy it to the clipboard. You will need this code to register the appliance.
- 5 Log in to the appliance at https://appliance_dns_name/appliance/index.html.
- 6 On the Admin page, click the appliance, then click **Register appliance**.
- 7 Enter the email address you used when you registered with the Customer Center.
- 8 Paste the Activation Code you copied to the clipboard from the Customer Center.
- 9 Click **Register**.
- 10 Repeat [Step 6](#) through [Step 9](#) for each appliance in the cluster.

When you have successfully registered all nodes in the cluster, the bomb icon disappears.

3.3 Configuring Networking Options and Certificates

CloudAccess contains a manual routing table, supports two Network Interface Cards (NICs), and provides a forward proxy. The forward proxy is intended only for testing purposes.

- ♦ [Section 3.3.1, “Configuring the Forward Proxy,” on page 27](#)
- ♦ [Section 3.3.2, “Configuring the Second Network Interface,” on page 27](#)
- ♦ [Section 3.3.3, “A Sample Network Configuration,” on page 28](#)
- ♦ [Section 3.3.4, “Configuring the Routing Table,” on page 28](#)
- ♦ [Section 3.3.5, “Changing the Certificates on the Appliance,” on page 29](#)

3.3.1 Configuring the Forward Proxy

The forward proxy takes requests from the internal network and forwards these requests to the Internet.

The forward proxy feature has the following limitations:

- The forward proxy is intended only for testing purposes, and is not supported in a production environment.
- When forward proxy is enabled, Simple Proxy connectors work only with web servers or resources (as specified in the **Connects to** field of the connector configuration) that are on the local segment. All simple proxied services must be reachable from the appliance without going through the forward proxy.

In addition, before you configure a Simple Proxy connector to work with a web server on the local segment, you must add the IP address of the web server to the Forward Proxy's **Ignore List** configuration field. Otherwise, the simple proxy configuration is not allowed, and the **Connects to** field turns red.

NOTE: Wildcard entries in the **Ignore List** field are not supported.

To configure the forward proxy:

- 1 Log in with an appliance administrator account to the administration console at https://appliance_dns_name/appliance/index.html.
- 2 Drag the **Forward Proxy** icon from the **Tools** palette to the **Tools** panel.
- 3 Use the following information to configure the forward proxy:
Forward Proxy Server: Specify the IP address and port number for your proxy server.
Ignore List: Specify any IP addresses with the associated DNS names that you want the forward proxy to ignore. For example, `127.0.0.0|localhost`.
- 4 Click **OK** to save your changes. Note that clicking **OK** causes the services to restart and you must log in to the appliance again.

3.3.2 Configuring the Second Network Interface

CloudAccess supports two Network Interface Cards (NICs) for each node in the cluster. You can configure one NIC for the administrative network and a second NIC for the public network. Whether the nodes in a cluster each have one or two NICs configured, the cluster itself has only two DNS names: one for the Admin NICs and one for the Public NICs.

IMPORTANT: If you configure two NICs on one appliance, you must configure all other nodes in the cluster with two NICs.

To configure the second NIC on a node:

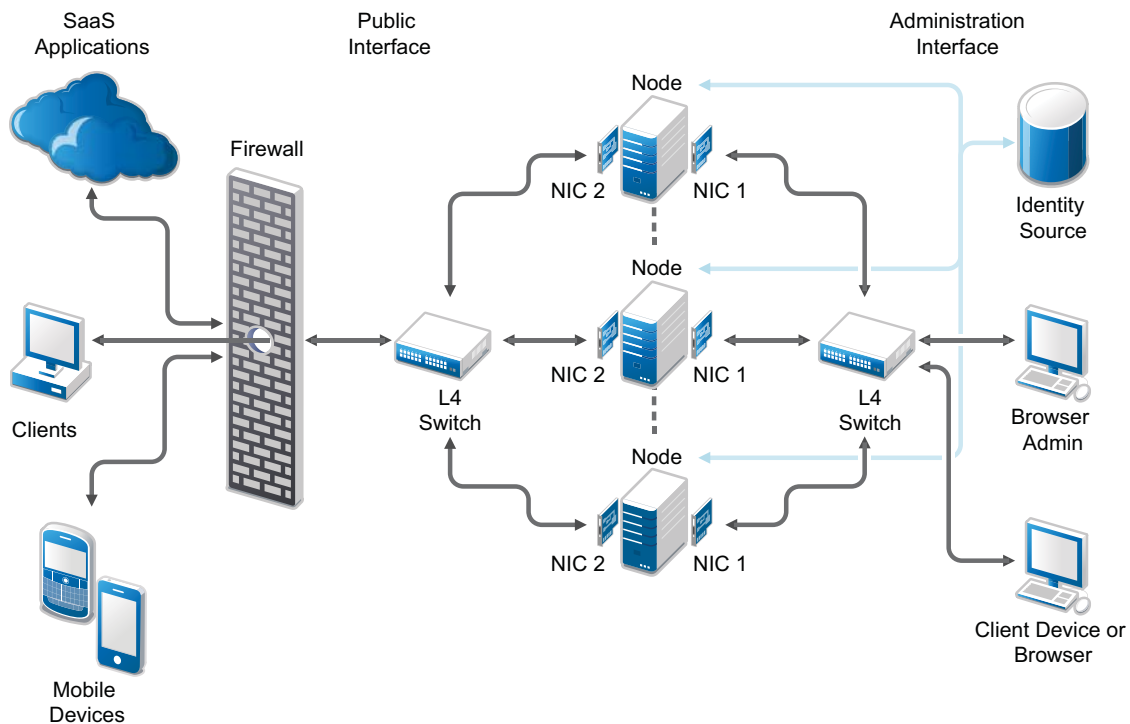

- 1 Log in with an appliance administrator account to the administration console at https://appliance_dns_name/appliance/index.html.
- 2 Click a node icon, then click **Configure**.
- 3 Click the **Public Interface** tab.
- 4 Select **Enable Separate Public Interface**.
- 5 Configure the network settings for your public network and click **OK**.

- 6 (Conditional) If this is the first node in the cluster with a Public NIC, type the DNS name for the public network. Modify the keypairs for SSL and SAML as needed and click **OK**.
- 7 Click **Apply** to save the changes.
- 8 Click **Close**.
- 9 Repeat [Step 2](#) through [Step 8](#) for each node in the cluster.

3.3.3 A Sample Network Configuration

The following graphic depicts a possible network configuration using CloudAccess with both NICs enabled on each node.

Figure 3-1 A Sample Network Diagram

The network diagram shows that each node has both NICs enabled. The first NIC is the administration interface for the node and the second NIC is the public interface of the node. All of the administration and corporate information stays on the administration interface side of the network. All user requests and application requests communicate only on the public interface. This configuration provides a layer of security for your corporate information.

3.3.4 Configuring the Routing Table

CloudAccess provides a routing table for your use if your network has static routes. The routing table allows you to define the next hop in your network for the node in the cluster to reach the appropriate destination.

To configure the routing table for each node:

- 1 Log in with an appliance administrator account to the administration console at https://appliance_dns_name/appliance/index.html.

- 2 Click the node icon, then select **Configure**.
- 3 Click the **Routing** tab.
- 4 Specify the appropriate **Reverse Path Filter** setting.
Reverse path filtering is used to prevent packets that arrived through one interface from leaving through a different interface. If you are in doubt, leave the default setting of **Strict mode**, because it prevents users from spoofing IP addresses from local subnets and reduces the likelihood of distributed denial-of-service (DDoS) attacks.
- 5 Click the plus sign (+) to add a route.
- 6 Define the appropriate route, then click **OK**.
- 7 (Optional) Add additional routes.
- 8 Click **Close**.
- 9 Repeat [Step 2](#) through [Step 8](#) for each node in the cluster.

3.3.5 Changing the Certificates on the Appliance

The appliance contains SSL and SAML self-generated certificates, by default both named `ag4csrv1`, but NetIQ highly recommends that you replace the default certificates with signed certificates from a well-known Certificate Authority. The required format for importing a key pair is `.pfx`. This format contains the private key, certificate, and trusted roots required to import.

To change the certificates:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Click the cluster icon under **Appliances**, then click **Configure**.
- 3 Delete the default key pairs by clicking the red delete (X) icon next to the SSL key pair and the SAML key pair.
- 4 Browse to and select the certificates you want to use, then click **OK**.
- 5 In the Instructions window, click **OK**.
- 6 Click **Apply** and wait for the configuration changes to be applied to the appliance. Do not perform other administration tasks in the console while the changes are being applied.
- 7 Close your browser and reopen it to start a new session using the new key pairs.

Expired key pair certificates prohibit changes from being made to this page and make the key pair field red. If the key pair expires, you must re-initialize the appliance before you can upload a new certificate. For more information, see [Section 2.6, “Initializing the Appliance,” on page 22](#).

3.4 Configuring Clustering

You can cluster the CloudAccess appliance. By default, it is a single node cluster, but CloudAccess supports up to a five-node cluster. You add a node to the cluster by selecting **Join Cluster** during the initialization process.

- ♦ [Section 3.4.1, “Advantages of Clustering,” on page 30](#)
- ♦ [Section 3.4.2, “Adding Nodes to the Cluster,” on page 30](#)
- ♦ [Section 3.4.3, “Promoting a Node to Master,” on page 30](#)
- ♦ [Section 3.4.4, “Removing a Node from the Cluster,” on page 31](#)
- ♦ [Section 3.4.5, “Configuring an L4 Switch for Clustering,” on page 32](#)

3.4.1 Advantages of Clustering

Clustering in CloudAccess offers several advantages. Most of these advantages are available only if you configure an L4 switch or Round-robin DNS. The L4 switch is the best solution.

Disaster Recovery: Adding additional nodes to the cluster provides disaster recovery for your appliance. If one node stops running or becomes corrupt, you can promote another node to master.

High Availability for Authentications: CloudAccess provides high availability for authentications and the single sign-on service, when using an L4 switch in conjunction with clustering. This solution allows users to authenticate in case of problems with the nodes within the cluster. The L4 switch sends authentication requests to the nodes with which it can communicate.

Load Balancing: You can configure the L4 switch to distribute authentications to nodes so one node does not receive all authentication requests while other nodes sit idle.

Scalability: Configuring an L4 switch with clustering increases the scalability of CloudAccess. Each node in the cluster increases the number of possible concurrent logins.

3.4.2 Adding Nodes to the Cluster

CloudAccess supports up to five nodes in a cluster. You add nodes to the cluster through the initialization process, and perform all other initialization tasks on the Admin page.

To add a node to the cluster:

- 1 Verify that the cluster is healthy.
 - ♦ All nodes must be running and communicating.
 - ♦ All components must be in a green state.
 - ♦ All failed nodes must be removed from the cluster.

For more information about verifying that your cluster is healthy, see [Section 13.4, “Troubleshooting Different States,” on page 96](#).

- 2 Download and deploy a new virtual machine (VM) for the new node.

For more information, see [Section 2.4, “Deploying the Appliance,” on page 21](#).

- 3 Initialize the appliance. Select **Join Cluster** as the first step to initialize the new node, then follow the on-screen prompts.

For more information, see [Section 2.6, “Initializing the Appliance,” on page 22](#).

When initialization is complete, the browser is redirected to `index.html` and a login page appears.

- 4 Log in to `index.html` and verify that the new appliance appears in the cluster. Wait until all spinner icons stop processing and all components are green before performing any other tasks.

The cluster is adding the node and there are several background processes running. This final step could take up to an hour to complete.

- 5 After the node is added to the cluster, register the node. For more information, see [Section 3.2, “Registering the Appliance,” on page 26](#).

3.4.3 Promoting a Node to Master

The first node that you install is the master node of the cluster by default. The master node runs provisioning, reporting, approvals, and policy mapping services. You can promote any node to become the master node.

To promote a node to master:

- 1 Verify that the cluster is healthy.
 - ♦ All nodes must be running and communicating.
 - ♦ All components must be in a green state.
 - ♦ All failed nodes must be removed from the cluster.

For more information about verifying that your cluster is healthy, see [Section 13.4, “Troubleshooting Different States,”](#) on page 96.

- 2 Verify that all nodes in the cluster are running the same version of CloudAccess. If any nodes need to be updated, ensure that you update the nodes *before* you switch the master node. For more information, see [Section 12.4, “Updating the Appliance,”](#) on page 90.

- 3 Take a snapshot of the cluster.

- 4 Click the node to become the master node on the Admin page, then click **Promote to master**.

An M appears on the front of the node icon indicating it is now the master node. This process might take a while to complete. Watch for the node spinner icons to stop and Health indicators to turn green before proceeding with any additional configuration changes.

The services move from the old master to the new master. The old master is now just a regular node in the cluster.

WARNING

- ♦ If the old master node is down when you promote another node to master, remove the old master from the cluster, then delete it from the host server. Otherwise, the appliance sees two master nodes and becomes corrupted.
 - ♦ When you switch the master node, the logs start again on the new master and reports start again on the new master. The historical logs are lost. The reporting data is also lost, unless you are using Sentinel Log Manager. For more information, see [Section 10.2, “Integrating with Sentinel Log Manager,”](#) on page 84.
-

3.4.4 Removing a Node from the Cluster

You can remove a node from the cluster if something is wrong with the node. However, ensure that you use the following steps to properly remove the node. If you simply delete a node from the cluster, the appliance deletes the node from the interface, but the virtual image still exists and continues to run. Leaving the virtual image running allows users to authenticate to a node that does not exist on the Admin page.

NOTE: After you remove a node, you cannot add the same VM instance back into the cluster. You must delete this instance of the appliance from your host server, then deploy another instance to the host server to add a node back into the cluster.

To remove a node from the cluster:

- 1 (Conditional) If the node you are removing is the master node, promote another node to be master before you remove the old node. For more information, see [Section 3.4.3, “Promoting a Node to Master,”](#) on page 30.
- 2 (Conditional) If you are using an L4 switch, delete the node from the L4 switch. For more information, see the L4 switch documentation.
- 3 On the Admin page, click the node you want to remove from the cluster.

4 Click **Remove from cluster**.

The Admin page immediately shows that the node is gone, but it takes some time for the background processes to finish.

5 Stop the virtual image on the host server, and then delete the instance of the node from the host server.

3.4.5 Configuring an L4 Switch for Clustering

If you want high availability or load balancing, you must configure an L4 switch for the CloudAccess appliance. An L4 switch can be configured in many different ways. Use the following recommendations to configure the L4 switch to work with the appliance:

- ♦ **Heartbeat:** Use the following URL to define the heartbeat for the L4 switch:

```
https://appliance_ip_address/osp/h/heartbeat
```

The L4 switch uses the heartbeat to determine if the nodes in the cluster are running and working properly. The heartbeat URL returns a text message of Success and an HTTP 200 response code.

- ♦ **Persistence:** Also known as **sticky sessions**, persistence allows all subsequent requests from a client to be sent to the same node. To make this happen, select SSL session ID persistence when configuring the L4 switch.

Session persistence ensures that the same real server is used for the CloudAccess login and the subsequent application single sign-on. Using the same server allows caching for a series of related transactions, which can improve the server performance and reduce the latency of transactions. It removes the delay that might occur if the client sends a request to a new node instead of using the existing session to the same node. To ensure that transactions for the same client are forwarded to the same real server in a load-balanced cluster configuration:

- ♦ You can set the L4 switch to use IP-based persistence, which uses the user device's IP address to maintain an affinity between the user session and the same real server in the cluster. IP-based persistence fails if a user's device IP address changes between requests, such as if a user's mobile device changes networks during a session. It also fails if all user devices come through a proxy service where all transactions appear to come from the same IP address.
- ♦ You can set the L4 switch to use sticky-bit persistence. However, note that sticky-bit persistence is problematic for L4 switches that do not support stickiness. Sticky sessions also do not work with browsers set to disable cookies.
- ♦ You can use a proxy approach for the identity provider nodes that does not depend on the L4 configuration. However, this solution can quickly become chatty.

3.5 Configuring an L4 Switch for Email Proxy

CloudAccess contains an email proxy for users with Google Apps that supports three protocols: SMTP, POP3S, and IMAPS. You must configure your L4 switch to handle these protocols. Use the following high level steps to configure the protocols for your L4 switch. For more information, see your specific L4 documentation.

- ♦ [Section 3.5.1, "Configuring the SMTP Protocol Handler," on page 33](#)
- ♦ [Section 3.5.2, "Configuring the POP Protocol Handler," on page 33](#)
- ♦ [Section 3.5.3, "Configuring the IMAP Protocol Handler," on page 34](#)

3.5.1 Configuring the SMTP Protocol Handler

To configure an SMTP protocol handler for your L4 switch:

- 1 On your L4 switch, configure a new IP group (traffic group) or use an existing group for the virtual servers in the L4 switch.
You can use this group for all of the protocols.
- 2 (Optional) Create a health monitor:
 - 2a Set the health checking for the pool to **TCP transaction monitor**.
 - 2b Set the timeout to 30 seconds.
 - 2c Set the health monitor to separately monitor each node.
- 3 Create a traffic pool for the SMTP virtual server to use:
 - 3a Add each appliance node to the pool using the IP address with the port.
For example: 192.168.1.14:25. The SMTP port is 25.
 - 3b (Optional) Add the health monitor created in [Step 2](#).
 - 3c Select your load balancing settings.
For example: round robin or random
 - 3d Set the session persistence to **SSL Session ID**.
- 4 Create a new virtual server:
 - 4a Specify the protocol as SMTP and the port as 25.
 - 4b Use the traffic group defined in [Step 1](#) and the pool defined in [Step 3](#) for the virtual server.
- 5 Start the virtual server.

3.5.2 Configuring the POP Protocol Handler

To configure a POP protocol handler for your L4 switch:

- 1 On your L4 switch, configure a new IP group (traffic group) or use an existing group for the virtual servers in the L4 switch.
You can use this group for all of the protocols.
- 2 (Optional) Create a health monitor:
 - 2a Set the health checking for the pool to **TCP transaction monitor**.
 - 2b Set the timeout to 30 seconds.
 - 2c Set the health monitor to separately monitor each node.
- 3 Create a traffic pool for the POP virtual server to use:
 - 3a Add each appliance node to the pool using the IP address with the port.
For example: 192.168.1.14:995. The POP port is 995.
 - 3b (Optional) Add the health monitor created in [Step 2](#).
 - 3c Select your load balancing settings.
For example: round robin or random
 - 3d Set the session persistence to **SSL Session ID**.

- 4 Create a new virtual server:
 - 4a Specify the protocol as SSL (POP3S) and the port as 995.
 - 4b Use the traffic group defined in [Step 1](#) and the pool defined in [Step 3](#) for the virtual server.
- 5 Start the virtual server.

3.5.3 Configuring the IMAP Protocol Handler

To configure an IMAP protocol handler for your L4 switch:

- 1 On your L4 switch, configure a new IP group (traffic group) or use an existing group for the virtual servers in the L4 switch.

You can use this group for all of the protocols.
- 2 (Optional) Create a health monitor:
 - 2a Set the health checking for the pool to **Connect**.
 - 2b Set the health monitor to separately monitor each node.
- 3 Create a traffic pool for the IMAP virtual server to use:
 - 3a Add each appliance node to the pool using the IP address with the port.

For example: 192.168.1.14:993. The IMAP port is 993.
 - 3b (Optional) Add the health monitor created in [Step 2](#).
 - 3c Select your load balancing settings.

For example: round robin or random.
 - 3d Set the session persistence to **SSL Session ID**.
- 4 Create a new virtual server:
 - 4a Specify the protocol as SSL (IMAPS) and the port as 993.
 - 4b Use the traffic group defined in [Step 1](#) and the pool defined in [Step 3](#) for the virtual server.
- 5 Start the virtual server.

4 Configuring Roles Management

CloudAccess provides the ability to assign different roles to administrative users in your identity sources. The roles allow administrators to perform certain tasks and deny them access to other tasks.

- ♦ [Section 4.1, “Understanding CloudAccess Role Types,” on page 35](#)
- ♦ [Section 4.2, “Assigning Roles to Users,” on page 36](#)

4.1 Understanding CloudAccess Role Types

CloudAccess includes the following types of roles:

- ♦ **Appliance Administrator:** One or more users can have the appliance administrator role in CloudAccess. You assign the first appliance administrator account during the initialization of the appliance.

The first appliance administrator has rights to access the Admin, Roles, Policy, Reports, and Devices pages. This administrator has rights to add and remove identity sources, tools, nodes, and applications. However, this administrator does not have application ownership and approval rights by default.

When an appliance administrator assigns a user the appliance administrator role, the new administrator also has rights to access the Admin, Roles, Policy, Reports, and Devices pages. However, like the first appliance administrator, subsequent administrators do not have ownership and approval rights by default.

Only appliance administrators can add SaaS applications, such as Google Apps and Salesforce. Any appliance administrator that imports and applies a SaaS application is also made that application owner and has rights to the Approvals page for that specific application. An administrator who is also an application owner can assign another administrator to be the application owner and application approver, and can either keep or remove himself from those roles.

- ♦ **Application Owner:** The application owner controls access to the SaaS applications. CloudAccess automatically assigns this role to the user who creates the SaaS application on the Admin page. The application owner can access the following web pages:
 - ♦ **Approvals:** The application owner can allow or deny approvals for users to obtain a SaaS application account.
 - ♦ **Policy:** The application owner can map authorizations between the identity source and the SaaS application and optionally require approval for authorizations.
 - ♦ **Roles:** The application owner can add or remove users from the application approver role.
- ♦ **Application Approver:** The application approver can access the Approvals page and allow or deny approvals for users to obtain a SaaS application account. CloudAccess automatically assigns this role to the administrator who creates the SaaS application on the Admin page.
- ♦ **Compliance Auditor:** The compliance auditor can access the Reports page and generate, view, and download the reports for the appliance. Users assigned to the appliance administrator role automatically have access to the Reports page.

- ♦ **Device Administrator:** The device administrator can view and delete other users' registered mobile devices on the Devices page. Users assigned to the appliance administrator role automatically have the device administrator role (though device administrators do not automatically have the appliance administrator role).
- ♦ **Helpdesk:** The helpdesk administrator manages the Self-Service User Store users. The helpdesk user can delete users and reset passwords.

In addition to the default role assignments, you can assign each role to additional users. However, the Roles page never allows you to remove the last appliance administrator role.

4.2 Assigning Roles to Users

To assign roles to users:

- 1 Log in to the administration console at https://appliance_dns_name/appliance/index.html as the appliance administrator or application owner.
- 2 Click **Roles** on the toolbar.
- 3 Type the name of a user into the search filter field, then click **Search**. Matching users appear in the left column.

NOTE: If you use wildcards such as an asterisk (*) or question mark (?) in the search filter field, CloudAccess does not correctly filter results. Filters must be full regular expressions. If you want to use wildcards, they must be regular expression wildcards. If the filter does not start with '^' and '.', then '.' is added to the filter. If the filter does not end with '\$' and '.', then '.' is added to the filter. Thus, a filter for "test" would end up as the regular expression ".*test.*".

- 4 Drag and drop the user to the role you want to assign to that user, then click **OK** to confirm the assignment.

The Roles page displays only the application owner and application approver roles of configured SaaS connectors.

5 Configuring Identity Sources

CloudAccess supports the use of one or more identity sources to authenticate users and for provisioning accounts to the SaaS applications. The initialization process configures the first identity source and adds the identity source to the Admin page.

The appliance supports more than one identity source and there are additional identity sources you can add to the appliance that are not available during the initialization process. For example, the Self-Service User Store (SSUS) and SAML 2.0 Inbound (SAML2 In) are identity sources that you can add only after you initialize the appliance. You can add as many additional identity sources as you want. However, all of the user IDs across the different identity sources must be unique.

For CloudAccess to provision user accounts to the SaaS applications, each user account in the identity source must contain the attributes listed. If you are using an LDAP identity source, there are specific attributes that must be populated on the user accounts. If you are using a JDBC database, there are certain columns of information that must be populated. The information for each identity source is different.

NOTE: For security reasons, by default CloudAccess does not allow you to add a user with a user name that is the same as a previously added user. If you attempt to do so, CloudAccess displays the user as not activated. For more information, see [Section 13.7, “Troubleshooting Provisioning Issues,” on page 102](#).

Review the information in the following sections before you deploy the appliance and when you configure additional identity sources. Ensure that your identity source meets all requirements and the user account information in the identity source contains the proper information to synchronize the accounts.

- ♦ [Section 5.1, “Active Directory Requirements,” on page 37](#)
- ♦ [Section 5.2, “eDirectory Requirements,” on page 38](#)
- ♦ [Section 5.3, “JDBC Requirements,” on page 39](#)
- ♦ [Section 5.4, “Changing the Initial Identity Source Configuration,” on page 44](#)
- ♦ [Section 5.5, “Configuring Self-Service Registration and Password Management,” on page 45](#)
- ♦ [Section 5.6, “Changing the Default Behavior of the Connectors for LDAP Identity Sources,” on page 50](#)
- ♦ [Section 5.7, “Configuring Additional Identity Sources,” on page 52](#)

5.1 Active Directory Requirements

Verify that your Active Directory environment meets the following requirements:

- ☐ Windows Server 2012 R2 or Windows Server 2008 R2.
- ☐ A unique identity for each user account, whether you have one or more domains or identity sources. The appliance uses the sAMAccountName as the unique identifier for the users.

To provision user accounts from Active Directory to the SaaS applications, all of the following attributes must be populated on the Active Directory users:

- ♦ First name
- ♦ Last name
- ♦ Full name (**Display name** is the field that populates this attribute.)
- ♦ sAMAccountName or Logon Name (Pre-Windows 2000)
- ♦ User Principal Name (UPN)
- ♦ Email address

Obtain the following required items:

- ♦ The password and the fully distinguished LDAP-formatted name of a user in Active Directory who has read access to the user objects. The appliance will use this user account to make LDAP binds to Active Directory.
- ♦ The name and password of a user in Active Directory who becomes the administrator of the appliance. The user must reside in the user search context specified during the appliance initialization procedure.
- ♦ The IP address of one or more Active Directory servers that contain the users.
- ♦ The context of the users in Active Directory.

5.2 eDirectory Requirements

Verify that your eDirectory environment meets the following requirements:

- ☐ eDirectory LDAP 8.8.8.
- ☐ A unique identity for each user account, whether you have one or more eDirectory trees or identity sources.

To provision user accounts from eDirectory to the SaaS applications, all of the following attributes must be populated on the eDirectory users:

- ♦ CN (**Username** is the field that populates this attribute.)
- ♦ Given Name (**First name** is the field that populates this attribute.)
- ♦ Internet EMail Address
- ♦ Surname (**Last name** is the field that populates this attribute.)

Obtain the following required items:

- ♦ The password and fully distinguished LDAP-formatted name of a user in eDirectory who has the following rights. The appliance will use this user account to make LDAP binds to eDirectory:
 - ♦ **Property Rights**
 - ♦ **CN:** compare, read, inherit
 - ♦ **Description:** compare, read, inherit
 - ♦ **Given Name:** compare, read, inherit
 - ♦ **GUID:** compare, read, inherit
 - ♦ **Internet EMail Address:** compare, read, inherit
 - ♦ **Login Disabled:** compare, read, inherit

- ♦ **Member:** compare, read, inherit
- ♦ **Group Membership:** compare, read, inherit
- ♦ **Surname:** compare, read, inherit
- ♦ **Entry Rights:** browse, inherit
- ♦ The name and password of a user in eDirectory who becomes the administrator of the appliance. The user must reside in the subtree of the search context for the identity source specified during the initialization of the appliance.
- ♦ The IP address of one or more eDirectory servers that contain a replica of the partition holding the user objects and that run NLDAP.
- ♦ The context of the users in eDirectory.

5.3 JDBC Requirements

To use the JDBC database as an identity source, you must know and understand JDBC databases. The information provided in this section is intended for database administrators.

- ♦ [Section 5.3.1, “Meeting the Requirements,” on page 39](#)
- ♦ [Section 5.3.2, “Obtaining the Script Files,” on page 39](#)
- ♦ [Section 5.3.3, “Populating the Required Columns,” on page 40](#)
- ♦ [Section 5.3.4, “Dataflow Information,” on page 41](#)

5.3.1 Meeting the Requirements

Verify that you meet the following requirements or obtain the following information before using a JDBC database as an identity source:

- ♦ The supported type of JDBC database. For more information, see [“Identity Sources” on page 19](#).
- ♦ The IP address of the JDBC database.
- ♦ The port for communication. The default port is 1433 for Microsoft SQL Server or 1521 for Oracle Database.
- ♦ The database name or sid. (`idm` for Microsoft SQL Server defined as the `sid` in Oracle Database).
- ♦ The script files must be installed before you can configure a JDBC database as an identity source. For more information, see [“Obtaining the Script Files” on page 39](#).
- ♦ The password for the user name in the sample scripts you install. For more information, see [“Obtaining the Script Files” on page 39](#).

5.3.2 Obtaining the Script Files

To use JDBC as an identity source, you must install script files on your JDBC database so CloudAccess knows what tables to read to access the users and groups information. You download the script files when you configure the JDBC identity source.

You can download the files during the initialization process, if you select JDBC as your identity source, or you can download the scripts when you configure JDBC as an identity source after the appliance is initialized. You download a single zipped file that contains multiple scripts.

The different scripts are:

- ♦ **indirect_install:** Installs the schema, which includes the indirect tablespace and `proc_authuser ()` stored procedure, as well as the automatic triggers for the `indirect.user` and `indirect.grp` tables.
- ♦ **copy_from:** Copies user account information from the database default user store into the `indirect.usr` table for processing by the connector for JDBC.
- ♦ **uninstall:** Removes the schema and deletes or drops the connector user accounts in the underlying database.

5.3.3 Populating the Required Columns

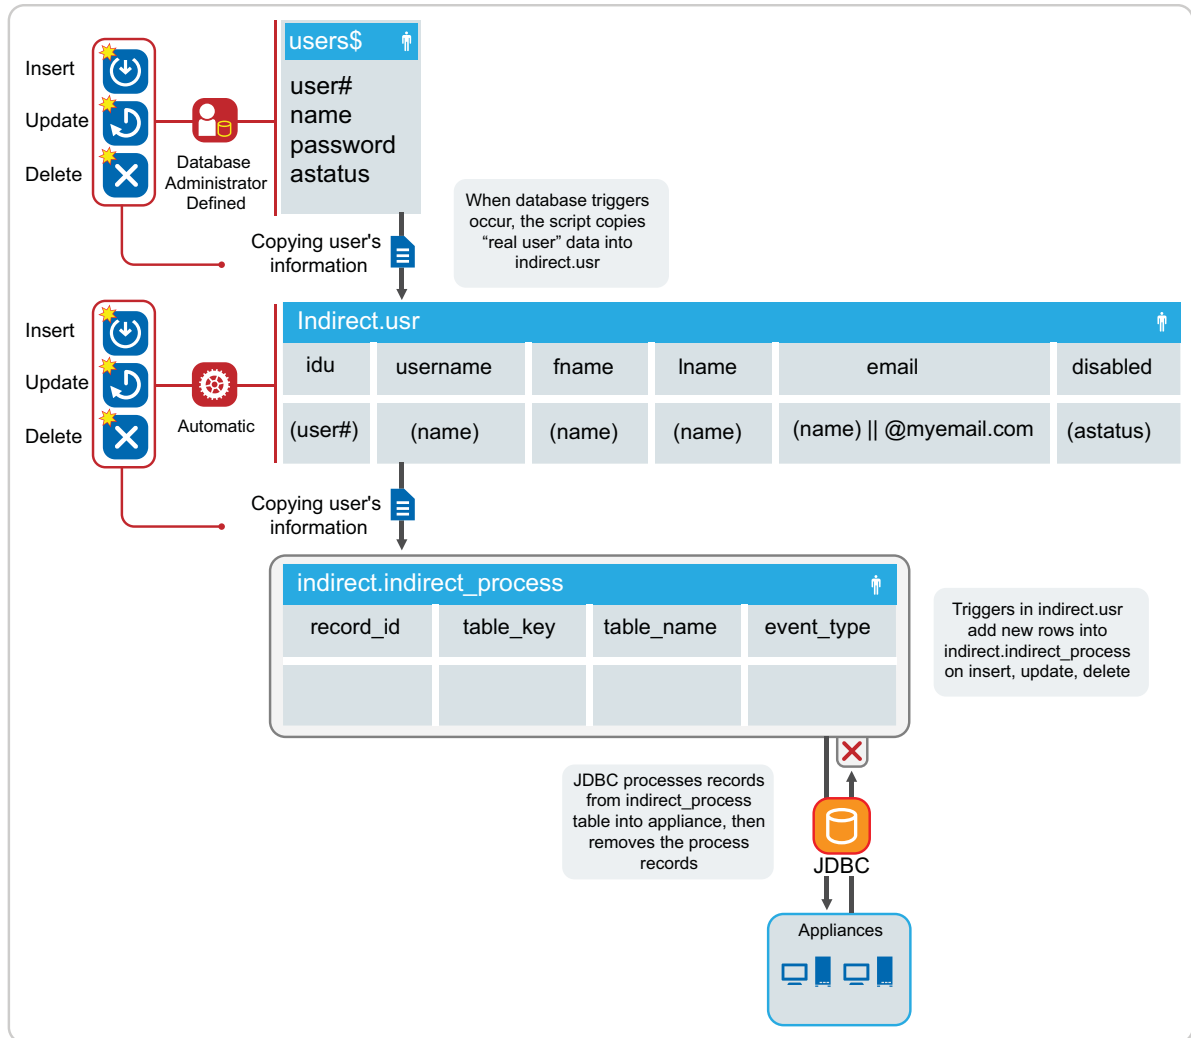

To provision users from the JDBC databases to the SaaS applications, you must have the following columns populated for each user account in the JDBC database:

- ♦ `indirect.usr.idu`
- ♦ `indirect.usr.username`
- ♦ `indirect.usr.fname` (Mandatory only for Google Apps accounts)
- ♦ `indirect.usr.lname`
- ♦ `indirect.usr.email` (Mandatory only for Salesforce accounts)

5.3.4 Dataflow Information

The connector for JDBC uses indirect tables to gather the needed information, ensuring that the appliance does not work directly with the information in the database. The following graphic depicts how the connector for JDBC obtains the information from the JDBC database. This process is the same regardless of the type of database to which the appliance connects.

Figure 5-1 Dataflow of User Information

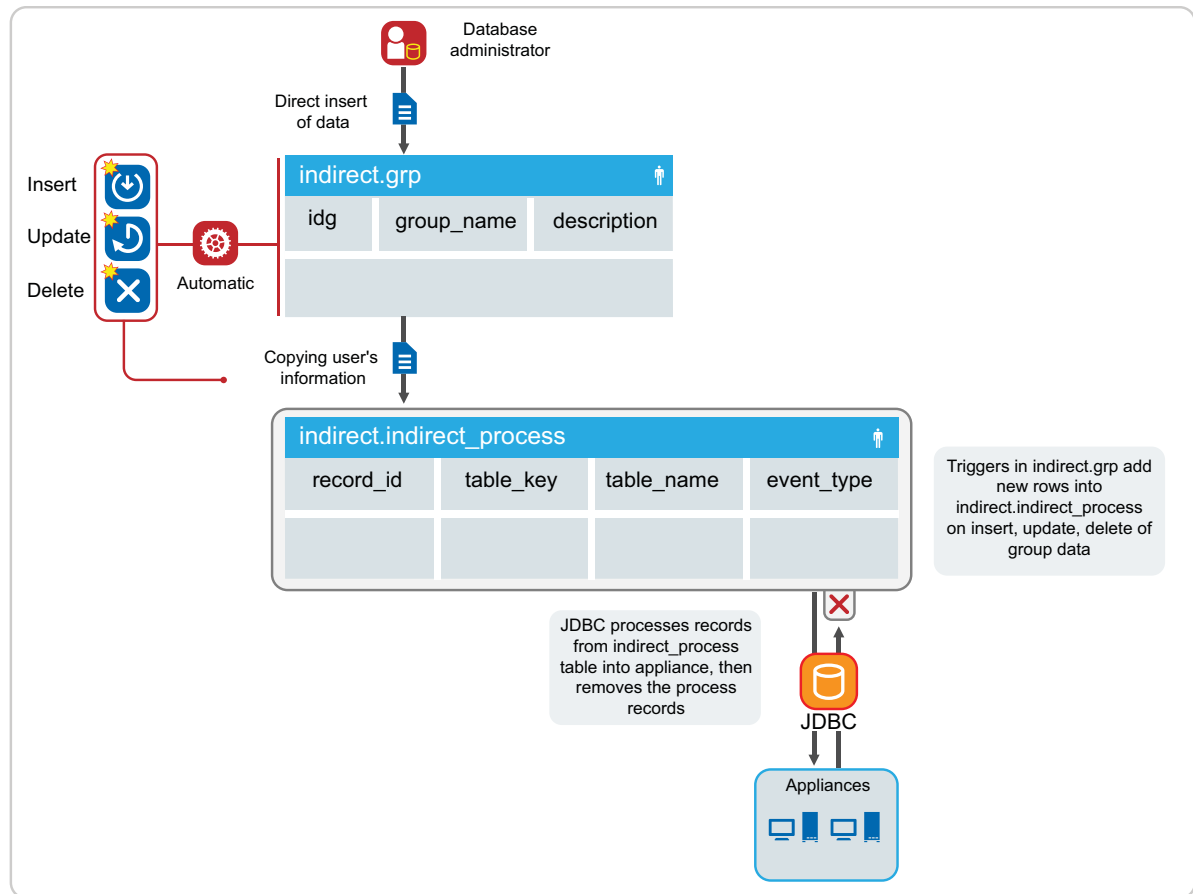

The database administrator creates the user accounts or logs in to the `users$` table. (The dataflow figures are based on the default Oracle security table `users$`.) The database administrator defines triggers or procedures that copy information into the `indirect.usr` table.

The `indirect_install` SQL script creates the automatic insert, update, or delete triggers on the `indirect.usr` table. When rows in the `indirect.usr` table are altered, the automatic triggers add a row to the `indirect.indirect_process` table.

The appliance polls the `indirect.indirect_process` table. When the appliance detects rows in the `indirect.indirect_process` table of type `user`, the appliance adds, modifies, or deletes the user account in the applications connected to the appliance.

The appliance then deletes the row from the `indirect.indirect_process` table after the appliance processes the information.

Figure 5-2 Dataflow of Group Information

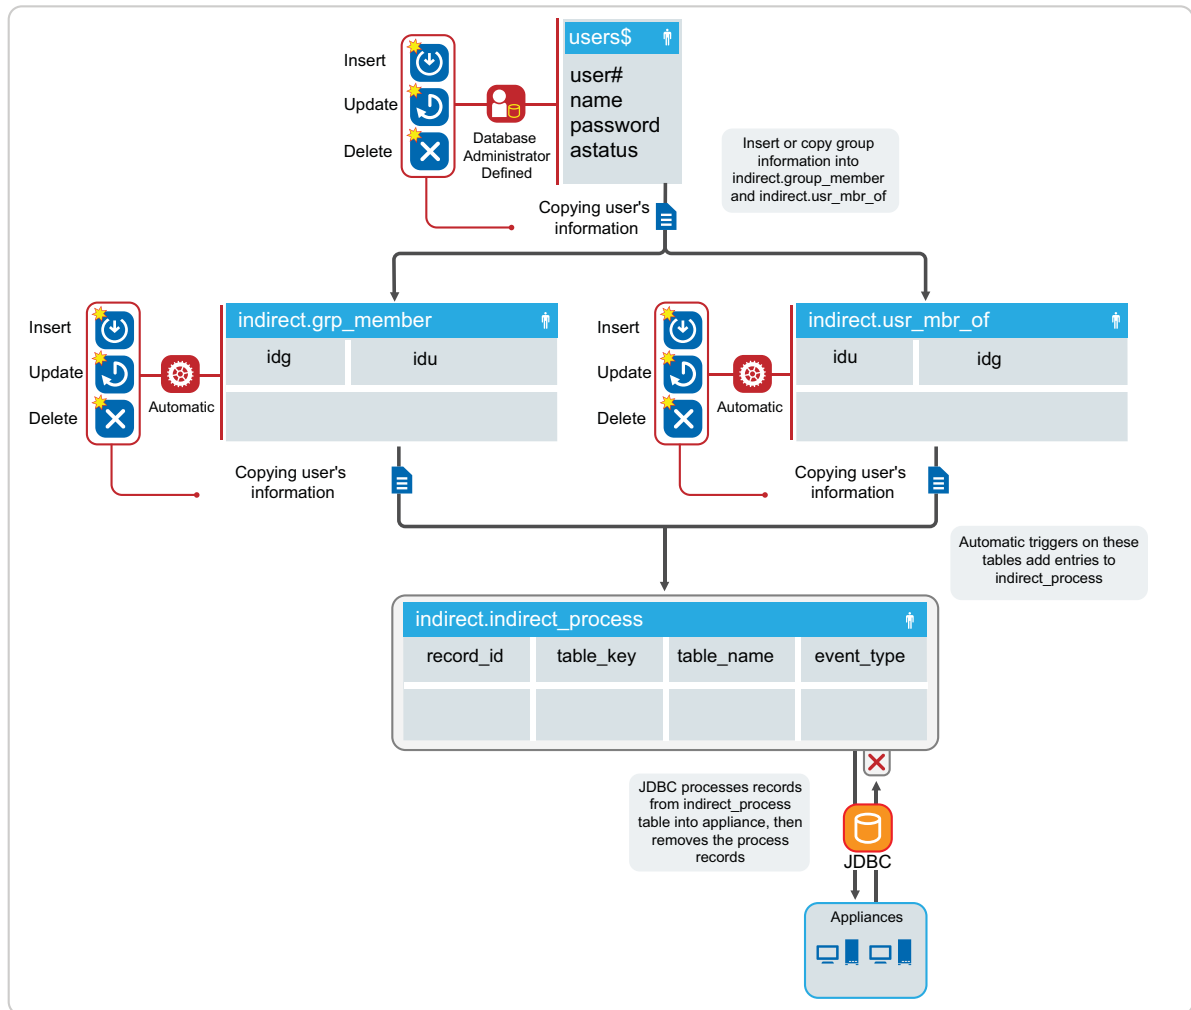

The database administrator performs a direct or triggered insert of data into the `indirect.grp` table.

The `indirect_install` SQL script creates the automatic insert, update, or delete triggers on the `indirect.grp` table. When rows in `indirect.grp` are altered, the automatic triggers add a row to the `indirect.indirect_process` table.

When the appliance detects rows in the `indirector.indirect_process` table of type group, the appliance adds, modifies, or deletes the groups in the applications connected to the appliance. The appliance then deletes the row from the `indirect.indirect_process` table after the appliance processes the information.

Figure 5-3 Relationship between Users and Groups

The indirect schema does not have a direct concept of group membership, but maintains a relationship between the user `idu` column and the group `idg` column in the `indirect.grp_member` and `indirect.usr_mbr_of` tables.

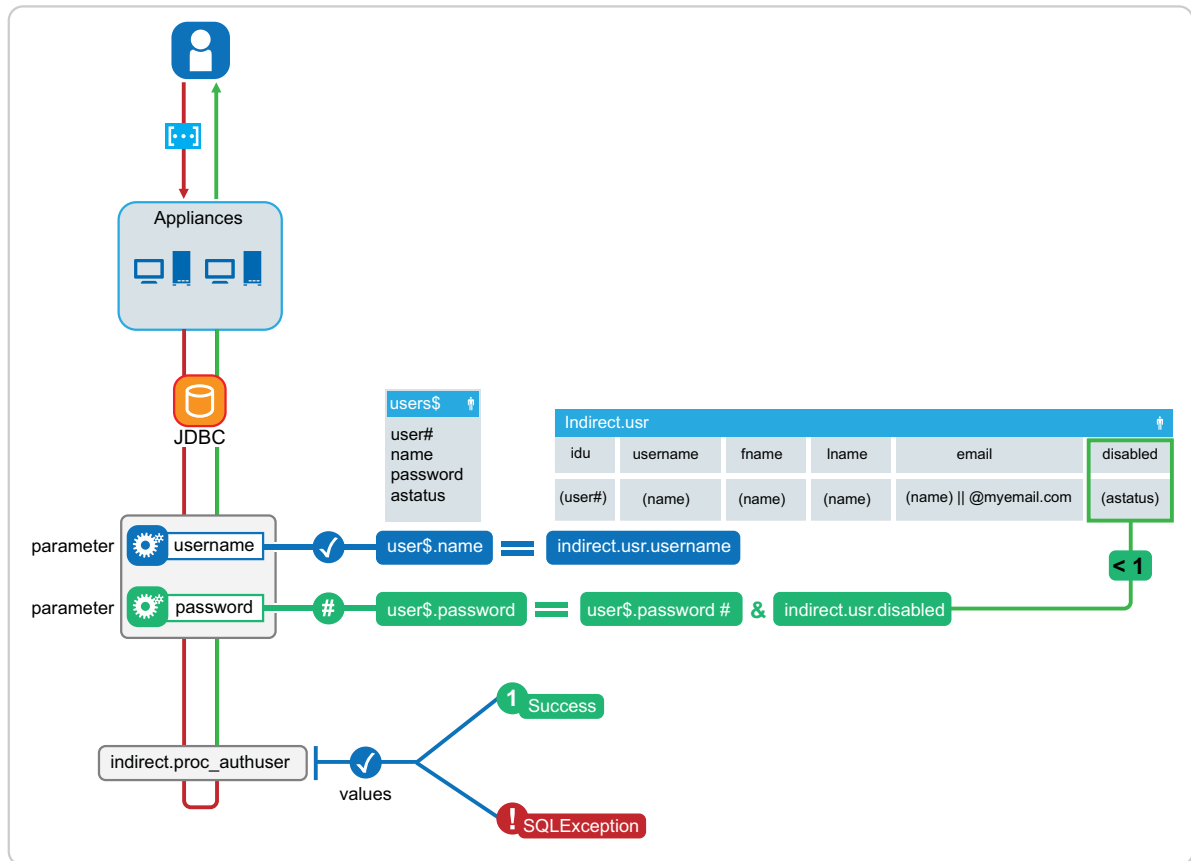

For group membership, the desired group `idg` and user `idu` must exist in both tables. The `indirect_install` SQL script creates the automatic insert, update, or delete triggers on the `indirect.grp_member` and `indirect.usr_mbr_of` tables. When rows in these tables are altered, the automatic triggers add a row to the `indirect.indirect_process` table.

When the appliance detects rows in the `indirect.indirect_process` table for group membership, the appliance adds, modifies, or deletes the group memberships in the applications connected to the appliance. The appliance then deletes the row from the `indirect.indirect_process` table after the connector processes the information.

For example, if the administrator wants to add a user with `idu` 6 to a group with `idg` 10, the administrator would have to manually (or through triggers) add entries into both the `grp_member` and `usr_mbr_of` tables.

```
"INSERT INTO indirect.grp_member(idg,idu) VALUES(10,6); INSERT INTO
indirect.usr_mbr_of(idu,idg) VALUES(6,10);"
```

Figure 5-4 Authentication Process

To verify authentication credentials, the appliance calls a stored procedure `indirect.proc_authuser` with the parameters of `@username, @password`. The procedure compares the `username` parameter with the default user table (`users$`) and the `indirect.usr.username` fields. If they match, the process checks the `indirect.usr.disabled` flag (`disabled > 0 = disabled`). If login is enabled (`disabled = 0`), the process compares the `password` parameter to the existing password hash in the `users$` table. If the password hash matches, the process authenticates the user successfully. If any of these conditions are not met, the process returns a `SQLException` to the appliance, and authentication fails.

You can alter the stored procedure based on the desired schema that the database administrator wishes to use for authentication. The administrator needs to keep in mind that the stored procedure `indirect.proc_authuser(@username, @password)` is hard-coded into the appliance, and expects either a success (1) or `SQLException` returned.

5.4 Changing the Initial Identity Source Configuration

If necessary, you can change configuration information for the identity source that you set up during initialization.

NOTE: Although CloudAccess allows you to modify an existing eDirectory or Active Directory connector to point to a different tree, NetIQ does not recommend this approach because it can result in inconsistent display of user and group data. If you want to point a connector to a different tree, delete the existing connector and create a new connector that points to the correct tree.

To change the initial identity source configuration information:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`
- 2 In the **Identity Sources** panel, click the icon of the identity source that you want to modify, then click **Configure**.
- 3 Modify the settings as needed, then click **OK** to save the configuration information.
- 4 Click **Apply** to commit the changes to the appliance.

5.5 Configuring Self-Service Registration and Password Management

The Self-Service Registration and Password Management tool (SSRPM) allows you to empower users to register for services and to manage their credentials. It provides selected services from the NetIQ Self-Service Password Reset tool. The Self-Service User Store (SSUS) stores identity and credentials for self-registered user accounts. It is an additional identity source you can use with the appliance.

- [Section 5.5.1, “Enabling a Self-Service User Store,” on page 45](#)
- [Section 5.5.2, “Using SSUS as an Authentication Source for an Application,” on page 46](#)
- [Section 5.5.3, “Using the Self-Service User Registration and Password Management Services,” on page 47](#)
- [Section 5.5.4, “Providing Helpdesk Services for Self-Registered Users,” on page 48](#)
- [Section 5.5.5, “Configuring SAML 2.0 Inbound Identity Sources,” on page 49](#)

5.5.1 Enabling a Self-Service User Store

The Self-Service User Store (SSUS) is an internal identity source you can use with the appliance. However, you can use this identity source only after you configure the appliance. The Self-Service User Store cannot be enabled during the initialization process of the appliance. There are no specific requirements to use this service.

A Self-Service User Store provides self-service registration and password management services. After you enable the service, users can immediately begin to self-register on the SSUS Registration page. Self-registered users can then log in and access public applications from the landing page. Policies are required to allow the self-registered users to access private applications.

NOTE: You can enable and activate only one Self-Service User Store.

By default, SSUS requires new users to have a valid email account to create an SSUS account. Users must be able to receive and respond to a verification email.

You can also configure which service options to support for your SSUS users, such as a helpdesk, new user, change password, and forgotten password.

To enable the SSUS service:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Drag the **Self-Service User Store** icon from the **Identity Sources** palette to the **Identity Sources** panel.

- 3 In the **Identity Sources** panel, click the new identity source, then click **Configure**.
- 4 On the **Configuration** tab, decide what options you want presented to your users and helpdesk administrators.
- 5 Click **OK** to enable the Service.
- 6 In the **System Configuration** panel of the administration console, click **Apply** to activate and start SSUS as a service.
- 7 Wait for the SSUS service to be activated and started across all nodes in the cluster.

In the **Appliances** panel, the icon on each node of the cluster spins until the service is ready on the node. Do not apply additional changes until this action is complete on all nodes.

A round green status icon in the lower left corner of the SSUS service icon indicates that the SSUS is configured and its status is healthy.

To allow the self-registered users to access to a private application that is enabled for SSUS, continue with [Section 5.5.2, “Using SSUS as an Authentication Source for an Application,” on page 46](#).

5.5.2 Using SSUS as an Authentication Source for an Application

The applications are not available for SSUS users until you configure policies that authorize SSUS to be an authentication source for them. All SSUS users receive rights to an application when you assign a policy to the SSUS identity source.

- ♦ [“Granting SSUS Users Access to a Private Application” on page 46](#)
- ♦ [“Denying SSUS Users Access to an Application” on page 47](#)

Granting SSUS Users Access to a Private Application

An application can have one or more authorizations for its resources. Each authorization can have one or more appmarks associated with it. (Appmarks are essentially bookmarks for applications. For more information, see [“Configuring Appmarks for Connectors”](#) in the *NetIQ CloudAccess Connectors Guide*.) You grant access to a private application by mapping one or more of its authorizations to the SSUS role. Users can access all of the appmarks associated with an authorization. You cannot control access at the appmark level.

NOTE: You should map authorizations for SSUS roles (groups) only to single sign-on applications. Do not map them to the SaaS applications with account provisioning (Google Apps, Office 365, or Salesforce). Provisioning is not supported for users in an SSUS identity source. For more information, see [“Requirements for Provisioning”](#) in the *NetIQ CloudAccess Connectors Guide*.

To create a policy that grants access to an application for SSUS users:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Click **Policy** on the toolbar.
- 3 On the Policy Mapping page, select **Other Identity Sources** from the drop-down list on the left, then select the **All SSUS Users** role.
- 4 On the right, select the SaaS application that you want to use for this policy, and then view its authorizations.
Some applications have multiple authorization options.
- 5 Drag the **All SSUS Users** role from the left side and drop it on the desired authorization on the right.

You can also select multiple authorizations under a single application, then drag them from the right and drop them on the **All SSUS Users** role on the left.

- 6 In the Mapping window, review the mapped settings, then click **OK** to accept the new policy, or click **Cancel** to back out of the setup.

You can remove an authorization in the list by selecting it, then clicking the **Delete** icon.

- 7 Under **Other Identity Sources**, view the **Authorization** column for the **All SSUS Users** role to confirm that the **Authorization Stamp** icon appears.
- 8 Under the application on the right, view the **Policy** column to confirm that the **Policy** icon appears for the mapped authorization.
- 9 The appmarks for each of the mapped authorizations are available to users at their next login.
- 10 Repeat [Step 4](#) through [Step 9](#) for each application for which you want to use SSUS as an identity source.

Denying SSUS Users Access to an Application

You can deny access to an application by deleting its SSUS policy. Deleting the policy does not interrupt current sessions. The application is not available to users at their next login.

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
 - 2 Click **Policy** on the toolbar.
 - 3 On the Policy Mapping page, select the **Self-Service User Store** role from the drop-down list on the left, then select the **All SSUS Users** role.
 - 4 In the **All Users** row, click the **Authorization Stamp** icon.
 - 5 In the Edit All Users Mappings window, select the authorization you want to remove, then click **Delete**. Repeat this action for every authorization that you want to remove.
- A strike-through line is drawn through the entry.
- 6 Click **OK** to accept the modified settings, or click **Cancel** to back out of the setup.

The application is not available to users at their next login.

5.5.3 Using the Self-Service User Registration and Password Management Services

After you have configured SSUS and mapped policies, users can self-register for accounts and manage their own credentials. Self-registered users can log in to the landing page for the appliance to access applications.

If you enabled the options during the SSUS configuration, users now see links on the appliance login page to create a new account or a link to reset their password if they have forgotten the password.

The user experience is as follows:

1. The new user accesses the appliance login page:
`https://appliance_dns_name`
2. The user clicks the link to create a new account.
3. The user follows the on screen prompts to create a new account that includes his name, email address, and a password.
4. After the account is created, the user is prompted to create security questions and answers.

If the user forgets the account password, the questions and responses are used to verify the user's identity and allow the user to reset the password

5. (Conditional) If the user does not create the security questions and answers now, the user will be prompted to create them when he logs in for the first time. If the user does not set up the security questions and answers, the appliance will not authenticate the user. The user must set up the security questions and answers to authenticate to the appliance.
6. After the user completes the new account setup, the appliance sends a verification email to the user's email address. The user responds to verify the account creation.
7. The user accesses the login page again.
8. The user logs in with his new user name and password.
9. The user sees and can access the applications that the policies entitle him to see.

After you enable the Self-Service User Store, the Self-Service User Store login page is available for users. On this page, users can register for the service as a new user, change their password, or reset their forgotten password after answering security questions.

5.5.4 Providing Helpdesk Services for Self-Registered Users

The Self-Service User Store (SSUS) provides a helpdesk service. If a password expires or a self-registered user is locked out of an account, an authorized helpdesk user for the SSUS service can reset the password. The helpdesk user sets a temporary randomized password for the account, and the user is notified of the temporary password by email. This allows the user to log in to the account and reset the temporary password to use a custom password.

- ♦ [“Assigning a User to the Helpdesk Role” on page 48](#)
- ♦ [“Resetting the Password for a Locked Self-Registered User Account” on page 49](#)
- ♦ [“Deleting a Self-Registered User Account” on page 49](#)

Assigning a User to the Helpdesk Role

You must assign a user to the SSUS Helpdesk role to provide helpdesk services for the related self-registered users.

NOTE: You should assign a user from an identity source other than the SSUS source as the helpdesk user.

To assign a user to the SSUS Helpdesk role:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Click **Roles** on the toolbar.
- 3 On the Roles page, type the name of a user you want to assign to the Helpdesk role, click **Search**, then select the name.
- 4 Drag the user name from the left side and drop it on the Helpdesk role on the right.
- 5 In the Add User to Role window, review the mapped settings, then click **OK** to accept the new role assignment, or click **Cancel** to back out of the setup.
- 6 After the page refreshes, view the **Role** column for the user to confirm that the **Role** icon appears.
- 7 Under the Helpdesk role on the right, verify that the authorized user's name appears.

After you have assigned a user to the SSUS Helpdesk role, the helpdesk user can access the helpdesk tools through the CloudAccess landing page.

Resetting the Password for a Locked Self-Registered User Account

An authorized helpdesk user can use the SSUS Helpdesk service to reset the password for a self-registered user account. Typically, the user needs helpdesk assistance because the account is locked. If the account is not locked, the user can alternatively reset the password by using the **Forgotten Password** option on the Self-Service Registration login page.

To reset the password for an SSUS account as the authorized helpdesk user:

- 1 Log in to CloudAccess using your corporate credentials.
- 2 On the landing page, click the **Helpdesk** icon to go to the Helpdesk page.
- 3 On the Helpdesk page, search for an SSUS user account, then click the self-registered user's name.
- 4 On the Password Policy page, view the password policy settings for the user account, then click **Change Password**.
- 5 On the Account Information page, confirm the user's information, then click **Change Password**.
- 6 In the **Random Passwords** window, select a password from the list of randomly generated passwords that satisfies the password policy for this account.
You can click **More** to choose from additional random passwords.
- 7 View the confirmation message with the new password, then click **OK**.

After the self-registered user receives the temporary password, the user is prompted to reset the password at his next login.

Deleting a Self-Registered User Account

An authorized helpdesk user can use the SSUS Helpdesk service to delete the SSUS account for a self-registered user.

To delete an SSUS account as the authorized helpdesk user:

- 1 Log in to CloudAccess using your corporate credentials.
- 2 On the landing page, click the **Helpdesk** icon to go to the Helpdesk page.
- 3 On the Helpdesk page, search for the SSUS user whose account you want to delete, then click the self-registered user's name.
- 4 On the Account Information page, confirm the user's information, then click **Delete Account**.
- 5 Click **OK** to confirm the account deletion.

5.5.5 Configuring SAML 2.0 Inbound Identity Sources

You can create a custom connector that allows users to authenticate to the CloudAccess appliance through a SAML federated connection. To create this federation, you must create a custom SAML In connector.

To allow the appliance to be a SAML 2.0 service provider, you can create a SAML 2.0 Inbound connector using the Access Connector Toolkit. SAML2 Inbound as an identity source is not available during initialization of the appliance. However, after you export the connector and import it in the appliance, the SAML2 In connector appears as an identity source. You configure an instance of the

identity source with information about an appropriate identity provider to enable the service provider functionality of the appliance, and to allow the identity provider to send a SAML token to the appliance using the SAML 2.0 POST profile.

After you configure the SAML2 In identity source, the appliance login page provides a link to the login page of the SAML 2.0 identity provider, located to the left of the user name and password login options. The SAML 2.0 users log in through the identity provider to gain access to the appliance landing page.

For more information, see “[Creating a SAML 2.0 Inbound \(SAML2 In\) Connector Template](#)” in the *NetIQ CloudAccess Connectors Guide*.

5.6 Changing the Default Behavior of the Connectors for LDAP Identity Sources

The connector for Active Directory and the connector for eDirectory contain predefined behaviors for importing, matching, and provisioning users. CloudAccess provides a way to override the default behavior of the connectors for LDAP identity sources through the Advanced Options on the connectors.

The advanced options allow you to customize which users and groups CloudAccess imports to provision to the connected systems. By default, CloudAccess uses an internal unique attribute to match users and to provision users to the connected systems. For more information about provisioning, see [Section 13.7, “Troubleshooting Provisioning Issues,” on page 102](#).

Use the information in the following sections to change the default behavior of the connectors for LDAP identity sources.

5.6.1 Customizing Import Options

CloudAccess allows you to change the default options when you are importing users. If you have a large number of users or groups and you want to import only a subset of those users and groups, you can use the Advanced Options to filter them to a set of users and groups you want imported.

To customize the import options:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`
- 2 Click the appropriate connector for the LDAP identity source, then click **Configure**.
- 3 Expand **Advanced Options**, then use the following information to customize the import of users and groups to CloudAccess:
 - ♦ **Identity source search polling rate every:** Select how often you want the connector for the LDAP directory to poll the LDAP identity source for changes. By default, the rate is every minute.
 - ♦ **Filter extension:** Specify a filter for the object class and attribute you want to use to import users. If users do not meet the criteria defined in the filter, CloudAccess does not import those users.

For example, `(&(objectclass=user)(samaccountname=abc*))` imports only users that start with the samaccountname of abc*.

NOTE: The connectors for the LDAP identity sources change all of the keys and values in the filter to lowercase. It is best to use a case-ignore attribute.

- ♦ **Identity source LDAP attribute to use for imported accounts:** Specify the LDAP attribute that the connector uses as the naming attribute (login name) when importing accounts from the identity source.
- ♦ **Allow unmapped users to authenticate:** Select whether to allow users to authenticate that have not been imported to CloudAccess, because they have been excluded by the filter extension. The unmapped users must use an email address to log in. These users can still log in to the User portal page, but will see only public appmarks.
- ♦ **Override default group filter:** Select whether to override the default group filter so you can limit which groups the connector for the LDAP identity source imports to CloudAccess. If you select this option, you must specify a correct filter.

For example, `(&(objectclass=group)(cn=custom*))` allows only groups with a CN that start with `custom*`.

NOTE: The connectors for the LDAP identity sources change all of the keys and values in the filter to lowercase. It is best to use a case-ignore attribute.

- 4 Click **OK**, then click **Apply** to save the changes.

NOTE: When you configure a filter extension for an eDirectory identity source, user objects in the external eDirectory identity store that do not match the filter are not imported into CloudAccess. If you also enable the option **Allow unmapped users to authenticate**, unmapped users can use Basic SSO type connectors, but they cannot store or play back their credentials for single sign-on later because their user objects do not actually exist in CloudAccess.

5.6.2 Customizing Attribute Mappings

CloudAccess automatically maps the attributes between the identity sources and the connected systems. If you want to use custom attributes for the identity sources, use the advanced configuration options on the identity source connectors.

The Admin page displays the default attribute mappings between the LDAP identity source and CloudAccess.

To view the default attribute mapping:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`
- 2 Click the appropriate connector for the LDAP identity source, then click **Configure**.
- 3 Expand **Advanced Options**.
- 4 Under the **Attribute Mapping** heading, click **Default** to expand and view the default attribute mappings.

The attributes on the left are the attributes for CloudAccess. The attributes on the right are for the LDAP directory. Above the default attributes, you can map five attributes to five custom attributes in CloudAccess. To map the LDAP directory attribute, specify the attribute name in the field next to the custom attribute, then click **OK** and **Apply** to save the changes.

5.6.3 Understanding the Relaxed User Matching Option

The **Relaxed user matching** option changes how CloudAccess matches users. By default, CloudAccess matches users using an internal unique ID. This option changes the appliance to match users by the CN or sAMAccountName attributes.

Use this option when you want to recreate previously deleted users so CloudAccess can manage the users again. However, you must ensure that you do not create different users with the same CN or sAMAccountName as previously deleted users. Otherwise, those users will have access to the previously deleted users' cloud application data.

5.7 Configuring Additional Identity Sources

CloudAccess supports multiple types of identity sources. During the initialization process, you configure one identity source, but you can add more identity sources after the initialization process completes. You can have one or more of each type of identity source configured on your appliance, and you can configure as many identity sources as you need.

The only restrictions are as follows:

- ♦ The source for each identity source must be unique. For example, do not configure multiple instances of an identity source for the same Active Directory domain.
- ♦ Every user account across the different identity sources must be unique.

To add another identity source:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`
- 2 Drag an identity source icon from the **Identity Sources** palette to the **Identity Sources** panel.
- 3 Click the identity source icon, then click **Configure**.
- 4 Complete the fields to configure the new identity source.
- 5 Click **OK** to save the configuration information.
- 6 Click **Apply** to commit the changes to the appliance.

6 Configuring Authentication Methods

The CloudAccess appliance allows you to configure one or more authentication methods for users. Some of the authentication methods are additive. For example, you can use Google reCAPTCHA with Integrated Windows Authentication. Use the information in the following sections to configure authentication methods for the appliance.

- ♦ [Section 6.1, “Configuring Integrated Windows Authentication with Kerberos,” on page 53](#)
- ♦ [Section 6.2, “Configuring Google reCAPTCHA,” on page 55](#)
- ♦ [Section 6.3, “Configuring the TOTP Tool for Two-Factor Authentication Using Google Authenticator,” on page 58](#)
- ♦ [Section 6.4, “Configuring the Advanced Authentication Tool for Two-Factor Authentication Using NetIQ Advanced Authentication Framework,” on page 62](#)
- ♦ [Section 6.5, “Configuring FIDO for Two-Factor Authentication,” on page 64](#)
- ♦ [Section 6.6, “Configuring the Authentication Filter to Set Session-Based Identity Information for a User,” on page 65](#)

6.1 Configuring Integrated Windows Authentication with Kerberos

CloudAccess allows user authentication with either name and password or Integrated Windows Authentication with Kerberos if your identity source is Active Directory. If you choose to use Integrated Windows Authentication, you must configure Kerberos.

CloudAccess supports the use of only one Kerberos realm. If there are multiple Active Directory domains used as the identity source, all of the domains must use the same realm.

Use the information in the following sections to enable Kerberos authentication between Active Directory and CloudAccess.

- ♦ [Section 6.1.1, “Configuring the Kerberos User in Active Directory,” on page 53](#)
- ♦ [Section 6.1.2, “Configuring the Appliance to Use Integrated Windows Authentication with Kerberos,” on page 54](#)
- ♦ [Section 6.1.3, “Configuring User Browsers,” on page 55](#)

6.1.1 Configuring the Kerberos User in Active Directory

To configure Kerberos in your Active Directory domain:

- 1 As an Administrator in Active Directory, use the Microsoft Management Console (MMC) to create a new user within the search context specified during the initialization of the appliance.

Name the new user according to the Host and DNS name of the appliance. For example, if the public DNS of the appliance is `serv1.example.com` and the context that has been enabled for cloud is `ou=acme corporation,dc=example,dc=com`, use the following information to create the user:

First name: `serv1`

User login name: HTTP/serv1.example.com

Pre-windows logon name: serv1

Set password: Specify the desired password. For example: Passw0rd

Password never expires: Select this option.

- 2 Associate the new user with the service principal name.

Any domain or realm references must be uppercase.

2a On the Active Directory server, open a cmd shell.

2b At the command prompt, enter the following:

```
setspn -A HTTP/appliancepublicdns@UPN.SUFFIX newusershortname
```

For example: `setspn -A HTTP/serv1.example.com@EXAMPLE.COM serv1`

2c Verify setspn by entering `setspn -L shortusername`

For example: `setspn -L serv1`

- 3 Generate the keytab file using the ktpass utility.

Any domain or realm references must be uppercase.

3a At the command prompt, enter the following:

```
ktpass /out filename /princ servicePrincipalName /mapuser userPrincipalName  
/pass userPassword
```

For example: `ktpass /out nidp.keytab /princ HTTP/`

`serv1.example.com@EXAMPLE.COM /mapuser serv1@EXAMPLE.COM /pass Passw0rd`

3b Ignore the message Warning: pType and account type do not match.

- 4 Copy the nidp.keytab file created in [Step 3](#) to the browser of the client computer that you are using for administration.

6.1.2 Configuring the Appliance to Use Integrated Windows Authentication with Kerberos

The following steps enable the appliance to use Integrated Windows Authentication (IWA) with Kerberos, if your identity source is Active Directory.

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Click the **Active Directory** icon in the **Identity Sources** palette, then click **Configure**. (Do not drag the icon to the **Identity Sources** panel as you would when you configure the connector for Active Directory itself. These IWA configuration options are global for all connectors for Active Directory.)
- 3 Select **Integrated Windows Authentication**.
- 4 Next to the **Keytab** field click **Browse**, then browse to and select the nidp.keytab file generated in [“Configuring the Kerberos User in Active Directory”](#) on page 53.
- 5 Click **OK** to save the changes.
- 6 Click **Apply** to apply the changes to the appliance.

6.1.3 Configuring User Browsers

To complete the Kerberos configuration for Active Directory, configure the user browser. For more information, see [Section 11.2, “Configuring End User Browsers for Kerberos Authentication,” on page 86](#).

6.2 Configuring Google reCAPTCHA

The Google reCAPTCHA tool helps protect your user login page against spam, malicious registrations, and other forms of attack where computers disguise themselves as humans. It provides an additional layer of security by displaying images of words that users must type in addition to their login credentials. Software bots typically cannot scan the images to provide a response.

Using reCAPTCHA helps prevent automated Denial of Service (DoS) attacks that can impact the performance of the appliance and the identity source. The tool uses the remote Google reCAPTCHA service to provide the images and verify the responses. If a response succeeds, the appliance verifies the user's authentication credentials against the identity source. If a response fails, the appliance fails the login attempt without processing the credentials, and re-displays the login page. Thus, the automated login attempts fail and cannot consume the processing resources of the appliance and identity source.

Use the information in the following sections to configure your system for reCAPTCHA:

- [Section 6.2.1, “Requirements for reCAPTCHA,” on page 55](#)
- [Section 6.2.2, “Configuring Intrusion Detection for Failed Logins,” on page 56](#)
- [Section 6.2.3, “Configuring a Google reCAPTCHA Account,” on page 57](#)
- [Section 6.2.4, “Configuring the reCAPTCHA Tool,” on page 57](#)

6.2.1 Requirements for reCAPTCHA

Ensure that your system meets the following requirements before you configure the Google reCAPTCHA tool:

- ☐ A CloudAccess appliance, installed and configured.
- ☐ One or more supported identity sources, with the connectors enabled and configured.

The reCAPTCHA tool supports users from Active Directory, eDirectory, and Self-Service User Store (SSUS) identity sources. It does not support users from other types of identity sources, such as users imported from Microsoft SQL Server or Oracle Database type identity sources that use the JDBC identity source connector.

Each identity source should be configured with an intrusion detection policy. For more information, see [Section 6.2.2, “Configuring Intrusion Detection for Failed Logins,” on page 56](#).
- ☐ A Google reCAPTCHA account, configured on the Google reCAPTCHA website. For more information, see [Section 6.2.3, “Configuring a Google reCAPTCHA Account,” on page 57](#).

6.2.2 Configuring Intrusion Detection for Failed Logins

Someone who attempts to use more than a few unsuccessful passwords while trying to log on to your system might be a malicious user. reCAPTCHA cannot prevent attacks by anyone who can read the image. It cannot differentiate between malicious users and legitimate users. Using reCAPTCHA cannot prevent coordinated human DoS attacks. If users have unlimited attempts to enter their authentication credentials, reCAPTCHA also cannot help prevent attacks to find passwords.

To help limit the effectiveness of brute force or human attacks that bypass the reCAPTCHA protection, you should enable the user's identity source to respond to this type of potential attack by disabling the account for a preset period of time after a specified number of failed logon attempts.

The supported identity sources have the following built-in intrusion detection systems:

- ♦ **Active Directory Account Lockout Policy:** Active Directory allows you to specify an account lockout policy for users and global security groups in a domain. Set the policy on the domain group policy object from the domain controller.

To configure the Account Lockout Policy settings:

1. Log in as an Active Directory administrator user to the Windows Server that hosts Active Directory Domain Services (the domain controller).
2. Configure the Account Lockout Policy on the group policy object for the domain controller.
For more information, see the [Account Lockout Policy](http://technet.microsoft.com/en-us/library/hh994563%28v=ws.10%29.aspx) (<http://technet.microsoft.com/en-us/library/hh994563%28v=ws.10%29.aspx>) in the Microsoft TechNet Library. (<http://technet.microsoft.com/>)
3. Verify that the **Account Lockout Threshold** value is higher than the number of failed login attempts you plan to specify for **Start reCAPTCHA at** in the reCAPTCHA tool.
4. Repeat these steps for each configured Active Directory identity source.

- ♦ **eDirectory Intruder Lockout Policy:** eDirectory allows you to enable Intruder Detection and specify an Intruder Lockout policy for the container object where your user objects reside.

To configure the eDirectory Intruder Detection and Intruder Lockout Policy:

1. Log in as the eDirectory administrator user to the management console for the eDirectory server.
2. Configure Intruder Detection and the Intruder Lockout policy on the container object where your user objects reside.
For more information, see “[Setting Up Intruder Detection for All Users in a Container](https://www.netiq.com/documentation/edir88/edir88/data/afxkmdi.html#a3p5g0i)” (<https://www.netiq.com/documentation/edir88/edir88/data/afxkmdi.html#a3p5g0i>) in the *eDirectory 8.8 SP8 Administration Guide*.
3. Verify that the Intruder Lockout value is higher than the number of failed login attempts you plan to specify for **Start reCAPTCHA at** in the reCAPTCHA tool.
4. Repeat these steps for each configured eDirectory identity source.

- ♦ **SSUS Lock Account After Detection:** The SSUS identity store automatically enables the Lock Account After Detection option. It allows up to 7 consecutive failed login attempts within a 30-minute interval. If the next login attempt also fails within the interval, SSUS locks the account for 15 minutes. After 15 minutes, the system automatically unlocks the account, and the user can log in using a correct user name and password. To log in before the lockout is reset, the user can contact the SSUS Helpdesk and ask the administrator to reset the password.

After you have configured intrusion detection for the supported identity sources, continue with [Section 6.2.3, “Configuring a Google reCAPTCHA Account,”](#) on page 57.

6.2.3 Configuring a Google reCAPTCHA Account

Before you configure the Google reCAPTCHA tool, you must configure an account to use for your domain at Google reCAPTCHA, and create a public and private key.

To configure a Google reCAPTCHA account to use for your appliance's domain:

- 1 Access the [Google reCAPTCHA](https://www.google.com/recaptcha/) (<https://www.google.com/recaptcha/>) website.
- 2 Click **Get reCAPTCHA > Sign up Now**.
- 3 Log in using one of your Google accounts.
For example, if you use your Gmail account, the reCAPTCHA account is associated with the Gmail account.
- 4 (Conditional) If this is not your first site, click **Add a New Site**. Otherwise, skip to the next step.
- 5 Specify a domain.
Read the **Tips** for more information.
- 6 Click **Create** to add the domain.
- 7 Copy the **Public Key** and **Private Key** that the interface displays to use when you configure the identity source.
- 8 Continue with [Section 6.2.4, "Configuring the reCAPTCHA Tool," on page 57](#).

6.2.4 Configuring the reCAPTCHA Tool

Before you configure the Google reCAPTCHA tool, you must [set up intruder detection](#) in the Active Directory and eDirectory identity sources, and [create public and private keys](#) for your appliance's domain at the Google reCAPTCHA website.

To configure the reCAPTCHA service:

- 1 Using the identity source's native management tools, verify that its intrusion detection setup meets the requirements specified in ["Configuring Intrusion Detection for Failed Logins" on page 56](#).
- 2 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`
- 3 In the **Identity Sources** panel, verify that you have configured an identity source for Active Directory or eDirectory, or both.
- 4 Drag the **reCAPTCHA** tool from the **Tools** palette to the **Tools** panel.
- 5 Configure the reCAPTCHA feature as follows:
Start reCAPTCHA at: Specify how many failed login attempts must occur before the login page displays the reCAPTCHA prompt. The value should be less than the lockout value set in the identity sources' intrusion detection system.
 - ♦ If the reCAPTCHA count is set to zero, the login page displays a reCAPTCHA prompt every time for all users. Every login requires user credentials and the reCAPTCHA response.
 - ♦ If the reCAPTCHA count is greater than zero, the login page displays the reCAPTCHA prompt only after the user login fails the specified number of times in the same browser window.

Public Key: Paste the Public Key value from your reCAPTCHA account configuration for this appliance's domain.

Private Key: Paste the Private Key value from your reCAPTCHA account configuration for this appliance's domain.

For information about the public and private keys for your reCAPTCHA account, see [Section 6.2.3, "Configuring a Google reCAPTCHA Account," on page 57](#).

- 6 Click **OK** to save the settings and enable the tool.
- 7 Click **Apply** to activate the configuration.
- 8 Wait while the service is activated across all nodes in the cluster. Do not attempt other configuration actions until the activation completes successfully.

6.3 Configuring the TOTP Tool for Two-Factor Authentication Using Google Authenticator

The Time-Based One-Time Password (TOTP) tool in CloudAccess supports the use of one-time passwords (OTPs) for two-factor authentication of users as they access applications through CloudAccess. With two-factor authentication, users must provide two categories of authentication factors before they can access the applications. The authentication factors used by the TOTP tool are:

- ♦ **Something the user knows:** The first authentication factor requires *something the user knows*, such as the password for the user's single-sign-on user name.
- ♦ **Something the user has:** The second authentication factor requires *something the user has*, such as a mobile device running Google Authenticator to generate time-based one-time passwords.

Google Authenticator is a free software-token app that users deploy on their mobile devices. Authenticator generates time-based OTPs for authentication, without requiring an Internet connection or cellular service.

If users construct strong passwords and protect them, one-factor authentication can be an effective measure against security breaches. Two-factor authentication provides an additional layer of security to help ensure the identity of a user and reduce the risk of unauthorized access to your applications and data. Users still enjoy the convenience of single sign-on, but the access is more secure.

The following sections describe how to set up and use TOTP for CloudAccess:

- ♦ [Section 6.3.1, "Configuring the TOTP Tool," on page 58](#)
- ♦ [Section 6.3.2, "Registering a Mobile Device with the TOTP Tool for OTP Generation," on page 59](#)
- ♦ [Section 6.3.3, "Using Two-Factor Authentication at Login," on page 61](#)
- ♦ [Section 6.3.4, "Resetting a Device \(Unregistering a Device\)," on page 61](#)

6.3.1 Configuring the TOTP Tool

You can enable the Time-Based One-Time Password tool to require users to use two-factor authentication when logging in through CloudAccess.

To configure the TOTP tool:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Drag the **TOTP Tool** icon from the **Tools** palette to the **Tools** panel.

- 3 Click the **TOTP** icon on the **Tools** panel, then click **Configure**.
- 4 (Optional) Specify the **Validity Time**.

Specify an integer value from 2 to 10. The default value is 5. Shorter validity times are considered more secure.
- 5 Click the **Applications** tab, then select the check box next to one or more applications to enable them for TOTP.

By default, no applications are enabled for TOTP.

When a user registers an authentication device, the device and authentication codes apply to all TOTP-enabled applications.
- 6 Click **OK** to save the setting and enable the TOTP tool.
- 7 Click **Apply** to activate the TOTP configuration.
- 8 Wait while the service is activated across all nodes in the cluster. Do not attempt other configuration actions until the activation completes successfully.

In the Appliances pane, a green gear icon spins on top of each node until the activation is complete across all nodes in the cluster.

6.3.2 Registering a Mobile Device with the TOTP Tool for OTP Generation

After you enable the TOTP tool, users are prompted to register a device to use for the additional verification the next time they sign in to CloudAccess. Each user must register a mobile device for generating the user's one-time passwords. For the initial setup, the user should use a web browser on a computer other than the mobile device where the one-time passwords will be generated.

The One-Time Authentication code page displays a QR code and its equivalent secret key. The user deploys the Google Authenticator app on a mobile device, and sets up an account for CloudAccess by using the shared key. The user can scan the QR code or manually enter the key. When the app runs, it generates a new one-time password every 30 seconds.

Before registering a device, the following setup is required:

- ☐ The user must be an authorized user of CloudAccess with a valid user name and password.
- ☐ The user must have access to a computer running a supported web browser.

For a list of supported web browsers, see [Table 2-2, "Product Requirements," on page 19](#).
- ☐ The user must use a supported mobile device.

For a list of supported mobile device platforms, see [Table 2-2, "Product Requirements," on page 19](#).
- ☐ The user must install the Google Authenticator app on the mobile device.

To register a mobile device for use with the TOTP tool:

- 1 (Conditional) If the Google Authenticator mobile app is not already installed on the mobile device, download and install it.
 - 1a Visit the app store for your mobile device.
 - 1b Search for Google Authenticator.
 - 1c Download and install the app.
- 2 From a computer that will not be used as the OTP device, access CloudAccess either directly or through a SAML2 redirect.

- 3 On the CloudAccess login page, enter your network user name and password (your normal identity source login credentials).

A message displays a QR code (and its equivalent secret key) to use for the TOTP registration.

If you are not prepared to register your mobile device at this time, you can cancel the registration process by closing the tab or your browser. On your next login, CloudAccess generates a new secret key, and prompts you to register a device with a new key.

- 4 On your mobile device, use the Google Authenticator app to scan the displayed QR code, and register the device with CloudAccess. You can alternatively type the secret key.

4a On your mobile device, open the Google Authenticator app.

4b Select **Settings > Add an account**.

4c Use either of the following methods to configure the account:

- ♦ **Scan a barcode:**

1. Select **Scan a barcode**.
2. Use your device's camera to scan the QR code that appears on the CloudAccess One-Time Authentication Code page.

- ♦ **Enter provided key:**

1. Select **Time Based**.
2. Select **Enter provided key**.
3. Type the 16-character secret key that appears on the CloudAccess One-Time Authentication Code page. The key is case sensitive. Do not add spaces or stray characters.

4d Specify a unique name for the account.

4e Tap **Done**.

- 5 On the mobile device, view the 6-character code that Google Authenticator displays for CloudAccess. This is your OTP.
- 6 On the computer on the One-Time Authentication Code page, type the OTP, then click **Sign In**.

CloudAccess confirms that the mobile device is registered, and the login is successful.

If the code does not validate, the registration page is redisplayed with the current secret key. You can generate a new code, and try again. The code might not validate if you enter an expired code, you do not enter a code, you mistype the code, or you make an error when setting up the secret key for the account in Google Authenticator.

- 7 To log in to your account from the mobile device, log in to CloudAccess as described in [Section 6.3.3, "Using Two-Factor Authentication at Login," on page 61](#).

On successful authentication, you can access the apps icons for the authorized services and resources associated with your user identity. Access is granted only for the duration of that session.

To deregister a mobile device:

- 1 Access CloudAccess, either directly or through a SAML2 redirect.
- 2 Log in and authenticate as described in [Section 6.3.3, "Using Two-Factor Authentication at Login," on page 61](#).
- 3 Click the **My Devices** icon.
- 4 In the **Registered Devices** list, select the mobile device.
- 5 Click the **Delete** icon for the device.

- 6 In the **Unregister** Device window, click OK to confirm.

At your next login, CloudAccess prompts you to register a device before you can access applications that require two-factor authentication.

6.3.3 Using Two-Factor Authentication at Login

When two-factor authentication is enabled for CloudAccess, a user must provide login credentials and a one-time authentication code to gain access to TOTP-enabled applications. The code is a 6-digit number generated for CloudAccess by the Google Authenticator app that is running on the user's mobile device. The user must have already registered the mobile device with CloudAccess, as described in [Section 6.3.2, "Registering a Mobile Device with the TOTP Tool for OTP Generation," on page 59](#).

The user should enter the newly generated code as soon as possible after it appears in the Google Authenticator app. Each OTP is intended for use by only one user, is valid for 30 seconds, and becomes invalid after the user successfully logs in. Access is granted only for the duration of that session.

To log in to CloudAccess using two-factor authentication:

- 1 Access CloudAccess, either directly or through a SAML2 redirect.
- 2 On the login page, enter your network user name and password (your normal identity source login credentials).

CloudAccess verifies the credentials against a defined identity source. If all applications require two-factor authentication, the One-Time Authentication Code page appears and prompts you to enter the code. Otherwise, CloudAccess displays the page when you first click any one of the applications that require it.

- 3 Use Google Authenticator to generate a new one-time password, and enter the code on the CloudAccess One-Time Authentication Code page.

If you enter the password incorrectly, you can try again with the same password until it times out. Google Authenticator generates a new OTP every 30 seconds.

On successful authentication, you can access the apps icons for the authorized services and resources associated with your user identity. Each session requires only a single successful authentication.

6.3.4 Resetting a Device (Unregistering a Device)

Each user can register a single device to use for generating one-time passwords. Resetting a device for a user's account unregisters the user's current device. The next time the user logs in, the TOTP tool creates a new secret key for the account.

An administrator can reset a device for a user account:

- ♦ To allow the user to register a different device
- ♦ To revoke access for a registered device that is lost or stolen

Information about a user's registered device and secret key is part of the user's identity information in the identity source. This information is deleted automatically if a user's identity object is permanently deleted from the identity source. The information is stored with the user's object if the user's identity object is disabled.

If the Time-Based One-Time Password tool is disabled, CloudAccess no longer prompts the users for an OTP at login. However, information about a user's registered device and secret key continue to be stored in the users' identity objects in the identity source. The OTPs generated for the user's CloudAccess account by the Google Authenticator app are no longer needed at login.

After a device is unregistered, the OTPs generated for the user's CloudAccess account by the Google Authenticator app are no longer valid. At the user's next login, the TOTP tool generates a new secret key for the user, and the user must register a device to work with it.

To reset (unregister) a device for a user account as an administrator user:

- 1 Log in with an appliance administrator account to the CloudAccess administration console at https://appliance_dns_name/appliance/index.html.
- 2 Click the **Devices** icon.
- 3 In the **User** field, type a few characters of the user name, and then scroll in the window to select the user identity.
- 4 Under **One-Time Password**, click **Reset**.

6.4 Configuring the Advanced Authentication Tool for Two-Factor Authentication Using NetIQ Advanced Authentication Framework

The Advanced Authentication tool supports the use of one-time passwords (OTPs) for two-factor authentication of users as they access applications through CloudAccess. The tool works with the NetIQ Advanced Authentication Framework appliance.

With two-factor authentication, users must provide two categories of authentication factors before they can access the applications:

- ♦ **Something the user knows:** The first authentication factor requires *something the user knows*, such as the password for the user's single-sign-on user name.
- ♦ **Something the user has:** The second authentication factor requires *something the user has*, such as a device to uniquely generate or receive one-time passwords or authentication requests that can be used only for that access moment.

Two-factor authentication provides an additional layer of security that helps ensure the identity of a user and reduce the risk of unauthorized access to your applications. Users still enjoy the convenience of single sign-on, but the access is more secure.

The Advanced Authentication tool supports multiple types of authentication providers for OTP in the NetIQ Advanced Authentication Framework. You configure a separate instance of the tool for each authentication provider type you want users to use. For each authentication provider type, you can enable one or more applications, but they must be mutually exclusive of the applications that you enable in other instances. The applications must also be mutually exclusive of applications configured to use the Time-Based One-Time Password tool with Google Authenticator.

At a user's next login, the tool prompts the user for additional authentication, according to the authentication provider type enabled for the application. If you enable a single authentication provider type for all applications, the prompt occurs immediately after CloudAccess validates the user's credentials. Otherwise, the prompt occurs when the user first selects any one of the applications enabled for Advanced Authentication. The authentication automatically applies to all applications for that session that were also enabled for the same type of authentication provider.

For more information about using the NetIQ Advanced Authentication Framework and the supported authentication providers, see the [NetIQ Advanced Authentication Framework \(https://www.netiq.com/documentation/advanced-authentication-framework/\)](https://www.netiq.com/documentation/advanced-authentication-framework/) documentation website.

Use the information in the following sections to configure your system for Advanced Authentication:

- ♦ [Section 6.4.1, “Requirements for Advanced Authentication,” on page 63](#)
- ♦ [Section 6.4.2, “Configuring the Advanced Authentication Tool,” on page 63](#)

6.4.1 Requirements for Advanced Authentication

Ensure that your system meets the following requirements before you configure Advanced Authentication as an authentication method:

- ☐ A CloudAccess appliance, installed and configured.
- ☐ A NetIQ Advanced Authentication Framework 5.x or later appliance, installed and configured.
- ☐ The Advanced Authentication tool supports many of the authentication providers available in Advanced Authentication Framework.

Before you configure the Advanced Authentication tool, ensure that you install and configure the authentication providers that you want to use on the NetIQ Advanced Authentication Framework appliance. For more information, see the [NetIQ Advanced Authentication Framework \(https://www.netiq.com/documentation/advanced-authentication-framework/\)](https://www.netiq.com/documentation/advanced-authentication-framework/) documentation website.

For SMS and Voice Call, the user's telephone number that will be used for authentication should be specified in the user's properties in Active Directory.

- ☐ The users must use the NetIQ Advanced Authentication Framework client or web user interface to enroll or re-enroll for the authentication providers that you want them to use.
- ☐ Identify the type of authentication provider that you want to use for each of your destination applications.

NOTE: You can use the NetIQ Advanced Authentication Framework for applications on desktop browsers, but this does not work with MobileAccess. When users access an application from MobileAccess, they are automatically logged in, ignoring any advanced authentication rules that you configure in CloudAccess. MobileAccess supports only OAuth by design.

6.4.2 Configuring the Advanced Authentication Tool

Before you configure the Advanced Authentication tool, ensure that your setup meets the requirements described in [Section 6.4.1, “Requirements for Advanced Authentication,” on page 63](#).

To configure the Advanced Authentication tool:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`
- 2 Drag the **Advanced Authentication** tool from the **Tools** palette to the **Tools** panel.
- 3 Configure the Advanced Authentication feature:

Authentication type: Select the type of authentication provider that you want to enable for the specified appliance running the NetIQ Advanced Authentication Framework.

NAAF host name/port: Specify the host name of the appliance running NetIQ Advanced Authentication Framework. The default port number is 443.

- 4 Click the **Applications** tab, then select the check box next to one or more applications that require the specification authentication provider.
You can enable one or more applications for the specified type of authentication provider. However, you must assign each application to only one type of authentication provider.
- 5 Click **OK** to save the settings and enable the tool.
- 6 Click **Apply** to activate the configuration.
- 7 Wait while the service is activated across all nodes in the cluster. Do not attempt other configuration actions until the activation completes successfully.

6.5 Configuring FIDO for Two-Factor Authentication

CloudAccess supports FIDO (Fast Identity Online) for two-factor authentication. FIDO requires that users enter their user name and password. The second factor authentication is a dongle that users must touch to authenticate. For more information, see the [FIDO Alliance \(https://fidoalliance.org/\)](https://fidoalliance.org/) website.

6.5.1 Requirements for FIDO

Ensure that your system meets the following requirements before you configure FIDO as an authentication method:

- ☐ A CloudAccess appliance, installed and configured.
- ☐ A FIDO supported dongle for each user.

6.5.2 Configuring the FIDO Tool

Before you configure the FIDO tool, ensure that your setup meets the requirements described in [Section 6.5.1, "Requirements for FIDO," on page 64](#).

To configure the FIDO tool:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`
- 2 Drag the **FIDO** tool from the **Tools** palette to the **Tools** panel.
- 3 Read the message that there is no configuration required.
- 4 Click the **Applications** tab, then select the check box next to one or more applications that require the specified authentication provider.
You can enable one or more applications for the specified type of authentication provider. However, you must assign each application to only one type of authentication provider.
- 5 Click **OK** to save the settings and enable the tool.
- 6 Click **Apply** to activate the configuration.
- 7 Wait while the service is activated across all nodes in the cluster. Do not attempt other configuration actions until the activation completes successfully.

6.6 Configuring the Authentication Filter to Set Session-Based Identity Information for a User

The CloudAccess single sign-on login is designed to authenticate a user against an identity source and to share this authentication with other protected applications. The authentication process does not provide extended functions to add, remove, or manage a user's identity information for the session. To address this need, CloudAccess provides the Authentication Filter tool. For more information, see the [Technical Reference: Authentication Filter for NetIQ CloudAccess](#).

7 Configuring Mobile Access for Users

Administrators can enable user access to SSO, proxy, and SaaS applications from supported mobile devices. For more information about supported mobile devices, see [Section 2.2, “Product Requirements,”](#) on page 18.

- ♦ [Section 7.1, “Introduction to Mobile Access,”](#) on page 67
- ♦ [Section 7.2, “Installing and Configuring the MobileAccess Appliance,”](#) on page 68
- ♦ [Section 7.3, “Configuring the MobileAccess Tool on the Appliance,”](#) on page 68
- ♦ [Section 7.4, “Replacing the Default Certificate on the Appliance,”](#) on page 69
- ♦ [Section 7.5, “Helping Users Register Their Mobile Devices,”](#) on page 70
- ♦ [Section 7.6, “Understanding the MobileAccess PIN,”](#) on page 72
- ♦ [Section 7.7, “Unregistering Mobile Devices,”](#) on page 72

7.1 Introduction to Mobile Access

Mobile access features are available for all application connectors that CloudAccess supports. Configurable mobile access options include the following:

- ♦ Which applications users should be able to access.
- ♦ Whether users can access an application through a desktop browser or a mobile device, or both.
- ♦ The preferred viewer for the application on the mobile device.
- ♦ Whether users are required to provide a PIN to use the MobileAccess app on their mobile devices, and if so, whether they are required to re-enter the PIN after a period of inactivity.

The MobileAccess app that end users install on their mobile devices enables them to access corporate and SaaS applications from those devices. Administrators can also make the MobileAccess app available to users in a private corporate store. After users have installed the app and registered their device, they can access assigned applications using their corporate user name and password.

NOTE: MobileAccess is HTTPS-only, and does not work over an unsecured connection.

Administrators can unregister user mobile devices in the administration console. So, if a registered mobile device is lost or stolen, or an employee leaves the company, you can ensure that unauthorized users cannot access corporate resources. Users can also unregister their own mobile devices if necessary, either from their device or from the appliance administration console.

7.2 Installing and Configuring the MobileAccess Appliance

The prerequisites for the MobileAccess appliance, and the steps for installing and configuring the appliance, are the same as those for the CloudAccess appliance. For more information, see the following sections:

- ♦ [Chapter 2, “Installing the Appliance,” on page 17](#)
- ♦ [Chapter 3, “Configuring the Appliance,” on page 25](#)

NOTE: If you have a full CloudAccess license, you do not need to install a separate appliance to access the MobileAccess features. The CloudAccess appliance includes all MobileAccess features. For more information about product licensing, see [Section 1.4, “Understanding Product Licensing,” on page 15](#).

After you have installed and configured the appliance, you must configure the MobileAccess tool if you want to enable mobile access for your users. For more information, see [Section 7.3, “Configuring the MobileAccess Tool on the Appliance,” on page 68](#).

7.3 Configuring the MobileAccess Tool on the Appliance

After you have installed and configured the appliance, you must configure the MobileAccess tool if you want to provide mobile access for users.

To configure the MobileAccess tool:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Drag the **MobileAccess** icon from the **Tools** palette to the **Tools** panel.
- 3 Click the **MobileAccess** icon on the **Tools** panel and then click **Configure**.
- 4 In the **Display name** field on the Mobile Application Access window, type your company name. This name appears in the bar at the top of the MobileAccess app window on users' mobile devices.
- 5 In the **Prompt for Password Re-authentication in x Days** field, specify how long users can continue to use an authenticated password on mobile devices before re-authentication is required.
- 6 (Optional) On the **Ask for pin** bar, specify whether users must set a PIN for the MobileAccess app on their mobile devices, and whether they must re-enter the PIN after a period of inactivity. You can change this requirement at any time. For more information, see [Section 7.6, “Understanding the MobileAccess PIN,” on page 72](#).
- 7 Click **OK**.
- 8 Click **Apply** on the Admin page.
- 9 Wait for the apply operation to finish. (The gear stops spinning on the appliance when the operation has finished.)
- 10 Continue with [Section 7.4, “Replacing the Default Certificate on the Appliance,” on page 69](#).

7.4 Replacing the Default Certificate on the Appliance

You must change the default certificate that comes with the appliance before you can successfully register mobile devices. For security reasons that are well-documented, as well as for administrator and user convenience, NetIQ highly recommends that you change the default certificate on the appliance to a well-known Certificate Authority signed certificate. For more information, see [Section 3.3.5, “Changing the Certificates on the Appliance,” on page 29](#).

Before you change the certificate on the appliance, ensure that your environment meets the following requirements:

- ☐ The appliance must be installed and running with a DNS entry that points to it.
- ☐ The certificate must be at least 2K key size (4K preferably) using SHA256.
- ☐ The certificate must be signed by a Certificate Authority, preferably a well-known Certificate Authority. If you choose to use a self-signed certificate, it must be flagged as a certificate authority.

If you use a self-signed or non-public CA-signed certificate, users must also install the certificate on their mobile devices. For more information, see the following topics:

- [Section 7.4.1, “Generating a Self-Signed Certificate,” on page 69](#)
- [Section 7.4.2, “Installing a Self-Signed Certificate on the Mobile Device,” on page 70](#)

7.4.1 Generating a Self-Signed Certificate

You can generate a self-signed certificate and use it on the appliance, but if you do so, you must also perform the steps in [Section 7.4.2, “Installing a Self-Signed Certificate on the Mobile Device,” on page 70](#) to ensure that you can successfully register mobile devices. You can run the Java 7 keytool on a computer other than the appliance to generate the certificate.

To generate a self-signed certificate:

- 1 Using the Java 7 keytool, use the following commands replacing *name* and *appliance_dns_name*:

```
keytool -genkeypair -keystore name.p12 -storepass changeit -sigalg  
SHA256withRSA -keyalg RSA -keysize 4096 -dname "CN=appliance_dns_name" -  
validity 365 -storetype pkcs12 -ext bc=ca:true
```

name can be anything you want, as long as it is the same between the two commands, and you can find it when you want to upload it.

appliance_dns_name must be the DNS name of the appliance.

The output of this command is a .p12 format file. You can use this file to replace the default certificate on the appliance. (Use the password of *changeit* when the administration console prompts for it.) For more information, see [Section 3.3.5, “Changing the Certificates on the Appliance,” on page 29](#).

- 2 To get the public certificate from that keyfile (which you will use when you perform the procedure in [Section 7.4.2, “Installing a Self-Signed Certificate on the Mobile Device,” on page 70](#)), use the following command, replacing *name* with the same value from above:

```
keytool -export -keystore name.p12 -storetype pkcs12 -alias mykey -file  
name.cer -storepass changeit
```

The output of this command is a *name.cer* file that you can use later.

7.4.2 Installing a Self-Signed Certificate on the Mobile Device

This procedure is required only if you used the commands in [Section 7.4, “Replacing the Default Certificate on the Appliance,” on page 69](#) to generate the certificate. If you are using a certificate signed by a well-known Certificate Authority, you can skip this section.

To install a self-signed certificate on the mobile device:

- 1 Take the `name.cer` file that you generated in [Section 7.4, “Replacing the Default Certificate on the Appliance,” on page 69](#) and email it to the user who has an email account configured on the mobile device. Alternatively, you could put it on a web or FTP site that is accessible from the mobile device.
- 2 Open the email (or web/FTP site) on the mobile device and tap the certificate attachment.
- 3 In the Install Profile window, tap **Install**.
- 4 Read the warning, then tap **Install**.
- 5 Verify that the certificate reads “Trusted” with a green check mark in the Profile Installed window.
- 6 (Conditional) If the certificate is not trusted, something is wrong with the certificate and the MobileAccess app will not work. Go back and try to generate the certificate again.
- 7 Tap **Done**.
- 8 Verify that this procedure worked by entering the appliance DNS name in the Safari address bar and ensuring that there is no warning about an untrusted certificate.

NOTE: This step does not currently work in Chrome.

This certificate is installed on the Settings > General > Profiles page on the mobile device and can be removed from that location on the device.

The server certificate and the trusted root certificate need to be at least 2K in size.

After you have replaced the default certificate on the appliance, you can continue with MobileAccess installation and configuration.

7.5 Helping Users Register Their Mobile Devices

Users can install the NetIQ MobileAccess app on a mobile device to use MobileAccess with CloudAccess. A user can register a device with multiple providers by setting up separate accounts for each one. If a user registers a device with multiple providers, the user must select the account to use for a session from the list of providers on the device. By default, the app connects the user to the first provider in the list.

Users must register their mobile devices to use MobileAccess with CloudAccess. As an administrator you can provide two different ways for users to register a mobile device with CloudAccess.

7.5.1 Registering iOS Devices

You can provide users with one of the following methods to register an iOS mobile device:

- ♦ **Manual URL Entry:** Send your users an email with the URL containing the DNS name of the appliance, including the correct port number. To enter the URL in the MobileAccess app, users tap the menu in the upper left corner of the app, then tap **Accounts** > **+** and enter the URL of the appliance in the **Providers** field. The URL is:

`https://appliance_dns_name:port`

For example:

`https://ias.example.com:8443`

- ♦ **Embedded Link in Email:** Send your users the following link. When users click the link, the link launches the MobileAccess app and the Sign In page appears. Users sign in using their corporate credentials to access the appmarks available in the MobileAccess app. The link is:

`comnetiqauth://x-callback-url/register?providerUrl=https://
appliance_dns_name:port/`

For example:

`comnetiqauth://x-callback-url/register?providerUrl=https://
ias.example.com:8443/`

NOTE: Email clients can prevent embedded links from working.

7.5.2 Registering Android Devices

You can provide users with one of the following methods to register an Android device:

- ♦ **Manual URL Entry:** Send your users an email with the URL containing the DNS name of the appliance, including the correct port number. To enter the URL in the MobileAccess app, users tap the menu in the upper right corner of the app, then tap **Manage Accounts** > **+** and enter the URL of the appliance in the **Provider** field. The URL is:

`https://appliance_dns_name:port`

For example:

`https://ias.example.com:8443`

- ♦ **HTML Page with Anchor Link:** Create an HTML page that contains an anchor link that users click to have the **Provider** field populated for them. The format of the anchor link is:

```
<html>  
  <body><a href="intent://x-callback-url/register?providerUrl= https://  
  appliance_dns_name:port#Intent;scheme=comnetiqauth;package=com.netiq.mobileacc  
  essforandroid;end;">Register</a></body>  
</html>
```

For example:

```
<html>  
  <body><a href="intent://x-callback-url/register?providerUrl= https://  
  ias.example.com:8443#Intent;scheme=comnetiqauth;package=com.netiq.mobileaccess  
  forandroid;end;">Register</a></body>  
</html>
```

7.6 Understanding the MobileAccess PIN

Administrators can require users to set a PIN on their mobile devices as a security measure to prevent unauthorized users from accessing protected resources through the MobileAccess app. Administrators can also specify whether users must re-enter the PIN after a period of inactivity on the device.

Users must install the MobileAccess app on the mobile device before they can set the PIN. If a PIN is required, the MobileAccess app prompts users to set the PIN the first time they open the app. Otherwise, users can set, change, or remove the PIN any time by accessing the Settings page from the MobileAccess app.

NOTE: The MobileAccess PIN is unrelated to the built-in device passcode, which is designed to protect other resources on the mobile device.

Even if the administrator does not require users to set a PIN, users can optionally set a PIN on their device. The PIN can be different for each mobile device the user registers. The PIN is not stored anywhere other than on the device itself.

Administrators can change the **Ask for pin** setting any time in the administration console. If the administrator specifies that a PIN is required after a mobile device has already been registered, the next time the user launches the MobileAccess app on the mobile device, MobileAccess prompts the user to set a PIN. The app then prompts the user for that PIN each subsequent time the user accesses the app. If the administrator initially requires users to set a PIN and then changes that requirement, users can remove the PIN from their device. However, MobileAccess does not notify users if a PIN is no longer required.

Whether the administrator requires users to set a PIN or a user chooses to set a PIN, by default users can enter their PIN incorrectly five times. On the fifth attempt, the application unregisters the mobile device and removes the current PIN. The user must then reregister the device and reset the PIN.

7.7 Unregistering Mobile Devices

Administrators who have the Device Administrator role in CloudAccess can manage and unregister user devices in the appliance administration console. So, if a registered mobile device is lost or stolen, or an employee leaves the company, you can ensure that unauthorized users cannot access corporate resources.

Users can also unregister their own mobile devices, either from their device or from the administration console. A mobile device that has previously been unregistered can be reregistered by the same user. However, for a different user to use the unregistered mobile device, the user must delete and reinstall the MobileAccess app on the device before reregistering the device.

The Devices page lists the devices for the logged-in user by default. If you are logged in with an account that has the Device Administrator role assigned, you have the option to search for and unregister devices that are registered to other users. If you log in with a regular user account, you can view and manage only your own registered devices.

To unregister mobile devices from the administration console as a Device Administrator user:

- 1 Log in to the administration console at https://appliance_dns_name/appliance/index.html.
- 2 Click **Devices** at the top of the page.

- 3 (Conditional) If you want to search for the devices belonging to a particular user, enter the user name in the **User** field.
- 4 Click the trash can icon next to the device you want to unregister, then click **OK** on the confirmation message.

To unregister mobile devices from the Devices page as a regular user:

- 1 Browse to `https://appliance_dns_name/appliance/Devices.html`.
- 2 Enter your login credentials when prompted.
- 3 Click the trash can icon next to the device you want to unregister, then click **OK** on the confirmation message.

After a mobile device has been unregistered, the device can be registered to a new user. However, the MobileAccess app on the device must first be deleted and reinstalled.

8 Configuring Connectors

CloudAccess provides multiple connectors to SaaS applications. The connector for Google Apps for Business, the connector for Salesforce, and the connector for Microsoft Office 365 enable both account provisioning and single sign-on (SSO). The other available connectors, which are downloadable from [NetIQ Downloads \(https://dl.netiq.com/\)](https://dl.netiq.com/), provide only single sign-on capability.

The connectors for Google Apps and Salesforce are embedded in the appliance and are visible on the Admin page of the administration console as soon as you have initialized the appliance. The connector for Office 365 is included with the CloudAccess appliance. However, the administration console displays the connector only after you have installed the connector on the Windows server.

NOTE: The connectors for Google Apps, Salesforce, and Office 365 are CloudAccess-only features and are not included in the MobileAccess-only license. For more information about product licensing, see [Section 1.4, “Understanding Product Licensing,” on page 15](#).

CloudAccess also ships with the connector for NetIQ Access Manager, the connector for Bookmarks, the connector for OAuth2 Resources, and the connector for Simple Proxy.

For more information, see the [NetIQ CloudAccess Connectors Guide](#).

9 Mapping Authorizations

Most companies define their business policies through authorization assignments. Examples of authorizations are groups, roles, and profiles. These authorizations are different depending on each SaaS application. For more information, see [Section 9.1, “Supported Roles and Authorizations,” on page 77](#).

Authorizations give users access to resources. CloudAccess provides a simple solution that allows you to map your identity source roles (groups) to the SaaS application authorizations and approve or deny access to those authorizations.

Authorization categories are available for the connector types that provision users (Office 365, Google Apps, and Salesforce). If you use connector types that provide only authentication and they require mapped authorizations for entitlements instead of Public access, their authorizations are available in the Other Applications category. By default, Public access is disabled for all connectors, except for the connectors for Basic SSO.

The Policy Mapping page maps the authorizations from the SaaS applications to the roles (groups) in the identity sources and allows you to select whether the authorization requires an approval. If approval is required, the Approval page allows you to accept or deny the authorization request.

- ♦ [Section 9.1, “Supported Roles and Authorizations,” on page 77](#)
- ♦ [Section 9.2, “Prerequisites,” on page 78](#)
- ♦ [Section 9.3, “Loading Authorizations,” on page 78](#)
- ♦ [Section 9.4, “Reloading Authorizations,” on page 78](#)
- ♦ [Section 9.5, “Mapping Authorizations,” on page 79](#)
- ♦ [Section 9.6, “Understanding Google Apps Mappings,” on page 80](#)
- ♦ [Section 9.7, “A Mapping Example,” on page 80](#)
- ♦ [Section 9.8, “Approving Requests,” on page 81](#)

9.1 Supported Roles and Authorizations

Each identity source can contain different roles that appear on the Policy Mapping page.

- ♦ **Active Directory:** groups, local groups, and global groups
- ♦ **eDirectory:** group
- ♦ **Other Identity Sources:** roles for JDBC and SSUS identity sources

Each application contains different authorizations that appear on the Policy Mapping page.

- ♦ **Google Apps:** user and groups
- ♦ **Office 365:** account, groups, and license
- ♦ **Salesforce:** groups, roles, and profiles (account types)
- ♦ **Other Applications:** appmarks for Bookmarks, Simple Proxy, or other applications that require mapped authorizations for entitlements instead of Public access.

Provisioning applications support mapped authorizations only for users in Active Directory, eDirectory, and JDBC identity sources. For more information, see [“Requirements for Provisioning”](#) in the *NetIQ CloudAccess Connectors Guide*.

9.2 Prerequisites

Verify that you meet the following prerequisites before mapping SaaS application authorizations to the identity source groups:

- ☐ Configure the appropriate connectors for your environment. For more information, see [Chapter 8, “Configuring Connectors,” on page 75](#).
- ☐ Ensure that roles (groups) in the identity source exist.
- ☐ Populate the required attributes on the users in the identity source. For more information, see [Chapter 5, “Configuring Identity Sources,” on page 37](#).

9.3 Loading Authorizations

To map an authorization, you must load the authorization into the Policy Mapping page.

To verify that applications are available for mapping authorizations:

- 1 Verify that you have configured the SaaS application connectors that provision users.
For more information, see [Chapter 8, “Configuring Connectors,” on page 75](#).
- 2 Log in to the administration console using the application administrator credentials you specified when you created the SaaS application connector.
- 3 Click **Policy** to open the Policy Mapping page.
- 4 In the right pane, click the down arrow next to the connector, then select your SaaS application connector, or select **Other Applications** and select the application.

If the Policy Mapping page does not display the SaaS application connector, you did not configure the connector properly. For example, if the **Public** policy is enabled for a connector, the application does not appear in the list. For more information, see [Chapter 8, “Configuring Connectors,” on page 75](#).

Successfully completing these steps populates the Policy Mapping page with the SaaS application's authorizations.

9.4 Reloading Authorizations

When you perform a switch master with the cluster nodes, or if authorizations change in the SaaS applications, or you add new roles in the identity sources, you must reload the authorizations on the Policy Mapping page.

To reload authorizations:

- 1 To reload roles (groups) from the identity sources, click the **Reload table** icon  at the end of the Identity Source table.
- 2 To reload authorizations from the SaaS applications, click the **Reload table** icon  at the end of the Authorizations table.

9.5 Mapping Authorizations

After the authorizations load, map the SaaS application authorizations to the identity source roles (groups). You can use filters in the search fields at the bottom of the window to filter applications and identity source roles.

NOTE: If you use wildcards such as an asterisk (*) or question mark (?) in the search filter field, CloudAccess does not correctly filter results. Filters must be full regular expressions. If you want to use wildcards, they must be regular expression wildcards. If the filter does not start with '^' and '.', then '.' is added to the filter. If the filter does not end with '\$' and '.', then '.' is added to the filter. Thus, a filter for "test" would end up as the regular expression ".*test.*".

To map authorizations:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Click **Policy** at the top of the page.
- 3 In the right pane of the Policy Mapping page, click the down arrow, then select the desired SaaS connector, or select **Other Applications** and select the application.
- 4 In the **Role Name** column on the left, select the role (group) from the identity source you want to map to an authorization from the selected SaaS connector.
- 5 In the right pane, drag and drop the desired authorization from the SaaS connector to the left mapping pane.
or
In the left pane, drag and drop the desired group from the identity source to the right mapping pane.
- 6 (Optional) Click the **Approvals** icon to specify that an approval is required to grant access.
NetIQ recommends a maximum of 2,000 simultaneous approvals. For more information about approvals, see [Section 9.8, "Approving Requests," on page 81](#).
- 7 Click **OK** to map the SaaS authorization to the identity source group.

The mapping grants access for users who are members of the identity source roles to the SaaS application authorization. When you add new users to the role (group) that is mapped to a SaaS account authorization, and the request is then approved (if approval is required), the users will see the associated appmark on the landing page or the MobileAccess application page. If the **Prompt users for an existing account before provisioning** option is enabled (available only for Salesforce), users are prompted to create a new SaaS account or to claim an existing account the first time they click or tap the appmark. If that option is not enabled, the accounts are provisioned automatically. For information, see ["How CloudAccess Provisions User Accounts"](#) in the *NetIQ CloudAccess Connectors Guide*.

NOTE: If you map a group to a role in CloudAccess and the group is subsequently removed from scope or deleted from the identity source, CloudAccess removes the policy mappings as well. If you recreate the group or add it back to the scope, you must remap the group to the appropriate role on the Policy Mapping page in CloudAccess.

9.6 Understanding Google Apps Mappings

Mapped placement of newly provisioned users to a sub-organization overrides the default placement in the top-level organization. On the Policy page, you can map the User Account authorization and a User Placement authorization value to the same identity source group. After users are added to the appropriate identity source group, which triggers user account provisioning to Google Apps, new users are placed in the organization that you mapped to the identity source group in Policy Mapping.

IMPORTANT: Pay careful attention when mapping User Placement authorization values to identity source groups on the Policy page to ensure that users are placed in the intended Google Apps organizations. Google Apps allows each user to be placed in only one organization at a time. If you grant a User Placement authorization to a user, and then grant another User Placement authorization to the same user, the first value is overwritten when the user is moved in the Google Apps organizational unit structure.

In addition, if you revoke a User Placement authorization for a user, even if that user has multiple User Placement authorizations, that user is moved to the default organization specified in the Google Apps connector configuration. (Because Google Apps allows a user to be placed into only one organization at a time, when a User Placement authorization value is overwritten, there is only one value that is removed, which moves the user back to the default placement.) If you want to move that user from the default location back into a new Google Apps sub-organization, you must add the user back to the appropriate identity source group and perform policy mappings again.

If you revoke a User Account authorization for a user after the user has been provisioned into Google Apps and one or more User Placement authorizations have been granted to the user, that user is placed in suspended mode in Google Apps. No placement activity takes place as long as the user account is suspended; the user simply remains in the Google Apps organization that they were in before the suspension. When you re-grant the User Account authorization, the account is moved to the “active user” state. If you performed a User Placement authorization change while the user account was suspended, the user is moved to the appropriate organization after the account is reactivated.

9.7 A Mapping Example

Use the following example of authorization mapping in Google Apps to understand how mapping works.

- 1 In Active Directory:
 - 1a Create a group named GoogleAppsUsers.
 - 1b Add users to the GoogleAppsUsers group.
- 2 In Google Apps for Business, create a Google Apps Account group.
- 3 In CloudAccess, configure the connector for Google Apps.
- 4 On the Policy Mapping page:
 - 4a Load the authorizations for the connector for Google Apps.
 - 4b In the **Role Name** column, select the connector for Active Directory.
 - 4c In the right pane, select the connector for Google Apps.
 - 4d Drag and drop the Google Apps Account into the left pane, over the GoogleAppsUsers group.

4e Click **OK**.

The appliance automatically provisions all users in the GoogleAppsUsers group to the Google Apps Account group.

5 In Active Directory, create a new user, then add the user to the GoogleAppsUsers group.

The user is automatically added to the Google Apps Account group and has access to Google Apps for Business.

9.8 Approving Requests

CloudAccess provides the ability to approve or deny requests to the SaaS applications. During the configuration of the connector, you specified an application owner. The application owner approves or denies requests for access to the SaaS applications. The application owner knows who should have access to the SaaS applications, whereas the appliance administrator might not have this knowledge.

The **Approval** icon appears in the administration console only if you have mapped roles and selected the option to require approval for the account. When there are accounts waiting for approval, CloudAccess adds the **Approval** icon.

By default, CloudAccess automatically provisions users according to mapped authorizations. To enable approvals so that automatic provisioning does not occur, click the **i** (Configure Authorizations Policies) icon when you map the roles (groups) from the identity source to the SaaS applications authorizations on the Policy Mapping page. Now an application owner must grant approval before provisioning can occur.

You can use filters in the search field at the bottom of the Approval window to filter approval requests.

NOTE: If you use wildcards such as an asterisk (*) or question mark (?) in the search filter field, CloudAccess does not correctly filter results. Filters must be full regular expressions. If you want to use wildcards, they must be regular expression wildcards. If the filter does not start with '^' and '.', *, then '.', *' is added to the filter. If the filter does not end with '\$' and '.', *, then '.', *' is added to the filter. Thus, a filter for "test" would end up as the regular expression ". *test.*".

To grant or deny approval:

- 1 Log in to the administration console at https://appliance_dns_name/appliance/index.html as the application owner.
- 2 Click the **Approval** tab.
- 3 Select the desired approval request.
- 4 Click **Approve** or **Deny**.

NOTE: Users who have been deleted from the identity source might still appear on the Approval page. If you know that certain users have been deleted, you can simply deny approval for those users. However, approving requests for users who have been deleted does *not* result in account provisioning for those users in the SaaS applications.

NetIQ recommends a maximum of 2,000 simultaneous approvals.

10 Reporting

CloudAccess provides reports of users' activity through the appliance. You can run, download, and save various reports on the **Reports** tab in the administration console.

CloudAccess provides the option to use Google Analytics as an external dashboard, and you can also configure CloudAccess to forward events to Sentinel Log Manager or a syslog server to help troubleshoot various issues. Event types that are forwarded include Login, Logout, Register Device, Un-register Device, and Failed Login.

- [Section 10.1, "Using Google Analytics as an External Dashboard," on page 83](#)
- [Section 10.2, "Integrating with Sentinel Log Manager," on page 84](#)
- [Section 10.3, "Configuring CloudAccess to Forward Events to a Syslog Server," on page 84](#)

10.1 Using Google Analytics as an External Dashboard

CloudAccess enables administrators to use Google Analytics as an external dashboard to monitor and analyze CloudAccess usage. After you have completed the free Google Analytics registration process for the CloudAccess appliance, data is available for analysis within a few hours. You can also do your own data mining with the API that Google provides. For more information, see [the Google Analytics website \(http://www.google.com/analytics/?gclid=CJCt792Y07kCFUlp7AodDBwALA\)](http://www.google.com/analytics/?gclid=CJCt792Y07kCFUlp7AodDBwALA).

To set up Google Analytics for CloudAccess:

- 1 (Conditional) If you do not already have a Google account, set one up on the Google web site.
- 2 Sign in to your Google account and select the option to register for Google Analytics.
- 3 Select the option to monitor a website and provide the base URL for the CloudAccess appliance. Google Analytics tracks both user and admin logins. For example, `https://appliance_dns_name`.
- 4 Specify an account name. This account name is only for managing Google Analytics and does not affect anything in CloudAccess. You can share this account name as needed.
- 5 Log in to the CloudAccess administration console.
- 6 On the Admin page, drag the Google Analytics icon from the **Tools** palette to the **Tools** panel.
- 7 Enter the Tracking ID (not the tracking code) that Google provided during the registration process and click **OK**.
- 8 Click **Apply** and wait for the appliance to update.

NOTE: If you have any issues with configuring the Google Analytics tool in the administration console, such as the tool being invisible on the Tools palette, verify that you do not have any ad blockers running in your browser that might be interfering with administration tasks. You should be able to disable any ad blockers on the web page itself.

10.2 Integrating with Sentinel Log Manager

The CloudAccess appliance can forward events to Sentinel Log Manager 1.2.x if you want more detailed reports.

To integrate the appliance with Sentinel Log Manager:

- 1 Configure Sentinel Link in Sentinel Log Manager.

For more information, see [Sentinel Link Overview Guide \(http://www.novell.com/documentation/sentinel70/sentinel_link_overview/data/bookinfo.html\)](http://www.novell.com/documentation/sentinel70/sentinel_link_overview/data/bookinfo.html).

- 2 Open TCP port 1290 on the Sentinel Log Manager server.

2a To change the port, use `ssh` and log in to the Sentinel Log Manager server as `root`.

2b At the command prompt, enter `yast firewall`.

2c Select **Advanced > Allowed Services**, then manually add port 1290 to the list of TCP ports.

- 3 On the Admin page in CloudAccess, drag the **Sentinel** icon from the **Tools** palette to the **Tools** panel.
- 4 Click the Sentinel icon, then click **Configure**.
- 5 Specify the IP address and port of the Sentinel Link server, then click **OK** and **Apply** to save the changes.

The CloudAccess appliance appears as another event source in Sentinel Log Manager.

10.3 Configuring CloudAccess to Forward Events to a Syslog Server

You can configure CloudAccess to forward various events to a syslog server to help troubleshoot various issues. Event types that are forwarded include Login, Logout, Register Device, Un-register Device, and Failed Login.

To configure CloudAccess to forward events to a syslog server:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Drag the **Syslog** tool from the **Tools** palette to the **Tools** panel.
- 3 In the **Tools** panel, click the Syslog tool, then click **Configure**.
- 4 Specify the IP address and the port of the syslog server.
- 5 Select the type of protocol to use: **UDP**, **TCP**, or **TLS**.
- 6 Click **OK** to save the tool settings.
- 7 On the Admin page, click **Apply** to activate event forwarding.

11 Configuring the End User Experience

CloudAccess allows you to configure the end user's email client or mobile devices to use the single sign-on authentication to access the SaaS applications. This increases the security of your company's information stored in the SaaS applications because users authenticate with their corporate credentials, but these credentials are never stored in the SaaS applications.

Configure each user's email client or mobile device to point to the CloudAccess appliance. The appliance acts as a proxy, so when users access the SaaS applications, the appliance automatically logs users in to the SaaS application.

CloudAccess also allows you to customize the login, logout, and landing pages so they display your company's branding instead of the default NetIQ branding.

- ♦ [Section 11.1, "Configuring Email Clients," on page 85](#)
- ♦ [Section 11.2, "Configuring End User Browsers for Kerberos Authentication," on page 86](#)
- ♦ [Section 11.3, "Customizing Branding on User-Facing Pages," on page 86](#)
- ♦ [Section 11.4, "Configuring User Session Timeouts," on page 88](#)

11.1 Configuring Email Clients

You can configure any supported email client to point to CloudAccess. The email clients allow you to receive email from multiple sources in one location. For a list of supported clients, see ["Email Clients" on page 20](#).

NOTE: The following procedure lists typical ports for email clients, but ports might vary depending on your environment.

To configure your email client to use a CloudAccess email account:

- 1 Access your email client.
- 2 Create a new email account using the following information to configure CloudAccess as your email source:

Incoming email server (IMAP/POP): Specify the IP address or hostname of your appliance.

Incoming email server username: Specify your identity source enterprise logon name for the account name.

Incoming email server password: Specify your identity source password.

If your password changes, you must change the password in the email account.

Outgoing email server (SMTP): Specify the IP address or hostname of your appliance.

SSL: You must select **SSL** for IMAP (port 993), POP (port 995), and SMTP (port 25).

The SMTP server requires authentication.

For more information, see the appropriate documentation for the email client you are using.

11.2 Configuring End User Browsers for Kerberos Authentication

If you are using Windows Integrated Authentication for Kerberos authentication to CloudAccess, each end user browser must be configured to use Kerberos authentication.

For information about configuring Kerberos, see [Section 6.1, “Configuring Integrated Windows Authentication with Kerberos,” on page 53.](#)

To configure Kerberos authentication for web browsers:

- 1 Add the user computers to the Active Directory domain.
For instructions, see your Active Directory documentation.
- 2 Log in to the Active Directory domain, rather than the computer.
- 3 (Conditional) If you are using Internet Explorer, configure the browser to trust the appliance:
 - 3a Click **Tools > Internet Options > Security > Local intranet > Sites > Advanced.**
 - 3b In the **Add this website to the zone** field, enter the Base URL for the appliance, then click **Add.**
In the configuration example, this URL is `serv1.example.com`.
 - 3c Click **Close**, then click **OK.**
 - 3d Click **Tools > Internet Options > Advanced.**
 - 3e Verify in the Security section that **Enable Integrated Windows Authentication** is selected, then click **OK.**
 - 3f Restart the browser.
- 4 (Conditional) If you are using Firefox, configure the browser to trust the appliance:
 - 4a In the URL field, specify `about:config`.
 - 4b In the **Filter** field, specify `network.n`.
 - 4c Double-click `network.negotiate-auth.trusted-uris`.
This preference lists the sites that are permitted to engage in SPNEGO Authentication with the browser. Specify a comma-delimited list of trusted domains or URLs.
For this example configuration, add `serv1.example.com` to the list.
 - 4d Click **OK**, then restart your browser.

11.3 Customizing Branding on User-Facing Pages

CloudAccess allows you to customize user-facing pages, such as the login page, so users see your company branding instead of the default NetIQ branding. After you have customized those pages, you can modify them as needed to meet new company requirements. Customizing the user pages does not affect any pages in the administration console itself.

If you implement custom branding in your CloudAccess environment and then re-run the initialization process to modify the DNS server or make other changes to an existing cluster, branding is reset to the default settings. Before you re-run the initialization process on an existing cluster, ensure that you back up your customized branding files so that you can reuse them.

IMPORTANT: Performing advanced branding customization requires advanced JavaServer Pages (JSP) knowledge. Before you make any changes, ensure that you have a good snapshot of your appliance that you can revert to if necessary. If you upload a bad branding file and are unable to log in to the administration console, you can re-run the appliance initialization to restore the default login pages. For more information, see [Section 2.6, “Initializing the Appliance,” on page 22](#).

To customize branding for users:

- 1 (Conditional) If you plan to perform extensive rebranding, take a snapshot of the appliance.
- 2 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 3 On the toolbar, click the Tools icon, then click **End user branding**.
- 4 (Conditional) If you want to customize the user login page, complete the following steps:
 - 4a Click **Basic Customization**.
 - 4b Change the title and background colors by specifying HTML color codes.
 - 4c Change the default image by either not showing the image, or uploading a new image.

The image size on the user landing and logout pages is always scaled to 60 x 60. On the login page, if the specified image is between a minimum of 60 x 60 and a maximum of 300 x 300, CloudAccess displays the image “as is.” If the image is outside this range, CloudAccess scales it to the nearest minimum or maximum value.
 - 4d Click **OK** to save the changes and then click **Apply**.
- 5 (Conditional) If you want to perform more extensive rebranding, complete the following steps:
 - 5a Click **Advanced Customization**.
 - 5b Click **Download default end user login code**.
 - 5c Save the file to your local computer.
 - 5d Save a backup copy of the file.
 - 5e Unzip the downloaded file and locate the `.jsp` files in the `osp\jsp` subdirectory.
 - 5f Modify the desired JSP pages. The default text for the login page is located in the `osp\resources\oidp_custom_resources_en_US.properties` file.

For more information about the JSP files, see [Appendix A, “Performing Advanced Branding,” on page 109](#).
 - 5g Zip up the files again, but include only the `images` and `jsp` directories.
 - 5h Log in to the CloudAccess console again.
 - 5i On the toolbar, click the Tools icon, then click **End user branding**.
 - 5j (Conditional) If you are customizing pages for the first time, click **Browse**, then browse to and select the modified file.
 - 5k (Conditional) If you are updating previously customized pages, delete the name of the existing file. Click **Browse**, then browse to and select the `.zip` file that contains the newly modified `.jsp` files.
 - 5l Wait until the file name changes to a hexadecimal value, then click **OK**.
 - 5m Click **Apply**.

The pages now display the branding you customized in the `.jsp` files.

11.4 Configuring User Session Timeouts

The user session timeout is set to 10 minutes by default, but it is configurable.

NOTE: The admin session timeout is set to 10 minutes and is not configurable.

To change the user session timeout:

- 1 On the Admin page, click the cluster icon at the bottom of the page, then click **Configure**.
- 2 Adjust the setting in the **User session timeout** field as needed, then click **OK**.

12 Maintenance Tasks

CloudAccess allows you to change various appliance configuration settings as needed. For example, moving your appliance from a staging configuration to a production environment requires changes to the networking components.

- ♦ [Section 12.1, “Changing the Cluster Password,” on page 89](#)
- ♦ [Section 12.2, “Changing the IP Address,” on page 89](#)
- ♦ [Section 12.3, “Changing the Public DNS Name or NTP Server Settings, or Uploading New Certificates,” on page 90](#)
- ♦ [Section 12.4, “Updating the Appliance,” on page 90](#)
- ♦ [Section 12.5, “Shutting Down or Rebooting a Node,” on page 91](#)
- ♦ [Section 12.6, “Recovering from a Disaster,” on page 91](#)

12.1 Changing the Cluster Password

You can change the administrator password for the cluster as needed. The administrator password is the same for all nodes in the cluster.

To change the cluster password:

- 1 On the Admin page, click the cluster icon at the bottom of the page, then click **Change cluster password**.
- 2 Type your old password, then type your new password twice and click **OK**.

12.2 Changing the IP Address

You can change whether a node uses a DHCP IP address or a static IP address on the Admin page.

To change the IP address:

- 1 Click the node icon, then click **Configure**.
- 2 Select whether the appliance uses a DHCP IP address or a static IP address.
If you select to use a static IP address, you can change the required values for the subnet mask, default gateway, and the DNS server.
- 3 Click **OK** to save the changes.
- 4 Click **Apply** to apply the changes to the appliance.

12.3 Changing the Public DNS Name or NTP Server Settings, or Uploading New Certificates

The appliance contains self-generated certificates. You can upload custom certificates through this interface. You can also change the public DNS name or NTP server if necessary.

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Click the cluster icon under **Appliances**, then click **Configure**.
- 3 Change the key pairs, NTP server, or public DNS name, then click **OK**.
- 4 Click **Apply** to apply the changes to the appliance.

Expired key pair certificates prohibit changes from being made to this page and make the key pair field red. If the key pair expires, you must re-initialize the appliance before you can upload a new certificate.

12.4 Updating the Appliance

CloudAccess provides an update channel for keeping your appliances current with the latest security fixes, bug fixes, and feature updates. Updates work only if you have registered each node in the cluster. For more information, see [Section 3.2, “Registering the Appliance,” on page 26](#).

When an update is available for one or more nodes in the cluster, the CloudAccess Admin page displays a flag icon in the upper right corner of the window. You can also configure the appliance to send an email notification when an update is available. When you click the flag icon, you can see the version of the pending update, instructions on how to apply the update, and the Release Notes associated with the update.

The flag icon for the update channel appears only if you are logged in to the Admin page with an administrator account. Other consoles do not display the flag icon.

CloudAccess automatically checks the NCC channel for updates once daily at 11:23:23 p.m. and downloads any available update. You can also manually check for updates any time by clicking **Tools > Check for updates** on the Admin page. You can download and install an update as soon as the flag appears on the Admin page, or you can wait for CloudAccess to download the update that night, to minimize network impact due to possible size of an update.

WARNING: If you download and update in the same step and the download is interrupted or incomplete, the update fails. The appliance might become unresponsive or seem to be in a restart loop. If this occurs, download the update, then go back to the snapshot and try again to apply the update.

NetIQ recommends always keeping your appliance up to date. However, updates are cumulative, so if you miss an update you can just install the next one when it is available.

IMPORTANT: If you apply an update to one node, you must apply the update to all the other nodes in the cluster. Update one node at a time. Ensure that the update was successful and the node is still working properly before you begin updating the next node. Do not perform any other administrative tasks that require an **Apply** command, and do not switch the master node, until all nodes have been successfully updated to the same version of CloudAccess.

This process allows you to run in a mixed environment while you update each node. After you have applied all available channel updates, the flag icon goes away.

To apply an update:

- 1 Take a snapshot of each node in the cluster to create a backup.
- 2 Click the desired node, then click **Apply update**.
CloudAccess displays status messages during the installation of the update and the rebooting of the node.
- 3 After the update completes and the node restarts, click **About** on the node to verify the updated version.
- 4 Verify the health of the updated node and all of the nodes in the cluster. Make sure all icons are green.
For more information, see [Section 13.2, “Displaying Health,” on page 93](#).
- 5 Repeat [Step 2](#) through [Step 4](#) for each node in the cluster.
- 6 When you are sure all of the nodes in the cluster are working as expected, delete the snapshot.

12.5 Shutting Down or Rebooting a Node

You can shut down or reboot a node in the cluster if necessary.

NOTE: If you shut down the node in a single node cluster, the administration console becomes inaccessible. You must then use the hypervisor management tools to power on the node. Similarly, if you reboot the node in a single node cluster, the administration console is inaccessible until the reboot is complete.

To shut down or reboot a node:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Click the node that you want to shut down or reboot, then click **Shutdown/Reboot** on the menu.
- 3 In the confirmation window, click **Shutdown** or **Reboot**.
- 4 (Conditional) Wait for the node to reboot, or use the hypervisor management tools to power the node back on.

12.6 Recovering from a Disaster

Use snapshots of the nodes to recover from a disaster. It is important to take snapshots of each node in the cluster regularly so you do not lose information.

To recover from a disaster:

- 1 On a regular basis, take snapshots of the nodes in the cluster.
 - 1a Power off the working node, then take a snapshot. NetIQ recommends this method, but it requires that you shut down and restart the node to take the snapshot.or

Take a snapshot of the running node, ensuring that you include the virtual machine's memory. Including the memory in the snapshot requires more time and space to store the snapshot, but taking a snapshot of a running node without the memory can result in corruption.

- 1b** Repeat Step 1a for each node in the cluster, within a short time.
- 2** When a failure happens, restore the master node snapshot first.
- 3** Restore the other nodes in the cluster.

Use these steps only for disaster recovery. Never restore one snapshot. CloudAccess contains a database that is time-sensitive. Restoring one node only and not the others causes corruption in the appliance.

13 Troubleshooting CloudAccess

The CloudAccess administration console displays health status information for the system, the nodes, and the cluster on the Admin page. This section describes the health status indicators, how to troubleshoot health issues, and how to work around known issues.

- ♦ [Section 13.1, “Troubleshooting the Appliance Initialization,” on page 93](#)
- ♦ [Section 13.2, “Displaying Health,” on page 93](#)
- ♦ [Section 13.3, “Using Troubleshooting Tools,” on page 94](#)
- ♦ [Section 13.4, “Troubleshooting Different States,” on page 96](#)
- ♦ [Section 13.5, “Understanding Support for International Characters,” on page 100](#)
- ♦ [Section 13.6, “Troubleshooting Networking Issues,” on page 100](#)
- ♦ [Section 13.7, “Troubleshooting Provisioning Issues,” on page 102](#)
- ♦ [Section 13.8, “Troubleshooting Policy Mapping Issues,” on page 104](#)
- ♦ [Section 13.9, “Troubleshooting Mobile Device Issues,” on page 105](#)
- ♦ [Section 13.10, “Troubleshooting CloudAccess Login Failures,” on page 105](#)
- ♦ [Section 13.11, “Troubleshooting Authentications or Single Sign-On Issues,” on page 106](#)
- ♦ [Section 13.12, “Troubleshooting Connector Issues,” on page 106](#)
- ♦ [Section 13.13, “Troubleshooting JDBC Identity Source Issues,” on page 106](#)

13.1 Troubleshooting the Appliance Initialization

If the appliance initialization fails, the user interface displays a link for log files. Click the link to download the log files that provide information about the failure.

13.2 Displaying Health

CloudAccess displays health status information for each node and for the cluster at the bottom of the Admin page. Hover the mouse over each node to display the health status of the node. If you want more details, click the node, then select **Show Health**. CloudAccess refreshes health status information every five minutes.

When you click **Show Health**, CloudAccess displays the status for each component of the appliance. If the status is anything other than green (healthy), use the troubleshooting tools to determine what is wrong.

13.3 Using Troubleshooting Tools

CloudAccess provides troubleshooting tools to help you resolve problems.

To access these tools:

- 1 Log in with an appliance administrator account to the administration console at `https://appliance_dns_name/appliance/index.html`.
- 2 Under **Appliances**, click the node icon, then click **Enter troubleshooting mode**.
- 3 Click the node icon again, then click **Troubleshooting tools**.
- 4 Select one or more of the troubleshooting scenarios listed.
- 5 Duplicate the error or condition.
- 6 Click **Download CloudAccess Log Files** to download the logs.

IMPORTANT: After you obtain the logs, turn off troubleshooting mode by clicking the node icon again and then clicking **Exit troubleshooting mode**. Leaving the logs running affects the performance of your appliance.

All of the log files in [Table 13-1](#) are included in the download, no matter what scenario you select. The scenario you select determines the amount of data displayed in the log files. Search the appropriate log file for errors while troubleshooting issues.

Table 13-1 Troubleshooting Log Files

Feature	Logs
Initialization or commands	ConfigurationReplicator.log
	ConfigurationReplicator_RL.log
	messages
	boot*
	packageoperations.log
	dserv.log
	firewall
Forward proxy	access.log

Mobile Devices	mail mail.err mail.info
Custom Connectors	catalina.out
End User Authentication	catalina.out

13.4 Troubleshooting Different States

CloudAccess displays indicators for the current state of the different appliance components. The display refreshes every five minutes. CloudAccess might not immediately display the change.

The following sections list the different components, the possible states, and troubleshooting steps you can take when the state changes.

- [Section 13.4.1, “Master Node Health,” on page 96](#)
- [Section 13.4.2, “Front Panel of the Node,” on page 96](#)
- [Section 13.4.3, “Top of the Node,” on page 97](#)
- [Section 13.4.4, “Identity Source,” on page 97](#)
- [Section 13.4.5, “Applications,” on page 98](#)
- [Section 13.4.6, “Tools,” on page 99](#)

13.4.1 Master Node Health

The master node is responsible for all administration functions in CloudAccess. If the master node is not running, the following functions do not work: provisioning or deleting user accounts, mapping authorizations, system roles, approving requests, and reporting. Other nodes in the cluster continue to capture and cache events, but do not send those events to the master node until it is running again. Similarly, event forwarding to Sentinel does not work as long as the master node is down.

13.4.2 Front Panel of the Node

The indicator on the front panel of the node displays the health state of the node.

Figure 13-1 Front Panel

The states are:

Green: The node is healthy.

Yellow: The node cannot communicate with the other nodes within the five minute refresh.

Red: The node cannot communicate with the other nodes within two of the five minute refresh cycles.

Clear: The node is initializing or the state of the node is unknown.

Perform the following troubleshooting steps in the order listed if the state is anything but green:

1. Wait at least five minutes for the display to refresh and display the current state.
2. Click the node, then select **Show health**.
Show Health displays which part of the appliance is having issues.
3. If Show Health displays a problem, use the troubleshooting tools to gather logs.

For more information, see [Section 13.3, “Using Troubleshooting Tools,” on page 94](#).

4. Restart the appliance, then wait at least another five minute cycle for all nodes to display the current state.

13.4.3 Top of the Node

The indicator on the top of the node shows whether the **Apply** commands completed successfully.

Figure 13-2 Top of the Node

The states are:

Green: All **Apply** commands completed successfully.

Red: The **Apply** commands did not complete successfully.

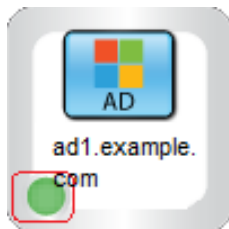

Perform the following troubleshooting steps in the order listed if the state is red:

1. Mouse over the top of the node to see the status of the last **Apply** command made on the node.
2. If there is not enough information in the summary, click **Enter troubleshooting mode** on the node, then mouse over the node again.
The troubleshooting mode displays a detailed summary of the last **Apply** command made on the node.
3. Restart the appliance, then wait at least another five minute cycle for all nodes to display the current state.

13.4.4 Identity Source

The health indicator for the identity source is the small icon in the lower left corner.

Figure 13-3 Identity Source Indicator

The states are:

Green: The connector to the identity source is healthy.

Yellow: The connector has communication problems with the identity source.

Red: The connector to the identity source is unhealthy or contains errors.

Question mark: The state of the connector to the identity source is unknown.

Perform the following troubleshooting steps in the order listed:

1. If the connector is green, but the CloudAccess interface is not displaying users, verify that the identity source servers are running and communicating properly.
2. Use the troubleshooting tools to gather logs, then look at the identity source provisioning logs listed in [Table 13-1 on page 94](#) for errors. The `ConnectorLogs.txt` file maps the display name of the connector with the log name of the connector, if there is more than one identity source connector.
3. Click **Show health** on the master node, then expand **Operational**.
If these items are yellow or red, the interface displays helpful information to help troubleshoot the issue.
4. If you are using LDAPS to communicate with the identity source, verify the LDAP certificates are not expired. You refresh the certificates as follows:
 - a. Log in to the CloudAccess administration console, then click **Configure** on the identity source.
 - b. Click the **Refresh** icon next to the identity source server.

13.4.5 Applications

The health indicator for an application connector is the small icon in the lower left corner.

Figure 13-4 Application Indicator

The states are as follows:

Green: The connector to the application is healthy.

Yellow: The connector to the application contains warnings.

Red: The connector to the application contains errors or cannot communicate with the application.

Question mark: The connector to the application is in an unknown state.

Perform the following troubleshooting steps in the order listed:

1. Click **Show health** on the master node, then expand **Operational**, and check the status of **Provisioning**.
If **Provisioning** is yellow or red, CloudAccess displays helpful information to help troubleshoot the issue.
2. Use the troubleshooting tools to gather logs, then look at the provisioning logs listed in [Table 13-1 on page 94](#) for errors.

3. Make a cosmetic change to the application connector configuration, then click **Apply**.
By forcing an **Apply**, the appliance refreshes the application connector state and this can resolve the issue.

13.4.6 Tools

The health indicator for a tool is the small icon in the lower left corner. Only tools that report health have an indicator. The following tools do not have a health indicator: Google Analytics, Mobile, and Time-Based One-Time Password (TOTP).

Figure 13-5 Tool Indicator

For all tools, the **Question Mark** icon indicates that the tool is in an unconfigured state.

Advanced Authentication: The states for the Advanced Authentication tool are as follows:

- ♦ **Green circle:** The connection to the NetIQ Advanced Authentication Framework is healthy, and only Active Directory identity sources exist in the configuration.
- ♦ **Yellow triangle:** The connection to the NetIQ Advanced Authentication Framework is healthy. The triangle indicator serves as a warning that identity source types other than Active Directory exist in the configuration and are not supported with the Advanced Authentication Framework authentication providers.
- ♦ **Red circle:** The connection to the NetIQ Advanced Authentication Framework is not working. The Advanced Authentication Framework server is unreachable.

Authentication Filter: The states for the Authentication Filter tool are as follows:

- ♦ **Green circle:** The connection to the destination ExtAPI script uses HTTPS. The traffic is secure.
- ♦ **Yellow triangle:** The connection to the destination ExtAPI script uses HTTP. The traffic is not secure.
- ♦ **Red circle:** The connection to the destination ExtAPI script is not working. The ExtAPI script is unreachable.

Forward Proxy: The states for the Forward Proxy tool are as follows:

- ♦ **Yellow triangle:** The connection to or through the proxy is healthy. The triangle indicator serves as a warning that use of Forward Proxy is intended for test environments only.
- ♦ **Red circle:** The connection to or through the proxy is not working. The proxy device is unreachable.

Google reCAPTCHA: The states for the Google reCAPTCHA tool are as follows:

- ♦ **Green circle:** All of the configured identity sources are valid for use with reCAPTCHA.
- ♦ **Yellow triangle:** One or more of the configured identity sources are not valid for use with reCAPTCHA. For more information, see [Section 6.2.1, "Requirements for reCAPTCHA," on page 55](#).

- ♦ **Red circle:** None of the configured identity sources are valid for use with reCAPTCHA.

Sentinel and Syslog: The states for the Sentinel and Syslog tools are as follows:

- ♦ **Green circle:** The connection to the specified address:port is healthy.
- ♦ **Red circle:** The connection to the specified address:port is not working.

13.5 Understanding Support for International Characters

CloudAccess supports the use of international characters in values for identity attributes, except where the related identity source or application does not allow them. The international character can cause the authentication-related CloudAccess transaction to fail. For example, CloudAccess might be unable to provision a user's application account, to create a new account in an SSUS identity source, or to allow access to Simple Proxy accounts that use identity injection.

[Table 13-2](#) identifies the identity attributes for external components that do not support using international characters.

Table 13-2 *Known Issues for International Characters in Identity Sources and Applications*

External Component	Does not support international characters for...
Identity Sources	
Active Directory	The email attribute value
Self Service User Store	The email address used as the user name for an account
Applications	
Any external OAUTH2 service	The user attribute
Google Apps for Business	The cn and sAMAccountName attribute values
Office 365	The cn and sAMAccountName attribute values
Salesforce	The email attribute value

13.6 Troubleshooting Networking Issues

As an appliance administrator or network administrator, you might need to troubleshoot some basic networking issues before you can successfully initialize the CloudAccess appliance. For example, if your appliance boots onto the network and gets the wrong IP address or falls back to the default IP address, you can use a basic set of commands in the network troubleshooting console to help you resolve these issues.

The console is in a `chroot` jail environment that gives you temporary connectivity to the appliance. You can use the `cat` command to check files such as `/etc/resolv.conf` and `/etc/hosts`, which exist in memory in the `chroot` environment. When you run the initialization process, the real files are updated on the system. Similarly, actions such as updating the IP address or route are not persistent and are reset if you reboot the appliance. You must run through the initialization process to set them permanently.

NOTE: As long as you have not yet completed the initialization process on the appliance, you automatically have console access without login credentials. Logins to the troubleshooting console are no longer available after you have completed the initialization process. However, you can change network settings after this point using the Init screens.

To troubleshoot network issues:

- 1 Using the vSphere client console or a similar tool, access the troubleshooting console.
- 2 (Optional) Press the Tab key twice to see all available commands. Some commonly used and supported commands are listed below.
- 3 (Conditional) Use the following steps if you need to change appliance network settings:
 - 3a Delete the default route: `route del default`
 - 3b Create an alias with the IP address that you want to use: `ifconfig eth0:0 IP_address netmask subnet`
 - 3c Enter `ifconfig` again to verify that the address is now available.
 - 3d Add a route: `route add default gw gateway_IP eth0:0`
 - 3e Check connectivity to various resources: for example, `ping gateway_IP` or `ping www.google.com`
 - 3f (Conditional) If DNS name resolution is not functioning correctly, add an entry to the `/etc/resolve.conf` file as follows: `echo "nameserver 0.0.0.0" > /etc/resolve.conf`

At this point, you should have connectivity to the appliance. You can run through the initialization process and configure the appropriate settings permanently.
 - 3g In a browser, enter `https://IP_address/appliance/Init.html`, replacing `IP_address` with the IP address that you used for your alias.
 - 3h At the certificate warning prompt, add an exception.
 - 3i In Step 1 - Network of the initialization process, replace the default network values with your preferred IP address and other network settings and click **Next**.
 - 3j After CloudAccess validates your entries, click **OK** to apply the new settings. CloudAccess applies the settings permanently and restarts services as needed.

If you return to the troubleshooting console, it now displays your preferred IP address. You can use the `ifconfig` command to verify that the new settings are working correctly.
 - 3k Continue with the remaining initialization steps.

Supported commands include the following:

- ♦ `arp`
- ♦ `bash`
- ♦ `cat`
- ♦ `date`
- ♦ `echo`
- ♦ `ifconfig`
- ♦ `ip`
- ♦ `mkdir`
- ♦ `netcat`
- ♦ `nslookup`
- ♦ `ping`

- ♦ pwd
- ♦ rm
- ♦ route
- ♦ sntp
- ♦ traceroute

The following table provides examples of some common actions and commands.

Table 13-3 *Examples*

Action	Command
Set the IP address of the appliance.	<code>ifconfig eth0 static_IP netmask netmask up</code>
Delete the default route.	<code>route del default</code>
Set the default route (or gateway).	<code>route add default gw gw_IP eth0</code>
Update the time.	<code>sntp -P no -v -r pool.ntp.org</code>
Check networking.	<code>ping 8.8.8.8</code> <code>traceroute 8.8.8.8</code>
Verify that DNS is working.	<code>nslookup www.google.com</code>

13.7 Troubleshooting Provisioning Issues

Use the information in the following sections to troubleshoot provisioning issues.

13.7.1 Capturing Logs for Provisioning Issues

By default, when you provision users, the appliance does not log any information about the provisioning process. Enabling logging causes performance issues, so you should never leave the logging running all of the time.

However, if you have provisioned users and select accounts are not showing up in the SaaS applications, you will need to enable logging to capture the cause.

To capture logs of provisioning issues:

- 1 Determine which account (or accounts) were not provisioned.
- 2 Remove that account from the group that grants access to the SaaS application.
- 3 Turn on logging:
 - 3a Access the Admin page of the appliance console.
 - 3b Under **Appliances**, click the **Node** icon, then click **Enter troubleshooting mode**.
 - 3c Click the **Node** icon again, then click **Troubleshooting tools**.
 - 3d Select **Provisioning**, then click **Apply** and **OK**.
- 4 Add the user to the group or initiate the provisioning action.
- 5 Access the troubleshooting tools again.
- 6 Click **Download CloudAccess Log Files** to download the logs.

7 Deselect **Provisioning**, then turn off troubleshooting mode.

8 Review the logs to find the error when provisioning occurs.

Ensure that you have turned off troubleshooting mode, otherwise it will cause performance problems with the appliance.

13.7.2 Understanding the Result of Actions Performed on Users and Groups

Actions that are taken on users and groups in the identity source might not be reflected in the SaaS applications (Google Apps, Salesforce, and Office 365). The following table lists the actions in the identity sources and the corresponding actions in the SaaS applications.

Table 13-4 *Provisioning Actions*

Identity Sources	SaaS Applications
Delete a user. (Or disable a user account.)	Disables the SaaS account. NOTE: In the MobileAccess app on an iOS device, the user continues to have access to the SaaS account until the in-progress user session times out.
Remove a user from the authorized group.	Disables the SaaS account.
Create a user.	<ul style="list-style-type: none">Creates an account for the user in the SaaS application, if the user is a member of a group with mapped SaaS authorizations. or <ul style="list-style-type: none">Users are prompted to validate their information when they log in the first time.
Move a user from out of the search context into the search context.	Creates an account for the user in the SaaS application, if the user is a member of a group with mapped SaaS authorizations.
Move a user out of the search context.	Disables the SaaS account.

By default, CloudAccess establishes identity based on an internal unique ID in the identity source, not based on the user name, and does not support recreating users with the same name unless they also have the same internal unique ID. Once a user has been mapped and provisioned, if you delete the user from the identity source and then recreate that user with the same name, you will not be able to cache and activate the user in CloudAccess or provision the user to SaaS applications. When CloudAccess is unable to cache users properly, the Cached User Status Bar indicates this status with a lower number of active users than cached users.

IMPORTANT: CloudAccess does provide a **Relaxed user matching** option under **Advanced Options** on the configuration window for the identity source. If you select this option, CloudAccess matches users based on CN or sAMAccountName instead of the internal unique ID. This option enables you to recreate previously deleted users so CloudAccess can manage them again, but you must ensure that you do not create different users with the same CN or sAMAccountName as previously deleted users. Otherwise, those users will have access to the previously deleted users' cloud application data.

13.7.3 Users No Longer See Private Appmarks

Issue: Users were previously able to see and access private appmarks, but they are no longer able to do so. The only change in the environment is that you are now using the filters for the connector for an LDAP identity source to reduce the search scope for importing users.

Solution: The product is working as designed. CloudAccess imports users based only on the original CN of the users. By using the filters, you are changing the search scope for the users.

If users are no longer in the search scope (as defined by the search filter), but the users exist internally in CloudAccess, those users see only public appmarks when they authenticate. The reason is that you can allow unmapped users to authenticate, but when users are outside of the search scope, CloudAccess removes the entitlements for the private appmarks.

13.7.4 Active Directory LDAP Search Treats Extended Characters and Normal Characters the Same

Issue: In the customized import options of the Active Directory identity source, you create a filter for Active Directory users or groups that contain special characters. The filter returns all users and groups regardless of whether the objects contain special characters. For example, if the filter searches for `groüp` and you have `groüp` and `group`, CloudAccess matches on both group objects. This happens whether it is group or user objects.

Workaround: The filter search option in CloudAccess uses an `ldapsearch` against Active Directory. Active Directory ignores the special characters during an `ldapsearch`. The workaround is to create filters that do not rely on special characters.

This same filter search works properly against eDirectory.

13.8 Troubleshooting Policy Mapping Issues

Use the information in the following sections to troubleshoot policy mapping issues.

13.8.1 No Connectors Appear on the Policy Mapping Page

If the Policy Mapping page does not display the connectors for the SaaS applications, there are two possible solutions:

- ♦ Verify that the connectors are configured properly and enabled. For more information, see the appropriate sections for configuring connectors in the *NetIQ CloudAccess Connectors Guide*.
- ♦ Click the **Refresh List** icon in the upper-right corner of the Policy Mapping page.

13.8.2 CloudAccess Does Not Reconcile Pending Approvals with Changes to Policy Mappings

Issue: CloudAccess does not reconcile pending approvals with changes to policy mappings. Users with pending approvals are granted the pending requests even if the mappings were removed after the requests were launched.

Workaround: If a policy mapping for a resource occurs by mistake, decline all the requests for that resource. If a policy mapping for a resource occurs correctly, but then the mapping is removed, simply decline all outstanding approval requests. You can often avoid this issue by verifying that the user is a member of the group before you grant approval, and by ensuring that requests are approved or denied in a timely manner.

13.8.3 Using Multiple Browsers or Browser Windows Can Result in Duplicate Mappings

Issue: If you simultaneously use more than one browser or browser window to map authorizations, CloudAccess does not warn you if you inadvertently do the same mapping in two different browsers. Clicking **Refresh** displays two identical mappings on the Approvals page, but only one of them is a valid mapping. If you remove one of the mappings, CloudAccess might not actually deprovision the user until you remove the authorization that is mapped to the group.

Workaround: You can avoid this issue by using only one browser when you create policy mappings. To work around this issue, on the CloudAccess Policy page, manually remove all duplicate authorization mappings from the role, then map the desired authorizations back to the role.

13.9 Troubleshooting Mobile Device Issues

Use the information in the following sections to troubleshoot mobile device issues.

13.9.1 Safari on Mobile Devices Cannot Access the Login Page After You Enable the MobileAccess Tool

If users cannot access the CloudAccess login page from the Safari browser on a mobile device after you enable the MobileAccess tool in the administration console, verify that they have installed the MobileAccess app on their mobile devices. This is a requirement once you have enabled the MobileAccess tool in the administration console.

13.9.2 Device Registration Issues

The user might not be able to register a mobile device if the device is connected to a network that uses HTTP proxy. The user receives the following error message: `Unable to parse metadata`. To work around this issue, the user can register the device from a different network that does not use HTTP proxy.

13.10 Troubleshooting CloudAccess Login Failures

When a user is unable to log in to the CloudAccess appliance, the login page displays the message `Login failed, please try again`. Some causes of a login failure might not be obvious to either a user or a CloudAccess administrator, such as when multiple users have the same email address.

To help administrators determine the cause of the failure, the error message provides mouseover text containing an ID. You can download the `/var/log/tomcat7/catalina.out` log file and then search the log file for the ID provided in the error message. For more information about downloading log files, see [Section 13.3, "Using Troubleshooting Tools," on page 94](#).

13.11 Troubleshooting Authentications or Single Sign-On Issues

There can be multiple reasons why authentications to the SaaS applications (Google Apps, Salesforce, and Office 365) fail.

Time Synchronization: CloudAccess depends on timestamps to function correctly. Synchronize time between the VMware or Hyper-V host server, the appliance, and the workstations. Download the authentication or single sign-on logs. In the `catalina.out` file, search for the error `clock skew`.

SAML Authentications: Firefox contains a SAML debug add-on you can use to view the SAML authentication between CloudAccess and the SaaS applications. Download the add-on [SAML tracer](https://addons.mozilla.org/en-US/firefox/addon/saml-tracer/) (<https://addons.mozilla.org/en-US/firefox/addon/saml-tracer/>) to view the SAML request.

Master Node Down: If the master node is not running, users who already have accounts can log in to SaaS applications, but CloudAccess cannot provision new users. So, if new users attempt to log in to SaaS applications and receive an error indicating they should contact their system administrator, verify that the master node is running.

13.12 Troubleshooting Connector Issues

For information about viewing the current health status of a connector, see [Section 13.4.5, “Applications,” on page 98](#).

For information about accessing log files for connectors, see [Table 13-1, “Troubleshooting Log Files,” on page 94](#).

For information about troubleshooting a specific connector, see the connector’s information in the [NetIQ CloudAccess Connectors Guide](#).

13.13 Troubleshooting JDBC Identity Source Issues

Use the following information to help you troubleshoot issues with your JDBC identity source.

Issue: I have copied all of my users into the `indirect.usr` table, and the **user count** on my appliance Admin page has increased, but my users cannot log in. The **user count** never reconciles to the same number.

I also see one of the following messages in the `catalina.out` file: `mssqljdbc count: 20`, or `oraclejdbc count: 20`.

Answer: The connector for JDBC uses triggered publications, meaning the connector caches the users in the `indirect.usr` table only if some event (insert, update, delete) has occurred on the `indirect.usr` table entry, so the built-in triggers add the rows to the `indirect.indirect_process` table for the connector to consume and process.

To trigger a synchronization of the existing users in the `indirect.usr` table, you must perform a trigger action. For example, run an SQL query that would touch the records and trigger an update.

```
UPDATE indirect.usr SET disabled = disabled WHERE idu IS NOT NULL
```

Question: I have groups defined in my `indirect.grp` table, but the users are not being imported to my appliance.

Answer: The connector for JDBC uses triggered publications, meaning the connector will cache the users and groups in the `indirect.usr` or `indirect.grp` table only if some event (insert, update, delete) has occurred on the table entry, so the built-in triggers add the rows to the `indirect.indirect_process` table for the connector to consume and process.

To trigger a synchronization of the existing users in the `indirect.usr` table, you must perform a trigger action. For example, run an SQL query that would touch the records and trigger an update. For example:

```
UPDATE indirect.usr SET disabled = disabled WHERE idu IS NOT NULL
```

For groups, a query similar to the one below will trigger group events:

```
UPDATE indirect.grp SET group_name = group_name
```

Issue: I cannot specify a user from my real user database tables as an appliance administrator when I run the initialization process for the appliance. The administrator user name keeps coming back invalid and turning red, even though the user exists in my database login table.

Answer: The connector for JDBC only connects directly to the indirect tables. The issue is that the administrative user whom you wish to use during the initialization process has not been copied from the real user database tables to the `indirect.usr` table. Use `Copy/select into` to copy the desired administrative user to the `indirect.usr` table.

Issue: I have changed the `indirect.proc_authuser` stored procedure to use my desired tables for authentication, but I am still getting a login failure.

Answer: There are two separate ways that the stored procedure verifies the user name and password parameters passed to the `proc_authuser` stored procedure.

- ♦ **Oracle:** The password parameter is hashed and then compared to the existing password with the default settings.
- ♦ **MSSQL:** The stored procedure uses the `PWDCOMPARE` built-in function with the default settings.

In some cases, when customizing the stored procedure, the password might not be encrypted. In cases like this, the `password=` clause in the stored procedure might also need to be altered.

A Performing Advanced Branding

CloudAccess allows you to customize user-facing pages, such as the login page, so users see your company branding instead of the default NetIQ branding.

IMPORTANT: Performing advanced branding customization requires advanced JavaServer Pages (JSP) knowledge. Before you make any changes, ensure that you have a good snapshot of your appliance that you can revert to if necessary. If you upload a bad branding file and are unable to log in to the administration console, you can re-run the appliance initialization to restore the default login pages. For more information, see [Section 2.6, “Initializing the Appliance,” on page 22](#).

The brandable code is contained in a set of JSP files in the `/osp/jsp` directory.

To change the standard header or footer:

Edit the HTML formatting in one or both of the following files: `inc_common_body_top.jsp` or `inc_common_body_bottom.jsp`. The Java variables that the `inc_*.jsp` requires are listed at the top of the `inc_*.jsp` file. Much of this work can be done using the **Basic Customization** feature in the CloudAccess administration console. For more information, see [Section 11.3, “Customizing Branding on User-Facing Pages,” on page 86](#).

To change the body (the space between the header and footer) of a page:

Each login, logout, and landing page contains the HTML formatting code that draws the “body” of its respective page. To customize this section of the page, you can edit the HTML formatting located between the include statements for the header and footer.

NOTE: The NetIQ logo at the bottom of the landing page cannot be removed or rebranded.

A.1 //Shared Include Files

`inc_common_imports.jsp`

Included in all non-shared JSPs in the Java imports area. Contains all shared import statements.

`inc_common_java.jsp`

Included in all non-shared JSPs in the Java code area. Contains the main Java code that processes request parameters and gathers data into standard Java variables that are used by the shared JSPs.

`inc_common_head.jsp`

Included in all non-shared JSPs in the JavaScript `<script>` area. Contains shared JavaScript functions that are used by the shared JSPs.

`inc_common_body_top.jsp`

Included in all non-shared JSPs at the top of the HTML `<body>` area. Contains the HTML formatting that creates the header for all non-shared pages. The header generally contains the product logo and name.

inc_common_body_bottom.jsp

Included in all non-shared JSPs at the bottom of the HTML `<body>` area. Contains the HTML formatting that creates the footer for all non-shared pages. The footer generally contains the NetIQ logo and a “demo version expired” warning, if applicable.

inc_common_locale.jsp

Included in the `loginselect.jsp` file in the Java code area. Contains Java code that sets the “temporary locale” form data items.

inc_common_usermessages.jsp

Included in all non-shared JSPs in the middle of the HTML `<body>` area. Contains the HTML formatting that creates the user error message section for all non-shared pages.

A.2 //Standard Login Page

loginselect.jsp

Contains the standard name-password form-based authentication page. All configurations of this page follow the standard header, body, and footer convention where the header and footer are defined in shared `inc_*.jsp` files. There are several optional objects on this page: radius login, recaptcha, and authentication contract selection.

A.3 //Second Factor Authentication Login Pages

logintotp.jsp

Contains the standard Timed One Time Password (TOTP) form-based authentication page.

fidoregister.jsp

Contains the standard Fast Identification Online (FIDO) form-based registration page.

fidologin.jsp

Contains the standard Fast Identification Online (FIDO) form-based authentication page.

A.4 //Landing Page (Home Page after Login)

landingpage_select.jsp

Contains the standard home page where users can select appmarks.

A.5 //Logout Page

landingpage_loggedout.jsp

Contains the “successful logout” page where the user is asked to close the browser to complete the logout.
