Installing and Removing NetIQ Advanced Authentication Framework Runtime Environment

RTE (Runtime Environment) allows to use SDK (Software Developer Kit) with no need to install "NetIQ Advanced Authentication Framework – Client" package. It is useful when you would like to use NetIQ Advanced Authentication Framework technology to secure access to certain applications only, without changing the regular Windows logon procedure. RTE authenticators can also be cached provided that caching is allowed by system administrator.

 For more detailed information, please see NetIQ Advanced Authentication Framework SDK Administrator's Guide, the separate guide for developers.

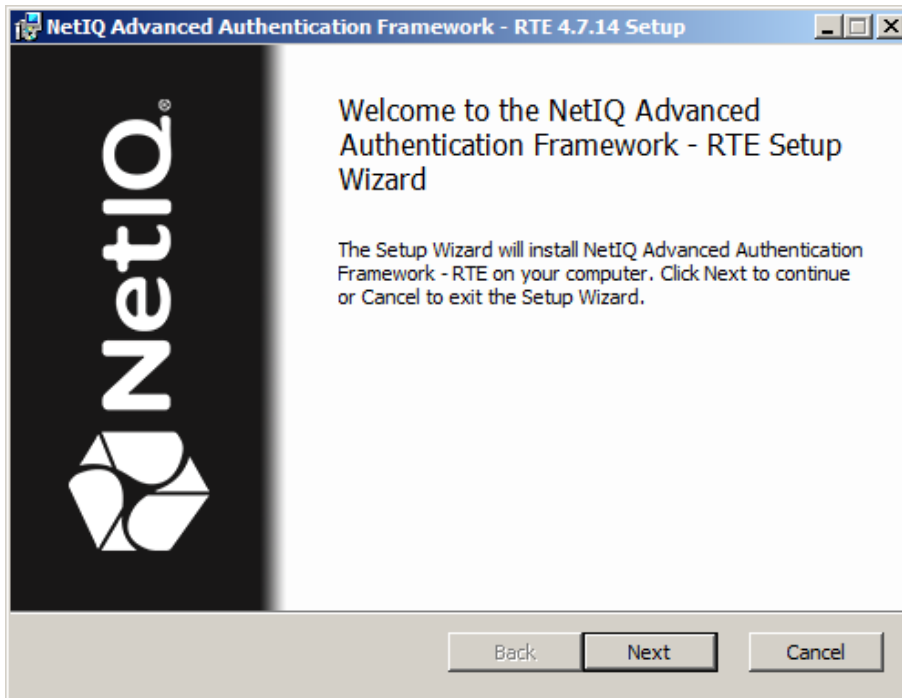

Installing RTE

 If RTE should be installed on non-domain client/thin client, it will be necessary to use msi parameter **WEBSERVICEURL** and specify path to NetIQ Web Service to check the license. E.g.: **msiexec /i rte.msi WEBSERVICEURL="https://core.authasas.local:8232/Service.svc/bsc"**. It is supported only from version 4.8.216.

 The start of installation may be frozen for a time up to 1 minute in the case of offline mode. This delay occurs due to check of digital signature of component.

To install RTE via Setup Wizard:

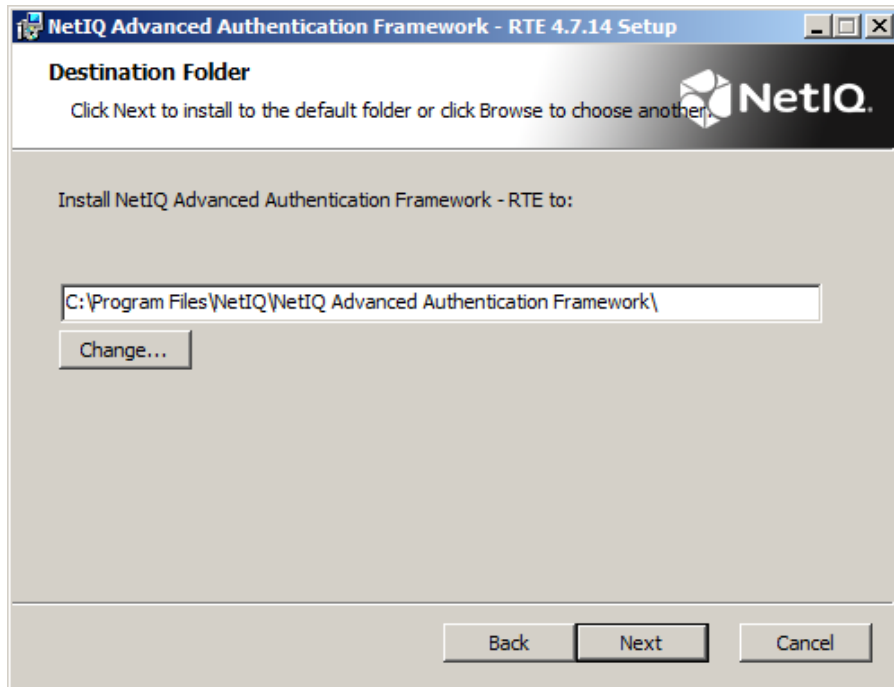

1. Run **Autorun.exe** from NetIQ Advanced Authentication Framework distribution kit. Tick **RTE** in the list of components and click **Continue**.
2. Click **Next** to continue.

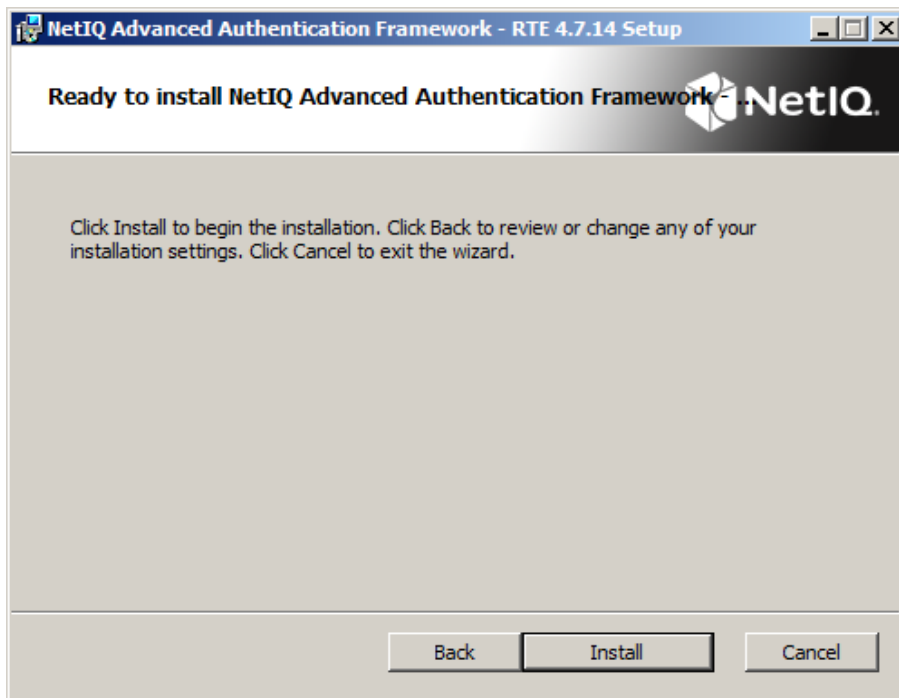

3. Read the **License agreement**. Click **I accept the terms in the license agreement** and then click **Next**.

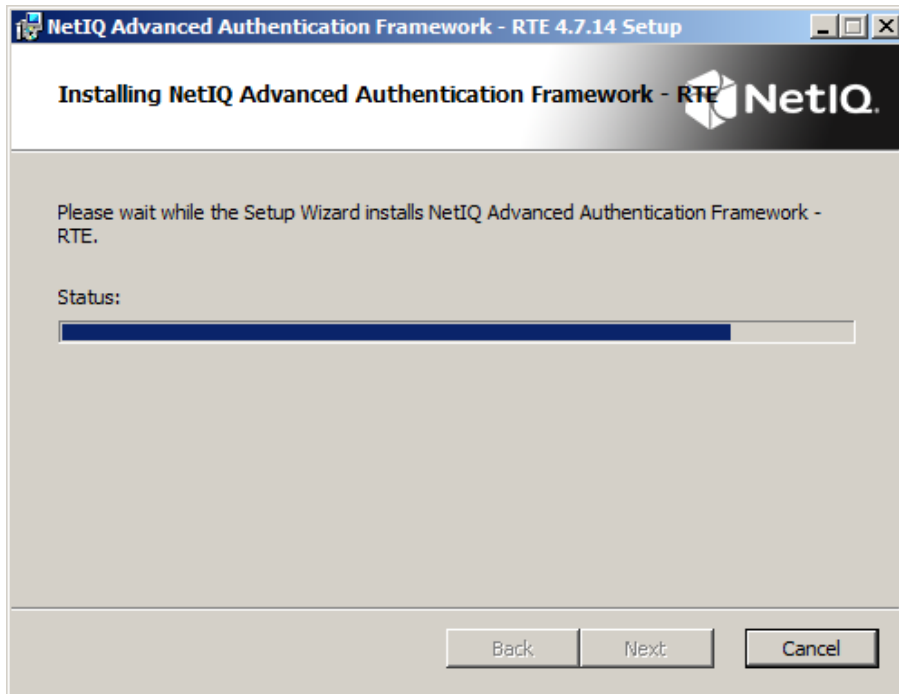

4. Check the destination folder and path.

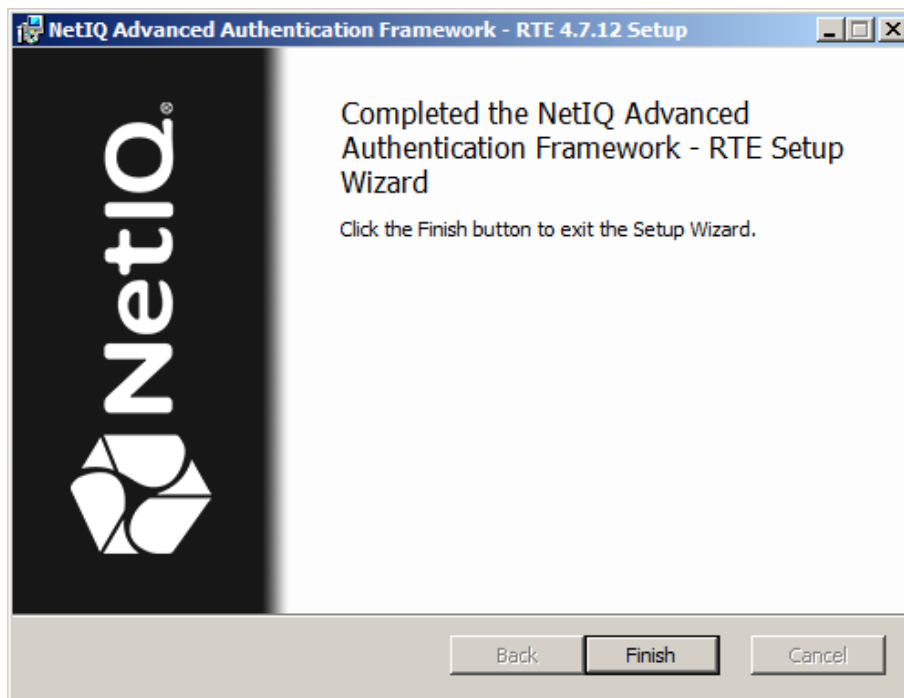

- To change the destination folder, use the **Change** button.
 - To continue, click **Next**.
5. Click **Install** and wait until the component is installed.

6. Click **Finish** to close the Wizard.

Upgrading RTE

In order to upgrade NetIQ Advanced Authentication Framework RTE, start to install the new version. You will receive a notification about already existing previous version. Continue the standard installation procedure and your NetIQ Advanced Authentication Framework version will be automatically updated.

After the upgrade is complete, the installer may ask you to restart a computer.

 You do not need to remove the previous NetIQ Advanced Authentication Framework version in order to upgrade RTE.

Using NetIQ RTE From Outside the Domain

NetIQ version 4.7 and later has a possibility to use NetIQ RTE for authentication of users from outside the domain through NetIQ Web Service. But in this case only some of SDK features are available (user credentials obtaining).

To use this feature, please create the following parameters in registry key HKEY_LOCAL_MACHINE\SOFTWARE\NetIQ:

- IsWSLogon (DWORD) - set to 1;
- WebAuthServer (String) - specify full URL of NetIQ Web Service (including https, port number and folder).
