<b>About NetIQ Corporation</b>	<b>9</b>
<b>About this Book and the Library</b>	<b>11</b>
<b>Part I Administering the Cloud Manager Orchestration Server</b>	<b>13</b>
<b>1 Basic Orchestration Functions</b>	<b>15</b>
1.1 Observing Discovery Jobs	15
1.2 Deploying a Sample Job	17
1.3 Creating a User Account	19
1.3.1 Opening the Users Monitor	19
1.3.2 Automatically Registering a User	20
1.3.3 Manually Registering a User	21
1.3.4 Logging In a User for Manual Registration	22
1.3.5 Directory Service Authentication (Optional)	23
1.4 Running a Sample Job	23
1.5 Looking at the Job After It Has Run	24
1.5.1 Verification at the Command Line	24
1.5.2 Verification at the Jobs Monitor	25
1.6 Using the <code>zosadmin</code> Command to Gather Information	26
1.7 Stopping and Starting Orchestration Components	27
1.7.1 Stopping and Starting the Orchestration Server	27
1.7.2 Stopping and Starting the Orchestration Agent	27
1.7.3 Starting and Stopping the Orchestration Server Console	28
1.8 Configuring the Orchestration Server for LDAP or ADS Authentication	29
1.9 Viewing Orchestration Server Data in the Sentinel Event Source Server	29
1.10 Orchestration Server Log Levels Mapped to Sentinel Log Levels	31
<b>2 Determining the Version of an Orchestration Component</b>	<b>33</b>
<b>3 Changing Orchestration Server Default Parameters and Values</b>	<b>35</b>
<b>4 Caching Computed Facts in a Grid with Large Numbers of Resources</b>	<b>37</b>
4.1 Walkthrough: Scheduling a System Job	38
4.1.1 Deploying a Sample System Job	38
4.1.2 Creating a New Schedule for the Job	39
4.1.3 Defining the New Schedule	40
4.1.4 Activating the New Schedule	44
4.1.5 Running the New Schedule Immediately	44
<b>5 Managing Virtual Machine Hosts</b>	<b>45</b>
5.1 Discovering VM Hosts and Repositories	45
5.2 Discovering VM Images	46
5.3 Resynchronizing the VM Host's State	47
5.4 Shutting Down VM Hosts	47
5.5 Restarting VM Hosts	48

5.6	Understanding VM Host Failover . . . . .	49
<b>6</b>	<b>Managing Virtual Machines</b>	<b>51</b>
6.1	Provisioning a Virtual Machine . . . . .	51
6.2	Provisioning Actions and History . . . . .	52
6.2.1	What are Provisioning Actions? . . . . .	52
6.2.2	How Actions Are Displayed in the Orchestration Console . . . . .	52
6.2.3	Prioritized Provisioning Actions . . . . .	55
6.3	Managing a Running Virtual Machine . . . . .	55
6.3.1	Using the Right-Click Menu for Provisioning Actions. . . . .	55
6.3.2	Prerequisites for Creating or Deleting vNIC and vDisk Objects on Hyper-V Managed Linux VMs . . . . .	60
6.3.3	Releasing a Virtual Machine from Usage . . . . .	60
6.3.4	Managing Virtual Machine Templates . . . . .	60
6.3.5	Managed Virtual Machine Actions . . . . .	62
6.3.6	Virtual Machine Technology-Specific Actions . . . . .	63
6.4	Resynchronizing the State of All VMs . . . . .	63
6.5	Resynchronizing the State of All VMs of a Specific VM Host. . . . .	63
6.6	Shutting Down Multiple VMs . . . . .	63
6.7	Destroying and Deleting a Virtual Machine . . . . .	64
<b>7</b>	<b>Managing VM Repositories</b>	<b>65</b>
7.1	Provisioning a VM from a Local Repository . . . . .	65
7.2	The Datagrid Repository . . . . .	66
7.3	Provisioning a VM from a NAS Repository . . . . .	66
7.4	The SAN Repository . . . . .	66
<b>Part II</b>	<b>Administering the Cloud Manager Application Server and Console</b>	<b>67</b>
<b>8</b>	<b>Setting Up the Cloud Environment</b>	<b>69</b>
8.1	Creating a Zone . . . . .	69
8.2	Creating Resource Groups Within the Zone . . . . .	70
8.2.1	Resource Group Requirements . . . . .	70
8.2.2	Shared and Dedicated Resource Groups . . . . .	70
8.2.3	Creating a Resource Group . . . . .	70
8.3	Creating Service Levels for Resource Groups . . . . .	72
8.4	Creating an Organization . . . . .	73
8.5	Creating an Organization's Business Groups . . . . .	75
8.6	Creating Users and Groups . . . . .	76
8.6.1	Manually Creating Users . . . . .	77
8.6.2	Manually Creating User Groups . . . . .	78
8.6.3	Importing Users from LDAP . . . . .	80
8.6.4	Importing User Groups from LDAP . . . . .	81
<b>9</b>	<b>Configuring the Cloud Manager System</b>	<b>85</b>
9.1	Managing Zones . . . . .	85
9.1.1	Creating Zones . . . . .	85
9.1.2	Disabling Zones . . . . .	86
9.1.3	Enabling Zones . . . . .	86
9.1.4	Removing Zones . . . . .	87
9.2	Customizing the Capacity Thresholds and Data Refresh Interval . . . . .	87
9.3	Managing System Users, User Groups, and Roles . . . . .	88

9.4	Configuring E-Mail Notifications . . . . .	88
9.5	Configuring Remote Console Access to Workloads . . . . .	89
9.5.1	Disabling Remote Console Access . . . . .	90
9.5.2	Setting Up the Built-In VNC Repeater . . . . .	90
9.5.3	Setting Up an External VNC Repeater . . . . .	90
9.5.4	Setting Up Direct Connections . . . . .	91
9.5.5	Enabling Repeater SSL Encryption . . . . .	91
9.6	Configuring Auto Approval for Business Service Requests . . . . .	92
9.7	Customizing the Workload Update Schedule . . . . .	92
9.8	Customizing the Cloud Manager Console Interface . . . . .	93
<b>10</b>	<b>Setting Up and Managing Users</b>	<b>95</b>
10.1	Creating User Accounts . . . . .	95
10.1.1	Manually Creating System and Organization Users . . . . .	95
10.1.2	Importing System Users from LDAP . . . . .	96
10.1.3	Importing Organization Users from LDAP . . . . .	97
10.2	Providing Self Registration for Users . . . . .	99
10.2.1	Setting Up Self Registration for System Users . . . . .	99
10.2.2	Setting Up Self Registration for Organization Users . . . . .	99
10.2.3	Automating Role Assignments to Self-Registered Users . . . . .	100
10.3	Creating User Groups . . . . .	100
10.3.1	Manually Creating System and Organization User Groups . . . . .	101
10.3.2	Importing System User Groups from LDAP . . . . .	101
10.3.3	Importing Organization User Groups from LDAP . . . . .	103
10.4	Assigning Roles to Users and Groups . . . . .	104
10.5	Deleting Users . . . . .	105
10.6	Deleting User Groups . . . . .	106
<b>11</b>	<b>Managing the Workload Template Catalog</b>	<b>107</b>
11.1	Creating Workload Templates . . . . .	107
11.2	Assigning Workload Templates to Organizations and Business Groups . . . . .	110
11.2.1	Assigning Workload Templates to an Organization . . . . .	110
11.2.2	Assigning Workload Templates to a Business Group . . . . .	111
11.2.3	Removing Workload Template Assignments from an Organization . . . . .	111
11.2.4	Removing Workload Template Assignments from a Business Group . . . . .	111
11.3	Modifying Workload Templates . . . . .	112
11.4	Deleting Workload Templates . . . . .	112
11.5	Add-on Applications . . . . .	113
11.5.1	Creating an Add-on Application . . . . .	113
11.5.2	Configuring an Add-on Application . . . . .	114
11.6	Add-On Services . . . . .	116
11.6.1	Creating an Add-on Service . . . . .	116
11.6.2	Configuring an Add-on Service . . . . .	117
11.7	Legal Agreements . . . . .	118
11.7.1	Creating a Legal Agreement . . . . .	118
11.7.2	Editing a Legal Agreement . . . . .	119
11.8	Resource Pricing Packages . . . . .	120
11.8.1	Creating a Resource Pricing Package . . . . .	121
11.8.2	Configuring a Resource Pricing Package . . . . .	122
<b>12</b>	<b>Managing Organizations</b>	<b>125</b>
12.1	Creating Organizations . . . . .	125
12.2	Customizing Organization Configuration Settings . . . . .	127
12.3	Creating Business Groups . . . . .	128

12.4	Assigning Resource Groups to Organizations and Business Groups	130
12.4.1	Assigning Resource Groups to an Organization	130
12.4.2	Assigning Resource Groups to a Business Group	131
12.4.3	Removing Resource Group Assignments from an Organization	131
12.4.4	Removing Resource Group Assignments from a Business Group	132
12.5	Managing Organization Users, User Groups, and Roles	132

## **13 Managing Resources** **133**

13.1	Creating, Modifying, and Deleting Resource Groups	133
13.1.1	Creating Resource Groups	133
13.1.2	Modifying Resource Groups	135
13.1.3	Deleting Resource Groups	135
13.2	Creating, Modifying, and Deleting Service Levels	136
13.2.1	Creating Service Levels	136
13.2.2	Modifying Service Levels	137
13.2.3	Deleting Service Levels	138
13.2.4	Creating Service Level Objectives	138
13.2.5	Modifying Service Level Objectives	139
13.2.6	Deleting Service Level Objectives	140
13.3	Assigning Service Levels to Resource Groups	140
13.3.1	Assigning Service Levels	140
13.3.2	Removing Service Levels	140
13.4	Monitoring Resource Capacity	141
13.4.1	Accessing the Capacity View	141
13.4.2	Understanding the Capacity View	141
13.4.3	Updating the Capacity Data	144
13.4.4	Debugging Capacity Collection Issues	144

## **14 Managing Business Services** **147**

14.1	Requesting Business Services	147
14.2	Managing Business Service Requests	149
14.2.1	Submitting a Request	149
14.2.2	Editing a Request	150
14.2.3	Withdrawing a Request	150
14.2.4	Deleting a Request	150
14.3	Importing Existing Virtual Machines	151
14.3.1	Importing a Virtual Machine into a New Business Service	151
14.3.2	Importing a Virtual Machine into a Deployed Business Service	152
14.3.3	Completing Pre-Build Configuration Tasks	153
14.3.4	Completing Post-Build Configuration Tasks	153
14.4	Managing Deployed Business Services	154
14.4.1	Starting, Suspending, or Shutting Down a Workload	154
14.4.2	Opening a Workload Console	154
14.4.3	Delegating Ownership of a Business Service	155
14.5	Changing Deployed Business Services	155
14.5.1	Changing a Business Service's Details	156
14.5.2	Reassigning a Business Service to a Different Business Group	156
14.5.3	Adding a Workload	157
14.5.4	Modifying a Workload	158
14.5.5	Removing a Workload	158
14.6	Extending Business Service Expiration Dates	159
14.7	Displaying or Hiding Business Service Costs	159
14.7.1	Configuring an Organization's Costs Setting	159
14.7.2	Configuring a Business Group's Costs Setting	160
14.7.3	Configuring a User's Costs Setting	160
14.8	Understanding Business Service Contracts	160

14.8.1	Restrictions Resulting from an Active Contract . . . . .	160
14.8.2	Contract Change Period . . . . .	161
14.8.3	Contract Renewals . . . . .	161
<b>15</b>	<b>Managing Tasks in the Business Service Workflow</b>	<b>163</b>
15.1	Displaying Administrator or Sponsor Tasks . . . . .	163
15.2	Claiming Tasks . . . . .	163
15.3	Approving and Denying Requests . . . . .	164
15.4	Completing Configuration Tasks . . . . .	164
15.4.1	Completing Pre-Build Configuration Tasks . . . . .	165
15.4.2	Completing Post-Build Configuration Tasks . . . . .	165
15.5	Completing Trigger Tasks . . . . .	166
15.5.1	Completing Reboot Trigger Tasks . . . . .	166
<b>16</b>	<b>Generating Cloud Manager Reports</b>	<b>169</b>
16.1	Report Descriptions . . . . .	169
16.2	Generating Reports . . . . .	170
<b>A</b>	<b>Setting Up Cloud Manager to Log to a Sentinel Collector</b>	<b>171</b>
<b>B</b>	<b>Integrating Cloud Manager with the Nixu IP Address Management System</b>	<b>173</b>
B.1	Configuring Nixu NameSurfer for Cloud Manager Integration . . . . .	173
B.2	Configuring Cloud Manager for Nixu NameSurfer Integration . . . . .	175
<b>C</b>	<b>Using REST APIs to Customize Cloud Manager Behavior</b>	<b>179</b>
C.1	Cloud Manager REST API Overview . . . . .	179
C.2	Using the REST APIs to Modify the Cloud Manager Workflow . . . . .	179
C.2.1	Workflow Callout Registration Concepts . . . . .	180
C.2.2	Skipping the PreConfig Approval Stage by Invoking REST Callouts . . . . .	181
C.2.3	REST URLs for Configuring and Registering Custom Callouts . . . . .	182
C.2.4	Overriding the Default Task Order . . . . .	186

# About NetIQ Corporation

NetIQ, an Attachmate business, is a global leader in systems and security management. With more than 12,000 customers in over 60 countries, NetIQ solutions maximize technology investments and enable IT process improvements to achieve measurable cost savings. The company's portfolio includes award-winning management products for IT Process Automation, Systems Management, Security Management, Configuration Audit and Control, Enterprise Administration, and Unified Communications Management. For more information, please visit [www.netiq.com](http://www.netiq.com).

## Contacting Sales Support

For questions about products, pricing, and capabilities, please contact your local partner. If you cannot contact your partner, please contact our Sales Support team.

**Worldwide:** [www.netiq.com/about\\_netiq/officelocations.asp](http://www.netiq.com/about_netiq/officelocations.asp)  
**United States and Canada:** 888-323-6768  
**Email:** [info@netiq.com](mailto:info@netiq.com)  
**Web Site:** [www.netiq.com](http://www.netiq.com)

## Contacting Technical Support

For specific product issues, please contact our Technical Support team.

**Worldwide:** [www.netiq.com/Support/contactinfo.asp](http://www.netiq.com/Support/contactinfo.asp)  
**North and South America:** 1-713-418-5555  
**Europe, Middle East, and Africa:** +353 (0) 91-782 677  
**Email:** [support@netiq.com](mailto:support@netiq.com)  
**Web Site:** [www.netiq.com/support](http://www.netiq.com/support)

## Contacting Documentation Support

Our goal is to provide documentation that meets your needs. If you have suggestions for improvements, click **Add Comment** at the bottom of any page in the HTML versions of the documentation posted at [www.netiq.com/documentation](http://www.netiq.com/documentation). You can also email [Documentation-Feedback@netiq.com](mailto:Documentation-Feedback@netiq.com). We value your input and look forward to hearing from you.

## Contacting the Online User Community

Qmunity, the NetIQ online community, is a collaborative network connecting you to your peers and NetIQ experts. By providing more immediate information, useful links to helpful resources, and access to NetIQ experts, Qmunity helps ensure you are mastering the knowledge you need to realize the full potential of IT investments upon which you rely. For more information, please visit <http://community.netiq.com>.

# About this Book and the Library

The *Procedures Guide* provides step-by-step procedures for common tasks to be performed by users of the NetIQ Cloud Manager product, regardless of their role in the organization. The tasks are organized roughly sequentially; tasks found earlier in this guide are typically executed prior to tasks later in the guide during the initial deployment and implementation phase of the product deployment project.

The guide is organized in the following general sections:

- ♦ [Part I, “Administering the Cloud Manager Orchestration Server,” on page 13](#)
- ♦ [Part II, “Administering the Cloud Manager Application Server and Console,” on page 67](#)

These sections include the detail you need to get your Cloud Manager system up and running in a test environment first, and eventually in a production environment.

## Intended Audience

This book provides information for individuals responsible for understanding administration concepts and implementing a secure, distributed administration model.

## Other Information in the Library

The library provides the following information resources:

### **Product Overview**

Provides information about the NetIQ Cloud Manager product features, functionality, and concepts.

### **Installation Guide**

Provides detailed planning and installation information.

### **Procedures Guide**

Provides step-by-step guidance for many administration tasks.

### **Reference Guide**

Provides detailed reference information about tools and interfaces used by this product.

---

# Administering the Cloud Manager Orchestration Server

## PartIntro

- ♦ [Chapter 1, “Basic Orchestration Functions,” on page 15](#)
- ♦ [Chapter 2, “Determining the Version of an Orchestration Component,” on page 33](#)
- ♦ [Chapter 3, “Changing Orchestration Server Default Parameters and Values,” on page 35](#)
- ♦ [Chapter 4, “Caching Computed Facts in a Grid with Large Numbers of Resources,” on page 37](#)
- ♦ [Chapter 5, “Managing Virtual Machine Hosts,” on page 45](#)
- ♦ [Chapter 6, “Managing Virtual Machines,” on page 51](#)
- ♦ [Chapter 7, “Managing VM Repositories,” on page 65](#)

---

# 1 Basic Orchestration Functions

After you install and configure the basic components of the NetIQ Cloud Manager Orchestration components, (that is, the Orchestration Server, the Orchestration Agent, and the Orchestration Clients, including the Orchestration Console), you will want to see them at work. The information in this section is organized sequentially (that is, in a “walkthrough” scenario) so that you can follow the process an administrator might use to begin applying Cloud Manager Orchestration capabilities in a production environment.

- ◆ [Section 1.1, “Observing Discovery Jobs,” on page 15](#)
- ◆ [Section 1.2, “Deploying a Sample Job,” on page 17](#)
- ◆ [Section 1.3, “Creating a User Account,” on page 19](#)
- ◆ [Section 1.4, “Running a Sample Job,” on page 23](#)
- ◆ [Section 1.5, “Looking at the Job After It Has Run,” on page 24](#)
- ◆ [Section 1.6, “Using the `zosadmin` Command to Gather Information,” on page 26](#)
- ◆ [Section 1.7, “Stopping and Starting Orchestration Components,” on page 27](#)
- ◆ [Section 1.8, “Configuring the Orchestration Server for LDAP or ADS Authentication,” on page 29](#)
- ◆ [Section 1.9, “Viewing Orchestration Server Data in the Sentinel Event Source Server,” on page 29](#)
- ◆ [Section 1.10, “Orchestration Server Log Levels Mapped to Sentinel Log Levels,” on page 31](#)

The first three subsections listed above are basic tasks you need to perform to make the Orchestration system perform at a basic level. The other sections include information to help you understand how Cloud Manager Orchestration can work in your production environment.

## 1.1 Observing Discovery Jobs

When you created a resource account for the first time, you might have noticed the status window of the Resource object change colors (see [Step 2](#) in “[Automatically Registering a Resource](#)” in the *NetIQ Cloud Manager Installation Guide*) from blue to green. You might also notice new jobs displayed as

objects in the Explorer panel. What you are observing are the “discovery” jobs that are shipped with the Orchestration Server (different discovery jobs are shipped with the Orchestration Server, depending on which management pack you license).

To understand the reason why these jobs run:

- 1 In the Orchestration Console, click *Scheduler* to open the Job Schedule view in the workspace.

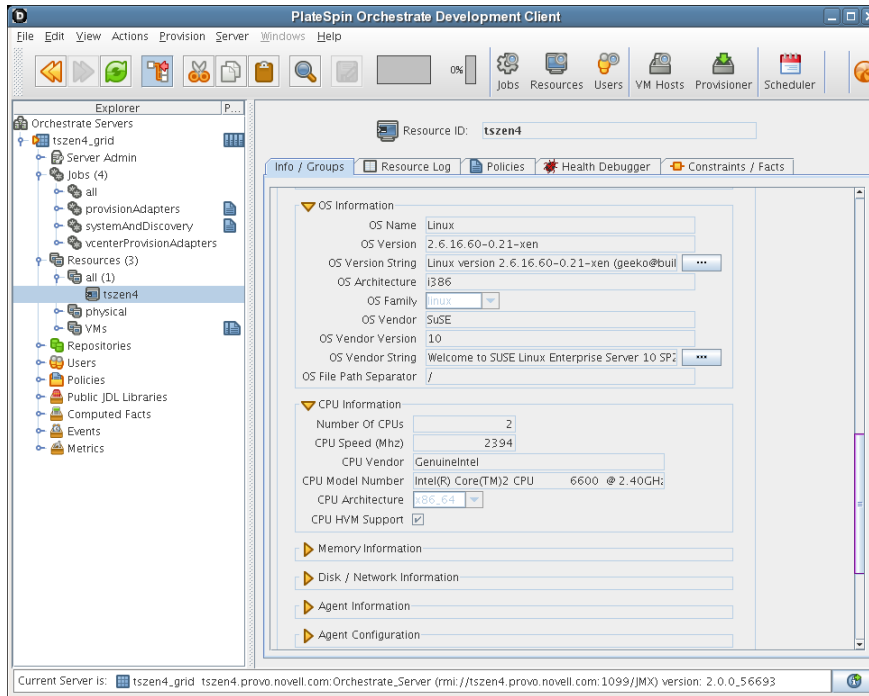

In this walkthrough of basic Orchestration Server functionality, you can see that several jobs are configured to run. If you select one of the jobs, such as `cpuInfo`, you will see that it was configured with a trigger called `RESOURCE_ONLINE`. All of the discovery jobs, like `cpuInfo`, are configured to run when the resource is online, that is, when the resource agent has logged into the Orchestration Server.

The discovery jobs, including provisioning adapter jobs, run basic operations at resource start as a convenience, to gather data that you or a job developer might need later when creating jobs, or that the Orchestration system might need as it allocates resources to run jobs. For example, the `cpuInfo` job and the `osInfo` job do some basic probing of the computing node (the machine where the agent is installed and has a resource account) for later reference.

To verify this, you can view the resource account that you created during the basic installation (as documented in “[Creating a Resource Account](#)” in the *NetIQ Cloud Manager Installation Guide*) by selecting its object in the Explorer tree. By default, the *Info/Groups* page for the resource opens in the Orchestration Console admin view.

Figure 1-1 Resource Information Page After Discovery Jobs Run

If you scroll down on the *Info/Groups* page, you see that the discovery jobs have gathered basic data about the processor and operating system of this computing node. If the jobs had not run at resource start, this information about the resource would not be ready for use.

Now that you have seen a how jobs are run by the Orchestration system on resource start, you can walk through the process of deploying and running a sample job on your own by proceeding with [Section 1.2, “Deploying a Sample Job,”](#) on page 17.

## 1.2 Deploying a Sample Job

One of the main functions of the Orchestration Server is to run application requests, called jobs, on grid resources. Because the Orchestration Server is capable of handling multiple application requests, it uses a policy-based broker and scheduler to decide when and how a job should run on the resources. These decisions are based on many controlled factors, including the number of resource nodes, their cost, and a variety of other factors as requested by the application, but managed under policy constraints set up by the administrator or the job developer.

Developing a job involves the creation of an application executable and a job file.

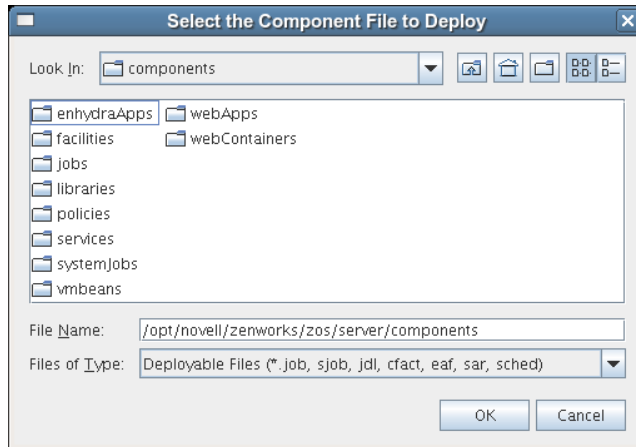

Before a job can run, the Orchestration Server administrator must deploy it, which involves moving it from a development state to a state where it is ready and available for users. Only the administrator has the necessary rights to deploy a job.

There are three methods you can use to deploy a job:

- ◆ Deploy from the Orchestration Console by right-clicking the *Jobs* container in the Explorer panel.
- ◆ Deploy from the Orchestration Console by selecting the *Actions* menu in the Orchestration Console.
- ◆ Deploy from the `zosadmin` command line (`zosadmin deploy path_to_job`).

For this walkthrough, we will deploy a simple job developed for Orchestration Server customers to demonstrate how jobs are deployed and run. Although the walkthrough shows only the first method for deploying, the other methods are relatively simple, so no further explanation is provided.

- 1 In the Explorer panel of the Orchestration Console, right-click the *Jobs* object, then click *Deploy Job* to open the Select the Component File to Deploy dialog box.

- 2 Open the *Look In* drop-down list, then navigate to the location of the job you want to deploy. Although a job developer can store Orchestration Server jobs at any location on the network, the sample jobs shipped with the Orchestration Server are limited to the directories where the product is installed. For this walkthrough, navigate to the `/opt/novell/zenworks/zos/server/examples` directory on the Orchestration Server. If the Orchestration Console is installed on a Windows machine, the default location is `c:\Program Files\Novell\zos\clients\examples`.
- 3 Select `whoami.job`, then click *OK* to deploy the job to the *Jobs* container. The *whoami* job appears in the *all* container and in the *examples* container in the tree.

When deployed, the job is sent over the wire to the Orchestration Server with which it is associated. It is persisted there until undeployed.

When the job is available, you need to create a user who can run that job. For more information, see [Section 1.3, “Creating a User Account,” on page 19](#)

## 1.3 Creating a User Account

Although the Orchestration Server has some pre-assembled jobs, such as the `cpuInfo` discovery job that you learned about earlier, most jobs must be developed by a job developer, then be run and managed by a user (also called a job manager). Without an authorized individual who can log in to the Orchestration Server system to manage the use of a job, the product does not realize its potential.

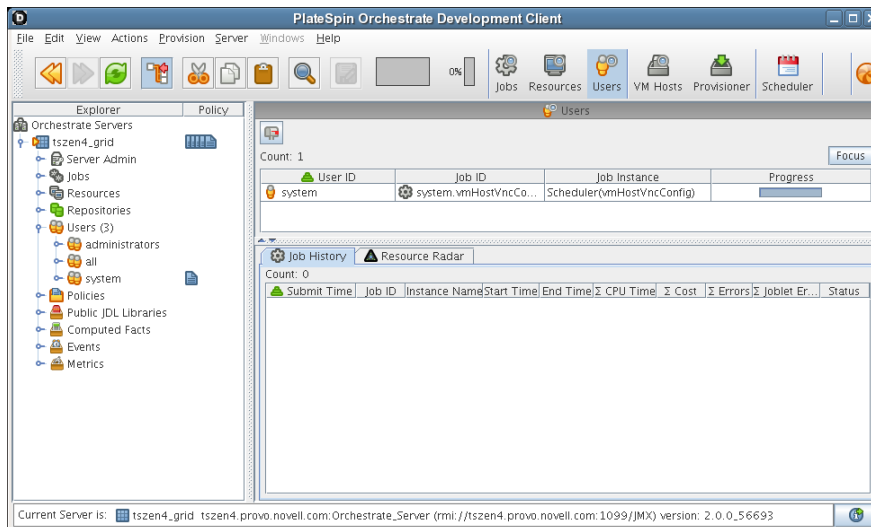

This section of the walkthrough introduces the basics of creating a user account:

- ◆ [Section 1.3.1, “Opening the Users Monitor,” on page 19](#)
- ◆ [Section 1.3.2, “Automatically Registering a User,” on page 20](#)
- ◆ [Section 1.3.3, “Manually Registering a User,” on page 21](#)
- ◆ [Section 1.3.4, “Logging In a User for Manual Registration,” on page 22](#)
- ◆ [Section 1.3.5, “Directory Service Authentication \(Optional\),” on page 23](#)

### 1.3.1 Opening the Users Monitor

Now that the Orchestration Server has run discovery jobs and you have deployed a sample job, you can begin to create user accounts. To do so, open the Orchestration Console and click *Users* in the toolbar to open the Users Monitor in the Workspace panel of the Orchestration Console.

**Figure 1-2** *Users Monitor of the Orchestration Server Console*

In this monitor, you can see the users that are connected to the server and what they are doing in the grid.

If a user logs in but has not been registered (that is, no account is created for that user), the authentication to the server is retried every 90 seconds. If this is the case, the User Registration icon has a “flag up”  status, meaning that a user is waiting to register. If the icon has a “flag down”  status, either no user accounts have been created or all active users are logged in, so none are waiting to register.

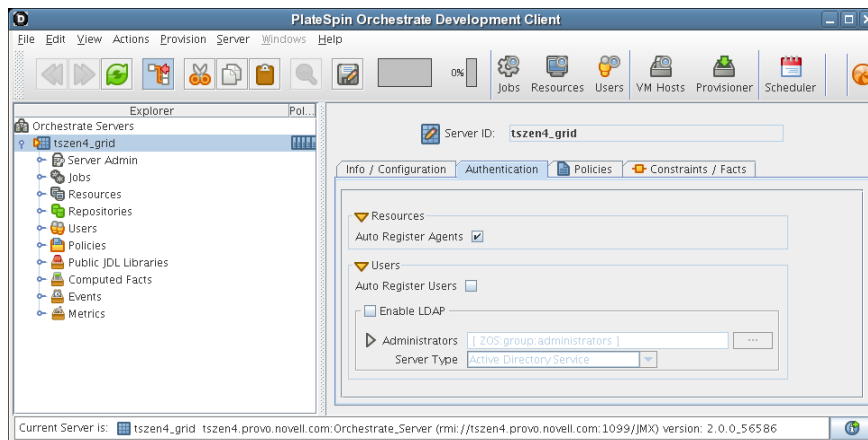

You can use the Orchestration Console to register a user automatically (see [Section 1.3.2, “Automatically Registering a User,”](#) on page 20) or to register a user manually (see [Section 1.3.3, “Manually Registering a User,”](#) on page 21). You can also select which users can log in to create accounts (see [“Selecting a Resource for Manual Registration”](#) in the *NetIQ Cloud Manager Installation Guide*).

The Users Monitor has many features to help you manage users when they are registered, including the jobs and joblets assigned to individual users. For more detailed information about the Users Monitor, see [Section 1.3.1, “Opening the Users Monitor,”](#) on page 19.

## 1.3.2 Automatically Registering a User

If your network environment does not require a high level of security (such as in a development and testing environment) and you want a quick way to create a user account without a password, you can do so at the Orchestration Console.

- 1 In the Explorer tree of the Orchestration Console, select the grid object representing the Orchestration Server to open the *Info/Configuration* page of the grid object, then select the *Authentication* tab to open the Authentication page.
- 2 In the *Users* section of the page, select the *Auto Register Users* check box, then click the Save  icon.

- 3 Use the `zos` command line interface to log in to the server.
  - 3a From a system terminal, enter the following command:
 

```
zos login -u user_ID
```

If you are attempting to log in to a machine other than the local host, you can alter the command to the following:

```
zos login Orchestration_Server_name -u user_ID
```
  - 3b When prompted for the user password, press Enter.
  - 3c (Conditional) If you are prompted for a decision regarding whether you want to accept the server certificate, enter yes.

---

**NOTE:** You can assign a password for the user at a later time in the *Info/Groups* page of the User Object.

---

When a user logs out, the User object icon  is dimmed in the Explorer tree or in the admin view of each User group to which it belongs.

### 1.3.3 Manually Registering a User

If you want a higher level of security for authorized users, you can manually create a user account in the Orchestration Console before the user logs in. When a user is created in the Orchestration Server Console, that user is ready to run jobs.

To create a new user in the Orchestration Console Explorer tree:

- 1 In the Explorer tree of the Orchestration Console, right-click *Users* > click *New User* to display the Create a New User dialog box.

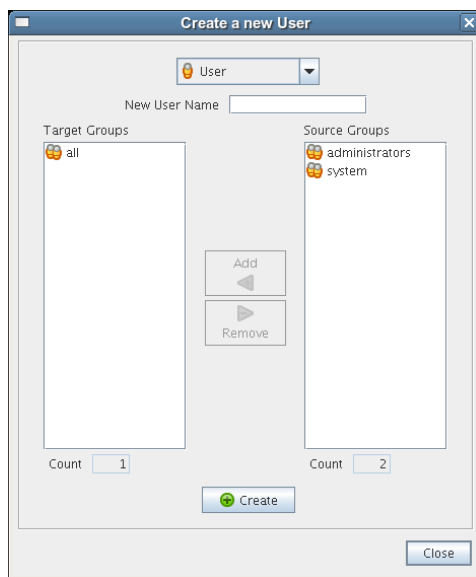

- 2 Specify the name of the new user you want to create in the *New User Name* field, then click *OK*.

The user account is created, but is not currently running jobs, as indicated by its object icon  in the Explorer tree or in the admin view of each User group to which it belongs.

To create a new user through the *Actions* menu:

- 1 In the Orchestration Console, click *Actions* > *Create User* to display an expanded version of the Create a New User dialog box.

This dialog box includes a method for designating the user as a member of the *administrators* user group. In this walkthrough, we will create the user as a member of the *all* group, which does not place the user in the *administrators* group.

- 2 Specify the new username in the *New User Name* field, click *Create*, then click *Close*.

### 3 Define the user password.

- 3a In the Explorer tree of the Orchestration Console, select the new User in the Users object *all* group to open its Info/Groups page.
- 3b In the Info/Groups page, select the collapse/expand icon in the Personal Information section to open the fields of that section.

- 3c In the *Password* field, change the default password, then click the Save  icon to display the Password Confirmation dialog box.

- 3d In the *Confirm New Password* field, enter the password you defined previously, click *OK*, then click the Save  icon to save the password.

When a user logs out, the User object icon  is dimmed in the Explorer tree or in the admin view of each User group to which it belongs.

## 1.3.4 Logging In a User for Manual Registration

If you do not select the *Auto Register Users* check box on the grid object's *Info/Configuration* page, you have the option of explicitly accepting or denying the login attempts of a user, thus preventing that user from creating an account.

- 1 Make sure that the *Auto Register Users* check box on the grid object's Authentication page is not selected (see [Step 2](#) in "[Automatically Registering a Resource](#)" in the [NetIQ Cloud Manager Installation Guide](#)) and that you have created a new user.
- 2 Use the `zos` command line interface to log in to the server.
  - 2a From a system terminal or from an Orchestration Server login in Windows, enter the following command:

```
zos login --user=user
```

If you are attempting to log in to a machine other than the local host, you can alter the command to the following:

```
zos login Orchestration_Server_name --user=user
```

- 2b Enter the password for the user credentials. For this walkthrough, you can simply press *Enter* to enter an empty password.

- 2c When prompted for a decision regarding whether you want to accept the server certificate, enter yes.

An error message is generated:

```
ERROR: login failed: user name or password 'incorrect'
```

- 3 In the Users Monitor, click the User Registration icon  to open the User Registration Monitor dialog box.

This dialog box lets you preview the users who are trying to log in to the server. The top row of radio buttons is a mass selector for all listed users, allowing you the choice to accept, deny, or ignore automatic registration for all listed agents.

If you want to choose the users that can be allowed to auto register, you can identify the user by name and select how you want to handle that agent's request for registration the next time it tries to log in.

- 4 For this example, select the *Accept* radio button adjacent to the user you want to register, then click *OK*.

The user account is created, but is not currently running jobs, as indicated by its object icon  in the Explorer panel, or in the Information view of each User group to which it belongs.

### 1.3.5 Directory Service Authentication (Optional)

There are some configuration steps you need to follow in the Orchestration Console if you want to immediately configure the authentication of both users and resources to the Orchestration Server using a directory service like ADS or LDAP. For more information, see "[Orchestration Server Authentication Page](#)" in the *NetIQ Cloud Manager Component Reference*.

## 1.4 Running a Sample Job

Deployed jobs can be run from the Scheduler utility inside of the Orchestration Server Console or from the `zos` command line. For the purpose of this walkthrough, we will run a sample job from the command line after logging in as a user.

- 1 From a system terminal, enter the following command:

```
zos run whoami
```

If you have more than one resource connected, you might want to run the job on one resource in particular. If you want to run the job this way, you can do so by adding an argument to the command line:

```
zos run whoami resource=name_of_resource
```

Now that you have run the sample job, you need to use some of the Orchestration Server tools to verify that it has run. For more information, see [Section 1.5, “Looking at the Job After It Has Run,” on page 24](#)

## 1.5 Looking at the Job After It Has Run

After you have run the job, there are several ways to verify that it has run. This section explains those methods.

- ♦ [Section 1.5.1, “Verification at the Command Line,” on page 24](#)
- ♦ [Section 1.5.2, “Verification at the Jobs Monitor,” on page 25](#)

### 1.5.1 Verification at the Command Line

The following sections explain some of the `zos` commands that you can use to verify that a job has run and monitor some of the results of the job:

- ♦ [“zos jobs” on page 24](#)
- ♦ [“zos jobinfo job\\_name” on page 24](#)
- ♦ [“zos status --detail” on page 25](#)
- ♦ [“zos log job\\_id --verbose” on page 25](#)

#### **zos jobs**

You can use the `zos jobs` command to list all of the jobs that have run while you have been logged in as a user. Running this command yields an output like this:

Job	JobID	User	Started	Elapsed	State
whoami	userA.whoami.60	userA	12/24/2008 02:35:38	0:00:00	Completed

#### **zos jobinfo job\_name**

You can use the `zos jobinfo -e job_name` command to display information for a named job the last time it was run. Running this command yields an output like this:

Jobname/Parameters	Attributes
whoami	Desc: This is a demo example of enhanced exec
numJoblets	Desc: The number of joblets to schedule Type: Integer Default: 1
resource	Desc: The resource id to run on Type: String Default: .*

## zos status --detail

You can use the `zos status --detail` command to display the status of the most recently run job. Running this command yields an output like this:

```
Job Status for userA.whoami.60
-----
      State: Completed
Resource Count: 0                (0 this job)
Percent Complete: 100%
      Queue Pos: n/a
Child Job Count: 0                (0 this job)
      Joblet Counts: 1 (0)        (1 (0/0/1/0/0) this job)

Instance Name: whoami
      Job Type: whoami
      Memo:
      Priority: medium
      Arguments: resource=tszen4_agent

Submit Time: 12/24/2008 02:35:38
Delayed Start: n/a
      Start Time: 12/24/2008 02:35:38
      End Time: 12/24/2008 02:35:39
Elapsed Time: 0:00:00
      Queue Time: 0:00:00
      Pause Time: 0:00:00

Total CPU Time: 0:00:00          (0:00:00 this job)
Total GCycles: 0:00:00          (0:00:00 this job)
Total Cost: $0.0002              ($0.0002 this job)
      Burn Rate: $0.8982/hr      ($0.8982/hr this job)

Termination Type: n/a
      Job Error: <none>

Joblet Error Count: 0            (0 this job)
Node Error Count: 0              (0 this job)
      Excluded Nodes: 0          (0 this job)

Bad Provision Count: 0           (0 this job)
Excluded Provisions: 0           (0 this job)
```

## zos log job\_id --verbose

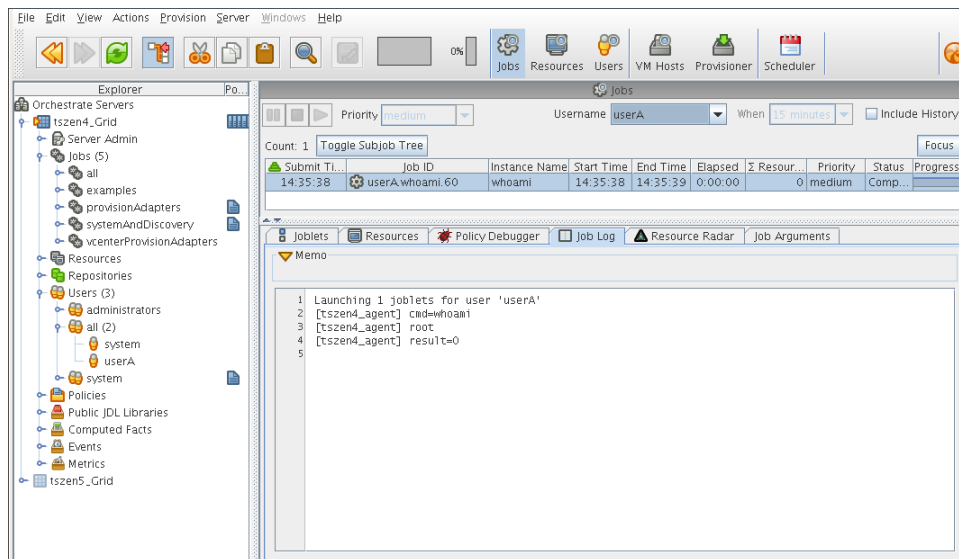

If you know the Job ID for a particular job that has run, you can use the `zos log job_id --verbose` command to display its detailed job log. Running this command yields an output like this:

```
Agent connected with ID: user_userA_64 (comms ok), Session ID: 52
Launching 1 joblets for user 'userA'
[tszen4_agent] cmd=whoami
[tszen4_agent] root
[tszen4_agent] result=0
Agent ID: null logged out.
```

## 1.5.2 Verification at the Jobs Monitor

If you want to use the Orchestration Server Console to verify that the job has run, you can open the *Jobs* Monitor to look at the Job Log and see the result of the job being run.

- 1 In the Orchestration Console, click *Jobs* in the main toolbar to open the Jobs Monitor view.
- 2 In the Jobs Monitor view, click the *Job Log* tab to open the Jobs page in the workspace panel.

- 3 In the *Username* drop-down list box, select the user who ran the whoami job.

Although there is much more you can learn about a job in the Jobs Monitor view, you can see by displaying a recent job that the Orchestration Console picks up the job activity and makes it available at the console.

## 1.6 Using the `zosadmin` Command to Gather Information

You can use the `zosadmin` command line to learn what users or nodes are defined in your Orchestration Server. Follow these steps to learn about the users and nodes in your system.

- 1 Log in to the Orchestration Server by using the following command:

```
zosadmin login
```

You can also use the server's host name as an argument when you log in.

If you use the `grid=` parameter, you can specify the grid name you want to log into. If other Orchestration Servers are installed on the local host, the system cannot log in to any of them unless you use this parameter. For more information, see [“The `zosadmin` Command Line Tool”](#) in the *NetIQ Cloud Manager Component Reference*.

- 2 Enter the administrator's user name and password.

If the login was successful, the command line tool returns a message like this:

```
Logged into tszen4_grid on server 'tszen4.provo.company.com'
```

- 3 Enter the following command to list the active users on your Orchestration Server:

```
zosadmin users
```

You can add the `--help` option at the command line to determine the run options for this command.

- 4 Enter the following command to list the active nodes on your Orchestration Server:

```
zosadmin nodes
```

You can add the `--help` option at the command line to determine the run options for this command.

With the completion of this part of the walkthrough, you have a good understanding of the parts of Orchestration Server and how they work.

## 1.7 Stopping and Starting Orchestration Components

Use the following methods for stopping and starting Cloud Manager Orchestration components.

- ♦ [Section 1.7.1, “Stopping and Starting the Orchestration Server,” on page 27](#)
- ♦ [Section 1.7.2, “Stopping and Starting the Orchestration Agent,” on page 27](#)
- ♦ [Section 1.7.3, “Starting and Stopping the Orchestration Server Console,” on page 28](#)

### 1.7.1 Stopping and Starting the Orchestration Server

You can use the following methods for stopping and starting the Orchestration Server.

- ♦ [“Stopping the Server” on page 27](#)
- ♦ [“Starting the Server” on page 27](#)

#### Stopping the Server

You need to shut down the Orchestration Server before you power off the computer where it is running. This routine prevents possible data corruption. You must be logged in to an Orchestration Server in order to stop it. There are two methods to stop the current server:

- ♦ If you are in the Orchestration Console, click *Server* > click *Shutdown ZOS*.
- ♦ If you are at the command line, enter the following command:

```
/etc/init.d/novell-zosserver stop
```

#### Starting the Server

The Cloud Manager Orchestration components installation and configuration automatically starts the Orchestration Server. The Orchestration Server must be stopped before you can start it. You must be logged in to an Orchestration Server to start it. There are two methods you can use to start the current server:

- ♦ If you are at the command line, enter the following command:

```
/etc/init.d/novell-zosserver start
```

- ♦ To restart the Orchestration Server from the command line, enter the following command:

```
/etc/init.d/novell-zosserver restart
```

This command stops the server before restarting it.

### 1.7.2 Stopping and Starting the Orchestration Agent

You can use the following methods for stopping and starting the Cloud Manager Orchestration Agent.

- ♦ [“Stopping the Agent” on page 28](#)
- ♦ [“Starting the Agent” on page 28](#)

## Stopping the Agent

There are several methods you can use to stop the agent:

- ♦ If you are in the Orchestration Server Console, select the *Resources* Monitor, select a resource, then click the red icon in the work area to shut down that agent.
- ♦ If you are running the agent on a Windows machine, click *Start > Programs > Novell > ZOS > Agent > Shutdown ZOS Agent*.
- ♦ If you are at the Linux bash prompt, enter the following command:  

```
/etc/init.d/novell-zosagent stop
```

## Starting the Agent

- ♦ To start the Orchestration Agent from a Windows machine, double-click the *ZOS Agent* shortcut on your desktop or click *Start > Programs > Novell > ZOS > Agent > Start ZOS Agent*.
- ♦ If you are at the Linux bash prompt, enter the following command:  

```
/etc/init.d/novell-zosagent start
```

### 1.7.3 Starting and Stopping the Orchestration Server Console

You can use the following methods for stopping and starting the Cloud Manager Orchestration Console.

- ♦ [“Stopping the Orchestration Console” on page 28](#)
- ♦ [“Starting the Orchestration Console” on page 28](#)

## Stopping the Orchestration Console

To stop the Orchestration Server Console at the console itself, click *File > Exit*, or click the shutdown icon on the console window.

## Starting the Orchestration Console

To start the Orchestration Console from a Linux machine: enter `./zoc`.

- ♦ On a SLES 11 machine, if you have installed the Orchestration Server along with the Orchestration Console, change to `/opt/novell/zenworks/zos/server/bin` and enter the following command  

```
./zoc
```
- ♦ On a SLES 11 machine, if you have installed the Orchestration Console alone, change to `/opt/novell/zenworks/zos/clients/bin` and enter the following command  

```
./zoc
```

To start the Orchestration Console on a Windows machine, double-click the *ZOS Clients* shortcut on your desktop or click *Start > Programs > Novell > ZOS > Clients > Orchestration Console*.

## 1.8 Configuring the Orchestration Server for LDAP or ADS Authentication

There are some configuration steps you need to follow in the Orchestration Console if you want to immediately configure the authentication of both users and resources to the Orchestration Server through a directory service like ADS or LDAP.

The Cloud Manager Orchestration Server uses only one attribute of a given LDAP user: its group membership. For example, if the following settings were already configured in the Orchestration Server,

```
BaseDN 'dc=domain,dc=novell,dc=com'  
UserAttribute 'uid'  
UserPrefix 'ou=Users'
```

you could further configure the Orchestration Server to identify users belonging to an LDAP group using the setting `LDAP:groupnocase:administrators`.

You would do this by specifying a filter in the Orchestration Server using these settings:

```
GroupFilter 'memberUid=${USER_NAME}'  
GroupPrefix 'ou=Groups'  
GroupAttribute 'cn'
```

Applying these settings would let authenticated users belonging to the “administrators” LDAP group be added to the “administrators” user group in the Orchestration Server (and so allow them to log in to the Orchestration Console, for example).

For information on configuring these settings in the Orchestration Server, see [“Orchestration Server Authentication Page”](#) in the *NetIQ Cloud Manager Component Reference*.

---

**NOTE:** Depending upon your selection at the *Server Type* drop down list on the *Enable LDAP* subpanel of the *Authentication* page of the Orchestration Console the configuration fields change to reflect the relevant settings. (One server type is *Active Directory Service*, the other is *Generic LDAP Directory Service*.)

---

## 1.9 Viewing Orchestration Server Data in the Sentinel Event Source Server

The Sentinel Event Source Server displays data from the Orchestration Server.

For each logging event, the Orchestration Server passes a free form text log message and log event metadata to the Sentinel Event Source Server. The following table shows how the data are mapped:

**Table 1-1** Orchestration Server Logged Data Mapped to Sentinel Event Source Server Fields

Sentinel Event Field Name	Orchestration Server Data Represented
<i>Message</i>	A free-form text log message.
<i>TargetServiceName</i>	The Orchestration Server grid name.
<i>ReporterIP</i>	The IP address of the Orchestration Server.
<i>TargetServiceComp</i>	The originating facility of the Orchestration Server event.

Sentinel Event Field Name	Orchestration Server Data Represented
<i>EventName</i>	A name formatted as <code>gridname: taxonomy_key</code> . For more information, see “ <a href="#">Event Classification and Taxonomy Keys</a> ” in the <i>NetIQ Cloud Manager Component Reference</i> .
<i>ProductName</i>	The product is always <code>Cloud Manager Orchestration</code> for convenient event filtering.
<i>InitUserName</i> <i>InitUserID</i>	The name of the Orchestration Server user. Used for user-oriented events.

For some events, the Orchestration Server Sentinel Collector passes some structured data related to the log event. When available, this data appears in the *ExtendedInformation* Sentinel Event field, which is a list of key/value pairs delimited by semicolons. Some keys are always present in *ExtendedInformation*, but others appear only when relevant. The following table lists these keys:

**Table 1-2** Orchestration Server Key/Value Pairs Displayed in the Sentinel Event Source Server

Key	Displayed	Value
<code>loglevel</code>	always	The original Orchestration Server log level, for example, NOTICE, or INFO.
<code>eventclass</code>	always	A symbolic identifier for this class of event, e.g. <code>admin_login</code> , <code>policy_association</code> . This also serves as the taxonomy key. The value is unclassified if the event does not contain any additional structured data.
<code>group</code>	when relevant	The Grid object group related to this log event.
<code>job</code>	when relevant	The job related to this log event.
<code>jobinstance</code>	when relevant	The job instance ID related to this log event.
<code>member</code>	when relevant	The Grid object group member related to this log event.
<code>policy</code>	when relevant	The policy related to this log event.
<code>repository</code>	when relevant	The repository related to this log event.
<code>resource</code>	when relevant	The resource related to this log event.
<code>schedule</code>	when relevant	The schedule related to this log event.
<code>trigger</code>	when relevant	The trigger related to this log event.
<code>type</code>	when relevant	The Grid object type related to this log event.
<code>user</code>	when relevant	The name of the user related to this log event. This key also appears in the <i>InitUserName</i> and <i>InitUserID</i> fields.
<code>vbridge</code>	when relevant	The Vbridge related to this log event.
<code>vdisk</code>	when relevant	The Vdisk related to this log event.
<code>vm</code>	when relevant	The VM related to this log event.
<code>vmhost</code>	when relevant	The VM host server related to this log event.
<code>vnic</code>	when relevant	The VNIC related to this log event.

Key	Displayed	Value
target	when relevant	The name of the Grid object related to this log event.
action	when relevant	The action related to this log event.

## 1.10 Orchestration Server Log Levels Mapped to Sentinel Log Levels

The information in the following table shows the correlation between the Orchestration Server logging levels and those you are likely to see in Novell Sentinel.

**Table 1-3** Orchestration Server Log Levels Mapped to Sentinel Log Levels

Orchestration Server Log Level (alpha)	Sentinel Collector Log Level (numeric)	Comments	Usage Examples
EMERGENCY	5	Urgent conditions that require immediate attention. Indicates that the system is no longer functioning.	
ALERT	5	Conditions that should be corrected immediately.	
CRITICAL	5	Critical conditions.	
ERROR	4	Errors that have been correctly handled.	Unsuccessful job runs and provisioner/VM actions that have been correctly handled but might require manual attention.
WARNING	3	Warning messages.	Unexpected but recoverable events indicating degraded operational status, fsuch as grid objects becoming unhealthy.
NOTICE	2	Conditions that are not error conditions, but should possibly be handled specially.	Events expected occasionally as part of usual business operations, such as password changes, failed authentications and authorizations, grid objects returning to good health, server shutdown.
STATUS	1	Conditions that report on changes in operational conditions.	Events expected frequently as part of usual business operations, such as successful authentications (logins and logouts), deletion of grid objects, changes in group membership, deployment of jobs/policies/schedules/triggers, policy association.
INFO	1	Informational messages.	Non-security-sensitive events expected very frequently as part of usual business operations, such as successful job runs and provisioner/VM actions, resources going online/offline, session expiration/timeout.

---

# 2 Determining the Version of an Orchestration Component

Cloud Manager Orchestration is made up of many components, which you choose whether to install when you first install the product. If you are new to Cloud Manager Orchestration, if you need to determine component compatibility, or if you need to confer with NetIQ Support, it is useful to know how to obtain the version numbers of the different components.

One way to determine which version of the Cloud Manager RPM packages you have installed is to use the following command on the machine where a Cloud Manager Orchestration component is installed:

```
rpm -qa | grep novell
```

The table below provides additional methods you can use to determine the version number for Orchestration components.

**Table 2-1** *Determining the Version Number for Cloud Manager Orchestration Components*

Component	How to Determine Version Number
Orchestration Server	<p>At the Orchestration Console Explorer view, select the grid object, then open the Info/Configuration page of the workspace panel. The version number is listed in the <i>Server Version</i> field.</p> <p>Advanced Orchestration Server users can also find the version value in the <code>matrix.version</code> fact.</p>
Orchestration Agent	<p>After the agent is registered at the Orchestration Console Explorer view, select its resource object listed under <i>Resources</i>, then open the Info/Groups page of the workspace panel. On the Info/Groups page, select <i>Agent Information</i>. The version number is listed in the <i>Agent Version</i> field.</p> <p>Advanced Orchestration Server users can also find the version value in the <code>resources.agent.version</code> fact.</p>
Orchestration Console	<p>At the console, click <i>Help &gt; About Cloud Manager Orchestration Console</i>.</p> <p>The console version number and license expiration date is listed on the About Cloud Manager Orchestration Console dialog box.</p>
Command Line Tools (zos, zosadmin)	No method is currently available.

---

<b>Component</b>	<b>How to Determine Version Number</b>
Cloud Manager Monitoring Server	<p>On the command line of the machine where the Monitoring Server is running, enter (at <code>/opt/novell/zenworks/monitor/sbin</code>) the following command:</p> <pre>gmetad -V</pre> <pre>gmetad -- version</pre>
Cloud Manager Monitoring Agent	<p>On the command line of the machine where the agent is running, enter (at <code>/opt/novell/zenworks/monitor/sbin</code>) the following command:</p> <pre>gmond -V</pre> <pre>gmond -- version</pre>

---

# 3 Changing Orchestration Server Default Parameters and Values

The following table provides the current default values for some key performance parameters of the Cloud Manager Orchestration Server. Although the server is fine-tuned by default for optimal performance at normal loads, if you want to perform hundreds of provisioning actions simultaneously you can change some of the default settings for increased server performance in such a scenario.

**Table 3-1** Default Parameters of the Cloud Manager Orchestration Server

Parameter Name	Shipping Default Value	Changing or Displaying the Parameter Configuration
File Descriptors Limit	2048	(Optional) You can change the value as shown below:  <code>/etc/init.d/novell-zos-server: ulimit -n &lt;new_limit&gt;</code>
Java Heap Space	2048 MB	Create a file of the following name: <code>/opt/novell/zenworks/zos/server/conf/cmosadmin.properties</code>  Add the following line to the newly created file:  <code>default.jvmargs=-Xmx2560m</code>
PermGen Space	512 MB	Create a file of the following name: <code>/opt/novell/zenworks/zos/server/conf/cmosadmin.properties</code>  Add the following line to the newly created file:  <code>default.jvmargs=- XX:MaxPermSize=1536m</code>
Audit Queue Size Max	200	Increase the value of this parameter by using the following command:  <code>zosadmin set -- mbean="local:facility=audit" -- attr=QueueSizeMax -- type=Integer --value=1000</code>

Parameter Name	Shipping Default Value	Changing or Displaying the Parameter Configuration
MaxRunJobWaitTimeout	120000	You can change the value of this parameter as shown below:  <pre>zosadmin set -- mbean="local:facility=broker" - -attr=MaxRunJobWaitTimeout -- type=Integer -- value=&lt;time_in_milliseconds&gt;</pre>
MatchingResourcesCheckinterval	30000	Increase the value of this parameter by using the following command:  <pre>zosadmin set -- mbean="local:facility=broker" - - attr=MatchingResourcesCheckInte rval --type=Integer -- value=600000</pre>
Kernel ARP Threshold Values	<ul style="list-style-type: none"> <li>◆ thresh1 = 128</li> <li>◆ thresh2 = 512</li> <li>◆ thresh3 = 1024</li> </ul>	Set these values higher than the default. For example:  <pre>cat /proc/sys/net/ipv4/neigh/ default/gc_thresh1 = 256  cat /proc/sys/net/ipv4/neigh/ default/gc_thresh2 = 1024  cat /proc/sys/net/ipv4/neigh/ default/gc_thresh3 = 2048</pre>
Job Limits: <ul style="list-style-type: none"> <li>◆ Soft Top Level Job Limit</li> <li>◆ Max Queued Jobs</li> <li>◆ Absolut Max Active Jobs</li> </ul>	<pre>matrix.maxtopjobs = 200  matrix.maxqueued = 300  matrix.maxactive = 400</pre>	Change the Grid Object default values in the Orchestration Console as follows:  <pre>matrix.maxtopjobs = 600  matrix.maxqueued = 700  matrix.maxactive = 1000</pre>

---

# 4 Caching Computed Facts in a Grid with Large Numbers of Resources

If your Orchestration grid includes a large number of resources with associated Computed Facts, it is likely that these computed facts are evaluated with each Ready for Work message received by the broker from the Orchestration Agent. These evaluations can cause an excessive load on the Orchestration Server, causing a decrease in performance. You might see warnings in the server log similar to the following:

```
07.07 18:27:54: Broker,WARNING: ----- Long scheduler cycle time detected -----
07.07 18:27:54: Broker,WARNING: Total:3204ms, JDL thrds:8, TooLong:false
07.07 18:27:54: Broker,WARNING: Allocate:0ms [P1:0,P2:0,P3:0], Big:488
07.07 18:27:54: Broker,WARNING: Provision:4ms [P1:0,P2:0,P3:0], Big:253
07.07 18:27:54: Broker,WARNING: Msgs:3204ms [50 msg, max: 3056ms (3:RFW)]
07.07 18:27:54: Broker,WARNING: Workflow:[Timeout:0ms, Stop:0ms]
07.07 18:27:54: Broker,WARNING: Line:0ms, Preemption:0ms, (Big: 3), Mem:0ms
07.07 18:27:54: Broker,WARNING: Jobs:15/0/16, Contracts:10, AvailNodes:628
07.07 18:27:54: Broker,WARNING: PermGen: Usage [214Mb] Max [2048Mb] Peak
[543Mb]
07.07 18:27:54: Broker,WARNING: Memory: free [1555Mb] max [3640Mb]
07.07 18:27:54: Broker,WARNING: Msgs:483/50000 (recv:128692,sent:14202),
More:true
07.07 18:27:54: Broker,WARNING: -----
```

To work around this issue, we recommend that you cache the Computed Facts.

- 1 In the Explorer tree of the Orchestration Console, expand the Computed Facts object, then select *vmbuilderPXEBot*.  
The *vmbuilderPXEBot* fact does not change, so setting the cache here is safe from any automatic modifications.
- 2 In the Computed Facts admin view, select the *Attributes* tab to open the Attributes page.
- 3 In the Attributes page, select the *Cache Result for* check box, then in the newly active field, enter 10 minutes (remember to change the drop-down list to indicate *Minutes*).  
This value must be greater than the default of 30 seconds.
- 4 Click the *Save* icon to save the new configuration.

---

**NOTE:** If necessary, you can also cache other computed facts to improve server performance.

---

## 4.1 Walkthrough: Scheduling a System Job

This section demonstrates how you can use the Orchestration Console to deploy and schedule an existing system job named `auditCleaner.job`. This example job is included in the `examples` directory of your Orchestration Server installation.

This section includes the following information:

- ♦ [Section 4.1.1, “Deploying a Sample System Job,” on page 38](#)
- ♦ [Section 4.1.2, “Creating a New Schedule for the Job,” on page 39](#)
- ♦ [Section 4.1.3, “Defining the New Schedule,” on page 40](#)
- ♦ [Section 4.1.4, “Activating the New Schedule,” on page 44](#)
- ♦ [Section 4.1.5, “Running the New Schedule Immediately,” on page 44](#)

### 4.1.1 Deploying a Sample System Job

Before a job can run, the Orchestration Server administrator must deploy it, which involves moving it from a developed package state to a state where it is ready and available for users. Only the administrator has the necessary rights to deploy a job.

There are four methods you can use to deploy a job:

- ♦ Deploy it from the Orchestration Console by right-clicking the *Jobs* container in the Explorer panel.
- ♦ Deploy it from the Orchestration Console by selecting the *Actions* menu in the console.
- ♦ Deploy it from the `zosadmin` command line (`zosadmin deploy path_to_job`).
- ♦ Copy the deployable component to the “hot” deployment directory under the Orchestration Server instance directory. Typically, this directory is located at `/var/opt/novell/zenworks/zos/server/deploy`. Using this method, deployment proceeds within a few seconds. The server monitors this directory.

A runnable job can also be scheduled, which means that the schedule for running the job and the trigger or triggers that initiate or “fire” the schedule (or both) are configured and packaged with the job.

For this walkthrough, you deploy one of several system jobs (`auditCleaner.job`) developed for Cloud Manager Orchestration Server administrators to demonstrate how system jobs are deployed and run. This job package, which is actually a `.jar` archive, includes only a `.policy` component and a `.jdl` component. It does not have a `.sched` component. You can use the Job Scheduler in the Orchestration Console to add the `.sched` component separately.

---

**NOTE:** A job developer can create and package jobs that include a `.jdl` file, a `.policy` file, a `.trig` file (trigger), and a `.sched` file (schedule). The presence of the `.sched` file in the job package is also typical of the predeployed discovery jobs installed with the Orchestration Server, which run without intervention when the criteria for firing the schedule are satisfied. Such jobs are visible in the Job Scheduler because they already include the `.sched` components.

---

Although this walkthrough demonstrates only the first method listed above for deploying, the other methods are relatively simple, so no further examples are provided to illustrate them.

- 1 In the Explorer panel of the Orchestration Console, right-click the *Jobs* container, then click *Deploy Job* to open the Select the Component File to Deploy dialog box.

- 2 Open the *Look In* drop-down list, then navigate to the location of the job you want to deploy. Although a job developer can store jobs at any location on the network, the sample jobs shipped with the Orchestration Server are limited to the directories where the product is installed. For this walkthrough, navigate to the `/opt/novell/zenworks/zos/server/components/systemJobs` directory.
- 3 Select *auditCleaner.job*, then click *OK* to deploy the job to the *Jobs* container. The job appears in the *all* container and in the *examples* container in the tree.

## 4.1.2 Creating a New Schedule for the Job

When a job has been deployed, you can create a schedule to specify when you want it to run. In this walkthrough, you create a schedule for the `auditCleaner` job by using the Scheduler tool in the Orchestration Console.

- 1 In the toolbar in the Orchestration Console, click the Job Scheduler button  to open the Job Scheduler view.
- 2 In the Job Scheduler view, click *New* to open the Enter Unique Schedule Name dialog box.
- 3 Specify a name for the schedule you want to create for this job. For this walkthrough, specify the name `cleaner` in the *Schedule Name* field, then click *OK* to return to the Job Scheduler view.

Schedule Name	Job Name	Priority	User ID	Status	Last Job ID	Last Job Status	Last Fire Time	Active Jobs
 cleaner				Paused		Not fired yet	n/a	

The new schedule is highlighted in the Job Schedules Table and is flagged with a pencil icon, signifying that the schedule has not been committed yet. Continue with [Section 4.1.3, “Defining the New Schedule,”](#) on page 40 to define this new schedule by adding the specific information you want.

### 4.1.3 Defining the New Schedule

Defining a new job schedule consists of selecting its general properties, its specific properties, and the triggers you want to be associated with it.

- ♦ [“Choosing General Properties for a New Schedule”](#) on page 40
- ♦ [“Creating and Assigning a Time Trigger for the New Schedule”](#) on page 41
- ♦ [“Adding Specific Parameters to the New Schedule”](#) on page 42

#### Choosing General Properties for a New Schedule

After you have created a new job schedule, its name cannot be changed, but you can add properties to it that help to identify and classify it in a general way. Use the following steps to add these properties:

- 1 In the Job Schedule Editor panel of the Scheduler view, select the *Job* drop-down list.
- 2 From the list of available jobs, select *auditCleaner* as the job to which this schedule applies.
- 3 In the Job Schedule Editor, select the *User* drop-down list.
- 4 From the list of available users, select *zosSystem* as the user who runs this job.

The *zos* user is the built-in user that is always present. It is commonly used for routine jobs like this example.

- 5 In the Job Schedule Editor, select the *Priority* drop-down list.

- 6 From the list of available priorities, select *high* as the priority for this job schedule.

The maximum selectable priority is dependent on an attribute associated with the selected user.

- 7 Click the *Save* button  on the toolbar of the Orchestration Console to save the general properties you have selected for the new schedule.

The schedule is now committed, and the attribute columns in the Job Schedules Table are populated with the name of the job that the schedule will run, the user it will run as, the priority at which it will run, and its current status. Because the schedule has not been activated yet, it remains in a *Disabled* state.

When you have chosen the general properties of the new schedule, you can either continue with [“Adding Specific Parameters to the New Schedule”](#) on page 42 or proceed directly to [“Creating and Assigning a Time Trigger for the New Schedule”](#) on page 41.

## Creating and Assigning a Time Trigger for the New Schedule

A job already defined in a schedule can be triggered with two main themes: the occurrence of an event or the arrival of a point in time. In this walkthrough, you define a time trigger for the `cleaner` schedule.

In this example, there are no defined time triggers in the Job Scheduler, so you use the following steps to define a time trigger.

- 1 In the Job Schedule view, click *Edit Triggers* to display the Triggers dialog box.  
Time triggers are shareable across schedules. After a time trigger is defined, it is added to a list of triggers in this dialog box. You can select a predefined trigger from this list when you create a new schedule, or you can create a new time trigger, as the next steps demonstrate.
- 2 In the Triggers dialog box, click *New* to clear and activate the fields in the dialog box for the creation of a unique time trigger.
- 3 In the Enter Unique Trigger Name dialog box, specify `24 hour` as the unique name of this time trigger, then click *OK*.
- 4 In the *Description* field, specify `Runs every 24 hours at noon` as the description for this time trigger.
- 5 Click *Fire Using CRON Expression* to activate the fields for defining a cron expression.

The screenshot shows a dialog box with a radio button selected for "Fire using CRON Expression". Below it is a text input field and a dropdown menu labeled "Examples".

- 6 Click the drop-down list of sample cron expressions, then select the default cron expression, `0 0 12 * * ?`, which is listed first.

The sample expressions in the drop-down list show cron strings with accompanying descriptions to remind you how a cron string is constructed. The examples are selectable and editable and can be used in the schedule, just as you have done in this step.

---

**NOTE:** For detailed information about cron syntax, see [“Understanding Cron Syntax in the Job Scheduler”](#) in the *NetIQ Cloud Manager Component Reference*.

---

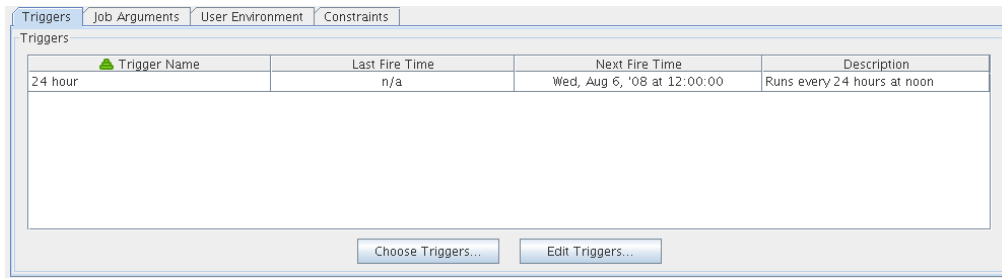

- 7 Click *Save* to save the trigger you just created, then click *Close* to return to the Job Scheduler view.
- 8 From the Job Scheduler view, make sure that the `cleaner` schedule is selected, then click *Choose Triggers* to display the Choose Triggers dialog box.
- 9 In the Choose Triggers dialog box, select `24 hour` (the name of the trigger you created), click *Add* to move the trigger definition to the *Scheduled Job Triggers* list, then click *OK* to return to the Job Scheduler view.

---

**NOTE:** You can select and combine as many time triggers as you want to apply to a given schedule. You can also combine time triggers with event triggers on a given schedule.

---

In the *Triggers* list of the Job Scheduler view, the `24 hour` trigger is now associated with the new schedule.

10 Click the *Save* button  to update the Orchestration Server with the new schedule/trigger association.

## Adding Specific Parameters to the New Schedule

If necessary, you can now add specific parameters to the schedule to edit its job arguments, to choose whether you want to pass the user environment variables to the schedule, or to specify policy constraints to further focus the purpose of this schedule when it fires.

For the purpose of this walkthrough, none of these specific parameters is modified, although a general overview of how to do so is explained.

The following specific parameters can be managed in the Job Scheduler Editor:

- ♦ [“Job Arguments” on page 42](#)
- ♦ [“User Environment” on page 43](#)
- ♦ [“Constraints” on page 43](#)

## Job Arguments

As explained in [“Creating or Modifying a Job Schedule”](#) in the *NetIQ Cloud Manager Component Reference*, a job argument defines the values that can be passed in to the process when a job is invoked. These values let you statically define and control job behavior. The job arguments that appear in the *Job Arguments* tab of the Schedule Editor depend on the job. The job might have no arguments.

By default, the `auditCleaner` job lists only one job argument, `jobargs.days`.

**Figure 4-1** The Job Arguments Tab of the Job Schedule Editor

According to the tooltip text, this argument is the number of days of job history to keep, so this job cleans up the history of the job in the Orchestration Server audit database after the job reaches the age of 60 days. Data older than 60 days is to be deleted. If you want to, you can change this parameter, or any other parameter in a job argument.

If the default value for a job argument parameter is missing, the job might fail, so you should inspect these parameters carefully.

## User Environment

As explained in “[Creating or Modifying a Job Schedule](#)” in the *NetIQ Cloud Manager Component Reference*, a user’s environment variables are available in the Job Scheduler only if that user utilizes the `zos` command line tool and elects to pass those environment variables to the server at login time or when he or she runs a job (running the job creates the environment variables as facts in the job). The `zos run` command passes the environment for that particular job run only.

In this walkthrough, the `zosSystem` user shows no user environment variables.

**Figure 4-2** The User Environment Tab of the Job Scheduler Editor, No User Environment Variables Available

Because there are no environment variables listed, there are none to pass to the schedule, so it is not necessary to select the *Pass User Environment* check box. By default, this check box is not selected, even if environment variables are present for a user specified to run the job.

Sometimes a job is written to work from a user’s environment variables. In this case, if a user has not logged in or has not run the job from the `zos` command line using the necessary environment option, the schedule must pass those variables to the job when it is invoked.

If you associate a user who has user environment variables with this schedule, you would see a list of those environment variables as they would be passed to the job.

**Figure 4-3** The User Environment Tab of the Job Scheduler Editor, User Environment Variables Available

Selecting the *Pass User Environment* check box in this scenario would create these variables as facts used for this job invocation.

## Constraints

As explained in “[Creating or Modifying a Job Schedule](#)” in the *NetIQ Cloud Manager Component Reference*, the *Constraints* tab displays a constraint editor that you can use to create additional constraints for the job being scheduled.

Any other constraints associated with the context of this job invocation (including but not limited to this job), with the user you’ve selected, with that user’s group, with the jobs group, with the resources that the job uses, or with the resource groups that the job uses, run in spite of the policy that you define here. These additional constraints usually restrict or refine what the job does when this schedule fires.

These constraints are passed to the job only when this schedule is invoked. For example, you could add a start constraint to delay the start of a job, a resource constraint to run on only one of three named machines, or a continue constraint to automatically time out the job if it takes too long to run. Anything you can do with a regular job policy constraint, you can add as a special constraint here for this particular schedule invocation.

Click the *Save* button  to update the Orchestration Server with the new schedule.

## 4.1.4 Activating the New Schedule

When the new schedule has been created and its triggers defined, you need to take it from the disabled state to an active state where it is ready to run.

- 1 In the Job Scheduler view, select the newly created job. The job shows that it is in a *Disabled* state.

 Schedule Name	 Job Name	Priority	User ID	Status	Last Job ID	Next Fire Time	Last Fire Time
cleaner	auditCleaner	high	zosSystem	 Disabled		12:00:00	n/a

- 2 Click *Enable* to enable the schedule.

 Schedule Name	 Job Name	Priority	User ID	Status	Last Job ID	Next Fire Time	Last Fire Time
cleaner	auditCleaner	high	zosSystem	 Enabled		12:00:00	n/a

The schedule is now enabled, but has not run yet.

## 4.1.5 Running the New Schedule Immediately

You can trigger the schedule immediately, rather than waiting for the triggers to fire.

- 1 In the Job Schedules Table of the Job Scheduler view, select *cleaner* (the name of the schedule you want to run), click *Run Now*, then click the job monitor button on the toolbar (*Jobs*) to open the Job Monitor view.

Submit Time	Job ID	Instance Name
16:52:13	zosSyst...	Scheduler(cleaner)

Jobslets	Resources	Policy Debugger
 Status: 1 Joblet Memo: 		

The joblet icon shows that the job is running.

- 2 Click the Job Scheduler button  on the toolbar to open the Job Scheduler view.

 Schedule Name	 Job Name	Priority	User ID	Status	Last Job ID	Last Fire Time	Active Jobs
cleaner	auditCleaner	high	zosSyst...	 Enabled		12:44:49	zosSystem.audit...

The cleaner schedule is listed as an active job. This indicates that the schedule has started the job as anticipated.

If you click the *Refresh* button , you can see that the job now has a Job ID.

 Schedule Name	 Job Name	Priority	User ID	Status	Last Job ID	Last Fire Time	Last Job Status
cleaner	auditCleaner	high	zosSystem	 Enabled	zosSystem.auditCleaner.9	12:44:49	 Job failed because of...

If the job invocation fails, as in this example, a red exclamation icon is also displayed.

---

# 5 Managing Virtual Machine Hosts

After you install the Cloud Manager Orchestration Agent on a physical resource, the Xen and Hyper-V hypervisor technologies running on that resource are determined by the Discover VM hosts job. You can then discover and manage VMs residing on the VM hosts.

For the VMware vsphere hypervisor, however, you need to associate the `vsphere_client` policy to a vSphere resource before the discovery works.

- ♦ [Section 5.1, “Discovering VM Hosts and Repositories,”](#) on page 45
- ♦ [Section 5.2, “Discovering VM Images,”](#) on page 46
- ♦ [Section 5.3, “Resynchronizing the VM Host’s State,”](#) on page 47
- ♦ [Section 5.4, “Shutting Down VM Hosts,”](#) on page 47
- ♦ [Section 5.5, “Restarting VM Hosts,”](#) on page 48
- ♦ [Section 5.6, “Understanding VM Host Failover,”](#) on page 49

## 5.1 Discovering VM Hosts and Repositories

- 1 Ensure that the policies appropriate to the VM technology are configured. For more information, see [“Orchestration Provisioning Adapter Information”](#) in the *NetIQ Cloud Manager Component Reference*.

For vSphere, the default number of slots is 4. We recommend that you increase this number to 10, depending on the hardware and available computing resources (RAM/CPU) of the server where the agent is running (this is also the server associated with the `vsphere_client` policy). Each joblet slot causes a separate Java instance on this resource. Each Java instance uses 50-60 MB of RAM and is quite CPU-intensive.

For Xen, we recommend that you accept the default slot number of 1. No more than one provision operation should happen concurrently on the Xen host, particularly any operation that is disk-related.

For more information on the policies, see [“Orchestration Provisioning Adapter Information”](#) in the *NetIQ Cloud Manager Component Reference*.

- 2 Ensure that you have set the correct number of joblet slots for the VM hosts in the policies appropriate to the VM technology. For more information, see [Joblet Slots](#) in the *NetIQ Cloud Manager Component Reference*.
- 3 In the Orchestration Console, click *Provision > Discover VM Hosts and Repositories*.  
The Discover VM Hosts and Repositories dialog box is displayed.

- 4 Select your provisioning adapter from the drop-down list.
- 5 Click *OK*.
- 6 Click *Jobs* to view the *Jobs* section in the Orchestration Console and verify that the job has started.

After your VM host machines are discovered, you can refresh your tree view or wait for the automatic tree refresh to see the VM host machine listed under the provisioning adapter, although no VMs are listed.

This also discovers:

- ◆ Local repositories for all types of hypervisors.
- ◆ SAN and NAS repositories for Xen and vSphere.

To view the discovered repositories, click *Repositories*, then click *xen30* or *esx*.

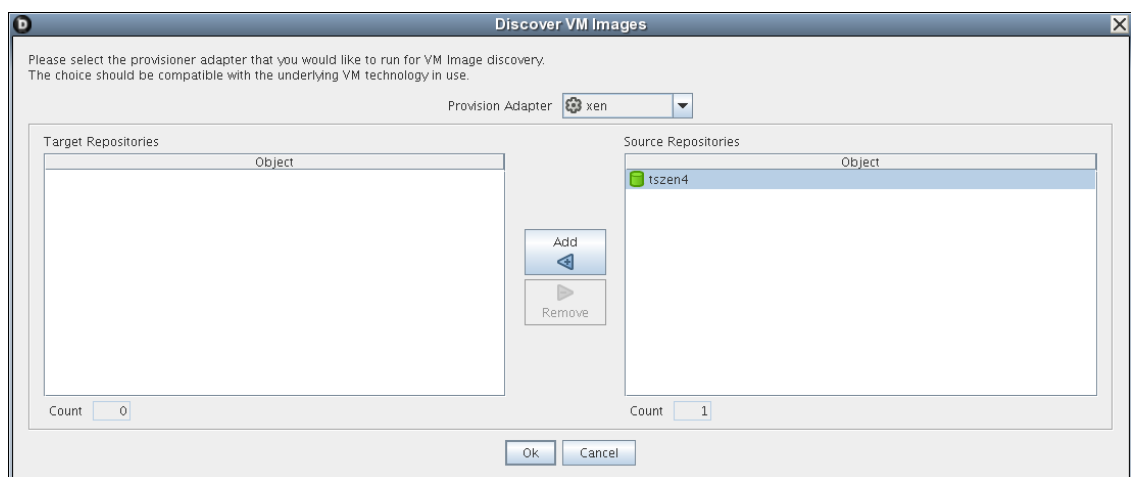

For a list of the VM technologies and supported host and guest operating systems, see “[Requirements and Cloud Manager Support for the Virtual Environment](#)” in the *NetIQ Cloud Manager Installation Guide*.

## 5.2 Discovering VM Images

To discover the VM images on a specific repository:

- 1 In the Orchestration Console, click *Provision > Discover VM Images*.

The Discover VM Images dialog box is displayed.

- 2 In the *Provisioning Adapter* drop-down list, select the provisioning adapter for which you want to discover the VM images.

The source repositories for the selected provisioning adapter are displayed.

For information on provisioning adapters, see [Section 6.1, “Provisioning a Virtual Machine,”](#) on page 51.

- 3 Select the source repositories, then click *Add*.

The selected repositories are added to the *Target Repositories* pane.

- 4 Click *OK*.

The VM images are discovered: a separate job is launched for each repository that the user selected. After all jobs are complete, you can refresh the Explorer tree in the Orchestration Console to see the discovered VMs.

## 5.3 Resynchronizing the VM Host's State

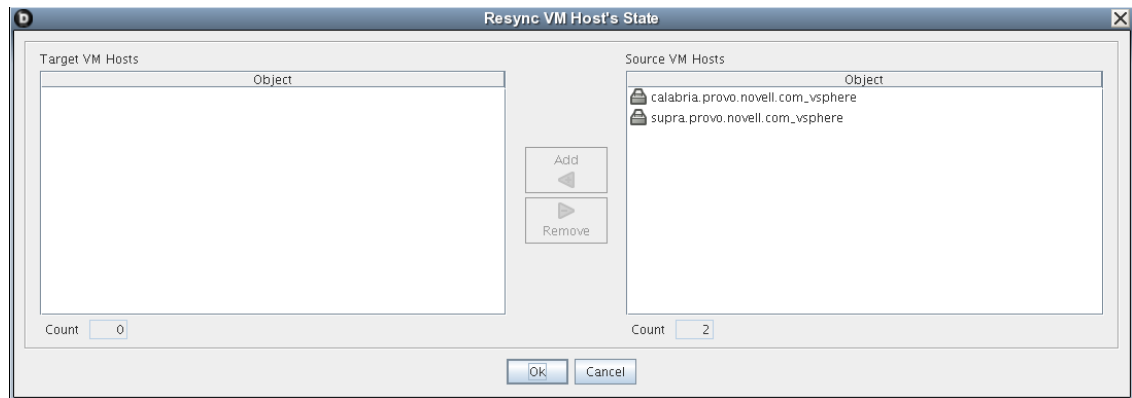

To manually verify and ensure that the state of a VM host displayed in the Orchestration Console is accurate:

- 1 In the Orchestration Console, right-click the VM host, then click *Discover*.

To manually verify and ensure that the state of multiple VM hosts displayed in the Orchestration Console is accurate:

- 1 In the Orchestration Console, click *Provision > Resync VM Host's State*.

The Resync VM Host's State dialog box is displayed.

- 2 In the *Source VM Hosts* pane, select the VM hosts to be resynchronized, then click *Add*.

The selected VM hosts are added to the *Target VM Hosts* pane.

- 3 Click *OK*.

## 5.4 Shutting Down VM Hosts

To shut down a single VM host:

- 1 In the Orchestration Console, right-click the VM host you want to shut down, then click *Shutdown*.

To shut down multiple VM hosts:

- 1 In the Orchestration Console, click *Provision > Shutdown Hosts*.

The Shut Down VM Hosts dialog box is displayed.

**2** Choose when to shut down the VM hosts.

You can choose to shut down the VM hosts after the Orchestration Agent becomes idle or to immediately shut down the VM hosts. By default, the *Wait for Agent to become Idle* option is selected.

**3** In the *Source VM Hosts* pane, select the VM hosts you want to shut down, then click *Add*.

The selected VM hosts are added to the *Target VM Hosts* pane.

**4** Click *OK*.

The VMs running on the host are automatically shut down and the VM host is moved to the Shutting Down state, where will not accept any Provisioning actions.

## 5.5 Restarting VM Hosts

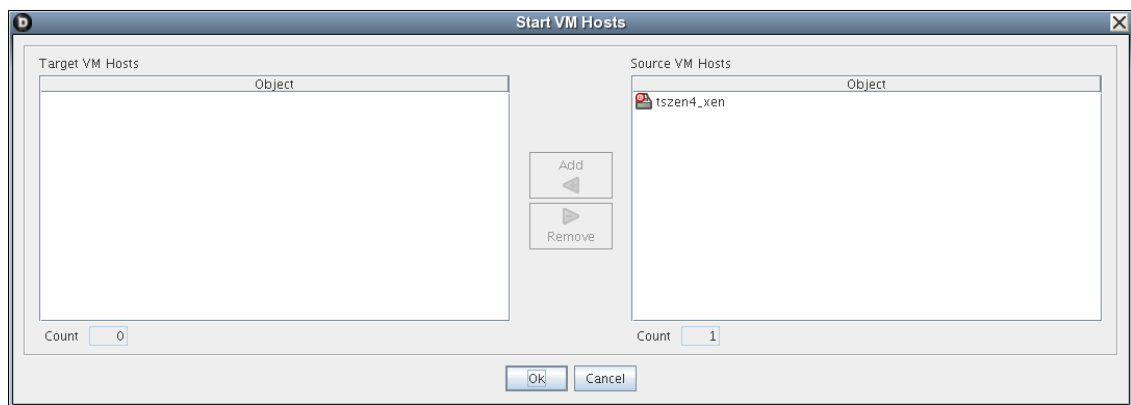

To restart a single VM host:

**1** In the Orchestration Console, right-click the VM host you want to start, then click *Start*.

To restart multiple VM hosts:

**1** In the Orchestration Console, click *Provision > Start VM Hosts*.

The Start VM Hosts dialog box is displayed.

**2** In the *Source VM Hosts* pane, select the VM hosts you want to restart, then click *Add*.

The selected VM hosts are added to the *Target VM Hosts* pane.

3 Click *OK*.

## 5.6 Understanding VM Host Failover

When the Orchestration Server comes back online after being offline, it rediscovers the state of all resources, including VM hosts and the VMs running on those hosts. This section provides more information about how the Orchestration Server behaves when the VM Host loses its agent connection.

There are two possible scenarios that can occur when a VM Host fails while running VMs. The failover behavior depends on where the VM image is stored and whether the VM has the agent installed.

The following table shows possible failover scenarios with the VM Host and the expected server behavior when it occurs.

**Table 5-1** Orchestration Server Behavior when the VM Host Loses Its Agent Connection

Scenario	Failover Behavior
<p><b>Scenario 1:</b> The VM image is:</p> <ul style="list-style-type: none"><li>◆ Stored on a non-local repository (for example, the zos repository)</li><li>◆ Accessible by other VM hosts</li><li>◆ Successfully provisioned</li></ul> <p><b>Situation:</b> The VM host fails.</p>	<p>The VMs that had been running on the failed VM host are reprovisioned to other available VM hosts.</p> <ul style="list-style-type: none"><li>◆ If the VM was provisioned from a template, there is now another instance of the VM. For example, if the template name is <code>sles10template</code>, the original VM provisioned from the template is then named <code>sles10template-1</code>.</li></ul> <p>If the host running <code>sles10template-1</code> goes down, or if it loses its agent connection, a new instance of the template named <code>sles10template-2</code> is reprovisioned to an available host.</p> <ul style="list-style-type: none"><li>◆ If the original VM was a standalone VM, it is reprovisioned to an available host.</li></ul>
<p><b>Scenario 2:</b> The VM image is stored on a local repository.</p> <p><b>Situation:</b> The VM host loses its agent connection.</p>	<ul style="list-style-type: none"><li>◆ Because the VM image is stored locally, it cannot be reprovisioned to another VM host.</li><li>◆ When the VM host comes back online, it is reprovisioned to the host where it is stored.</li></ul>

In either of these scenarios, if the Orchestration Agent is installed on the VM and if the VM host loses its agent connection but the VMs retain their agent connection (for example, if someone kills the agent process on the VM host), no reprovisioning occurs.

If the VM host loses its agent connection, and if the Orchestration Agent is not installed on the running VMs, the VMs can continue running indefinitely. However, if the location of the VM image warrants it, the VMs are reprovisioned to other available hosts. When there are two (or more) of the same VM instance running on different VM hosts, the Orchestration Server is aware only of the VMs running on a VM host with an active agent connection, so the administrator must stop the VMs on the host that has lost its agent connection.

---

**NOTE:** If you are interested in failover in a high availability environment, see [“Preparing the Cloud Manager Orchestration Server for SUSE High Availability Support”](#) and [“Installing and Configuring the Orchestration Agent for Xen VM Deployment in a SLES HAE Cluster”](#) in the *NetIQ Cloud Manager Installation Guide*

---

---

# 6 Managing Virtual Machines

Review the following sections for specific information about the VM management functions in Cloud Manager Orchestration:

- ◆ [Section 6.1, “Provisioning a Virtual Machine,” on page 51](#)
- ◆ [Section 6.2, “Provisioning Actions and History,” on page 52](#)
- ◆ [Section 6.3, “Managing a Running Virtual Machine,” on page 55](#)
- ◆ [Section 6.4, “Resynchronizing the State of All VMs,” on page 63](#)
- ◆ [Section 6.5, “Resynchronizing the State of All VMs of a Specific VM Host,” on page 63](#)
- ◆ [Section 6.6, “Shutting Down Multiple VMs,” on page 63](#)
- ◆ [Section 6.7, “Destroying and Deleting a Virtual Machine,” on page 64](#)

## 6.1 Provisioning a Virtual Machine

Provisioning is the first step in a VM’s life cycle. The Orchestration Server determines the best VM host machine for running the VM, unless you select a specific host server, datastore, or network to run the VM.

By default, you can run eight VMs at one time on a VM host. If you want to provision additional VMs, you must proportionately increase the `vmhost.maxvmslots` fact value for a particular VM host in the Orchestration Console.

Provisioning VMs that have only an NPIV disk is not supported. You can provision a VM that has a hard disk and an NPIV disk (that is, a SAN repository). The OS image of the VM is stored on the local hard disk and the data resides in the SAN repository.

The Orchestration Server uses provisioning adapters to perform life cycle functions. Provisioning adapters are programs that control (start, stop, snapshot, migrate, or pause) a VM. They run as regular jobs on the Orchestration Server.

The system can discover SAN repositories for Xen and vSphere hosts.

The constraints used to determine a suitable VM host evaluate the following criteria to provide heterogeneous VM management:

- ◆ Machine architectures
- ◆ CPU
- ◆ Bit width
- ◆ Available virtual memory
- ◆ Other administrator-configured constraints, such as the number of virtual machine slots

For procedures and more information on provisioning VMs, see [Section 6.3, “Managing a Running Virtual Machine,” on page 55](#).

## 6.2 Provisioning Actions and History

The following information is included in this section:

- ♦ [Section 6.2.1, “What are Provisioning Actions?,” on page 52](#)
- ♦ [Section 6.2.2, “How Actions Are Displayed in the Orchestration Console,” on page 52](#)
- ♦ [Section 6.2.3, “Prioritized Provisioning Actions,” on page 55](#)

### 6.2.1 What are Provisioning Actions?

The provisioning operations you perform in Cloud Manager Orchestration are recorded as “actions.” For example, in the Orchestration Console main menu:

- ♦ A VM Host Discovery action is initiated if you select *Provision > Discover VM Hosts and Repositories* and then you select a provisioning adapter in the Discover VM Hosts and Repositories dialog box.
- ♦ A VM Discovery action is initiated if you select *Provision > Discover VM Images* and then you select a provisioning adapter in the Discover VM Images dialog box. An action is specified for each Repository you specify.
- ♦ A Migrate action is initiated when you perform the migration of a Virtual Machine (VM).

For a comprehensive list of the provisioning operations supported by each Cloud Manager Orchestration provisioning adapter, see [“Orchestration Provisioning Adapter Information”](#) in the *NetIQ Cloud Manager Component Reference*.

### 6.2.2 How Actions Are Displayed in the Orchestration Console

Depending on the Grid object you select, an Action History tab is displayed in several views of the Orchestration Console.

- ♦ [“Action History in Monitor Views of the Orchestration Console” on page 52](#)
- ♦ [“Action History in Admin Views of the Orchestration Console” on page 53](#)

#### Action History in Monitor Views of the Orchestration Console

You can see the Action History tab in the VM Hosts monitor view if you select a migrating VM:

**Figure 6-1** VM Hosts Actions

Two action-specific menu selections are available if you right-click an action in the action history table:

- ◆ *Show Log* opens the provision log for the VM
- ◆ *Cancel Action* cancels the selected active action

The action history table is updated at the same time the polling view is updated.

---

**NOTE:** The format of action history table is similar in the Provisioner monitor view and in the Users monitor view.

---

If the *Include Audit Database* check box is selected in this view, the action status is not polled. Click the refresh icon to fetch and display fresh data.

---

**NOTE:** The Orchestration Server must be connected to an audit database for the *Include Audit Database* check box to be available. This behavior is the same in the Job monitor view.

---

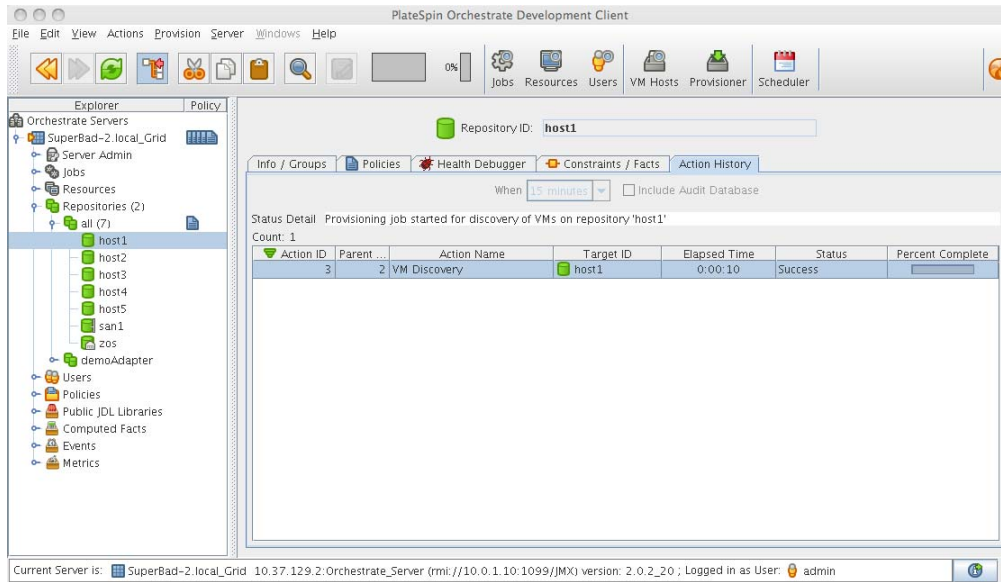

## Action History in Admin Views of the Orchestration Console

Action history is displayed in other Grid object admin views of the Orchestration Console:

- ◆ User object
- ◆ Resource object
- ◆ Repository object

The following illustration shows an example of action history in the Repository admin view:

**Figure 6-2** Repository Action History

The table below defines some of the column names and the values that can populate those columns in the action history table:

**Table 6-1** Action History Table Columns

Column Name	Purpose
Action ID	A unique integer value used to identify the action.
Parent Action ID	If a value is displayed, the action is a child of this parent, identified with a unique integer value.
Action Name	Specific to the action being invoked.
Target ID	The identifying string of the object where the action is to occur.
Status	Displays the status of this action (specific to the action being invoked). Possible values in this column include: <ul style="list-style-type: none"> <li>◆ Started</li> <li>◆ In Progress</li> <li>◆ Success</li> <li>◆ Failed</li> <li>◆ Canceled</li> </ul>

## 6.2.3 Prioritized Provisioning Actions

Because the Orchestration Server must efficiently manage many resources and jobs while providing acceptable response times, short-running, user-facing jobs, such as stopping a running VM instance are prioritized above long-running background tasks such as building a VM image.

The Orchestration Server increases the priority for the *Start*, *Stop*, *Pause*, *Suspend*, *CheckStatus* and *Resume* provisioning actions so that they are run before the *Clone*, *Build*, or *Save Config* provisioning actions. These prioritized provisioning actions run as “privileged provisioning actions,” which means that they can run in a resource’s extra system joblet slots. This is done so that customer-initiated provisioning actions can be run immediately, even when resource joblet slots are filled by lower priority actions, congesting the grid.

---

**NOTE:** A prioritized provisioning action runs with a new “mediumlow” priority in the Orchestration Console rather than the traditional “low” priority.

---

For more information about adding joblet slots, see [Joblet Slots](#) in the “[The Resource Object](#)” section of the *NetIQ Cloud Manager Component Reference*.

## 6.3 Managing a Running Virtual Machine

There are many ways you can control a VM after it has been deployed. All actions from provisioning to shutting down the VM can be managed directly from the Orchestration Console, through provisioning adapter jobs, and through custom jobs written by the user.

Review the following sections for ways to manage running VMs:

- [Section 6.3.1, “Using the Right-Click Menu for Provisioning Actions,” on page 55](#)
- [Section 6.3.2, “Prerequisites for Creating or Deleting vNIC and vDisk Objects on Hyper-V Managed Linux VMs,” on page 60](#)
- [Section 6.3.3, “Releasing a Virtual Machine from Usage,” on page 60](#)
- [Section 6.3.4, “Managing Virtual Machine Templates,” on page 60](#)
- [Section 6.3.5, “Managed Virtual Machine Actions,” on page 62](#)
- [Section 6.3.6, “Virtual Machine Technology-Specific Actions,” on page 63](#)

### 6.3.1 Using the Right-Click Menu for Provisioning Actions

You can perform provisioning actions by right-clicking a VM in the Explorer tree of the Orchestration Console.

For information on provisioning adapters, see [Section 6.1, “Provisioning a Virtual Machine,” on page 51](#).

The provisioning actions available from the right-click menu are as follows:

**Table 6-2** Right-Click VM Commands

Action	Description
Provision	<p>Starts a VM to a running state. The Orchestration Server automatically looks for the best VM host machine to run the VM on, unless you have specifically designated another server to run the VM.</p> <p>If a VM has snapshots, you cannot start the VM on a different host. If a VM that has snapshots is on a shared repository, you can register the VM to a different host and start the VM if the host is also connected to the shared repository.</p>
Pause	<p>Prevents the VM from gaining access to the processor of the host machine, although it is still resident in the memory of the host machine.</p>
Resume	<p>Allows a paused VM to access the processor of the host machine again.</p>
Suspend	<p>Pauses the VM and takes a snapshot of its disk and memory status. In the suspended state, a VM can be moved or migrated to another host machine.</p> <p><b>NOTE:</b> A suspended VM must be provisioned to make it active again. The <i>Resume</i> action does not perform this function.</p>
Shutdown	<p>Stops a VM from running, just like shutting down a physical machine. The operating system stops and acts as if it is shut down.</p>
Restart	<p>Shuts down and restarts a running VM.</p>
Migrate	<p><b>vSphere:</b> Migrates the VM from one host machine to another only if both the source and destination host machines have VMotion enabled. VM migrations can be of the following types:</p> <ul style="list-style-type: none"> <li>◆ A “warm migrate” is the migration of a suspended VM to another host. From a user’s perspective, if a VM is suspended, it is effectively “down.” This function requires shared storage.</li> <li>◆ A “hot migrate” (also called a “live migrate”) is the migration of a running VM to another host and starting it there with minimal resulting downtime (measured in milliseconds). This function requires shared storage.</li> </ul> <p>For more information, see the <a href="http://www.vmware.com/products/vmotion/">VMware VMotion documentation (http://www.vmware.com/products/vmotion/)</a>.</p> <p><b>Hyper-V:</b> VM migration is not supported by Cloud Manager Orchestration.</p> <p><b>Xen:</b> VM migrations can be of the following types:</p> <ul style="list-style-type: none"> <li>◆ A “hot migrate” (also called a “live migrate”) is the migration of a running VM to another host and starting it there with minimal resulting downtime (measured in milliseconds). This function requires shared storage.</li> </ul> <p><b>NOTE:</b> Migration of a Xen VM on Fibre Channel SAN disks is not supported.</p>

Action	Description
Resync State	Ensures that the state of the VM displayed in the Orchestration Console is accurate.
Rediscover VM	<p>If changes have been made to a virtual machine in the hypervisor's native management console, that new configuration might not be reflected in Orchestration fact values. The <i>Rediscover VM</i> action triggers an Orchestration event that rediscovers the fact configuration of a single VM in the hypervisor and then updates the facts of the counterpart VM Grid Object represented in the Orchestration Server.</p> <p><b>NOTE:</b> This action is supported only for VMs managed by the KVM hypervisor.</p>
Save Config	<p>Requests that the runtime VM configuration be persisted on the VM image for future use.</p> <p><b>NOTE:</b> If you add a vNIC or a vDisk to a VM, you must initiate the <i>Save Config</i> action. Clicking the <i>Save</i> icon on the Orchestration Console toolbar does not save the change.</p>
Apply Config	Updates the VM transient configuration. The VM must be running.
Create Template (VM only)	Creates a new template object based on the VM. Other versions of the VM can be cloned from this template. This menu item is replaced by the <i>Clone</i> menu item when you right-click a template VM.
Clone (VM template only)	Creates a standalone VM instance from the template but does not power on that instance. This action is unlike the <i>Provision</i> action from a template, which performs a <i>Clone</i> action, powers on the instance, then destroys the VM instance when it is powered off.
Delete/Destroy Resource	<p>Removes a VM from the <i>Resources</i> list in the Orchestration Console. If you want to delete the VM from the host machine, select the <i>Destroy VM Instance</i> option.</p> <p><b>NOTE:</b> If you previously added a vDisk to the VM, it is not deleted with the VM unless the vDisk is marked <a href="#">moveable</a>.</p>
Move Disk Images	<p>A "move" is the relocation of VM disk images between two storage devices when the VM is in a not running state (including VMs that are suspended with a checkpoint file). This function does not require shared storage; the move is between separate repositories. Select the storage location from the drop-down menu.</p> <p>You can also move a VM from one VM host machine to another. This is a "cold" migration. VMware Server VMs must be migrated in this manner.</p> <p>If you want to move a VM of considerable size, appropriately increase the timeout fact value in the VM policy. The default value is 2400. For more information on editing the policy, see "<a href="#">Orchestration Provisioning Adapter Information</a>" in the <a href="#">.NetIQ Cloud Manager Component Reference</a></p> <p>If a VM has snapshots, you cannot move the VM but you can register it to a different host if the VM and the host are connected to a shared repository.</p>

Action	Description
Checkpoint	<p>Creates a named snapshot of a VM image. This image is stored on the disk of the repository machine. Xen VMs cannot have a checkpoint applied to them.</p> <p>All the snapshots of a VM are chronologically listed in the <code>resource.vm.snapshots</code> fact, and the latest snapshot is listed in the <code>resource.vm.current_snapshot</code> fact.</p> <p>If the vSphere VM or the Hyper-V VM already has snapshots taken through other management consoles, the snapshots are synchronized with the latest snapshot taken through the Orchestration Console, and are listed in the <code>resource.vm.snapshots</code> fact.</p>
Restore	<p>Starts a Checkpoint VM (that is, resumes the operations of a VM made into a stored checkpoint from the moment of storage).</p> <p>If the vSphere VM already has snapshots taken through other management consoles, the snapshots are synchronized with the latest snapshot taken through the Orchestration Console, and are listed in the <code>resource.vm.snapshots</code> fact.</p>
Remove Template Dependency	<p>Changes a cloned instance of a VM into a VM instance.</p>
Install Agent	<p>Launches a job that automatically installs the Orchestration Agent on a Xen-managed VM the next time you provision the VM.</p> <p><b>IMPORTANT:</b> If you stop or cancel a running Install Agent job, the VM is locked and you cannot provision the VM. The VM is automatically released after a period of time.</p>
Personalize	<p>Allows you to customize the VM. This includes changing elements like the DNS server. The changes are made to a VM that is shut down.</p> <p>This action relates to all guest OS-level changes, not hardware changes. With vSphere, guest customization occurs the next time the VM is powered on. The vSphere administrator must have properly configured the vCenter server to handle sysprep and the VMware tools must be installed to the VM.</p> <p><b>IMPORTANT:</b> If you stop or cancel a running Personalize job, the VM is locked and you cannot provision the VM. The VM is automatically released after a period of time.</p>
Shutdown Agent	<p>Shuts down the Orchestration Agent and makes the VM unavailable as a resource.</p>
Create Virtual NIC	<p>Manually creates a vNIC on the VM to configure its network interface configuration by way of a vBridge connection.</p> <p>For more information, see <a href="#">“Creating or Deleting a vNIC in the Orchestration Console”</a> in the <i>NetIQ Cloud Manager Component Reference</i>.</p> <p><b>NOTE:</b> You can manually delete the new vNIC after it is created by right-clicking the vNIC object in the Explorer tree, then selecting <i>Delete</i>.</p>

Action	Description
Create Virtual Disk	<p>Manually creates a vDisk image of a specified size (measured in Mb) to associate to the VM.</p> <p>For more information, see <a href="#">“Creating or Deleting a vDisk in the Orchestration Console”</a> in the <i>NetIQ Cloud Manager Component Reference</i>.</p> <p><b>NOTE:</b> You can manually delete the new vDisk after it is created by right-clicking the vDisk object in the Explorer tree, then selecting <i>Delete</i>.</p>
Cancel Action	Stops an action that has been requested.
Check Host Assignment	Opens a window so you can compare the VM hosts capable of hosting the VM.
Launch Remote Desktop	<p>Launches a VNC terminal in which you can view and control the VM. Specify the credentials configured for the Web service in the appropriate VM policy.</p> <p>Some provisioning adapters require additional setup before you can launch a remote desktop. For more information about this setup for the <i>vsphere</i> provisioning adapter, see <a href="#">“Setting Up Orchestration VNC for a VM Managed by vSphere”</a> in the <i>NetIQ Cloud Manager Installation Guide</i>. For more information about this setup for the <i>xenserv</i> provisioning adapter, see <a href="#">“Deploying the Citrix XenServer Provisioning Adapter”</a> in the <i>NetIQ Cloud Manager Installation Guide</i>.</p>

## Authorization Constraint Messages Are Not Readily Visible in the Orchestration Console

If you unsuccessfully attempt to provision a VM whose Host/Repository selection has been designated as Automatic, it is possible that a policy with an authorization constraint has been associated to that VM. In this scenario, no message explaining the restriction is displayed.

To confirm that the provisioning has an authorization constraint:

- 1 In the Explorer tree of the Orchestration Console, select the VM that you want to provision.
- 2 In the Orchestration Console toolbar, select *Provisioner* to open the provisioning monitor view for that VM.
- 3 Select the *Show Log* tab to open the provisioning log.
 

Scan the log to find errors indicating that the VM could not be provisioned because of authorization constraints in its policy.

## 6.3.2 Prerequisites for Creating or Deleting vNIC and vDisk Objects on Hyper-V Managed Linux VMs

Although you can create vNICs and vDisks on Windows VMs managed by the Microsoft Hyper-V hypervisor, there is a prerequisite for creating or deleting these objects on a Linux VM managed by Hyper-V.

To make these actions work, it is necessary to install Linux Integration Components from Microsoft. For download and installation information, see the [Linux Integration Components page \(http://www.microsoft.com/downloads/details.aspx?FamilyID=c299d675-bb9f-41cf-b5eb-74d0595ccc5c&displaylang=en\)](http://www.microsoft.com/downloads/details.aspx?FamilyID=c299d675-bb9f-41cf-b5eb-74d0595ccc5c&displaylang=en) at the Microsoft downloads Web site.

## 6.3.3 Releasing a Virtual Machine from Usage

When the demand and load on your data center decreases, the Orchestration Server analyzes the remaining resources and releases the most appropriate resource. If a VM meets the requirements of the remaining job demands better than a physical machine, the physical machine is released before the VM is released. This dynamic analysis allows you to make sure that the needs of your data center are met.

## 6.3.4 Managing Virtual Machine Templates

A VM template is a special kind of VM that is not deployed separately.

Review the following tasks to manage VM templates:

- ♦ [“Making a Virtual Machine Instance into a Template” on page 60](#)
- ♦ [“Changing a Virtual Machine Template Clone to an Instance” on page 61](#)
- ♦ [“Hyper-V VM Template Actions” on page 61](#)

This section also includes some information about support for the provisioning actions of a VM template created from a Hyper-V VM. See [“Hyper-V VM Template Actions” on page 61](#).

### Making a Virtual Machine Instance into a Template

- 1 In the Orchestration Console, right-click the VM.
- 2 Select *Create Template*.
- 3 Name the template.
- 4 Specify a repository.
- 5 Specify a visible VM host.
- 6 Select a recommended host for the VMs to be launched on, if any are present.
- 7 Click *OK*.

When the instance of the template VM is provisioned, it appears as a sub-branch of the template's location in the resources tree.

This clone functions as an instance of a VM and runs as though it were its own version with its own MAC address and other unique identifiers. The UUID is the only new information that is automatically generated for the clone. All the rest of the new information comes from autoprep, including the MAC address if an asterisk (\*) is placed in the *Mac Address* field in the *Autoprep Network*

*Adapter* section of the *Info/Groups* tab for the template (the default is a blank field, meaning no MAC address is created), and if the *Use Autoprep* check box is enabled in the *Create VM from Template* dialog box.

## Changing a Virtual Machine Template Clone to an Instance

- 1 If you decide to keep a clone VM, go to the Cloud Manager Orchestration Console, right-click it, and select *Remove Template Dependency*.  
The Remove Template Dependency dialog box is displayed.
- 2 Click *OK*.

---

**NOTE:** This procedure works only when a VM instance has been cloned from a template. It does not work when a VM instance is provisioned from a template.

---

## Hyper-V VM Template Actions

VM templates created in the Cloud Manager Orchestration Server from discovered Hyper-V VMs have limited functionality. The following actions are supported in a Hyper-V VM template:

- ◆ Provision
- ◆ Move Disk Images
- ◆ Clone
- ◆ Delete/Destroy Resource
- ◆ Resync State

---

**IMPORTANT:** Even though the *Create Virtual NIC* and *Create Virtual Disk* actions appear to be legitimate actions on the right-click menu of a Hyper-V VM template (that is, they are not dimmed), these are not supported actions.

---

The following actions are not supported in a Hyper-V VM template:

- ◆ Save Config
- ◆ Checkpoint
- ◆ Restore
- ◆ Install Agent
- ◆ Personalize
- ◆ Create Virtual NIC
- ◆ Create Virtual Disk

## 6.3.5 Managed Virtual Machine Actions

You can perform many actions on the VM through the Orchestration Console, from Cloud Manager itself, or you can write jobs to have actions performed on the VMs in your data center. The following table lists the managed VM actions that you can perform or use in a written job.

**Table 6-3** *Managed VM Actions*

Action	Description
Provision	Starts a VM. This action clones and start a cloned VM template.
Clone	Creates a new, unique instance of a VM template.
Cold Migrate	Moves the storage location of the configuration and first disk files to another physical storage host. This might allow the VM to start faster.
Shutdown	Stops an active VM instance (including a started template VM).  <b>NOTE:</b> If you manually shut down a running VM (either by logging in to the VM and shutting it down manually or by using any hypervisor-specific tool to shut down the VM), that VM is still displayed in the Orchestration Console as running. If you then choose the <i>Shutdown</i> action rather than the <i>Resync State</i> action for that VM, the Orchestration Server job log shows that the shutdown job fails. This condition always exists unless a Resync operation occurs on the VM or when an Orchestration Agent on the VM relays its current state to the Orchestration Server.
Delete/Destroy	Removes a VM from the <i>Resources</i> list in the Orchestration Console. If you want to delete the VM from the host machine, select the <i>Destroy VM Instance</i> option.
Suspend	Takes a snapshot of an active VM and pauses it in order to move it to another VM host.
Pause	Prevents the VM from obtaining CPU cycles, but it stays resident.
Resume	Allows a paused VM to access the CPU again.
Create Template	Creates a VM template from a VM instance.
Hot Migrate	Changes the association of the VM, which is residing in a shared storage location, from one host machine to another.
Checkpoint	Create a named snapshot of a moment that can later be accessed to restart from the same point
Restore	Resumes a VM at a previously stored checkpoint.
Install Orchestrator Agent	Opens a VM image and installs the Orchestration Agent.
Make Standalone	Removes the association of a template and makes the active VM into its own instance.
Check Status	Checks the current state of the VM to verify if the VM is provisioned or shut down.
Personalize	Modifies the Orchestration Agent properties and disk image that are currently part of a clone.
Save Config	Transfers changes made to a VM to its permanent image storage.

## 6.3.6 Virtual Machine Technology-Specific Actions

For a detailed breakdown of the actions you can perform on and with a VM, see the appropriate VM technology and configuration section in “[Orchestration Provisioning Adapter Information](#)” in the [NetIQ Cloud Manager Component Reference](#).

## 6.4 Resynchronizing the State of All VMs

To manually verify and ensure that the state of the VMs of all VM hosts displayed in the Orchestration Console is accurate:

- 1 In the Orchestration Console, click *Provision > Resync VM's State*.

The Resync VMs' State dialog box is displayed.

- 2 In the *Source VMs* pane, select the VMs to be resynchronized, then click *Add*.

The selected VMs are added to the *Target VMs* pane.

- 3 Click *OK*.

## 6.5 Resynchronizing the State of All VMs of a Specific VM Host

To manually verify and ensure that the state of the VMs of a specific VM host displayed in the Orchestration Console is accurate:

- 1 In the Orchestration Console, click *Provision > Reset State of All VMs*.

The Reset State of All VMs dialog box is displayed.

- 2 Select the VM host whose VMs you want to resynchronize.

- 3 Click *OK*.

## 6.6 Shutting Down Multiple VMs

- 1 In the Orchestration Console, click *Provision > Shutdown VMs*.

The Shutdown VMs dialog box is displayed.

- 2 You can choose to shut down the VMs after the Orchestration Agent becomes idle or to immediately shut down the VMs. By default, the *Wait for Agent to become Idle* option is selected.
- 3 In the *Source VMs* pane, select the VMs you want to shut down, then click *Add*.

The selected VMs are added to the *Target VMs* pane.

- 4 Click *OK*.

## 6.7 Destroying and Deleting a Virtual Machine

- 1 In the Orchestration Console, right-click the VM in the tree and select *Delete/Destroy Resource*. The Delete Resource dialog box is displayed.

- 2 (Optional) To delete a VM from the VM host, select the *Destroy VM Instance* option.

This completely deletes the VM and all its versions from your data center. You cannot restore any version of the VM after you delete it.

If you do not choose this option, the VM is removed from the resource list. However, the actual image of the VM is still stored in its directory.

- 3 Click *OK*.

If you choose only to delete a VM from your resource tree, you can rediscover the VM by running a discovery job (click *Provision > Discover VM Images*).

---

# 7 Managing VM Repositories

The Cloud Manager Orchestration Server uses the Repository object to represent where VMs are stored. VMs can be stored on local disks, the datagrid, a network attached storage (NAS), or a storage area network (SAN, Fibre Channel, or iSCSI).

Before VMs can be used by Cloud Manager Orchestration, you must create or discover Repository objects and then discover the VM images within the Repository:

- [Section 7.1, “Provisioning a VM from a Local Repository,” on page 65](#)
- [Section 7.2, “The Datagrid Repository,” on page 66](#)
- [Section 7.3, “Provisioning a VM from a NAS Repository,” on page 66](#)
- [Section 7.4, “The SAN Repository,” on page 66](#)

## 7.1 Provisioning a VM from a Local Repository

By default, the Xen and vSphere provisioning adapters create a local Repository object for local VM images (or datastores) on a VM host when the Orchestration Server performs the Discover VM Hosts action.

---

**NOTE:** For vSphere, the Orchestration Server models all repositories the Virtual Center server is aware of. There is not necessarily a local repository for each ESX host, although that is the default.

---

A local repository represents VMs residing in a VM Host’s local storage where the VMs are only visible to the VM Host. VMs are searched for in the default paths for each adapter.

---

**IMPORTANT:** Do not use local repositories for shared directories visible to more than one VM Host. Instead, create a new NAS or SAN repository.

---

For information on NAS storage, see [“Provisioning a VM from a NAS Repository” on page 66](#). For information on SAN storage, see [“The SAN Repository” on page 66](#).

---

When discovering VM Images, the adapters use the `location`, `searchpath` and `preferredpath` facts for searching. The `repository.location` is usually the root path, such as `/`. For Xen, the adapter creates a local repository with search paths of `/etc/xen/vm` and a preferred search path of `/var/lib/xen/images`.

When the Discover VM Images action is run, the [provisioning adapter](#) follows these steps:

- Concatenates the `repository.location` and every element of `repository.searchpath` and searches for VMs in those directories.
- Concatenates the `repository.location` and `repository.preferredpath` and searches for VMs in that directory.

These steps are also followed when searching in NAS and SAN repositories when representing auto-mounted file systems, and when the location, search path, and preferred path are set.

## 7.2 The Datagrid Repository

By default, a datagrid repository named `zos` is automatically created when the Orchestration Server is initialized. The datagrid repository represents VMs residing in the Orchestration datagrid, which is a storage area on the Orchestration Server.

The `zos` datagrid repository has a location of `grid:///vms`, which points to an area in the datagrid reserved for VM archival storage.

The datagrid repository storage is archival because VMs cannot be run from the datagrid repository. You must move VMs out of the datagrid to a VM Host in order to run them.

## 7.3 Provisioning a VM from a NAS Repository

The Network Attached Storage (NAS) repository represents VMs stored on a NAS. This is a storage area where VMs are visible to multiple VM hosts, so they can be run by any one of the connected hosts.

The following procedure shows an example of setting up a NAS repository. For the example, assume you have a Xen setup where the `/vms` directory is auto-mounted on multiple VM hosts as the shared storage location for your VMs.

- 1 To create a new Repository object, go to the Orchestration Console, then click *Actions > Create Repository*.
- 2 Specify a new name and choose which adapter group this repository is used for.  
This example is for Xen VMs, so choose the `xen30` adapter.
- 3 Close the dialog box to display the *Info/Groups* tab for the new repository.
- 4 Set the location path.  
This is the root path for the repository. It is usually `/`.
- 5 Set the search path and preferred path.  
In this example, the VMs are all in `/vms`, so leave `searchpath` empty and set the `preferredpath == "/vms"`.
- 6 Select the VM Host objects that have visibility to the shared directory and add the new repository to the VM hosts list of available repositories.  
To find a VM host, either select *VM Hosts* to open the VM Hosts admin view or open the *Physical* tree under *Resources* and open the physical host representing the VM host.
- 7 Run *Provision > Discover VM Images* on the new repository.

## 7.4 The SAN Repository

The Storage Area Network (SAN) repository is a single storage server that can be accessed by multiple machines. The Cloud Manager Orchestration Server does not support booting a VM from a SAN repository. SAN repositories can only be used as data disks for VMs.

---

# 8 Setting Up the Cloud Environment

The following sections provide information to help you set up your Cloud environment. The sections follow the same process and include the same information as the Getting Started view in the Cloud Manager console:

- ◆ Section 8.1, “Creating a Zone,” on page 69
- ◆ Section 8.2, “Creating Resource Groups Within the Zone,” on page 70
- ◆ Section 8.3, “Creating Service Levels for Resource Groups,” on page 72
- ◆ Section 8.4, “Creating an Organization,” on page 73
- ◆ Section 8.5, “Creating an Organization’s Business Groups,” on page 75
- ◆ Section 8.6, “Creating Users and Groups,” on page 76

## 8.1 Creating a Zone

A Cloud Manager zone is single Cloud Manager Orchestration Server and its managed resources (VM hosts, storage repositories, networks, and so forth). You create a zone by defining a connection from the Cloud Manager Application Server to the Cloud Manager Orchestration Server. After you create the zone, its resources become part of the Cloud environment that you can use to service your customers.

- 1 On the main navigation bar, click  *Getting Started*, then click *Create Zones* (in the *Set Up Your Cloud Environment* list).

or

On the main navigation bar, click  *Configuration*, click the *Zones* tab, then click *Create*.

- 2 Provide the following information:

**Name:** Provide a unique name for the zone. You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.

**Description:** If desired, add more information to further identify the zone. The description is displayed in the Cloud Manager console to all users.

**Enabled:** Do not change this setting. The zone should be enabled.

**Server Address:** Specify the DNS name or IP address of the Orchestration Server.

**Server Port:** Specify the port used by the Orchestration Server Web Service.

**Username:** Specify the Administrator user name that enables login to the Orchestration Server.

**Password:** Specify and confirm the password for the Administrator username.

**Secure Connection:** Select this option if the Cloud Manager Application Server is configured for an SSL connection to the Orchestration Server.

- 3 Click *OK* to create the zone and add it to the list.

For more information about zones, see [Chapter 9.1, “Managing Zones,”](#) on page 85.

## 8.2 Creating Resource Groups Within the Zone

A resource group defines a set of VM hosts that an organization can use for its business services. In addition to the VM hosts, the resource group includes one or more service levels that define the cost of the host resources (vCPUs, memory, storage, and networks) and the service objectives (availability, support response time, and so forth).

- ♦ [Section 8.2.1, “Resource Group Requirements,”](#) on page 70
- ♦ [Section 8.2.2, “Shared and Dedicated Resource Groups,”](#) on page 70
- ♦ [Section 8.2.3, “Creating a Resource Group,”](#) on page 70

### 8.2.1 Resource Group Requirements

All VM hosts that you include in a resource group must reside in the same Cloud Manager zone. Additionally, the hosts should be identical in terms of hypervisor technology, operating system version, network configuration, storage repository configuration, and hardware capabilities. This ensures a consistent environment for business services regardless of the host. It also ensures that the resource group’s service levels apply to all hosts.

As an example, you might create a Business Critical resource group that consists of high-performance hosts intended for mission-critical applications and services. You assign the resource group a Platinum service level with costs that reflect the more expensive hardware and service contract. Any business service that is provisioned to the resource group also inherits the resource and service costs.

Or, you might create a Lab resource group that consists of standard-performance hosts intended for software testing. You assign the resource group a Bronze service level with costs that reflect the less expensive hardware and service contract.

### 8.2.2 Shared and Dedicated Resource Groups

A resource group can be shared among multiple organizations, which means that each organization’s business services utilize the same resources, or a resource group can be assigned to only one organization, in which case only that organization’s business services consume the resources.

### 8.2.3 Creating a Resource Group

- 1 On the main navigation bar, click  *Getting Started*, then click *Create Resource Groups* (in the *Set Up Your Cloud Environment* list).

or

On the main navigation bar, click  *Resources*, click the *Resource Groups* tab, then click *Create*.

- 2 If your Cloud Manager system has multiple zones, the *Select Zone* dialog box is displayed. Select the zone that contains the resources you are grouping, then click *OK* to display the *Create Resource Group* dialog box.
- 3 In the *General* fields, provide the following information for the resource group:
  - Name:** Specify a unique name for the group. You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.

**Zone:** Displays the zone whose hosts you can add to the group. You cannot change this setting.

**Hypervisor:** Select the hypervisor technology for the group's hosts. You can add only those hosts that meet the hypervisor criteria.

**Workload Repository:** The *Default* setting causes a provisioned workload to be stored in the same repository as the VM template used to create it. If you want workloads provisioned to this resource group to be stored in a different shared repository, you must add hosts to the group (see [Step 4](#)), then come back and select the shared repository for the workloads. The Workload Repository list is populated only after you add hosts to the resource group.

**Group Type:** This applies only if VMware vSphere is the selected hypervisor. Select *Host* if you want the resource group to use hosts and host clusters. Select *Resource Pool* if you want the resource group to use a resource pool.

**Resource Pool:** If you specified *Resource Pool* as the group type, select the resource pool to include in the group.

**Description:** Provide any additional information for the resource group.

4 If the group type is *Host*, add hosts to the group:

4a Under *Associations*, click the *Hosts* tab.

4b Click *Add* to display the Add Hosts dialog box.

The list displays all available hosts and host clusters in the zone that meet the selected hypervisor criteria. Hosts that are already assigned to another resource group are not displayed.

4c Select the hosts.

You can Shift-click and Ctrl-click to select multiple hosts.

4d Click *OK* to add the selected hosts to the *Hosts* list.

5 Ignore the *Service Levels* tab.

At this point, there are no service levels to assign to the resource group. The next task is to create service levels (see [Chapter 8.3, "Creating Service Levels for Resource Groups," on page 72](#)). You assign service levels to resource groups at that time.

6 Ignore the *Networks* tab.

The *Networks* tab shows the networks associated with the hosts you added to the group. The list is view-only so you can't make any changes. However, the list is not generated until you save the resource group. If you want to see the networks at this time, click *Save*, double-click the resource group to open it again, then click the *Networks* tab.

7 Ignore the *Organizations* tab.

At this point, there are no organizations to assign the resource group to. You create organizations and assign resource groups to them later (see [Chapter 8.4, "Creating an Organization," on page 73](#)).

8 Click *Save* to add the resource group to the list.

For more information about resource groups, see [Chapter 13, "Managing Resources," on page 133](#).

## 8.3 Creating Service Levels for Resource Groups

A resource group has no costs associated with it until you create a service level and assign it to the resource group. The service level defines the cost of the host resources (vCPUs, memory, storage, and networks) and the cost of the service objectives (availability, support response time, and so forth).

You can use the same service level for multiple resource groups. For example, you might have two identical resource groups that require the same service level.

You can also assign multiple service levels to a single resource group. For example, you might create two service levels with the same resource costs but with different service support levels—the first with 24x7x365 support and the second with 12x5x365 support. The user, when requesting a business service, could select the desired service level.

- 1 On the main navigation bar, click  *Getting Started*, then click *Create Service Levels* (in the *Set Up Your Cloud Environment* list).

or

On the main navigation bar, click  *Resources*, click *Service Levels*, then click *Create*.

- 2 In the *General* section, provide the following details for the service level:

**Name:** Specify a unique name for the service level. This name is displayed in business service workloads.

You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.

**Creation Date:** Displays the current date.

**Description:** Provide any additional information for the service level.

- 3 In the *Monthly Resource Costs* fields, define the cost (per month) to use the host resources:

**vCPU:** Specify the cost per virtual CPU.

**Memory:** Specify the cost per megabyte (MB) of memory.

**Disk:** Specify the cost per gigabyte (GB) of disk space.

**Network:** Specify the cost per network interface card.

- 4 Assign the service level to the appropriate resource groups:

**4a** Under *Associations*, click the *Resource Groups* tab.

**4b** Click *Add* to display the Add Resource Groups dialog box.

**4c** Select the groups to add.

You can Shift-click and Ctrl-click to select multiple groups.

**4d** Click *OK*.

- 5 If you don't want to add service level objectives, click *Save*, then continue with the next task, ["Creating Workload Templates" on page 107](#).

or

If you want to add service level objectives, you must create them first. Click *Save* to save the service level, then do the following:

**5a** Click the *Service Level Objectives* link.

**5b** Click *Create* to display the Create Service Level Objective dialog box.

**5c** Provide the following information:

**Name:** Specify a name for the objective. This name is displayed in all business service workloads.

You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.

**Monthly Cost:** Specify the cost associated with the objective. If the objective does not have a cost, leave the field empty.

**Description:** Provide optional text to further identify the service level objective.

**Creation Date:** Displays the current date.

**Objective Type:** If this objective represents workload availability, select *Availability*. Otherwise, select *General*.

**Value:** If the objective type is *Availability*, specify the target availability as a percentage (for example, 99.9). If the objective type is *General*, specify an appropriate objective value.

**5d** Click *Save*.

**6** Add objectives to the service level:

**6a** Click the *Service Levels* link, select the service level, then click *Edit*.

**6b** Under *Associations*, click the *Service Level Objectives* tab.

**6c** Click *Add* to display the Add Service Level Objectives dialog box.

**6d** Select the objectives to add.

You can Shift-click and Ctrl-click to select multiple objectives.

**6e** Click *OK* to add the selected objectives to the *Service Level Objectives* list.

**6f** Click *Save*.

You can include the same objective in more than one service level.

## 8.4 Creating an Organization

An organization represents a tenant to which you are offering Cloud services. Through the organization, you make resource group assignments that dictate the hosts, service levels, repositories, and networks available to the organization, and make workload template assignments that determine the types of business service workloads available to the organization.

After you create an organization, you can define the organization's membership and assign roles such as Business Service Owner, Business Group Sponsor, and Organization Manager to those members. Membership and role assignments are covered in the next task, "[Creating Users and Groups](#)" on page 76.

**1** On the main navigation bar, click  *Getting Started*, then click *Create Organizations* (in the *Set Up Your Cloud Environment* list).

or

On the main navigation bar, click  *Organizations*, click the *Organizations* tab, then click *Create*.

**2** Provide the following details to define the organization:

**Name:** Specify a unique name for the organization. You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.

**Description:** Provide any additional information to identify the organization.

**Domains:** If you want to enable users to self-register in this organization, specify the e-mail domains associated with the organization.

Self-registration occurs when a valid LDAP user who does not have a Cloud Manager account first logs in. The user's e-mail domain is compared to the e-mail domains defined for the organization. If it matches one of the e-mail domains, the user is added to organization's Members list.

You can associate one or more e-mail domains with the organization. To specify multiple e-mail domains, separate the names with commas (for example, `netiq.com,novell.com,attachmate.com`).

**Discount %:** If you want a discount applied to all business services created by members of this organization, specify the discount percentage.

**Auto Approval:** When a user creates a business service request, the request goes through an approval workflow that includes both a Sponsor and an Administrator. The Sponsor is a member of the organization who provides the financial approval for the business service. The Administrator is a System user (such as yourself, another Cloud Administrator, or a Zone Administrator) who provides the resource capacity approval for the business service. You can use Auto Approval to bypass one or both of the approvals.

The organization inherits the Auto Approval settings from the Cloud Manager system settings (accessed through *Configuration* on the main navigation bar). To change the settings for the organization, click *Override*, then configure the settings as desired.

**Logo:** You can upload a logo file for the organization. Three formats are supported: PNG, JPG, and GIF. Any size is acceptable. Cloud Manager resizes the logo to a maximum of 216x216 pixels, maintaining the width-to-height proportions. For example, a 432x200 image would be resized to 216x100. The logo file is stored on the Cloud Manager Application Server.

To upload a file, mouse over *No Image*, then click *Upload New Image*. Browse for and select the image, then click *OK* to upload it to the Cloud Manager Application Server.

**3** Add the resource groups that you want the organization to have access to:

**3a** Under *Membership and Access*, click the *Resource Groups* tab.

**3b** Click *Add* to display the Add Resource Groups dialog box.

**3c** Select the resource groups you want to add.

You can Shift-click and Ctrl-click to select multiple groups.

**3d** Click *OK* to add the selected resource groups to the *Resource Groups* list.

**4** Add the workload templates that you want the organization to have access to:

**4a** Under *Membership and Access*, click the *Workload Templates* tab.

**4b** Click *Add* to display the Add Workload Templates dialog box.

**4c** Select the workload templates.

You can Shift-click and Ctrl-click to select multiple workload templates.

**4d** Click *OK* to add the selected workload templates to the *Workload Templates* list.

**5** Add the networks that you want the organization to have access to.

The available networks are determined by the VM hosts included in the resources group. However, to enable you to provide isolated networks for organizations that share the same resource group, the networks from a resource group are not automatically assigned to an organization when you add the resource group. Instead, you must separately add the networks you want assigned to the organization.

**5a** Under *Membership and Access*, click the *Networks* tab.

**5b** Click *Add* to display the Add Networks dialog box.

**5c** Select the networks.

You can Shift-click and Ctrl-click to select multiple workload templates.

- 5d Click *OK* to add the selected networks to the *Networks* list.
- 6 Ignore the *Users* tab and the *Business Groups* tab at this time.

The *Users* tab lets you add members to the organization and assign them roles within the organization. The *Business Groups* tab lets you view the sub-units that have been created for the organization. Creating business groups is covered in the next task, “[Creating an Organization’s Business Groups](#)” on page 75. Creating users is covered in [Chapter 8.6, “Creating Users and Groups,”](#) on page 76.

- 7 Click *Save* to create the organization and add it to the list.

For more information about organizations, see [Chapter 12, “Managing Organizations,”](#) on page 125.

## 8.5 Creating an Organization’s Business Groups

An organization includes one or more business groups. A business group represents a unit within the organization, such as a department or cost center, for which business services can be deployed.

A business group can be assigned access to all of an organization’s resources or only some of the resources. When a business service is created for a business group, it uses only the assigned resources. Multiple business groups can be assigned the same resources, which means that the resources become shared resources.

- 1 On the main navigation bar, click  *Getting Started*, then click *Create Business Groups* (in the *Set Up Your Cloud Environment* list).

or

On the main navigation bar, click  *Organizations*, click the *Business Groups* tab, then click *Create*.

- 2 Provide the following details to define the business group:

**Name:** Specify a unique name for the group. You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.

**Organization:** Select the organization where you want to add the business group.

**Description:** Provide any additional information to identify the business group.

**Auto Approval:** Business service requests require approval from both the group’s Sponsor and an administrator. The *Auto Approval* settings let you bypass one or both of the approvers.

The business group inherits the *Auto Approval* settings from its organization. To change the settings for the business group, click *Override*, then configure the settings as desired.

**Costs:** The business group inherits the *Costs* setting from its organization. To change the setting for the business group, click *Override*, then configure the setting as desired. The *Show* setting allows group members to see cost information for workloads. The *Hide* setting prevents group members from seeing cost information.

- 3 Add the resource groups that you want the business group to have access to:

- 3a Under *Membership and Access*, click the *Resource Groups* tab.

- 3b Click *Add* to display the Add Resource Groups dialog box.

The list displays the organization’s resource groups. A business group is limited to the resource groups assigned to its organization.

- 3c Select the resource groups you want to add.

You can Shift-click and Ctrl-click to select multiple groups.

**3d** Click *OK* to add the selected resource groups to the *Resource Groups* list.

**4** Add the workload templates that you want the business group to have access to:

**4a** Under *Membership and Access*, click the *Workload Templates* tab.

**4b** Click *Add* to display the Add Workload Templates dialog box.

The list displays the organization's workload templates. A business group is limited to the workload templates assigned to its organization.

**4c** Select the workload templates.

You can Shift-click and Ctrl-click to select multiple workload templates.

**4d** Click *OK* to add the selected workload templates to the *Workload Templates* list.

**5** Add the networks that you want the business group to have access to.

The available networks are determined by the VM hosts included in the resources groups you added in [Step 3](#). However, to enable you to provide isolated networks for business groups that share the same resource group, the networks from a resource group are not automatically assigned to a business group when you add the resource group. Instead, you must separately add the networks you want assigned to the business group.

**5a** Under *Membership and Access*, click the *Networks* tab.

**5b** Click *Add* to display the Add Networks dialog box.

The list displays the organization's networks. A business group is limited to the networks assigned to its organization.

**5c** Select the networks.

You can Shift-click and Ctrl-click to select multiple networks.

**5d** Click *OK* to add the selected networks to the *Networks* list.

**6** Ignore the *Users* tab and the *Business Services* tab at this time.

The *Users* tab lets you add members to the business group and assign them roles within the business group. The *Business Services* tab lets you view the business services that are currently deployed for the business unit. Creating users for the business group is covered in the next task, ["Creating Users and Groups" on page 76](#).

**7** Click *Save* to create the business group and add it to the list.

For more information about business groups, see [Chapter 12, "Managing Organizations," on page 125](#).

## 8.6 Creating Users and Groups

Access to Cloud Manager requires a Cloud Manager user account. Through the account, a user receives rights to perform various roles in the Cloud Manager system, in an organization, or in both. Rights can also be assigned to user groups to enable all members of the group to perform specific roles.

You can create users and groups by manually entering information or by importing information from your LDAP authentication source.

- ◆ [Section 8.6.1, "Manually Creating Users," on page 77](#)
- ◆ [Section 8.6.2, "Manually Creating User Groups," on page 78](#)
- ◆ [Section 8.6.3, "Importing Users from LDAP," on page 80](#)
- ◆ [Section 8.6.4, "Importing User Groups from LDAP," on page 81](#)

## 8.6.1 Manually Creating Users

- 1 On the main navigation bar, click  *Getting Started*, then click *Create Users and Groups* (in the *Set Up Your Cloud Environment* list).

or

On the main navigation bar, click  *Organizations*, then click the *Users* tab.

- 2 On the *Users* tab, click *Create* to display the Create User dialog box.

- 3 Provide the following details to define the user:

**Full Name:** Specify the user's full name as you want it to appear in NetIQ Cloud Manager.

**E-Mail Address:** Specify the user's e-mail address as defined in their LDAP authentication account. If necessary, you can specify more than one address; use commas to separate addresses.

The e-mail address enables the Cloud Manager system to send messages (tasks, notifications, and so forth) to the user as needed.

**Phone Number:** This field is optional. Specify a contact number if desired.

- 4 Select the user's scope:

**Organization:** An organization scope enables the user to perform roles within a specific organization. The roles are Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor.

To give the user an organization scope, select *Organization*, then select the organization in which to place the user.

**System:** A system scope enables the user to administer the Cloud Manager system. The roles are Approver, Build Administrator, Catalog Manager, Cloud Administrator, and Zone Administrator. In addition, a System user can be given any of the organization roles.

- 5 (Organization user only) If you want the user to always be able to view business service costs regardless of the *Costs* setting for a business group, select *Always show costs*.

An organization's or business group's *Costs* setting can be set to *Show* or *Hide*. The purpose of the *Always show costs* setting is to ensure that business service costs are always visible to the user even if the *Costs* setting is set to *Hide*.

For example, you might want to select this option for users who are Sponsors. This ensures that the users can always see costs even if the organization or business group is set to hide costs.

- 6 (System user only) Assign system-level roles to the user.

The system-level roles are Approver, Build Administrator, Catalog Manager, Cloud Administrator, and Zone Administrator. These roles can be assigned only to System users.

**6a** To assign the Approver, Build Administrator, Catalog Manager, or Cloud Administrator role, click the *System* tab, click *Add*, select the desired roles, then click *OK*.

**6b** To assign the Zone Administrator role, click the *Zone* tab, click *Add*, select the desired zone, then click *OK*.

- 7 Assign organization-level roles to the user.

The organization-level roles are Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor. The Approver and Build Administrator roles can be assigned only to System users. The other roles can be assigned to both System users and Organization users.

Several of the roles can be assigned at the organization, business group, or business service level. For example, you can make a user a Sponsor for a business group, in which case the user can approve requests for business services from that business group only. Or, you can make the user a Sponsor for the organization, in which case the user can approve requests for all business services in the organization.

- 7a** Click the *Organization* tab to add a role at the organization level, click the *Business Group* tab to add a role at the business group level, or click the *Business Service* tab to add a role at the business service level.
  - 7b** Click the role that you want to assign  
For example, if you selected the *Business Group* tab and you want to enable the user to create business services for the business group, click *Business Service Owner*.
  - 7c** Click *Add*, select the object (organization, business group, or business service) to which you want the role to apply, then click *OK* to add it to the list.
- 8** Ignore the *Membership* tab at this time.  
The *Membership* tab lets you add users to groups. You must create the groups first. This task is discussed in [“Manually Creating User Groups” on page 78](#) and [“Importing User Groups from LDAP” on page 81](#)
- 9** When you have finished assigning roles to the user, click *Save*.

For more information about users and roles, see [Chapter 10, “Setting Up and Managing Users,” on page 95](#).

## 8.6.2 Manually Creating User Groups

Rather than assign roles to individual users, you can create user groups and assign roles to the user groups. Users (and other user groups) that are added to a group inherit the group’s roles.

User group roles are cumulative. If you add a user to a group, the user retains its directly assigned roles and also gains the roles inherited from the group.

- 1** On the main navigation bar, click  *Getting Started*, then click *Create Users and Groups* (in the *Set Up Your Cloud Environment* list).  
or  
On the main navigation bar, click  *Organizations*.
- 2** Click the *User Groups* tab, then click *Create* to display the Create User Group dialog box.
- 3** Provide the following details to define the user group:  
**Full Name:** Specify the group’s full name as you want it to appear in NetIQ Cloud Manager.  
**E-Mail Address:** This field is optional. If you enter an e-mail address, any messages generated for the group’s roles are sent to the e-mail address. If you don’t enter an e-mail address, the messages are sent to the group members’ addresses.
- 4** Select the group’s scope:  
**Organization:** An organization scope enables the group to be assigned roles within a specific organization. The roles are Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor.  
To give the group an organization scope, select *Organization*, then select the organization in which to place the group.

**System:** A system scope enables the group to be assigned roles for the Cloud Manager system. The roles are Approver, Build Administrator, Catalog Manager, Cloud Administrator, and Zone Administrator. In addition, a System group can be given any of the organization roles.

**5** (System user groups only) Assign system-level roles to the group.

The system-level roles are Approver, Build Administrator, Catalog Manager, Cloud Administrator, and Zone Administrator. These roles can be assigned only to System user groups.

**5a** To assign the Approver, Build Administrator, Catalog Manager, or Cloud Administrator role, click the *System* tab, click *Add*, select the desired roles, then click *OK*.

**5b** To assign the Zone Administrator role, click the *Zone* tab, click *Add*, select the desired zone, then click *OK*.

**6** Assign organization-level roles to the group.

The organization-level roles are Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor. The Approver and Build Administrator roles can be assigned only to System user groups. The other roles can be assigned to both System and Organization user groups.

Several of the roles can be assigned at the organization, business group, or business service level. For example, you can make a user group a Sponsor for a business group, in which case the group members can approve requests for business services from that business group only. Or, you can make the user group a Sponsor for the organization, in which case the group members can approve requests for all business services in the organization.

**6a** Click the *Organization* tab to add a role at the organization level, click the *Business Group* tab to add a role at the business group level, or click the *Business Service* tab to add a role at the business service level.

**6b** Click the role that you want to assign.

For example, if you selected the *Business Group* tab and you want to enable the user group to create business services for the business group, click *Business Service Owner*.

**6c** Click *Add*, select the object (organization, business group, or business service) to which you want the role to apply, then click *OK* to add it to the list.

**7** Add members to the group:

**7a** Click the *Membership* tab.

**7b** Click *Members*, then click *Add* to display the Add Members dialog box.

**7c** Select the users and user groups you want to add to the group.

You can Shift-click and Ctrl-click to select multiple users and groups.

**7d** Click *OK* to add the users and user groups to the Members list.

**8** When you have finished assigning roles and adding members, click *Save*.

For more information about user groups and roles, see [Chapter 10, "Setting Up and Managing Users,"](#) on page 95.

## 8.6.3 Importing Users from LDAP

You can create users by importing information from your LDAP authentication source. You can import users as System or Organization users. After you import a user, you can assign roles to the user.

- 1 On the main navigation bar, click  *Getting Started*, then click *Create Users and Groups* (in the *Set Up Your Cloud Environment* list).

or

On the main navigation bar, click  *Organizations*.

- 2 If you want to import Organization users, click the *Organizations* tab, select the target organization for the import, click *Edit* to display the Edit Organization dialog box, then click *Import* (located above the *Members* list on the *Users* tab).

or

If you want to import System users, click  *Configuration* (on the main navigation bar) to display the System Configuration dialog box, click the *Users* tab, click the *Members* tab, then click *Import*.

- 3 Authenticate to the LDAP directory:

- 3a Click the *LDAP* tab.

- 3b In the *LDAP Location* section, fill in the following fields:

**Host:** Specify the FQDN (fully qualified domain name) or IP address of the host machine running the LDAP server. For example, `ldap.mycompany.com` or `123.45.67.8`.

**Port:** Specify the TCP port (on the host machine) where the LDAP server is listening for LDAP connections. The standard port for non-SSL connections is 389. The standard port for SSL connections is 636.

**Use SSL:** If the Cloud Manager Application Server is configured for an SSL connection to the LDAP server, select this option to enable the secure connection.

- 3c In the *Search Bind Account* section, fill in the following fields:

**DN:** Specify an account that has search rights to the directory location from which you want to import users. For example, `cn=Administrator, cn=Users, dc=MyCompany, dc=com`

**Password:** Specify the password for the account.

**Password Confirm:** Confirm the password for the account.

- 3d Click *Test Connection*.

If the connection is successful, the Test Status is displayed as *Passed*. If the connection is not successful, validate the connection information and try again.

- 4 Import users:

- 4a Click the *Import* tab.

- 4b Click *Add*.

When you click *Add*, a new import entry is added to the list. You use the fields below the list to define the entry.

- 4c In the DN field, use standard LDAP notation (`ou=provo, dc=netiq, dc=com`) to specify the distinguished name for the target container or object, then click *Validate*.

If you specify a container, all users located within the container are imported. If you only want to import one user, specify the DN of the user object.

- 4d If you specified a container for import, select *Users*.

**4e** If you specified a container for import, select *Scan Tree* if you want to import users located in its subcontainers.

**4f** Click *Import*.

The imported users are added to the *Members* list. Users are identified by the  icon.

**5** When you have finished importing users, click *OK* or *Save* to close the dialog box.

**6** Assign roles to the users:

**6a** On the main navigation bar, click *Organizations*.

**6b** Click the *Users* tab, select the user to whom you want to assign roles, then click *Edit*.

**6c** (System user only) Assign system-level roles.

The system-level roles are Approver, Build Administrator, Catalog Manager, Cloud Administrator, and Zone Administrator. These roles can be assigned only to System users.

**6c1** To assign the Approver, Build Administrator, Catalog Manager, or Cloud Administrator role, click the *System* tab, click *Add*, select the desired roles, then click *OK*.

**6c2** To assign the Zone Administrator role, click the *Zone* tab, click *Add*, select the desired zone, then click *OK*.

**6d** Assign organization-level roles.

The organization-level roles are Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor. The Approver and Build Administrator roles can be assigned only to System users. The other roles can be assigned to both System users and Organization users.

Several of the roles can be assigned at the organization, business group, or business service level. For example, you can make a user a Sponsor for a business group, in which case the user can approve requests for business services from that business group only. Or, you can make the user a Sponsor for the organization, in which case the user can approve requests for all business services in the organization.

**6d1** Click the *Organization* tab to add a role at the organization level, click the *Business Group* tab to add a role at the business group level, or click the *Business Service* tab to add a role at the business service level.

**6d2** Click the role that you want to assign

For example, if you selected the *Business Group* tab and you want to enable the user to create business services for the business group, click *Business Service Owner*.

**6d3** Click *Add*, select the object (organization, business group, or business service) to which you want the role to apply, then click *OK* to add it to the list.

**6e** When you have finished assigning roles to the user, click *Save*.

For more information about users and roles, see [Chapter 10, "Setting Up and Managing Users," on page 95](#).

## 8.6.4 Importing User Groups from LDAP

You can create user groups by importing them from your LDAP authentication source. After you import a group, you can assign roles to the group.

An imported user group's membership is maintained in the LDAP authentication source. Any users who are members of the user group in the LDAP source receive the roles that are assigned to the user group in Cloud Manager.

An imported user group's members are not imported and do not display in the group's *Members* list. In addition, you cannot manually add users or user groups to an imported group.

- 1 On the main navigation bar, click  *Getting Started*, then click *Create Users and Groups* (in the *Set Up Your Cloud Environment* list).

or

On the main navigation bar, click  *Organizations*.

- 2 If you want to import Organization user groups, click the *Organizations* tab, select the target organization for the import, click *Edit* to display the Edit Organization dialog box, then click *Import* (located above the *Members* list on the *Users* tab).

or

If you want to import System user groups, click  *Configuration* (on the main navigation bar) to display the System Configuration dialog box, click the *Users* tab, click the *Members* tab, then click *Import*.

- 3 Authenticate to the LDAP directory:

- 3a Click the *LDAP* tab.

- 3b In the *LDAP Location* section, fill in the following fields:

**Host:** Specify the FQDN (fully qualified domain name) or IP address of the host machine running the LDAP server. For example, `ldap.mycompany.com` or `123.45.67.8`.

**Port:** Specify the TCP port (on the host machine) where the LDAP server is listening for LDAP connections. The standard port for non-SSL connections is 389. The standard port for SSL connections is 636.

**Use SSL:** If the Cloud Manager Application Server is configured for an SSL connection to the LDAP server, select this option to enable the secure connection.

- 3c In the *Search Bind Account* section, fill in the following fields:

**User DN:** Specify an account that has read rights to the directory location from which you want to import users. For example, `cn=Administrator, cn=Users, dc=MyCompany, dc=com`

**Password:** Specify the password for the account.

**Password Confirm:** Confirm the password for the account.

- 3d Click *Test Connection*.

If the connection is successful, the Test Status is displayed as *Passed*. If the connection is not successful, validate the connection information try again.

- 4 Import user groups:

- 4a Click the *Import* tab.

- 4b Click *Add*.

When you click *Add*, a new import entry is added to the list. You use the fields below the list to define the entry.

- 4c In the DN field, use standard LDAP notation (`ou=provo, dc=netiq, dc=com`) to specify the distinguished name for the target container or object, then click *Validate*.

If you specify a container, all user groups located within the container are imported. If you only want to import one user group, specify the DN of the user group object.

- 4d If you specified a container for import, select *Groups*.

- 4e If you specified a container for import, select *Scan Tree* if you want to import user groups located in its subcontainers.

**4f** Click *Import*.

The imported user groups are added to the *Members* list. User groups are identified by the  icon.

**5** When you have finished importing user groups, click *OK* or *Save* to close the dialog box.

**6** Assign roles to the groups:

**6a** On the main navigation bar, click  *Organizations*.

**6b** Click the *Users* tab, select the user group to which you want to assign roles, then click *Edit*.

**6c** (System user groups only) Assign system-level roles.

The system-level roles are Approver, Build Administrator, Catalog Manager, Cloud Administrator, and Zone Administrator. These roles can be assigned only to System user groups.

**6c1** To assign the Approver, Build Administrator, Catalog Manager, or Cloud Administrator role, click the *System* tab, click *Add*, select the desired roles, then click *OK*.

**6c2** To assign the Zone Administrator role, click the *Zone* tab, click *Add*, select the desired zone, then click *OK*.

**6d** Assign organization-level roles.

The organization-level roles are Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor. The Approver and Build Administrator roles can be assigned only to System user groups. The other roles can be assigned to both System and Organization user groups.

Several of the roles can be assigned at the organization, business group, or business service level. For example, you can make a user group a Sponsor for a business group, in which case the group members can approve requests for business services from that business group only. Or, you can make the user group a Sponsor for the organization, in which case the group members can approve requests for all business services in the organization.

**6d1** Click the *Organization* tab to add a role at the organization level, click the *Business Group* tab to add a role at the business group level, or click the *Business Service* tab to add a role at the business service level.

**6d2** Click the role that you want to assign

For example, if you selected the *Business Group* tab and you want to enable the user group to create business services for the business group, click *Business Service Owner*.

**6d3** Click *Add*, select the object (organization, business group, or business service) to which you want the role to apply, then click *OK* to add it to the list.

**6e** When you have finished assigning roles to the user group, click *Save*.

For more information about user groups and roles, see [Chapter 10, "Setting Up and Managing Users,"](#) on page 95.

---

# 9 Configuring the Cloud Manager System

The following sections provide information to help configure and manage your Cloud Manager system:

- ◆ [Section 9.1, “Managing Zones,” on page 85](#)
- ◆ [Section 9.2, “Customizing the Capacity Thresholds and Data Refresh Interval,” on page 87](#)
- ◆ [Section 9.3, “Managing System Users, User Groups, and Roles,” on page 88](#)
- ◆ [Section 9.4, “Configuring E-Mail Notifications,” on page 88](#)
- ◆ [Section 9.5, “Configuring Remote Console Access to Workloads,” on page 89](#)
- ◆ [Section 9.6, “Configuring Auto Approval for Business Service Requests,” on page 92](#)
- ◆ [Section 9.7, “Customizing the Workload Update Schedule,” on page 92](#)
- ◆ [Section 9.8, “Customizing the Cloud Manager Console Interface,” on page 93](#)

## 9.1 Managing Zones

A Cloud Manager zone is single Cloud Manager Orchestration Server and its managed resources (VM hosts, storage repositories, networks, and so forth). The following sections provide instructions to help you manage your zones:

- ◆ [Section 9.1.1, “Creating Zones,” on page 85](#)
- ◆ [Section 9.1.2, “Disabling Zones,” on page 86](#)
- ◆ [Section 9.1.3, “Enabling Zones,” on page 86](#)
- ◆ [Section 9.1.4, “Removing Zones,” on page 87](#)

### 9.1.1 Creating Zones

---

**Roles that Can Perform This Task:** Cloud Administrator

---

A Cloud Manager zone is a single Cloud Manager Orchestration Server and its managed resources (VM hosts, storage repositories, networks, and so forth). You create a zone by defining a connection to the Orchestration Server. After you create the zone, its resources become part of the Cloud environment that you can use to service your customers.

- 1 On the main navigation bar, click  *Configuration*, click the *Zones* tab, then click *Create*.
- 2 Provide the following information:
  - Name:** Provide a unique name for the zone. You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.

**Description:** If desired, add more information to further identify the zone. The description is displayed in Cloud Manager to administrators only.

**Enabled:** Leave this setting selected.

**Server Address:** Specify the DNS name or IP address of the Orchestration Server.

**Server Port:** Specify the port used by the Orchestration Server Web Service.

**Username:** Specify the Administrator user name that enables login to the Orchestration Server.

**Password:** Specify and confirm the password for the user name you supplied.

**Secure Connection:** Select this option if the Cloud Manager Application Server is configured for an SSL connection to the Orchestration Server.

- 3 Click *OK* to create the zone and add it to the list.
- 4 When you have finished creating zones, click *OK* to close the System Configuration dialog box.

## 9.1.2 Disabling Zones

---

**Roles that Can Perform This Task:** Cloud Administrator

---

The primary purpose for disabling a zone is to perform maintenance tasks on the Cloud Manager Orchestration Server without receiving error messages and exceptions in the Cloud Manager console because the server is down. While the zone is disabled, the following occurs:

- ♦ Any objects (hosts, VM templates, and so forth) provided by the zone's Orchestration Server are no longer displayed in the Cloud Manager console. However, Cloud Manager objects (resource groups, service levels, workload templates, and so forth) are still displayed. A user receives a "Zone Disabled" error when adding, editing, or deleting any Cloud Manager object that includes an Orchestration Server object.
- ♦ Any workloads deployed in the zone continue in their current state (unless an issue with the zone causes them to be stopped). In the Cloud Manager console, a workload's state displays as "Unknown" and the owner cannot cycle the workload.

To disable a zone:

- 1 On the main navigation bar, click  *Configuration*, then click the *Zones* tab.
- 2 Select the zone to disable, then click *Edit*.
- 3 Deselect the *Enabled* check box.
- 4 Click *OK* to disable the zone.

## 9.1.3 Enabling Zones

---

**Roles that Can Perform This Task:** Cloud Administrator

---

To enable a zone:

- 1 On the main navigation bar, click  *Configuration*, then click the *Zones* tab.
- 2 Select the zone to enable, then click *Edit*.
- 3 Select the *Enabled* check box.

- 4 Provide the Administration password for the Cloud Manager Orchestration Server.
- 5 Click *OK* to enable the zone.

## 9.1.4 Removing Zones

---

**Roles that Can Perform This Task:** Cloud Administrator

---

You cannot remove a zone that has 1) business service workloads running in the zone, 2) business service requests in process, or 3) resource groups, service levels, and workload templates associated with the zone.

To remove a zone:

- 1 On the main navigation bar, click  *Configuration*, then click the *Zones* tab.
- 2 Select the zone to remove, then click *Remove*.  
If the *Remove* action is not available, the zone has workload templates or resource groups associated with it.
- 3 Click *Yes* to confirm removal of the zone.

## 9.2 Customizing the Capacity Thresholds and Data Refresh Interval

---

**Roles that Can Perform This Task:** Cloud Administrator

---

The Capacity view provides resource capacity and usage information for the organizations and zones in your system.

The Capacity view has two settings you can customize: *Thresholds* and *Data Refresh Interval*. *Thresholds* lets you set the Warning threshold and Problem threshold for used resource capacity. *Data Refresh Interval* lets you determine how often capacity data is collected.

- 1 On the main navigation bar, click  *Configuration*, then click the *Capacity* tab.
- 2 Under *Thresholds*, select the Warning and Problem thresholds you want for each resource (Memory, CPU, and Storage).

The Capacity view displays resource usage as a percentage of the total capacity. Visually, this is displayed as a horizontal bar ranging from 0 percent to 100 percent.

The Warning and Problem thresholds help you quickly see when resource usage is approaching your resource capacity. Up to the Warning threshold, usage is displayed as a green bar. When the Warning threshold is reached, usage is displayed as a yellow bar. When the Problem threshold is reached, usage is displayed as a red bar.

- 3 Under *Data Refresh Interval*, specify a frequency for collecting capacity data from your system.
  - 3a (Optional) Select *No Refresh* if you choose not to periodically refresh the data. This option keeps the original capacity data for display on the Capacity dashboard.
  - 3b (Optional) Select *Interval* to specify how frequently you want to initiate capacity data collection.

Keep in mind that data collection can be an intensive process. The frequency of data collection and the duration of data collection (which is dependent on the size of your system) could affect your system's performance. You should specify an interval that balances the need for up-to-date information against the potential impact to system performance while the Capacity engine is running.

The system must update the capacity data at least once before you can accurately estimate the interval. You can base your estimate on the data displayed in the Capacity Update dialog box when you select [Update](#) in the Capacity view.

- 3c (Optional) Select *Daily Time* to specify the time each day (based on the Cloud Manager Application Server's clock and time zone) when you want Cloud Manager to collect capacity data.
- 4 Click *OK* to save your change.

## 9.3 Managing System Users, User Groups, and Roles

---

**Roles that Can Perform This Task:** Cloud Administrator

---

You can add users and user groups to the system and then assign roles to the users and groups so that they can perform specific functions within the system or within organizations.

Users, user groups, and roles are covered in [Chapter 10, "Setting Up and Managing Users,"](#) on page 95.

## 9.4 Configuring E-Mail Notifications

---

**Roles that Can Perform This Task:** Cloud Administrator

---

Cloud Manager can send e-mail messages to remind task owners about tasks that need to be completed and to notify Business Service Owners of business services that are about to expire or that have expired. For Cloud Manager to do this, you must provide the connection information for an SMTP server to route the messages. You can also customize the schedule for the message notifications.

- 1 On the main navigation bar, click  *Configuration*, then click the *Notification* tab.
- 2 Configure the SMTP server connection:
  - Host:** Specify the IP address or DNS name of the host running the SMTP server.
  - Server Port:** Specify the port on which the SMTP server listens for incoming messages.
  - Use Authentication:** If the SMTP server requires an authentication user name and password, select this option, then specify the user name and password.
- 3 If desired, customize the schedule for task notifications:
  - Number of days allocated to complete a task:** Select how long a task owner has to complete a task before it becomes overdue. The default is 5 days.
  - Number of days before first reminder notification:** Select when a task owner receives the first reminder notification about the due date. The default is 3 days before the task due date.
  - Number of days between notifications:** Select how often, after the first reminder notification, a task owner receives follow-up notifications about the due date. The default is every day.

- 4 If desired, customize the schedule for business service expiration notifications:
  - Number of days before first expiration notification:** Select when a Business Service Owner receives the first e-mail that the business service is about to expire. The default is 7 days before the expiration date.
  - Number of days between notifications:** Select how often, after the initial notification, a Business Service Owner receives follow-up e-mails about the expiration date. The default is every day.
- 5 Click *OK*.

## 9.5 Configuring Remote Console Access to Workloads

The Cloud Manager console provides remote console access to business service workloads via an embedded Flash VNC application. The application can connect to workloads either directly or through a VNC repeater (proxy).

By default, the Cloud Manager console is configured to use the VNC repeater included with the Cloud Manager Application Server. Alternately, you can set up an external VNC repeater or configure the VNC application to connect directly to workloads. Each solution has advantages and disadvantages

Solution	Advantages	Disadvantages
Built-In Repeater	<ul style="list-style-type: none"> <li>◆ Minimal setup</li> <li>◆ Supports NAT and firewalls</li> <li>◆ If used with NAT or a firewall, use can be limited to Cloud Manager users</li> </ul>	<ul style="list-style-type: none"> <li>◆ VNC traffic flows through Cloud Manager Application Server, increasing workload on a single server</li> </ul>
External Repeater	<ul style="list-style-type: none"> <li>◆ Supports NAT and firewalls</li> <li>◆ Offloads VNC traffic from the Cloud Manager Application Server</li> <li>◆ Scalable by clustering the repeater</li> </ul>	<ul style="list-style-type: none"> <li>◆ Increased setup</li> <li>◆ VNC requests are not authenticated through Cloud Manager</li> </ul>
Direct Connection	<ul style="list-style-type: none"> <li>◆ Most scalable</li> </ul>	<ul style="list-style-type: none"> <li>◆ Each workload must include a VNC server</li> <li>◆ No support for NAT or firewalls</li> <li>◆ VNC requests are not authenticated through Cloud Manager</li> </ul>

The following sections provide instructions for configuring each of the remote console access solutions:

- ◆ [Section 9.5.1, “Disabling Remote Console Access,” on page 90](#)
- ◆ [Section 9.5.2, “Setting Up the Built-In VNC Repeater,” on page 90](#)
- ◆ [Section 9.5.3, “Setting Up an External VNC Repeater,” on page 90](#)
- ◆ [Section 9.5.4, “Setting Up Direct Connections,” on page 91](#)
- ◆ [Section 9.5.5, “Enabling Repeater SSL Encryption,” on page 91](#)

## 9.5.1 Disabling Remote Console Access

---

**Roles that Can Perform This Task:** Cloud Administrator

---

If you don't want users to be able to access workloads through the Cloud Manager console, you can disable remote console access. This disables remote console access to all workloads through the Cloud Manager console only. It does not disable VNC on the host or the workload.

- 1 On the main navigation bar, click  *Configuration*, then click the *Remote Console* tab.
- 2 In the *Connection* field, select *Disable*.
- 3 Click *OK*.

## 9.5.2 Setting Up the Built-In VNC Repeater

---

**Roles that Can Perform This Task:** Cloud Administrator

---

To have the Cloud Manager console use the built-in VNC repeater:

- 1 On the main navigation bar, click  *Configuration*, then click the *Remote Console* tab.
- 2 In the *Connection* field, select *Use built-in VNC repeater*.
- 3 If the VNC repeater requires a static port for reasons such as firewall support, specify the port in the *Repeater Port* field. Otherwise, leave the field blank so that the VNC repeater dynamically selects an available port when it starts.
- 4 Click *OK*.

## 9.5.3 Setting Up an External VNC Repeater

---

**Roles that Can Perform This Task:** Cloud Administrator

---

To have the Cloud Manager console use an external VNC repeater:

- 1 Install the VNC repeater by using the product's documentation.
- 2 Configure the repeater to respond to both Flash policy requests and VNC proxy requests.
- 3 In the Cloud Manager console, configure the remote console to use the external repeater:
  - 3a On the main navigation bar, click  *Configuration*, then click the *Remote Console* tab.
  - 3b In the *Connection* field, select *Use external VNC repeater*.
  - 3c In the *Repeater Address* field, specify the DNS or IP address of the VNC repeater's server.
  - 3d In the *Repeater Port* field, specify the port assigned to the repeater.
  - 3e Click *OK*.

## 9.5.4 Setting Up Direct Connections

---

**Roles that Can Perform This Task:** Cloud Administrator

---

To have the Cloud Manager console connect directly to workloads:

- 1 Make sure that each VM host or VM is configured with a VNC Server.  
Depending on the hypervisor, the VM host might handle the VNC requests for the VM or the VM might handle the requests. Refer to your hypervisor documentation for information about how your hypervisor handles VNC requests to VMs.
- 2 Configure the VNC Server to respond to Flash policy requests.
- 3 In the Cloud Manager console, configure the remote console to use a direct connection:
  - 3a On the main navigation bar, click  *Configuration*, then click the *Remote Console* tab.
  - 3b In the *Connection* field, select *Connect directly*.
  - 3c Click *OK*.

## 9.5.5 Enabling Repeater SSL Encryption

---

**Roles that Can Perform This Task:** Cloud Administrator

---

To enable SSL encryption of VNC traffic between your browser and the VNC repeater (making it difficult for an outside entity to intercept and analyze activity between your browser and the repeater):

- 1 On the main navigation bar, click  *Configuration*, then click the *Remote Console* tab.
- 2 Select the *Enable Repeater SSL Encryption* check box.
- 3 In the *Repeater Keystore* field, enter the path to a Java keystore where the SSL key to the VNC Repeater is stored.  
By default, this field is populated from the original Cloud Manager SSL configuration (if that option was chosen).
- 4 In the *Keystore Password* field, enter the password to the Java keystore where the SSL key to the VNC Repeater is stored.  
By default, this field is populated from the original Cloud Manager SSL configuration (if that option was chosen).
- 5 (Conditional) If you select the built-in repeater, specify the path to the repeater keystore and passwords. The first password (required) opens the keystore file. The second password (optional) retrieves the private key within the file. The need for the second password depends on the settings you used when you generated the keystore.

---

**NOTE:** The fields on this page validate the keystore and passwords as you make changes: if you enter an incorrect password, the field displays a red asterisk.

---

- 6 Click *OK*.

## 9.6 Configuring Auto Approval for Business Service Requests

---

**Roles that Can Perform This Task:** Cloud Administrator

---

When a business service request is submitted, the request goes through an approval workflow that requires both a Sponsor approval and an Administrator approval. The Sponsor approval is intended to be a financial check and the Administrator approval is intended to be a resource capacity check.

You can enable automatic Sponsor approval, Administrator approval, or both for your system. This eliminates the need to assign users as Sponsors and Approvers for organizations or business group. If you don't want the system settings to apply to an organization or a business group, you can override the settings at the organization or business group.

To configure the system Auto Approval settings:

- 1 On the main navigation bar, click  *Configuration*, then click the *Tasks* tab.
- 2 Select *Sponsor* to enable automatic Sponsor approval.
- 3 Select *Administrator* to enable automatic Administrator approval.
- 4 Click *OK* to save the changes.

## 9.7 Customizing the Workload Update Schedule

---

**Roles that Can Perform This Task:** Cloud Administrator

---

When a business service is deployed, Cloud Manager takes a snapshot of the business service's workloads. This snapshot maintains a record of the service levels, resource allocations, and costs associated with the workloads at deployment time.

For business services with an expiration date, the snapshot is updated only if the business service is changed and redeployed. At that time, Cloud Manager takes a new snapshot that reflects any changes to the service levels, resource allocations, and costs associated with the workloads. For example, if the cost of the resources has increased since the first deployment, the second deployment reflects the cost increase.

For business services without an expiration date, you can determine when workload snapshots are updated so that non-expiring business services accurately reflect changes in the service levels, resource allocations, and costs associated with their workloads. You can update workloads either weekly or monthly. The update occurs on the last day of the selected period. You can also force an immediate update.

- 1 On the main navigation bar, click  *Configuration*, then click the *Workload Updates* tab.
- 2 Select *Weekly* or *Monthly* for the update frequency.
- 3 If you want to force an update immediately, click *Update Now*.
- 4 Click *OK*.

## 9.8 Customizing the Cloud Manager Console Interface

---

**Roles that Can Perform This Task:** Cloud Administrator

---

The Cloud Manager console has two interface settings that you can customize: *Currency* and *Workload Dialog*. *Currency* determines the display symbol that is used in Cloud Manager currency fields. *Workload Dialog* determines which tabs (*Windows Settings*, *Windows Licensing*, *Linux Settings*, and *Networks*) are displayed when creating and managing business service workloads.

- 1 On the main navigation bar, click  *Configuration*, then click the *User Interface* tab.
- 2 Under *Currency*, select the currency symbol you want to use.

This setting affects only the display symbol. It does not affect the format of the currency fields. All fields are formatted as 00.00 regardless of the currency symbol. In addition, changing the currency symbol does not perform any currency conversion on existing costs (workloads, workload templates, resources, and so on). For example, if you change from United States Dollar (USD) to Euro (EUR), \$50.00 simply becomes €50.00.

Any users who log in after the change see the new currency symbol. For you to see the change, you must log out and then log in again.

- 3 Under *Workload Dialog*, select the workload tabs you want hidden.

A workload contains *Windows Settings*, *Windows Licensing*, *Linux Settings*, and *Networks* tabs that must be configured when requesting a business service. By default, these are displayed so that the user can fill in the required information.

If you don't want to require the user to provide this information, you can hide any or all of the tabs. The Build Administrator or a Cloud Administrator must then provide the information when completing the pre-build configuration task for the requested business service.

All organizations inherit this setting; however, you can override the inherited setting at each organization.

- 4 Under *Workload Dialog*, specify whether the entering the virtual machine name is to be mandatory for pre-configuration.
- 5 Click *OK* to save your change.

---

# 10 Setting Up and Managing Users

The following sections provide information to help you manage the users and user groups in your Cloud environment:

- ◆ [Section 10.1, “Creating User Accounts,” on page 95](#)
- ◆ [Section 10.2, “Providing Self Registration for Users,” on page 99](#)
- ◆ [Section 10.3, “Creating User Groups,” on page 100](#)
- ◆ [Section 10.4, “Assigning Roles to Users and Groups,” on page 104](#)
- ◆ [Section 10.5, “Deleting Users,” on page 105](#)
- ◆ [Section 10.6, “Deleting User Groups,” on page 106](#)

## 10.1 Creating User Accounts

Access to Cloud Manager requires a Cloud Manager user account. Through the account, a user receives rights to perform various roles in the Cloud Manager system, in an organization, or in both.

There are two types of user accounts: System and Organization. A System account enables a user to be assigned system-level roles (Approver, Build Administrator, Catalog Manager, Cloud Administrator, and Zone Administrator) and organization-level roles (Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor). You can also create accounts for Organization users. Organization users can be assigned organization-level roles only.

You can create users by manually entering information or by importing information from your LDAP authentication source.

- ◆ [Section 10.1.1, “Manually Creating System and Organization Users,” on page 95](#)
- ◆ [Section 10.1.2, “Importing System Users from LDAP,” on page 96](#)
- ◆ [Section 10.1.3, “Importing Organization Users from LDAP,” on page 97](#)

### 10.1.1 Manually Creating System and Organization Users

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager (Organization users only)

---

The following steps explain how to create users by manually entering their information. For information about creating users by importing their information from your LDAP authentication source, see [“Importing System Users from LDAP” on page 96](#) and [Section 10.1.3, “Importing Organization Users from LDAP,” on page 97](#).

- 1 On the main navigation bar, click  *Organizations*.
- 2 Click the *Users* tab, then click *Create* to display the Create User dialog box.
- 3 Provide the following details to define the user:

**Full Name:** Specify the user's full name as you want it to appear in Cloud Manager.

**E-Mail Address:** Specify the user's e-mail address as defined in their LDAP authentication account. If necessary, you can specify more than one address; use commas to separate addresses.

The e-mail address enables the Cloud Manager system to send messages (tasks, notifications, and so forth) to the user as needed.

If LDAP is being used for authentication (without Access Manager or Cloud Security Services), the e-mail address is also used for login.

**Phone Number:** This field is optional. Specify a contact number if desired.

**4** Select the user's scope:

**Organization:** An organization scope enables the user to perform roles within a specific organization. The roles are Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor.

To give the user an organization scope, select *Organization*, then select the organization in which to place the user.

**System:** A system scope enables the user to administer the Cloud Manager system. The roles are Approver, Build Administrator, Catalog Manager, Cloud Administrator, and Zone Administrator. In addition, a System user can be given any of the organization roles.

**5** Add the user to user groups.

When you add a user to a group, the user inherits the roles assigned to the group.

**5a** Click the *Membership* tab.

**5b** Click *Add*, select the desired user groups, then click *OK*.

You can Shift-click and Ctrl-click to select multiple groups.

**6** Click *Save* to add the user to the *Users* list.

**7** To assign roles to the user, see [Assigning Roles to Users and Groups](#).

## 10.1.2 Importing System Users from LDAP

---

**Roles that Can Perform This Task:** Cloud Administrator

---

The following steps explain how to create System users by importing information from your LDAP authentication source. For information about creating System users by manually entering information, see [“Manually Creating System and Organization Users” on page 95](#).

**1** On the main navigation bar, click  *Configuration*.

**2** Click the *Users* tab, click *Members*, then click *Import*.

**3** Authenticate to the LDAP directory:

**3a** Click the *LDAP* tab.

**3b** In the *LDAP Location* section, fill in the following fields:

**Host:** Specify the FQDN (fully qualified domain name) or IP address of the host machine running the LDAP server. For example, `ldap.mycompany.com` or `123.45.67.8`.

**Port:** Specify the TCP port (on the host machine) where the LDAP server is listening for LDAP connections. The standard port for non-SSL connections is 389. The standard port for SSL connections is 636.

**Use SSL:** If the Cloud Manager Application Server is configured for an SSL connection to the LDAP server, select this option to enable the secure connection.

**3c** In the *Search Bind Account* section, fill in the following fields:

**DN:** Specify the distinguished name of an account that has search rights to the directory location from which you want to import users. For example, `cn=Administrator, cn=Users, dc=MyCompany, dc=com`

**Password:** Specify the password for the account.

**Confirm Password:** Confirm the password for the account.

**3d** Click *Test Connection*.

If the connection is successful, the Test Status is displayed as *Passed*. If the connection is not successful, validate the connection information and try again.

**4** Import users:

**4a** Click the *Import* tab.

**4b** Click *Add*.

When you click *Add*, a new import entry is added to the list. You use the fields below the list to define the entry.

**4c** In the *DN* field, use standard LDAP notation (`ou=provo, dc=netiq, dc=com`) to specify the distinguished name for the target container or object, then click *Validate*.

If you specify a container, all users located within the container are imported. If you only want to import one user, specify the DN of the user object.

**4d** If you specified a container for import, select *Users*.

**4e** If you specified a container for import, select *Scan Tree* if you want to import users located in its subcontainers.

**4f** Click *Import*.

The imported users are added to the *Members* list. Users are identified by the  icon.

**5** Click *OK* to close the System Configuration dialog box.

**6** To assign roles to a user, see [Assigning Roles to Users and Groups](#).

## 10.1.3 Importing Organization Users from LDAP

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

The following steps explain how to create Organization users by importing information from your LDAP authentication source. For information about creating Organization users by manually entering information, see [“Manually Creating System and Organization Users” on page 95](#).

**1** On the main navigation bar, click  *Organizations*.

**2** Click the *Organizations* tab, select the target organization for the import, click *Edit* to display the Edit Organization dialog box.

**3** On the *Users* tab, click *Members*, then click *Import*.

**4** Authenticate to the LDAP directory:

**4a** Click the *LDAP* tab.

**4b** In the *LDAP Location* section, fill in the following fields:

**Host:** Specify the FQDN (fully qualified domain name) or IP address of the host machine running the LDAP server. For example, `ldap.mycompany.com` or `123.45.67.8`.

**Port:** Specify the TCP port (on the host machine) where the LDAP server is listening for LDAP connections. The standard port for non-SSL connections is 389. The standard port for SSL connections is 636.

**Use SSL:** If the Cloud Manager Application Server is configured for an SSL connection to the LDAP server, select this option to enable the secure connection.

**4c** In the *Search Bind Account* section, fill in the following fields:

**DN:** Specify the distinguished name of an account that has search rights to the directory location from which you want to import users. For example, `cn=Administrator, cn=Users, dc=MyCompany, dc=com`

**Password:** Specify the password for the account.

**Confirm Password:** Confirm the password for the account.

**4d** Click *Test Connection*.

If the connection is successful, the Test Status is displayed as *Passed*. If the connection is not successful, validate the connection information and try again.

**5** Import users:

**5a** Click the *Import* tab.

**5b** Click *Add*.

When you click *Add*, a new import entry is added to the list. You use the fields below the list to define the entry.

**5c** In the *DN* field, use standard LDAP notation (`ou=provo, dc=netiq, dc=com`) to specify the distinguished name for the target container or object, then click *Validate*.

If you specify a container, all users located within the container are imported. If you only want to import one user, specify the DN of the user object.

**5d** If you specified a container for import, select *Users*.

**5e** If you specified a container for import, select *Scan Tree* if you want to import users located in its subcontainers.

**5f** Click *Import*.

The imported users are added to the *Members* list. Users are identified by the  icon.

**6** Assign roles to a user.

An Organization user can be assigned roles at the organization level, business group level, or business service level. If you want to assign an imported user a role at the organization level, continue with the following steps. If you want to assign roles at the other two levels, exit the dialog box and see [Assigning Roles to Users and Groups](#).

Users must be given roles in order to do anything in the organization. There are six roles that apply at the organization level: Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor.

Role assignments at the organization level are inherited by the organization's business groups. For example, if you give a user the Business Service Owner role for an organization, the user can create business services for any business group in the organization. If you want to limit the user to a role in specific business group, you must make the role assignment in the business group.

**6a** Click the role (*Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, or Sponsor*) that you want to assign to a user.

**6b** Click *Add*.

Depending on the role that you are adding, the selection dialog box can contain two lists: *Members* and *System Users*. The *Members* list includes all members of the organization and the *System Users* list includes all Cloud Manager System users.

**6c** Select the users you want to add, then click *OK*.

You can Shift-click and Ctrl-click to select multiple users.

**7** Click *Save* to close the Edit Organization dialog box.

## 10.2 Providing Self Registration for Users

You can enable user accounts to be created automatically the first time valid LDAP users log in to the Cloud Manager Application Console. This process, referred to as self registration, requires you to associate users' domain names with the Cloud Manager system (for registering System users) or with organizations (for registering Organization users). For example, if you associated the `netiq.com` domain name with your system, any user who logged in with `netiq.com` in their e-mail address would be made a System user.

The following sections explain how to set up self registration and how to automate role assignments for self-registering users:

- ♦ [Section 10.2.1, "Setting Up Self Registration for System Users," on page 99](#)
- ♦ [Section 10.2.2, "Setting Up Self Registration for Organization Users," on page 99](#)
- ♦ [Section 10.2.3, "Automating Role Assignments to Self-Registered Users," on page 100](#)

### 10.2.1 Setting Up Self Registration for System Users

---

**Roles that Can Perform This Task:** Cloud Administrator

---

- 1 On the main navigation bar, click  *Configuration*.
- 2 Click the *Users* tab.
- 3 In the *Domains* field, specify the e-mail domains that you want registered to the system.  
For example, if you want all users who log in with e-mail addresses that include the `netiq.com` or `novell.com` domain names, specify `netiq.com,novell.com`. Use a comma to separate domain names.
- 4 Click *OK* to save your changes.

### 10.2.2 Setting Up Self Registration for Organization Users

---

**Roles that Can Perform This Task:** Cloud Administrator

---

- 1 On the main navigation bar, click  *Organizations*.
- 2 On the *Organizations* tab, select the organization for which you want to set up self registration, then click *Edit*.
- 3 In the *Domains* field, specify the e-mail domains that you want registered to the organization.  
For example, if you want all users who log in with e-mail addresses that include the `suse.com` domain name, specify `suse.com`. If you specify multiple domains, use a comma to separate domain names.
- 4 Click *OK* to save your changes.

## 10.2.3 Automating Role Assignments to Self-Registered Users

---

**Roles that Can Perform This Task:** Cloud Administrator

---

When a user self registers, his or her user account is created without any role assignments. You can manually assign roles to the user after the account is created, but this negates much of the administrative benefit gained by allowing the user to self register.

To receive the maximum benefit of self registration, you can assign roles to users through the use of LDAP user groups. By assigning roles to LDAP user groups, you can ensure that LDAP users who are members of those groups automatically inherit those roles when they self register.

To automate role assignments for self-registered users:

- 1 In your LDAP source, create the LDAP user groups you want.

For example, in the LDAP directory used for authenticating System users, you could create an LDAP user group for Cloud Administrators, another for Zone Administrators, and another for Build Administrators. In the LDAP directory used for authenticating an organization's users, you could create LDAP user groups for Organization Managers and Business Service Owners.

- 2 Add the appropriate LDAP users to each LDAP user group.

For example, if you created a Business Service Owners group, add the users who are Business Service Owners for the organization.

- 3 Add the LDAP user groups to Cloud Manager using one of the following methods:

- ♦ Import the user group information from LDAP. For instructions, see [“Importing System User Groups from LDAP” on page 101](#) and [“Importing Organization User Groups from LDAP” on page 103](#).
- ♦ Create the user groups by manually adding group information, including the distinguished name of the user group in LDAP. For instructions, see [“Manually Creating System and Organization User Groups” on page 101](#).

- 4 Assign roles to the user groups. For instructions, see [“Assigning Roles to Users and Groups” on page 104](#).

## 10.3 Creating User Groups

Rather than assign roles to individual users, you can create user groups and assign roles to the user groups. Users who are added to a group inherit the group's roles.

User group roles are cumulative. If you add a user to a group, the user retains its directly assigned roles and also gains the roles inherited from the group.

As with users, there are two types of user groups: System and Organization. A System group can be assigned system-level roles (Approver, Build Administrator, Catalog Manager, Cloud Administrator, and Zone Administrator) and organization-level roles (Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor). An Organization user group can be assigned organization-level roles only.

You can create user groups by manually entering information or by importing information from your LDAP authentication source.

- ♦ [Section 10.3.1, “Manually Creating System and Organization User Groups,”](#) on page 101
- ♦ [Section 10.3.2, “Importing System User Groups from LDAP,”](#) on page 101
- ♦ [Section 10.3.3, “Importing Organization User Groups from LDAP,”](#) on page 103

## 10.3.1 Manually Creating System and Organization User Groups

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager (Organization users only)

---

The following steps explain how to create user groups by manually entering information. For information about creating user groups by importing information from your LDAP authentication source, see [“Importing System User Groups from LDAP”](#) on page 101 and [Section 10.1.3, “Importing Organization Users from LDAP,”](#) on page 97.

- 1 On the main navigation bar, click  *Organizations*.
- 2 Click the *User Groups* tab, then click *Create* to display the Create User Group dialog box.
- 3 Provide the following details to define the user group:
  - Full Name:** Specify the group’s full name as you want it to appear in Cloud Manager.
  - E-Mail Address:** This field is optional. If you enter an e-mail address, any messages generated for the group’s roles are sent to the e-mail address. If you don’t enter an e-mail address, the messages are sent to the group members’ addresses.
- 4 In the *Scope* field, select *System*.
- 5 In the *Type* field, select the group’s type:
  - ♦ **LDAP DN:** Select this option to specify an LDAP group. The group’s membership is maintained in the LDAP source. You cannot add users to the group in Cloud Manager. Use standard LDAP notation to specify the distinguished name of the user group in the LDAP source (for example, `cn=orgmanagers,dc=provo,dc=netiq,dc=com`).
  - ♦ **Cloud Manager:** Select this option to create a user group that exists only in Cloud Manager. You maintain the group membership in Cloud Manager. The group can include both users and other groups (including LDAP user groups).
- 6 Add members to the group:
  - 6a Click the *Membership* tab.
  - 6b Click *Members*, then click *Add* to display the Add Members dialog box.
  - 6c Select the users and user groups you want to add to the group.

You can Shift-click and Ctrl-click to select multiple users and groups.
  - 6d Click *OK* to add the users and user groups to the Members list.
- 7 Click *Save*.
- 8 To assign roles to the user, see [Assigning Roles to Users and Groups](#).

## 10.3.2 Importing System User Groups from LDAP

---

**Roles that Can Perform This Task:** Cloud Administrator

---

The following steps explain how to create System user groups by importing information from your LDAP authentication source. For information about creating Organization user groups by manually entering information, see [“Manually Creating System and Organization User Groups”](#) on page 101.

An imported user group’s membership is maintained in the LDAP authentication source. Any users who are members of the user group in the LDAP source receive the roles that are assigned to the user group in Cloud Manager.

An LDAP user group’s members are not imported to Cloud Manager and do not display in the group’s *Members* list. In addition, you cannot manually add users or user groups to an imported group.

- 1 On the main navigation bar, click  *Configuration*.
- 2 Click the *Users* tab, click *Members*, then click *Import*.
- 3 Authenticate to the LDAP directory:
  - 3a Click the *LDAP* tab.
  - 3b In the *LDAP Location* section, fill in the following fields:
    - Host:** Specify the FQDN (fully qualified domain name) or IP address of the host machine running the LDAP server. For example, `ldap.mycompany.com` or `123.45.67.8`.
    - Port:** Specify the TCP port (on the host machine) where the LDAP server is listening for LDAP connections. The standard port for non-SSL connections is 389. The standard port for SSL connections is 636.
    - Use SSL:** If the Cloud Manager Application Server is configured for an SSL connection to the LDAP server, select this option to enable the secure connection.
  - 3c In the *Search Bind Account* section, fill in the following fields:
    - User DN:** Specify an account that has read rights to the directory location from which you want to import users. For example, `cn=Administrator, cn=Users, dc=MyCompany, dc=com`
    - Password:** Specify the password for the account.
    - Password Confirm:** Confirm the password for the account.
  - 3d Click *Test Connection*.
    - If the connection is successful, the Test Status is displayed as *Passed*. If the connection is not successful, validate the connection information and try again.
- 4 Import user groups:
  - 4a Click the *Import* tab.
  - 4b Click *Add*.
    - When you click *Add*, a new import entry is added to the list. You use the fields below the list to define the entry.
  - 4c In the DN field, use standard LDAP notation (`ou=provo, dc=netiq, dc=com`) to specify the distinguished name for the target container or object, then click *Validate*.
    - If you specify a container, all user groups located within the container are imported. If you only want to import one user group, specify the DN of the user group object.
  - 4d If you specified a container for import, select *Groups*.
  - 4e If you specified a container for import, select *Scan Tree* if you want to import user groups located in its subcontainers.
  - 4f Click *Import*.
    - The imported user groups are added to the *Members* list. User groups are identified by the  icon.

- 5 Click *Save* to close the System Configuration dialog box.
- 6 To assign roles to a user group, see [Assigning Roles to Users and Groups](#).

### 10.3.3 Importing Organization User Groups from LDAP

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

The following steps explain how to create Organization user groups by importing information from your LDAP authentication source. For information about creating Organization user groups by manually entering information, see [“Manually Creating System and Organization Users” on page 95](#).

An imported user group’s membership is maintained in the LDAP authentication source. Any users who are members of the user group in the LDAP source receive the roles that are assigned to the user group in Cloud Manager.

An LDAP user group’s members are not imported to Cloud Manager and do not display in the group’s *Members* list. In addition, you cannot manually add users or user groups to an imported group.

- 1 On the main navigation bar, click  *Organizations*.
- 2 Click the *Organizations* tab, select the target organization for the import, click *Edit* to display the Edit Organization dialog box.
- 3 On the *Users* tab, click *Members*, then click *Import*.
- 4 Authenticate to the LDAP directory:
  - 4a Click the *LDAP* tab.
  - 4b In the *LDAP Location* section, fill in the following fields:
    - Host:** Specify the FQDN (fully qualified domain name) or IP address of the host machine running the LDAP server. For example, `ldap.mycompany.com` or `123.45.67.8`.
    - Port:** Specify the TCP port (on the host machine) where the LDAP server is listening for LDAP connections. The standard port for non-SSL connections is 389. The standard port for SSL connections is 636.
    - Use SSL:** If the Cloud Manager Application Server is configured for an SSL connection to the LDAP server, select this option to enable the secure connection.
  - 4c In the *Search Bind Account* section, fill in the following fields:
    - DN:** Specify the distinguished name of an account that has search rights to the directory location from which you want to import users. For example, `cn=Administrator, cn=Users, dc=MyCompany, dc=com`
    - Password:** Specify the password for the account.
    - Confirm Password:** Confirm the password for the account.
  - 4d Click *Test Connection*.
    - If the connection is successful, the Test Status is displayed as *Passed*. If the connection is not successful, validate the connection information and try again.
- 5 Import user groups:
  - 5a Click the *Import* tab.
  - 5b Click *Add*.

When you click *Add*, a new import entry is added to the list. You use the fields below the list to define the entry.

- 5c** In the *DN* field, use standard LDAP notation (*ou=provo,dc=netiq,dc=com*) to specify the distinguished name for the target container or object, then click *Validate*.

If you specify a container, all user groups located within the container are imported. If you only want to import one user group, specify the DN of the user group object.

- 5d** If you specified a container for import, select *Groups*.

- 5e** If you specified a container for import, select *Scan Tree* if you want to import users located in its subcontainers.

- 5f** Click *Import*.

The imported user groups are added to the *Members* list. User groups are identified by the  icon.

- 6** Assign roles to a user group.

An Organization user group can be assigned roles at the organization level, business group level, or business service level. If you want to assign an imported user group a role at the organization level, continue with the following steps. If you want to assign roles at the other two levels, exit the dialog box and see [Assigning Roles to Users and Groups](#).

User groups must be given roles in order for group members to do anything in the organization. There are six roles that apply at the organization level: Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor.

Role assignments at the organization level are inherited by the organization's business groups. For example, if you give a group the Business Service Owner role for an organization, the group members can create business services for any business group in the organization. If you want to limit the user group to a role in specific business group, you must make the role assignment in the business group.

- 6a** Click the role (*Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, or Sponsor*) that you want to assign to a user group.

- 6b** Click *Add*.

Depending on the role that you are adding, the selection dialog box can contain two lists: *Members* and *System Users*. The *Members* list includes all members of the organization and the *System Users* list includes all Cloud Manager System users.

- 6c** Select the user groups you want to add, then click *OK*.

You can Shift-click and Ctrl-click to select multiple groups.

- 7** Click *Save* to close the Edit Organization dialog box.

## 10.4 Assigning Roles to Users and Groups

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager (Organization users only)

---

System users and user groups can be assigned both system-level roles (Approver, Build Administrator, Catalog Manager, Cloud Administrator, and Zone Administrator) and organization-level roles (Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor). Organization users can be assigned organization-level roles only.

For role descriptions, see “[Cloud Manager Roles](#)” in the *NetIQ Cloud Manager Product Overview*.

- 1 On the main navigation bar, click  *Organizations*.
- 2 To assign a role to a user, click the *Users* tab, select the user, then click *Edit* to display the Edit User dialog box.  
or  
To assign a role to a user group, click the *User Groups* tab, select the user group, then click *Edit* to display the Edit User Group dialog box.
- 3 (System user or group only) Assign system-level roles.  
The system-level roles are Approver, Build Administrator, Catalog Manager, Cloud Administrator, and Zone Administrator. These roles can be assigned only to System users or groups.
  - 3a To assign the Approver, Build Administrator, Catalog Manager, or Cloud Administrator role, click the *System* tab, click *Add*, select the desired roles, then click *OK*.
  - 3b To assign the Zone Administrator role, click the *Zone* tab, click *Add*, select the desired zone, then click *OK*.
- 4 Assign organization-level roles.  
The organization-level roles are Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor. The Approver and Build Administrator roles can be assigned only to System users and groups. The other roles can be assigned to both System and Organization users and groups.  
Several of the roles can be assigned at the organization, business group, or business service level. For example, you can make a user a Sponsor for a business group, in which case the user can approve requests for business services from that business group only. Or, you can make the user a Sponsor for the organization, in which case the user can approve requests for all business services in the organization.
  - 4a Click the *Organization* tab to add a role at the organization level, click the *Business Group* tab to add a role at the business group level, or click the *Business Service* tab to add a role at the business service level.
  - 4b Click the role that you want to assign.  
For example, if you selected the *Business Group* tab and you want to enable the user or group to create business services for the business group, click *Business Service Owner*.
  - 4c Click *Add*, select the object (organization, business group, or business service) to which you want the role to apply, then click *OK* to add it to the list.
- 5 When you have finished assigning roles, click *Save* to save the role changes.

## 10.5 Deleting Users

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager (Organization users only)

---

When you delete a user, be aware of the following:

- ♦ The user’s deployed business services remain deployed. Other users (Cloud Administrators, Business Service Owners, and so forth) who had access to the business services continue to have access. If the user was the sole owner of a business service, you can assign other users as owners of the business service, either before or after the user is deleted.

- ♦ The user's business service requests remain in progress. As with deployed business services, other users (Cloud Administrators, Business Service Owners, and so forth) who had access to the requests continue to have access. If the user was the sole owner of a business service request, you can assign other users as owners of the business service, either before or after the user is deleted.
- ♦ The user's claimed tasks must be released (unclaimed) or claimed by another user, either a Cloud Administrator or another user who has the same role as the deleted user. The tasks can be claimed before or after the user is deleted.

To delete a user:

- 1 On the main navigation bar, click  *Organizations*.
- 2 Click the *Users* tab, select the user to delete, then click *Delete*.
- 3 Click *Yes* to confirm the deletion.

## 10.6 Deleting User Groups

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager (Organization user groups only)

---

When you delete a user group, the group members are not deleted, but they lose any roles that they inherited through membership in the group.

- 1 On the main navigation bar, click  *Organizations*.
- 2 Click the *User Groups* tab, select the user group to delete, then click *Delete*.
- 3 Click *Yes* to confirm the deletion.

---

# 11 Managing the Workload Template Catalog

The following sections provide information to help you manage the catalog of workload templates in your Cloud environment:

- ◆ [Section 11.1, “Creating Workload Templates,” on page 107](#)
- ◆ [Section 11.2, “Assigning Workload Templates to Organizations and Business Groups,” on page 110](#)
- ◆ [Section 11.3, “Modifying Workload Templates,” on page 112](#)
- ◆ [Section 11.4, “Deleting Workload Templates,” on page 112](#)
- ◆ [Section 11.5, “Add-on Applications,” on page 113](#)
- ◆ [Section 11.6, “Add-On Services,” on page 116](#)
- ◆ [Section 11.7, “Legal Agreements,” on page 118](#)
- ◆ [Section 11.8, “Resource Pricing Packages,” on page 120](#)

## 11.1 Creating Workload Templates

Business service workloads are created from workload templates. Each workload template identifies a VM template and the customizations (such as increased CPUs or decreased memory) that you want applied when creating a workload from the template.

The VM templates you can use come from your Cloud Manager zones. A single VM template can be used in multiple workload templates.

- 1 On the main navigation bar, click  *Getting Started*, then click *Create Workload Templates* (in the *Set Up Your Cloud Environment* list).

or

On the main navigation bar, click  *Catalog*, click the *Workload Templates* tab, then click *Create*.

- 2 If your Cloud Manager system has multiple zones, the *Select Zone* dialog box is displayed. Select the zone that contains the VM template you want, then click *OK* to display the *Create Workload Template* dialog box.

- 3 In the *General* section, provide the following information for the workload template:

**Name:** Specify a unique name for the workload template. Users see this name (along with the description, zone, and operating system) when selecting the workload template they use to create their business service workload.

You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.

**Setup Cost:** Specify the cost associated with setting up the workload. This is a one-time fee.

**License Cost:** Specify the license costs associated with the workload's software. This cost is per month.

**Zone:** Displays the zone you selected for the workload template. You cannot change this setting.

**Creation Date:** Displays the current date. You cannot change this setting.

**Description:** Provide any additional information to identify the workload template. Users see this description (along with the name, zone, and operating system) when selecting the workload template from which to create business service workload.

4 In the *Virtual Machine Settings* section:

4a In the *VM Template* list, select a VM template.

After you select a VM template, the template's operating system and hypervisor information is displayed. You cannot change these settings.

The VM template's resource information (CPUs, memory, network interface cards, and disks) is also displayed. You can customize this information as necessary.

4b Customize the settings to increase or decrease the workload resources:

**Number of CPUs:** Select the number of CPUs for the workload. Some hypervisor technologies do not support more than 8 CPUs per workload, so the maximum number allowed is 8.

**Memory:** Select the megabytes (MB) of RAM to allocate to the workload.

**Number of NICs:** Select the number of network interface cards (NICs) to allocate to the workload.

**Disks Summary:** Displays the size of the mandatory workload disks and the number of optional workload disks defined in the template, Mandatory workload disks are always created. They are inherited from the VM template or manually defined on the *Disks* tab. Optional workload disks are available to the user but are created only if the user specifies sizes for the disks.

You add disks on the *Disks* page (see [Step 5](#) below) and the disk information is then displayed in these fields.

4c By default, each resource setting is unlocked, which means that users can change it when creating workloads from the template. If you want to prevent users from changing a setting, select the  check box.

5 If you want to add disks to the workload template, or if you want to specify whether or not the current disks should be included when calculating the cost of the workload:

5a Click the *Disks* tab.

The template can include up to 10 additional disks.

5b Click *Add* to add a disk to the list.

5c Make sure the disk is selected in the list, then specify a size (in the *Size* field below the list) to make the disk mandatory.

or

Leave the size set to 0 to make the disk optional.

The maximum size per disk is 1024 GB (1 TB). If you specify the size when adding a disk, the disk becomes mandatory. Users cannot remove or change a mandatory disk. If you add a disk with the size set to 0, the disk becomes optional. Users can leave the size at 0, in which case the disk is not created with the workload, or they can specify a size and create the disk.

**5d** In the *Cost* field, select the check box if you want to include the cost of the disk in the workload's total cost.

If you don't enable the *Cost* option, the disk becomes a free disk and is not included when calculating the cost of the workload.

**6** If the template is a Windows-based template and you want to pre-populate some of the Windows settings, click *Windows Settings*, then complete the following steps.

You might not want to pre-populate some settings, such as *Computer Name*, if the template will be used to create multiple workloads. Any settings that you do not pre-populate must be filled in when requesting a new business service (by the user) or when performing the pre-build configuration (by an administrator).

**6a** Configure the *Domain Settings*:

**Computer Name:** Specify the computer name for the virtual machine.

**Domain or Workgroup:** Select *Domain* or *Workgroup*, then specify the name of the domain or workgroup to which you want the virtual machine added.

**Domain Administrator User ID:** This applies only if you are adding the virtual machine to a domain. Specify a domain administrator user ID that can be used to add the virtual machine to the domain specified in the *Domain* field.

**6b** Modify the *Installation Settings*:

**Run Once Commands:** Specify any Windows RunOnce commands that you want run during the first log in to the virtual machine. For information about Windows RunOnce commands, see the Microsoft Windows documentation.

**7** If the template is a Windows-based template and you want to pre-populate some of the Windows licensing information, click *Windows Licensing* and fill in the fields., then click *OK* to create the workload template and add it to the list.

**Windows Product Key:** Specify the product key for the workload's Windows operating system.

If you pre-populate this field in the template, the data is masked from users and cannot be copied.

**Registered to Name:** Specify an individual, department, company or so forth to whom the Windows operating system software is registered.

You might not want to pre-populate some settings, such as *Windows Product Key*, if the template will be used to create multiple workloads and the key does not cover multiple installations. Any settings that you do not pre-populate must be filled in when requesting a new business service (by the user) or when performing the pre-build configuration (by an administrator).

**8** If the template is a Linux-based template and you want to pre-populate some of the Linux settings, click *Linux Settings* and fill in the fields, then click *OK* to create the workload template and add it to the list.

**Hostname:** Specify the host name for the workload

**Domain Name:** Specify the domain for the workload (for example, netiq.com or provo.netiq.com).

You might not want to pre-populate some settings, such as *Hostname*, if the template will be used to create multiple workloads. Any settings that you do not pre-populate must be filled in when requesting a new business service (by the user) or when performing the pre-build configuration (by an administrator).

- 9 (Optional) If you have already created organizations and resource groups that support workload templates, you can associate the workload template with the organizations and business groups of your choice, but you must choose an organization whose resource groups support the type of hypervisor (and VM template) compatible with the workload template.
- 9a Click *Associations*, then select either the *Organizations* tab or the *Business Groups* tab to open a list.
- 9b Select (that is, click) the organization or business group you want to associate with this workload template, then click *OK*.
- or
- Select (that is, Ctrl+click) the organizations or business groups you want to associate with this workload template, then click *OK*.

---

**NOTE:** The Workload Templates list displays only the workload templates from the organization where your business group resides. You must assign workload templates at the organization level before they become available for selection at the business group level.

---

## 11.2 Assigning Workload Templates to Organizations and Business Groups

The workload template catalog is not directly available to organizations. Any workload templates you want available to an organization must be assigned to the organization. After a workload template is assigned to an organization, you can then make it available for use in all or some of the organization's business groups.

- ♦ [Section 11.2.1, "Assigning Workload Templates to an Organization," on page 110](#)
- ♦ [Section 11.2.2, "Assigning Workload Templates to a Business Group," on page 111](#)
- ♦ [Section 11.2.3, "Removing Workload Template Assignments from an Organization," on page 111](#)
- ♦ [Section 11.2.4, "Removing Workload Template Assignments from a Business Group," on page 111](#)

### 11.2.1 Assigning Workload Templates to an Organization

---

**Roles that Can Perform This Task:** Cloud Administrator

---

- 1 On the main navigation bar, click  *Organizations*.
- 2 In the *Organizations* list, select the target organization, then click *Edit*.
- 3 Click the *Workload Templates* tab.
- 4 Click *Add* to display the Add Workload Templates dialog box, select the workload templates to be added, then click *OK*.  
You can Shift-click or Ctrl-click to select multiple workload templates.
- 5 When you have finished adding templates, click *Save* to save the changes to the organization.

## 11.2.2 Assigning Workload Templates to a Business Group

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

A business group does not automatically inherit the workload templates assigned to its organization. Any of the organization's workload templates that you want available to the business group must be assigned to it.

- 1 On the main navigation bar, click  *Organizations*, then click the *Business Groups* tab.
- 2 In the *Business Groups* list, select the target business group, then click *Edit*.
- 3 Click the *Workload Templates* tab.
- 4 Click *Add* to display the Add Workload Templates dialog box, select the workload templates to be added, then click *OK*.  
You can Shift-click or Ctrl-click to select multiple workload templates.
- 5 When you have finished adding templates, click *Save* to save the changes to the business group.

## 11.2.3 Removing Workload Template Assignments from an Organization

---

**Roles that Can Perform This Task:** Cloud Administrator

---

You can remove a workload template from an organization unless it is currently being used to build a workload for one of the organization's business groups. As soon as the workload is built and deployed, you can remove the workload template.

Removing a workload template assignment from an organization also removes any assignments from its business groups.

- 1 On the main navigation bar, click  *Organizations*.
- 2 In the *Organizations* list, select the organization from which you want to remove the workload template assignment, then click *Edit*.
- 3 Click the *Workload Templates* tab.
- 4 Select the workload template to be removed, click *Remove*, then click *Yes* to confirm the template removal.  
You can Shift-click or Ctrl-click to select multiple workload templates.
- 5 When you have finished removing templates, click *Save* to save the changes to the organization.

## 11.2.4 Removing Workload Template Assignments from a Business Group

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

You can remove a workload template from a business group unless it is currently being used to build a workload for the business group. As soon as the workload is built and deployed, you can remove the workload template.

- 1 On the main navigation bar, click  *Organizations*.
- 2 Click the *Business Groups* tab, select the business group from which you want to remove the workload template assignment, then click *Edit*.
- 3 Click the *Workload Templates* tab.
- 4 Select the workload template to be removed, click *Remove*, then click *Yes* to confirm the template removal.  
You can Shift-click or Ctrl-click to select multiple workload templates.
- 5 When you have finished removing templates, click *Save* to save the changes to the business group.

## 11.3 Modifying Workload Templates

---

**Roles that Can Perform This Task:** Cloud Administrator, Catalog Manager

---

You can change workload template settings at any time, even if the template has been used to create workloads. The only restriction is that you cannot specify a different VM template if the workload template is in use by a requested or deployed business service.

Changing a workload template has no immediate effect on deployed workloads. However, if a change is requested for a deployed workload, the workload settings are validated against the new workload template settings. This might require the Business Service Owner to change settings that he or she did not plan to change. For example, suppose that you create a workload template that allocates 4 CPUs. A Business Service Owner creates a workload (with 4 CPUs) from the workload template. You then change the workload template's CPU allocation from 4 to 2. After the change, the Business Service Owner requests a change to the workload's number of disks. When creating the change request, the Business Service Owner is also required to change the CPUs from 4 to 2 because 4 CPUs are no longer supported by the new workload template.

- 1 On the main navigation bar, click  *Catalog*.
- 2 On the *Workload Templates* tab, select the template to modify, then click *Edit*.
- 3 Make the desired changes to the template, then click *OK* to save the changes.

For a description of the workload template settings, see [“Creating Workload Templates” on page 107](#) or click the  icon in the Edit Workload Template dialog box.

## 11.4 Deleting Workload Templates

---

**Roles that Can Perform This Task:** Cloud Administrator, Catalog Manager

---

You can delete a workload template unless it is currently being used to build a workload. As soon as the workload is built and deployed, you can delete the workload template.

Deleting a workload template has no effect on deployed workloads, even if the Business Service Owner of one of the workloads requests a change to it.

- 1 On the main navigation bar, click  *Catalog*.
- 2 On the *Workload Templates* tab, select the template to delete, then click *Delete*.
- 3 Confirm the deletion.

## 11.5 Add-on Applications

You can make licensed or proprietary applications available to organization users who might find that such applications add value to the business services they request. You can create a selection of such applications in the Cloud Manager catalog, and then associate one or more of these applications to a workload template.

You can define the initial setup costs and the ongoing monthly cost for each application. For example, you might define the setup cost of the application at \$25 and its monthly operating costs at \$10.

An add-on application can be associated to multiple workload templates. For example, two similar workload templates might offer the same application.

Multiple add-on applications can also be associated to a single workload template. The user, when requesting a business service, could select a workload template with the desired application.

This section includes the following information:

- ♦ [Section 11.5.1, “Creating an Add-on Application,” on page 113](#)
- ♦ [Section 11.5.2, “Configuring an Add-on Application,” on page 114](#)

### 11.5.1 Creating an Add-on Application

---

**Roles that Can Perform This Task:** Cloud Administrator, Catalog Manager

---

When you associate an add-on application with a workload template, the setup costs and monthly operating costs are applied to any business service workloads deployed to the resource group's hosts.

For example, you might define the setup cost of the application at \$25 and its monthly operating costs at \$10, making the initial month's cost \$35 and \$25 monthly thereafter.

An add-on application can be associated to multiple workload templates. For example, two similar workload templates might offer the same application.

- 1 On the main navigation bar, click  *Catalog*.
- 2 On the Add-ons tab, click *Applications*, then click *Create* to open a Create Add-on Application dialog box.
- 3 In the *General* section of the dialog box, provide the following details for the add-on application:
  - Name:** Specify a name for the application. The name should be different from any other application name.
  - Monthly Cost:** Define the ongoing cost (per month) for using the workload templates associated with the application.
  - Setup Cost:** Specify the one-time fee associated with the licensing, installation, and configuration of the application.

**Creation Date:** Displays the current date.

**Description:** Provide any additional information to further identify the application.

**Configuration Instructions:** Enter text asking the user of the application how the application should be configured. If you enter text here, the business service owners must provide a reply in order to add the application to a workload.

- 4 Click *Create* to display the Create Add-On Application dialog box
- 5 Associate the application with workload templates:
  - 5a Under *Associations*, click the Workload Templates tab.
  - 5b Click *Add* to display the Add Workload Templates dialog box
  - 5c Select the workload templates to add.  
You can Shift-click and Ctrl-click to select multiple objectives.
  - 5d Click *OK* to add the selected objectives to the *Service Level Objectives* list.
- 6 Associate the service level with resource groups:
  - 6a Under *Associations*, click the *Resource Groups* tab.
  - 6b Click *Add* to display the Add Resource Groups dialog box.
  - 6c Select the groups to add.  
You can Shift-click and Ctrl-click to select multiple workload templates.
  - 6d Click *OK*.

## 11.5.2 Configuring an Add-on Application

---

**Roles that Can Perform This Task:** Cloud Administrator, Catalog Manager

---

You can configure an add-on application to change its setup and monthly costs or to edit the text that asks the user for specific configuration information for the application. Changing a application might impact the cost of business services currently using the application. For more information, see [Chapter 14.7, “Displaying or Hiding Business Service Costs,” on page 159](#).

- 1 On the main navigation bar, click  *Catalog*.
- 2 On the Add-ons tab, click *Applications*, select an application from the list, then click *Edit* to open a Configure Add-on Application dialog box.

The following table lists the tasks and actions that you might want to perform as you configure an add-on application in Cloud Manager.

Task	Steps
Change the name or description	<ol style="list-style-type: none"><li>1. In the <i>General</i> section, modify the following details:  <b>Name:</b> Specify a name for the application. The name should be different from any other application name.  <b>Description:</b> Provide any additional information to further identify the application.</li></ol>

Task	Steps
Change the one-time setup cost or the monthly operating cost	<ol style="list-style-type: none"> <li>1. In the <i>Monthly Cost</i> field, define the cost (per month) to use the application associated with the workload template.</li> <li>2. In the <i>Setup Cost</i> field, define the one-time cost to install and configure this application associated with the workload template.</li> </ol>
Change the application configuration instructions	<p>Change the text you provide to the user that instructs him or her to provide configuration instructions to the build administrator. The user cannot add the application to a workload if he or she doesn't provide this information.</p> <p>If you leave the field blank, the user is not required to provide any information.</p>
Associate the application to workload templates	<ol style="list-style-type: none"> <li>1. In the <i>Workload Templates</i> list, click <i>Add</i> to display the Add Workload Templates dialog box.</li> <li>2. Select the workload templates to add. You can Shift-click and Ctrl-click to select multiple workload templates.</li> <li>3. Click <i>OK</i>.</li> </ol>
Associate the application to legal agreements	<ol style="list-style-type: none"> <li>1. In the <i>Legal Agreements</i> list, click <i>Add</i> to display the Add Legal Agreement dialog box.</li> <li>2. Select the legal agreements to add. You can Shift-click and Ctrl-click to select multiple legal agreements.</li> <li>3. Click <i>OK</i>.</li> </ol>
View an add-on application associated to a workload template	<ol style="list-style-type: none"> <li>1. In the <i>Workload Templates</i> list, select a workload template you want to view.</li> <li>2. When you are finished viewing the workload template, click <i>Close</i>.</li> </ol>
View a legal agreement associated to a workload template	<ol style="list-style-type: none"> <li>1. In the <i>Legal Agreements</i> list, select a legal agreement you want to view.</li> <li>2. When you are finished viewing the legal agreement, click <i>Close</i>.</li> </ol>
Lock the application to a workload templates, making it required	<ol style="list-style-type: none"> <li>1. In the <i>Workload Templates</i> list, select a workload template you want to lock.</li> <li>2. Click <i>Lock</i> to lock the application to the workload template. This makes the application required for this template.</li> </ol>
Remove the application from workload templates	<ol style="list-style-type: none"> <li>1. In the <i>Workload Templates</i> list, select the workload templates you want to unassociate from the application. You can Shift-click and Ctrl-click to select multiple templates.</li> <li>2. Click <i>Remove</i>.</li> </ol>
Remove the application from legal agreements	<ol style="list-style-type: none"> <li>1. In the <i>Legal Agreements</i> list, select the legal agreements you want to unassociate from the application. You can Shift-click and Ctrl-click to select multiple agreements.</li> <li>2. Click <i>Remove</i>.</li> </ol>

## 11.6 Add-On Services

As a Cloud Administrator or a Catalog Manager, you can make services available to organization users who might find that such services add value to the business services they request. You can create a selection of such services in the Cloud Manager catalog, and then associate one or more of these services to a workload template.

You can define the initial setup costs and the ongoing monthly cost for each service. For example, you might define the setup cost of the service at \$25 and its monthly operating costs at \$10.

An add-on service can be associated to multiple workload templates. For example, two similar workload templates might offer the same service.

Multiple add-on services can also be associated to a single workload template. The user, when requesting a business service, could select a workload template with the desired service.

- ◆ [Section 11.6.1, “Creating an Add-on Service,” on page 116](#)
- ◆ [Section 11.6.2, “Configuring an Add-on Service,” on page 117](#)

### 11.6.1 Creating an Add-on Service

---

**Roles that Can Perform This Task:** Cloud Administrator, Catalog Manager

---

When you associate an add-on service with a workload template, the setup costs and monthly operating costs are applied to any business service workloads deployed to the resource group’s hosts.

For example, you might define the setup cost of the service at \$25 and its monthly operating costs at \$10, making the initial month’s cost \$35 and \$25 monthly thereafter.

An add-on service can be associated to multiple workload templates. For example, two similar workload templates might offer the same service.

- 1 On the main navigation bar, click  *Catalog*.
- 2 On the Add-ons tab, click *Services*, then click *Create* to open a Create Add-on Service dialog box.
- 3 In the *General* section of the dialog, provide the following details for the add-on service:
  - Name:** Specify a name for the service. The name should be different from any other service name.
  - Monthly Cost:** Define the ongoing cost (per month) for using the workload templates associated with the service.
  - Setup Cost:** Specify the one-time fee associated with the licensing, installation, and configuration of the service.
  - Creation Date:** Displays the current date.
  - Description:** Provide any additional information to further identify the service.
  - Configuration Instructions:** Enter text asking the user of the service how the service should be configured. If you enter text here, the business service owner must provide a reply in order to add the service to a workload.
- 4 Click *Create* to display the Create Add-On Service dialog box

- 5 Associate the service with workload templates:
  - 5a Under *Associations*, click the Workload Templates tab.
  - 5b Click *Add* to display the Add Workload Templates dialog box
  - 5c Select the workload templates to add.  
You can Shift-click and Ctrl-click to select multiple objectives.
  - 5d Click *OK* to add the selected objectives to the *Service Level Objectives* list.
- 6 Associate the service level with resource groups:
  - 6a Under *Associations*, click the *Resource Groups* tab.
  - 6b Click *Add* to display the Add Resource Groups dialog box.
  - 6c Select the groups to add.  
You can Shift-click and Ctrl-click to select multiple workload templates.
  - 6d Click *OK*.

## 11.6.2 Configuring an Add-on Service

---

**Roles that Can Perform This Task:** Cloud Administrator, Catalog Manager

---

You can configure an add-on service to change its setup and monthly costs or to edit the text that asks the user for specific configuration information for the service. Changing a service might impact the cost of business services currently using the service. For more information, see [Chapter 14.7, “Displaying or Hiding Business Service Costs,”](#) on page 159.

- 1 On the main navigation bar, click  *Catalog*.
- 2 On the Add-ons tab, click *Services*, select a service from the list, then click *Edit* to open a Configure Add-on Service dialog box.

The following table lists the tasks and actions that you might want to perform as you configure an add-on service in Cloud Manager.

Task	Steps
Change the name or description	<ol style="list-style-type: none"> <li>1. In the <i>General</i> section, modify the following details:               <p><b>Name:</b> Specify a name for the service. The name should be different from any other service name.</p> <p><b>Description:</b> Provide any additional information to further identify the service.</p> </li> </ol>
Change the one-time setup cost or the monthly operating cost	<ol style="list-style-type: none"> <li>1. In the <i>Monthly Cost</i> field, define the cost (per month) to use the service associated with the workload template.</li> <li>2. In the <i>Setup Cost</i> field, define the one-time cost to install and configure this service associated with the workload template.</li> </ol>
Change the add-on service configuration instructions	<p>Change the text you provide to the user that instructs him or her to provide configuration instructions to the build administrator. The user cannot add the service to a workload if he or she doesn't provide this information.</p> <p>If you leave the field blank, the user is not required to provide any information.</p>

Task	Steps
Associate the service to workload templates	<ol style="list-style-type: none"> <li>1. In the <i>Workload Templates</i> list, click <i>Add</i> to display the Add Workload Templates dialog box.</li> <li>2. Select the workload templates to add. You can Shift-click and Ctrl-click to select multiple workload templates.</li> <li>3. Click <i>OK</i>.</li> </ol>
View an add-on service associated to a workload template	<ol style="list-style-type: none"> <li>1. In the <i>Workload Templates</i> list, select a workload template you want to view.</li> <li>2. When you are finished viewing the workload template, click <i>Close</i>.</li> </ol>
Lock the service to a workload templates	<ol style="list-style-type: none"> <li>1. In the <i>Workload Templates</i> list, select a workload template you want to lock.</li> <li>2. Click <i>Lock</i> to lock the service to the workload template. This makes the service required for this template.</li> </ol>
Remove the service from workload templates	<ol style="list-style-type: none"> <li>1. In the <i>Workload Templates</i> list, select the workload templates you want to unassociate from the service. You can Shift-click and Ctrl-click to select multiple templates.</li> <li>2. Click <i>Remove</i>.</li> </ol>

## 11.7 Legal Agreements

As a Cloud Administrator or a Catalog Manager, you can create (or copy and paste) legal agreement text that you can associate with add-on applications or services or to workload templates that use such add-ons. When created, these legal agreements are listed in the Cloud Manager catalog. From the catalog, you can edit a legal agreement that has not yet been accepted by a user as part of a workload or you can view it to check its associations. A legal agreement cannot be edited or deleted after it has been accepted by a user.

The Legal Agreements page lists all of the agreements that have been identified in the Cloud Manager system.

- ♦ [Section 11.7.1, “Creating a Legal Agreement,” on page 118](#)
- ♦ [Section 11.7.2, “Editing a Legal Agreement,” on page 119](#)

### 11.7.1 Creating a Legal Agreement

---

**Roles that Can Perform This Task:** Cloud Administrator, Catalog Manager

---

As a Cloud Administrator or a Catalog Manager, you can create (or copy and paste) legal agreement text that you can associate with add-on applications or services or to workload templates that use such add-ons. When created, these legal agreements are listed in the Cloud Manager catalog. From the catalog, you can edit a legal agreement that has not yet been accepted by a user as part of a workload or you can view it to check its associations. A legal agreement cannot be edited or deleted after it has been accepted by a user.

An add-on service can be associated to multiple workload templates. For example, two similar workload templates might offer the same service.

- 1 On the main navigation bar, click  *Catalog*.
- 2 Click *Legal Agreements*, then click *Create* to open a Create Legal Agreement dialog box.
- 3 In the *General* section of the dialog box, provide the following details for the legal agreement:
  - Name:** Specify a name for the legal agreement. The same legal agreement can be associated to one or more workload templates, add-on applications or add-on services.
  - Version:** Define a version of the legal agreement. This helps you track the changes in legal agreements from the software vendor, or from you as a service provider.
  - Agreement Text:** Enter (or copy and paste) text that describes the terms, conditions, or legal agreements that must be accepted by a business service sponsor or the requestor of the add-on application or service. These terms must be accepted prior to adding a workload to a business service request.
  - Creation Date:** Displays the current date.
- 4 (Optional) You can associate the legal agreement with one or more workload templates:
  - 4a Under *Associations*, click the *Workload Templates* tab.
  - 4b Click *Add* to display the Add Workload Templates dialog box
  - 4c Select the workload templates to add.
    - You can Shift-click and Ctrl-click to select multiple workload templates.
  - 4d Click *OK* to add the selected workload templates to the *Workload Templates* list.
- 5 (Optional) You can associate the legal agreement with an add-on service or an add-on application.
  - 5a Under *Associations*, click the *Add-Ons* tab.
  - 5b Choose either *Applications* or *Services*, then click *Add* to display the list of available applications or services that you can choose to associate to this legal agreement.
  - 5c On the Applications or Services dialog box, choose one or more applications or services to which you want to associate this legal agreement, click *OK*, then click *Save*.

## 11.7.2 Editing a Legal Agreement

---

**Roles that Can Perform This Task:** Cloud Administrator, Catalog Manager

---

To edit a legal agreement in the catalog:

- 1 On the main navigation bar, click  *Catalog*.
- 2 On the Legal Agreements tab, select an unaccepted legal agreement from the list, then click *Edit* to open a Configure Legal Agreement dialog box.

The following table lists the tasks and actions that you might want to perform as you configure a legal agreement in the Cloud Manager catalog.

Task	Steps
Change the legal agreement details	<p>1. In the <i>General</i> section, modify the following legal agreement details:</p> <p><b>Name:</b> Specify a name for the legal agreement. The same legal agreement can be associated to one or more workload templates, add-on applications or add-on services.</p> <p><b>Version:</b> Define a version of the legal agreement. This helps you track the changes in legal agreements from the software vendor, or from you as a service provider.</p> <p><b>Agreement Text:</b> Enter (or copy and paste) text that describes the terms, conditions, or legal agreements that must be accepted by a business service sponsor or the requestor of the add-on application or service. These terms must be accepted prior to adding a workload to a business service request.</p> <p><b>Creation Date:</b> Displays the date the legal agreement was created. You cannot change this setting.</p>
Change how add-on applications or services are associated	<p>You can change the association of the legal agreement with one or more workload templates:</p> <ol style="list-style-type: none"> <li>Under <i>Associations</i>, click the <i>Workload Templates</i> tab.</li> <li>Click <i>Add</i> to display the Add Workload Templates dialog box.</li> <li>Select the workload templates to add. You can Shift-click and Ctrl-click to select multiple workload templates.</li> <li>Click <i>OK</i>.</li> </ol> <p>You can change the association of the legal agreement with an add-on service or an add-on application.</p> <ol style="list-style-type: none"> <li>Under <i>Associations</i>, click the <i>Add-Ons</i> tab.</li> <li>Choose either <i>Applications</i> or <i>Services</i>, then click <i>Add</i> to display the list of available applications or services that you can choose to associate to this legal agreement.</li> <li>On the <i>Applications</i> or <i>Services</i> dialog box, choose one or more applications or services to which you want to associate this legal agreement, click <i>OK</i>, then click <i>Save</i>.</li> </ol>

## 11.8 Resource Pricing Packages

As a Cloud Administrator or Catalog Manager, you can create and edit a variety of resource packages (that is, the resources you configure and assign to a VM) with a different price points, applied discounts, and contract lengths. You can even assign a minimum contract length that must be fulfilled to receive special pricing.

- ◆ [Section 11.8.1, “Creating a Resource Pricing Package,” on page 121](#)
- ◆ [Section 11.8.2, “Configuring a Resource Pricing Package,” on page 122](#)

For more information about business contracts, see [Chapter 14.8, “Understanding Business Service Contracts,” on page 160](#).

## 11.8.1 Creating a Resource Pricing Package

---

**Roles that Can Perform This Task:** Cloud Administrator, Catalog Manager

---

You can create resource pricing packages to apply special pricing and discounts for customers who agree to use customized workload resources for a specific contract period. When created, these packages are listed in the Cloud Manager catalog. From the catalog, you can edit a package that has not yet been accepted by a user as part of a workload, or you can view it to check its associations.

A single resource pricing package can be associated to multiple workload templates. For example, two similar workload templates might offer the same package. You can also associate a resource pricing package with all of the workload templates in a zone.

- 1 On the main navigation bar, click  *Catalog*.
- 2 Click *Resource Pricing Packages*, then click *Create* to open a Create Resource Pricing Package dialog box.
- 3 In the *General* section of the dialog box, provide the following details for the resource pricing package:
  - Name:** Specify a name for the resource pricing package. The same package can be associated to one or more workload templates.
  - Description:** Specify a description of the pricing package that can provide more information about the nature of the pricing package.
  - Minimum Contract:** Choose a minimum contract length from the drop-down list. The user must agree to this contract length.
  - Renewal Contract:** Choose a duration period for a renewable contract for the resource pricing package. The user is notified about the expiration of the contract in time for renewal.
- 4 In the *Virtual Machine Resources* section:
  1. Customize the following settings to increase or decrease the workload resources.
    - Number of CPUs:** Select the minimum and maximum number of CPUs for a workload. The maximum allowed vCPUs cannot exceed the number supported by the hypervisor.  
You can also apply a discount to this resource, to give the customer an incentive to purchase the package.
    - Memory:** Select the minimum and maximum number megabytes (MB) of RAM to allocate to a workload.  
You can also apply a discount to this resource, to give the customer an incentive to purchase the package.
    - Number of NICs:** Select the number of network interface cards (NICs) to allocate to the workload.  
You can also apply a discount to this resource, to give the customer an incentive to purchase the package.
    - Total Storage:** Displays the amount of virtual storage (in GB) that you can designate as the minimum and maximum allowed for this resource pricing package.

You can also apply a discount to this resource, to give the customer an incentive to purchase the package.

2. (Optional) Select *Try these values* to open a worksheet dialog where you can experiment with different discount percentages and apply them to each resource. The list shows the effect of the discounts applied to each service level. You can click *Apply* to bring your tested values forward as the actual configured resource values.
- 5 (Optional) You can associate the resource pricing package with one or more workload templates:
  - 5a Under *Associations*, click the *Workload Templates* tab.
  - 5b Click *Add* to display the Add Workload Templates dialog box
  - 5c Select the workload templates to add.  
You can Shift-click and Ctrl-click to select multiple workload templates.  
If you want to associate the resource pricing package with all workload templates in the catalog, select *Assign to all Workload Templates*.
  - 5d Click *Save* to add the selected workload templates to the *Workload Templates* list.

---

**NOTE:** If any resource pricing packages are associated with a workload template, the business service owner is required to pick a package when configuring a workload. If you want to provide a way for the business service owner to opt out of picking a package, you need to create a package without restrictions or discounts. For example, you could create a package called “No Package” with no restrictions and no discounts.

---

## 11.8.2 Configuring a Resource Pricing Package

---

**Roles that Can Perform This Task:** Cloud Administrator, Catalog Manager

---

To configure a resource pricing package in the catalog:

- 1 On the main navigation bar, click  *Catalog*.
- 2 On the Legal Agreements tab, select a resource pricing package from the list, then click *Edit* to open an Edit Resource Pricing Package dialog box.

The following table lists the tasks and actions that you might want to perform as you configure a resource pricing package in the Cloud Manager catalog.

Task	Steps
Change the resource pricing package details	<ol style="list-style-type: none"> <li>1. In the <i>General</i> section, modify the following resource pricing package details: <ul style="list-style-type: none"> <li><b>Name:</b> Specify a name for the resource pricing package. The same package can be associated to one or more workload templates.</li> <li><b>Description:</b> Specify a description of the pricing package that can provide more information about the nature of the pricing package.</li> <li><b>Minimum Contract:</b> Choose a minimum contract length from the drop-down list. The user must agree to this contract length.</li> <li><b>Renewal Contract:</b> Choose a duration period for a renewable contract for the resource pricing package. The user is notified about the expiration of the contract in time for renewal.</li> </ul> </li> <li>2. In the <i>Virtual Machine Resources</i> section: <ol style="list-style-type: none"> <li>a. Customize the following settings to increase or decrease the workload resources. <ul style="list-style-type: none"> <li><b>Number of CPUs:</b> Select the minimum and maximum number of CPUs for a workload. The maximum allowed vCPUs cannot exceed the number supported by the hypervisor.</li> <li>You can also apply a discount to this resource, to give the customer an incentive to purchase the package.</li> <li><b>Memory:</b> Select the minimum and maximum number megabytes (MB) of RAM to allocate to a workload.</li> <li>You can also apply a discount to this resource, to give the customer an incentive to purchase the package.</li> <li><b>Number of NICs:</b> Select the number of network interface cards (NICs) to allocate to the workload.</li> <li>You can also apply a discount to this resource, to give the customer an incentive to purchase the package.</li> <li><b>Total Storage:</b> Displays the amount of virtual storage (in GB) that you can designate as the minimum and maximum allowed for this resource pricing package.</li> <li>You can also apply a discount to this resource, to give the customer an incentive to purchase the package.</li> </ul> </li> <li>b. (Optional) Select <i>Try these values</i> to open a worksheet dialog where you can experiment with different discount percentages and apply them to each resource. The list shows the effect of the discounts applied to each service level. You can click <i>Apply</i> to bring your tested values forward as the actual configured resource values.</li> </ol> </li> </ol>

Task	Steps
<p>Change how resource pricing packages are associated</p>	<p>You can associate the resource pricing package with one or more workload templates:</p> <ol style="list-style-type: none"> <li>1. Under <i>Associations</i>, click the <i>Workload Templates</i> tab.</li> <li>2. Click <i>Add</i> to display the Add Workload Templates dialog box.</li> <li>3. Select the workload templates to add.  <p style="margin-left: 20px;">You can Shift-click and Ctrl-click to select multiple workload templates.</p> </li> <li>4. Click <i>Save</i>.</li> </ol> <p>If you want to associate the resource pricing package with all workload templates in the catalog, select <i>Assign to all Workload Templates</i>.</p> <p><b>NOTE:</b> If any resource pricing packages are associated with a workload template, the business service owner is required to pick a package when configuring a workload. If you want to provide a way for the business service owner to opt out of picking a package, you need to create a package without restrictions or discounts. For example, you could create a package called “No Package” with no restrictions and no discounts.</p>

---

# 12 Managing Organizations

The following sections provide information to help you manage the organizations in your Cloud environment:

- ♦ [Section 12.1, “Creating Organizations,” on page 125](#)
- ♦ [Section 12.2, “Customizing Organization Configuration Settings,” on page 127](#)
- ♦ [Section 12.3, “Creating Business Groups,” on page 128](#)
- ♦ [Section 12.4, “Assigning Resource Groups to Organizations and Business Groups,” on page 130](#)
- ♦ [Section 12.5, “Managing Organization Users, User Groups, and Roles,” on page 132](#)

## 12.1 Creating Organizations

---

**Roles that Can Perform This Task:** Cloud Administrator

---

An organization represents a tenant to which you are offering Cloud services. Through the organization, you make resource group assignments that dictate the hosts, service levels, repositories, and networks available to the organization, and make workload template assignments that determine the types of business service workloads available to the organization.

After you create an organization, you (or an Organization Manager) can define the organization’s membership and assign roles such as Business Service Owner, Business Group Sponsor, and Organization Manager to those members. Membership and role assignments are covered in the next task, *Create Users and Groups*.

- 1 On the main navigation bar, click  *Organizations*, click the *Organizations* tab, then click *Create*.
- 2 Provide the following details to define the organization:

**Name:** Specify a unique name for the organization. You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.

**Description:** Provide any additional information to identify the organization.

**Domains:** If you want to enable users to self-register in this organization, specify the e-mail domains associated with the organization.

Self-registration occurs when a valid LDAP user who does not have a Cloud Manager account first logs in. The user’s e-mail domain is compared to the e-mail domains defined for the organization. If it matches one of the e-mail domains, the user is added to organization’s Members list.

You can associate one or more e-mail domains with the organization. To specify multiple e-mail domains, separate the names with commas (for example, `netiq.com,novell.com,attachmate.com`).

**Discount %:** If you want a discount applied to all business services created by members of this organization, specify the discount percentage.

**Auto Approval:** When a user creates a business service request, the request goes through an approval workflow that includes both a Sponsor and an Administrator. The Sponsor is a member of the organization who provides the financial approval for the business service. The Administrator is a System user (such as yourself, another Cloud Administrator, or a Zone Administrator) who provides the resource capacity approval for the business service. You can use Auto Approval to bypass one or both of the approvals.

The organization inherits the Auto Approval settings from the Cloud Manager system settings (accessed through *Configuration* on the main navigation bar). To change the settings for the organization, click *Override*, then configure the settings as desired.

**Logo:** You can upload a logo file for the organization. Three formats are supported: PNG, JPG, and GIF. Any size is acceptable. Cloud Manager resizes the logo to a maximum of 216x216 pixels, maintaining the width-to-height proportions. For example, a 432x200 image would be resized to 216x100. The logo file is stored on the Cloud Manager Application Server.

To upload a file, mouse over *No Image*, then click *Upload New Image*. Browse for and select the image, then click *OK* to upload it to the Cloud Manager Application Server.

**3** Add the workload templates that you want the organization to have access to.

You do not need to assign workload templates to the organization at this time. If you want to do it later, see [Section 11.2.1, “Assigning Workload Templates to an Organization,”](#) on page 110 when you are ready.

**3a** Under *Membership and Access*, click the *Workload Templates* tab.

**3b** Click *Add* to display the Add Workload Templates dialog box.

**3c** Select the workload templates.

You can Shift-click and Ctrl-click to select multiple workload templates.

**3d** Click *OK* to add the selected workload templates to the *Workload Templates* list.

**4** Add the resource groups that you want the organization to have access to.

You do not need to assign resource groups to the organization at this time. If you want to do it later, see [“Assigning Resource Groups to Organizations and Business Groups”](#) on page 130 when you are ready.

**4a** Under *Membership and Access*, click the *Resource Groups* tab.

**4b** Click *Add* to display the Add Resource Groups dialog box.

**4c** Select the resource groups you want to add.

You can Shift-click and Ctrl-click to select multiple groups.

**4d** Click *OK* to add the selected resource groups to the *Resource Groups* list.

**5** Add the networks that you want the organization to have access to.

The available networks are determined by the VM hosts included in the resources groups. However, to enable you to provide isolated networks for two or more organizations that share the same resource group, the networks from a resource group are not automatically assigned to an organization when you add the resource group. Instead, you must separately add the networks you want assigned to the organization.

**5a** Under *Membership and Access*, click the *Networks* tab.

**5b** Click *Add* to display the Add Networks dialog box.

**5c** Select the networks.

You can Shift-click and Ctrl-click to select multiple networks.

**5d** Click *OK* to add the selected networks to the *Networks* list.

## 6 Add organization members.

### 6a Click *Save* to create the organization.

You can only add users after the organization has been saved.

### 6b Refer to [“Manually Creating System and Organization Users” on page 95](#) for details about creating users and adding them to an organization. Or refer to [“Importing Organization Users from LDAP” on page 97](#) for details about importing users from an LDAP source into the organization.

## 7 Assign roles for the organization.

Users must be given roles in order to do anything in the organization. There are six roles that apply to an organization: Approver, Build Administrator, Business Group Viewer, Business Service Owner, Organization Manager, and Sponsor.

Role assignments at the organization level are inherited by the organization’s business groups. For example, if you give a user the Business Service Owner role for an organization, the user can create business services for any business group in the organization. If you want to limit the user to a role in specific business group, you must make the role assignment in the business group.

### 7a Click the *Users* tab, then click the role (*Approver*, *Build Administrator*, *Business Group Viewer*, *Business Service Owner*, *Organization Manager*, or *Sponsor*) that you want to assign to a user.

### 7b Click *Add*.

Depending on the role that you are adding, the selection dialog box can contain two lists: *Members* and *System Users*. The *Members* list includes all members of the organization and the *System Users* list includes all Cloud Manager System users.

### 7c Select the users you want to add, then click *OK*.

You can Shift-click and Ctrl-click to select multiple users.

## 8 Click *Save* to add the organization to the *Organizations* list.

## 12.2 Customizing Organization Configuration Settings

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

The Organization Configuration settings determine if organization members can see all workload costs and settings when creating and managing business services.

To customize the settings:

### 1 On the main navigation bar, click *Organizations*.

### 2 On the *Organizations* tab, select the target organization, then click *Edit*.

### 3 In the upper-right corner of the dialog box, click the icon to display the Organization Configuration dialog box.

### 4 Configure the following settings:

**Organization Costs:** Select whether the organization’s business service costs are hidden from or shown to the organization’s members. This applies to all Organization members regardless of their assigned roles.

You can override this setting on a business group. For example, if you show business service costs for the organization, you can hide costs for a specific business groups. Organization users can see the costs associated with all of the organization’s business services with the exception of business services created by the one business group.

In some cases, you might want to hide costs from some users but not from others. To achieve this, you can hide the costs at the organization or business group level, but then enable the *Always show costs* option on the individual user accounts.

**Workload Dialog:** A workload contains *Windows Settings*, *Windows Licensing*, *Linux Settings*, and *Networks* tabs that must be configured when requesting a business service. These tabs can be hidden, in which case a Build Administrator or Cloud Administrator must provide the information when completing the pre-build configuration tasks for the business service.

The organization inherits the Workload Dialog settings configured at the system level. If you want to override the system settings to apply different settings for the organization, select *Override System Setting*, then enable or disable the tabs as desired.

To revert the settings to the system settings, deselect *Override System Setting*.

- 5 Click *OK*.

## 12.3 Creating Business Groups

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

A business group represents a unit within an organization, such as a department or cost center, with which business services are associated. An organization can have one or more business groups.

A business group can be assigned all of an organization's resources or only some of the resources. When a business service is created for a business group, it uses only the assigned resources. Multiple business groups can be assigned the same resources, which means that the resources become shared resources.

- 1 On the main navigation bar, click  *Organizations*.

- 2 Click the *Business Groups* tab, then click *Create*.

- 3 Provide the following details to define the business group:

**Name:** Specify a name for the group. The name should be different than any other business group name.

**Organization:** Select the organization for the business group. The organization assignment cannot be changed after the business group is created.

**Description:** Provide any additional information to identify the business group.

**Auto Approval:** Business service requests require both a Sponsor approval and an Administrator approval. The Sponsor approval is a financial check, while the Administrator approval is a resource capacity check. You can use Auto Approval to bypass one or both of the approvals.

*Sponsor* is selected by default. If you don't want automatic Sponsor approval, you must add sponsors to the group (see [Step 4](#)).

Select *Administrator* to automatically grant Administrator approval for the group's business services.

**Costs:** The business group inherits the *Costs* setting from its organization. To change the setting for the business group, click *Override*, then configure the setting as desired. *Show* allows group members to see cost information for workloads. *Hide* to prevent group members from seeing cost information.

- 4 Assign roles for the business group.

There are three roles that apply to a business group: Business Group Viewer, Business Service Owner, and Sponsor. By default, users assigned these roles at the organization also have these same roles in the business group.

**4a** Click the *Users* tab, then click the role (*Business Group Viewer*, *Business Service Owner*, or *Sponsor*) that you want to assign to a user.

**4b** Click *Add*.

Depending on the role that you are adding, the selection dialog box can contain two lists: *Members* and *System Users*. The *Members* list includes all members of the organization and the *System Users* list includes all Cloud Manager System users.

**4c** Select the users you want to add, then click *OK*.

You can Shift-click and Ctrl-click to select multiple users.

**5** Add the workload templates that you want the business group to have access to.

You do not need to assign workload templates to the business group at this time. If you want to do it later, see [Section 11.2.2, “Assigning Workload Templates to a Business Group,” on page 111](#) when you are ready.

**5a** Under *Membership and Access*, click the *Workload Templates* tab.

**5b** Click *Add* to display the Add Workload Templates dialog box.

The list displays the organization’s workload templates. A business group is limited to the workload templates assigned to its organization.

**5c** Select the workload templates.

You can Shift-click and Ctrl-click to select multiple workload templates.

**5d** Click *OK* to add the selected workload templates to the *Workload Templates* list.

**6** Add the resource groups you want the business group to have access to.

You do not need to assign resource groups to the organization at this time. If you want to do it later, see [“Assigning Resource Groups to Organizations and Business Groups” on page 130](#) when you are ready.

**6a** Under *Membership and Access*, click the *Resource Groups* tab.

**6b** Click *Add* to display the Add Resource Groups dialog box.

The list displays the organization’s resource groups. A business group is limited to the resource groups assigned to its organization.

**6c** Select the resource groups you want to add.

You can Shift-click and Ctrl-click to select multiple resource groups.

**6d** Click *OK* to add the selected resource groups to the *Resource Groups* list.

**7** Add the networks that you want the business group to have access to.

The available networks are determined by the VM hosts included in the resource groups. However, to enable you to provide isolated networks for business groups that share the same resource group, the networks from a resource group are not automatically assigned to a business group when you add the resource group. Instead, you must separately add the networks you want assigned to the business group.

**7a** Under *Membership and Access*, click the *Networks* tab.

**7b** Click *Add* to display the Add Networks dialog box.

**7c** Select the networks.

You can Shift-click and Ctrl-click to select multiple networks.

- 7d** Click *OK* to add the selected networks to the *Networks* list.
- 8** Click *Save*.

## 12.4 Assigning Resource Groups to Organizations and Business Groups

Resource groups must be assigned to an organization in order for the organization's business services to use those resources. After you assign resource groups to an organization, you or the Organization Manager can make them available to business groups within the organization.

The following steps assume that the resource groups you want to assign already exist. If they do not, see ["Creating, Modifying, and Deleting Resource Groups" on page 133](#).

- ♦ [Section 12.4.1, "Assigning Resource Groups to an Organization," on page 130](#)
- ♦ [Section 12.4.2, "Assigning Resource Groups to a Business Group," on page 131](#)
- ♦ [Section 12.4.3, "Removing Resource Group Assignments from an Organization," on page 131](#)
- ♦ [Section 12.4.4, "Removing Resource Group Assignments from a Business Group," on page 132](#)

### 12.4.1 Assigning Resource Groups to an Organization

---

**Roles that Can Perform This Task:** Cloud Administrator

---

- 1** On the main navigation bar, click  *Organizations*.
- 2** On the *Organizations* tab, select the target organization, then click *Edit*.
- 3** Add the resource groups you want the organization to have access to:
  - 3a** Under *Membership and Access*, click the *Resource Groups* tab.
  - 3b** Click *Add* to display the Add Resource Groups dialog box.
  - 3c** Select the resource groups to add.

You can Shift-click and Ctrl-click to select multiple groups.
  - 3d** Click *OK* to add the selected resource groups to the *Resource Groups* list.
- 4** Add the networks that you want the organization to have access to.

The resource group's networks are determined by its VM hosts. To enable you to provide isolated networks for organizations that share the same resource group, the networks are not automatically added when you add the resource group. You must explicitly add the networks you want assigned to the organization.

  - 4a** Under *Membership and Access*, click the *Networks* tab.
  - 4b** Click *Add* to display the Add Networks dialog box.
  - 4c** Select the networks to add.

You can Shift-click and Ctrl-click to select multiple networks.
  - 4d** Click *OK* to add the selected networks to the *Networks* list.
- 5** When you have finished adding resource groups, click *Save* to save the changes.

## 12.4.2 Assigning Resource Groups to a Business Group

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

A business group does not automatically inherit the resource groups assigned to its organization. Any of the organization's resource groups that you want to be available to the business group must be assigned to it.

- 1 On the main navigation bar, click  *Organizations*, then click the *Business Groups* tab.
- 2 In the *Business Groups* list, select the target business group, then click *Edit*.
- 3 Add the resource groups you want the business group to have access to:
  - 3a Under *Membership and Access*, click the *Resource Groups* tab.
  - 3b Click *Add* to display the Add Resource Groups dialog box.
  - 3c Select the resource groups to add.

You can Shift-click and Ctrl-click to select multiple groups.
  - 3d Click *OK* to add the selected resource groups to the *Resource Groups* list.
- 4 Add the networks that you want the business group to have access to.

The resource group's networks are determined by its VM hosts. To enable you to provide isolated networks for business groups that share the same resource group, the networks are not automatically added when you add the resource group. You must explicitly add the networks you want assigned to the business group.

  - 4a Under *Membership and Access*, click the *Networks* tab.
  - 4b Click *Add* to display the Add Networks dialog box.
  - 4c Select the networks to add.

You can Shift-click and Ctrl-click to select multiple networks.
  - 4d Click *OK* to add the selected networks to the *Networks* list.
- 5 When you have finished adding resource groups, click *Save* to save the changes to the business group.

## 12.4.3 Removing Resource Group Assignments from an Organization

---

**Roles that Can Perform This Task:** Cloud Administrator

---

You can remove a resource group from an organization only if the resource group is not hosting any deployed business services from the organization's business groups.

Removing a resource group assignment from an organization also removes any assignments from its business groups.

- 1 On the main navigation bar, click  *Organizations*.
- 2 In the *Organizations* list, select the organization from which you want to remove the resource group assignment, then click *Edit*.
- 3 Click the *Resource Groups* tab.
- 4 Select the resource group to be removed, click *Remove*, then click *Yes* to confirm the removal.

You can Shift-click or Ctrl-click to select multiple resource groups.

- 5 When you have finished removing resource groups, click *Save* to save the changes to the organization.

## 12.4.4 Removing Resource Group Assignments from a Business Group

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

You can remove a resource group from a business group only if the resource group is not hosting any of the business group's deployed business services.

- 1 On the main navigation bar, click  *Organizations*.
- 2 Click the *Business Groups* tab, select the business group from which you want to remove the resource group assignment, then click *Edit*.
- 3 Click the *Resource Groups* tab.
- 4 Select the resource group to be removed, click *Remove*, then click *Yes* to confirm the removal.  
You can Shift-click or Ctrl-click to select multiple resource groups.
- 5 When you have finished removing resource groups, click *Save* to save the changes to the business group.

## 12.5 Managing Organization Users, User Groups, and Roles

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

You can add users and user groups to an organization and then assign roles to the users and groups so that they can perform specific functions within the organization.

Users, user groups, and roles are covered in [Chapter 10, "Setting Up and Managing Users,"](#) on [page 95](#).

---

# 13 Managing Resources

The following sections provide information to help you manage the resources in your Cloud environment:

- ♦ [Section 13.1, “Creating, Modifying, and Deleting Resource Groups,” on page 133](#)
- ♦ [Section 13.2, “Creating, Modifying, and Deleting Service Levels,” on page 136](#)
- ♦ [Section 13.3, “Assigning Service Levels to Resource Groups,” on page 140](#)
- ♦ [Section 13.4, “Monitoring Resource Capacity,” on page 141](#)

## 13.1 Creating, Modifying, and Deleting Resource Groups

A resource group defines a set of VM hosts that an organization can use for its business services. In addition to the VM hosts, the resource group includes one or more service levels that define the cost of the host resources (vCPUs, memory, storage, and networks) and the service objectives (availability, support response time, and so forth).

- ♦ [Section 13.1.1, “Creating Resource Groups,” on page 133](#)
- ♦ [Section 13.1.2, “Modifying Resource Groups,” on page 135](#)
- ♦ [Section 13.1.3, “Deleting Resource Groups,” on page 135](#)

### 13.1.1 Creating Resource Groups

---

**Roles that Can Perform This Task:** Cloud Administrator, Zone Administrator (create resource groups and add hosts only; cannot add service levels or assign resource groups to organizations)

---

- 1 On the main navigation bar, click  *Resources*.
- 2 Click the *Resource Groups* tab, then click *Create*.
- 3 If you are the Zone Administrator for multiple zones, the Select Zone dialog box is displayed. Select the zone that contains the resources you are grouping, then click *OK* to display the Create Resource Group dialog box.
- 4 In the *General* fields, provide the following information for the resource group:
  - Name:** Specify a unique name for the group. You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.
  - Zone:** Displays the zone whose hosts you can add to the group. You cannot change this setting.
  - Hypervisor:** Select the hypervisor technology for the group’s hosts. You can add only those hosts that meet the hypervisor criteria.

**Workload Repository:** The *Default* setting causes a provisioned workload to be stored in the same repository as the VM template used to create it. If you want workloads provisioned to this resource group to be stored in a different shared repository, you must add hosts to the group (see [Step 5](#)), then come back and select the shared repository for the workloads. The *Workload Repository* list is populated only after you add hosts to the resource group.

**Group Type:** This applies only if VMware vSphere is the selected hypervisor. Select *Host* if you want the resource group to use hosts and host clusters. Select *Resource Pool* if you want the resource group to use a resource pool.

**Resource Pool:** If you specified *Resource Pool* as the group type, select the resource pool to include in the group.

**Description:** Provide any additional information for the resource group.

5 If the group type is *Host*, add hosts to the group:

5a Under *Associations*, click the *Hosts* tab.

5b Click *Add* to display the Add Hosts dialog box.

The list displays all available hosts and host clusters in the zone that meet the selected hypervisor criteria. Hosts that are already assigned to another resource group are not displayed.

5c Select the hosts.

You can Shift-click and Ctrl-click to select multiple hosts.

5d Click *OK* to add the selected hosts to the *Hosts* list.

6 Add service levels to the group:

6a Under *Associations*, click the *Service Level* tab.

6b Click *Add* to display the Add Service Levels dialog box.

6c Select the service levels.

You can Shift-click and Ctrl-click to select multiple service levels.

6d Click *OK* to add the selected service levels to the *Service Levels* list.

7 Ignore the *Networks* tab.

The *Networks* tab shows the networks associated with the hosts you added to the group. The list is view-only so you can't make any changes. However, the list is not generated until you save the resource group. If you want to see the networks at this time, click *Save*, double-click the resource group to open it again, then click the *Networks* tab.

8 Specify the organizations that can use the resource group:

8a Under *Associations*, click the *Organizations* tab.

8b Click *Add* to display the Add Organizations dialog box.

8c Select the organizations to which you want to assign the resource group.

You can Shift-click and Ctrl-click to select multiple hosts.

8d Click *OK* to add the selected organizations to the *Organizations* list.

---

**IMPORTANT:** The resource group is added to the organization, but its networks are not made available to the organization. To make the networks available, edit the organization and add the resource group's networks to the *Networks* list.

---

9 Click *Save*.

## 13.1.2 Modifying Resource Groups

---

**Roles that Can Perform This Task:** Cloud Administrator, Zone Administrator (add and remove hosts only)

---

You can modify a resource group to add or remove hosts, to add or remove service levels, and to change the organization assignments.

Be aware of the following when you remove hosts and service levels from a resource group and a resource group from an organization:

- ♦ You can remove a host at any time. Any business service workloads running on the host continue to run until they are cycled (stopped, then started) in the Cloud Manager console. At that point, they are moved to another host in the resource group.
- ♦ You cannot remove a service level if it is associated with a business service that is deployed to the resource group.
- ♦ You cannot remove a resource group assignment from an organization if the organization has business services deployed to the resource group. In addition, removing a resource group assignment from an organization also removes any assignments from its business groups.

To modify a resource group:

- 1 On the main navigation bar, click  *Resources*.
- 2 Click the *Resource Groups* tab, select the resource group you want to modify, then click *Edit*.
- 3 Make the desired changes to the resource group, then click *OK* to save the changes.

For a description of the resource group settings, see [“Creating, Modifying, and Deleting Resource Groups” on page 133](#) or click the  icon in the Edit Resource Group dialog box.

## 13.1.3 Deleting Resource Groups

---

**Roles that Can Perform This Task:** Cloud Administrator, Zone Administrator

---

You can delete a resource group only if the resource group is not hosting any deployed business services.

- 1 On the main navigation bar, click  *Resources*.
- 2 On the *Resource Groups* tab, select the resource group to delete, then click *Delete*.  
If the *Delete* action is not available, the resource group is hosting deployed business services and cannot be deleted.
- 3 Click *Yes* to confirm the deletion.

## 13.2 Creating, Modifying, and Deleting Service Levels

A service level defines the monthly cost for each type of host resource (vCPUs, memory, storage, and networks). For example, you might set the cost of one vCPU at \$25 per month. If a workload requires two vCPUs, \$50 is added to the monthly cost of the workload.

A service level can also include service objectives. Objectives typically define measurable behaviors such as host availability (uptime) or support response time and have a cost associated with them. Any service objective costs are added to the monthly cost of a workload that is deployed in the resource group.

The following sections provide instructions for managing service levels and service level objectives:

- ◆ [Section 13.2.1, “Creating Service Levels,” on page 136](#)
- ◆ [Section 13.2.2, “Modifying Service Levels,” on page 137](#)
- ◆ [Section 13.2.3, “Deleting Service Levels,” on page 138](#)
- ◆ [Section 13.2.4, “Creating Service Level Objectives,” on page 138](#)
- ◆ [Section 13.2.5, “Modifying Service Level Objectives,” on page 139](#)
- ◆ [Section 13.2.6, “Deleting Service Level Objectives,” on page 140](#)

### 13.2.1 Creating Service Levels

---

**Roles that Can Perform This Task:** Cloud Administrator

---

- 1 On the main navigation bar, click  *Resources*.
- 2 Click the *Service Levels* tab, then click *Create*.
- 3 In the *General* section, provide the following details for the service level:
  - Name:** Specify a unique name for the service level. This name is displayed in business service workloads.  
You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.
  - Creation Date:** Displays the current date.
  - Description:** Provide any additional information for the service level.
- 4 In the *Monthly Resource Costs* fields, define the cost (per month) to use the host resources:
  - vCPU:** Specify the cost per virtual CPU.
  - Memory:** Specify the cost per megabyte (MB) of memory.
  - Disk:** Specify the cost per gigabyte (GB) of disk space.
  - Network:** Specify the cost per network interface card.
- 5 (Optional) Add objectives to the service level.
  - 5a Under *Associations*, click the *Service Level Objectives* tab.
  - 5b Click *Add* to display the Add Service Level Objectives dialog box.
  - 5c Select the objectives to add.  
You can Shift-click and Ctrl-click to select multiple objectives.

If you have not yet created the objectives you want, see [“Creating Service Level Objectives” on page 138](#)

- 5d Click *OK* to add the selected objectives to the *Service Level Objectives* list.
- 6 Assign the service level to the appropriate resource groups:
  - 6a Under *Associations*, click the *Resource Groups* tab.
  - 6b Click *Add* to display the Add Resource Groups dialog box.
  - 6c Select the groups to add.

You can Shift-click and Ctrl-click to select multiple groups.
  - 6d Click *OK*.
- 7 Click *Save*.

## 13.2.2 Modifying Service Levels

---

**Roles that Can Perform This Task:** Cloud Administrator

---

You can modify a service level to change the resource costs and objectives. Changing a service level can impact the cost of business services currently using the service level.

- 1 On the main navigation bar, click  *Resources*, then click the *Service Levels* tab.
- 2 Select the service level you want to modify, then click *Edit*.
- 3 In the *General* section, modify the details for the service level:

**Name:** Specify a unique name for the service level. This name is displayed in business service workloads.

You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The maximum length is 110 characters.

**Creation Date:** Displays the current date.

**Description:** Provide any additional information for the service level.
- 4 In the *Monthly Resource Costs* fields, define the cost (per month) to use the host resources:

**vCPU:** Specify the cost per virtual CPU.

**Memory:** Specify the cost per megabyte (MB) of memory.

**Disk:** Specify the cost per gigabyte (GB) of disk space.

**Network:** Specify the cost per network interface card.
- 5 Add objectives to the service level:
  - 5a Under *Associations*, click the *Service Level Objectives* tab.
  - 5b Click *Add* to display the Add Service Level Objectives dialog box.
  - 5c Select the objectives to add.

You can Shift-click and Ctrl-click to select multiple objectives.

If you have not yet created the objectives you want, see [“Creating Service Level Objectives” on page 138](#)
  - 5d Click *OK* to add the selected objectives to the *Service Level Objectives* list.

- 6 Remove objectives from the service level:
  - 6a Under *Associations*, click the *Service Level Objectives* tab.
  - 6b In the *Service Level Objectives* list, select the objectives you want to remove.  
You can Shift-click and Ctrl-click to select multiple objectives.
  - 6c Click *Remove*.
- 7 Assign the service level to resource groups:
  - 7a Under *Associations*, click the *Resource Groups* tab.
  - 7b Click *Add* to display the Add Resource Groups dialog box.
  - 7c Select the groups to add.  
You can Shift-click and Ctrl-click to select multiple groups.
  - 7d Click *OK*.
- 8 Remove the service level from resource groups:
  - 8a Under *Associations*, click the *Resource Groups* tab.
  - 8b Select the resource groups from which to remove the service level.  
You can Shift-click and Ctrl-click to select multiple groups.
  - 8c Click *Remove*.
- 9 Click *Save* to save your changes to the service level.

## 13.2.3 Deleting Service Levels

---

**Roles that Can Perform This Task:** Cloud Administrator

---

If a service level is associated with a business service, you cannot delete the service level.

- 1 On the main navigation bar, click  *Resources*, then click the *Service Levels* tab.
- 2 Select the service level you want to delete, then click *Delete*.
- 3 Click *Yes* to confirm the deletion.

If the service level is associated with a workload, you receive a message informing you that the service level cannot be deleted.

## 13.2.4 Creating Service Level Objectives

---

**Roles that Can Perform This Task:** Cloud Administrator

---

Service level objectives define measurable characteristics such as availability, throughput, frequency, response time, and quality. Each of these characteristics typically has multiple objectives that identify a different level of service.

For example, you might define three availability objectives (97%, 98%, and 99%) and associate them with different service levels (Silver, Gold, and Platinum). By associating different costs with the objectives, you can establish the desired cost structure for your service levels.

- 1 On the main navigation bar, click  *Resources*.
- 2 Click the *Service Levels* tab, click *Service Level Objectives*, then click *Create* to display the Create Service Level Objective dialog box.
- 3 Provide the following details:
  - Name:** Specify a name for the service level objective. The name should be different than any other objective name. This name not only appears to administrators but also to business service requestors when they configure workloads with service levels that include the objective.
  - Monthly Cost:** Specify the cost associated with the objective. If the objective does not have a cost, leave the field empty.
  - Description:** Provide optional text to further identify the service level objective.
  - Creation Date:** Displays the current date.
  - Objective Type:** If this objective represents workload availability, select *Availability*. Otherwise, select *General*.
  - Value:** If the objective type is *Availability*, specify the target availability as a percentage (for example, 99.9). If the objective type is *General*, specify an appropriate objective value.
- 4 Click *Save*.

## 13.2.5 Modifying Service Level Objectives

---

**Roles that Can Perform This Task:** Cloud Administrator

---

- 1 On the main navigation bar, click  *Resources*.
- 2 Click the *Service Levels* tab, then click *Service Level Objectives*.
- 3 Select the objective you want to modify, then click *Edit*.
- 4 Modify the following details:
  - Name:** Specify a name for the service level objective. The name should be different than any other objective name. This name not only appears to administrators but also to business service requestors when they configure workloads with service levels that include the objective.
  - Monthly Cost:** Specify the cost associated with the objective. If the objective does not have a cost, leave the field empty.
  - Description:** Provide optional text to further identify the service level objective.
  - Creation Date:** Displays the current date.
  - Objective Type:** If this objective represents workload availability, select *Availability*. Otherwise, select *General*.
  - Value:** If the objective type is *Availability*, specify the target availability as a percentage (for example, 99.9). If the objective type is *General*, specify an appropriate objective value.
- 5 Click *Save*.

## 13.2.6 Deleting Service Level Objectives

---

**Roles that Can Perform This Task:** Cloud Administrator

---

You cannot delete a service level objective that is associated with a service level. Remove the objective from any service levels before deleting it.

- 1 On the main navigation bar, click  *Resources*.
- 2 Click the *Service Levels* tab, then click *Service Level Objectives*.
- 3 Select the service level you want to delete, then click *Delete*.
- 4 Click *Yes* to confirm the deletion.

If the objective is associated with a service level, you receive a message informing you of the association.

## 13.3 Assigning Service Levels to Resource Groups

A resource group identifies a collection of VM hosts to which workloads can be deployed. However, a resource group does not include any costs associated with running workloads on the hosts. A resource group also does not include any service objectives for the workloads (such as host availability or support response time). The resource costs and service objectives are applied to resource groups through the assignment of service levels.

- ◆ [Section 13.3.1, “Assigning Service Levels,” on page 140](#)
- ◆ [Section 13.3.2, “Removing Service Levels,” on page 140](#)

### 13.3.1 Assigning Service Levels

---

**Roles that Can Perform This Task:** Cloud Administrator

---

- 1 On the main navigation bar, click  *Resources*.
- 2 Click the *Resource Groups* tab, select the resource group to which you want to assign a service level, then click *Edit*.
- 3 Under *Associations*, click the *Service Level* tab.
- 4 Click *Add* to display the Add Service Levels dialog box.
- 5 Select the service level.  
You can Shift-click and Ctrl-click to select multiple service levels.
- 6 Click *OK* to add the selected service level to the *Service Levels* list.
- 7 Click *Save* to save the changes to the resource group.

### 13.3.2 Removing Service Levels

---

**Roles that Can Perform This Task:** Cloud Administrator

---

You cannot remove service levels that are associated with business services deployed in the resource group.

- 1 On the main navigation bar, click  *Resources*.
- 2 Click the *Resource Groups* tab, select the resource group from which you want to remove the service level, then click *Edit*.
- 3 Under *Associations*, click the *Service Level* tab.
- 4 Select the service level to remove.  
You can Shift-click and Ctrl-click to select multiple service levels.
- 5 Click *Remove* to remove the selected service level from the *Service Levels* list.
- 6 Click *Save* to save the changes to the resource group.

If the service level is associated with a business service that is deployed in the resource group, you receive a message stating that the service level cannot be removed.

## 13.4 Monitoring Resource Capacity

---

**Roles that Can Perform This Task:** Cloud Administrator, Zone Administrator (zone only), Approver (organization only)

---

The Capacity view provides information about used, reserved, and allocated resource capacity for organizations and zones.

- ♦ [Section 13.4.1, “Accessing the Capacity View,” on page 141](#)
- ♦ [Section 13.4.2, “Understanding the Capacity View,” on page 141](#)
- ♦ [Section 13.4.3, “Updating the Capacity Data,” on page 144](#)
- ♦ [Section 13.4.4, “Debugging Capacity Collection Issues,” on page 144](#)

### 13.4.1 Accessing the Capacity View

To open the Capacity view:

- 1 On the main navigation bar, click  *Capacity*.

### 13.4.2 Understanding the Capacity View

The Capacity view includes three main sections:

- ♦ [“Capacity Summary Bar” on page 142](#)
- ♦ [“Organizations or Zones List” on page 142](#)
- ♦ [“Organizations or Zones Details” on page 143](#)

## Capacity Summary Bar

The Capacity Summary bar provides a summary for the total resources within your management scope.

For example, if you are a Cloud Administrator, you see a summary for all of the resources in your Cloud. If you are a Zone Administrator, you see a summary of all of the resources in the zones you manage. If you are an Approver, you see a summary of all of the resources in your assigned organizations and zones.

Each resource (Memory, CPU, and Storage) has its own capacity indicator. The indicator displays the used and reserved capacity as a percentage of the total available capacity.

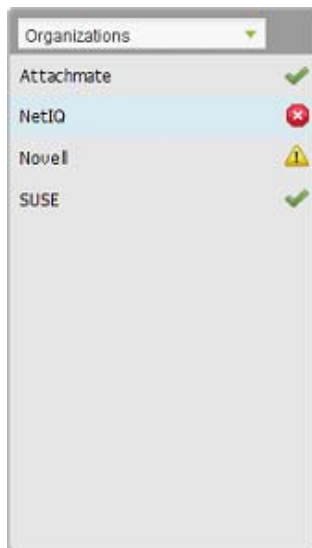

The color of the indicator is determined by the Warning and Problem thresholds set for the Cloud environment. Green indicates that no thresholds have been reached, yellow indicates that the Warning threshold has been reached, and red indicates that the Problem threshold has been reached.

The Issues section of the Capacity Summary bar shows the following:

- ◆ ✓ No resource issues.
- ◆ ⚠ The number of resources that have reached the Warning threshold.
- ◆ ✖ The number of resources that have reached the Problem threshold.

## Organizations or Zones List

The Organizations or Zones list displays the organizations or zones for which you can view resource capacity.

Depending on your role, you might be able to see either organizations or zones but not both.

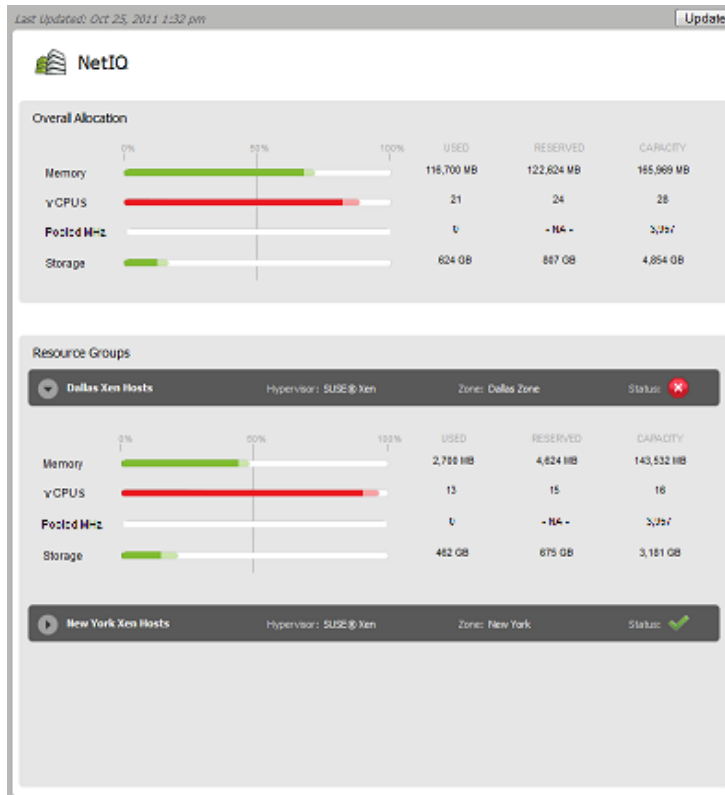

The icon next to each organization or zone indicates the current status of the resources for that item. The statuses correspond to the statuses that can be listed in the Capacity Summary bar:

- ◆ ✓ No resource issues.

- ◆ ⚠ One or more resources for the organization or zone have reached the Warning threshold.
- ◆ ❌ One or more resources for the organization or zone have reached the Problem threshold.

## Organizations or Zones Details

The Organizations or Zones Details panel displays the resource capacity information for the organization or zone that is selected in the list.

The *Overall Allocation* section provides a summary of the used, reserved, and available capacity for the entire organization or zone. The *Resource Groups* section shows the same type of information for the each resource group in the organization or zone.

- ◆ **Memory:** The memory (RAM) resources.
- ◆ **vCPUs:** The host and cluster virtual CPU resources, represented in number of CPUs. This resource is displayed only if a resource group contains hosts or clusters.
- ◆ **Pooled MHz:** The resource pool CPU resources, represented in MHz of CPU. This resource is displayed only if a resource group contains vSphere resource pools.
- ◆ **Storage:** The shared storage resources. This includes SAN (Storage Area Network) and NAS (Network-attached Storage). Local storage is not included.

For each resource, the following information is displayed:

- ◆ **Used:** The amount of the resource that is actually being consumed by deployed workloads. For example, a workload might be allocated 4 GB of memory but only be using 2 GB.
- ◆ **Reserved:** The amount of the resource that is reserved for deployed workloads. For example, if a workload is allocated 4 GB of memory, all 4 GB are reserved.

- ♦ **Capacity:** The total amount of the resource that is available for deployed workloads. For memory from hosts and clusters, the *Capacity* field reflects the total physical memory of the hosts, not just the memory that is available for workloads. For example, a host's physical memory might be 16252 MB, with the actual memory available for workloads being 10695 MB. Because the *Capacity* field uses the physical memory amount (16252 MB), you might not have as much memory capacity as appears. For memory from resource pools, the *Capacity* field reflects the actual memory pool size.

The *Resource Groups* sections provide capacity details for each resource group assigned to the organization or zone. The status of each resource group is also displayed.

The *Last Updated* field displays the last time the capacity data was updated. The *Update* button lets you update the data.

### 13.4.3 Updating the Capacity Data

The Capacity engine collects capacity data on a regular interval specified in System Configuration. The collected data is cached on the Cloud Manager Application Server.

The Capacity data is static, meaning that the Capacity view displays the same data until you update from the cached data on the Cloud Manager Application Server.

To update the data:

- 1 Click *Update*.

If the cached data is newer than the current data, the Capacity view is updated with the cached data.

- 2 Click *Yes* to confirm that you to continue with the manual update.

The Capacity engine collects the new data from the system. As soon as the data is collected, the Capacity view automatically updates to the new data.

### 13.4.4 Debugging Capacity Collection Issues

As a Cloud Manager administrator, you might occasionally encounter capacity collection issues in the Cloud Manager system. You can enable the debugging for capacity collection logging on your production level Cloud Manager Application Server to help you or NetIQ Support troubleshoot these issues.

The Cloud Manager Application Server uses a custom properties file, */etc/cmplanner.logging.properties*, to enable logging. Its contents, including the `DEBUG` setting, look like this:

```

# Set root logger level to DEBUG and its only appender to A1.
log4j.rootLogger=WARN, CMFILE, CMOUT

# Planner is set to be a ConsoleAppender.
log4j.appender.CMOUT=org.apache.log4j.ConsoleAppender
log4j.appender.CMOUT.layout=org.apache.log4j.PatternLayout
log4j.appender.CMOUT.layout.ConversionPattern=%-4r [%t] %-5p %c %x - %m%n

# File appender
log4j.appender.CMFILE=org.apache.log4j.RollingFileAppender
log4j.appender.CMFILE.layout=org.apache.log4j.PatternLayout
log4j.appender.CMFILE.layout.ConversionPattern=[%d{dd MMM yyyy HH:MM:ss}] %-5.5p
| %-16.16t | %-32.32c{1} | %X{bundle.id} - %X{bundle.name} - %X{bundle.version} |
%m%n
log4j.appender.CMFILE.file=${karaf.base}/logs/cloudmanager_server.log
log4j.appender.CMFILE.append=true
log4j.appender.CMFILE.maxFileSize=10MB
log4j.appender.CMFILE.maxBackupIndex=10

# Logging category modifications for novell-esb
log4j.logger.org.quartz=DEBUG
log4j.logger.com.netiq.rest.planner.CmPlanner=DEBUG
log4j.logger.com.netiq.service.planner.capacitybot.CapacityBot=DEBUG

```

To enable debug logging,

- 1 Edit the properties file, changing any WARN value to a DEBUG value (see example, above).
- 2 In the Karaf console, run an update on the AppServices bundle.

The update process requires that you enter a module ID. You can find this ID using a `list` command and then browsing the list of modules and their accompanying IDs.

---

# 14 Managing Business Services

The following sections provide information to help you deploy business services, manage deployed business services, and change deployed business services:

- ◆ [Section 14.1, “Requesting Business Services,” on page 147](#)
- ◆ [Section 14.2, “Managing Business Service Requests,” on page 149](#)
- ◆ [Section 14.3, “Importing Existing Virtual Machines,” on page 151](#)
- ◆ [Section 14.4, “Managing Deployed Business Services,” on page 154](#)
- ◆ [Section 14.5, “Changing Deployed Business Services,” on page 155](#)
- ◆ [Section 14.6, “Extending Business Service Expiration Dates,” on page 159](#)
- ◆ [Section 14.7, “Displaying or Hiding Business Service Costs,” on page 159](#)
- ◆ [Section 14.8, “Understanding Business Service Contracts,” on page 160](#)

## 14.1 Requesting Business Services

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

A deployed business service starts as a request. The request defines the business service, including its name, contract period, and workloads. As soon as you submit the request, it goes through an approval and build process that you can track until the business service is deployed.

- 1 On the main navigation bar, click  *Business Services*, then click the *Requests* tab.
- 2 Click *Create* to display the Create Business Service Request dialog box.
- 3 Provide the following details for the business service:

**Service Name:** Specify a name that is different than any other business service names for the business group. You can use letters, numbers, and the following special characters: space, hyphen, underscore, apostrophe, percent, ampersand, and period. The name must begin with a letter or number and have a maximum length of 110 characters.

**Start Date:** Click  to select the date you want the business service to be available.

**Expiration Date:** Click  to select the date you want the business service to no longer be available. If you don't want the business service to expire, delete the date from the field.

**Contract Length:** If an expiration date is selected, this field displays the total number of months for the contract.

**Organization:** Select the organization for which you are creating the business service. You can select the business group before the organization, in which case the correct organization is automatically selected.

**Business Group:** Select the business group for which you are creating the business service.

**Creator:** Displays your user name.

**Business Purpose:** Provide details that explain the purpose or justification for the business service. This information is visible to the business service's approvers during the request approval process.

- 4 Add a workload to the business service:
  - 4a Click *Add* to display the Select Workload Template dialog box.

The dialog box displays a list of workload templates. A template provides the base settings and costs for the workload.
  - 4b Select the workload template from which to create the workload, then click *OK* to display the Configure Workload dialog box.
  - 4c On the *Resources* tab, specify a name for the workload, select a service level, and customize the resources allocated to the workload.

You cannot customize the resources if they are locked. For additional information about the *Resources* settings, click the  button.
  - 4d Click the *Disks* tab to configure the workload's disks.

The workload's mandatory disks are listed. The mandatory disks are created with the workload and cannot be customized.

If the *Add* action, located above the list, is available, there are optional disks you can create for the workload. Click *Add*, then specify the size for the disk.

For additional information about the *Disks* settings, click the  button.
  - 4e Click the *Networks* tab (if it is displayed), select a network interface card, then assign the network and configure the network address and name servers.

For additional information about the *Networks* settings, click the  button.
  - 4f (Optional) Click the *Windows Settings* tab (if it is displayed), then provide an Administrator account password, computer name, and workgroup or domain information.

If you do not provide this information at this time, a Build Administrator or Cloud Administrator must provide during pre-build configuration of the workloads. For additional information about the *Windows Settings* settings, click the  button.
  - 4g (Optional) Click the *Windows Licensing* tab (if it is displayed), then provide a Windows product key, and registration name.

If the Cloud Administrator has pre-populated the Windows Product Key field, the data is masked. You cannot copy this data.

If you do not provide this information at this time, a Build Administrator or Cloud Administrator must provide during pre-build configuration of the workloads. For additional information about the *Windows Licensing* settings, click the  button.
  - 4h (Optional) Click the *Linux Settings* tab (if it is displayed), then provide a host name and domain name.

If you do not provide this information at this time, a Build Administrator or Cloud Administrator must provide during pre-build configuration of the workloads. For additional information about the *Linux Settings* settings, click the  button.
  - 4i (Optional) Click the *Console Access* tab, then set the password for VNC access to the workload.

If you do not provide this information at this time, a Build Administrator or Cloud Administrator must provide during pre-build configuration of the workloads. For additional information about the *Console Access* settings, click the  button.
  - 4j Click *OK* to save the workload and add it to the *Workloads* list.
- 5 Add any additional workloads to the business service.

You can add additional workloads by repeating [Step 4](#) or by copying an existing workload and then modifying it as necessary. To copy a workload:

**5a** Select the workload to copy, then click *Copy*.

**5b** Select the number of copies to create, and provide a unique name for each copy.

**5c** Click *OK*.

The new workloads are added to the *Workloads* list.

**5d** Edit each new workload to provide any missing information.

Each new workload contains as much of the original information as possible, but information such as network addresses, Windows computer names, and Linux host names are not copied because they need to be unique for each workload.

**6** (Optional) Give other users ownership rights to the business service.

The *Users* list lets you see any users who have been explicitly assigned ownership rights to the business service. It does not show users who inherit ownership rights to the business service through their roles.

**6a** Click the *Users* tab, then click *Add*.

**6b** Select users from the two lists.

The *Members* list displays all users who are members of the business service's organization. The *System Users* list displays users who are not members of the organization.

You can Shift-click and Ctrl-click to select multiple users (or user groups).

**6c** Click *OK*.

The users are added to the list.

**7** Click *Save* to add the request to the *Requested Services* list without submitting it.

or

Click *Submit* to add the request and submit it for approval.

## 14.2 Managing Business Service Requests

After you request a business service, a business service request is added to your *Requests* list. You can complete any of the following tasks to manage the request.

- ♦ [Section 14.2.1, "Submitting a Request," on page 149](#)
- ♦ [Section 14.2.2, "Editing a Request," on page 150](#)
- ♦ [Section 14.2.3, "Withdrawing a Request," on page 150](#)
- ♦ [Section 14.2.4, "Deleting a Request," on page 150](#)

### 14.2.1 Submitting a Request

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

The following steps assume that you have a saved business service request that you want to submit. If you have not yet created the request, see [Requesting Business Services](#).

- 1** On the main navigation bar, click  *Business Services*, then click *Requests*.
- 2** Select the request, then click *Submit*.

## 14.2.2 Editing a Request

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

You can edit only unsubmitted requests. If you want to change a submitted request, you must withdraw it, change it, and then resubmit it. For information about withdrawing a request, see [Withdrawing a Request](#).

- 1 On the main navigation bar, click  *Business Services*, then click the *Requests* tab.
- 2 Select the request, then click *Edit*.  
or  
Double-click the request.
- 3 Modify the request as desired.  
For a description of the settings, click the  button.
- 4 Click *Save* to save your changes without submitting the request.  
or  
Click *Submit* to save your changes and submit the request.

## 14.2.3 Withdrawing a Request

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

Withdrawing a request stops the provisioning process. You can withdraw a submitted request until it reaches a certain phase in the *Building* process. At that point, the *Withdraw* action is no longer available.

After you withdraw a request, you can make changes to it and resubmit it, or you can delete it.

- 1 On the main navigation bar, click  *Business Services*, then click the *Requests* tab.
- 2 Select the request, then click *Withdraw*.

## 14.2.4 Deleting a Request

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

You can delete non-submitted requests. To delete a submitted request, you must first withdraw it so that it becomes a non-submitted request. For information about withdrawing a request, see [Withdrawing a Request](#).

- 1 On the main navigation bar, click  *Business Services*, then click the *Requests* tab.
- 2 Select the request, then click *Delete*.
- 3 Click *Yes* to confirm the deletion.

## 14.3 Importing Existing Virtual Machines

If you have an existing virtual machine that is not part of the Cloud Manager system, you can import it as new business service or you can import it into a deployed business service. Because the virtual machine is already provisioned, the request and provisioning processes are skipped and the virtual machine is imported directly as a deployed workload.

In order to import a virtual machine, it must reside on a host associated with a resource group. The virtual machine can be running, shut down, or suspended.

- ♦ [Section 14.3.1, “Importing a Virtual Machine into a New Business Service,”](#) on page 151
- ♦ [Section 14.3.2, “Importing a Virtual Machine into a Deployed Business Service,”](#) on page 152
- ♦ [Section 14.3.3, “Completing Pre-Build Configuration Tasks,”](#) on page 153
- ♦ [Section 14.3.4, “Completing Post-Build Configuration Tasks,”](#) on page 153

### 14.3.1 Importing a Virtual Machine into a New Business Service

---

**Roles that Can Perform This Task:** Cloud Administrator

---

The following steps explain how to import a virtual machine as a new business service. To import a virtual machine into an existing business service, see [Section 14.3.2, “Importing a Virtual Machine into a Deployed Business Service,”](#) on page 152.

- 1 On the main navigation bar, click  *Business Services*, then click *Deployed*.
- 2 Click *Import* to display the Import Business Service dialog box.
- 3 Provide the following details for the business service:

**Service Name:** Specify a name for the business service. The name should be unique among other business services you have created.

**Start Date:** Defaults to the current date. You cannot change the start date.

**Expiration Date:** Click  to select the date you want the business service to no longer be available. If you don't want the business service to expire, leave the field empty.

**Contract Length:** If an expiration date is selected, this field displays the total number of months for the contract.

**Organization:** Select the organization for which you are importing the business service.

**Business Group:** Select the business group for which you are importing the business service.

**Creator:** Displays your name. You cannot change the creator.

**Business Purpose:** Provide details that explain the purpose or justification for the business service.

- 4 Import a virtual machine:

- 4a On the *Workloads* tab, click *Import* to display the Select Virtual Machine dialog box.

The dialog box displays a list of virtual machines that can be imported into the selected business group.

- 4b Select the virtual machine to import, then click *OK* to display the Configure Imported Workload dialog box.

- 4c On the *Resources* tab, configure the following:

**Workload Name:** By default, the workload inherits the virtual machine name. Make sure the name is different from other workloads included in the business service.

**License Costs:** Specify the monthly cost for licenses associated with the workload.

**Service Level:** Select the service level for the workload.

- 4d** (Optional) On the *Disks* tab, select a disk, then enable the *Cost* check box to include the disk's cost in the business service cost or disable the check box to exclude the disk from the business service cost.
- 4e** Click *OK* to save the configuration and add the workload to the business service.
- 5** Assign users as owners of the business service:
  - 5a** On the *Users* tab, click *Add* to display the Add Business Service Owner dialog box.
  - 5b** Select the users to add as owners.

You can add members of the organization or System users. Shift-click and Ctrl-click to select multiple users.
  - 5c** Click *OK*.
- 6** Click *Import* to add the business service to the list of deployed business services.

At this point, you can change the imported workload's resources if necessary. This is a change to the business service and requires a change request to go through the approval process and the imported workload to be rebuilt. See [Chapter 14.5, "Changing Deployed Business Services,"](#) on page 155.

## 14.3.2 Importing a Virtual Machine into a Deployed Business Service

---

**Roles that Can Perform This Task:** Cloud Administrator

---

The following steps explain how to import a virtual machine into an existing deployed business service. To import a virtual machine as a new business service, see [Section 14.3.1, "Importing a Virtual Machine into a New Business Service,"](#) on page 151.

- 1** On the main navigation bar, click  *Business Services*, then click *Deployed*.
- 2** Select the business service to which you want to import the virtual machine, then click *Manage*.

or

Double-click the business service.
- 3** On the *Workloads* tab, click *Import* to display the Select Virtual Machine dialog box.

The dialog box displays a list of virtual machines that can be imported into the selected business group.
- 4** Select the virtual machine to import, then click *OK* to display the Configure Imported Workload dialog box.
- 5** On the *Resources* tab, configure the following:

**Workload Name:** By default, the workload inherits the virtual machine name. Make sure the name is different from other workloads included in the business service.

**License Costs:** Specify the monthly cost for licenses associated with the workload.

**Service Level:** Select the service level for the business service.
- 6** (Optional) On the *Disks* tab, select a disk, then enable the *Cost* check box to include the disk's cost in the business service cost or disable the check box to exclude the disk from the business service cost.

- 7 Click *OK* to save the configuration and add the workload to the business service.
- 8 Click *Save* to save the business service.

### 14.3.3 Completing Pre-Build Configuration Tasks

After a business service request receives both Administrator and Sponsor approval, a *Pre-build configuration* task is sent to you and any other Build Administrators assigned to the business service's organization or business group. Cloud Administrators also receive the task.

The task pauses the provisioning workflow to give you an opportunity to perform any pre-build configuration tasks for the workloads. This might be a task that you complete in the Cloud Manager console, such as configuring the Windows settings (Administrator account password, computer name, product license key, and registered name) or remote console password for one of the workloads. Or, it might be a task that you need to perform at the Cloud Manager Orchestration Server or in your hypervisor tools.

- 1 On the main navigation bar, click  *Tasks*, then click the *Unclaimed* tab.
- 2 Select the task (the subject is *Pre-build configuration of a new Business Service*)  
If there are configuration tasks that must be completed for the business service in the Cloud Manager console, the *Complete* action is not available and an asterisk (\*) appears next to it. You can mouse over the asterisk to view the remaining tasks.
- 3 If you want to claim the task so that others cannot work on it, click *Claim*.  
Claimed tasks are moved to your *My Tasks* list.
- 4 Complete any pre-build configuration tasks required for the workloads:
  - ♦ **Cloud Manager console tasks:** Select the configuration task, then click the *Review* action to display the task. Select a workload that needs to be configured, then click *Edit*. Configure the required settings and save the workload.
  - ♦ **External tasks:** Complete the tasks.
- 5 Mark the task as complete:
  - ♦ If you claimed the task, it is in your *My Tasks* list. Select the task, then click *Complete*.
  - ♦ If you did not claim the task, it is in the *Unclaimed* list. Select the task, then click *Complete*.

### 14.3.4 Completing Post-Build Configuration Tasks

After a business service is successfully built, a *Post-build configuration* task is sent to you and any other Build Administrators assigned to the business service's organization or business group. The task is also sent to Cloud Administrators.

The task pauses the provisioning workflow to give you an opportunity to perform any post-build configuration tasks for the workloads. You must complete the configuration (if any) and then mark the task as complete to continue the provisioning workflow.

- 1 On the main navigation bar, click  *Tasks*, then click the *Unclaimed* tab.
- 2 If you want to claim the task so that no others can work on it, select the task, then click *Claim*.  
Claimed tasks are moved to your *My Tasks* list.
- 3 If you want to review the business service request, select the task (the subject is *Post-build configuration of a new Business Service*), then click *Review*.
- 4 Complete any post-build configuration tasks required for the workloads.

- 5 Mark the task as complete:
  - ♦ If you claimed the task, it is in your *My Tasks* list. Select the task, then click *Complete*.
  - ♦ If you did not claim the task, it is in the *Unclaimed* list. Select the task, then click *Complete*.

## 14.4 Managing Deployed Business Services

You can cycle (start, suspend, stop) a deployed business service's workloads, open a remote console to a workload, and give other users access to the business service.

- ♦ [Section 14.4.1, "Starting, Suspending, or Shutting Down a Workload," on page 154](#)
- ♦ [Section 14.4.2, "Opening a Workload Console," on page 154](#)
- ♦ [Section 14.4.3, "Delegating Ownership of a Business Service," on page 155](#)

### 14.4.1 Starting, Suspending, or Shutting Down a Workload

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

- 1 On the main navigation bar, click  *Business Services*, then click *Deployed*.
- 2 Select the business service with the workload you want to cycle, then click *Manage*.
- 3 In the *Workloads* list, select the workload.
- 4 Click one of the following controls:
  - ▶ Start the workload.
  - || Suspend the workload.
  - Shut down the workload.
- 5 Click *Close*.

### 14.4.2 Opening a Workload Console

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

Cloud Manager provides remote access to workloads via a VNC console.

- 1 On the main navigation bar, click  *Business Services*, then click *Deployed*.
- 2 Select the business service with the workload you want to access, then click *Manage*.
- 3 In the *Workloads* list, select the workload, then click *Console*.
  - ♦ The *Console* action opens a new browser window that provides VNC access to the selected workload's desktop. The *Console* action is enabled even when a workload is shut down, which gives users the opportunity to enter a password before restarting the virtual machine.

- ♦ If the VNC session does not require a password, the user can press Enter. If the user enters a password incorrectly when the VNC session is established, he or she can enter the password again.
- ♦ The *Console* action is not enabled for imported workloads that have not yet been configured for VNC access.

4 Specify the console password to log in.

After you log in, Cloud Manager opens a remote console session to the workload. Most functions of the remote console work the same as the local console. However, if you need to use special key sequences such as Ctrl+Alt+Del, you must select them from the *Send Special Key Sequence* menu located at the top of the console.

---

**NOTE:** In this version of Cloud Manager, the VNC console is rendered using HTML 5. If you use Internet Explorer 9 as the browser to view the Cloud Manager Web Console, you need to make sure that either the Adobe (Shockwave) Flash add-on is enabled or that the Google Chrome Frame add-on is enabled. Both of these add-ons are available for free download.

---

5 When you have finished, close the browser window to end the session.

### 14.4.3 Delegating Ownership of a Business Service

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

By default, the following users have ownership rights to a business service:

- ♦ The creator of the business service
- ♦ All Business Service Owners for the business group that the business service belongs to
- ♦ All Business Service Owners for the organization
- ♦ All Organization Managers

If necessary, you can delegate ownership to other users. When you do so, the user receives rights to view, manage, and change the business service.

- 1 On the main navigation bar, click  *Business Services*, then click *Deployed*.
- 2 Select the business service to which you want to give another user access, then click *Manage*.
- 3 Click the *Users* tab to display the *Business Service Owner* list.
- 4 Click *Add*, select the users or user groups you want to give access to the business service, then click *OK*.

You can Shift-click and Ctrl-click to select multiple users and user groups.

If the *Add* action is not available, you do not have rights to give access to other users.

## 14.5 Changing Deployed Business Services

You can change a business service's details (expiration date and business purpose) and workloads. Any change (including changing the expiration date and business purpose) generates a change request that must be approved before the changed business service can be redeployed.

- ♦ [Section 14.5.1, "Changing a Business Service's Details," on page 156](#)
- ♦ [Section 14.5.2, "Reassigning a Business Service to a Different Business Group," on page 156](#)

- [Section 14.5.3, “Adding a Workload,”](#) on page 157
- [Section 14.5.4, “Modifying a Workload,”](#) on page 158
- [Section 14.5.5, “Removing a Workload,”](#) on page 158

## 14.5.1 Changing a Business Service’s Details

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

- 1 On the main navigation bar, click  *Business Services*, then click *Deployed*.
- 2 Select the business service, then click *Change*.
- 3 Modify the details for the business service:
  - Expiration Date:** Specify the date you want the business service to no longer be available.
  - Business Purpose:** Provide details that explain the purpose or justification for the change to the business service.
- 4 Click *Submit* to submit your business service change request.

or

If you don’t want to submit the change request at this time, click *Save* to save the change request.

A change icon  is added next to the business service name in the *Deployed* list to indicate that a change request has been generated and added to the *Requests* list. If you saved the change request rather than submitting it, you must go to the *Requests* list to edit the request or submit it.

## 14.5.2 Reassigning a Business Service to a Different Business Group

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

You can reassign a business service to a different business group if 1) you have rights to the other business group and 2) the business group’s resources (hypervisor, service levels, and so forth) support the business service’s workloads.

- 1 On the main navigation bar, click  *Business Services*, then click *Deployed*.
- 2 Select the business service, then click *Change*.
- 3 In the *Business Group* list, select the target business group.
- 4 Click *Submit* to submit your business service change request.

or

If you don’t want to submit the change request at this time, click *Save* to save the change request.

A change icon  is added next to the business service name in the *Deployed* list to indicate that a change request has been generated and added to the *Requests* list. If you saved the change request rather than submitting it, you must go to the *Requests* list to edit the request or submit it.

## 14.5.3 Adding a Workload

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

- 1 On the main navigation bar, click  *Business Services*, then click *Deployed*.
- 2 Select the business service to which you want to add a workload, then click *Change*.
- 3 On the *Workloads* tab, click *Add* to display the Select Workload Template dialog box.

The dialog box displays a list of workload templates. A template is the basis for a workload, providing basic workload settings and costs.
- 4 Select the workload template from which to create the workload, then click *OK* to display the Configure Workload dialog box.
- 5 On the *Resources* tab, specify a name for the workload, select a service level, and customize the resources allocated to the workload.

If the resources are locked, you cannot customize them. For additional information about the *Resources* settings, click the  button.
- 6 Click the *Disks* tab to configure the workload's disks.

The workload's mandatory disks are listed. The mandatory disks are created with the workload and cannot be customized.

If the *Add* action, located above the list, is available, there are optional disks you can create for the workload. Click *Add*, then specify the size for the disk

For additional information about the *Disks* settings, click the  button.
- 7 Click the *Networks* tab (if it is displayed), select a network interface card, then assign the network and configure the network address and name servers.

For additional information about the *Networks* settings, click the  button.
- 8 (Optional) Click the *Windows Settings* tab (if it is displayed), then provide an Administrator account password, computer name, and workgroup or domain information.

If you do not provide this information at this time, a Build Administrator or Cloud Administrator must provide it during pre-build configuration of the workloads. For additional information about the *Windows Settings* settings, click the  button.
- 9 (Optional) Click the *Windows Licensing* tab (if it is displayed), then provide a Windows product key, and registration name.

If you do not provide this information at this time, a Build Administrator or Cloud Administrator must provide it during pre-build configuration of the workloads. For additional information about the *Windows Licensing* settings, click the  button.

If the Cloud Administrator has pre-populated the Windows Product Key field, the data is masked. You cannot copy this data.
- 10 (Optional) Click the *Linux Settings* tab (if it is displayed), then provide a host name and domain name.

If you do not provide this information at this time, a Build Administrator or Cloud Administrator must provide it during pre-build configuration of the workloads. For additional information about the *Linux Settings* settings, click the  button.
- 11 (Optional) Click the *Console Access* tab, then set the password for VNC access to the workload.

If you do not provide this information at this time, a Build Administrator or Cloud Administrator must provide it during pre-build configuration of the workloads. For additional information about the *Console Access* settings, click the  button.

12 Click *OK* to save the workload and add it to the *Workloads* list.

13 Click *Submit* to submit your business service change request.

or

If you don't want to submit the change request at this time, click *Save* to save the change request.

A change icon  is added next to the business service name in the *Deployed* list to indicate that a change request has been generated and added to the *Requests* list. If you saved the change request rather than submitting it, you must go to the *Requests* list to edit the request or submit it.

## 14.5.4 Modifying a Workload

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

1 On the main navigation bar, click  *Business Services*, then click *Deployed*.

2 Select the business service with the workload you want to modify, then click *Change*.

3 On the *Workloads* tab, select the workload to modify, then click *Edit*.

4 Modify the workload settings as desired.

For information about the workload settings, click the  button.

---

**IMPORTANT:** The *Service Level* field and *Resource Group* field (if it is available) determine which resource group hosts the workload. If you use either of these fields to change the workload's resource group, you need to stop and then start the workload after it is rebuilt. The workload is not moved to the new resource group until it is manually restarted.

---

5 Click *OK* to save the workload changes.

6 Click *Submit* to submit your business service change request.

or

If you don't want to submit the change request at this time, click *Save* to save the change request.

## 14.5.5 Removing a Workload

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager, Business Service Owner

---

1 On the main navigation bar, click  *Business Services*, then click *Deployed*.

2 Select the business service with the workload you want to remove, then click *Change*.

3 On the *Workloads* tab, select the workload, then click *Remove*.

4 Click *Yes* to confirm the action.

5 Click *Submit* to submit your business service change request.

or

If you don't want to submit the change request at this time, click *Save* to save the change request.

## 14.6 Extending Business Service Expiration Dates

---

**Roles that Can Perform This Task:** Cloud Manager, Organization Manager, Business Service Owner

---

To extend the expiration date for a business service, you must submit a business service change request. The request goes through the standard approval and configuration workflow for a business service.

- 1 On the main navigation bar, click  *Business Services*, then click *Deployed*.
- 2 Select the business service, then click *Change*.
- 3 Change the expiration date to the desired date.
- 4 Click *Submit* to submit your business service change request.

or

If you don't want to submit the change request at this time, click *Save* to save the change request.

A change icon  is added next to the business service name in the *Deployed* list to indicate that a change request has been generated and added to the *Requests* list. If you saved the change request rather than submitting it, you must go to the *Requests* list to edit the request or submit it.

## 14.7 Displaying or Hiding Business Service Costs

The Cloud Manager console displays business service costs in places such as the business service lists, the individual business service dialog boxes, and business service cost reports. System users always see the business service costs. However, you can choose whether or not to display costs to Organization members.

There are three levels at which you can configure the *Costs* setting:

- ♦ **Organization:** This setting applies to all Organization members. For example, if the *Costs* setting is set to *Hide*, no Organization members can see business service costs.
- ♦ **Business Group:** This setting overrides the organization setting for the business group. For example, if the organization *Costs* setting is set to *Hide*, but the business group *Costs* setting is set to *Show*, Organization members can see the costs for that business group's business services.
- ♦ **User:** Each user account has an *Always show costs* setting that overrides the organization and business group *Costs* setting.

### 14.7.1 Configuring an Organization's Costs Setting

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

- 1 On the main navigation bar, click  *Organizations*.
- 2 On the *Organizations* tab, select the target organization, then click *Edit*.
- 3 In the upper-right corner of the dialog box, click the  icon to display the Organization Configuration dialog box.
- 4 Under *Organizations Costs*, select *Show* or *Hide*.

The setting applies to all Organization members unless it is overridden for a business group or individual user.

- 5 Click *OK* to save your changes.

## 14.7.2 Configuring a Business Group's Costs Setting

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

- 1 On the main navigation bar, click  *Organizations*.
- 2 Click the *Business Groups* tab, select the target business group, then click *Edit*.
- 3 In the *Costs* field, select *Override* to override the setting inherited from the organization, then select *Show* or *Hide*.

The setting applies to all business services created for the business group. If the costs are hidden, no Organization members can see the costs unless you enable the *Always show costs* setting for individual users.

- 4 Click *Save* to save your changes.

## 14.7.3 Configuring a User's Costs Setting

---

**Roles that Can Perform This Task:** Cloud Administrator, Organization Manager

---

- 1 On the main navigation bar, click  *Organizations*.
- 2 Click the *Users* tab, select the target user, then click *Edit*.
- 3 In the *Cost Visibility* field, select *Always show costs* to enable the user to see business service costs regardless of the organization and business group *Costs* settings.

The setting is disabled for System users. System users can always see business service costs.

- 4 Click *Save* to save your changes.

## 14.8 Understanding Business Service Contracts

Business services with an expiration date are considered “under contract” until the expiration date is reached. A business service under contract will not change price during the contract. In addition, you cannot make certain changes to business services that are under contract.

### 14.8.1 Restrictions Resulting from an Active Contract

Changes to a business service are restricted if the business service is under contract. The following restrictions apply when the business service is under contract:

- ♦ You can change the resources on the business service (that is, the number of CPUs, the amount of RAM, the number of NICs, and the total costable storage) only within the minimum/maximum limits defined on the associated package.

- ◆ You can change the associated resource pricing package only if it is an “upgrade,” that is, the new package must require the minimum resources and/or contract length to be the same or greater value. A package “downgrade,” that is, changing the settings to the minimum resources and/or contract length, is not allowed.
- ◆ You can only upgrade the service level of the business service to the same price or more expensive price. A downgrade of the service level is not allowed.
- ◆ You cannot reduce or delete an expiration date on a business service.
- ◆ You cannot delete a workload from the business service.
- ◆ You cannot delete a contracted business service.

## 14.8.2 Contract Change Period

When the business service nears its expiration date, you will receive an email notifying you that changes to the business service are no longer restricted. During this “change period” you can make any change, including deleting the business service.

## 14.8.3 Contract Renewals

Some resource pricing packages have minimum contract lengths. When you choose one of these packages for a workload, the business service must have a contract that is at least as long as the workload’s minimum contract length. Some packages also include a contract renewal length. If a business service contains a workload with a contract renewal length, the business service’s contract renews for the specified length when it reaches the expiration date. In other words, when the business service’s expiration date is reached, the expiration date is extended by the renewal length.

You can expect the following behaviors for contract renewals:

- ◆ If a business service has several workloads, the contract renewal length for the entire business service is derived from the workload with the longest contract renewal length.
- ◆ If a business service has no number of days for contract renewal, the business service expires.
- ◆ If a business service contract is renewed, the expiration date is extended. No cost changes occur.
- ◆ If a business service undergoes a change request during the change period, the expiration date is extended.
- ◆ If a business service change request is pending during a contract change period, its contract is not renewed until the change request is reviewed and approved.

---

# 15 Managing Tasks in the Business Service Workflow

The following sections provide information to help you manage the tasks that are created when requesting, changing, or deleting a business service:

- ♦ [Section 15.1, “Displaying Administrator or Sponsor Tasks,” on page 163](#)
- ♦ [Section 15.2, “Claiming Tasks,” on page 163](#)
- ♦ [Section 15.3, “Approving and Denying Requests,” on page 164](#)
- ♦ [Section 15.4, “Completing Configuration Tasks,” on page 164](#)
- ♦ [Section 15.5, “Completing Trigger Tasks,” on page 166](#)

## 15.1 Displaying Administrator or Sponsor Tasks

---

**Roles that Can Perform This Task:** Cloud Administrator, Sponsor

---

In the *Unclaimed Tasks* list and the *All Tasks* list, tasks are categorized as Administrator tasks or Sponsor tasks. The Administrator tasks are the two configuration tasks (pre-build configuration and post-build configuration) and the Administrator approval task. The Sponsor task is the Sponsor approval task.

You can filter the two lists to show only Administrator tasks, only Sponsor tasks, or all tasks.

- 1 On the main navigation bar, click  *Tasks*.
- 2 Click the list you want (*Unclaimed* or *All Tasks*).
- 3 In the select box at the top of the list, select the tasks you want to display (*All Tasks*, *Administrator Tasks*, or *Sponsor Tasks*).

## 15.2 Claiming Tasks

---

**Roles that Can Perform This Task:** Cloud Administrator, Approver (Administrator approval tasks only), Sponsor (Sponsor approval tasks only), Build Administrator (configuration tasks only)

---

You can claim an unclaimed task or a task that is owned by another user. When you claim a task, you become the task owner. No one else can work on the task unless you release (unclaim) the task or the other user claims it from you.

You cannot assign a task to another user. The task must be claimed by the other user.

1 On the main navigation bar, click  *Tasks*.

2 To claim an unclaimed task, click the *Unclaimed* tab.

or

To claim a task owned by another user, click the *All Tasks* tab.

3 Select the task to claim, then click *Claim*.

The task is added to your *My Tasks* list. It also remains in the *All Tasks* list but you are added as the task owner.

## 15.3 Approving and Denying Requests

---

**Roles that Can Perform This Task:** Cloud Administrator, Approver (Administrator approval tasks only), Sponsor (Sponsor approval tasks only)

---

As a Cloud Administrator, you can complete both Administrator approval tasks and Sponsor approval tasks.

1 On the main navigation bar, click  *Tasks*, then click the *Unclaimed* tab.

2 Select the task for the business service request, then click one of the following options:

- ◆ *Review*: Lets you review the business service before approving or denying the request.
- ◆ *Approve*: Approves the request.
- ◆ *Deny*: Denies the request. You must specify the reason for the denial. The user receives an e-mail with the reason and can modify the business service and resubmit the request.
- ◆ *Claim*: Assigns the task to you and moves it to your *My Tasks* list. No other user can access the task. This is useful if you want to make sure that you own the task but want to complete it at a later time.

3 If you clicked *Review*, review or change the business service details, including the workload details. When you are finished, select one of the following:

- ◆ *Approve*: Approves the request.
- ◆ *Deny*: Denies the request. You must specify the reason for the denial. The user receives an e-mail with the reason and can modify the business service and resubmit the request.
- ◆ *Claim*: Assigns the task to you and moves it to your *My Tasks* list.
- ◆ *Close*: Closes the task without approving or denying it.

## 15.4 Completing Configuration Tasks

As a Cloud Administrator, you can complete both pre-build configuration and post-build configuration tasks.

- ◆ [Section 15.4.1, “Completing Pre-Build Configuration Tasks,” on page 165](#)
- ◆ [Section 15.4.2, “Completing Post-Build Configuration Tasks,” on page 165](#)

## 15.4.1 Completing Pre-Build Configuration Tasks

---

**Roles that Can Perform This Task:** Cloud Administrator, Build Administrator

---

The pre-build configuration task pauses the workflow process to give you an opportunity to perform any configuration required before the business service workloads are built. This might be configuration that you complete in the Cloud Manager console, such as configuring the Windows settings (Administrator account password, computer name, product license key, and registered name) or remote console password for one of the workloads. Or, it might be a task that you need to perform at the Cloud Manager Orchestration Server or in your hypervisor tools.

- 1 On the main navigation bar, click  *Tasks*, then click the *Unclaimed* tab.
- 2 Select the task (the subject is *Pre-build configuration of a new Business Service* or *Pre-build configuration of a changed Business Service*).

If there is configuration that must be completed for the business service in the Cloud Manager console, the *Complete* action is not available and an asterisk (\*) appears next to it. You can mouse over the asterisk to view the remaining configuration requirements.

- 3 If you want to claim the task so that others cannot work on it, click *Claim*.

Claimed tasks are moved to your *My Tasks* list.

- 4 Complete any configuration required for the workloads:
  - ♦ **Cloud Manager console tasks:** Select the configuration task, then click the *Review* action to display the task. Select a workload that needs to be configured, then click *Edit*. Configure the required settings and save the workload.
  - ♦ **External tasks:** Complete the tasks.
- 5 Mark the task as complete:
  - ♦ If you claimed the task, it is your *My Tasks* list. Select the task, then click *Complete*.
  - ♦ If you did not claim the task, it is in the *Unclaimed* list. Select the task, then click *Complete*.

## 15.4.2 Completing Post-Build Configuration Tasks

---

**Roles that Can Perform This Task:** Cloud Administrator, Build Administrator

---

The post-build configuration task pauses the provisioning workflow to give you an opportunity to perform any post-build configuration for the business service workloads. You must complete the configuration (if any) and then mark the task as completed to continue the workflow process.

- 1 On the main navigation bar, click  *Tasks*, then click the *Unclaimed* tab.
- 2 If you want to claim the task so that no others can work on it, select the task, then click *Claim*.  
Claimed tasks are moved to your *My Tasks* list.
- 3 If you want to review the business service request, select the task (the subject is *Post-build configuration of a new Business Service* or *Post-build configuration of a changed Business Service*), then click *Review*.
- 4 Complete any configuration required for the workloads.

5 Mark the task as complete:

- ◆ If you claimed the task, it is your *My Tasks* list. Select the task, then click *Complete*.
- ◆ If you did not claim the task, it is in the *Unclaimed* list. Select the task, then click *Complete*.

## 15.5 Completing Trigger Tasks

As a Cloud Administrator, you can complete or schedule a reboot trigger task.

- ◆ [Section 15.5.1, “Completing Reboot Trigger Tasks,” on page 166](#)

### 15.5.1 Completing Reboot Trigger Tasks

---

**Roles that Can Perform This Task:** Business Service Owner, Cloud Administrator, Build Administrator

---

As a Cloud Administrator, you can complete any workload reboot trigger task. The trigger task pauses the provisioning change request workflow between the pre-build configuration task and before the changes are applied to the workloads in the system build. This gives you an opportunity to immediately reboot or to schedule the reboot of a business service workload at a later time.

The reboot trigger task stops progress of the workflow, pending user interaction. The task blocks an unintentional reboot of a workload from occurring at an inopportune time. The *Reboot Now* feature in the task lets you decide when the system is in a state to accommodate a reboot, and then to take the appropriate action to reboot immediately.

The reboot scheduling feature accommodates situations when you want the workload to change significantly and these changes will result in the service being taken offline for a significant amount of time. Scheduling an off-hours, weekend, or vacation reboot can make the downtime less impactful to your business.

- 1 On the main navigation bar, click  *Tasks*, then click the *Unclaimed* tab.
- 2 Select the task for the business service change request (it should be tagged with a “needs reboot” message), then click one of the following options:
  - ◆ *Review*: Lets you review the business service change request before immediately rebooting or scheduling a reboot of the workload.
  - ◆ *Reboot Now*: Reboots the workload when the option is selected.
  - ◆ *Schedule Reboot*: Lets you specify the date and time when you want the workload reboot to occur.
  - ◆ *Claim*: Assigns the task to you and moves it to your *My Tasks* list. No other user can access the task. This is useful if you want to make sure that you own the task but want to complete it at a later time.
  - ◆ *Unclaim*: Releases the task and returns it to the *Unclaimed* list.
- 3 If you clicked *Review*, you can review or change the business service details, including the workload details using one of these options:
  - ◆ *Add*: Opens a list of workload templates where you can select an additional template to add and configure for the business service request.
  - ◆ *Edit*: Lets you edit the configuration details of the selected workload.

- ◆ *Remove*: Deletes the selected workload from the business service change request.
- ◆ *Copy*: Lets you create copies of the selected workload.

You can also select *Claim*, *Reboot Now*, or *Schedule Reboot* from this Review Task dialog box, as explained in Step 2.

---

# 16 Generating Cloud Manager Reports

The following sections provide information to help you generate reports:

- ♦ [Section 16.1, “Report Descriptions,” on page 169](#)
- ♦ [Section 16.2, “Generating Reports,” on page 170](#)

## 16.1 Report Descriptions

Cloud Manager provides nine reports that provide information about business service costs, resource usage, organizations, and zones.

As a Cloud Administrator, you can generate all nine reports with an unlimited scope (all organizations, zones, business services, and so forth). Other roles can generate specific reports, as indicated in the following table, with a limited scope as determined by their roles.

For example, you can generate a Business Service Cost Details report for any organization, while an Organization Manager can generate the same report but only for his or her organization.

---

Report Name	Description
Business Service Cost Details	<p>The cost details for each business service in an organization, organized by business group.</p> <p>Can be generated by: Cloud Administrator, Organization Manager, Sponsor, Business Service Owner, Business Group Viewer</p>
Business Service Cost History	<p>The history of all cost changes for each business service in an organization, organized by business group.</p> <p>Can be generated by: Cloud Administrator, Organization Manager, Sponsor, Business Service Owner, Business Group Viewer</p>
Business Service Cost Summary	<p>A summary of the setup, monthly, annual, and contract costs for all business services in an organization, organized by business group.</p> <p>Can be generated by: Cloud Administrator, Organization Manager, Sponsor, Business Service Owner, Business Group Viewer</p>
Cloud Business Service Cost Details	<p>The cost details for each business service in every organization, organized by organization and then business group.</p> <p>Can be generated by: Cloud Administrator</p>
Organization Overview	<p>A summary of the number of users, business groups, resource groups, business services, and workloads in the organization, along with the monthly and annual business service costs.</p> <p>Can be generated by: Cloud Administrator</p>

---

Report Name	Description
Resource Group Details	A summary of the resource groups in a zone.  Can be generated by: Cloud Administrator, Zone Administrator
Shared Storage Details	The details (such as capacity, used and free space, and stored VMs and templates) for all shared storage devices in a zone.  Can be generated by: Cloud Administrator, Zone Administrator
Shared Storage Summary	A summary of the shared storage devices in a zone.  Can be generated by: Cloud Administrator, Zone Administrator
Zone Overview	A summary of the number of resource groups, hosts, clusters, workloads, workload templates, networks, and storage devices in a zone.  Can be generated by: Cloud Administrator, Zone Administrator

## 16.2 Generating Reports

---

**Roles that Can Perform This Task:** Cloud Administrator, Zone Administrator, Organization Manager, Sponsor, Business Service Owner, Business Group Viewer

---

You can generate reports in PDF, CSV, and XLS format. Generated reports are saved in your *My Reports* list until you delete them. For descriptions of the reports, see [Chapter 16.1, “Report Descriptions,”](#) on page 169.

To generate a report:

- 1 On the main navigation bar, click  *Reports*.
- 2 Click *Generate* to display the Reports dialog box.
- 3 In the *Report Templates* list, select the report you want to generate and the format you want, then click *Next*.
- 4 In the Report Parameters dialog box, select the organization or zone for which to generate the report, then click *Generate*.

A report window appears. Depending on the amount of data to be collected, the report might be completed quickly or it might take a while. As soon as the report is completed, it is displayed in the report window, saved to your computer, opened in an associated application, or you are prompted about which action you want to take (depending on your browser configuration).

If the report is taking a while, you can close the report window and the report continues to generate. If you close the report, its status is shown in the *My Reports* list. As soon as it is complete, you can view it.

---

# A Setting Up Cloud Manager to Log to a Sentinel Collector

NetIQ has created a Sentinel Collector to provide data capture capabilities for NetIQ Cloud Manager Application Server. Sentinel must be installed and operational before attempting to use this Collector.

The Collector parses, normalizes, and enhances records received from a data source (known as an Observer). Other Event Source Management (ESM) components like Connectors and Collector Managers perform functions such as remote protocol connections and data mapping. To learn more about Sentinel and its components, see the [NetIQ Sentinel product page \(http://www.netiq.com/products/sentinel/index.asp\)](http://www.netiq.com/products/sentinel/index.asp) or the [NetIQ Sentinel product documentation \(https://www.netiq.com/documentation/sentinel70/\)](https://www.netiq.com/documentation/sentinel70/).

You can download a custom-built Sentinel Collector plug-in for Cloud Manager at the [Sentinel Plugins Web site \(http://support.novell.com/products/sentinel/secure/sentinelplugins.html\)](http://support.novell.com/products/sentinel/secure/sentinelplugins.html). The site also has a link to download documentation for the Cloud Manager Collector.

If you choose to use this Collector, you need to configure Cloud Manager to send its syslog information to the Collector. Use the following steps to set up Cloud Manager.

- 1** At the Cloud Manager Application Server, modify the file: `/opt/netiq/cloudmanager/etc/cmauditlogger.properties`.

- 1a** In the properties file, change the following line

```
log4j.appender.CMSYSLOG.layout.ConversionPattern=%m\n
```

to look like this:

```
log4j.appender.CMSYSLOG.layout.ConversionPattern=NQ_CloudManager: %m\n
```

- 1b** In the properties file, change the current audit location line

```
log4j.category.com.novell.cm.audit.api.impl.AuditLogger=INFO, CMFILE
```

to look like this:

```
log4j.category.com.novell.cm.audit.api.impl.AuditLogger=INFO, CMFILE, CMSYSLOG
```

- 1c** (Optional) If you don't want the local audit file, change the current audit location line

```
log4j.category.com.novell.cm.audit.api.impl.AuditLogger=INFO, CMFILE
```

to look like this:

```
og4j.category.com.novell.cm.audit.api.impl.AuditLogger=INFO, CMSYSLOG
```

- 1d** Save the properties file and restart the Application Server.

- 2** At the Cloud Manager Application Server, configure syslog to receive messages from the Application Server and then send it to the Sentinel server. To do this, modify the file: `/etc/syslog-ng/syslog-ng.conf`.

**2a** In the syslog file, add a new source. For example:

```
source r_src { udp(ip("localhost") port(514)); };
```

**2b** (Conditional) If other services are already logging locally over UDP, you can add a filter line in the syslog file. For example:

```
filter f_ncm { facility(syslog) and match('NQ_CloudManager:'); };
```

---

**NOTE:** The `syslog` value shown for the facility in the line above should match the value for the facility specified in the `cmauditlogger.properties` file. The default is `syslog`.

---

**2c** In the syslog file, create a destination and log entry for syslog. For example:

```
destination sentinel { tcp("###.###.###.###" port(1468)); };  
log { source(r_src); filter(f_ncm); destination(sentinel); };
```

---

**NOTE:** The port number shown in the first line above must match the port for the Syslog TCP listener on the Sentinel server.

---

**2d** Save the file and restart syslog on the Application Server. On SUSE Linux Enterprise Server 11, the syslog restart command looks like this:

```
/etc/init.d/syslog-ng restart
```

- 3** Ensure that the Sentinel Collector for NetIQ Cloud Manager Collector is added to Sentinel and that the Syslog TCP connector in Sentinel is configured and running.

---

# B Integrating Cloud Manager with the Nixu IP Address Management System

NetIQ Cloud Manager supports the integration of the Nixu NameSurfer Suite (version 7.2.3), an IP Address Management (IPAM) system that can simplify planning, monitoring, and managing the IP addresses in a network, including the addresses of various network interface cards on provisioned workloads.

Cloud Manager deploys its integration as an OSGI bundle with an accompanying configuration file. Use the steps in the following sections to enable Cloud Manager integration with an installed Nixu NameSurfer Suite.

- ♦ [Section B.1, “Configuring Nixu NameSurfer for Cloud Manager Integration,” on page 173](#)
- ♦ [Section B.2, “Configuring Cloud Manager for Nixu NameSurfer Integration,” on page 175](#)

## B.1 Configuring Nixu NameSurfer for Cloud Manager Integration

In the Nixu NameSurfer environment, you need to create values to match specific Cloud Manager networking settings. This enables IPAM option at the network level.

The following steps assume you are familiar with the Nixu NameSurfer environment:

- 1 Create an NSAPI key to enable Nixu to communicate with the Cloud Manager Web Service.
  - 1a From the NameSurfer *Configuration* menu, click *Keys > Add NSAPI key* to open the New NSAPI key view.
  - 1b Specify a *Key name*, then save the *Key secret part* value for use later when you configure Cloud Manager for the IPAM integration.
  - 1c (Optional) You can check the *Restrict access rights with groups* check box to restrict access rights associated with a defined Nixu user group.
- 2 Create a forward lookup zone to contain your IP address block.
  - 2a From the NameSurfer *DNS* menu, click *Forward zones > Create zone*.
  - 2b Configure the zone as required.

- 3 Add (or identify an existing) an IP address block to associate with each Cloud Manager network you will be using.
  - 3a (Conditional) To add an IP address block, from the NameSurfer *IP Address* menu, click *Add block*, then configure the new block as required.
  - or
  - 3b (Conditional) From the NameSurfer *IP Address* menu, click *Root Blocks* to open the list of blocks, then select an unused block.
- 4 Configure the block with required DNS information for Cloud Manager integration.
  - 4a From the *Blocks* list, select the block you want to configure, then select the *DNS* tab for this block.
  - 4b Specify the *DNS zone information*. This is the name you gave to the forward lookup zone in [Step 2](#).
  - 4c (Optional) If you want Nixu to automatically generate a host name for the block, follow the pattern listed in the interface and enter the Host name pattern.

---

**NOTE:** This value is co-dependent with a value in the Cloud Manager configuration file. See [autoHostname](#) below, for more information.

---

- 5 From the block details page, select the *Information* tab, then select the *Add information* menu option to open an Information dialog box.
- 6 Create the following name/value pair in the Information dialog box for this block:
  - ◆ **Name:** NCMNetworkID  
 This is the Cloud Manager network ID, as displayed in the upper left-hand corner of the Edit Network dialog of the Cloud Manager Application Server Web console. Note that Cloud Manager configures this name without a period (.) in the string.
  - Value:** (example) 362:Network:digitalAirlines-Prod  
 This value is co-dependent with a value in the Cloud Manager configuration file. If you have set value of the [NCMNetworkIDValueIsName](#) property to TRUE in the configuration file, you need to provide only the Cloud Manager network name (for example, DigitalAirlines-Prod) instead of the Cloud Manager network ID.
- 7 Continue configuring the block to return the values that, if matched, are used to configure a corresponding Cloud Manager vNIC.

Open and complete information for each of the following name/value pairs:

- ◆ **Name:** NCM.DNSServers  
**Value:** (example) 192.168.0.1 192.168.0.2  
 What you specify for this value depends on your individual network setup. More than one value can be listed, with each value separated by a space.
- ◆ **Name:** NCM.DNSSuffixes  
**Value:** (example) acme.com test.com da.com  
 What you specify for this value depends on your individual network setup. More than one value can be listed, with each value separated by a space.
- ◆ **Name:** NCM.Gateways  
**Value:** (example) 192.168.0.3 192.168.0.4  
 What you specify for this value depends on your individual network setup. More than one value can be listed, with each value separated by a space.
- ◆ **Name:** NCM.NetMask

**Value:** (example) 255.355.255.0

What you specify for this value depends on your individual network setup.

## B.2 Configuring Cloud Manager for Nixu NameSurfer Integration

- 1 From the Cloud Manager Application Server, open `/opt/netiq/cloudmanager/etc/cloudmanager-ipam-nixu.cfg`
- 2 Edit the configuration file:
  - 2a Edit the properties that specify the Nixu Server connection information:

Configuration Property and Default Value	Value Detail	Example
<code>url=&lt;server:port&gt;/SOAP</code>	Specify the Nixu Server URL, without the "http" connection protocol.	<code>url=mynixuserver.mydomain.com:8443/SOAP/</code>
<code>secureConnection=true</code>	Specify whether the connection is secure. If http, specify <code>false</code> . If https, specify <code>true</code> .	<code>secureConnection=true</code>
<code>keyname=&lt;keyname&gt;</code>	This is the name of the NSAPI key configured in the Nixu NameSurfer console. It is needed for Web Service API access.	<code>keyname=EngKey</code>
<code>keyvalue=&lt;keyvalue&gt;</code>	This is the value of the NSAPI key specified in "keyname" property, as configured in the Nixu NameSurfer console. It is needed for Web Service API access.	<code>keyvalue=KrqcCHySczwIFfshSMfrPoCESY3ip8Nh90egtrmouTg=</code>

**2b** Edit the properties that specify the Cloud Manager options:

Configuration Property and Default Value	Value Detail
autoHostname=TRUE	Specifies whether Nixu NameSurfer should auto-create a hostname for the requested address. Hostname auto-generation follows the rules specified on the Address Block in the Nixu NameSurfer console.
addToDNS=FALSE	Specifies whether Nixu NameSurfer should auto-register the hostname with Nixu NameSurfer's DNS service. If you are not using Nixu NameSurfer for your DNS server, set this to FALSE.
defaultToDHCP=FALSE	<p>Specifies behavior in the case of a Nixu NameSurfer integration failure. Failures can occur because of inability to connect to the server, inability to find a Nixu Address Block that is correctly configured to provide an address for a specified Cloud Manager Zone, etc.</p> <p>In case of a failure, if this value is TRUE, the Cloud Manager workload is configured to obtain its network information from DHCP.</p>
NCMNetworkIDValueIsName=FALSE	<p>Specifies whether to use the full Cloud Manager Network ID or the simple Network Name as the match string in Nixu NameSurfer Address Blocks.</p> <p>Using the full Cloud Manager Network ID is preferable, because it provides a greater probability of uniqueness.</p> <p><b>NOTE:</b> This property is codependent with a Nixu IP Address block setting. See <a href="#">NCMNetworkID</a>, above, for more information.</p> <p>Do not set this value to TRUE unless you are sure that all network interfaces have unique names.</p>
defaultVMNameFromHostName=FALSE	<p>Specifies whether to set the workload's PreferredVMName from the hostname provided by Nixu NameSurfer. We recommend that you set this value to FALSE, because the VM's name is now attached to a network name or IP address, which could change in the future if the Cloud Manager Network is deleted or modified.</p> <p>If TRUE, the PreferredVMName that will be set (the filename and display name of the VM) follows the pattern: <code>&lt;hostname&gt;.&lt;workloadid&gt;</code></p> <p><b>NOTE:</b> The PreferredVMName does not change in change requests, even if the hostname changes as a result of an altered NIC configuration.</p>

Configuration Property and Default Value	Value Detail
<code>failBusinessServiceRequestOnIPAMFailure=TRUE</code>	<p>Specifies what Cloud Manager should do in the case of a failure to obtain a valid NIC configuration from the IPAM system. the case of such a failure.</p> <p>If the value is set to TRUE, the business service is placed in a BUILD_FAILED state and the administrator can reconfigure the NIC and resubmit the business service.</p> <p>If the value is set to FALSE, the business service advances to the pre-build configuration phase. The administrator can then override the network type and specify a different NIC configuration.</p>
<code>nixuIntegrationEnabled=FALSE</code>	<p>Leave the value at FALSE until you finish setting all of the properties above. Setting the value to TRUE enables Cloud Manager to detect the Nixu IPAM integration and to display it as a network option.</p>

- 3 Restart the Cloud Manager Application Server to refresh the configuration settings and enable IPAM integration.

---

# C Using REST APIs to Customize Cloud Manager Behavior

This section includes the following information:

- ♦ [Section C.1, “Cloud Manager REST API Overview,” on page 179](#)
- ♦ [Section C.2, “Using the REST APIs to Modify the Cloud Manager Workflow,” on page 179](#)

## C.1 Cloud Manager REST API Overview

---

**NOTE:** This section is not intended to explain REST concepts. It assumes that the reader has a prior understanding of REST concepts.

---

NetIQ Cloud Manager provides a complete set of REST APIs that are available for scripting or customizing the product. The APIs support both application/xml and application/json values for the Accept and Content-type request and response headers. You can use the GET, PUT, POST, and DELETE methods in the Cloud Manager REST calls as appropriate

You can visit <http://<server>:<port>/cloudmanager-api> for a full reference of the REST API, including the contents of the API packets include on return or should include on input.

## C.2 Using the REST APIs to Modify the Cloud Manager Workflow

A Cloud Manager user can create, change, or delete a business service. Cloud Manager processes each of these three “requests” in its own unique workflow process: a series of steps occurring in the build and provisioning process.

During the workflow process, actions are taken sequentially as needed so that the process flows correctly. In general, the workflow proceeds in the order listed in the following table:

**Table C-1** *Cloud Manager Workflow Phases*

---

Workflow Phase (Action Type)	Operation Type	Default, TaskBased Callout	Customizeable by Using Callouts
1. Submit	n/a	no	no
2. Approval	Approval	yes	yes
3. Pre-build configuration (also known as “PreConfig”)	Configuration	yes	yes
4. Mid approval	Approval	yes	yes

---

Workflow Phase (Action Type)	Operation Type	Default, TaskBased Callout	Customizeable by Using Callouts
5. VM/workload build	n/a	no	no
6. Post-build configuration (also known as "PostConfig")	Configuration	yes	yes
7. Post-build approval (also known as "PostApproval")	Approval	yes	yes
8. Pre-deploy (or "PreDeploy")	Notification	no	yes

At the appropriate time in the workflow, the Cloud Manager Application Server invokes a uniquely registered and configured external process to execute each individual, categorized step. After the process (also known as a "callout") performs its function in order, it reports its status to the Application Server, so that the server can invoke the next process. For Approval type operations, the completion status is either *Approved* or *Denied*. For Configuration type operations, the completion status is either *Success* or *Failure*. For Notify type operations, the callout is invoked asynchronously, so the server does not need to wait for confirmation. Without waiting for confirmation, the server signals this callout that it is time to execute its functions.

The default callout registered for each of these phases (except for PreDeploy) is handled by a task system (a TaskBasedCallout). One or more tasks are created for each phase and assigned, based on a set of rules. In the TaskBasedCallout system, each callout is configured with predefined tasks. For each business service request, the callout detects the tasks that must be created and to which Cloud Manager user (based on assigned roles and rights) the tasks should be assigned.

The workflow configuration can be specified at the system, organization, or business group layer, with the lowermost level dominating.

As a Cloud Administrator, you can skip any of the phases of the workflow and you can change or override default tasks by altering the permission assignment or the order.

As the Cloud Administrator, you can customize the workflow to invoke alternative callouts in place of Cloud Manager's default task-based callouts. This might be useful if you want to integrate the Cloud Manager workflow with other existing approval processes or scripted configuration procedures. This section explains how to use REST calls to customize the callouts you need to integrate Cloud Manager's workflow with the workflow of a 3rd party system.

This section includes the following information:

- ♦ [Section C.2.1, "Workflow Callout Registration Concepts," on page 180](#)
- ♦ [Section C.2.2, "Skipping the PreConfig Approval Stage by Invoking REST Callouts," on page 181](#)
- ♦ [Section C.2.3, "REST URLs for Configuring and Registering Custom Callouts," on page 182](#)
- ♦ [Section C.2.4, "Overriding the Default Task Order," on page 186](#)

## C.2.1 Workflow Callout Registration Concepts

"(header of customizing callouts section)" After you have created a custom callout (separate doc) you can invoke a REST API call to actually register a callout in Cloud Manager. The registration defines a combination of conditions that, when satisfied, trigger Cloud Manager to invoke that callout. The conditions include the following:

- ♦ The domain level where the operation should happen, such as the entire Cloud Manager system, one of the organizations in the system, or one of the business groups in an organization.

When you register a callout, you do so at a domain level (system, organization, or business group). The registration levels are hierarchical. That is, if you do not register the callout at the organization level, it inherits the registration from its parent. You can register only one callout per operation, per domain level.

- ◆ The intended behavioral differences for the callout when applied to different business service request types:
  - ◆ Create a new business service (NEW)
  - ◆ Change an existing business service (CHANGE)
  - ◆ Delete an existing business service (DELETE)
- ◆ The intended action of “step” of the callout in the workflow, which would be one of the following:
  - ◆ Approval
  - ◆ PreConfig
  - ◆ PostConfig
  - ◆ PostApproval
  - ◆ PreDeploy

## C.2.2 Skipping the PreConfig Approval Stage by Invoking REST Callouts

If you want to bypass (that is, “skip”) PreConfig approval of a workload that you customize for a user, it is not possible to do so using the Application Server Console, but you can invoke REST callouts that let you modify the skip flag in that stage of the workflow for new or changed business service requests.

The following skip flags are supported in Cloud Manager:

- ◆ skipNewWorkflowApproval
- ◆ skipNewWorkflowPreConfig
- ◆ skipNewWorkflowPostConfig
- ◆ skipNewWorkflowPostApproval
- ◆ skipChgReqWorkflowApproval
- ◆ skipChgReqWorkflowPreConfig
- ◆ skipChgReqWorkflowMidApproval
- ◆ skipChgReqWorkflowPostConfig
- ◆ skipChgReqWorkflowPostApproval
- ◆ skipDelWorkflowApproval
- ◆ skipDelWorkflowPreConfig

The following instructions for modifying PreConfig workflow REST callouts assume that you want to invoke the change for the entire Cloud Manager system. The instructions also assume that you are using the `application/json` payload type, although Cloud Manager also supports the `application/xml` payload type.

- 1 Invoke a REST GET call at the following URL:

```
http://<server>:<port>/8183/cloudmanager-api/system/integrationconfigs
```

The call returns the current settings. For example:

```
{
  "skipChgReqWorkflowPostApproval": true,
  "skipDelWorkflowPreConfig": true,
  "skipNewWorkflowPostApproval": true,
  "sourceObjId": 1,
  "sourceObjName": "System",
  "sourceObjType": "SYSTEM",
  "url": "http://localhost:8183/cloudmanager-api/system/integrationconfigs"
}
```

The skip flags are tri-state: true, false, or empty. The empty state implies that it is inherited from the parent (if there is one). The true and false states imply an override of the parent setting, if there is one.

- 2 In the callout, add the skip flag for the PreConfig stage of the workflow when business services are created or changed:

```
{
  "skipChgReqWorkflowPostApproval": true,
  "skipDelWorkflowPreConfig": true,
  "skipNewWorkflowPostApproval": true,
  "skipNewWorkflowPreConfig": true,
  "skipChgReqWorkflowPreConfig": true,
  "sourceObjId": 1
}
```

In this example, the URL and the source object information are removed from the callout packet because they are not necessary for the PUT.

- 3 Invoke a REST PUT call at the same URL,

`http://<server>:<port>/8183/cloudmanager-api/system/integrationconfigs`

making sure that the payload type is correct, then save the PUT.

- 4 Confirm that the PUT was correctly by invoking a GET at the same URL and checking the packet structure, shown in [Step 2](#).

---

**NOTE:** If you wanted to make this modification for a single system, you would replace the `http://<server>:<port>/8183/cloudmanager-api/system/integrationconfigs` URL with `http://<server>:<port>/8183/cloudmanager-api/organizations/<orgId>/integrationconfigs`.

---

## C.2.3 REST URLs for Configuring and Registering Custom Callouts

You can configure Cloud Manager by using different REST API calls on the Cloud Manager Application Server. The REST Client plugin for Firefox, or the Advanced Rest Client plugin for the Google Chrome browser have been tested for such calls.

You can visit `http://<server>:<port>/cloudmanager-api` for a full reference of the REST API, including the contents of the API packets include on return or should include on input.

The tables below show the REST endpoints you can use to view the current Cloud Manager callouts. The URLs in the tables contain variables (that is, address elements surrounded by brackets <>) that imply specific information that you must provide:

`/<domID>/` implies that you substitute one of the following:

- ◆ `/system/`

`/organizations/<orgID>/`

`/businessgroups/<bgID>/`

**Table C-2** REST Calls for installed or available callouts

URL Suffix	Method	Purpose of the Command / The Resulting Payload
/callouts	GET	<p><b>Purpose:</b> Represents the list of services mentioned in <a href="#">Section C.2, “Using the REST APIs to Modify the Cloud Manager Workflow,”</a> on page 179.</p> <p><b>Payload:</b></p> <pre>{   "count": "4",   "items": [     {       "bundleName": "com...taskBasedCallouts",       "canonicalClassName": "org.eclipse...ServiceReferenceImpl",       "implementedInterface": "interface com...ApprovalCalloutIfc",       "provides": "Approval",       "registrationName": "TaskBasedApproval",       "simpleClassName": "ServiceReferenceImpl",       "url": "http://host:8183/cloudmanager-api/callouts/ TaskBasedApproval"     },     ...   ] }</pre>
/callouts/ {name}	GET	<p><b>Purpose:</b> Gets the specified callout available in the OSGI system.</p> <p>{name}=registrationName</p> <p><b>NOTE:</b> Everything in this payload is defined by the OSGI bundle, nothing is configurable, so no PUT operation is used.</p> <p><b>Payload:</b></p> <pre>{   "bundleName": "com...taskBasedCallouts",   "canonicalClassName": "org.eclipse...ServiceReferenceImpl",   "implementedInterface": "interface com...ApprovalCalloutIfc",   "provides": "Approval",   "registrationName": "TaskBasedApproval",   "simpleClassName": "ServiceReferenceImpl",   "url": "http://host:8183/cloudmanager-api/callouts/ TaskBasedApproval" }</pre>

**Table C-3** REST Calls for integration configuration flags

URL Suffix	Method	Purpose of the Command / The Resulting Payload
/<domID>/ integrationconfigs	GET	<p><b>Purpose:</b> Gets the domain object's integration configuration flags.</p> <p><b>Payload:</b></p> <pre>{   "skipChgReqWorkflowApproval":false,   "skipChgReqWorkflowPostApproval":true,   "skipChgReqWorkflowPostConfig":false,   "skipChgReqWorkflowPreConfig":false,   "skipDelWorkflowApproval":false,   "skipDelWorkflowPreConfig":true,   "skipNewWorkflowApproval":false,   "skipNewWorkflowPostApproval":false,   "skipNewWorkflowPostConfig":false,   "skipNewWorkflowPreConfig":false,   "sourceObjId":1,   "sourceObjName":"System",   "sourceObjType":"SYSTEM",   "url":"http://host:8183/cloudmanager-api/system/   integrationconfigs" }</pre>
/<domID>/ integrationconfigs	PUT	<p><b>Purpose:</b> Sets the domain object's integration configuration "skip" flags.</p> <p><b>Payload:</b> Same payload as specified <a href="#">above</a>. Skip flags have a tri-state: True, False, or empty. An empty value implies inheritance from the domain object's parent.</p>
/<domID>/ integrationcalloutitems	GET	<p><b>Purpose:</b> Lists all callout registrations for the specified domain object.</p> <p><b>Payload:</b></p> <pre>{   "count":10,   "items":[     {       "key":"NEW_BUSINESS_SERVICE_REQUEST:POST_CONFIG",       "sourceObjId":1,       "sourceObjName":"System",       "sourceObjType":"SYSTEM",       "value":"TaskBasedPostConfig",       "url":http://host:8183/cloudmanager-api/system/       integrationcalloutitems/&lt;key&gt;     },     ...   ] }</pre>

URL Suffix	Method	Purpose of the Command / The Resulting Payload
<code>/&lt;domID&gt;/integrationcalloutitems/{key}</code>	GET	<p><b>Purpose:</b> Gets the specified callout registration.</p> <p><b>Payload:</b> The payload in the example below indicates that at the system level, the TaskBasedPostConfig callout is used for PostConfig phase of new business service requests.</p> <pre>{   "key": "NEW_BUSINESS_SERVICE_REQUEST:POST_CONFIG",   "sourceObjId": 1,   "sourceObjName": "System",   "sourceObjType": "SYSTEM",   "value": "TaskBasedPostConfig",   "url": "http://host:8183/cloudmanager-api/system/integrationcalloutitems/&lt;key&gt;" }</pre>
<code>/&lt;domID&gt;/integrationcalloutitems</code>	PUT	<p><b>Purpose:</b> Creates or modifies the registration for the specified domain object.</p> <p><b>Payload:</b></p> <pre>{   "key": "NEW_BUSINESS_SERVICE_REQUEST:POST_CONFIG",   "value": "TaskBasedPostConfig", }</pre>
<code>/&lt;domID&gt;/integrationconfigitems</code>	GET	<p><b>Purpose:</b> Gets the callout-specific configurations for the specified domain object. The "value" tag of the payload is specific to the callout.</p> <p><b>Payload:</b> The payload in this example indicates that when the TaskBasedPostConfig callout is invoked for new business service requests. The callout creates a single task and assigns it to the TASK_COMPLETE_CONFIG_BS role.</p> <pre>{   "count": 13,   "items": [     {       "key": "TaskBasedPostConfig:NEW_BUSINESS_SERVICE_REQUEST",       "sourceObjId": 1,       "sourceObjName": "System",       "sourceObjType": "SYSTEM",       "value": "1=TASK_COMPLETE_CONFIG_BS",       "url": "http://host:8183/cloudmanager-api/system/integrationconfigitems/key"     }     ...   ] }</pre>

URL Suffix	Method	Purpose of the Command / The Resulting Payload
/<domID>/ integrationconfigitem s/{key}	GET	<p><b>Purpose:</b> Gets the callout-specific configuration for the specified key and domain object. The "value" tag of the payload is specific to the callout.</p> <p><b>Payload:</b></p> <pre>{   "key": "TaskBasedPostConfig:NEW_BUSINESS_SERVICE_REQUEST",   "sourceObjId": 1,   "sourceObjName": "System",   "sourceObjType": "SYSTEM",   "value": "1=TASK_COMPLETE_CONFIG_BS",   "url": "http://host:8183/cloudmanager-api/system/integrationconfigitems/key" }</pre>
/<domID>/ integrationconfigitem s/{key}	PUT	<p><b>Purpose:</b> Sets or modifies the callout-specific configuration for the specified key and domain object. The "value" tag of the payload is specific to the callout.</p> <p><b>Payload:</b></p> <pre>{   "key": "TaskBasedPostConfig:NEW_BUSINESS_SERVICE_REQUEST",   "value": "1=TASK_COMPLETE_CONFIG_BS",   "url": "http://host:8183/cloudmanager-api/system/integrationconfigitems/key" }</pre>

## C.2.4 Overriding the Default Task Order

The following is an example of how to use the REST API to get the current configuration:

**method:** GET

**URL:** `http://localhost:8183/cloudmanager-api/system/integrationconfigitems/TaskBasedApproval:NEW_BUSINESS_SERVICE_REQUEST`

**Return packet:**

```
{
  "key": "TaskBasedApproval:NEW_BUSINESS_SERVICE_REQUEST",
  "sourceObjId": 1,
  "sourceObjName": "System",
  "sourceObjType": "SYSTEM",
  "value": "2=TASK_SPONSOR_BS@!@1=TASK_ADMIN_APPROVE_BS",
  "url": "http://localhost:8183/cloudmanager-api/system/integrationconfigitems/TaskBasedApproval:NEW_BUSINESS_SERVICE_REQUEST"
}
```

This GET call returns the current configuration for the specified configuration item. In this case, the specified item called for is the TaskBasedApproval step in new business services requested throughout the Cloud Manager system.

**NOTE:** You could replace the /system/ component of the URL with /organizations/<orgID>/ if you wanted to work with the configuration for a specific organization.

If a configuration doesn't exist at `/organizations/<orgID>/`, it inherits that configuration from the system level.

---

To change the current configuration, execute a PUT call with an appropriate packet. In the example to follow, assume a new custom permission, `MY_CUSTOM_PERMISSION`, has been created in the system and that specific users have been given this permission.

If you want to change the approval task order so that it is routed first to administrator approval permission and then to the new custom permission, you would use the following procedure:

**Method:** PUT

**URL:** `http://localhost:8183/cloudmanager-api/system/integrationconfigitems/TaskBasedApproval:NEW_BUSINESS_SERVICE_REQUEST`

**Input Packet:**

```
{
  "key": "TaskBasedApproval:NEW_BUSINESS_SERVICE_REQUEST",
  "sourceObjId": 1,
  "value": "2=MY_CUSTOM_PERMISSION@!@1=TASK_ADMIN_APPROVE_BS"
}
```

In both of these sample REST calls, the PUT and the GET methods both use the `cloudmanager-api` configuration URL. The `value` property in the packet is defined by the specific callout. Task callouts expect an order of permissions, but custom callouts define their own value format.

To accomplish the same GET and PUT that we did above, but in a Task callout-specific way, use the following procedure, with the GET call first:

**Method:** GET

**URL:** `http://localhost:8183/tasks-api/system/taskconfigurations/TaskBasedApproval:NEW_BUSINESS_SERVICE_REQUEST`

**Return Packet:**

```
{
  "calloutName": "TaskBasedApproval",
  "configItem": {
    "key": "TaskBasedApproval:NEW_BUSINESS_SERVICE_REQUEST",
    "sourceObjId": 1,
    "sourceObjName": "System",
    "sourceObjType": "SYSTEM",
    "value": "2=TASK_SPONSOR_BS@!@1=TASK_ADMIN_APPROVE_BS"
  },
  "key": "TaskBasedApproval:NEW_BUSINESS_SERVICE_REQUEST",
  "opType": "NEW_BUSINESS_SERVICE_REQUEST",
  "option": "",
  "taskAssignmentOrder":
  [
    {
      "name": "TASK_ADMIN_APPROVE_BS"
    },
    {
      "name": "TASK_SPONSOR_BS"
    }
  ],
  "url": "http://localhost:8183/tasks-api/system/taskconfigurations/TaskBasedApproval:NEW_BUSINESS_SERVICE_REQUEST"
}
```

The GET call results in more information, and makes sense of the `value` property in a way that the Task Callout understands it.

The PUT call would look like this:

**Method:** PUT

**URL:** `http://localhost:8183/tasks-api/system/taskconfigurations/  
TaskBasedApproval:NEW_BUSINESS_SERVICE_REQUEST`

**Input Packet:**

```
{
  "key": "TaskBasedApproval:NEW_BUSINESS_SERVICE_REQUEST",
  "taskAssignmentOrder":
  [
    {
      "name": "TASK_ADMIN_APPROVE_BS"
    },
    {
      "name": "MY_CUSTOM_PERMISSION"
    }
  ]
}
```
