

Abstract

TGSecure 2.4 contains the following:

New Features

System Value Management

- Added product component to the audit and enforce system value configuration.

User Profile Manager

- Added the profile archive cleanup tool (TGPRFCLEAN).

Enhancements

Resource Manager

- Added depth-level control for Integrated File System (IFS) schemas.
- Added filter-data control for Integrated File System (IFS) schemas.

Bug Fixes

Profile Management

- The system now updates the date for the inactivity compliance enforcement and report use profiles when a user profiles is deleted.

Inactive Session Lockdown

- Fixed the issue where audit records are sent when job is disconnected.
- The system now supports 10 byte user names and 28 byte job names.

Network Security

- The sysetm now now collects remote SQL fetch transactions whenthe Operation Server setting is set to *UNKNOWN.
- Fixed the issue where the FTP Remote Command initiates a CALL statement when the PGM parameter specified is incorrectly collected.

Resource Manager

- When complex SQL with multiple joins are performed, the object collected may contain characters such as commas, open parenthesis, or closed parenthesis.
- Creating a schema exceptions by object type is not allowed when object groups are used.
- Creating object groups with object name of *ALL or a generic object name (such as AR*) triggers the warning message "Object does not exist."
