About This Guide

This Rebuild Guide provides information about rebuilding and reconfiguring the PlateSpin Forge disaster recovery appliance by using the PlateSpin Forge 11.2.0 Upgrade/Rebuild Kit.

- Chapter 1, “Overview of the Appliance Upgrade or Rebuild,” on page 7
- Chapter 2, “Reconfiguring the RAID Controller (Conditional),” on page 11
- Chapter 3, “Installation Tasks,” on page 15
- Chapter 4, “Troubleshooting,” on page 27
- Appendix A, “Documentation Updates,” on page 29

Intended Audience

This document is intended for IT staff, such as data center administrators and operators, who use PlateSpin Forge in their ongoing workload protection projects.

Information in the Library

The library for this product is available in HTML and PDF formats on the PlateSpin Forge Documentation (https://www.netiq.com/documentation/platespin-forge/) website. In addition to the English language, online documentation is available in the Chinese Simplified, Chinese Traditional, French, German, Japanese, and Spanish languages.

The PlateSpin Forge library provides the following information resources:

Release Notes

- Provides information about new features and enhancements in the release, as well as any known issues.

Getting Started Guide

- Provides information about how to configure the appliance for your environment.

User Guide

- Provides conceptual information, an overview of the user interface, and step-by-step guidance for common tasks.

Rebuild Guide

- Provides information about how to rebuild and reconfigure the appliance.

Upgrade Guide

- Provides information about how to upgrade the appliance software.
Additional Resources

We encourage you to use the following additional resources online:

- **PlateSpin Forge Product** ([https://www.netiq.com/products/forge/](https://www.netiq.com/products/forge/)): A web-based product brochure that provides information about features, how to buy, technical specifications, frequently asked questions, and a variety of resources such as videos and white papers.

- **NetIQ User Community** ([https://www.netiq.com/communities/](https://www.netiq.com/communities/)): A web-based community with a variety of discussion topics.

- **NetIQ Support Forums** ([https://forums.netiq.com/forum.php](https://forums.netiq.com/forum.php)): A web location where product users can discuss NetIQ product functionality and advice with other product users.

- **MyNetIQ** ([https://www.netiq.com/f/mynetiq/](https://www.netiq.com/f/mynetiq/)): A website offering product information and services, such as access to premium white papers, webcast registrations, and product trial downloads.
Overview of the Appliance Upgrade or Rebuild

PlateSpin Forge 11.2 does not provide an Upgrade/Rebuild Kit. You can update your PlateSpin Forge appliance to version 11.2 using the following methods:

- Update your PlateSpin Forge 11.1 Appliance 3 installation to PlateSpin Forge 11.2 Appliance 3. For rebuilds, use the PlateSpin Forge 11.1 Upgrade/Rebuild Kit (https://dl.netiq.com/Download?buildid=Kg-XXFwChvk~) to rebuild the appliance to factory specifications, and then update the PlateSpin Forge software to version 11.2.
- Update your PlateSpin Forge 11.0 Appliance 3 installation to PlateSpin Forge 11.2 Appliance 3. For rebuilds, use the PlateSpin Forge 11.0 Upgrade/Rebuild Kit (https://dl.netiq.com/Download?buildid=SbsM_PR9owg~) to rebuild the appliance to factory specifications, and then update the PlateSpin Forge software to version 11.2.

There is no direct upgrade from a PlateSpin Forge 4 Appliance 2 installation to PlateSpin Forge 11.2.0 Appliance 3. You must first upgrade your appliance from version 4 Appliance 2 to version 11.0 Appliance 3. For more information, see the PlateSpin Forge 11 Appliance 3 Rebuild Guide (https://www.netiq.com/documentation/platespin-forge-11/forge11-field-rebuild/).

- Section 1.1, “About the Forge Appliance Rebuild Process,” on page 7
- Section 1.2, “What You Need,” on page 8

1.1 About the Forge Appliance Rebuild Process

You can use the PlateSpin Forge 11.1 Appliance Upgrade/Rebuild Kit (https://dl.netiq.com/Download?buildid=Kg-XXFwChvk~) to rebuild PlateSpin Forge 11.1 Appliance Version 3 to factory specifications, and then update the software to version 11.2. Contact Micro Focus Customer Care (https://www.netiq.com/support/kb/product.php?id=PlateSpin_Forge) and ask for the licenses you need for the rebuild.

Before you begin this process, ensure that you have your licenses available. See Section 1.2, “What You Need,” on page 8.

At a high level, the Forge 11.1, Appliance Version 3 rebuild process consists of the following major tasks:

- (Conditional) Re-create the RAID array on the appliance
  - If you upgraded your Forge Appliance to version 11.0 from an earlier release prior to this rebuild, you will be reconfiguring the RAID controller for Forge Appliance Version 2 on earlier hardware.
- Set up the system BIOS
- Re-install the hypervisor
- Re-deploy Forge software (including the Forge Management VM and the Forge Appliance Configuration Console (Forge ACC))
- Re-license all components
NOTE: The rebuild process erases all data in the Forge appliance's local storage.

If you need only to revert the appliance to its factory default state, use the Factory Reset feature that the appliance ships with Forge appliance. See “Resetting the Forge Appliance to Factory Defaults” in the PlateSpin Forge User Guide. The complete rebuild instructions that are in this section should be used only when Factory Reset is not working or is not applicable (for example, after a major hardware failure that prevents Factory Reset from working, or when you are upgrading from an older version of the appliance).

Table 1-1 provides information that can help you identify the RAID configuration that applies to the Forge Appliance that you purchased. For information about the latest available hardware, see the PlateSpin Forge Technical Specifications web page (https://www.netiq.com/products/forge/technical-information/).

For information about configuring the RAID controller for rebuild, see Chapter 2, “Reconfiguring the RAID Controller (Conditional),” on page 11.

1.2 What You Need

Before you start rebuilding Forge, ensure that you have the following prerequisites:

A Forge Field Rebuild Kit, containing:
- Forge OVF template files
- forge-esx5-<kit-version>.xxx-provider.iso
- This Field Rebuild guide.

Contact Micro Focus Customer Care (https://www.netiq.com/support/kb/product.php?id=PlateSpin_Forge) to request a Kit.

A VMware ESXi 5.5 license

Contact Micro Focus Customer Care (https://www.netiq.com/support/kb/product.php?id=PlateSpin_Forge) for help to retrieve your license.

A Microsoft SQL 2014 Standard Edition license

Contact Micro Focus Customer Care (https://www.netiq.com/support/kb/product.php?id=PlateSpin_Forge) for help to retrieve your license.

Overview of the Appliance Upgrade or Rebuild
Reconfiguring the RAID Controller (Conditional)

Use the information in this section if you need to reconfigure the RAID controller on the PlateSpin Forge Appliance Hardware. Reconfiguring the RAID controller is not necessary unless you are adding or replacing hard disks in your Forge Appliance as part of the product rebuild.

For more information about choosing which RAID controller you should select for reconfiguring, see Table 1-1 on page 8.

On first boot, you use the PERC Configuration utility to configure the RAID controller:

1. Press Ctrl+R at the RAID Controller boot prompt, approximately 24 seconds into the boot sequence.

2. Configure the PERC RAID controller to have multiple logical disks over a single RAID array (that is, a RAID 1, a RAID 5, or a RAID 6, based on your hardware):
   2a. Delete any existing disk groups:
       IMPORTANT: Remember, deleting a disk group also deletes the data on that disk group.
       2a1. Select a disk group and press F2.
       2a2. Select Delete Disk Group.
       2a3. Repeat Step 2a1 and Step 2a2 for all existing disk groups.
   2b. Create a new disk group for the Forge system:
       2b1. Select the controller and press F2.
       2b2. Select Create New VD.
       2b3. Select the RAID Level value, press Enter, select the RAID controller type you need from the list, then press Enter again.
       2b4. Select all available physical disks by selecting a disk item and pressing the Spacebar (disk sizes might vary).
       2b5. Under Basic Settings, fill in the following fields:
           VD Size: If the PERC Controller displays the disk size in MB, enter 307200. If the disk size is displayed in GB, enter 300.
           VD Name: Use ForgeSystem as the value.
   2c. Create a new disk group for the Forge failover VMs:
       2c1. On the Virtual Disk page tree view, select Disk Group: 0, RAID_ (see Step 2b3) and press F2 to open the Operations dialog.
       2c2. In the dialog, select Add New VD to open the Add VD in Disk Group 0 page.
       2c3. On this the page, configure the new virtual disk for the failover by completing the following fields:
           • VD Size: Depending on the appliance you have, use the remaining disk space value as your default backup storage.
- **VD Name:** Enter `FailoverVMs`.
  Click **OK** when these fields are completed.

2d Configure the VD disks: to fast initialize:

2d1 On the **Virtual Disk** page tree view, select **Virtual Disks** > `<disk_name>` and press F2 to open the Operations dialog.

2d2 In the dialog, select **Initialization** > **Fast Init** > **OK**.

2d3 Repeat **Step 2d1** and **Step 2d2** for each virtual disk.

The final configuration screen for RAID 1 should look like this:

The final configuration screen for RAID 5 should look like this:
The final configuration screen for RAID 6 should look like this:

3 Press Esc to exit the controller configuration utility.
4 Press Ctrl+Alt+Del if you are prompted. The server reboots with the new settings.
3 Installation Tasks

This section provides information about installing the hypervisor and Forge software components in your appliance.

- Section 3.1, “Installing the Hypervisor and Forge Components,” on page 15
- Section 3.2, “Licensing Microsoft Products on the Forge Management VM,” on page 19
- Section 3.3, “Licensing the ESXi 5.5 Hypervisor,” on page 21
- Section 3.4, “Running the Forge Appliance Configurator,” on page 22
- Section 3.5, “Backing Up the Factory VM,” on page 22
- Section 3.6, “Restarting the Appliance,” on page 23
- Section 3.7, “Configuring the Appliance for Immediate Use,” on page 23
- Section 3.8, “Launching the PlateSpin Forge Web Client,” on page 23
- Section 3.9, “Licensing the Forge Product,” on page 24

3.1 Installing the Hypervisor and Forge Components

This section provides information about installing the hypervisor and Forge software components in your appliance.

- Section 3.1.1, “Installing VMware ESXi 5.5.0 to the Appliance,” on page 15
- Section 3.1.2, “Reconnecting the Forge Administrative Computer,” on page 16

3.1.1 Installing VMware ESXi 5.5.0 to the Appliance

PlateSpin Forge requires VMware ESXi 5.5 to control the Forge Management VM. Ensure that you have the PlateSpin Forge Installation CD to proceed with the installation.

To install VMware ESXi 5.5.0 to the Forge Appliance:

1. Power on the appliance and press F11 at the boot prompt.
2. While at the boot prompt, insert the installation CD into the CD-ROM drive.
   - It might take some time for the Boot Manager utility to be displayed.
3. On the Boot Manager Main Menu, select BIOS Boot Menu to launch the BIOS Boot Manager.
4. In the BIOS Boot Manager utility, navigate to the option that lets you boot from an optical device (for example, a SATA optical drive), then press Enter.
**NOTE:** The name of the optical device might vary, depending on the device driver installed on the appliance.

5 On the Forge ESXi build installation menu, select ESX Scripted Install for the Forge Appliance, then press Enter to load the ESXi installer.

The installation progress updates on the screen and moves through several stages. When the process is completed, the following dialog is displayed prior to the system reboot:

![The system has finished installing and must reboot. The system will operate in evaluation mode for 60 days. To use ESXi 5.5.0 after the evaluation period, you must register for a VMware product license. To administer your server, use the vSphere Client or the Direct Control User Interface. There were warnings. See log file.](image)

**NOTE:** If you choose not to attend the installation, the system reboots on its own. You will see the ESXi console when you return.

If you encounter problems during the installation, see Section 4.2, “Errors Occurring During ESXi Installation,” on page 27 of this guide.

6 In the dialog, press Enter to reboot the system (or let the system reboot itself), then continue with the instructions in Section 3.1.2, “Reconnecting the Forge Administrative Computer,” on page 16.

### 3.1.2 Reconnecting the Forge Administrative Computer

To continue with the installation and configuration of the appliance, you need to connect directly to it through another computer, an “administrative computer.” You should have been using a Windows notebook computer (that is, a “laptop”) for this purpose in the past.

This section includes the following information:

- “Connecting the Appliance and the Administrative Computer” on page 16
- “Deploying the OVF Template” on page 18

#### Connecting the Appliance and the Administrative Computer

For licensing and configuration tasks in this section, use the following procedure to connect your administrative computer to the Forge hardware appliance. This requires setting up a physical connection, configuring with a static IP address in the same subnet as Forge, then re-connecting the administrative computer to the Forge appliance. It also includes establishing a management connection, which enables the administrative computer to configure aspects of the Forge appliance software.

This section includes the following information:

- “Establishing a Physical Connection” on page 17
- “Establishing a Management Connection through the vSphere Client” on page 17
Establishing a Physical Connection

To establish a physical connection between the administrative computer and the Forge Appliance:

1 Use one of these methods:
   - **Connection through a Network Switch:** Connect both units to a network switch or a hub through an Ethernet network cable:

     ![Network Switch Diagram]

     PlateSpin Forge Appliance
     Hub/switch
     Administrative Computer

   - **Direct Connection:** Connect your PlateSpin Forge appliance and the computer directly through a crossover cable:

     ![Crossover Cable Diagram]

     PlateSpin Forge Appliance
     Crossover Cable
     Administrative Computer

2 Turn on the power at the Forge appliance. Wait at least 10 minutes for the system to fully start before trying to connect.

3 Access the TCP/IP properties of the administrative computer’s wired LAN adapter and assign it an IP address (192.168.1.205) and an associated subnet mask (255.255.255.0).

   **NOTE:** Do not use the following IP addresses:
   - 192.168.1.200 - used by the hypervisor
   - 192.168.1.210 - used by the Forge VM (assigned by an automatic appliance configuration utility).

4 Save the settings and close the LAN Properties applet.

Establishing a Management Connection through the vSphere Client

When the administrative computer has been connected physically, you need to establish the management connection between the administrative computer and the ESXi hypervisor and the Forge Management VM. The connection is enabled through the VMware vSphere Client on the administrative computer. By using the vSphere client on the administrative computer, you can access the ESXi hypervisor and the Forge Management VM.

You already installed ESXi 5.5 on the Forge Appliance. From the administrative computer’s physical connection to the Forge Appliance, you can access and download the vSphere Client.
NOTE: You will need a connection to the Internet for the download to be successful. You can either copy the link location and download the client while you are connected, or you can manually download the vSphere Client from the VMware download site (see the procedure below).

On the administrative computer, use the following steps to install the VMware Infrastructure Client program:

1. From a browser, enter the Forge Host address to open the VMware ESXi 5.5 Welcome page, then select Download vSphere Client.
2. At the download location, run the vSphere Client installation .exe.
3. Launch the vSphere Client login, then connect to the PlateSpin Forge using these parameters:
   - IP address: 192.168.1.200
   - User name: root
   - Password: Password1
   The vSphere Client opens, connected to the hypervisor.

Deploying the OVF Template

Included in the PlateSpin Forge Appliance Upgrade/Rebuild Kit is the PLATESPINFORGE01.ovf file used in the PlateSpin Forge release build. You will deploy this .ovf file during the installation process to import the Forge VM into ESXi.

Use the following steps to deploy the OVF template:

1. From the PlateSpin Forge 11.1 Appliance Upgrade/Rebuild Kit download site (https://dl.netiq.com/Download?buildid=Kg-XXFwChvk~), select and download the following files and copy them to the same location on the administrative computer:
   - PLATESPINFORGE01-disk1.vmdk
   - PLATESPINFORGE01-disk2.vmdk
   - PLATESPINFORGE01-file1.flp
   - PLATESPINFORGE01.mf
   - PLATESPINFORGE01.ovf

   NOTE: The OVF template uses the other files from the kit to create the Forge Management VM.

2. In the vSphere Client (see “Installing VMware ESXi 5.5.0 to the Appliance” on page 15), click File > Deploy OVF Template.
3. In the Deploy OVF Template dialog, browse to the location where you downloaded the .ovf file, then click Next.
4. In the Name field of the Name and Location view, enter PLATESPINFORGE01 as the name for the imported PlateSpin Forge Management VM, then click Next.
5. From the Storage view, select ForgeSystem as the destination storage location, then click Next.
6. From the Disk Format view, select Thick Provision Eager Zeroed, then click Next.
7. From the Ready to Complete view, select Power on after deployment, then click Finish.
   The VM import process should complete after approximately 15 minutes.
8. In the vSphere client, locate the Forge Management VM (PLATESPINFORGE01), right-click the VM, then rename it to PlateSpin Forge Management VM.
9. In the vSphere client, click the Console tab, then click inside the remote console window.
At the Product Key Settings page, enter the product key.

On the Administrator Account Settings page, set the Administrator user password as Password1, then click Finish.

Click inside the console window, press Ctrl+Alt+Insert to evoke the login prompt for Windows on the VM, then log in as Administrator (Password1) to the PlateSpin Forge Management VM.

When you are prompted to enable Networks, click Yes to confirm that you want to find PCs, devices, and content on this network, and to automatically connect to devices like printers and TVs.

Network support is required for the PlateSpin Server configuration, management, and operations.

### 3.2 Licensing Microsoft Products on the Forge Management VM

NetIQ subscribes to a Microsoft Volume Licensing agreement, allowing us to pre-install Windows Server 2012 and SQL Server 2014 on the Forge Management VM without activating a license for either installation. You are not required to obtain a license from Microsoft yourself. Contact NetIQ Support for assistance with questions or issues regarding Microsoft product licensing.

**WARNING:** You must activate your Windows license key before you perform any PlateSpin Forge operations.

#### 3.2.1 Licensing Windows Server 2012

There are two methods you can use to activate the Windows Server 2012 license:

- “Offline License Activation by Phone” on page 19
- “Multiple Activation Key License Activation” on page 20

### Offline License Activation by Phone

To license Windows Server 2012 offline for the Forge Management VM and log in for the first time:

1. In the program tree view of the vSphere client (on the administrative computer), select the PlateSpin Forge Management VM item and click the green Play button to power it on (if it is not already on).

2. Click the Console tab, then click inside the remote console window.

3. On the Windows Server 2012 desktop, right-click the Start button, then select Command Prompt (Admin) to open the command line interface with administrative privileges.
4. At the command line, enter `slui 4`.
   The command launches the Software Licensing User Interface (Wizard) used for calling Microsoft for manual license activation.

5. In the interface, select your country or region, dial the toll-free number provided by Microsoft, write down the confirmation ID provided by the Microsoft automated phone system, then click **Enter confirmation ID**.

6. In the **Enter your confirmation ID** Wizard page of the interface, enter the confirmation ID you obtained from Microsoft, then click **Activate Windows**.

### Multiple Activation Key License Activation

As an OEM provider, you might have already made Volume Licensing arrangements with Microsoft to automate and manage the activation process of Volume Licensing media. Under such an arrangement, you could have a Multiple Activation Key License (MAK) that allows the use of a command line licensing tool.

**To license Windows Server 2012 for the Forge Management VM using a command line:**

1. In the program tree view of the vSphere client (on the administrative computer), select the **PlateSpin Forge Management VM** item and click the green **Play** button to power it on (if it is not already on).

2. Click the **Console** tab, then click inside the remote console window.

3. On the Windows Server 2012 desktop, right-click the Start button, then select **Command Prompt (Admin)** to open the command line interface with administrative privileges.

4. At the command line, enter `slmgr.vbs /ipk <MultipleActivationKey>`. The command launches a visual basic script that configures licensing on the Windows 2012 Server. After the script executes, a pop-up dialog confirms that the product key is installed successfully.

5. In the dialog, click **OK** to finish the key installation.
IMPORTANT: The Microsoft SQL Upgrade window does not display a progress bar. Because upgrading might take a few minutes, you need to wait for an indication that the upgrade completed before you close the dialog.

3.2.2 Licensing the SQL Server 2014

To license the SQL Server 2014 for the Forge Management VM:

1. Open the remote console window of the running Forge Management VM, click Start, then select the Apps arrow located at the lower-left corner of the Start screen.
2. In the Apps tiles array, expand the list, then scroll right to find SQL Server 2014 Installation Center.

IMPORTANT: Do not select the SQL Server Installation Center app listed in the Microsoft SQL Server 2008 category.

3. In this Installation Center app, click Maintenance > Edition Upgrade.
4. On the Edition Upgrade dialog, select Enter the product key, then enter the product key you obtained from Microsoft to activate the SQL Server 2014 OEM license on the Forge Management VM.
5. On subsequent upgrade dialogs, click Next or Upgrade until the licensing process is complete, then close the licensing application.

3.3 Licensing the ESXi 5.5 Hypervisor

NetIQ subscribes to a VMware Volume Licensing agreement, allowing us to pre-install ESXi 5.5 on the Forge Management VM without activating a license for the installation. As the OEM reseller and NetIQ partner, you need to activate the vSphere OEM license as you prepare each Forge Appliance for shipping.

Obtaining the vSphere Product Key

To obtain the OEM Product Keys:

2. Advise the support representative of the VMware Customer number for NetIQ (supplied in the Forge Appliance Rebuild Kit) and that you are activating a license for PlateSpin Forge. The representative will provide an ESXi 5.5 OEM product key.
3. Write down the ESXi 5.5 OEM product key for later use.

Activating the ESXi 5.5 License

To activate the ESXi 5.5 license for the Forge Management VM:

1. In the tree view of the vSphere client, select the ESXi server node, click the Configuration tab, then click Licensed Features.
2 In the upper right corner of the client interface, click Edit and select Assign a new license key to this host.
3 In the Assign License dialog, enter your license key and click OK.
4 Click OK and exit the vSphere Client program.

3.4 Running the Forge Appliance Configurator

After its components are installed, the Forge Appliance is ready for configuration.

To configure the Forge Appliance after installation:

1 On the Windows desktop of the Forge Management VM, double-click the Configure Forge Appliance shortcut.
   The tool runs for about two minutes. The configuration is complete when the system console displays a SUCCESS message at the command prompt.
2 Shut down the Forge Management VM in Windows (Settings > Power > Shut down).

3.5 Backing Up the Factory VM

As a precaution after the installation and configuration, you need to back up the Forge Management VM (a.k.a. the “Factory VM”) on the Forge Appliance.

To back up the Factory VM:

1 Verify that the Forge Factory VM is shut down.
2 At the local console of the Forge Appliance (that is, the Dell Server iDRAC), press Alt+F1.
3 Log in as root (password: Password1).
4 At the console prompt, enter the following command:
   python /opt/platespin/config/backup_forge_vm.py -f
Wait for the Python script to complete the factory backup process:

3.6 Restarting the Appliance

To restart the Forge appliance software:

Some aspects of the appliance configuration do not take effect until the next boot. You must reboot the appliance to complete the rebuild process.

1. Remove the PlateSpin Forge Installation CD.
2. At the console prompt, enter the `reboot` command and press Enter.
   The shutdown sequence switches screens, hiding the shutdown process.
3. Press Alt+F2 to return to the screen displaying the shutdown sequence.
   Forge is now rebuilt and is in the same state as it was when it left the factory.

3.7 Configuring the Appliance for Immediate Use

To begin the configuration of the appliance, reconnect your administrative machine and use the browser-based Forge Appliance Configuration Console (Forge ACC) utility.

To configure the appliance:

1. Power on the appliance hardware.
2. Configure Forge by following the instructions in the "Appliance Configuration Procedure" section of the PlateSpin Forge Getting Started Guide.

3.8 Launching the PlateSpin Forge Web Client

Most of your interaction with the appliance takes place through the browser-based PlateSpin Forge Web Client.

The supported browsers are:

- **Google Chrome**, version 34.0 and later
**Installation Tasks**

* Microsoft Internet Explorer, version 11.0 and later
* Mozilla Firefox, version 29.0 and later

**NOTE:** JavaScript (Active Scripting) must be enabled in your browser:

**To enable JavaScript:**

* **Chrome:**
  1. From the Chrome menu, select Settings, then scroll to and click Show advanced settings.
  2. Under Privacy, click Content Settings.
  3. Scroll to JavaScript, then select Allow all sites to run JavaScript.
  4. Click Done.

* **Firefox:**
  1. In the Location bar, type about:config and press Enter.
  2. Click I'll be careful, I promise!
  3. In the Search bar, type javascript.enabled, then press Enter.
  4. In the search results, view the value for the javascript.enabled parameter. If its value is false, right-click javascript.enabled and select Toggle to set its value to true.

* **Internet Explorer:**
  1. From the Tools menu, select Internet Options.
  2. Select Security, then click Custom level.
  3. Scroll to Scripting > Active scripting, then select Enable.
  4. Click Yes at the warning dialog box, then click OK.
  5. Click Apply > OK.

**To launch the PlateSpin Forge Web Client from any computer:**

1. Open a web browser and go to:

   http://<hostname | IP_address>/Forge

   Replace <hostname | IP_address> with the hostname or the IP address of your Forge VM.

   If SSL is enabled, use https in the URL.

   The first time you log into PlateSpin Forge, the browser is automatically redirected to the License Activation page.

**3.9 Licensing the Forge Product**

For Forge product licensing, you must have a license activation code. If you do not have a PlateSpin Forge license activation code, request one through the Customer Center website (http://www.netiq.com/center/). A license activation code will be emailed to you.

You have two options for activating your product license: online or offline.

* Section 3.9.1, "Online License Activation," on page 25
* Section 3.9.2, "Offline License Activation," on page 25
3.9.1 Online License Activation

For online activation, the PlateSpin Forge Web Client must have Internet access.

**NOTE:** HTTP proxies might cause failures during online activation. Offline activation is recommended for users in HTTP proxy environments.

To activate a Forge license online:

1. In the PlateSpin Forge Web Client, click Settings > Licenses > Add License. The License Activation page is displayed.

2. Select Online Activation, specify the email address that you provided when placing your order and the activation code you received, then click Activate.

   The system obtains the required license over the Internet and activates the product.

3.9.2 Offline License Activation

For offline activation, the PlateSpin Forge Web Client must have Internet access.

**NOTE:** To obtain a license key, you must have an eLogin account. If you are an existing PlateSpin customer and you don’t have an eLogin account, you must first create one. Use your existing PlateSpin username (a valid email address registered with PlateSpin) as input for your eLogin account username.

To activate a Forge license when offline:

1. In the PlateSpin Forge Web Client, click Settings > License, then click Add license. The License Activation page is displayed.

2. Select Offline Activation.

3. Use your hardware ID to create a license key file at the PlateSpin Product Activation website (http://www.platespin.com/productactivation/ActivateOrder.aspx). This also requires a user name, password, the email address that you provided when placing your order and the activation code you received.

4. Type the path to the file or browse to its location and click Activate.

   The license key file is saved and the product is activated based on this file.
Troubleshooting

This section includes current information that can help you to troubleshoot the setup of the Forge Appliance.

- Section 4.1, “Log File Locations,” on page 27
- Section 4.2, “Errors Occurring During ESXi Installation,” on page 27
- Section 4.3, “Errors Occurred During Forge VM Configuration,” on page 28

4.1 Log File Locations

Use these installation logs to help you diagnose problems with the configuration of the Forge Appliance:

- The automated ESXi installer writes log files located at /var/log/messages.
- Forge installation logs are located at /var/log/forge/.

4.2 Errors Occurring During ESXi Installation

An error has occurred while parsing the installation script

Source: When you are performing the VMware ESXi configuration, you might see the following error:

```
Error (see log for more info):
An error has occurred while parsing the installation script

error:/vmfs/volumes/mpx.vmmhba33:0:0:0:0/KICK/KS_CFG:
line 37: "%pre" script returned with an error.
```

Explanation: This is a symptom of the hardware model verification script that is failing.
Action: You need to gather information from the installation to understand the corrective actions you need to take.

1. Press Alt+F11. This command displays the ESXi alert messages related to the installation failure.
2. Press Alt+F1. This command displays the ESXi shell, where you can log in to locate the relevant diagnostic log file:
   2a. Log in with these credentials:
       
       **username:** root  
       **password:** press Enter for an “empty” password (this is the beginning of the ESXi install, so no root password is set)
   2b. When logged in, navigate to /var/log/forge/forge.log. This file can provide clues to reasons behind the failure of the install.

### 4.3 Errors Occurred During Forge VM Configuration

**A FAILURE error occurred on running Forge Appliance Configurator**

**Source:** When you run the Forge Appliance Configurator, you might not see SUCCESS.

**Troubleshoot:** Check the log file found at the location mentioned in the error message. For example:

```
D:\Program Files\PlateSpin Forge Server\ForgeApplianceConfigurator\ForgeApplianceConfigurator.log
```

**Explanation:** The possible causes for this problem could be any of the following:

**Possible Cause:** The Forge VM disk is not PLATESPINFORGE01.

**Action:** Delete the Forge VM, then deploy the OVF Template, according to the instructions in “Deploying the OVF Template” on page 18, where the name of the imported VM is PLATESPINFORGE01.

**Possible Cause:** The Forge VM name is not PlateSpin Forge Management VM.

**Action:** Rename the Forge VM to PlateSpin Forge Management VM. In the vSphere client, locate the Forge Management VM, right-click the VM, then rename it to PlateSpin Forge Management VM.

**Possible Cause:** The Forge ESXi Hypervisor has the Evaluation License.

**Action:** Follow the instructions in Section 3.3, “Licensing the ESXi 5.5 Hypervisor,” on page 21, and then re-run the Forge Appliance Configurator.

**Possible Cause:** The Forge Appliance Configurator log reports an Installing self-signed SSL certificate event before the exception error. Check the Event Log if the Forge VM’s IIS Admin Service failed to manually or automatically start up because of an Invalid Signature error.

**Action:** We are not sure why this happens, but here are the possible solutions (so far):

- Delete the Forge VM, then deploy the OVF Template, according to the instructions in “Deploying the OVF Template” on page 18, where the name of the imported VM is PLATESPINFORGE01.
- The checksums of the copied VM folder might not match. Re-copy the VM folder and repeat “Deploying the OVF Template” on page 18.
This section contains information on documentation content changes that were made in this Field Rebuild Guide after the initial release of NetIQ PlateSpin Forge 11.2.

**NOTE:** This updated information does not appear in localized versions of the Field Rebuild Guide.
