Contents

About this Book and the Library	13
Part I Getting Started	15
1 Understanding Sentinel Applications	17
2 Adding a License Key	19
Adding a License Key By Using the Sentinel Main Interface	19
Adding a License Key through the Command Line	19
3 Security Considerations	21
Basic Security Considerations	21
Traditional Installation	21
Appliance Installation	22
Securing Sentinel Data	22
Best Practices	22
Changing Passwords	22
Enforcing Password Policies for Users	23
Securing Communication with Collector Managers and Event Sources	24
Securing Communication for Traditional Storage	24
Auditing Sentinel	24
Determining if Data was Tampered	24
Using CA Signed Certificates	28
Using Multi-factor Authentication	31
Network Communication Options	31
Communication between Sentinel, Collector Manager, and Correlation Engine	32
Communication between Sentinel and the Sentinel Control Center and Solution Designer	
Client Applications	33
Enabling Higher Versions of TLS for Communication	33
Communication between the Server and the Database	33
Communication with Web Browsers	34
Communication between Sentinel and Elasticsearch	34
Communication between the Database and Other Clients	34
Sensitive Data Locations	35
Implementing Intruder Detection and Lockout Mechanisms	36
Applying Updates for Security Vulnerabilities in Embedded Third-Party Products	37
Securing Communication with Elasticsearch	37
Part II Configuring Roles and Users	39
4 Configuring Roles and Users	41
Overview	41
Creating Roles	43

Creating a Role	43
Configuring Password Complexity	47
Creating Users	48

5 Authentication Methods 51

Enablement Considerations	51
LDAP Authentication Against a Single LDAP Server Or Domain	53
Overview	54
Prerequisites	54
Setting Up LDAP Authentication	55
Logging in by Using LDAP User Credentials	57
Configuring Multiple LDAP Servers for Failover	58
LDAP Authentication Against Multiple LDAP Servers Or Domains	59
Prerequisites	60
Enabling Strong Authentication	60
Configuring LDAP Servers Or Domains Properties	61
Configuring LDAP Servers Or Domains As Authentication Sources	62
Logging In With LDAP User Credentials	68
Prerequisites for MFA, Kerberos, and OAuth	69
Sentinel DNS Name is Case-Sensitive	69
LDAP and Active Directory	69
Edit Sentinel Server Hosts File	69
Edit OSP Configuration Properties	70
Edit Sentinel Configuration Properties	71
Update All Computers That Access Sentinel	71
Ensure All Users Have a Valid Email ID	72
Using LDAP with SSL	72
Restart Sentinel	72
Configuring Sentinel In High Availability	72
Kerberos Authentication	73
Configuring the Sentinel Server for Kerberos Authentication	74
Configuring the Kerberos User Account in Active Directory	74
Configuring Browsers to Use Integrated Windows Authentication	77
Multi-factor Authentication	78
Using Advanced Authentication	78
Configuring Sentinel in FIPS Mode to use Advanced Authentication	81
Using Other SAML 2.0 IDP Software	82
Configuring Sentinel in FIPS Mode to use SAML 2.0 IDP	83
OAuth Authentication	84
Creating Credentials for the Google Web Application	84
Configuring the Sentinel Server for OAuth Authentication	84
Configuring Sentinel in FIPS Mode to Use Google OAuth	85
Troubleshooting	86
An Invalid OAuth2 Request was Received	86
Invalid Host Header Name or Request URL Domain Name	86
Login Redirects to the Standard Login Page	86

Part III Collecting and Routing Event Data 89

6 Configuring Agentless Data Collection 91

Before You Begin	91
----------------------------	----

Resolving Hostnames and IP Addresses	92
Configuring Data Collection for Syslog Event Sources	92
Parsing Logic for Syslog Messages	93
Configuring Syslog Servers	93
Configuring Client Authentication for the SSL Syslog Server	94
Configuring Data Collection for the Novell Audit Server	96
Specifying the Audit Server Settings	96
Setting the Audit Server Options	97
Configuring Data Collection for Other Event Sources	100
Accessing Event Source Management	100
Viewing Data in Event Source Management	101
Searching for Event Sources	106
Installing Plug-Ins	107
Updating a Connector or a Collector Plug-In	108
Adding Components to Sentinel	108
Connecting to Event Sources	110
Exporting Configurations	114
Importing Configurations	115
Debugging	115
Troubleshooting	118
Managing Event Sources	119
Viewing the Event Sources Page	119
Changing the Data Logging Status of Event Sources	122
7 Configuring Agent-Based Data Collection	123
8 Configuring ArcSight SmartConnectors for Data Collection	125
9 Managing Event Sources	127
Viewing the Event Sources Page	127
Viewing Event Sources	127
Configuring Event Sources	129
Viewing Collector Managers	129
Viewing Event Source Servers	130
Viewing Collector Plug-Ins	130
Filtering Event Sources	131
Filtering Event Sources by Name	131
Filtering Event Sources by Health Status	132
Filtering by Event Sources Event Search Results	132
Filtering Event Sources by Collector Managers	132
Filtering Event Sources by Event Source Servers	132
Filtering Event Sources by Collector Plug-Ins	133
Changing the Data Logging Status of Event Sources	133
Changing the Associated Collector Plug-In for Event Sources	133
10 Configuring Event Routing Rules	135
Creating an Event Routing Rule	135
Ordering Event Routing Rules	136
Activating or Deactivating an Event Routing Rule	137

11 Mapping Events	139
Overview	139
Maps	139
Mapping Events	140
Default Maps	142
Accessing Map Definitions	143
Adding Map Definitions	143
Adding a Number Range Map Definition	145
Updating Map Data	148
Updating Map Data from the Sentinel Control Center	148
Updating Map Data by Using the Command Line	148
Using Maps for Event Configuration	149
Renaming Event Fields	150
12 Linking to Additional Sentinel Systems	151
Benefits	151
Prerequisite	151
Configuring Sentinel Link	151
Part IV Configuring Data Storage	153
13 Configuring Traditional Storage	155
Raw Data Storage	155
Raw Data Representation	157
Disabling Raw Data Collection	160
Event Data	160
Configuring Secondary Storage Locations	162
Supported Storage Options	162
Types of Secondary Storage	163
Configuring Secondary Storage	163
Changing the Secondary Storage Location	167
Configuring Disk Space Usage	168
Verifying and Downloading Raw Data Files	168
Configuring Data Synchronization	169
Overview	169
Creating Data Synchronization Policies	172
Managing Data Synchronization Policies	176
Viewing Primary and Secondary Storage Capacity	176
Using Sequential-Access Storage for Long Term Data Storage	177
Determining What Data You Need to Copy to Tape	177
Backing Up Data	177
Configuring Storage Utilization	178
Configuring Data Retention	178
Copying Data to Tape	178
Restoring Data	179
14 Configuring Scalable Storage	183
Enabling Scalable Storage Post-Installation	183

Performance Tuning Guidelines	184
Performance Tuning in CDH	184
Performance Tuning in SSDM	188
Processing Data	189
Working with Sentinel Scalable Data Manager	190
Migrating Data from Sentinel with Traditional Storage	190
Modifying Scalable Storage Configuration	190
Viewing the Complete Event Data and Raw Data	191
Re-Indexing Data from HBase	191
Upgrading Scalable Storage Setup	192
Troubleshooting	192
Sentinel Operations Do Not Complete Successfully When Any of the CDH Components Are Not Running	192
Event Visualization Interface May Not Launch Due to Time-Out Error	193
15 Configuring Data Retention Policies	195
Rules for Applying a Retention Policy	195
Raw Data Retention Policy	196
Event Data Retention Policies	196
Creating Event Data Retention Policies	196
Configuring the Retention Period for the Event Associations Data	197
Data Deletion Policy for Traditional Storage	197
Data Deletion Policy for Scalable Storage	198
16 Re-indexing Event Data Partitions	199
Overview	199
Deciding When to Re-Index or Restore Data	199
Scheduling Re-indexing	200
Re-indexing By Using the Web Interface	200
Re-Indexing in the Offline Mode	201
Using the Offline Tool On the Sentinel Server	201
Using the Re-Indexing Tool On a Separate Machine	202
Part V Integrating with External Systems	205
17 Configuring Actions	207
Overview	207
Understanding the Action Manager Interface	208
Managing Actions	209
Adding an Action	210
Debugging Actions	211
Managing Action Plug-Ins	212
Understanding the Action Plug-In Manager Interface	212
Importing an Action Plug-In	213
18 Configuring Integrators	215
Overview	215

Managing Integrators	216
Configuring the Default Integrators	216
Adding an Integrator	219
Viewing Integrator Health Details	219
Managing Integrator Plug-Ins	221
Importing an Integrator Plug-In	221
19 Integrating Identity Information	223
Overview	223
Integration with Identity Management Systems	224
Leveraging Identity Information	226
20 Configuring Threat Intelligence Data Sources	227
Adding Threat Intelligence Data Sources	227
Understanding How Sentinel Processes Data	228
Managing Feeds from Threat Intelligence Solution Pack	229
Part VI Monitoring Your Network	231
21 Configuring Data Federation	233
Overview	233
Configuring Servers for Data Federation	235
Enabling Data Federation	235
Using the Administrator Credentials to Add a Data Source Server	235
Using the Opt-in Password to Add a Data Source Server	236
Searching for Events	238
Managing the Data Federation Search Results	239
Viewing the Search Activities	240
Running Reports	240
Viewing Alerts	241
Editing the Data Source Server Details	241
Troubleshooting	241
Permission Denied	242
Connection Down	242
Unable to View Raw Data	242
Problems While Adding Data Source	242
Some Events Are Only Visible from the Local System	243
Cannot Run Reports on the Data Source Servers	243
Different Users Get Different Results	243
Cannot Set the Admin Role as the Search Proxy Role	243
Error Logs	243
22 Visualizing IP Flow Communications	245
Configuring IP Flow Data Collection	245
Visualizing and Analyzing IP Flow Data	245

23 Viewing Compliance to Configuration Policies	247
Receiving Compliance Details from Secure Configuration Manager	247
24 Viewing Change Guardian Events	249
25 Configuring Alert Notifications	251
Understanding Alerts	251
Overview	251
Configuring Alert Creation	252
Visualizing and Analyzing Alerts.....	254
Managing Alerts	254
Filtering Alerts	254
Configuring Alert Retention Policies	255
Part VII Managing Solution Packs	257
26 Using Solution Packs	259
Overview	259
Solution Pack Components	260
Using the Import Plug-In Wizard to Import a Solution Pack	261
Using the Solution Manager.....	262
Launching the Solution Manager	262
Solution Manager Interface	262
Installing and Managing Solution Packs	265
Viewing the Contents of a Solution Pack	265
Installing Content from Solution Packs	265
Configuring Controls	266
Implementing a Control	268
Testing a Control	269
Uninstalling a Control	269
Viewing Solution Pack Status	270
Deleting a Solution Pack	271
Installing an Edited Solution Pack	272
Solution Designer	272
27 Creating Solution Packs	273
Accessing the Solution Designer	273
Creating a Solution Pack.....	273
Adding Content to a Solution Pack	274
Sentinel Content	274
Using Placeholders	276
File Attachments	276
Initializing Dynamic Lists Through Solution Pack	276
Documenting a Solution Pack	277
Description	277
Implementation Steps	277
Testing Steps.....	277
Synchronizing Content	278

Handling Inter-control Dependency	278
Managing a Solution Pack	278
Adding a Node to a Control	279
Moving Nodes	279
Part VIII Managing Your Sentinel Environment	281
28 Managing Active Searches and Reports	283
29 Monitoring the Events Per Second Rate	285
Viewing the Operational EPS	285
Viewing a Graphical Representation of the Events Per Second Rate	286
Viewing the Events Per Second Rate of Event Source Servers	286
30 Monitoring Sentinel Health	287
31 Configuring Sentinel for High Availability	289
32 Configuring Alert Generation	291
33 Configuring the Report Retention Period	293
34 Generating a Report in CSV and PDF Format	295
35 Backing Up and Restoring Data	297
Parameters for the Backup and Restore Utility Script	298
Running the Backup and Restore Utility Script	299
Restoring Dashboards After Restoring Data from a Different Sentinel Server	301
36 Updating Sentinel Clients	303
37 Customizing Sentinel Settings	305
Customizing Elasticsearch Settings in Traditional Storage	305
Configuring the Number of Incidents to be Listed in the Incidents List	306
Configuring the Number of Alert Trigger Events to be Attached with the Incident	306
Optimizing the Operating System	306
Configuring the Resources for Event Partition Compression	307
Setting the Grace Period to Close Event Data Partitions	307
Compressing the Storage Index on Primary Partition	307
Configuring Memory for the Sentinel Server	308
Setting the Raw Data Limit	309
Configuring the Number of Trigger Events to be Associated with a Correlated Event	309
Configuring the Number of Trigger Events to be Displayed in the Alert View	309
Maintaining Custom Settings in XML Files	310
Customizing the Default Search Field	310

Configuring the Proxy Port	311
Enabling the Use of Special Characters in Event Field Values	311
Configuring the Number of User Identities to be Displayed for People Search	311
Configuring the Report Generation Idle Timeout Period	312
Customizing Incident Probability Refresh Interval	312
38 Rebranding Reports	313
39 Generating an Audit Event when a List Item Expires From a Dynamic List	315
40 Configuring Sentinel for Multitenancy	317
40.1 Understanding MSSP Models	317
40.1.1 SOC Outsourcing Model	317
40.1.2 Hybrid Model	319
40.1.3 Full SaaS or Cloud Model	320
40.2 Configuring Multitenancy	321
40.2.1 Creating Tenants	321
40.2.2 Associating Incoming Events with a Tenant	321
40.2.3 Setting Up Retention Policies for Data Segregation	322
40.2.4 Providing Data Access for Tenants	322
40.2.5 Configuring Sentinel Functions	323
40.3 Role-Based Access Control and Multitenancy for Visualization	325
40.3.1 Use Case	325
40.4 Decommissioning Tenants	326
Part IX Appendix	327
A Command Line Utilities	329
Managing the Sentinel Services	329
Sentinel Scripts	330
Running the Report Development Utility	331
Getting the .jar Version Information	332
Changing the Hostname of a Sentinel Server	332
Importing or Exporting Event Association Data	333
Managing the Internal Database	334
Commands	334
Options	335
Cleaning Up the Internal Database	335
Prerequisites	335
Using the clean_db.sh Script	335
Managing the Sentinel Server	337
Commands	337
Options	337
B Troubleshooting	339
Collector Manager Logs Display the Copying back to Persist Queue Error	339
Event Visualization Dashboards Take a Longer Time to Load Data	340
Unable to View Alerts in the Dashboard and Alert Views	340

Unable to Connect to Sentinel Agent Manager Database	340
Customizing Logging Settings in Sentinel	341
Customizing Logging Settings in Elasticsearch	341
Sentinel Control Center Does Not Launch When Identity Manager Designer is Installed on the Client Computer	341
Error While Installing Correlation Rules	341
Sentinel High Availability Installation in FIPS 140-2 Mode Displays an Error	342
Sentinel Services Might Not Start Automatically After the Installation	342
Sentinel Does Not Configure the Sentinel Appliance Network Interface By Default	342
New Incoming Alerts Incorrectly Appear to be Selected When You Modify Existing Alerts	342
Error When Configuring the NFS Storage After Upgrading Sentinel Appliance to Version 7.3 SP1 and Later	343
Cannot Receive Events from Secure Configuration Manager After Upgrading Sentinel to Version 7.3 SP1 and Later	343
Cannot Receive Events from Sentinel UNIX Agent 7.4 After Upgrading Sentinel to Version 7.3 SP1 and Later	343
Cannot Create Reports by Using Sentinel SDK	343
Data Synchronization Fails While Synchronizing IPv6 Addresses in Human Readable Format	344
Mapping Conflict Warning in the Kibana Search	344

About this Book and the Library

The *Administration Guide* provides the administration information and tasks required to manage a Sentinel deployment.

Intended Audience

This guide is intended for Sentinel administrators and consultants.

Other Information in the Library

The library provides the following information resources:

Installation and Configuration Guide

The Installation and Configuration Guide provides an introduction to Sentinel and explains how to install and configure Sentinel.

User Guide

Provides conceptual information about Sentinel. This book also provides an overview of the user interfaces and step-by-step guidance for many tasks.

Getting Started

Sentinel is a Security Information and Event Management (SIEM) system that receives information from many sources throughout an enterprise, standardizes it, prioritizes it and presents it to you to make threat, risk and policy related decisions. For detailed information about Sentinel and its components, see “[Understanding Sentinel](#)” in the *Sentinel Installation and Configuration Guide*.

This section provides information about the following:

- ♦ [Chapter 1, “Understanding Sentinel Applications,”](#) on page 17
- ♦ [Chapter 2, “Adding a License Key,”](#) on page 19
- ♦ [Chapter 3, “Security Considerations,”](#) on page 21

1 Understanding Sentinel Applications

There are different tools to help you take advantage of all of the features Sentinel has to offer. For more information about these tools, see [“Introduction to the Sentinel Interface”](#) in the *Sentinel User Guide*.

2 Adding a License Key

You can add a license key when installing Sentinel. This section provides information about adding the license key after the Sentinel installation.

If you are using the temporary license key, you must add the enterprise license key before the temporary key expires to avoid any interruption in the Sentinel functionality. For information about how to purchase the license, see the [Sentinel Product Web site](#).

You can add a license key either by using the Sentinel Main interface or through the command line.

- ♦ “Adding a License Key By Using the Sentinel Main Interface” on page 19
- ♦ “Adding a License Key through the Command Line” on page 19

Adding a License Key By Using the Sentinel Main Interface

- 1 Log in to Sentinel as a user in the administrator role:

```
https://IP_AddressOrDNS_Sentinel_server:8443
```

Where *IP_AddressOrDNS_Sentinel_server* is the IP address or DNS name of the Sentinel server and *8443* is the default port for the Sentinel server.

- 2 Click the **Sentinel Main** icon.

- 3 Click **About > Licenses**.

- 4 In the Licenses section, click **Add License**.

- 5 Specify the license key in the **Key** field. After you specify the license, the following information is displayed in the Preview section:

Features: The features that are available with the license.

Hostname: This field is for internal Novell use only.

Serial: This field is for internal Novell use only.

EPS: Event rate built into the license key. Beyond this rate, Sentinel generates warnings but will continue to collect data.

Expires: Expiry date of the license. You must specify a valid license key before the expiry date to prevent an interruption in functionality.

- 6 Click **Save**.

Adding a License Key through the Command Line

If you are using the Sentinel traditional installation, you can add the license through the command line by using the `softwarekey.sh` script.

- 1 Log in to the Sentinel server as `root`.
- 2 Change to the `/opt/novell/sentinel/bin` directory.

3 Enter the following command to change to the novell user:

```
su novell
```

4 Specify the following command to run the `softwarekey.sh` script.

```
./softwarekey.sh
```

5 Enter 1 to insert the license key.

6 Specify the license key, then press Enter.

3 Security Considerations

This section provides information on how to securely maintain your Sentinel environment.

- ♦ [“Basic Security Considerations” on page 21](#)
- ♦ [“Securing Sentinel Data” on page 22](#)
- ♦ [“Best Practices” on page 22](#)
- ♦ [“Network Communication Options” on page 31](#)
- ♦ [“Sensitive Data Locations” on page 35](#)
- ♦ [“Implementing Intruder Detection and Lockout Mechanisms” on page 36](#)
- ♦ [“Applying Updates for Security Vulnerabilities in Embedded Third-Party Products” on page 37](#)
- ♦ [“Securing Communication with Elasticsearch” on page 37](#)

Basic Security Considerations

Sentinel has undergone security hardening before being released. This section describes some of the hardening mechanisms used in Sentinel.

- ♦ [“Traditional Installation” on page 21](#)
- ♦ [“Appliance Installation” on page 22](#)

Traditional Installation

- ♦ All unnecessary ports are turned off.
- ♦ Whenever possible, a service port listens only for local connections and does not allow remote connections.
- ♦ Files are installed with least privileges so that the least number of users can read the files.
- ♦ Default passwords are not used.
- ♦ Reports against the database are run as a user that only has SELECT permissions on the database.
- ♦ All web interfaces require HTTPS.
- ♦ All communication over the network uses SSL by default and is configured to require authentication.
- ♦ User account passwords are encrypted by default when they are stored on the file system or in the database.

Appliance Installation

In addition to the points mentioned in [“Traditional Installation” on page 21](#), the appliance has undergone the following additional hardening:

- ◆ Only the minimally required packages are installed.
- ◆ The firewall is enabled by default and all unnecessary ports are closed in the firewall configuration.
- ◆ Sentinel is automatically configured to monitor the local operating systems syslog messages for audit purposes.

Securing Sentinel Data

Because of the highly sensitive nature of data in Sentinel, you must keep the computer physically secure and in a secure area of the network. To collect data from event sources outside the secure network, use Collector Managers. For more information, see the [Sentinel Installation and Configuration Guide](#).

Sentinel is compatible with disk encryption technologies. These technologies provide a higher level of data privacy when they are used on file systems where Sentinel stores its data. However, software-based encryption technologies, such as dm-crypt, have a significant CPU overhead, and they can dramatically reduce the performance of Sentinel by 50% or more. However, hardware-based encryption technologies have a much lower impact on the performance of the rest of the system and are available from leading hard drive manufacturers.

Best Practices

Use the following best practices to secure your Sentinel server:

- ◆ [“Changing Passwords” on page 22](#)
- ◆ [“Enforcing Password Policies for Users” on page 23](#)
- ◆ [“Securing Communication with Collector Managers and Event Sources” on page 24](#)
- ◆ [“Securing Communication for Traditional Storage” on page 24](#)
- ◆ [“Auditing Sentinel” on page 24](#)
- ◆ [“Determining if Data was Tampered” on page 24](#)
- ◆ [“Using CA Signed Certificates” on page 28](#)
- ◆ [“Using Multi-factor Authentication” on page 31](#)

Changing Passwords

To increase security, you can change the passwords of the system users created during the installation of Sentinel. There are three types of users:

- ◆ [“Administration Users” on page 23](#)
- ◆ [“Operating System Users” on page 23](#)
- ◆ [“Application and Database Users” on page 23](#)

Administration Users

The `admin` user is the administrator user for Sentinel applications. The password is set during the installation process.

Operating System Users

The Sentinel server installation creates a `novell` system user and a `novell` group that owns the installed files within the `install_directory`. The user's home directory is set to `/home/novell`. The `novell` user does not have a password and cannot log in to the operating system unless you assign a password after installation.

Application and Database Users

Sentinel application users are native database users and their passwords are protected by the native database platform, unless you have configured LDAP authentication. These users have only read access to certain tables in the database so that they can execute queries against the database. Users authenticated by LDAP do not have read access on the database.

dbauser: The `dbauser` is created as a superuser who can manage the database and is typically the user who can log in to pgAdmin for troubleshooting purposes. The password for the `dbauser` is the same as the `admin` user password specified during installation. The password must meet PostgreSQL database password standards.

appuser: The `appuser` is used to connect to the database for regular operations that do not require a superuser. The password for the `appuser` is the same as the password for the `admin` user specified during installation.

To modify the password for `admin`, `dbauser`, or `appuser`, use the `configure.sh` script. For more information, see [Appendix A, “Command Line Utilities,” on page 329](#). When you change the password by using the script, Sentinel updates the password in all relevant places without any manual intervention. However, if you try to change the password by any other method, the password does not get updated in all of the relevant files and some parts of Sentinel might stop working.

NOTE: There is also a PostgreSQL database user that owns the entire database, including system database tables. By default, the PostgreSQL database user is set to `NOLOGIN`, so that no one can log in as the PostgreSQL user.

Enforcing Password Policies for Users

To achieve robust password policy enforcement in Sentinel, use Sentinel's built-in password complexity policy enforcement capability. For more information about configuring password complexity, see [“Configuring Password Complexity” on page 47](#).

You can also use an LDAP directory to authenticate Web application users. To enable this option by using the Sentinel Main interface, see [“LDAP Authentication Against a Single LDAP Server Or Domain” on page 53](#). This option has no effect on accounts used by back-end services, which continue to authenticate through PostgreSQL.

Securing Communication with Collector Managers and Event Sources

You can configure Sentinel to securely collect data from various event sources. However, secured data collection is determined by the specific protocols supported by the event source. For example, the Check Point LEA, Syslog, and Audit Connectors can be configured to encrypt their communication with event sources.

For more information about the possible security features that you can enable, see the [Sentinel Plug-ins Web site \(https://marketplace.microfocus.com/arcsight/category/sentinel\)](https://marketplace.microfocus.com/arcsight/category/sentinel).

Securing Communication for Traditional Storage

For secondary storage, you must consider the security implications before deciding the type of secondary storage location to use. If you are using CIFS or NFS servers as secondary storage locations to store the Sentinel event data and raw data, remember that these protocols do not offer data encryption. An alternative is to use direct attached storage (Primary, formerly known as local or SAN), which does not have the same security vulnerabilities. If you choose to use CIFS or NFS, it is important to configure the CIFS or NFS server to maximize the security of your data.

For more information about configuring the secondary storage location server settings, see [“Configuring Secondary Storage Locations” on page 162](#).

Auditing Sentinel

Sentinel generates audit events for many actions performed manually and also for actions performed internally for system activities. Sentinel tags these events with the `Sentinel` tag. To include these events in a report, perform a search by using the `rv145:Sentinel` query and select **include system events**. However, you must have the necessary permissions to view system events. For more information, see [Chapter 4, “Configuring Roles and Users,” on page 41](#).

Sentinel provides reports that are preconfigured to include only the events tagged with the `Sentinel` tag.

A well-audited Sentinel system not only audits events occurring within Sentinel, but also the infrastructure on which Sentinel is running. You can set up data collection from the computers and the devices that make up the Sentinel infrastructure and tag them with the `Sentinel` tag to enable a complete auditing of the systems that can affect the behavior of Sentinel. For appliance installations, Sentinel is automatically configured to monitor the local operating system’s syslog messages for audit purposes.

Determining if Data was Tampered

There are two approaches to verify that the event was not tampered while in storage.

Event Data Approach

The event data approach involves proving that a particular event of interest has not been tampered with. At a high level, this involves verifying that the partition that the event is stored in has not been tampered. Since Sentinel computes integrity hashes at the partition level and not the per-event level, the integrity check must be done at the partition level.

You can verify the integrity of event data by checking if the data in the secondary storage location has been tampered. Immediately after an event data partition is copied from primary storage to secondary storage, a hash is computed on the copy of the partition in the secondary storage. You can verify the integrity of event data using the hash.

The hash is computed as follows:

1. In the event partition, the data in the following files are concatenated in the following order:
 - a. `index.sqfs`
 - b. All the files in the `events.evt` directory, in alphabetical order.
2. The concatenation of the files is hashed using the SHA-256 algorithm.
3. The hash is base64 encoded. The base64 encoded hash value is stored in the row associated with the event partition under the HASH column of the IXLOG_PART table. The event partition directory name is stored under the NAME column of the IXLOG_PART table.

After the event partition is copied to the secondary storage, the hash value populates in the HASH column of the IXLOG_PART table. You can determine if the integrity of the event partition has been compromised by recomputing the hash of the event partition and comparing it with the HASH value in the IXLOG_PART table.

NOTE: This approach depends on the concept that the hash is stored separately and securely from the event data. The hash is stored in the authenticated Sentinel database whereas the event data is stored on the file system (not within the database). You can further protect the hashes by taking regular backups of the Sentinel database and storing the backups in an even more secure location. You can retrieve the hashes later to check the event data integrity.

To verify whether the event data was tampered:

- 1 Determine the partition the event is stored in:
 - 1a Export the event of interest to a CSV file and including the RetentionPolicyID (rv171) field in the export.
 - 1b Note down the value in the RetentionPolicyID (rv171) field. It is a unique ID of the retention policy under which the event is stored.
 - 1c Find the exact partition by executing database queries by running the following command as the novell user on the Sentinel server:

```
db.sh sql SIEM dbauser "select name, part_date, hash, state,
part_id, ret_pol_id from IXLOG_PART where
ret_pol_id='<retention_policy_ID>'"
```

where `<retention_policy_ID>` is the value in the RetentionPolicyID (rv171) field determined in [Step 1b](#).

- 1d** Determine the exact partition by comparing the value in the EventTime field of the event with the partition dates. The partition dates are in UTC. If you are viewing the EventTime in your local time, you need to convert the time to UTC to find the right partition date.
- 2** Find the hash stored in the database for the partition by running the following command:

```
db.sh sql SIEM dbauser "select name, hash, state from IXLOG_PART where name='<partition_name>'"
```

where *<partition_name>* is the name of the partition

The hash value is in base64 format. You need to convert the hash value to hexadecimal to compare it with the value returned by sha256sum.

- 3** Convert the hash value found into hexadecimal.

```
echo "<hash>" | base64 -d - | hexdump -e '/1 "%02x" '
```

For example,

```
echo "lUrp+hejhDbyb59ZRpoQ88vpA8eiZfI2ySVCibMoDXo=" | base64 -d - | hexdump -e '/1 "%02x" '
```

- 4** Calculate the hash of an event partition by executing the following command in the partition directory.

```
cat index.sqfs events.evt/* | sha256sum
```

- 5** Compare the hash values calculated in [Step 2](#) and [Step 3](#). If they match, the event partition has not been tampered with. If they do not match, the integrity of the file has been compromised.

Raw Data Approach

The raw data approach involves finding the raw data associated with the normalized event and proving the raw data has not been tampered.

Sentinel stores the raw data files in one of the following locations:

- ◆ Primary storage location: *<Sentinel data directory>/rawdata/online*
- ◆ Secondary storage location: *<Sentinel secondary storage directory>/rawdata_archive*

If your secondary storage is NFS or CIFS, the NFS/CIFS share is automatically mounted to the `/var/opt/novell/sentinel/data/archive_remote` directory on the Sentinel server. If the secondary storage is SAN, the NFS/CIFS share is mounted to the configured directory.

Each raw data file is a `.gz` compressed file.

To identify the raw data associated with the normalized event:

- 1** Perform the steps described in section, [Event Data Approach](#). These steps are important because the data in the event is required to find the associated raw data record.
- 2** In the event, find the value in the following fields:
 - ◆ **RawDataRecordId:** The ID of the raw data record that was normalized to create the event is stored in this field. For example, B926DF62-462C-1031-8FE2-000C29E90B7D.

- ♦ **EventSourceID:** The ID of the event source the data came from. For example, 9DA14E20-4595-1031-BE22-000C29E90B7D. In some cases, the display name is shown for the EventSourceID, such as: sles11sp2:Syslog:Map Output (universal).
 - ♦ **SentinelProcessTime:** the time when Sentinel processed the data. This information is useful as an approximation of which raw data log file the data is stored in.
- 3 In the Sentinel Main interface, click **Storage > Download Raw Data**.
 - 4 Identify the event source in the list that exactly matches the EventSourceID.
 - 5 Using the SentinelProcessTime, find the raw data files that have a date that is approximately around this time.
 - 6 Download the raw data files that might have the raw data record.
 - 7 Open the file and search for the RawDataRecordId.
 - 8 After identifying the right raw data file, verify the integrity of the file by clicking **Verify Integrity**.

To determine if the deleted raw data files were tampered:

- ♦ Verify the sequence number of JSON records. All JSON records have the same ChainID with a monotonically increasing ChainSequence number starting with zero. There are no gaps or missing numbers in the ChainID sequence. If a new ChainID is present, its ChainSequence begins with zero. If there are gaps in the sequence of numbers, the records were either tampered or were manually deleted.
- ♦ Verify the RawDataHash against the RawData. To do this, convert the RawData value to a sequence of bytes in UTF-8 format. Calculate a 256 SHA digest against those bytes. Convert the digest to a HEX string, and compare the string with the value in RawDataHash. If they are not identical, either the RawData or the RawDataHash file was tampered.

If, for example, you want to compute the hash of a file on the file system on Linux, specify a command similar to the following:

```
sha256sum F6673C60-573A-102D-ADE0-003048306A7C/2010-06/15-1600.gz
```

For example, if you want to query the database for the hash of a file, you can specify a command similar to the following:

```
db.sh sql SIEM dbauser "select FILE_HASH from RAW_DATA_FILES_INFO where FILE_NAME= '/F6673C60-573A-102D-ADE0-003048306A7C/2010-06/15-1600.gz' ;"
```

However, there is a possibility that a person tampered the files in such a way that the tampering cannot be detected, because the person also recomputed the sequence number or the RawDataHash. To determine if the raw data files were tampered, you can also use the hash key values of each raw data file stored in the database. The Sentinel server calculates a hash key value for every raw data file and stores it in the RAW_DATA_FILES_INFO in the database.

The table has the following columns:

- ♦ **FILE_NAME:** This column contains the relative file name in the following format:
<Event Source UUID>/<Date>/<RawDataFile>
- ♦ **STATE:** This column indicates if the raw data file is in the primary storage location or the secondary storage location. If the value is ARCHIVED, the raw data file is in the secondary storage location. If the value is ONLINE or COMPRESSED, the raw data file is in the primary storage location. If the value is DELETED, it indicates that the file is deleted from the disk and was not present either in primary or in secondary storage location.

- ♦ **FILE_HASH:** The hash value is computed when the files are closed for writing. Therefore, only files in the COMPRESSED or ARCHIVED state have a hash value. The FILE_HASH column contains a SHA256 hash key value computed over the contents of the file. The file is treated as a stream of binary bytes to compute the hash. The hash is stored as a HEX string (lowercase).

To determine if a file is tampered, compute the SHA-256 hash, convert it to a HEX string (lowercase), then compare this computed value with the hash value stored in the RAW_DATA_FILES_INFO. If the values are different, it indicates that either the file or the database has been tampered.

To determine if the files were deleted in an unauthorized way, you can scan the records in the RAW_DATA_FILES_INFO and look for files whose STATE value is ARCHIVED, ONLINE, or COMPRESSED. You can ignore those marked DELETED. If the STATE value is ARCHIVED, the raw data file should be in the secondary storage location. If the STATE value is ONLINE or COMPRESSED, the raw data file should be in the primary storage location or the secondary storage location.

Using CA Signed Certificates

Sentinel uses several digital, public-key certificates as part of establishing secure TLS/SSL communications. During the initial configuration of Sentinel, these certificates are self-signed. In some circumstances, it might be necessary to obtain certificates digitally signed by a certificate authority (CA).

You can replace the self-signed certificate with a certificate signed by a well-known CA, such as VeriSign, Thawte, or Entrust. You can also replace the self-signed certificate with a certificate digitally signed by a less common CA, such as a CA within your company or organization.

NOTE: There are many well-known CAs and identifying which CAs are most commonly used varies with country.

This section provides information about various certificates used in Sentinel, instructions about configuring the TLS/SSL certificates to get them digitally signed by a CA, and then importing the digitally signed certificates into Sentinel:

- ♦ [“Types of Certificates” on page 28](#)
- ♦ [“Configuring the TLS/SSL Certificates” on page 29](#)
- ♦ [“Using a Signed Certificate on Distributed Components” on page 31](#)

Types of Certificates

- ♦ [“Web Server Certificate” on page 28](#)
- ♦ [“Java Messaging Service Certificates” on page 29](#)
- ♦ [“SSL Proxy Server Certificate” on page 29](#)

Web Server Certificate

The web server certificate is used for the following purposes:

- ♦ With web browsers to connect to the Sentinel Main interface.
- ♦ Establish trust relationships for the REST API calls between Sentinel instances. For example, it is used when configuring Data Federation.

If the web server certificate is not signed by a well-known CA and you connect to the Sentinel Main interface, Sentinel displays the `Connection is Untrusted` message.

Java Messaging Service Certificates

The Java Messaging Service (JMS) certificates include the following:

- ◆ Broker Certificate
- ◆ Client Certificate

The JMS certificates are used to establish secure communications between various components of Sentinel, including the Sentinel server and remote Collector Managers.

SSL Proxy Server Certificate

The Client Proxy Server certificate is used to establish secure communication between the Sentinel server and client applications, such as the Sentinel Control Center or the Solution Designer. This certificate is not used with the Sentinel Main interface.

Configuring the TLS/SSL Certificates

Configuring the TLS/SSL certificates involves the following steps:

- ◆ [“Generating a Certificate Signing Request” on page 29](#)
- ◆ [“Getting the CSR Signed by the CA” on page 29](#)
- ◆ [“Importing the Digitally Signed Certificates into Sentinel” on page 30](#)

Generating a Certificate Signing Request

To obtain a digitally signed certificate, you must first generate a certificate signing request (CSR), which is presented to the CA. To generate one or more CSRs, perform the following steps on the Sentinel server:

- 1 Log in to the Sentinel server as the `novell` user.
- 2 Create a certificate pair by using the following command:

```
/opt/novell/sentinel/jdk/jre/bin/keytool -genkey -alias webserver -
validity <days> -storetype JKS -keyalg RSA -keysize 2048 -storepass
password -keypass password -keystore .webserverkeystore.jks -dname
"CN=<certificate_common_name>,OU=<organization_unit>,O=<organization>,
L=<city or town>,ST=<state>,C=<country>" -ext san=dns:<domain_name>
&& /opt/novell/sentinel/jdk/jre/bin/keytool -certreq -alias webserver -
file .webserverkeystore.csr -keystore .webserverkeystore.jks -storepass
password -ext san=dns:<domain_name>
```

The above command generates a CSR using the PKCS#10 format.

The certificate signing requests are now saved in the specified file.

Getting the CSR Signed by the CA

- 1 Submit the CSRs to the CA for signature.
- 2 Obtain the signed certificate files from the CA.

The details of how this is done depend on the CA. For more information, consult your CA.

Importing the Digitally Signed Certificates into Sentinel

Copy the files that contains the digital certificates signed by the CA to the Sentinel server. If the files are signed by an enterprise or organizational CA rather than a well-known CA, you must copy the CA's self-signed root certificate to the Sentinel server.

You must import the intermediate, root, and signed certificates. You can specify the desired alias names for the intermediate and root certificates. However, the signed certificate must be imported with the same alias that was used while creating a certificate pair, which is `webserver`.

The default keystore password is `password`. If you have changed the keystore password, specify the changed password.

To import the certificate files to the Sentinel server:

- 1 Log in to the Sentinel server as the `novell` user.
- 2 Back up the default self-signed certificate:

```
cp /etc/opt/novell/sentinel/config/.webserverkeystore.jks /etc/opt/novell/sentinel/config/.webserverkeystore.jks_bkp
```

- 3 Copy the CA signed certificate to the Sentinel server:

```
cp <CA_signed_certificate> /etc/opt/novell/sentinel/config/.webserverkeystore.jks
```

- 4 Import the intermediate certificate:

```
/opt/novell/sentinel/jdk/jre/bin/keytool -importcert -alias <alias_name> -file /opt/cert/intermediate.pem -keystore /etc/opt/novell/sentinel/config/.webserverkeystore.jks -storepass <keystore_password>
```

- 5 Import the root certificate:

```
/opt/novell/sentinel/jdk/jre/bin/keytool -importcert -alias <alias_name> -file /opt/cert/root.pem -keystore /etc/opt/novell/sentinel/config/.webserverkeystore.jks -storepass <keystore_password>
```

- 6 Import the signed certificate:

```
/opt/novell/sentinel/jdk/jre/bin/keytool -importcert -alias webserver -file /opt/cert/signedcert.pem -keystore /etc/opt/novell/sentinel/config/.webserverkeystore.jks -storepass <keystore_password>
```

- 7 (Optional) Verify whether all the certificates are imported successfully:

```
/opt/novell/sentinel/jdk/jre/bin/keytool -list -keystore /etc/opt/novell/sentinel/config/.webserverkeystore.jks
```

- 8 Restart Sentinel:

```
rcsentinel restart
```

Using a Signed Certificate on Distributed Components

You can use the same signed certificate you have used on Sentinel on the distributed components such as Collector Manager and Correlation Engine. To do this, synchronize Sentinel certificate with the distributed components.

To synchronize the signed certificate with the distributed components after you have successfully configured it for Sentinel using the steps provided in [“Configuring the TLS/SSL Certificates” on page 29](#), run the `configure.sh` script on each distributed component.

- 1 Log in to the distributed component computer to which you want to synchronize the signed certificate as the `novell` user.
- 2 Go to the `/opt/novell/sentinel/setup` directory.
- 3 Run the following command:

```
configure.sh
```

For more information about the `configure.sh` script, see the description in [Table A-2 on page 331](#).

This ensures that the distributed components use the same signed certificate that Sentinel uses, and avoids any conflict.

Using Multi-factor Authentication

By default, Sentinel uses single-factor authentication, which matches a password to a user name in the database. Sentinel also supports multi-factor authentication, which is a more advanced method of authentication that uses a combination of at least two factors. For example, a combination of a password and a token or a smart card and a fingerprint. For more information, see [“Multi-factor Authentication” on page 78](#).

For more information about the various authentication methods Sentinel supports, see [Chapter 5, “Authentication Methods,” on page 51](#).

Network Communication Options

Various components of Sentinel communicate across the network, and there are different types of communication protocols used throughout the system. All of these communication mechanisms affect the security of your system.

- ♦ [“Communication between Sentinel, Collector Manager, and Correlation Engine” on page 32](#)
- ♦ [“Communication between Sentinel and the Sentinel Control Center and Solution Designer Client Applications” on page 33](#)
- ♦ [“Enabling Higher Versions of TLS for Communication” on page 33](#)
- ♦ [“Communication between the Server and the Database” on page 33](#)
- ♦ [“Communication with Web Browsers” on page 34](#)
- ♦ [“Communication between Sentinel and Elasticsearch” on page 34](#)
- ♦ [“Communication between the Database and Other Clients” on page 34](#)

Communication between Sentinel, Collector Manager, and Correlation Engine

The communication between Sentinel server, Correlation Engine, and Collector Manager is by default over SSL through ActiveMQ. The processes use the following configuration information in the `${esecurity.config.home}/config/configuration.xml`:

```
<jms brokerURL="failover://(ssl://
${activemq.ip.server}:${activemq.port.userapps}?wireFormat.maxInactivityDuration=30000)?randomize=false" interceptors="compression"
keystore="${esecurity.config.home}/config/.activemqclientkeystore.jks"
keystorePassword="${sentinel.keystore.password}" password-
file="${esecurity.config.home}/config/activemqusers.properties"
username="${activemq.client.username}"/>
```

The `jms` strategy shown in this XML snippet defines how the Sentinel process connects to the server. This snippet defines the client-side settings of the connection.

Table 3-1 XML Entries in the `configuration.xml` File

XML Entry	Description
<code>ssl://</code>	Indicates that SSL is used for secure connection. You should not modify this value.
<code>\${activemq.ip.server}</code>	The hostname or IP address where the Java message service (JMS) server is running.
<code>\${activemq.port.userapps}</code>	The port that the JMS server is listening on. The default value is 61616.
<code>?wireFormat.maxInactivityDuration=30000)?randomize=false"</code>	This is where ActiveMQ configuration parameters are passed to the transport mechanism. These entries should be modified only if you are an ActiveMQ expert.
<code>interceptors="compression"</code>	Enables compression over the connection. You should not modify this value.
<code>keystore="\${esecurity.config.home}/config/.activemqclientkeystore.jks"</code>	The path to the Java keystore that is used to check if the server is trusted.
<code>keystorePassword="\${sentinel.keystore.password}"</code>	The password to the Java keystore file.
<code>password-file="\${esecurity.config.home}/config/activemqusers.properties"</code>	The location of the file containing the password to present to ActiveMQ for authenticating the connection.
<code>username="\${activemq.client.username}"</code>	The user name to present to ActiveMQ for authenticating the connection. This corresponds to a ActiveMQ user name in the <code>password-file</code> .

The server-side settings are defined in the `/etc/opt/novell/sentinel/config/activemq.xml` file. For instructions about how to edit the `activemq.xml` file, see the [ActiveMQ Web site \(http://activemq.apache.org/\)](http://activemq.apache.org/). However, modifying of the server-side settings is not supported.

Communication between Sentinel and the Sentinel Control Center and Solution Designer Client Applications

The Sentinel Control Center and Solution Designer client applications use SSL communication through the SSL proxy server by default.

The client applications use SSL by reading the following information in `/etc/opt/novell/sentinel/config/configuration.xml`:

```
<strategy active="yes" id="proxied_client"
location="com.esecurity.common.communication.strategy.proxystrategy.Proxie
dClientStrategyFactory">
  <transport type="ssl">
    <ssl host="10.0.0.1" port="10013" keystore="./novell/sentinel/
.proxyClientKeystore" />
  </transport>
</strategy>
```

Enabling Higher Versions of TLS for Communication

Some Sentinel components allow TLSv1.0 for communication. To improve the security posture and to prevent known vulnerabilities, you can disable TLSv1.0.

Perform the following steps on Sentinel server, Collector Manager, and Correlation Engine:

- 1 Log in as the novell user.
- 2 Edit the `/opt/novell/sentinel/jdk/jre/lib/security/java.security` file.
- 3 Add TLSv1 to the list of disabled algorithms as follows:

```
jdk.tls.disabledAlgorithms=SSLv3, TLSv1, RC4, MD5withRSA, DH keySize <
768
```

- 4 Restart the Sentinel services.

IMPORTANT: If you are using Agent Manager for host-based data collection, you must use Agent Manager 8.2 and later and enable a higher version of TLS on the Agent Manager server. For steps to enable a higher version of TLS on the Agent Manager server, see [Enabling Sentinel Agent Manager to Communicate using TLS 1.2](#).

Communication between the Server and the Database

The protocol used for communication between the server and the database is defined by a JDBC driver.

Sentinel uses the PostgreSQL driver to connect to the PostgreSQL database, which is a Java Type IV implementation. This driver supports encryption for data communication.

NOTE: Turning on encryption has a negative impact on the performance of the system. Therefore, this security concern needs to be weighed against your performance needs. The database communication is not encrypted by default for this reason. Lack of encryption is not a major concern because communication with the database occurs over the localhost network interface.

Communication with Web Browsers

The web server is by default configured to communicate via HTTPS. For more information, see the [Jetty documentation \(http://wiki.eclipse.org/Jetty/Howto/Configure_SSL\)](http://wiki.eclipse.org/Jetty/Howto/Configure_SSL).

Communication between Sentinel and Elasticsearch

If you have configured Sentinel with scalable storage, Sentinel uses Elasticsearch to index events. Elasticsearch cluster nodes can be accessed by various clients. Sentinel provides a security plug-in that authenticates and authorizes access to Elasticsearch. The plug-in uses either a SAML token or a whitelist for validation depending on how the clients connect. For more information about securing Elasticsearch using this plug-in, see [Configuring Elasticsearch for Event Visualization](#) in the *Sentinel Installation and Configuration Guide*.

Communication between the Database and Other Clients

You can configure the PostgreSQL SIEM database to allow connections from any client computer that uses pgAdmin or another third-party application.

The PostgreSQL database is compiled with the `--with-openssl` flag. You can configure it to use encrypted communication, although that is not the default setting. Typically all database communication in Sentinel is performed locally and not over the network.

To allow pgAdmin to connect from any client computer, add the following line in the `/var/opt/novell/sentinel/3rdparty/postgresql/data/pg_hba.conf` file:

```
host all all 0.0.0.0/0 md5
```

If you want to limit the client connections that are allowed to run and connect to the database through pgAdmin, specify the IP address of the host in the above line. The following line in the `pg_hba.conf` file is an indicator to PostgreSQL to accept connections from the local computer so that pgAdmin is allowed to run only on the server.

```
host all all 127.0.0.1/32 md5
```

To allow connections from other client computers, you can add additional `host` entries in the `pg_hba.conf` file.

To provide maximum security, by default, PostgreSQL only allows connections from the local computer.

Sensitive Data Locations

For certain components, passwords must be stored so that they are available to the components when the system needs to connect to a resource such as a database or an event source. In this case, the password is first encrypted to avoid unauthorized access to the clear-text password.

Even if the password is encrypted, you must ensure that the access to the stored password data is protected to avoid password exposure. For example, you can set permissions to ensure that files with sensitive data are not readable by other users.

Database credentials are stored in the `/etc/opt/novell/sentinel/config/obj-component.ConnectionManager.properties` file.

```
username=appuser
database=SIEM
password=<password>
```

The following database tables store passwords (/certificate) in encrypted format. You must limit access to these tables.

- ♦ **EVT_SRC:** column: evt_src_config column data
- ♦ **evt_src_collector:** column: evt_src_collector_props
- ♦ **evt_src_grp:** column: evt_src_default_config
- ♦ **md_config:** column: data
- ♦ **integrator_config:** column: integrator_properties
- ♦ **md_view_config:** column: view_data
- ♦ **esec_content:** column: content_context, content_hash
- ♦ **esec_content_grp_content:** column: content_hash
- ♦ **sentinel_plugin:** column: content_pkg, file_hash

Sentinel stores both configuration data and event data in the following locations:

Table 3-2 *Locations for Configuration Data and Event Data*

Components	Location for Configuration Data	Location for Event Data
Sentinel server	<p>The database tables and file system at <code>/etc/opt/novell/sentinel/config</code>.</p> <p>This configuration information includes the encrypted database, event source, integrators, and passwords.</p>	<p>The database (for example, <code>CORRELATED_EVENTS</code> and <code>EVT_RPT_*</code> tables) and the file system at <code>/var/opt/novell/sentinel/data/eventdata</code>, <code>/var/opt/novell/sentinel/data/rawdata</code>, <code>/var/opt/novell/sentinel/data/server.cache</code>, <code>/var/opt/novell/sentinel/data/map_data</code>, and <code>/var/opt/novell/sentinel/3rdparty/postgresql</code>.</p>

Components	Location for Configuration Data	Location for Event Data
Collector Manager	The file system at <code>/etc/opt/novell/sentinel/config</code> . The most sensitive configuration information is the client key pair used to connect to the message bus.	Event data might be cached on the file system during error conditions such as the message bus being down or event overflow. This event data is stored in the <code>/var/opt/novell/sentinel/data/collector_mgr.cache</code> directory.

Implementing Intruder Detection and Lockout Mechanisms

Sentinel supports intruder detection and lockout to prevent potential brute-force attacks. Sentinel provides several configurable parameters that help you implement intruder detection and lockout mechanisms.

- ◆ **failedAuthDelay:** Specifies the duration in milliseconds that a subsequent authentication request must wait after a failed authentication for a specific user. The default value is 2000 (2 seconds). If the value is 0, the delay is disabled. This wait period is calculated for each user. If an authentication request for User A fails, it does not cause a delay for an authentication request for User B.
- ◆ **intruderDetectInterval:** Specifies the time period in milliseconds in which consecutive failed authentication requests for a user must occur for Sentinel to identify the failures as a possible intruder detection. For example, if the value is 300000 (5 minutes) and four failed authentication requests happen within 4 minutes, but the 5th consecutive request happens 5:01 (minutes:seconds) later than the 1st failed request, Sentinel does not consider the requests suspicious. If the value is 360000 (6 minutes) and the same sequence of failed requests happen, Sentinel considers the requests to be suspicious. The default value for this parameter is 300000 (5 minutes).
- ◆ **intruderDetectMaxFailedAttempts:** Specifies the number of consecutive, failed authentication requests that must occur for Sentinel to consider a user name during the `intruderDetectInterval` for the requests as suspicious. If the value is 0 then intruder detection and lockout is disabled. The default value for this parameter is 5.
- ◆ **intruderDetectLockPeriod:** Specifies the duration that a Sentinel user account remains locked when the user account is automatically locked in response to a suspicious series of failed authentication requests. If the value is 0, automatically locked accounts are not automatically unlocked. They must be unlocked manually by an administrator. The default value for this parameter is 900000 (15 minutes).
- ◆ **intruderDetectAdminAutoLock:** Specifies whether or not the Sentinel admin account is subject to automatic locking in response to a series of failed authentication requests. The default is `false` since a denial-of-service attack exists in which an attacker can continually lock the built-in admin account, unless there is a separate administrator account.

The values listed above are defined in the `AuthenticationService` component of the `/etc/opt/novell/sentinel/config/server.xml` file. To customize the `AuthenticationService` component, see [“Maintaining Custom Settings in XML Files” on page 310](#).

Applying Updates for Security Vulnerabilities in Embedded Third-Party Products

Sentinel contains embedded third-party products such as JRE, Jetty, PostgreSQL, and ActiveMQ. Sentinel includes patches to address the security vulnerabilities (CVE) for these products when updates for Sentinel are released.

However, each of these products has its own release cycle, which means that there might be CVEs that are discovered before a Sentinel update is released. You need to separately review the CVEs for each embedded third-party product, and decide whether to apply these updates to your Sentinel system outside of the Sentinel updates.

If you decide to apply patches to address these CVEs outside of a Sentinel update, contact [Technical Support](#).

Securing Communication with Elasticsearch

From the 8.4.0.0 version of Sentinel, the in-built Elasticsearch is bundled with an X-Pack security plug-in, out of the box. X-Pack plugin is an Elastic Stack extension that provides security and other capabilities. With this change, Sentinel now only communicates with Elasticsearch (which is used to store alerts and event data) over SSL. Also, all the Elasticsearch **node-to-node** cluster communications too are now mandated over SSL, thereby making the data transfer across Elasticsearch nodes more secure. This enhanced security setting is now mandated from Sentinel 8.4.0.0 onwards and the users are expected to complete few manual steps like certificate configuration, as part of their install/upgrade process.

For more information about securing communication with Elasticsearch, see the [Configuring Elasticsearch for Event Visualization](#) section.

Configuring Roles and Users

This section provides information about configuring roles and users that can use Sentinel.

- ♦ [Chapter 4, “Configuring Roles and Users,” on page 41](#)
- ♦ [Chapter 5, “Authentication Methods,” on page 51](#)

4 Configuring Roles and Users

In Sentinel, you can add, edit, and delete roles. You can also grant different permissions at the role level, and edit the details of user and role profiles.

- ♦ [“Overview” on page 41](#)
- ♦ [“Creating Roles” on page 43](#)
- ♦ [“Configuring Password Complexity” on page 47](#)
- ♦ [“Creating Users” on page 48](#)

Overview

You can create different user roles and assign them different permissions. Role assignment helps you control users access to functionality, data access based on fields in the incoming events, or both. Each role can contain any number of users. Users belonging to the same role inherit the permissions of the role they belong to. You can set multiple permissions for a role.

Sentinel has the following roles by default:

Administrator: A user in this role has administrative rights in the Sentinel system. You cannot delete users in this role. Administrative rights include the ability to perform user administration, data collection, data storage, search operations, rules, report, dashboard, and license management.

You cannot modify or delete the administrator role.

Database Administrator: A user in this role has access to events coming from database event sources. The Collector parsing the data from the event source determines the type of the event source (database). A user in this role can view data that matches filter `rv32: "DB"` and search data targets.

Data Proxy User: This is a system role for proxy users. This role is critical to setting up another Sentinel system to access your local Sentinel system using the Data Federation feature.

Incident Administrator: A user in this role can manage incidents in the system and control incidents being handled by other users.

Network Administrator: A user in this role can administer network infrastructure devices, such as routers, switches, and VPNs. This role has access to events coming from devices in the category `NETD` or `VPN` (as determined by the Collector parsing the data) or from event sources with the `Network` tag. Set the `Network` tag on network infrastructure event sources to allow users in this role to view the events. A user in this role can view data that matches filter `rv32: "NETD" OR rv32: "VPN" OR rv145: "Network"`, and can search data targets.

Network Security Administrator: A user in this role can administer network security infrastructure devices, such as firewalls, Ides, and Web proxies. This role has access to events coming from devices in the category `AV`, `FW`, or `IDS` (as determined by the Collector parsing the data) or from event sources with the `NetworkSecurity` tag. Set the `NetworkSecurity` tag on network infrastructure

event sources to allow users in this role to view the events. A user in this role can view data that matches filter `rv32:"AV" OR rv32:"FW" OR rv32:"IDS" OR rv145:"NetworkSecurity"`, and can search data targets.

Operator A user in this role can manage alerts, view Security Intelligence Dashboards, share alert and event views, run reports, view and rename reports, and delete report results. The Threat Response dashboard allows Operators to triage alerts quickly and efficiently.

PCI Compliance Auditor: A user in this role has access to view events that are tagged with at least one of the regulation tags such as PCI, SOX, HIPAA, NERC, FISMA, GLBA, NISPOM, JSOX, and ISO/IEC_27002:2005, and can view system events, view the Sentinel configuration data, and search data targets.

Report Administrator: A user in this role can run reports, view, rename and delete report results, add and delete report templates and report results, run reports on configuration database, export all reports, and save search results as a report. A Report Administrator can also tag report templates and report results. The Report Administrator can search report templates and report results based on these tags.

Security Policy Administrator: A user in this role can implement the security policies within the system for users to access anomaly detection, correlation, incident remediation, and iTRAC workflows.

System Event Monitor: A user in this role can monitor the Sentinel system for errors or outages. This role has access only to events coming from Sentinel systems. A user in this role can also access data coming from event sources that Sentinel is dependent on. For example, you can tag operating systems on which Sentinel and the Collector Managers are running with a Sentinel event source tag so that the users in this role can monitor problems in the operating systems. A user in this role can view data that matches filter `rv145:"Sentinel"`, view system events, and search data targets.

Unix Administrator: A user in this role has access to events from operating system event sources that are not Windows computers. The type of the event source is determined by verifying the Collector parsing data and also by verifying if a Windows tag is present. A user in this role can view data that matches filter `(rv32:"OS" NOT (("Microsoft?Active?Directory*" NOT msg:"Microsoft?Active?Directory*") OR ("Microsoft?Windows*" NOT msg:"Microsoft?Windows*"))) NOT rv145:"Windows"` and search data targets.

User: A user in this role can manage dashboards, run reports, view and rename reports, and delete report results.

Windows Administrator: A user in this role can administer Windows computers. This role has access to data generated by Windows event sources. The type of the event source is determined by verifying the Collector parsing the data. If data from a Windows event source is not being processed by the Active Directory or the Windows Collector, add the Windows tag to event sources to indicate that Windows data is being collected from the event source. This enables the Windows administrator to access the data. A user in this role can view data that matches filter `(rv32:"OS" AND (("Microsoft?Active?Directory*" NOT msg:"Microsoft?Active?Directory*") OR ("Microsoft?Windows*" NOT msg:"Microsoft?Windows*"))) OR rv145:"Windows"` and search data targets.

Creating Roles

Roles allow you define what a user can manage and what data they can view. Permissions are granted to the role, and then the user is assigned to the role.

Creating a Role

- 1 From **Sentinel Main**, click **Users**.
- 2 Select a tenant from the **Tenant** drop-down list to assign a tenant to the role.
Users created under this role will have access to view events from the selected tenant.
- 3 Click **Create** in the **Roles** section to create a new role.
- 4 Use the following information to create the role:

Role name: Specify a unique name for the role. A role name should not exceed 40 characters.

Description: Specify a description of the role.

Users with this role can: Select the permissions that a role grants to users assigned to the role.

- ♦ **View all event data:** Select this option to allow users to view all the data in the Sentinel system. If you select this option, you must select one or more of the following permissions:
 - ♦ **Manage Correlation Engine/Rules:** Allows users to manage Correlation rules and all data associated with these rules. The Correlation feature is displayed in the Sentinel Main interface only if this permission is selected.
 - ♦ **Manage and View Security Intelligence Dashboards:** Allows user to view, create, and manage the Security Intelligence dashboards and the data displayed in the dashboards. The Security Intelligence option is displayed in the Sentinel Main interface only if this permission is selected.
 - ♦ **View Security Intelligence Dashboards:** Allows user to view the Security Intelligence dashboards and the data displayed in the dashboards. The Security Intelligence option is displayed in the Sentinel Main interface only if this permission is selected.
- ♦ **View the following data:** Select this option to allow users to view only selected data in the Sentinel system.
 - ♦ **Only events matching the filter:** Allows users to view only the events returned by the specified search query. For example, if you set the filter value to `sev:5`, users with this permission can view only events of severity five in a search.
For more information about using filters, see [“Configuring Filters”](#) in the *Sentinel User Guide*.
Select one or more of the following permissions to use when viewing the filtered data:
 - ♦ **Search Data Targets:** When this permission is set on a role, all members of that role can perform searches on Sentinel systems that are in a distributed location.
For more information on distributed searching and reporting, see [Chapter 21, “Configuring Data Federation,”](#) on page 233.
 - ♦ **View asset data:** Allows users to view asset data.
 - ♦ **View asset vulnerability data:** Allows users to view vulnerability data.
 - ♦ **View data in the embedded database:** Allows users to view the data in the embedded database.

- ♦ **View people browser:** Allows users to view the data in the Identity Browser.
- ♦ **View system events:** Allows users to view the Sentinel system events.
- ♦ **Allow users to access reports:** Select this option to allow users to access and manage reports.
 - ♦ **Manage reports:** Allows users to create, modify, run, and delete reports.
 - ♦ **Import reports:** Allows users to import reports.
 - ♦ **Run reports:** Allows users to only run reports.
- ♦ **Allow users to manage alerts:** Select this option to allow users to view and manage alerts. Select either of the following options:
 - ♦ **Manage all alerts:** Allows users to view and edit all the alerts and configure alert creation.
 - ♦ **Manage only alerts that match the following criteria:** Allows users to view and edit the alerts that match the specified criteria. This permission also allows users to configure alert creation.
- ♦ **Create and use Alert Views:** Allows non-administrator users to create private alert views and view shared alert views. For more information, see [“Creating an Alert View”](#) in the *Sentinel User Guide*.

After you select this permission, you can assign the following permissions:

- ♦ **Share Alert Views:** Allows users to share their alert views as follows:
 - ♦ Non-administrator users of the default tenant can share their alert views with other users.
 - ♦ Users of a non-default tenant can share their alert views with other users of the same tenant.
- ♦ **Edit Alert Views:** Assigns the **Share Alert Views** permission and allows users to edit shared alert views as follows:
 - ♦ Non-administrator users of the default tenant can edit shared alert views.
 - ♦ Users of a non-default tenant can edit shared alert views except public alert views.
- ♦ **Create and use Event Views:** Allows non-administrator users to create private event views and view shared event views. For more information, see [“Viewing Events”](#) in the *Sentinel User Guide*.

After you select this permission, you can assign the following permissions:

- ♦ **Share event views:** Allows users to share their event views as follows:
 - ♦ Non-administrator users of the default tenant can share their event views with other users.
 - ♦ Users of a non-default tenant can share their event views with other users of the same tenant.
- ♦ **Edit Event Views:** Assigns the **Share Event Views** permission and allows users to edit shared event views as follows:
 - ♦ Non-administrator users of the default tenant can edit shared event views.
 - ♦ Users of a non-default tenant can edit shared event views except public event views.

- ◆ **Visualization:** Visualization allows users in the role to view/hide/edit various options in the visual analytics page:
 - ◆ **Discover:** Discover option enables users to search and explore their data in the Sentinel.

Select one of the followings permissions that enable users to manage Discover:

 - ◆ **View:** Enables users to view the visual analytics Discover options.
 - ◆ **Hide:** Enables users to hide the visual analytics Discover options.
 - ◆ **Edit:** Enables users to edit the visual analytics Discover options.
 - ◆ **Dashboard:** A Dashboard is a collection of panels that helps user to analyze their data by adding a variety of panels such as visualizations, maps, markdown, and more.

Select one of the followings permissions that enable users to manage Dashboard:

 - ◆ **View:** Enables users to view the visual analytics Dashboard.
 - ◆ **Hide:** Enables users to hide the visual analytics Dashboard.
 - ◆ **Edit:** Enables users to edit the visual analytics Dashboard.
 - ◆ **Management:** Management is the option to manage all things including index patterns, advanced settings and more.

Select one of the followings permissions that enable users to manage Management:

 - ◆ **View:** Enables users to view the visual analytics Management options.
 - ◆ **Hide:** Enables users to hide the visual analytics Management options.
 - ◆ **Edit:** Enables users to edit the visual analytics Management options.
 - ◆ **DevTools:** DevTools contains tools that helps user to interact with their data by executing the commands.

Select one of the followings permissions that enable users to manage DevTools:

 - ◆ **View:** Enables users to view the visual analytics DevTools options.
 - ◆ **Hide:** Enables users to hide the visual analytics DevTools options.
- ◆ **Incidents:** Select one of the followings permissions that enable users to manage incidents:
 - ◆ **View incidents assigned to user:** Allows a user to view any incident that is assigned to them.
 - ◆ **View or create incidents and add events to incidents:** Allows users to create incidents and add events to the incidents.
 - ◆ **Create, modify and execute actions on assigned incidents:** Allows users to create, modify, and execute actions on incidents that are assigned to them.
 - ◆ **Manage all aspects of incidents: create, modify and delete:** Allows users to manage all incidents.
- ◆ **Sharing:** Allows users in the role to share filters, and reports with other users.

This permission is not available for tenants.
- ◆ **Edit Home Dashboard:** Assigns the **Share Home dashboard** permission and allows users to edit shared dashboards as follows:
 - ◆ Non-administrator users of the default tenant can edit shared dashboards.
 - ◆ Users of a non-default tenant can edit shared dashboards except public dashboards.

- ◆ **Share Home Dashboard:** Allows users to share their dashboards as follows:
 - ◆ Non-administrator users of the default tenant can share their dashboards with other users.
 - ◆ Users of a non-default tenant can share their dashboards with other users of the same tenant.
- ◆ **Miscellaneous:** Assign miscellaneous permissions as necessary:
 - ◆ **Edit knowledge base:** Allows users to view and edit the knowledge base in the **Alert Details** page.
 - ◆ **Manage Tags:** When this permission is set on a role, all members of this role can create, delete, and modify tags, and associate tags to different event sources. For more information about tags, see [“Configuring Tags”](#) in the *Sentinel User Guide*.
 - ◆ **Manage roles and users:** Allows non-administrator users to administer specific roles and users. For example, in a multitenancy environment, the MSSP administrator can delegate the responsibility of administering a tenant's roles and users to the tenant, thus reducing the load on the MSSP administrator.
 - ◆ **Proxy for Authorized Data Requestors:** When this permission is set on a role, the members of this role can accept searches from remote data sources. For more information, see [Chapter 21, “Configuring Data Federation,”](#) on page 233.
 - ◆ **Send events and attachments:** Allows users to send events and attachments from Change Guardian and Secure Configuration Manager to Sentinel.
 - ◆ **Share search filters:** When this permission is set on a role, all members of this role can share search filters that they have created. For more information about sharing filters, see [“Configuring Filters”](#) in the *Sentinel User Guide*.
 - ◆ **Solution Designer access:** When this permission is set on a role, all members of this role can access Solution Designer. For more information, see [“Solution Designer”](#) on page 272.
 - ◆ **View and execute event actions:** When this permission is set on a role, all members of this role can view events and execute actions on the selected events. For more information, see [“Manually Performing Actions on Events”](#) in the *Sentinel User Guide*.
 - ◆ **View detailed internal system state data:** When this permission is set on a role, all members of this role can view detailed internal system state data by using a JMX client.
 - ◆ **View knowledge base:** Allows users to view the knowledge base in the **Alert Details** page.

5 Click **Save**.

To create users for this role, see [“Creating Users”](#) on page 48.

Configuring Password Complexity

A complex password improves security by preventing password guessing attacks. Sentinel provides a set of password validation rules that help you maintain a complex password for all local user passwords. You can select the desired validation rules as applicable for your environment.

You can configure the password validation rules in the `/etc/opt/novell/sentinel/config/passwordrules.properties` file. The validation rules apply only to the local user passwords and not LDAP user passwords. For existing users, validation rules apply only after the users update their password.

By default, all the validation rules are disabled and commented with `#`. To enable validation rules, uncomment the rules, specify the values for the rules, and save the file.

The following table describes the password complexity validation rules:

Table 4-1 Password Complexity Rules

Validation Rule	Description
MINIMUM_PASSWORD_LENGTH	Specifies the minimum number of characters required in a password.
MAXIMUM_PASSWORD_LENGTH	Specifies the maximum number of characters allowed in a password.
UNIQUE_CHARACTER_LENGTH	Specifies the minimum number of unique characters required in a password. For example, if the UNIQUE_CHARACTER_LENGTH value is 6 and a user specifies the password as "aaaabbccc", the Sentinel does not validate the password because it contains only 3 unique characters a, b, and c.
LOWER_CASE_CHARACTERS_COUNT	Specifies the minimum number of lowercase characters required in a password.
UPPER_CASE_CHARACTERS_COUNT	Specifies the minimum number of uppercase characters required in a password.
ALPHABET_CHARACTERS_COUNT	Specifies the minimum number of alphabetic characters required in a password.
NUMERIC_CHARACTERS_COUNT	Specifies the minimum number of numeric characters required in a password.
NON_ALPHA_NUMERIC_CHARACTERS_COUNT	Specifies the minimum number of non-alphanumeric or special characters required in a password. The rule considers only the following non-alphanumeric characters: ` ~ ! @ # \$ % ^ & * () - _ = + [{] } \ ; : ' " < , > . / ?

Validation Rule	Description
RESTRICTED_WORDS_IN_PASSWORD	<p>Specifies the words that are not allowed in a password. The restricted words are case-insensitive. You can specify multiple words separated by a comma.</p> <p>For example, RESTRICTED_WORDS_IN_PASSWORD=admin,password,test</p>

Creating Users

Adding a user in the Sentinel system creates an application user who can then log in to Sentinel. You also assign roles when you create the user.

- 1 From **Sentinel Main**, click **Users**.
- 2 Click **Create** in the **Users** section.

- 3 Specify the name and email address of the user.

The fields with an asterisk (*) are mandatory, and the user name must be unique.

A user name cannot exceed 30 characters, and you can use extended characters when you create it.

- 4 Select a role for the user.
- 5 Select the authentication type:

Local: Select this option for the server to authenticate the user login against the internal database. By default, the **Local** option is selected.

Directory: The **Directory** option is enabled only if you have configured the Sentinel server for LDAP authentication. Select this option for the server to authenticate the user login against an LDAP directory.

- 6 (Conditional) If you specified Local for the authentication type in [Step 5](#), specify any user name in the Username field and continue with [Step 8](#).
- 7 (Conditional) If you specified Directory for the authentication type in [Step 5](#), specify the user name according to the settings you used when you configured LDAP, then continue with [Step 10](#).

- ♦ **If you selected Yes for Anonymous Search:** The user name must be the same as the LDAP directory user name.
- ♦ **If you selected No for Anonymous Search and did not specify the domain name:** The user name does not need to be the same as the LDAP directory user name.

You must also specify the **LDAP User DN**. If Base DN was set, the Base DN is appended to the relative user DN to construct the absolute user DN.

For example, if the Base DN was set to `o=netiq` and the absolute user DN is `cn=sentinel_ldap_user,o=netiq` only the relative user DN for example, `cn=sentinel_ldap_user` can be specified.

When some reserved special characters are used as literals in an **LDAP User DN**, they must be escaped with a backslash (\). The following characters must be escaped:

- ♦ A space or '#' character occurring at the beginning of the string

- ♦ A space character occurring at the end of the string
- ♦ Any one of the characters, +, ", \, <, > or ;

For more information, see [LDAPv3 Distinguished Names](#).

For example, if the **LDAP User DN** contains a ',' (comma) as a literal, specify the LDAP User DN as follows:

```
CN=Test\ ,User ,CN=Users ,DC=netiq ,DC=com
```

eDirectory or Active Directory might require additional characters to be escaped. Refer the eDirectory or Active Directory documentation for any additional characters to be escaped.

- ♦ **If you selected No for Anonymous Search and specified the domain name:** The user name must be the same as the LDAP directory user name.

8 Specify a password in the **Password** field.

NOTE: For local user password, ensure that the password adheres to the password complexity validation rules. For more information, see [“Configuring Password Complexity” on page 47](#).

9 Re-enter the password in the **Verify** field.

10 The **Title**, **Office #**, **Ext**, **Mobile #**, and **Fax**. fields are optional. The phone number fields allow any format. Make sure you enter a valid phone number so that the user can be contacted directly.

11 Click **Save**.

5 Authentication Methods

Authentication comprises the following three factors:

- ◆ Something that you know, such as a password, a PIN, or security questions.
- ◆ Something that you have, such as a smart card, a token, or a mobile phone.
- ◆ Something that you are, such as biometrics (fingerprint or iris).

By default, Sentinel uses single-factor authentication (SFA), which matches a password (“something that you know”) to a user name in the database. Sentinel Administrators can configure different types of strong and multi-factor techniques for all its users.

In addition to the default SFA authentication, Sentinel supports the following types of authentication:

- ◆ **LDAP Authentication:** Allows users to log in to Sentinel with their LDAP directory credentials. For more information, see [“LDAP Authentication Against a Single LDAP Server Or Domain” on page 53](#) and [“LDAP Authentication Against Multiple LDAP Servers Or Domains” on page 59](#).
- ◆ **Kerberos Authentication:** Uses secret-key cryptography to provide strong authentication. For more information, see [“Kerberos Authentication” on page 73](#).
- ◆ **Multi-factor Authentication (MFA):** A more advanced method of authentication that uses a combination of at least two factors. For example, a combination of a password and a token or a smart card and a fingerprint. For more information, see [“Multi-factor Authentication” on page 78](#).
- ◆ **OAuth Authentication:** Allows users to log in to Sentinel using providers such as Google or Facebook. For more information, see [“OAuth Authentication” on page 84](#).

An administrator can switch to a different authentication method at any time. Once the administrator enables an authentication method, Sentinel requires all users to use the authentication process associated with the selected authentication method.

NOTE: Only Sentinel administrators can configure or enable authentication methods.

Enablement Considerations

Before you enable a different authentication method, be aware of the following:

- ◆ If your environment contains multiple Sentinel servers, all servers must use the same authentication method. If the servers use different authentication methods, some Sentinel features, such as distributed search, remote alerts, and Data Federation, do not work.
- ◆ When you enable MFA, Sentinel is not compatible with the following software:
 - ◆ Secure Configuration Manager 6.2
 - ◆ Change Guardian 4.2.1

- ◆ Identity Manager
- ◆ Sentinel and Cisco ISE pxGrid Integration utility
- ◆ When you enable MFA, the installation processes for the following components prompt you for an OAuth client ID and OAuth client secret:
 - ◆ Remote Collector Manager
 - ◆ Remote Correlation Engine
- ◆ When you map the LDAP user to the Sentinel user, ensure the **LDAP user DN** field in Sentinel contains the full DN of the LDAP user in the same case. For example, if the LDAP DN in LDAP directory is `CN=doej,CN=Users,DC=mycompany,DC=com`, the **LDAP user DN** field must also contain `CN=doej,CN=Users,DC=mycompany,DC=com`.
- ◆ For any Sentinel administrator, ensure the logon name contains no spaces between the first name and last name. For example, `JohnSmith`. If the logon name has a space, such as `John Smith`, the administrator will not be able to install the following:
 - ◆ Remote Collector Manager
 - ◆ Remote Correlation Engine
- ◆ When you enable MFA, using a previously downloaded `.jnlp` file to launch either Sentinel Control Center or Solution Designer is disabled for security reasons. Instead, use the web console to launch Sentinel Control Center or Solution Designer. For more information, see [Sentinel Control Center](#) or [“Accessing the Solution Designer”](#) on page 273.
- ◆ If you are using Sentinel in FIPS mode, Kerberos authentication is not supported.
- ◆ When you enable MFA, the following utility scripts must specify the OAuth client ID and OAuth client secret:
 - ◆ `backup_util.sh`
 - ◆ `convert_to_fips.sh`
 - ◆ `configure.sh`
 - ◆ `rest_client.sh`

To retrieve the OAuth client ID and OAuth client secret, go to the following URL:

`https://Hostname:port/SentinelAuthServices/oauth/clients`

Where:

- ◆ *Hostname* is the host name of the Sentinel server.
- ◆ *Port* is the port Sentinel uses (typically 8443).

The specified URL uses your current Sentinel session to retrieve the OAuth client ID and OAuth client secret.

You can create any number of client IDs and clients. To create a new client ID and client secret, use a RESTful API to send a POST request with the following settings:

- ◆ Header: `application/json`
- ◆ URL: `https://Hostname:port/SentinelAuthServices/oauth/clients`

Where:

- ◆ *Hostname* is the host name of the Sentinel server.
- ◆ *Port* is the port Sentinel uses (typically 8443).
- ◆ Payload:

```
{
  appname : "<appname>"
}
```

To delete a client ID and client secret, use a RESTful API to send a DELETE request to the following URL:

`https://Hostname:port/SentinelAuthServices/oauth/clients/<clientID>`

Where:

- ◆ *Hostname* is the host name of the Sentinel server.
- ◆ *Port* is the port Sentinel uses (typically 8443).
- ◆ *<clientID>* is the client ID you want to delete.
- ◆ When you run the `backup_util.sh` script, use the mapped LDAP logon credentials of the Sentinel administrator wherever the user name and password are required.

For example:

```
./backup_util.sh -m backup -s -A -b -c -e -l -r -w -u myusername -p mypassword -f fullbackup_up.tar.gz
```

Where *myusername* and *mypassword* are the mapped LDAP credentials for the Sentinel administrator.

- ◆ If you create a backup of Sentinel configurations when either MFA or Kerberos is enabled, you must restore the backup on the same computer.
- ◆ When you enable Kerberos, logging into Windows also logs you in to Sentinel. When you launch Sentinel, your browser bypasses the Sentinel login window and automatically proceeds to the Sentinel landing page. When users log out of Sentinel, they can log back in at any point in time during the same Windows session by specifying the Sentinel URL.

LDAP Authentication Against a Single LDAP Server Or Domain

You can configure a Sentinel server for LDAP authentication to enable users to log in to Sentinel with their LDAP directory credentials.

NOTE: Sentinel LDAP authentication has been tested with Novell eDirectory and Microsoft Active Directory. Other LDAP compliant directories might be used, but have not been tested. If an issue is encountered with a directory that has not been tested, support will be provided to the extent that the issue can be reproduced on one of the tested directories.

- ◆ [“Overview” on page 54](#)
- ◆ [“Prerequisites” on page 54](#)
- ◆ [“Setting Up LDAP Authentication” on page 55](#)
- ◆ [“Logging in by Using LDAP User Credentials” on page 57](#)
- ◆ [“Configuring Multiple LDAP Servers for Failover” on page 58](#)

Overview

LDAP authentication can be performed either using an SSL connection or an unencrypted connection to the LDAP server.

You can configure the Sentinel server for LDAP authentication either with or without using anonymous searches on the LDAP directory.

NOTE: If anonymous search is disabled on the LDAP directory, you must not configure the Sentinel server to use anonymous search.

- ♦ **Anonymous:** When you create Sentinel LDAP user accounts, the directory user name must be specified and the user distinguished name (DN) does not need to be specified.

When the LDAP user logs in to Sentinel, the Sentinel server performs an anonymous search on the LDAP directory based on the specified user name, finds the corresponding DN, then authenticates the user login against the LDAP directory by using the DN.

- ♦ **Non Anonymous:** When you create Sentinel LDAP user accounts, the user DN must be specified along with the user name.

When the LDAP user logs in to Sentinel, the Sentinel server authenticates the user login against the LDAP directory by using the specified user DN and does not perform any anonymous search on the LDAP directory.

There is an additional approach applicable only for Active Directory. For more information, see [“Domain Name:” on page 56](#).

Prerequisites

- ♦ [“Exporting the LDAP Server CA Certificate” on page 54](#)
- ♦ [“Enabling Anonymous Search in the LDAP Directory” on page 55](#)

Exporting the LDAP Server CA Certificate

If you want to connect to the LDAP server by using an SSL connection and the LDAP server certificate is not signed by a well-known certificate authority (CA), you must export the LDAP server CA certificate to a Base64-encoded file.

- ♦ **eDirectory:** See [“Exporting an Organizational CA's Self-Signed Certificate”](#).

To export an eDirectory CA certificate in iManager, the Novell Certificate Server plug-ins for iManager must be installed.

- ♦ **Active Directory:** See [“How to enable LDAP over SSL with a third-party certification authority” \(<http://support.microsoft.com/kb/321051>\)](#).

Enabling Anonymous Search in the LDAP Directory

To perform LDAP authentication using anonymous search, you must enable anonymous search in the LDAP directory. By default, anonymous search is enabled in eDirectory and is disabled in Active Directory.

- ♦ **eDirectory:** See `ldapBindRestrictions` in section [Attributes on the LDAP Server Object \(http://www.novell.com/documentation/edir88/edir88/data/agq8auc.html\)](http://www.novell.com/documentation/edir88/edir88/data/agq8auc.html).
- ♦ **Active Directory:** Enabling anonymous binds for Active Directory requires two steps. These steps are the same for both Windows 2003 and Windows 2008 Active Directory.
 - ♦ **Enable Anonymous LDAP Operations:** By default, anonymous LDAP operations are disabled in Active Directory. You must enable anonymous LDAP operations in Active Directory by setting the `dsHeuristics` attribute to an appropriate value.
For more information, see [Anonymous LDAP operations in Windows 2003 AD \(http://www.petri.co.il/anonymous_ldap_operations_in_windows_2003_ad.htm\)](http://www.petri.co.il/anonymous_ldap_operations_in_windows_2003_ad.htm).
 - ♦ **Assign Permissions to the ANONYMOUS LOGON User:** The Read and List Contents permissions must be assigned to the ANONYMOUS LOGON user.
For more information, see [Granting anonymous read access \(http://www.petri.co.il/anonymous_ldap_operations_in_windows_2003_ad.htm\)](http://www.petri.co.il/anonymous_ldap_operations_in_windows_2003_ad.htm).

Setting Up LDAP Authentication

1 From **Sentinel Main**, click **Users**.

2 On the Users page, click the **LDAP Settings** tab.

3 Specify the following to configure LDAP authentication:

Host: Specify the hostname or the IP address of the LDAP server.

This is a required field if you select the SSL option.

SSL: Select this option if you want to connect to the LDAP server by using a Secure Socket Layer (SSL) connection.

Port: Specify the port number for the LDAP connection. The default SSL port number is 636 and the default non-SSL port number is 389.

Certificate File Path: Specify the path of the CA certificate file for the LDAP server.

This field should be used only if you selected the SSL option and if the LDAP server certificate is not signed by well-known CA and is not trusted by default.

Anonymous Search: Select **Yes** to perform anonymous searches or select **No** if you do not want to perform anonymous searches on the LDAP directory.

Base DN: Specify the root container to search for users, such as `o=netiq` for eDirectory or `cn=users,dc=example,dc=co` for Active Directory.

- ♦ **If Anonymous Search is Yes:** Specify the root container in the LDAP directory to search for users.

This is optional for eDirectory, and mandatory for Active Directory. For eDirectory, if the Base DN is not specified, the entire directory is searched to locate the users.

- ♦ **If Anonymous Search is No:** Specify the root container in the LDAP directory that contains the users.

This is mandatory if you are using Active Directory and if you set a domain name. For all other cases, this is optional.

Search Attribute: Specify the LDAP attribute holding the user login name. This is used to search for users.

For example:

- ♦ eDirectory:

uid

- ♦ Active Directory:

sAMAccountName

This field is available only if you selected **Yes** for Anonymous Search.

Domain Name: Specify the name of the Active Directory domain.

This is an additional approach applicable only for Active Directory for performing LDAP authentication without using anonymous search.

When you specify the Domain Name, username@domainname (userPrincipalName) is used to authenticate the user before searching for the LDAP user object.

For example, test.example.com

This field is applicable only for Active Directory and is available only if you selected **No** for Anonymous Search.

NOTE: If **Base DN** is set and **Domain Name** is not set, the **Base DN** is appended to the relative user DN to construct the absolute user DN.

For example, if the Base DN is set to o=netiq and the absolute user DN is cn=sentinel_ldap_user,o=netiq when the LDAP user account is created, only the relative user DN of cn=sentinel_ldap_user can be specified.

4 Click **Test Connection** to test whether the LDAP connection is successful.

4a Specify the test credentials to connect to the LDAP server:

If Anonymous Search is Yes: Specify the user name and password.

If you selected No for Anonymous Search and did not specify the Domain Name: Specify the user DN and password. The user DN can be relative to the Base DN.

The **User DN** is based on the RFC 2253 standard. According to RFC 2253, when some reserved special characters are used as literals in a **User DN**, they must be escaped with a backslash (\). The following characters must be escaped:

- ♦ A space or # character occurring at the beginning of the string
- ♦ A space character occurring at the end of the string
- ♦ One of the characters , + , " , \ , < , > or ;

For more information, see [RFC 2253 \(http://www.ietf.org/rfc/rfc2253.txt\)](http://www.ietf.org/rfc/rfc2253.txt).

For example, if the **User DN** contains a comma (,) as a literal, specify the **User DN** as follows:

CN=Test\,User,CN=Users,DC=netiq,DC=com

eDirectory or Active Directory might require additional characters to be escaped. Refer the eDirectory or Active Directory documentation for any additional characters to be escaped.

If you selected No for Anonymous Search and specified the Domain Name: Specify the user name and password.

4b Click **Test** to test the LDAP connection.

A message is displayed that indicates whether the connection is successful.

If there is an error, review the configuration details you provided and test the connection again. You can determine the cause of the failure by examining the `/var/opt/novell/sentinel/log/server0.0.log` file. You must ensure that the test connection is successful before saving the LDAP settings.

5 Click **Save** to save the LDAP settings.

On successful configuration:

- ◆ The `LdapLogin` section of the `/etc/opt/novell/sentinel/config/auth.login` file is updated. For example:

```
LdapLogin {
    com.sun.security.auth.module.LdapLoginModule required
    java.naming.ldap.factory.socket="com.esecurity.common.communication
    .ProxyLdapSSLSocketFactory"
    userProvider="ldap://10.0.0.1:636/o=netiq"
    userFilter="(&(uid={USERNAME})(objectclass=user))"
    useSSL=true;
};
```

- ◆ The LDAP server CA certificate, if provided, is added to a keystore named `/etc/opt/novell/sentinel/config/.ldapkeystore.jks`.

After saving the LDAP settings successfully, you can create LDAP user accounts to enable users to log in to Sentinel by using their LDAP directory credentials.

NOTE: You can also configure the Sentinel server for LDAP authentication by running the `ldap_auth_config.sh` script in the `/opt/novell/sentinel/setup` directory.

The script also supports command line options. To view the command line options, run the script as follows:

```
/opt/novell/sentinel/setup/ldap_auth_config.sh --help
```

Logging in by Using LDAP User Credentials

After you successfully configure the Sentinel server for LDAP authentication, you can create Sentinel LDAP user accounts. For more information on creating LDAP user accounts, see [“Creating Users” on page 48](#).

After you create the LDAP user account, you can log in to the Sentinel by using your LDAP user name and password.

Configuring Multiple LDAP Servers for Failover

To configure one or more LDAP servers as failover servers for LDAP authentication:

1 Log in to the Sentinel server as `root` user.

2 Switch to the `novell` user:

```
su - novell
```

3 Change to the `/etc/opt/novell/sentinel/config` directory:

```
cd /etc/opt/novell/sentinel/config/
```

4 Open the `auth.login` file for editing:

```
vi auth.login
```

5 Update the `userProvider` in the `LdapLogin` section to specify multiple LDAP URLs. Separate each URL by a blank space.

For example:

```
userProvider="ldap://primary_server_IP:port/BaseDN ldap://  
failover_server_IP:port/BaseDN"
```

For Active Directory, ensure that the BaseDN in the LDAP URL is not blank.

For more information on specifying multiple LDAP URLs, see the description of the `userProvider` option in “Class `LdapLogin Module`” (<http://java.sun.com/javase/6/docs/jre/api/security/jaas/spec/com/sun/security/auth/module/LdapLoginModule.html>).

6 Save the changes.

If you are using an SSL connection to the LDAP server and if the LDAP server certificate is not signed by a well-known CA, you must perform the following additional steps:

1 Export the certificate of each failover LDAP server and copy the certificate file to the `/etc/opt/novell/sentinel/config` directory on the Sentinel server.

For more information, see “[Exporting the LDAP Server CA Certificate](#)” on page 54.

2 Ensure that you set the necessary ownership and permissions of the certificate file for each LDAP server.

```
chown novell:novell /etc/opt/novell/sentinel/config/<cert-file>
```

```
chmod 600 /etc/opt/novell/sentinel/config/<cert-file>
```

3 Add each LDAP server certificate to the keystore named `.ldapkeystore.jks`.

```
/opt/novell/sentinel/jdk/jre/bin/keytool -importcert -noprompt -  
trustcacerts -file <certificate-file> -alias <alias_name> -keystore /  
etc/opt/novell/sentinel/config/.ldapkeystore.jks -storepass password
```

Replace `<certificate-file>` is the LDAP certificate filename and `<alias_name>` with the alias name for the certificate to be added.

IMPORTANT: Ensure that you specify the alias. If no alias is specified, the keytool takes `mykey` as the alias by default. When you import multiple certificates into the keystore without specifying an alias, the keytool reports an error that the alias already exists.

In some environments, the Sentinel server might not connect to the failover LDAP server if the Sentinel server times out before it finds that the primary LDAP server is down. In such cases, perform the following additional steps to ensure that the Sentinel server connects to the failover LDAP server without timing out:

- 1 Open the `sysctl.conf` file for editing:

```
vi /etc/sysctl.conf
```

- 2 Ensure that the `net.ipv4.tcp_syn_retries` value is set to 3. If the entry does not exist, add the entry. Save the file:

```
net.ipv4.tcp_syn_retries = 3
```

- 3 Execute the following commands for the changes to take effect:

```
/sbin/sysctl -p
```

```
/sbin/sysctl -w net.ipv4.route.flush=1
```

- 4 Open the `server.conf` file for editing:

```
vi /etc/opt/novell/sentinel/config/server.conf
```

- 5 Set the Sentinel server time out value to 60 seconds by appending a new parameter in the *Java Additional Parameters* section as follows:

```
wrapper.java.additional.53=-Desecurity.remote.timeout=60
```

- 6 Restart the Sentinel server:

```
/etc/init.d/sentinel restart
```

LDAP Authentication Against Multiple LDAP Servers Or Domains

You can now configure LDAP authentication against multiple LDAP servers or domains for unique users. The procedures in this section consider three servers or domains for as examples. You can add the required number of servers or domains.

- ♦ [“Prerequisites” on page 60](#)
- ♦ [“Enabling Strong Authentication” on page 60](#)
- ♦ [“Configuring LDAP Servers Or Domains Properties” on page 61](#)
- ♦ [“Configuring LDAP Servers Or Domains As Authentication Sources” on page 62](#)
- ♦ [“Logging In With LDAP User Credentials” on page 68](#)

Prerequisites

- ◆ Complete the prerequisites listed in [“Enablement Considerations”](#) on page 51.
- ◆ (Conditional) Edit the Sentinel server Hosts file. If the Sentinel server is not a member of the enterprise domain, update the `/etc/hosts` file with the fully qualified domain name (FQDN) of the Sentinel server.
- ◆ Update the `hosts` file on all the client machines that access Sentinel:

1. Open the `hosts` file:

Windows: Browse to `C:\Windows\System32\Drivers\etc` directory.

Linux: Go to `/etc` directory.

2. Add the following entry:

```
<sentinel_ip> <sentinel_fqdn> <sentinel_hostname>
```

Where:

`<sentinel_ip>` is the IP address of the Sentinel server.

`<sentinel_fqdn>` is the FQDN of the Sentinel server.

`<sentinel_hostname>` is the host name of the Sentinel server.

For example:

```
1.2.3.4 sentinel.mycompany.com sentinel
```

- ◆ Ensure that all LDAP users have an email ID and that the email ID is populated in the `mail` attribute in the LDAP directory.
- ◆ (Conditional) If you are using LDAP with SSL and you want the Sentinel server to communicate with LDAP servers over the SSL port (default 636), perform the following:
 - ◆ If the Sentinel server is running in non-FIPS mode, import the CA certificate chain of each LDAP server into the Sentinel server keystore:
 1. Log in to the Sentinel server as `root`.
 2. Execute the following commands:

```
cd /opt/novell/sentinel/jdk/jre/bin
```

```
./keytool -importcert -file <cert_file_path> -keystore /etc/opt/  
novell/sentinel/config/.webserverkeystore.jks -alias <alias>
```

Where:

`<cert_file_path>` is the path of the certificate file you want to import.

`<alias>` is the alias name you want to assign to the certificate in the Sentinel keystore.

- ◆ If the Sentinel server is running in FIPS mode, import the CA certificate chain of each LDAP server into the Sentinel FIPS keystore. For more information about importing certificates in FIPS mode, see [Importing Certificates into FIPS Keystore Database](#).

Enabling Strong Authentication

- 1 Log in as `root` user to the Sentinel server.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.

- 3 Set `strong.authentication.enabled=true`
- 4 Add `admin.user.auth.dn=<ldap_dn_for_sentinel_admin_user>`
Where `<ldap_dn_for_sentinel_admin_user>` is the LDAP User DN to which the Sentinel admin user will be mapped to. You can specify the DN of a LDAP User in any of the LDAP servers or domains. For example,
`admin.user.auth.dn=CN=Administrator,CN=Users,DC=mycompany,DC=com`
- 5 (Conditional) If you are using Sentinel in High Availability (HA) mode, add
`sentinel.ha.cluster.hostname=<cluster_virtual_fqdn>`
Where `<cluster_virtual_fqdn>` is the virtual FQDN of the HA cluster.

Configuring LDAP Servers Or Domains Properties

- 1 Log in as the root user to the Sentinel server.
- 2 Open the `/etc/opt/osp-configuration.properties` file.
- 3 Add the following properties to configure the details of the **first** LDAP server or domain:

NOTE: Ensure that there are no extra spaces when you add the following properties.

- ♦ `com.netiq.sentinel.osp.ldap.host=<ldap_host>`
Where `<ldap_host>` is the IP address or hostname of the LDAP server.
- ♦ `com.netiq.sentinel.osp.ldap.port=<ldap_port>`
Where `<ldap_port>` is the port number of the LDAP connection. The default SSL port number is 636 and the default non-SSL port number is 389.
- ♦ `com.netiq.sentinel.osp.ldap.use-ssl=true/false`
Where `true/false` specifies whether the LDAP connection uses SSL or not.
- ♦ `com.netiq.sentinel.osp.ldap.dir-type=<ldap_directory_type>`
Where `<ldap_directory_type>` is the directory type of the LDAP server. For example, the directory type of Active Directory is AD and the directory type of eDirectory is edir.
- ♦ `com.netiq.sentinel.osp.as.naming-attr=<naming_attribute>`
Where `<naming_attribute>` is the naming attribute of the LDAP server. Naming attribute is the LDAP attribute that contains the user login name and is used in the LDAP search filter while searching for users. For example, the naming attribute for Active Directory can be `sAMAccountName` and the naming attribute for eDirectory can be `uid` or `cn`.
- ♦ `com.netiq.sentinel.osp.as.admins-container-dn=<admins_container_dn>`
Where `<admins_container_dn>` is the DN of the container for admin users in the LDAP server. For example, `CN=Users,DC=mycompany,DC=com`.
- ♦ `com.netiq.sentinel.osp.as.users-container-dn=<users_container_dn>`
Where `<users_container_dn>` is the DN of the container for users in the LDAP server. For example, `CN=Users,DC=mycompany,DC=com`.
- ♦ `com.netiq.sentinel.osp.ldap.admin-dn=<ldap_admin_dn>`
Where `<ldap_admin_dn>` is the DN of the admin user in the LDAP server. For example, `CN=Administrator,CN=Users,DC=mycompany,DC=com`.
- ♦ `com.netiq.sentinel.osp.ldap.admin-pwd=<ldap_admin_pwd>`

Where `<ldap_admin_pwd>` is the encrypted password of the admin user in the LDAP server.

To get the encrypted password, run the `encryptpwd` script. Log in as the `novell` user and go to the `/opt/novell/sentinel/bin` directory. Run the following command:

```
./encryptpwd -e LDAPAdminPassword
```

- 4 Configure every additional LDAP server or domain by adding the properties of each additional LDAP server or domain to the `osp-configuration.properties` as follows:

- ◆ For the **second** LDAP server or domain, add:

```
com.netiq.sentinel.osp.ldap.host2,  
com.netiq.sentinel.osp.ldap.port2, com.netiq.sentinel.osp.ldap.use-  
ssl2, com.netiq.sentinel.osp.ldap.dir-type2,  
com.netiq.sentinel.osp.as.naming-attr2,  
com.netiq.sentinel.osp.as.admins-container-dn2,  
com.netiq.sentinel.osp.as.users-container-dn2,  
com.netiq.sentinel.osp.ldap.admin-dn2,  
com.netiq.sentinel.osp.ldap.admin-pwd2
```

- ◆ For the **third** LDAP server or domain, add:

```
com.netiq.sentinel.osp.ldap.host3,  
com.netiq.sentinel.osp.ldap.port3, com.netiq.sentinel.osp.ldap.use-  
ssl3, com.netiq.sentinel.osp.ldap.dir-type3,  
com.netiq.sentinel.osp.as.naming-attr3,  
com.netiq.sentinel.osp.as.admins-container-dn3,  
com.netiq.sentinel.osp.as.users-container-dn3,  
com.netiq.sentinel.osp.ldap.admin-dn3,  
com.netiq.sentinel.osp.ldap.admin-pwd3
```

Repeat the same instructions for subsequent LDAP servers or domains.

Configuring LDAP Servers Or Domains As Authentication Sources

The first LDAP server or domain is already configured as an authentication source in the `authcfg.xml` file. You can configure additional LDAP servers or domains as authentication sources in the `authcfg.xml` file using the procedure below.

To configure LDAP Servers Or Domains As Authentication Sources

- 1 Log in as root user to the Sentinel server.
- 2 Open the `/etc/opt/novell/sentinel/osp/WEB-INF/conf/current/siem/services/authcfg.xml` file.
- 3 Add additional `LDAPDataSource` elements:
 - 3a Search for the existing `LDAPDataSource` element corresponding to the *first* LDAP server or domain:
 - 3b Add a new `LDAPDataSource` element below the existing element in a sequence, for every additional LDAP server or domain, as follows:
 - ◆ For the **second** LDAP server or domain:

```

<LDAPDataSource
    displayName="LDAP Datasource2"
    id="ds-ldap2"
    adminName="\${com.netiq.sentinel.osp.ldap.admin-
dn2}"
    adminPassword="\${com.netiq.sentinel.osp.ldap.admin-pwd2}"
    dirType="\${com.netiq.sentinel.osp.ldap.dir-
type2}"
    >
    <Server
secureConnection="\${com.netiq.sentinel.osp.ldap.use-ssl2}"
host="\${com.netiq.sentinel.osp.ldap.host2}"
maxConnections="\${com.netiq.sentinel.osp.ldap.max-
connections2:31}"
port="\${com.netiq.sentinel.osp.ldap.port2}"
    />
</LDAPDataSource>

```

- ◆ For the **third** LDAP server or domain:

```

<LDAPDataSource
    displayName="LDAP Datasource3"
    id="ds-ldap3"
    adminName="\${com.netiq.sentinel.osp.ldap.admin-
dn3}"
    adminPassword="\${com.netiq.sentinel.osp.ldap.admin-pwd3}"
    dirType="\${com.netiq.sentinel.osp.ldap.dir-
type3}"
    >
    <Server
secureConnection="\${com.netiq.sentinel.osp.ldap.use-ssl3}"
host="\${com.netiq.sentinel.osp.ldap.host3}"
maxConnections="\${com.netiq.sentinel.osp.ldap.max-
connections3:31}"
port="\${com.netiq.sentinel.osp.ldap.port3}"
    />
</LDAPDataSource>

```

Repeat these instructions for the subsequent LDAP servers or domains.

4 Add additional LDAPAuthenticationSource elements:

4a Search for the existing LDAPAuthenticationSource element corresponding to the first LDAP server or domain.

4b Add a new LDAPAuthenticationSource element below the existing element in a sequence, for every additional LDAP server or domain, as follows:

- ♦ For the **second** LDAP server or domain:

```
<LDAPAuthenticationSource
    displayName="LDAP Authentication Source2"
    id="as-ldap2"

restrictToContexts="{com.netiq.sentinel.osp.as.restrict-to-
contexts2:false}"
    >
    <Reference refId="ds-ldap2" type="DataSource"/>
    <!-- NamingAttr values for LDAP define which
attributes are used in an LDAP search filter when search for a
user object -->
    <NamingAttr
name="{com.netiq.sentinel.osp.as.naming-attr2:cn}"/>
    <NamingAttr name="mail"/>
    <!-- Context values define the base context(s) in
which to search for users. Each context will be searched in
order -->
    <Context
context="{com.netiq.sentinel.osp.as.users-container-dn2}"
decorator="search" order="0"
scope="{com.netiq.sentinel.osp.as.scope2:subtree}"/>
    <Context
context="{com.netiq.sentinel.osp.as.admins-container-dn2}"
decorator="search" order="1"
scope="{com.netiq.sentinel.osp.as.scope2:subtree}"/>
    <AttributeMapping>
        <AttributeMapEntry localName="userDN"
nativeName="{dn}"/>
        <!-- The "dn" entry is for use in admin-
defined SelectExpression instances ("{$dn}" is a predefined
"pseudo" attr name) -->
        <AttributeMapEntry localName="dn"
nativeName="{dn}"/>
        <AttributeMapEntry localName="userName"
nativeName="{com.netiq.sentinel.osp.as.naming-attr2:cn}"/>
        <AttributeMapEntry localName="saml2-
mapping-attr"
nativeName="{com.netiq.sentinel.osp.login.saml2.mapping-
attr2:mail}"/>
    </AttributeMapping>
</LDAPAuthenticationSource>
```

- ◆ For the **third** LDAP server or domain:

```

<LDAPAuthenticationSource
    displayName="LDAP Authentication Source3"
    id="as-ldap3"

restrictToContexts="{com.netiq.sentinel.osp.as.restrict-to-
contexts3:false}"
    >
    <Reference refId="ds-ldap3" type="DataSource"/>
    <!-- NamingAttr values for LDAP define which
attributes are used in an LDAP search filter when search for a
user object -->
    <NamingAttr
name="{com.netiq.sentinel.osp.as.naming-attr3:cn}"/>
    <NamingAttr name="mail"/>
    <!-- Context values define the base context(s) in
which to search for users. Each context will be searched in
order -->
    <Context
context="{com.netiq.sentinel.osp.as.users-container-dn3}"
decorator="search" order="0"
scope="{com.netiq.sentinel.osp.as.scope3:subtree}"/>
    <Context
context="{com.netiq.sentinel.osp.as.admins-container-dn3}"
decorator="search" order="1"
scope="{com.netiq.sentinel.osp.as.scope3:subtree}"/>
    <AttributeMapping>
        <AttributeMapEntry localName="userDN"
nativeName="{dn}"/>
        <!-- The "dn" entry is for use in admin-
defined SelectExpression instances ("{$dn}" is a predefined
"pseudo" attr name) -->
        <AttributeMapEntry localName="dn"
nativeName="{dn}"/>
        <AttributeMapEntry localName="userName"
nativeName="{com.netiq.sentinel.osp.as.naming-attr3:cn}"/>
        <AttributeMapEntry localName="saml2-
mapping-attr"
nativeName="{com.netiq.sentinel.osp.login.saml2.mapping-
attr3:mail}"/>
    </AttributeMapping>
</LDAPAuthenticationSource>

```

Repeat these instructions for the subsequent LDAP servers or domains.

5 Add additional PrincipalMapping elements:

- 5a** Search for the existing PrincipalMapping element corresponding to the **first** LDAP server or domain.
- 5b** Add a new PrincipalMapping element below the existing element in a sequence, for every additional LDAP server or domain, as follows:
 - ◆ For the **second** LDAP server or domain:

```

<PrincipalMapping
    id="ldap-mapping2"
    displayName="LDAP User to Sentinel User Mapping2"
    enabled="true"
  >
    <Reference refId="as-ldap2" type="AuthenticationSource"
decorator="srcId" />
    <Reference refId="as-sentinel"
type="AuthenticationSource" decorator="destId" />
    <And>
      <Or>
        <Equal sourceAttrName="userDN"
targetAttrName="userDN" />
        <Equal sourceAttrName="userName"
targetAttrName="userName" />
      </Or>
      <Equal targetAttrName="authSource">LDAP</Equal>
    </And>
  </PrincipalMapping>

```

- ◆ For the **third** LDAP server or domain:

```

<PrincipalMapping
    id="ldap-mapping3"
    displayName="LDAP User to Sentinel User Mapping3"
    enabled="true"
  >
    <Reference refId="as-ldap3" type="AuthenticationSource"
decorator="srcId" />
    <Reference refId="as-sentinel"
type="AuthenticationSource" decorator="destId" />
    <And>
      <Or>
        <Equal sourceAttrName="userDN"
targetAttrName="userDN" />
        <Equal sourceAttrName="userName"
targetAttrName="userName" />
      </Or>
      <Equal targetAttrName="authSource">LDAP</Equal>
    </And>
  </PrincipalMapping>

```

Repeat these instructions for the subsequent LDAP servers or domains.

- 6 Add references to the LDAPAuthenticationSource elements created earlier:

In the existing PasswordAuthentication element whose id="np-auth", there is an existing Reference element whose refId="as-ldap".

Add additional Reference elements below this element to refer to the LDAPAuthenticationSource elements created earlier in [Step 4 on page 64](#) as follows:

```

<PasswordAuthentication
    displayName="Name/Password (Form)"
    id="np-auth"
    enabled="{com.netiq.sentinel.osp.np-enabled:true}"
    continueButton="{com.netiq.sentinel.osp.login.use-continue-
button:true}"
    showHide="{com.netiq.sentinel.osp.login.allow-show-
hide:undefined}"
    showHideInitialState="{com.netiq.sentinel.osp.login.show-hide-
initial-state:undefined}"
    useHints="{com.netiq.sentinel.osp.login.use-hints:false}"
<!-- these references define which authentication sources will be used
with the name/password auth class -->
    <!-- disabled db user login in strong auth mode -->
    <!--<Reference refId="as-sentinel" type="AuthenticationSource">
        <Reference refId="ul-sentinel" type="UserLookup"
decorator="additional-criteria"/>
    </Reference-->
    <Reference refId="as-ldap" type="AuthenticationSource"/>
    <Reference refId="as-ldap2" type="AuthenticationSource"/>
    <Reference refId="as-ldap3" type="AuthenticationSource"/>
    <!-- And so on... -->
</PasswordAuthentication>

```

7 Add references to the PrincipalMapping elements created earlier:

In the existing AuthContract element whose id="np-contract", search for the existing Reference element whose refId="ldap-mapping".

Add additional Reference elements below this element to refer to the PrincipalMapping elements created in [Step 5 on page 65](#), as follows:

```

<AuthContract
    displayName="Username/Password Login"
    id="np-contract"
    uri="sentinel:login:user:np"

expiredPasswordUrl="{com.netiq.sentinel.osp.auth.pwd.expire.url}"

showExpiredPwdUI="{com.netiq.sentinel.osp.auth.pwd.expire.show:false}
"
    enabled="{com.netiq.sentinel.osp.np-enabled:true}"
    >
    <Reference refId="np-auth" type="ContractExecutable"/>
        <Reference refId="ldap-mapping" type="ContractExecutable"/>
    <Reference refId="ldap-mapping2" type="ContractExecutable"/>
    <Reference refId="ldap-mapping3" type="ContractExecutable"/>
    <!-- And so on... -->
        <Reference refId="unlocked-validator"
type="ContractExecutable"/>
        <Reference refId="admin-role-mapping" type="ContractExecutable"/>
</AuthContract>

```

8 (Conditional) If you are using Sentinel in High Availability (HA) mode, perform the steps at [“Configuring Sentinel In High Availability” on page 72](#).

- 9 For the above configuration changes to take effect, restart the Sentinel server:

```
rcsentinel restart
```

Logging In With LDAP User Credentials

- 1 Specify the following URL in your web browser to launch Sentinel:

```
https://<hostname>:<port>/sentinel/views/main.html
```

Where *<hostname>* is the host name of the Sentinel server.

<port> is the Sentinel web server port (8443 by default).

NOTE: After you enable LDAP authentication against multiple LDAP servers or domains, you can only use the hostname in the URL, and not the IP address.

- 2 Log in to Sentinel with the value of the naming attribute of the LDAP user to which you mapped the Sentinel *admin* user.

You mapped the Sentinel *admin* user to a corresponding LDAP user DN in [Step 4 on page 61](#) and configured the LDAP naming attribute when “[Configuring LDAP Servers Or Domains Properties](#)” on [page 61](#).

NOTE: After you enabled LDAP authentication against multiple LDAP servers or domains, you cannot use the user name *admin* to log in to Sentinel as the *admin* user.

For example, consider you had set

```
admin.user.auth.dn=CN=Administrator,CN=Users,DC=mycompany,DC=com in Step 4 on page 61 and configured the LDAP naming attribute as sAMAccountName in “Configuring LDAP Servers Or Domains Properties” on page 61. Log in to Sentinel as Administrator, which is the sAMAccountName of the LDAP User whose DN is CN=Administrator,CN=Users,DC=mycompany,DC=com
```

- 3 Create a Sentinel user account for every LDAP user who will access Sentinel:

- 3a In **Sentinel Main**, click **Users > Users and Roles**.

- 3b Specify the **Email** and **LDAP User DN**. For more information, see “[Creating Users](#)” on [page 48](#).

For example, specify **Email** as `john@mycompany.com` and **LDAP User DN** as `CN=john,CN=Users,DC=mycompany,DC=com`.

- 4 Log in to Sentinel by specifying the value of the LDAP naming attribute of the users created in the [Step 3 on page 68](#).

For example, you specified a **LDAP User DN** as `CN=john,CN=Users,DC=mycompany,DC=com` in [Step 3 on page 68](#) and configured the LDAP naming attribute as `sAMAccountName` in “[Configuring LDAP Servers Or Domains Properties](#)” on [page 61](#).

You can log in as *john*, which is the `sAMAccountName` of the LDAP user whose DN is `CN=john,CN=Users,DC=mycompany,DC=com`.

Prerequisites for MFA, Kerberos, and OAuth

This section covers the prerequisites your environment must meet before you enable any of the supported authentication methods.

Before you configure the Sentinel server to use either MFA or Kerberos, complete the following:

- ♦ [“Sentinel DNS Name is Case-Sensitive” on page 69](#)
- ♦ [“LDAP and Active Directory” on page 69](#)
- ♦ [“Edit Sentinel Server Hosts File” on page 69](#)
- ♦ [“Edit OSP Configuration Properties” on page 70](#)
- ♦ [“Edit Sentinel Configuration Properties” on page 71](#)
- ♦ [“Update All Computers That Access Sentinel” on page 71](#)
- ♦ [“Ensure All Users Have a Valid Email ID” on page 72](#)
- ♦ [“Using LDAP with SSL” on page 72](#)
- ♦ [“Restart Sentinel” on page 72](#)
- ♦ [“Configuring Sentinel In High Availability” on page 72](#)

Sentinel DNS Name is Case-Sensitive

The Sentinel DNS name is case-sensitive. Ensure you specify the DNS name with the correct case each time the configuration procedure request it.

LDAP and Active Directory

Ensure that your environment uses LDAP authentication and Active Directory. For more information about configuring LDAP authentication, see [“LDAP Authentication Against a Single LDAP Server Or Domain” on page 53](#).

NOTE: After you configure your environment to use MFA, the **Email ID** and **User DN** fields are required. As a result, existing Sentinel users will not be able to log in to Sentinel. You must update all users with valid email ID and User DN.

When you create new users, ensure that they have a valid email ID and User DN.

Edit Sentinel Server Hosts File

(Conditional) If the Sentinel server is not a member of the enterprise domain, you need to update the `/etc/hosts` file with the fully qualified domain name (FQDN) of the Sentinel server.

Edit OSP Configuration Properties

After you enable MFA or Kerberos, the Sentinel admin will not be able to create 'local' users. The admin will be able to create only 'directory' users. This prerequisite gives the admin the permissions to create new 'directory' users.

In the `/etc/opt/novell/sentinel/config` directory, open the `osp-configuration.properties` file and ensure the following property values:

- ◆ `com.netiq.sentinel.osp.as.naming-attr=LDAPProviderName`

Where *LDAPProviderName* is the name attribute of your LDAP provider. For example, the name attribute for Active Directory is `sAMAccountName`.

- ◆ `com.netiq.sentinel.osp.ldap.dir-type=LDAPDirectoryType`

Where *LDAPDirectoryType* is the directory type of your LDAP provider. For example, the directory type for Active Directory is `AD`.

- ◆ `com.netiq.sentinel.osp.as.admins-container-dn=AdminContainerDN`

Where *AdminContainerDN* is the container DN for the admin user in Sentinel. For example, `CN=Users,DC=mycompany,DC=com`.

- ◆ `com.netiq.sentinel.osp.ldap.host=LDAP_IP`

Where *LDAP_IP* is the IP address of the LDAP server.

- ◆ `com.netiq.sentinel.osp.ldap.port=LDAP_Port`

Where *LDAP_Port* is the port number for the LDAP connection. The default SSL port number is 636 and the default non-SSL port number is 389.

- ◆ `com.netiq.sentinel.osp.ldap.use-ssl=true/false`

Where *true/false* specifies whether LDAP uses SSL.

(Conditional) If this value is `true`, you must use the `keytool` command to import the LDAP server certificate into the `/etc/opt/novell/sentinel/config/.webserverkeystore.jks` file.

For example:

```
/opt/novell/sentinel/jdk/jre/bin/keytool -importcert -alias <AliasName>
-file <FileName>.cer -keystore /etc/opt/novell/sentinel/config/
.webserverkeystore.jks
```

Where:

- ◆ *<AliasName>* is the new alias name you want to assign to the certificate in the Sentinel keystore.
- ◆ *<FileName>* is the name of the certificate file you want to import.
- ◆ `com.netiq.sentinel.osp.as.users-container-dn=UserContainerDN`
Where *UserContainerDN* is the container DN for the users in Sentinel. For example, `CN=Users,DC=mycompany,DC=com`.
- ◆ `com.netiq.sentinel.osp.ldap.admin-dn=AdminDN`
Where *AdminDN* is the DN for the admin user in Sentinel. For example, `CN=Administrator,CN=Users,DC=mycompany,DC=com`.
- ◆ `com.netiq.sentinel.osp.ldap.admin-pwd=LDAPAdminPassword`

Where *LDAPAdminPassword* is the encrypted password for the LDAP server administrator.

NOTE: To encrypt the password, run the `encryptpwd` script as the novell user:

```
./encryptpwd -e LDAPAdminPassword
```

The script is located in the `/opt/novell/sentinel/bin` directory.

Edit Sentinel Configuration Properties

In the `/etc/opt/novell/sentinel/config` directory, open the `configuration.properties` file and complete the following steps:

- 1 Set `strong.authentication.enabled=true`
- 2 Add `admin.user.auth.dn=LDAP_DN_ForSentinelAdminUser`

Where *LDAP_DN_ForSentinelAdminUser* is the mapped LDAP DN for the admin user in Sentinel.

NOTE: When you install Sentinel, the installation process creates the admin user by default as an out-of-the-box user. To enable MFA or Kerberos authentication and use the admin user again, you must map the admin user to a corresponding LDAP DN. Once you enable Kerberos authentication, you cannot use the out-of-the-box admin user to log in to Sentinel. Instead, you must use the mapped LDAP DN to log in to Sentinel.

- 3 (Conditional) If you are using Sentinel in High Availability (HA) mode, Add `sentinel.ha.cluster.hostname=FQDN_Virtual_Hostname`.

Where *FQDN_Virtual_Hostname* is the FQDN of the HA virtual IP address in all nodes of the HA cluster.

Update All Computers That Access Sentinel

On every computer your users will use to access Sentinel, go to `C:\Windows\System32\Drivers\etc` and complete the following steps:

- 1 Open the `hosts` file.
- 2 Add the following entry:

```
Sentinel_IP FQDN_Sentinel_server Hostname
```

Where:

- ♦ *Sentinel_IP* is the IP address of the Sentinel server.
- ♦ *FQDN_Sentinel_server* is the FQDN of the Sentinel server.
- ♦ *Hostname* is the host name of the Sentinel server.

For example:

```
127.0.0.1 rbpm.mycompany.com rbpm
```

Ensure All Users Have a Valid Email ID

MFA and Kerberos Ensure that all Sentinel users (including the admin) have a valid registered email ID in LDAP. To add a registered LDAP email ID to every Sentinel user account, use the **Users** tab in Sentinel.

OAuth Ensure that all Sentinel users (including the admin) have a valid registered email ID with the same email provider as the OAuth IDP. For example, if you use Google, all users must have valid gmail IDs.

Using LDAP with SSL

If Sentinel uses MFA, Kerberos, or OAuth, and needs to integrate with an LDAP server that uses SSL, complete the following:

- 1 Import the certificate file for AD and LDAP to the Sentinel server keystore.

In a command prompt, go to `/opt/novell/sentinel/jdk/jre/bin` and use the following command:

```
./keytool -importcert -file FileName.cer -keystore /etc/opt/novell/sentinel/config/.webserverkeystore.jks -alias AliasName
```

Where:

- ◆ *FileName* is the name of the certificate file you want to import.
- ◆ *AliasName* is the new alias name you want to assign to the certificate in the Sentinel keystore.

- 2 Go to the `/etc/opt/novell/sentinel/config` directory and complete the following steps:

2a Open the `osp-configuration.properties` file.

2b Ensure the following:

```
com.netiq.sentinel.osp.ldap.port=636  
com.netiq.sentinel.osp.ldap.use-ssl=true
```

- 3 Log in to the Sentinel server as the `novell` user, then run the following command:

```
touch /etc/opt/novell/sentinel/3rdparty/jetty/context/osp.xml
```

Restart Sentinel

After you have completed all the prerequisites, restart Sentinel. Use the following command:

```
rcsentinel restart
```

Configuring Sentinel In High Availability

(Conditional) If you are using Sentinel in High Availability (HA) mode, complete the following steps:

- 1 Log in to the active node of the HA cluster and run the following command:

```
csync2 -x -v
```

- 2** (Conditional) If the cluster does not start correctly, perform the following steps:
- 2a** Manually copy the `/etc/corosync/corosync.conf` file from `node01` to `node02`, or run the `csync2 -x -v` on `node01`, or manually set the cluster up on `node02` through YaST.
 - 2b** (Conditional) If the `csync2 -x -v` command you run in the previous step fails to synchronize all the files, perform the following procedure:
 - 2b1** Clear the `csync2` database (in the `/var/lib/csync2` directory) on all the nodes.
 - 2b2** Run the following command on all servers to update the `csync2` database to match the filesystem, but without marking anything as needing to be synchronized to other servers:

```
csync2 -cIr /
```
 - 2b3** Run the following command to find all the differences between authoritative server and remote servers, and mark for synchronization:

```
csync2 -TUXI
```
 - 2b4** Run the following command to reset the database to force the current server to be winner on any conflicts:

```
csync2 -fr /
```
 - 2b5** Run the following command to start a synchronization to all the other servers:

```
csync2 -xr /
```
 - 2b6** Run the following command to verify that all the files are synchronized:

```
csync2 -T
```

This command will not list any files if the synchronization is successful.
 - 2c** Run the following command on `node02`:
 - For SLES 11 SP4:**

```
/etc/rc.d/openais start
```
 - For SLES 12 SP1 and later:**

```
systemctl start pacemaker.service
```

(Conditional) If the `xinetd` service does not properly add the new `csync2` service, the script will not function properly. The `xinetd` service is required so that the other node can sync the cluster configuration files down to this node. If you see errors like `csync2 run failed`, you may have this problem.

To resolve this issue, execute the `kill -HUP `cat /var/run/xinetd.init.pid` command and then re-run the `sleha-join` script.
 - 2d** Run `crm_mon` on each cluster node to verify that the cluster is running properly. You can also use 'hawk', the web console, to verify the cluster. The default login name is `ishacluster` and the password is `linux`.

Kerberos Authentication

This section provides instructions for configuring Sentinel to work with Kerberos authentication.

Before you continue, ensure that you have met all prerequisites. For more information, see [“Prerequisites for MFA, Kerberos, and OAuth” on page 69](#).

NOTE: Before you continue, ensure that you have read the enablement considerations and met all prerequisites. For more information, see [“Enablement Considerations” on page 51](#) and [“Prerequisites for MFA, Kerberos, and OAuth” on page 69](#).

- ◆ [“Configuring the Sentinel Server for Kerberos Authentication” on page 74](#)
- ◆ [“Configuring the Kerberos User Account in Active Directory” on page 74](#)
- ◆ [“Configuring Browsers to Use Integrated Windows Authentication” on page 77](#)

Configuring the Sentinel Server for Kerberos Authentication

To use Kerberos authentication in Sentinel, you must complete the following steps on the Sentinel server.

- 1 Log in to the Sentinel server as the novell user.
- 2 Go to the `/etc/opt/novell/sentinel/config` directory and complete the following steps:
 - 2a Open the `osp-configuration.properties` file.
 - 2b Add the following properties:

```
com.netiq.sentinel.osp.krb.enabled=true
com.netiq.sentinel.osp.login.method=krb
```

Configuring the Kerberos User Account in Active Directory

To use Kerberos authentication in Sentinel, you need to create a new Active Directory user account for the Sentinel server. The user account name must use the DNS name of the Sentinel server. Use the Active Directory administration tools to configure Active Directory for Kerberos authentication.

NOTE: For domain or realm references, use uppercase format. For example `@MYCOMPANY.COM`.

- 1 As an Administrator in Active Directory, use the Microsoft Management Console (MMC) to create a new user account with the DNS name of the Sentinel server.

For example, if the DNS name of the Sentinel server is `rbpm.mycompany.com`, ensure the following:

First name: `rbpm`

User logon name: `HTTP_rbpm.mycompany.com`

NOTE: The slash character (/) is not supported during user creation. After you save the user account, edit the user account and replace / with an underscore (_).

Pre-windows logon name: `rbpm`

Set password: Specify the appropriate password

Password never expires: `TRUE`

User must change password at next logon: `FALSE`

This account supports Kerberos AES 128 bit encryption: `TRUE`

This account supports Kerberos AES 256 bit encryption: `TRUE`

Do not require Kerberos preauthentication: TRUE

2 To associate the new user with the Service Principal Name (SPN), complete the following steps:

2a Open a cmd shell.

2b Run the following command:

```
setspn -A HTTP/DNS_Sentinel_server@WINDOWS-DOMAIN userID
```

For example:

```
setspn -A HTTP/rbpm.mycompany.com@MYCOMPANY.COM rbpm
```

3 To generate the keytab file, complete the following steps:

3a At the command prompt, enter the following:

```
ktpass /out filename.keytab /princ servicePrincipalName /mapuser  
userPrincipalName /pass password /crypto AES256-SHA1 /ptype  
KRB5_NT_PRINCIPAL
```

For example:

```
ktpass /out rbpm.keytab /princ HTTP/rbpm.mycompany.com@MYCOMPANY.COM /  
mapuser rbpm /pass Passw0rd /crypto AES256-SHA1 /ptype  
KRB5_NT_PRINCIPAL
```

IMPORTANT: For domain or realm references, use uppercase format. For example, @MYCOMPANY.COM.

3b Copy the *filename.keytab* file to the `/etc/opt/novell/sentinel/config` directory on the Sentinel server, and then change the file permission to `novell`.

4 Log in to the Sentinel server as the `novel` user.

5 Go to the `/etc/opt/novell/sentinel/config` directory and create `krb5.conf`.

6 Open `krb5.conf` and add the following:

```

# Default Kerberos Realm
[libdefaults]
default_realm = <WINDOWS-DOMAIN>
kdc_timeout = 15000
max_retries = 2
udp_preference_limit = 1
admin_server = <DomainControllerIPAddress>
default_tkt_etypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96
default_tgs_etypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96
permitted_etypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96

# Define Kerberos Realms. Each realm needs to be in its own section
[realms]
<WINDOWS-DOMAIN> = {
kdc = <DomainControllerIPAddress>
}
# Define Domain to Kerberos Realm mapping for each realm
[domain_realm]
<Windows-Domain> = <WINDOWS-DOMAIN>
# Logging
[logging]
kdc = FILE:/home/novell/kdc.log
admin_server = FILE:/home/novell/admin.log
default = SYSLOG:NOTICE:DAEMON

```

- 7** In the `/etc/opt/novell/sentinel/config` directory, open the `auth.login` file and add the following entry:

```

com.sun.security.jgss.krb5.accept {
com.sun.security.auth.module.Krb5LoginModule required
debug="true"
refreshKrb5Config="true"
doNotPrompt="true"
principal="HTTP/<DNS_Sentinel_server>@<WINDOWS-DOMAIN>"
useKeyTab="true"
keyTab="/etc/opt/novell/sentinel/config/<filename>.keytab"
useTicketCache="false"
storeKey="true";
};

```

- 8** (Optional) To enable debug logs for troubleshooting, complete the following steps:

8a In the `/etc/opt/novell/sentinel/config` directory, open the `server.conf` file.

8b Ensure the following:

- ♦ `wrapper.java.additional.50=-Dsun.security.krb5.debug=true`
- ♦ `com.netiq.sentinel.osp.logging.level=ALL`

- 9** Ensure that user mapping are correct between AD, LDAP, and Sentinel.

- 10** Restart the Sentinel server:

```
rcsentinel restart
```

- 11** (Conditional) If you are running Sentinel in an HA environment, log in to the active node of the HA cluster and run the following command:

```
csync2 -x -v
```

Configuring Browsers to Use Integrated Windows Authentication

To use Kerberos authentication in Sentinel, any browser you use to access Sentinel must use Integrated Windows Authentication.

NOTE: You must perform this procedure for each user's computer.

Internet Explorer

- 1 In the Internet Options dialog box, click **Security**.
- 2 Click **Trusted Sites > Sites**.
- 3 Add the DNS name of the Sentinel server.
For example: `https://rbpm.mycompany.com`
- 4 Click **Add**, then click **Close**.
- 5 Click **Custom level**.
- 6 Under **User Authentication**, select **Automatic logon with current user name and password**.
- 7 Click **OK**.
- 8 Repeat this procedure for each end-user computer.

Mozilla Firefox

- 1 In the browser's address field, type `about:config`.
- 2 Set the **Value** of the following **Preferences** to the Windows domain name, such as `.mycompany.com`:
 - ◆ `network.automatic-ntlm-auth.trusted-uris`
 - ◆ `network.negotiate-auth.trusted-uris`
- 3 Repeat this procedure for each end-user computer.

Google Chrome

- 1 Go to Settings, and then click **Show advanced settings**.
- 2 Under Network, click **Change proxy settings**.
- 3 In the Internet Properties dialog box, click **Security**.
- 4 Click **Trusted Sites > Sites**.
- 5 Add the DNS name of the Sentinel server.
For example: `https://rbpm.mycompany.com`
- 6 Click **Add**, then click **Close**.
- 7 Click **Custom level**.
- 8 Under **User Authentication**, select **Automatic logon with current user name and password**.
- 9 Click **OK**.
- 10 Repeat this procedure for each end-user computer.

Multi-factor Authentication

Sentinel supports MFA by integrating with any identity provider (IDP) software that supports the following:

- ◆ Multi-factor authentication
- ◆ SAML 2.0

For example, if you integrate Sentinel with Advanced Authentication™ in your environment, Advanced Authentication handles authentication while Sentinel handles authorization.

NOTE: Before you continue, ensure that you have read the enablement considerations and met all prerequisites. For more information, see [“Enablement Considerations” on page 51](#) and [“Prerequisites for MFA, Kerberos, and OAuth” on page 69](#).

- ◆ [“Using Advanced Authentication” on page 78](#)
- ◆ [“Configuring Sentinel in FIPS Mode to use Advanced Authentication” on page 81](#)
- ◆ [“Using Other SAML 2.0 IDP Software” on page 82](#)
- ◆ [“Configuring Sentinel in FIPS Mode to use SAML 2.0 IDP” on page 83](#)

Using Advanced Authentication

This section provides the steps to integrate Sentinel with Advanced Authentication.

NOTE: Ensure that you are using a supported version of Advanced Authentication. For information about which versions of Advanced Authentication are supported, see [Sentinel System Requirements](#).

- 1 Log in to the Sentinel server as the novell user.
- 2 In the `/etc/opt/novell/sentinel/config` directory, open the `osp-configuration.properties` file and add the following properties:
 - ◆ `com.netiq.sentinel.osp.login.method = saml2`
 - ◆ `com.netiq.sentinel.osp.saml2.enabled = true`
 - ◆ `com.netiq.sentinel.osp.login.saml2.metadata-url = https://
IDP_IPAddress/osp/a/TOP/auth/saml2/metadata`
Where `IDP_IPAddress` is the IP address for the server where Advanced Authentication is installed.
 - ◆ `com.netiq.sentinel.osp.login.saml2.mapping-attr=mail`
 - ◆ `com.netiq.sentinel.osp.as.duplicate-resolution-naming-attr=mail`
- 3 Run the following command:

```
touch /etc/opt/novell/sentinel/3rdparty/jetty/contexts/osp.xml
```
- 4 To establish a trust relationship between Sentinel and Advanced Authentication, you need to generate a `.jks` file for the keystore that contains a self-signed certificate for Advanced Authentication.

NOTE: You cannot use the existing Advanced Authentication certificate because it does not contain a subject alternative name.

Complete the following steps:

4a Go to the `/opt/novell/sentinel/jdk/jre/bin` directory.

4b Create the `.jks` file for Advanced Authentication. Use the following command:

```
./keytool -genkey -keyalg RSA -alias AliasName -keystore  
FileName.jks -storepass Password -validity 360 -keysize 2048 -ext  
SAN=dns:Domain_Name,dns:IDP_DNS_Name,ip:IDP_IPAddress
```

Where:

- ◆ *AliasName* is the alias you want to assign to the certificate.
- ◆ *FileName* is the name of the `.jks` file you want to create.
- ◆ *Password* is the password to access the Advanced Authentication server.
- ◆ *Domain_Name* is the domain name of the Advanced Authentication server.
- ◆ *IDP_DNS_Name* is DNS name of the Advanced Authentication server.
- ◆ *IDP_IPAddress* is the IP address of the Advanced Authentication server.

For example:

```
./keytool -genkey -keyalg RSA -alias selfsigned1 -keystore AA.jks -  
storepass password -validity 360 -keysize 2048 -ext  
SAN=dns:aff.com,dns:aucore-7941,ip:10.10.10.10
```

4c Provide the appropriate answers to the questions the `keytool` command displays.

5 To import to the new keystore file to the Advanced Authentication keystore, you must convert it to `.pfx` format. Complete the following steps:

5a Go to the `/opt/novell/sentinel/jdk/jre/bin` directory.

5b Run the following command:

```
./keytool -importkeystore -srckeystore FileName.jks -srcstoretype  
JKS -srcstorepass Password -destkeystore FileName1.pfx -  
deststoretype PKCS12 -deststorepass Password1
```

Where:

- ◆ *FileName* is the name of the file you want to convert.
- ◆ *Password* is the password to access the JKS keystore.
- ◆ *FileName1* is the name of the file you want to create.
- ◆ *Password1* is the password you used to create the `.jks` file.

For example:

```
./keytool -importkeystore -srckeystore AA.jks -srcstoretype JKS -  
srcstorepass password -destkeystore test.pfx -deststoretype PKCS12 -  
deststorepass password1
```

6 To export the self-signed certificate from `FileName.jks` to a `.cer` file, complete the following steps:

6a Go to the `/opt/novell/sentinel/jdk/jre/bin` directory.

6b Use the following command:

```
./keytool -exportcert -keystore FileName.jks -alias AliasName -file  
FileName1.cer
```

Where:

- ♦ *FileName* is the name of the file you want to convert.
- ♦ *AliasName* is the alias name you assigned to the certificate.
- ♦ *FileName1* is the name of the file you want to create.

For example:

```
./keytool -exportcert -keystore AA.jks -alias selfsigned1 -file  
myAA.cer
```

7 To import the new certificate file to the Sentinel server keystore, complete the following steps.

7a Go to the `/opt/novell/sentinel/jdk/jre/bin` directory.

7b Use the following command:

```
./keytool -importcert -file FileName.cer -keystore /etc/opt/novell/  
sentinel/config/.webserverkeystore.jks -alias AliasName
```

Where:

- ♦ *FileName* is the name of the certificate file you want to import.
- ♦ *AliasName* is the new alias name you want to assign to the certificate in the Sentinel keystore.

For example:

```
./keytool -importcert -file myAA.cer -keystore /etc/opt/novell/  
sentinel/config/.webserverkeystore.jks -alias myAA
```

8 Log in to Advanced Authentication and complete the following steps:

8a Navigate to **Server Options**.

8b Upload the `.pfx` file you created previously, using the password you used for creating the `.jks` file.

8c (Conditional) For Advanced Authentication 5.6 or prior, enable **WebAuth**.

You do not have to enable WebAuth in Advanced Authentication 6.0 or later because it is enabled by default.

9 On the Sentinel server, run the following command:

```
touch /etc/opt/novell/sentinel/3rdparty/jetty/context/osp.xml
```

10 To retrieve the SAML metadata from Sentinel, complete the following steps:

10a In the `/etc/opt/novell/sentinel/osp/WEB-INF/conf/current/siem/services` directory, open the `authcfg.xml` file and modify the following property:

```
failOnError="false"
```

10b In your web browser, go to the following URL:

```
https://DNS_Sentinel_server:Port/osp/a/siem/auth/saml2/spmetadata
```

Where *DNS_Sentinel_server* is the FQDN of the Sentinel server and *Port* is the port Sentinel uses (typically 8443).

10c Copy the SAML metadata and save it in a new `sentinel.xml` file.

- 11** In Advanced Authentication, complete the following steps:
- 11a** Navigate to **Events**.
 - 11b** Create a new event named `SAML` and upload the `sentinel.xml` file.
 - 11c** (Optional) Create a new chain of authentication factors to replace the default `Password only` chain.
 - 11d** Specify the IP address of the Advanced Authentication server in one of the following ways:
 - ♦ For Advanced Authentication 5.6 or prior versions:
 1. Navigate to **Policies**.
 2. Edit the **SAML 2.0** policy.
 3. Specify the IP address of the Advanced Authentication server.
 - ♦ For Advanced Authentication 6.0 and later:
 1. Navigate to **Policies**.
 2. Edit the **Web Authentication** policy.
 3. Specify the IP address of the Advanced Authentication server.

Navigate to **Policies** and edit the SAML 2.0 policy and specify the IP address of the Advanced Authentication server.
 - 11e** Navigate to **Repositories** and add the LDAP repository.
 - 12** (Conditional) Ensure that you add any additional authenticators that are required for the authentication chain. The default authentication chain includes the Email, OTP, LDAP password, Mobile ID, and RADIUS authentication methods. For more information, see the [Advanced Authentication Administration Guide](#).
 - 13** (Conditional) If your authentication chain includes any authentication methods other than the default methods, have all users go to the Advanced Authentication Self-Service Portal (`https://IDP_IP/account`, where `IDP_IP` is the IP address of the Advanced Authentication server) and enroll in the additional authenticator methods, as defined in the authentication chain. For example, finger prints, retinal scans, or security questions. For more information, see the [Advanced Authentication User Guide](#).
 - 14** (Conditional) If you are using Sentinel in High Availability (HA) mode, log in to the active node of the HA cluster and run the following command:

```
csync2 -x -v
```

Configuring Sentinel in FIPS Mode to use Advanced Authentication

- 1** Log in to the Sentinel server.
- 2** Browse to the Sentinel bin directory.
- 3** To import the Advanced Authentication certificate to the NSS database, complete the following steps:
 - 3a** Copy the Advanced Authentication certificate to the Sentinel server.
 - 3b** Import the Advanced Authentication certificate to the Sentinel server. Use the following command:

```
./convert_to_fips.sh -i /<location to certificate/certificate_file>
```

For example:

```
./convert_to_fips.sh -i /opt/aaf.crt
```

- 4 Run the following script:

```
./create_mfa_fips_keys.sh <nss_password/password_file>
```

Where *nss_password* is the password for the NSS database and *password_file* is the file that stores the NSS password. Specify only one of these.

- 5 Update the `/etc/hosts` file with the hostname of the Advanced Authentication server.

- 6 In the `/etc/opt/novell/sentinel/config` directory, open the `osp-configuration.properties` file and modify the following property:

```
com.netiq.sentinel.osp.login.saml2.metadata-url=https\:\/\/  
<IDP_Hostname>/osp/a/TOP/auth/saml2/metadata
```

Where `<IDP_Hostname>` is the host name for the Advanced Authentication server.

- 7 Restart the Sentinel server:

```
rcsentinel restart
```

- 8 (Conditional) If you are using Sentinel in High Availability (HA) mode, log in to the active node of the HA cluster and run the following command:

```
csync2 -x -v
```

Using Other SAML 2.0 IDP Software

This section provides the steps to integrate Sentinel with any other SAML 2.0 IDP software.

- 1 Log in to the Sentinel server as the `novell` user.

- 2 In the `/etc/opt/novell/sentinel/config` directory, open the `osp-configuration.properties` file and add the following new properties:

- ◆ `com.netiq.sentinel.osp.login.method = saml2`
- ◆ `com.netiq.sentinel.osp.saml2.enabled = true`
- ◆ `com.netiq.sentinel.osp.login.saml2.metadata-url = https://
IDP_IPAddress`

Where `IDP_IPAddress` is the IP address for the server where your IDP software is installed.

- ◆ `com.netiq.sentinel.osp.login.saml2.mapping-attr = mail`
- ◆ `com.netiq.sentinel.osp.as.duplicate-resolution-naming-attr = mail`
- ◆ `com.netiq.sentinel.osp.logout.saml2.landing-page=internal`

- 3 On the Sentinel server, run the following command:

```
touch /etc/opt/novell/sentinel/3rdparty/jetty/contexts/osp.xml
```

- 4 To retrieve the SAML metadata from Sentinel, go to the following URL:

```
https://Sentinel_IP:Port/osp/a/siem/auth/saml2/spmetadata
```

Where `Sentinel_IP` is the IP address of the Sentinel server and `Port` is the port Sentinel uses (typically 8443).

- 5 Use the metadata to configure your IDP. For detailed instructions, see the documentation for your IDP software.

6 To establish a trust relationship between Sentinel and your IDP software, you need to create self-signed certificates for both Sentinel and your IDP software. For detailed instructions about creating and importing certificates in your IDP software, see the documentation for your IDP software.

7 On the Sentinel server, go to the `/opt/novell/sentinel/jdk/jre/bin` directory.

8 Import the new certificate file to the Sentinel server keystore. Use the following command:

```
./keytool -importcert -file FileName.cer -keystore /etc/opt/novell/sentinel/config/.webserverkeystore.jks -alias AliasName
```

Where:

- ◆ *FileName* is the name of the certificate file you want to import.
- ◆ *AliasName* is the new alias name you want to assign to the certificate in the Sentinel keystore.

9 (Conditional) If you are using Sentinel in High Availability (HA) mode, log in to the active node of the HA cluster and run the following command:

```
csync2 -x -v
```

Configuring Sentinel in FIPS Mode to use SAML 2.0 IDP

1 Log in to the Sentinel server.

2 Browse to the Sentinel bin directory.

3 Run the following script:

```
create_mfa_fips_keys.sh <nss_password/password_file>
```

Where *nss_password* is the password for the NSS database and *password_file* is the file that stores the NSS password. Specify only one of these.

4 Update the `/etc/hosts` file with the hostname of your IDP server.

5 In the `/etc/opt/novell/sentinel/config` directory, open the `osp-configuration.properties` file and modify the following property:

```
com.netiq.sentinel.osp.login.saml2.metadata-url=https\://  
<IDP_Hostname>/osp/a/TOP/auth/saml2/metadata
```

Where `<IDP_Hostname>` is the host name for your IDP server.

6 To import the IDP server certificate to the NSS database, complete the following steps:

6a Copy the IDP server certificate to the Sentinel server.

6b Import the IDP server certificate to the Sentinel server. Use the following command:

```
/usr/bin/certutil -A -d sql:/etc/opt/novell/sentinel/3rdparty/nss -  
t "CT,CT,CT" -n SAMLIDP -i /<location to certificate>/FileName.crt
```

For example:

```
/usr/bin/certutil -A -d sql:/etc/opt/novell/sentinel/3rdparty/nss -  
t "CT,CT,CT" -n SAMLIDP -i /root/SAMLIDP.crt
```

7 Run the following command:

```
touch /etc/opt/novell/sentinel/3rdparty/jetty/contexts/osp.xml
```

- 8 (Conditional) If you are using Sentinel in High Availability (HA) mode, log in to the active node of the HA cluster and run the following command:

```
csync2 -x -v
```

OAuth Authentication

OAuth authentication allows users to log in to Sentinel using OAuth 2.0 providers such as Google or Facebook. This section provides instructions for configuring Sentinel to work with Google as the OAuth provider.

NOTE: By design, OAuth authentication does not support single logout. To completely log out of a Sentinel session when you are using OAuth authentication, you must clear your browser cache and cookies.

NOTE: Before you continue, ensure that you have read the enablement considerations and met all prerequisites. For more information, see [“Enablement Considerations” on page 51](#) and [“Prerequisites for MFA, Kerberos, and OAuth” on page 69](#).

Creating Credentials for the Google Web Application

- 1 In your browser, go to <https://console.developers.google.com/>.
- 2 Create the credentials for a web application. For more information, click the Help button on the toolbar to see the Google documentation.

Configuring the Sentinel Server for OAuth Authentication

- 1 Log in to the Sentinel server as the novell user.
- 2 Run the following command:

```
touch /etc/opt/novell/sentinel/3rdparty/jetty/contexts/osp.xml
```

- 3 In the `/etc/opt/novell/sentinel/config` directory, open the `osp-configuration.properties` file and add the following new properties:

- ◆ `com.netiq.sentinel.osp.login.method=google`
- ◆ `com.netiq.sentinel.osp.google.enabled=true`
- ◆ `com.netiq.sentinel.osp.google.client-secret=google app secret`
Where *google app secret* is the Google client secret.
- ◆ `com.netiq.sentinel.osp.google.client-id=google app client id`
Where *google app client id* is the Google client ID.
- ◆ `com.netiq.sentinel.osp.instance-data-enabled=true`
- ◆ `com.netiq.sentinel.osp.as.scope=subtree`
- ◆ `com.netiq.sentinel.osp.instance-data-enabled=true`

- 4 Import the Google certificates to the Sentinel keystore. In a command prompt, go to `/opt/novell/sentinel/jdk/jre/bin` and use the following command for each certificate:

```
./keytool -importcert -file <google.crt> -keystore /etc/opt/novell/sentinel/config/.webserverkeystore.jks -alias google
```

Where *<google.crt>* is the name of the Google certificate you want to import.

NOTE: You must run this command separately for each of the Google certificates.

- 5 Restart the Sentinel server. Use the following command:

```
rcsentinel restart
```

- 6 (Conditional) If you are using Sentinel in High Availability (HA) mode, log in to the active node of the HA cluster and run the following command:

```
csync2 -x -v
```

Configuring Sentinel in FIPS Mode to Use Google OAuth

To import the Google server chain certificates to the NSS database, complete the following steps:

- 1 Copy the Google certificate to the Sentinel server.

- 2 Run the following script:

```
create_mfa_fips_keys.sh <nss_password/password_file>
```

Where *nss_password* is the password for the NSS database and *password_file* is the file that stores the NSS password. Specify only one of these.

- 3 Import the Google certificates to the Sentinel server. Use the following command for each certificate:

```
/usr/bin/certutil -A -d sql:/etc/opt/novell/sentinel/3rdparty/nss -t "CT,CT,CT" -n google -i /<location to certificate>/FileName.crt
```

For example:

```
/usr/bin/certutil -A -d sql:/etc/opt/novell/sentinel/3rdparty/nss -t "CT,CT,CT" -n google -i /root/sai/google.crt
```

NOTE: You must run this command separately for each of the Google certificates.

- 4 Restart the Sentinel server. Use the following command:

```
rcsentinel restart
```

- 5 (Conditional) If you are using Sentinel in High Availability (HA) mode, log in to the active node of the HA cluster and run the following command:

```
csync2 -x -v
```

Troubleshooting

This section helps you troubleshoot issues that might occur when using a non-default authentication method.

- ♦ [“An Invalid OAuth2 Request was Received” on page 86](#)
- ♦ [“Invalid Host Header Name or Request URL Domain Name” on page 86](#)
- ♦ [“Login Redirects to the Standard Login Page” on page 86](#)

An Invalid OAuth2 Request was Received

Issue: Sentinel displays the following error message:

The service may be disabled or an invalid request was made to an active service. Please contact your system administrator. (An invalid OAuth2 request was received.)

Fix: You need to correct one or more settings for the current authentication method. For detailed information, check the `osp-sentinel-<date>.log` file in the `/var/opt/novell/sentinel/log/osp` directory.

Invalid Host Header Name or Request URL Domain Name

Issue: Sentinel displays the following error message:

Unrecognized interface. Invalid Host Header Name or Request URL Domain Name.

Fix: Ensure the FQDN is set properly. On the Sentinel server, update the `/etc/hosts` file with the following:

```
Sentinel_IP FQDN_Sentinel_server Hostname
```

Where:

- ♦ *Sentinel_IP* is the IP address of the Sentinel server.
- ♦ *FQDN_Sentinel_server* is the FQDN of the Sentinel server.
- ♦ *Hostname* is the host name of the Sentinel server.

For example:

```
127.0.0.1 rbpm.mycompany.com rbpm
```

NOTE: You can use the `$hostname` command to verify whether the host name is correct.

For detailed information, check the `osp-sentinel-<date>.log` file in the `/var/opt/novell/sentinel/log/osp` directory.

Login Redirects to the Standard Login Page

Issue: Sentinel displays the following error message:

Integrated Windows Authentication is not properly configured in your environment. You will be redirected to the standard login page in 5 seconds.

Fix 1: Clear your browser cache and remove all cookies.

Fix 2: If Fix 1 does not work, ensure the Sentinel server time is synchronized with NTP, and then restart the Sentinel server.

Collecting and Routing Event Data

This section provides information about collecting and routing events.

- ♦ [Chapter 6, “Configuring Agentless Data Collection,” on page 91](#)
- ♦ [Chapter 7, “Configuring Agent-Based Data Collection,” on page 123](#)
- ♦ [Chapter 8, “Configuring ArcSight SmartConnectors for Data Collection,” on page 125](#)
- ♦ [Chapter 9, “Managing Event Sources,” on page 127](#)
- ♦ [Chapter 10, “Configuring Event Routing Rules,” on page 135](#)
- ♦ [Chapter 11, “Mapping Events,” on page 139](#)
- ♦ [Chapter 12, “Linking to Additional Sentinel Systems,” on page 151](#)

6 Configuring Agentless Data Collection

Sentinel can collect data from a wide range of event sources, such as intrusion detection systems, firewalls, operating systems, routers, databases, switches, mainframes, antivirus applications, and Novell applications. A modular architecture divides the task of protocol-level connections (Connectors) and the parsing logic (Collectors) for specific event sources.

Sentinel supports a wide variety of Connectors and also includes a variety of Collectors. The configuration required to integrate a new event source with Sentinel varies, depending on the type of event source and the communication method selected.

You should review the Collector and Connector documentation for any new event source integration to ensure that all available features are enabled.

The configuration required to integrate a new event source with Sentinel varies depending on the type of event source and the communication method selected.

- ♦ [“Before You Begin” on page 91](#)
- ♦ [“Resolving Hostnames and IP Addresses” on page 92](#)
- ♦ [“Configuring Data Collection for Syslog Event Sources” on page 92](#)
- ♦ [“Configuring Data Collection for the Novell Audit Server” on page 96](#)
- ♦ [“Configuring Data Collection for Other Event Sources” on page 100](#)
- ♦ [“Managing Event Sources” on page 119](#)

Before You Begin

- ♦ Determine the Collector and Connector plug-ins installed in the system by clicking **Plug-ins > Catalog**. You can see the plug-ins versions and other metadata, which helps you determine whether you have the latest version of a plug-in. If you want a later version of a plug-in, download the plug-in from the [Sentinel Plug-ins Web site](#).
- ♦ For information about editing Collectors that are already included in Sentinel, see the [Sentinel Plug-ins SDK Web site](#).

Resolving Hostnames and IP Addresses

Events include either IP addresses or hostnames, by default. You can configure Sentinel to resolve IP addresses to hostnames or vice versa so that events include both IP addresses and the corresponding hostnames. You can also configure Sentinel to include both IPv4 and IPv6 IP addresses. This additional information helps you to easily relate events from devices reporting IP addresses and other devices reporting hostnames when analyzing events and alerts.

You can configure Sentinel to resolve hostnames to IP addresses or vice versa by editing the `configuration.properties` file. These two options can be enabled independently. Both successful and failed lookups are cached for a short period to minimize lookups to the DNS server and maximize event throughput.

To resolve hostnames and IP addresses in an event:

- 1 Log in to the Sentinel server as `novell` user.
- 2 Open the `<sentinel_install_directory>/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 (Conditional) To resolve hostnames to IP addresses, add the `enrich.event.host_ip_lookup` property and set the value to `true` as follows:

```
enrich.event.host_ip_lookup=true
```

This includes the corresponding IP addresses of the hostnames in events.

If the hostname resolution returns both IPv4 and IPv6 addresses, only the IPV4 address is included in an event, by default. To include the IPV6 address in the event, add the `event.host_ip_lookup.prefer.ipv6` property and set the value to `true` as follows:

```
event.host_ip_lookup.prefer.ipv6=true
```

- 4 (Conditional) To resolve IP addresses to hostnames, add the `enrich.event.ip_host_lookup` property and set the value to `true` as follows:

```
enrich.event.ip_host_lookup=true
```

This includes the corresponding hostnames of the IP addresses in events.

- 5 Restart Sentinel to apply the changes made to the `configuration.properties` file.

Configuring Data Collection for Syslog Event Sources

Sentinel is preconfigured to accept Syslog data from Syslog event sources that send data over TCP (port 1468), UDP (port 1514), or SSL (port 1443). You can also configure Sentinel to listen on additional ports. To collect Syslog data, configure your Syslog event sources to send data to one of these ports.

The following sections describe how you can configure the event sources to send data to Sentinel and how you can configure new Syslog ports to receive data:

- ♦ [“Parsing Logic for Syslog Messages” on page 93](#)
- ♦ [“Configuring Syslog Servers” on page 93](#)
- ♦ [“Configuring Client Authentication for the SSL Syslog Server” on page 94](#)

Parsing Logic for Syslog Messages

Sentinel can receive, store, and search against events from any Syslog source. If it recognizes the data source, Sentinel automatically chooses the most suitable Collector to parse the data, parses the data into events, and stores the data in the configured secondary storage location.

You can filter the collected data to drop any unwanted events. Messages from recognized data sources are parsed into fields such as `target IP address` and `source username`. Messages from unrecognized data sources are placed in a single field for storage, searching, and reporting.

The Generic Event Collector collects and processes data from unrecognized event sources that have suitable Connectors. If the data was generated by a supported event source, the Generic Event Collector analyzes the received data and attempts to parse the information. If the Generic Event Collector does not understand the message, it does minimal parsing and places the text in the **Message** (Msg) field.

Configuring Syslog Servers

When you point your Syslog event sources to Sentinel, Sentinel automatically creates an event source entry to track data received from the event source. An entry is created for each unique IP address or hostname that appears in the header portion of the Syslog messages. This entry enables you to identify the computers generating the Syslog messages, regardless of whether they are being aggregated by a Syslog relay or not. It also enables you to manage how the data is processed.

To add or remove Syslog servers, use the Event Source Management interface. For more information, see [“Configuring Data Collection for Other Event Sources” on page 100](#).

- 1 From **Sentinel Main**, click **Collection > Event Source Servers**.
- 2 In the **Syslog Server** section, specify the SSL, TCP, and UDP port numbers for the Syslog servers. The default ports for SSL, TCP, and UDP are 1443, 1468, and 1514 respectively.
- 3 To start or stop the data collection for each of the Syslog servers, select the On or Off options next to them.
- 4 To change the port values, specify a valid port value.

The following table shows the status messages you see after entering the valid or non-valid port values.

Status Icon	Message
Green Check Mark	If the specified port is valid and is not in use, a <code>port is valid and open</code> message is displayed.
Red Cross	If the specified port is not valid (non-numeric or not between 1 to 65535), a <code>port is not valid</code> message is displayed.
Red Cross	If the specified port is valid but it is already in use, or if the Syslog server does not have permission to use it, a <code>port is valid but not open</code> message is displayed.

- 5 Set the appropriate client authentication and server key pairs settings for the SSL Syslog server. For more information about setting the client authentication, see [“Configuring Client Authentication for the SSL Syslog Server” on page 94](#).

The SSL Syslog server is automatically restarted if any changes are made here.

6 (Optional) Click **Reset** to restore the previous settings.

7 Click **Save** to save the new settings.

The **Save** button is disabled until you specify a valid port for all of the servers.

Configuring Client Authentication for the SSL Syslog Server

The client authentication settings determine how strictly the SSL Syslog server verifies the identity of Syslog event sources that are attempting to send their data. You should use a strict client authentication policy that is applicable in your environment to prevent rogue Syslog event sources from sending undesired data into Sentinel.

Open: No authentication is required. Sentinel does not request, require, or validate a certificate from the event source.

Loose: A valid X.509 certificate is required from the event source, but the certificate is not validated. It does not need to be signed by a certificate authority.

Strict: A valid X.509 certificate is required from the event source, and it must be signed by a trusted certificate authority. If the event source does not present a valid certificate, Sentinel does not accept its event data.

- ♦ [“Creating a Trust Store” on page 94](#)
- ♦ [“Importing a Certificate into the Trust Store” on page 95](#)
- ♦ [“Server Key Pair” on page 95](#)

Creating a Trust Store

For strict authentication, you must have a trust store that contains the public certificate of the certificate authority (CA) that signed the event source certificate. After you have a DER or PEM certificate, you can create the trust store by using the `TruststoreCreator` utility that comes with Sentinel.

- 1 Log in to the Sentinel server as `novell` user.
- 2 Go to the `/var/opt/novell/sentinel/data/updates/done` folder.
- 3 Use the following command to extract the `syslog_connector.zip` file:

```
unzip syslog_connector.zip
```

- 4 Copy the `TruststoreCreator.sh` or `TruststoreCreator.bat` file to the machine that has the certificates.

or

Copy the certificates to the computer with the `TruststoreCreator` utility.

- 5 Run the `TruststoreCreator.sh` utility as follows:

```
TruststoreCreator.sh -keystore /tmp/my.keystore -password password1 -  
certs /tmp/cert1.pem,/tmp/cert2.pem
```

In this example, the `TruststoreCreator` utility creates a keystore file called `my.keystore` that contains two certificates (`cert1.pem` and `cert2.pem`). It is protected by the password `password1`. The keystore file must be imported into the trust store.

Importing a Certificate into the Trust Store

For strict authentication, the administrator can import a certificate by using the **Import** button. This helps ensure that only authorized event sources are sending data to Sentinel. The trust store must include public certificate of the certificate authority (CA) that signed the event source certificate.

The following procedure must be run on the computer that has the trust store on it. You can open a web browser on the computer with the trust store or move the trust store to any computer with a web browser.

NOTE: If the CA is signed by another CA, you must import the chain of CA certificates until the root CA.

To import a trust store:

- 1 From **Sentinel Main**, click **Collection > Event Source Servers**.
- 2 In the Syslog Server section, select the **Strict** option under **Client authentication**.
- 3 Click **Browse** and browse to the trust store file (for example, `my.keystore`)
- 4 Specify the password for the truststore file.
- 5 Click **Import**.
- 6 (Optional) Click **Details** to see more information about the trust store.
- 7 (Optional) Click **Reset** to restore the previous settings.
- 8 Click **Save**.

After the trust store is successfully imported, you can click **Details** to see the certificates included in the trust store.

Server Key Pair

Sentinel is installed with a built-in certificate, which is used to authenticate the Sentinel server to the event sources. This certificate can be overridden with a certificate signed by a public certificate authority (CA).

To replace the built-in certificate:

- 1 From **Sentinel Main**, click **Collection > Event Source Servers**.
- 2 In the Syslog Server section, under **Server key pairs**, select **Custom**.
- 3 Click **Browse** and browse to the trust store file.
- 4 Specify the password for the trust store file.
- 5 Click **Import**.
- 6 (Optional) If there is more than one public-private key pair associated with the file, select the desired key pair, then click **OK**.
- 7 (Optional) Click **Details** to see more information about the server key pair.
- 8 (Optional) Click **Reset** to restore the previous settings.
- 9 Click **Save**.

Configuring Data Collection for the Novell Audit Server

Many Novell products send data to Sentinel by using a Platform Agent. Data is received by an Event Source Server called the Audit Server, which is packaged with Sentinel. The Audit Server is similar in many ways to a Syslog server.

The following sections describe the procedure to configure the Audit Server port to receive data and also to set the Audit Server options:

- ♦ [“Specifying the Audit Server Settings” on page 96](#)
- ♦ [“Setting the Audit Server Options” on page 97](#)

Specifying the Audit Server Settings

To specify the data collection settings for the Audit Server:

- 1 From **Sentinel Main**, click **Collection** > **Event Source Servers**.
- 2 In the **Audit Server** section, select the **On** or **Off** options to start or stop the data collection for the Audit Server.
- 3 In the Audit Server section, specify the port on which the Sentinel server listens to messages from the event sources.

For more information about setting the port, see [“Port Configuration and Port Forwarding for the Audit Server” on page 97](#).

- 4 Set the appropriate client authentication and server key pairs settings.

For more information about client authentication, see [“Client Authentication for the Audit Server” on page 98](#).

The Audit server and all related Audit Connectors are automatically restarted if any changes are made here.

- 5 Select the Sentinel server behavior when the number of events received exceeds the buffer capacity.

WARNING: If you select **Drop oldest messages**, there is no supported method to recover dropped messages,

- 6 Select **Idle Connection** to disconnect event sources that have not sent data for a certain period of time.

The event source connections are automatically re-created when they start sending data again.

- 7 Specify the number of minutes before an idle connection is disconnected.

- 8 (Optional) Select **Event Signatures** to receive a signature with the event.

To receive a signature, the Platform Agent on the event source must be configured properly. For information on validating event signatures, see the Signing Events section in the [Audit Platform Agent Guide](#).

- 9 (Optional) Click **Reset** to restore the previous settings.

- 10 Click **Save** to save the new settings.

The **Save** button is disabled until a valid port is specified for the server.

These settings might affect data collection for several servers (for example, multiple eDirectory instances). However, they do not start or stop services on the event source computers. Changes on this page take effect immediately.

To view the health of the Audit Server and its event sources, see [“Managing Event Sources” on page 119](#).

Setting the Audit Server Options

Administrators can change the settings for how Sentinel listens for data from the event source applications, set the port on which Sentinel listens, and select the type of authentication between the event source and Sentinel.

- ♦ [“Port Configuration and Port Forwarding for the Audit Server” on page 97](#)
- ♦ [“Client Authentication for the Audit Server” on page 98](#)

Port Configuration and Port Forwarding for the Audit Server

By default, Sentinel listens on port 1289 for messages from the server. When the port is changed, the system checks whether the specified port is valid and open.

Binding to ports lower than 1024 requires `root` privileges, so you should use a port higher than 1024. You can change the source devices to send data to a higher port or use port forwarding on the Sentinel server.

To change the Platform Agent to send data to a different port:

- 1 Log in to the event source computer.
- 2 Open the `logevent` file for editing. The file location depends on the operating system:
 - ♦ Linux: `/etc/logevent.conf`
 - ♦ Windows: `C:\WINDOWS\logevent.cfg`
 - ♦ NetWare: `SYS:\etc\logevent.cfg`
 - ♦ Solaris: `/etc/logevent.conf`
- 3 Set the `LogEnginePort` parameter to the desired port.
- 4 Save the file.
- 5 Restart the Platform Agent.

The method varies by operating system and application. Restart the computer or refer to the application-specific documentation on the [Documentation Web site \(http://www.netiq.com/documentation\)](http://www.netiq.com/documentation) for more instructions.

To configure port forwarding on the Sentinel server:

- 1 Log in to the Sentinel server operating system as `root` (or `su` to `root`).
- 2 Open the `/etc/init.d/boot.local` file for editing.
- 3 Add the following command at the end of the bootup process:

```
iptables -A PREROUTING -t nat -p protocol --dport incoming port -j DNAT  
--to-destination IP:rerouted port
```

Replace *protocol* with `tcp` or `udp`, *incoming port* with the port where the messages are arriving, and *IP:rerouted port* with the IP address of the local computer and an available port above 1024.

- 4 Save the changes.
- 5 Reboot the server. If you cannot reboot immediately, run the `iptables` command in [Step 3](#) from a command line.

Client Authentication for the Audit Server

The event sources send their data over an SSL connection, and the Client authentication setting for the Sentinel server determines what kind of authentication is performed for the certificates from the Audit Server on the event sources.

Open: No authentication is required. Sentinel does not request, require, or validate a certificate from the Event Source.

Loose: A valid X.509 certificate is required from the Event Source, but the certificate is not validated. It does not need to be signed by a certificate authority.

Strict: A valid X.509 certificate is required from the Event Source, and it must be signed by a trusted certificate authority. If the Event Source does not present a valid certificate, Sentinel does not accept its event data.

- ♦ [“Creating a Trust store” on page 98](#)
- ♦ [“Importing a Certificate into the Trust Store” on page 99](#)
- ♦ [“Server Key Pair” on page 99](#)

Creating a Trust store

For strict authentication, you must have a trust store that contains the public certificate of the certificate authority (CA) that signed the event source certificate. After you have a DER or PEM certificate, you can create the trust store by using the `CreateTrust store` utility that comes with Sentinel.

- 1 Log in to the Sentinel server as `novell`.
- 2 Go to `/var/opt/novell/sentinel/data/updates/done`.
- 3 Unzip the `audit_connector.zip` file:

```
unzip audit_connector.zip
```
- 4 Copy `TruststoreCreator.sh` or `TruststoreCreator.bat` to the computer with the certificates

or

Copy the certificates to the computer with the `TruststoreCreator` utility

- 5 Run the `TruststoreCreator.sh` utility:

```
TruststoreCreator.sh -keystore /tmp/my.keystore -password password1 -  
certs /tmp/cert1.pem,/tmp/cert2.pem
```

In this example, the `TruststoreCreator` utility creates a keystore file called `my.keystore` that contains two certificates (`cert1.pem` and `cert2.pem`). It is protected by the password `password1`.

Importing a Certificate into the Trust Store

For strict authentication, the administrator can import a certificate. This helps ensure that only authorized event sources are sending data to Sentinel. The trust store must include public certificate of the certificate authority (CA) that signed the event source certificate.

The following procedure must be run on the machine that has the trust store on it. You can open a web browser on the machine with the trust store or move the trust store to any machine with a web browser.

NOTE: If the CA is signed by another CA, then you must import the chain of CA certificates until the root CA.

- 1 From **Sentinel Main**, click **Collection > Event Source Servers**.
- 2 In the Audit Server section, select the **Strict** option under **Client authentication**.
- 3 Click **Browse** and browse to the trust store file (for example, `my.keystore`)
- 4 Specify the password for the trust store file.
- 5 Click **Import**.
- 6 (Optional) Click **Details** to see more information about the trust store.
- 7 (Optional) Click **Reset** to restore the previous settings.
- 8 Click **Save**.

After the trust store is imported successfully, you can click **Details** to see the certificates included in the trust store.

Server Key Pair

Sentinel is installed with a built-in certificate, which is used to authenticate the Sentinel server to the event sources. This certificate can be overridden with a certificate signed by a public certificate authority (CA).

To replace the built-in certificate:

- 1 From **Sentinel Main**, click **Collection > Event Source Servers**.
- 2 In the Audit Server section, under **Server key pairs**, select **Custom**.
- 3 Click **Browse** and browse to the trust store file.
- 4 Specify the password for the trust store file.
- 5 Click **Import**.
- 6 (Optional) If there is more than one public-private key pair in the file, select the desired key pair and click **OK**.
- 7 (Optional) Click **Details** to see more information about the server key pair.
- 8 (Optional) Click **Reset** to restore the previous settings.
- 9 Click **Save**.

Configuring Data Collection for Other Event Sources

The Event Source Management (Live View) interface provides a set of tools to manage and monitor connections between Sentinel and the event sources that provide data to Sentinel. The graphical interface shows the current event sources and the software components that are processing data from that event source. Each component can be easily deployed to integrate the devices in the enterprise, and it can be monitored in real time within the Event Source Management interface. Some Connectors and Collectors must be configured in Event Source Management, such as the WMS connector for Windows, Database connectors, and SDEE connectors for Cisco devices.

NOTE: If you are using openSUSE11.1, update your JRE to the latest version. Then use the Java Web Start (`javaws`) launcher command to launch the Event Source Management.

You can perform the following tasks through the Event Source Management window:

- ♦ Add or modify connections to event sources by using Configuration wizards.
- ♦ View the real-time status of the connections to event sources.
- ♦ Import or export configuration of event sources to or from the Live View.
- ♦ View and configure Connectors and Collectors that are installed.
- ♦ Import or export Connectors and Collectors from or to a centralized repository.
- ♦ Monitor data flowing through the Collectors and Connectors.
- ♦ Design, configure, and create the components of the event source hierarchy, and execute required actions by using these components.

- ♦ [“Accessing Event Source Management” on page 100](#)
- ♦ [“Viewing Data in Event Source Management” on page 101](#)
- ♦ [“Searching for Event Sources” on page 106](#)
- ♦ [“Installing Plug-Ins” on page 107](#)
- ♦ [“Updating a Connector or a Collector Plug-In” on page 108](#)
- ♦ [“Adding Components to Sentinel” on page 108](#)
- ♦ [“Connecting to Event Sources” on page 110](#)
- ♦ [“Exporting Configurations” on page 114](#)
- ♦ [“Importing Configurations” on page 115](#)
- ♦ [“Debugging” on page 115](#)
- ♦ [“Troubleshooting” on page 118](#)

Accessing Event Source Management

- 1 From **Sentinel Main**, click **Applications > Launch Control Center**.
or
From **Sentinel Main**, click **Collection > Advanced > Launch Control Center**.
- 2 Log in to the Sentinel Control Center.
- 3 In toolbar, click **Event Source Management > Live View**.

Viewing Data in Event Source Management

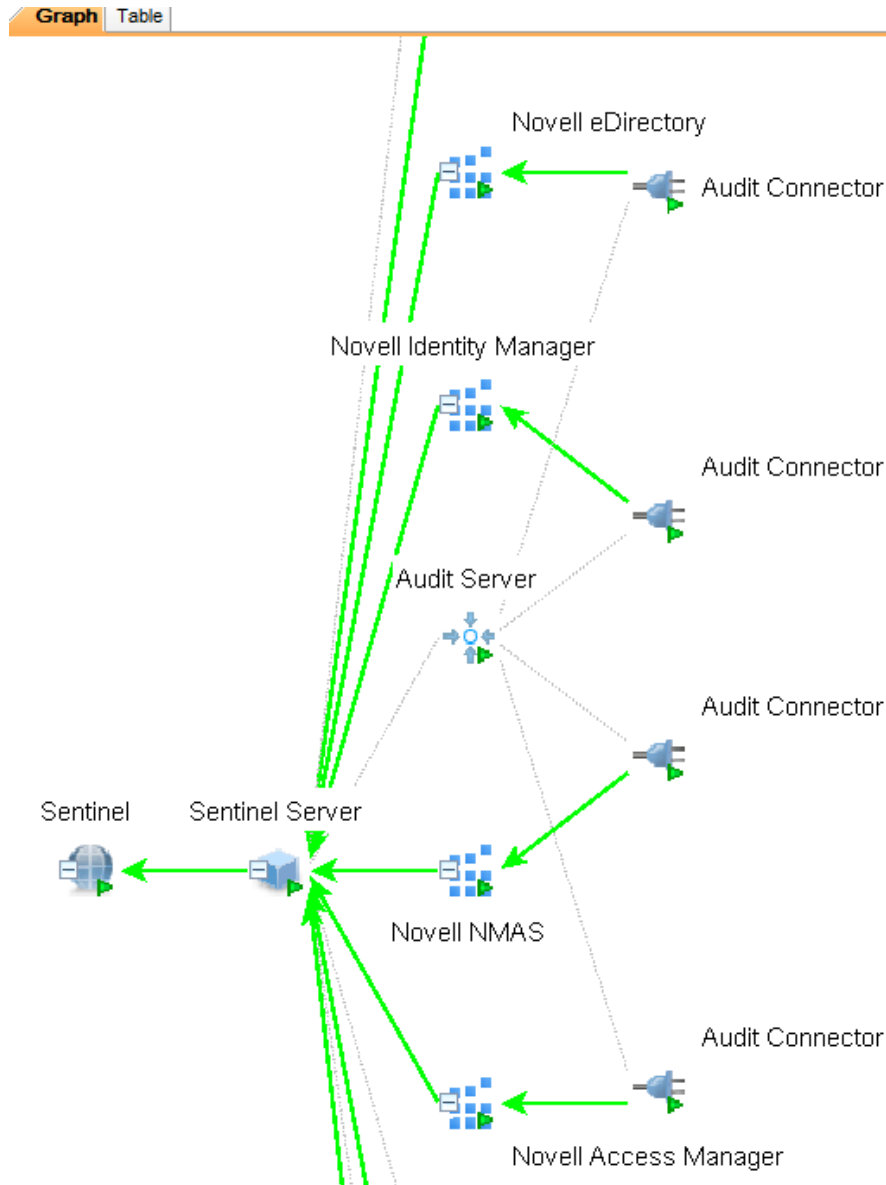

In the Event Source Management, you can view configuration data in different views:

- ◆ [“Graphical ESM View” on page 101](#)
- ◆ [“Table ESM View” on page 103](#)
- ◆ [“How the Components Are Displayed” on page 104](#)
- ◆ [“Component Status Indicators” on page 105](#)
- ◆ [“Right-Click Menus” on page 105](#)

Graphical ESM View

The graphical view is the default view in Event Source Management. In the graphical view, you can view the status of a Collector and access the configuration settings of Collectors and Collector objects as a graph of connected nodes.

Figure 6-1 Graphical View

By default, the Health Monitor Display frame displays in the graphical view. The data can be displayed in several different layouts. The default layout in graph is the Hierarchic Left to Right layout. You can change between these layouts by selecting the layout format from the drop-down list in the toolbar.

TIP: Click in the graphical ESM view and use the “+” or “-” sign to zoom in or zoom out, or use the mouse wheel to zoom in and zoom out.

In the graphical view, the lines connecting the components are color-coded to indicate data flow.

Green Line: Indicates that data is flowing between the components.

Grey Line: Indicates that the connection is not live and there is no data flow.

Blue dashed Line: Indicates the logical relation of Event Source Servers to their associated Collector Managers and event sources.

To improve the manageability and performance of the graphical display, Sentinel automatically collapses any node with 20 or more immediate child node. This is especially useful for Connectors such as Syslog or Novell Audit that have the ability to automatically configure a large number of event sources.

In collapsed state, a node displays the number of immediate child nodes, such as WMI Connector (3) [Collector name (Number of immediate children)]. The Children panel of a collapsed node shows the immediate children of that node, each of which can be managed in the same way as nodes in the tabular ESM view.

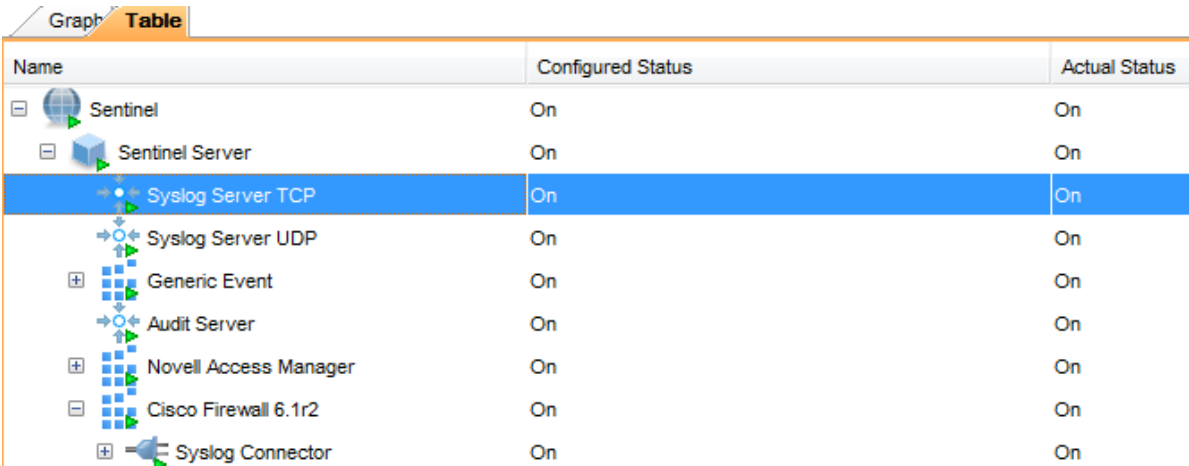

NOTE: Event Source Server node do not have the plus or minus sign after their names even if they contain child nodes.

The parent node can take several minutes to expand if it has a large enough number of child nodes to potentially cause the user interface to become unresponsive.

Table ESM View

The components visible in the graphical view of ESM can also be viewed in a table. You can view the status of a Collector in the table and access the configuration settings of Collectors and Collector related objects.

Figure 6-2 Event Source Management Table View

The screenshot shows a software interface with two tabs: 'Graph' and 'Table'. The 'Table' tab is active, displaying a table with three columns: 'Name', 'Configured Status', and 'Actual Status'. The table lists several components, with 'Syslog Server TCP' highlighted in blue. The 'Name' column includes expand/collapse icons (minus/plus signs) and a globe icon for Sentinel. The 'Configured Status' and 'Actual Status' columns both show 'On' for all listed items.

Name	Configured Status	Actual Status
Sentinel	On	On
Sentinel Server	On	On
Syslog Server TCP	On	On
Syslog Server UDP	On	On
Generic Event	On	On
Audit Server	On	On
Novell Access Manager	On	On
Cisco Firewall 6.1r2	On	On
Syslog Connector	On	On

The columns in the ESM table view are as follows:

Configured Status: The On state the object is configured to be in. This is the state that is stored in the database, which does not necessarily match the actual On state of the object. For example, the two states do not match if a parent object is turned off or if there is an error.

Actual Status: The On state of the object as reported by the actual running Collector Manager.

Connection Info (populated for Event Sources only): A text description of the event source connection.

Error: A text description of an error that occurred in the running object.

TIP: Use the **Table** and **Graph** tabs to change to tabular and graphical views.

How the Components Are Displayed

ESM displays the information on the Collectors and other components in a hierarchy specific to ESM.

Table 6-1 Components of the ESM Hierarchy

	Sentinel	<p>The single Sentinel icon represents the main Sentinel Server that manages all events collected by the Sentinel system.</p> <p>The Sentinel object is installed automatically through the Sentinel installer.</p>
	Collector Manager or the Sentinel Server	<p>The Collector Manager display name in the ESM is Sentinel Server.</p> <p>Each icon represents another instance of a Collector Manager process. Multiple Collector Manager processes can be installed throughout the enterprise. As each Collector Manager process connects to Sentinel, the objects are automatically created in ESM.</p>
	Collector	<p>Collectors instantiate the parsing logic for data from a particular event source. Each Collector icon in ESM refers to a deployed Collector script as well as the runtime configuration of a set of parameters for that Collector.</p>
	Connector	<p>Connectors are used to provide the protocol-level communication with an event source, using industry standards like Syslog, JDBC, and so forth. Each instance of a Connector icon in ESM represents the Connector code as well as the runtime configuration of that code.</p>
	Event Source Server	<p>An Event Source Server (ESS) is considered part of a Connector, and is used when the data connection with an event source is inbound rather than outbound. The ESS represents the daemon or server that listens for these inbound connections. The ESS caches the received data, and one or more Connectors connect to the ESS to retrieve a set of data for processing. The Connector requests only the data from its configured event source (defined in the metadata for the event source) that matches additional filters.</p>
	Event Source	<p>The event source represents the actual source of data for Sentinel. Unlike other components, this is not a plug-in, but is a container for metadata, including runtime configuration about the event source. In some cases a single event source can represent many real sources of event data, such as if multiple devices are writing to a single file.</p>

Component Status Indicators

Indicators are used to represent various states as follows:

Table 6-2 Component Status Indicators

	Stopped	Indicates that the component is stopped.
	Running	Indicates that the component is running.
	Warning	Indicates that a warning is associated with the component. At this time, this warning indicator is primarily used to show when the configured state and actual state of a component differ. (That is, a component is configured to be running, but the actual state of the component is stopped.)
	Error	Indicates that an error is associated with the component. See the individual component's status display for details about the error.
	Reporter Time is Skewed	Indicates when the time of a component differs from the main server's time. (The difference is greater than a predefined time threshold.)
	Debug	Indicates that the component is in Debug mode. Only a Collector can be in Debug mode.
	Unknown	Indicates that the status of the object in the ESM panel is not yet known.

Right-Click Menus

The Health Monitor Display View provides a set of right-click menus that helps you execute a set of actions, as described below:

The right-click actions available depend on the object you click.

Status Details: View all information known about the status of the selected object.

Start: Run an object.

The selected object starts only after the parent nodes starts and is running.

Stop: Stops the running object.

Edit: Modifies the editable information (Filter information, Object name and so on).

Debug: Debugs the Collector. You must stop the running Collector before you debug it.

Move: Moves the selected object from its current parent object to another parent object. You can move objects from a Live View to the scratch pad and vice versa.

Clone: Creates a new object that has its configuration information pre-populated with the settings of the currently selected object. This allows you to quickly create a large number of similar event sources without retyping the same information over and over again. You can clone objects from Live View to the scratch pad and vice versa. Cloning an object copies all the settings except the Run status. New objects created using the Clone command are always in the Stopped state after creation.

Remove: Deletes a selected object from the system.

Contract: Collapses the child nodes into this node. This option is only available on parent nodes that are currently expanded.

Expand: Expands the child nodes of this node. This option is only available on parent nodes that are currently collapsed.

Add Collector: Opens an Add Collector Wizard that guides you through the process of adding a Collector to the selected Collector Manager.

Add Connector: Opens an Add Connector Wizard that guides you through the process of adding a Connector to the selected Collector.

Add Event Source: Opens an Add Event Source Wizard that guides you through the process of adding an event source to the selected Connector.

Open Raw Data Tap: Lets you view the live stream of raw data from an event source or flowing through the selected object.

Zoom: In the graphical view, zoom in on the selected object.

Show in Tabular/Graphical View: Lets you switch between the graphical view and the tabular view and automatically selects the object that is selected in the current view. When switching to the graphical view, it also zooms in on the selected object.

Raw Data Filter: Filters the raw data flowing through the selected node. The raw data filter is available on Collectors, Connectors, and event sources. If a filter specifies to drop data, the data to be dropped is not passed to the parent node and is not converted into events.

Import Configuration: Imports the configuration of ESM objects.

Export Configuration: Exports the configuration of ESM objects

Add Event Source Server: Adds an Event Source Server to the selected Collector Manager

Add Collector Manager: In Scratch pad mode, you can add a Collector Manager to the scratch pad by using this option. In the Live view, Collector Manager objects are created automatically as each Collector Manager connects to the Sentinel system.

When you select multiple objects in the ESM panel and right-click, the following options are available:

Start: Starts all objects

Stop: Stops all objects

Remove selected objects: Removes the selected objects along with their children.

Searching for Event Sources

You can use the Attribute Filter panel to search for event sources.

- 1 Access Event Source Management.

For more information, see [“Accessing Event Source Management” on page 100.](#)

- 2 In the Attribute Filter panel, use the following information to display objects you want:

Search: Specify the name of the objects you want displayed.

Limit to: Select the types of objects to display.

Status: Select the status of the objects to display.

As you define each filter, the display is automatically updated.

Installing Plug-Ins

Although some Sentinel components are preinstalled with the Sentinel system, you should also check the [Sentinel Plug-ins Web site](#) to download the latest versions on the plug-ins.

- ♦ [“Installing a Connector Plug-In” on page 107](#)
- ♦ [“Installing a Collector Plug-In” on page 107](#)

Installing a Connector Plug-In

- 1 Access Event Source Management.

For more information, see [“Accessing Event Source Management” on page 100](#).

- 2 In the toolbar, click **Tools > Import plug-in**.

- 3 Select **Import Collector Script or Connector plug-in package file (.zip, .clz, .cnz)**.

- 4 Click **Next**.

- 5 Click **Browse**.

- 6 Browse to and select the Connector plug-in package file, then click **Open**.

- 7 Click **Next**.

- 8 (Conditional) If the Connector already exists in the plug-in repository, select to replace the existing plug-in with the new plug-in by clicking **Next**.

- 9 (Conditional) In the plug-in details window, select **Deployed Plug-ins** to deploy the plug-in from this window.

For more information, see [“Access Event Source Management.” on page 111](#).

- 10 Click **Finish**.

When you add a plug-in to Sentinel, it is placed in the plug-in repository, which enables Sentinel components on other machines to start using the plug-in without adding the plug-in separately.

Installing a Collector Plug-In

- 1 Access Event Source Management.

For more information, see [“Accessing Event Source Management” on page 100](#).

- 2 In the toolbar, click **Tools > Import plug-in**.

- 3 Select **Import Collector Script or Connector plug-in package file (.zip, .clz, .cnz)**.

or

Select **Import Collector Script from directory**.

- 4 Click **Next**.

- 5 Click **Browse**.

- 6 Browse to and select the Collector script from a file or directory, then click **Open**.
- 7 Click **Next** to display the plug-in details window.
- 8 Select **Deploy Plug-in** to deploy the plug-in from this window.
For more information on the deployment procedure, see [“Access Event Source Management.” on page 111.](#)
- 9 Click **Finish**.

Updating a Connector or a Collector Plug-In

If a new version of a Connector or Collector is released, you can update the Sentinel system and any deployed instances of the Connector or Collector.

- 1 Access Event Source Management.
For more information, see [“Accessing Event Source Management” on page 100.](#)
- 2 In the toolbar, click **Tools > Import plug-in**.
- 3 Select **Import Collector Script or Connector plug-in package file (.zip, .clz, .cnz).**
or
Select **Import Collector Script from directory**.
- 4 Click **Next**.
- 5 Click **Browse**.
- 6 Browse to and select the Connector or Collector plug-in package file, then click **Open**.
- 7 Click **Next**.
- 8 Click **Next** to update an already-imported Connector or Collector.
- 9 In the plug-in details window, select **Update Deployed Plug-ins** to update any currently deployed plug-ins that use this Connector or Collector.
- 10 Click **Finish**.

When you add a plug-in to Sentinel, it is placed in the plug-in repository, which enables Sentinel components on other machines to start using the plug-in without adding the plug-in separately.

Adding Components to Sentinel

After the plug-ins are installed in the Event Source Management, you must add the different components to your Sentinel solution.

- ♦ [“Adding a Collector” on page 108](#)
- ♦ [“Adding a Connector” on page 109](#)
- ♦ [“Adding an Event Source” on page 109](#)
- ♦ [“Adding an Event Source Server” on page 109](#)

Adding a Collector

- 1 Access Event Source Management.
For more information, see [“Accessing Event Source Management” on page 100.](#)

- 2 In the main ESM display, locate the Collector Manager where the Collector will be associated.
- 3 Right-click the Collector Manager, then select **Add Collector**.
- 4 Follow the prompts in the Add Collector Wizard.
These prompts are unique for each Collector. For details, see the specific Collector documentation at the [Sentinel Plug-ins Web page \(https://marketplace.microfocus.com/arcmsight/category/sentinel\)](https://marketplace.microfocus.com/arcmsight/category/sentinel).
- 5 Click **Finish**.

The Collector Script enables the ESM panel to prompt you for parameter values as well as enable Event Source Management to automatically select supported connection methods that work well with the Collector script.

Adding a Connector

- 1 Access Event Source Management.
For more information, see “[Accessing Event Source Management](#)” on page 100.
- 2 In the main ESM display, locate the Collector where the new Connector will be associated
- 3 Right-click the Collector, then select **Add Connector**.
- 4 Follow the prompts in the Add Connector Wizard.
These prompts are unique for each Connector. For details, see the specific Connector documentation at the [Sentinel Plug-ins Web page \(https://marketplace.microfocus.com/arcmsight/category/sentinel\)](https://marketplace.microfocus.com/arcmsight/category/sentinel).
- 5 Click **Finish**.

Adding an Event Source

- 1 Access Event Source Management.
For more information, see “[Accessing Event Source Management](#)” on page 100.
- 2 In the main ESM display, locate the Connector where the new event source will be associated.
- 3 Right-click the Connector, then select **Add Event Source**.
These prompts are unique for each event source that is associated with the Connector. For details, see the specific Connector documentation at the [Sentinel Plug-ins Web page \(https://marketplace.microfocus.com/arcmsight/category/sentinel\)](https://marketplace.microfocus.com/arcmsight/category/sentinel).
- 4 Follow the prompts in the Add Event Source Wizard.
- 5 Click **Finish**.

Adding an Event Source Server

Certain event source Connectors (such as the Syslog Connector) require a process to collect data from the actual data source. These processes are called Event Source Servers. They collect data from the data source and then serve it to the event source Connector. Event Source Servers must be added and associated to any event source Connectors that require a server.

- 1 Access Event Source Management.
For more information, see “[Accessing Event Source Management](#)” on page 100.

2 Right-click the Collector Manager, then select **Add Event Source Server**.

3 Select a Connector that supports your device, then click **Next**.

If you do not have any connectors in the list that supports your device, click **Install More Connectors**. For more information on installing a Connector plug-in, see “[Installing a Collector Plug-In](#)” on page 107.

4 Configure the various parameters for the server that is associated with the selected Connector. For example, Syslog Connector, NAudit Connector, and so on.

These parameters are unique for each Connector. For details, see the specific Connector documentation at the [Sentinel Plug-ins Web page \(https://marketplace.microfocus.com/arcsight/category/sentinel\)](https://marketplace.microfocus.com/arcsight/category/sentinel).

5 Click **Next**.

6 Specify a name for the Event Source Server.

7 (Optional) If you want this server to run, select **Run**.

8 Click **Finish**.

In the Health Monitor Display frame, the Event Source Server is displayed with a dashed line showing which the Collector Manager it is associated with.

This Add Event Source Server Wizard can also be initiated from within the Add Connector Wizard if a compatible Event Source Server has not yet been added.

Connecting to Event Sources

There are many different ways to add an event source. The following procedures walk you through the process.

- ♦ “[Prerequisites](#)” on page 110
- ♦ “[Connecting to the Event Source](#)” on page 111
- ♦ “[Creating a New Collector and Connector](#)” on page 112
- ♦ “[Using an Existing Collector](#)” on page 113
- ♦ “[Using an Existing Connector](#)” on page 114

Prerequisites

Make sure you have the following prerequisites:

Collector Script: Collector scripts can be downloaded from the [Sentinel Plug-ins Web site \(https://marketplace.microfocus.com/arcsight/category/sentinel\)](https://marketplace.microfocus.com/arcsight/category/sentinel) or built with the Collector Builder.

Connector: Connectors can be downloaded from the [Sentinel Plug-ins Web site \(https://marketplace.microfocus.com/arcsight/category/sentinel\)](https://marketplace.microfocus.com/arcsight/category/sentinel). There are also some Connectors included in the installed Sentinel system, but there might be more recent versions on the Web site.

Documentation: Check the documentation for each Connector and Collector, because they have different configuration steps for the event source. The documentation is located on the [Sentinel Plug-ins Web site \(https://marketplace.microfocus.com/arcsight/category/sentinel\)](https://marketplace.microfocus.com/arcsight/category/sentinel). Make sure you download the documentation when you download the Connector and Collector.

Event Source Configuration: You must have configuration information for the event source.

Connecting to the Event Source

- 1 Access Event Source Management.

For more information, see [“Accessing Event Source Management” on page 100](#).

- 2 In the toolbar, click **Tools** > **Connect to Event Source**.

The event source types for the compatible Collector parsing scripts are listed here.

- 3 Select the desired Event Source.

You can click **Add More** to import an event source not listed.

- 4 After the event source is selected, click **Next**.

- 5 Select a Collector script from the list.

You can click **Install More Scripts** to install additional Collector scripts that support your Event Source.

For more information on installing a Collector script, see [“Installing a Collector Plug-In” on page 107](#).

- 6 Click **Next**.

- 7 Select a connection method from the list.

There are many different types of Connectors. Depending on the type of Connector you select, there are additional configuration screens.

You can click **Install More Connectors** to install additional Connectors.

For more information, see [“Installing a Connector Plug-In” on page 107](#) to install connectors.

- 8 Click **Next**.

- 9 Use the following information to select how to manage the event source connection, then proceed to [Step 10](#).

- ◆ [“Creating a New Collector and Connector” on page 112](#)
- ◆ [“Using an Existing Collector” on page 113](#)
- ◆ [“Using an Existing Connector” on page 114](#)

Based on the existing Collectors and Connectors in your system that are compatible with your new event source, one or more of these options might be unavailable.

- 10 Use the following information to configure the event source:

Name: Specify a unique name for the event source.

Run: Select **Run** if you want the event source to run automatically.

Details: Allows you to see the details of the plug-in.

Alert if no data received in specified time period: Select this option to receive notifications if no data is received during the specified time period.

Limit Data Rate: Use this option to limit the maximum number of records the Connector receives per second.

Number of Threads: (Optional) Specify the number of CPU threads to use to process data. Using multiple threads allows the collector to process more events per second.

You can view the actual number of threads the collector is using in the Health statistics in the Sentinel Main interface.

Trust Event Source Time: (Optional) Select this option to set the event time to the time the event occurred, rather than the time Sentinel received the data.

You can also set this option while configuring an event source. If the **Trust Event Source Time** option is selected, all data flowing through the Collector has the event time set to the time the event occurred, even if the event sources do not have this option selected.

Set Filters: Allows you to set filters on the data in the event source.

- 11 Click **Next**.
- 12 Click **Test Connection** to test the event source.
 - 12a Click the **Data** tab to view the data in the event source.

It takes a few seconds for the raw data to be displayed in the **Data** tab.
 - 12b Specify the maximum number of rows to control the number of raw data records obtained at one time.
 - 12c Click the **Error** tab to view if there are any errors in the configuration of the event source.
 - 12d Click **Stop** to stop the test.
- 13 Click **Finish**.

The Collector parsing script is executed on the same system as the Collector Manager that you select here.

Creating a New Collector and Connector

Use the following information to create a new Collector and Connector to manage the event source connection. This procedure is a continuation of [Step 9 on page 111](#).

- 1 Select **Create a new Collector and Connector**, then click **Next**.
- 2 Select the Collector Manager you want to use, then click **Next**.
- 3 Change any of the Collector properties, then click **Next**.
- 4 Use the following information to configure the Collector:
 - Name:** Specify a unique name for the Collector.
 - Run:** Select **Run** if you want to run the Collector automatically.
 - Details:** Allows you to view the details of the plug-in.
 - Alert if no data received in specified time period:** Select this option to receive notifications if no data is received during the specified time period.
 - Lime Data Rate:** Use this option to limit the maximum number of records the Collector receives per second.
 - Trust Event Source Time:** (Optional) Select this option to set the event time to the time the event occurred, rather than the time Sentinel received the data.

You can also set this option while configuring an event source. If the **Trust Event Source Time** option is selected, all data flowing through the Collector has the event time set to the time the event occurred, even if the event sources do not have this option selected.
 - Set Filters:** Allows you to set filters on the data in the Collector.
- 5 Click **Next**.

There is a different configuration page displayed depending on the type of Connector you selected in [Step 7 on page 111](#). For the Connector-specific documentation, see the [Sentinel Plug-ins Web site](#).

- 6 Use the following information to configure the Connector:

Name: Specify a unique name for the Connector.

Run: Select **Run** if you want to run the Connector automatically.

Details: Allows you to view the details of the plug-in.

Alert if no data received in specified time period: Select this option to receive notifications if no data is received during the specified time period.

Limit Data Rate: You can limit the maximum number of records the Connector receives per second.

Set Filters: Allows you to set filters on the data in the Connector.

Copy Raw Data to a file: Select this option, then specify a location where you want to copy the raw data coming from the event source.

- 7 Click **Next**, then continue with [Step 10 on page 111](#).

Using an Existing Collector

If you are using an existing Collector, but want to create a new Connector to manage the Event Source connection, use the following information to complete the procedure from [Step 9 on page 111](#).

- 1 Select **Use an Existing Collector**, then click **Next**.

- 2 Select the Collector you want to use, then click **Next**.

There is a different configuration page displayed depending on the type of Connector you selected in [Step 7 on page 111](#). For the Connector-specific documentation, see the [Sentinel Plug-ins Web site](#).

- 3 Use the following information to configure the Connector:

Name: Specify a unique name for the Connector.

Run: Select **Run** if you want to run the Connector automatically.

Details: Allows you to view the details of the plug-in.

Alert if no data received in specified time period: Select this option to receive notifications if no data is received during the specified time period.

Limit Data Rate: Use this option to limit the maximum number of records the Connector receives per second.

Set Filters: Allows you to set filters on the data in the Connector.

Copy Raw Data to a file: Select this option, then specify a location where you want copy the raw data coming from the event source.

- 4 Click **Next**, the continue with [Step 10 on page 111](#).

Using an Existing Connector

If you are using an existing Connector, but want to create a new Collector to manage the event source connection, use the following information to continue the procedure from [Step 9 on page 111](#).

- 1 Select **Use an Existing Connector**, then click **Next**.
- 2 Select the Collector Manager you want to use, then click **Next**.
- 3 Change any of the Collector properties, then click **Next**.
- 4 Use the following information to configure the Collector:
 - Name:** Specify a unique name for the Collector.
 - Run:** Select **Run** if you want to run the Collector automatically.
 - Details:** Allows you to view the details of the plug-in.
 - Alert if no data received in specified time period:** Select this option to receive notifications if no data is received during the specified time period.
 - Lime Data Rate:** Use this option to limit the maximum number of records the Collector receives per second.
 - Trust Event Source Time:** (Optional) Select this option to set the event time to the time the event occurred, rather than the time Sentinel received the data.
You can also set this option while configuring an event source. If the **Trust Event Source Time** option is selected, all data flowing through the Collector has the event time set to the time the event occurred, even if the event sources do not have this option selected.
 - Set Filters:** Allows you to set filters on the data in the Collector.
- 5 Click **Next**, then continue with [Step 10 on page 111](#).

Exporting Configurations

Event Source Management allows you to export the configuration of Event Source Management objects along with the associated Collector scripts and the Connector plug-ins. You can export the configuration at Sentinel level or at individual objects' level such as Collector Manager, Collector and Connector. However, exporting the configuration at Collector Manager level allows you to easily import the configuration to individual Collector Manager.

- 1 Access Event Source Management.
For more information, see [“Accessing Event Source Management” on page 100](#).
- 2 Right-click the Collector Manager, then click **Export Configuration**.
- 3 Select which nodes you want to export, then click **Next**.
- 4 Select the Collector scripts to export, then click **Next**.
- 5 Select the Connector plug-ins to export, then click **Next**.
- 6 Click **Browse**, then browse to a location to save the export.
- 7 Specify a file name, then click **Save**.
The export information is saved as a `.zip` file.

- 8 Click **Next**.
- 9 Review the items to be exported, then click **Finish**.

Importing Configurations

Event Source Management allows you to import the configuration files that you export. The configuration files contain configuration information for Event Source Management objects along with the associated Collector scripts and Connector plug-ins.

- 1 Access Event Source Management.
For more information, see [“Accessing Event Source Management” on page 100](#).
- 2 Right-click the Collector Manager, then click **Import Configuration**.
- 3 Click **Browse** and browse to and select the configuration file, then click **Open**.
The configuration files are .zip files.
- 4 Click **Next**.
- 5 Select the nodes to import, then click **Next**.
- 6 Select the Collector scripts to import, then click **Next**.
- 7 Select the Connector plug-ins to import, then click **Next**.
- 8 Review the items to import, then click **Finish**.

Debugging

Sentinel's Collectors are designed to be easily customizable and to be created by customers and partners. The debugging interface analyzes the Collector code running in place on the Collector Manager.

For more information on customizing or creating new Collectors, obtain the Developer's Kit for Sentinel at the [Sentinel SDK Web site](#).

- ♦ [“Collector Workspace and Collector Directory” on page 115](#)
- ♦ [“Debugging JavaScript Collectors” on page 116](#)
- ♦ [“Generating a Flat File using the Raw Data Tap” on page 118](#)

Collector Workspace and Collector Directory

Collectors are simple text scripts that are run by a Collector Manager. The handling of these scripts is a bit complex:

1. The code for all Collectors is stored in a plug-in repository on the central Sentinel server when the Collectors are imported.

Location: `sentinel/data/plugin_repository` on the Sentinel server.
2. The runtime configuration for the Collector (when it is configured to run on a particular Collector Manager) is stored separately in the Sentinel database.
3. When a Collector is actually started in the Collector Manager, the Collector plug-in is deployed to the Collector Manager, the runtime configuration is applied, and the code is started. Any pre-existing instance of the Collector code on that Collector Manager is overwritten.

Location: `sentinel/data/collector_mgr.cache/collector_instances` on each Collector Manager.

4. In order to edit a Collector, you need to use the ESM Debugger **Download** button, which copies the Collector to the local Collector workspace on the client machine (the machine where you are running Sentinel Control Center). Edits are made against that local copy and then uploaded back into the central plug-in repository.

Location: `sentinel/data/collector_workspace` on the client application machine.

Debugging JavaScript Collectors

The debugger for JavaScript Collectors can be used to debug any JavaScript Collector.

- 1 Access Event Source Management.

For more information, see [“Accessing Event Source Management” on page 100](#).

- 2 Select a Collector to debug in the Live View.

- 3 Select the debug mode:

Live Mode: Requires that the Collector Manager is currently running. For more information, see [“Live Mode” on page 117](#).

Stand-alone Mode: Allows you to run the Collector in debug mode without a Collector Manager running. For more information, see [“Stand-alone Mode” on page 117](#).

- 4 Right-click the Collector and select **Stop**, then click **Debug**.

The following describe how to use the JavaScript debug window:

Debug: Launches the JavaScript file in this window.

Upload/Download: Upload or download a JavaScript file here. You can download an existing JavaScript file, edit it, and upload it again to continue debugging.

Context: Displays the variable that the debugger is pointing to and its value.

Expression: Watch the values of a selected parameter here.

You can use the following options when debugging a Collector:

Run	Starts debugging.
Pause	Pauses debugging.
Step Into	Steps to the next line in the script.
Step Over	Steps over a function.
Step Out	Steps out of a function.
Stop	Stops debugging.

- ♦ [“Hot Keys” on page 117](#)
- ♦ [“Live Mode” on page 117](#)
- ♦ [“Stand-alone Mode” on page 117](#)

Hot Keys

When the source code window has the focus in the debugger, you can use the following hot keys:

- ♦ Ctrl+F to find a string in the source code
- ♦ Ctrl+G to go to a line number
- ♦ Ctrl+M to find the parenthesis or brace that matches the selected parenthesis or brace

You can also open a script file, set break-point, step through the script code, and watch variables and methods values at each step.

Live Mode

- ♦ Live debug mode requires that the Collector Manager associated with the Collector is running.
- ♦ In Live debug mode, Input to the script comes from actual event sources connected to the Collector. To get data from a specific event source, you must right-click and start the desired event source via the Event Source Management display. Starting or stopping event sources can be done any time during the debug session.

If no event source is started during the debug session, no data is available in the buffer for the Collector and you see the Collector script's readData method blocking.

- ♦ In Live debug mode, output from the script is via live Sentinel Events.

When you are in Live debug mode, the script engine is executed on the local computer rather than the actual computer that the associated Collector Manager is running on. The Connectors and event sources still runs on the same box as the Collector Manager. When you are running debug mode, data is automatically routed from the event sources to the script engine running in debug on the local box.

Stand-alone Mode

- ♦ Stand-alone debug mode allows you to debug a Collector even if the associated Collector Manager is not running.
- ♦ For stand-alone mode, input to the script comes from an input file rather than a live event source. Specify the path to a raw data file that is used as input. For Collectors that use a DB Connector, the input file is a text file with log data in nvp format and for a Collector that uses the File Connector, the input file is a text file with log data in CSV format.
- ♦ For stand-alone mode, Output from the script is to an output file rather than to live events. You must specify the path to the output file that the script uses for output. If you specify an output file that does not exist, the system creates the file for you.

To debug in Stand-alone mode:

- 1 In Event Source Management, right-click the Collector to debug.
- 2 Select **Stop**.
- 3 Select **Debug**.
- 4 Select **Stand-alone Mode**, then specify a path for the input and output files.
If you specify an output file that does not exist, the system creates the file for you.
- 5 Click **OK** to display the Debug Collector window.
- 6 In the Debug Collector window, click **Run**.

In the Source text area, the source code of the Collector appears and stops at the first line of the text script.

- 7 Click the left side bar to toggle a breakpoint in the script code.
- 8 Click **Step Into** to go to the next breakpoint.
- 9 Click **Pause** to pause debugging whenever you want.
- 10 After debugging is complete, click **Stop** to stop debugging.
- 11 Click the **Upload/Download** tab in the debugger window.
- 12 Click **Download**, then specify a location to download the script file.
- 13 Open the file with any JavaScript editor, then make your edits.
- 14 Save the file, then click **Upload**.
- 15 Debug the uploaded script to have a Collector Script ready to use.

Generating a Flat File using the Raw Data Tap

Occasionally when debugging, it might be helpful to view Connector output data. In addition to the **Raw Data Tap** right-click option for nodes in the Sentinel Control Center, Sentinel also includes an option to save the raw data from a Connector to a file for further analysis.

To save raw data from a deployed Connector to a file:

- 1 Access Event Source Management.
For more information, see [“Accessing Event Source Management” on page 100](#).
- 2 Right-click the Connector node, then click **Edit**.
- 3 Click the **Configure Connector** tab.
- 4 Select the **Copy Raw Data** to a file.
- 5 Specify (or browse to and select) a path on the Collector Manager machine where the raw data is saved.

IMPORTANT: The account running the Sentinel service on the Collector Manager machine must have permissions to write to the file location.

Troubleshooting

If the help does not launch, there is a cache file on the local machine that is running the Event Source Management that must be deleted.

- 1 Exit Event Source Management and the Sentinel Control Center.
- 2 On the local machine running Event Source Management, search for the `.novell` directory.
- 3 Delete the `sentinel` subdirectory in the `.novell` directory.
- 4 Launch Event Source Management, then click **Help**.
For more information, see [“Accessing Event Source Management” on page 100](#).

Managing Event Sources

The Event Sources interface displays the health of the event source and the volume of data being received from it in events per second. The event sources page lists all the event sources, such as Syslog, Audit, File, and Database, that are configured in the Event Source Management interface.

You can refine the displayed event sources by selecting Collector Managers, Event Source Servers, and Collector plug-ins. You can also specify a filter on the event source name and select particular event source health states you want to view. All of these selections and filters are stored on a per-user basis, so that each time you log into the Sentinel server you can view event sources that match your last selections. You can also perform filtering based on tags. For more information, see [“Configuring Tags”](#) in the *Sentinel User Guide*.

- ◆ [“Viewing the Event Sources Page”](#) on page 119
- ◆ [“Changing the Data Logging Status of Event Sources”](#) on page 122

Viewing the Event Sources Page

The Event Sources page consists of different sections that allow you to perform different functions.

Collector Managers: Lists all the Collector Managers associated with the Sentinel system. It also displays the state and details about the Collector Managers.

Event Source Servers: Lists all the Event Source Servers associated with the Sentinel system. It also displays the state of the Event Source Servers.

Collector Plug-ins: Lists all the Collector plug-ins associated with the Sentinel system. You can also view the details about the installed plug-ins.

The Event Sources section in the right pane lists the event sources based on the options selected from the left pane.

NOTE: The Event Sources page shows event sources that were already configured or automatically detected. To manually configure additional event sources, use the Event Source Management user interface described in [“Configuring Data Collection for Other Event Sources”](#) on page 100.

- ◆ [“Viewing Event Sources”](#) on page 119
- ◆ [“Viewing Collector Managers”](#) on page 121
- ◆ [“Viewing Event Source Servers”](#) on page 121
- ◆ [“Viewing Collector Plug-Ins”](#) on page 121

Viewing Event Sources

- 1 From **Sentinel Main**, click **Collection > Event Sources**.

The Event Sources page is displayed.

Each column in the Event Source section has different information:

Health Icon: The colored icon indicates the event source health.

- ◆ **Green:** Indicates that the event source is healthy and Sentinel has received data from it.

- ◆ **Red:** Indicates that the Sentinel server is reporting an error about connecting to or receiving data from this event source.
- ◆ **Gray:** Indicates that the event source is turned off. Sentinel is not processing any data from it.
- ◆ **Orange:** Indicates that the event source is running with some warnings.

You can sort the event sources based on their health status.

Name: Displays the name given to the Event Source by the system (if it was auto-created) or by a user. For Syslog Event Sources, if the Event Source was auto-created by the system, the name is a combination of the hostname/IP address and the Collector connection mode the event source is using.

You can rename any Event Source at any time through the Event Source Management interface.

You can sort the Event Sources in alphabetical order based on their names.

Collector Plug-in: Displays the name of the Collector plug-in that the event source is connected to.

This is the name of the Collector plug-in, not the name of the Collector instance. You can sort the event sources based on Collector plug-in name.

Store raw data: Indicates whether the raw data from the associated event source should be stored.

- ◆ **Yes:** If **Store raw data** is set to Yes, all the data from the event source is saved and events are generated. When it is set to Yes, data is always saved, regardless of whether a filter is set on the event source using the Event Source Management user interface. However, if a filter is set, events might not be generated if the filter causes the data to be ignored.

You can sort the event sources based on the store raw data status.

- ◆ **No:** If **Store raw data** is set to No, all the data received from the event source is not stored. This means that the data is not saved and events are not generated.

Create Date: Specifies the date and time when the event source was created. You can sort the event sources based on when they were created.

EPS: Displays the events per second value received from the event source. You can sort the event sources based on their events per second value.

If you see a value of less than one (<1) in this column, it indicates that the EPS rate is greater than zero, but less than one.

- 2 To select or deselect an event source, select the check box next to the event source.

To select all the available event sources, select the check box at the top of the column.

- 3 To sort the event sources by **Health**, **Name**, **Collector Plug-in**, **Store raw data**, **Create Date**, and **EPS** values, click the column header. The selected column header is displayed in bold.

When you first click a column header, the event sources are arranged in ascending order. A blue down-arrow is displayed to indicate that the sort order is ascending. When you click the column header for the second time, the sort order is changed to descending, and a blue up-arrow is displayed to indicate that the sort order is descending.

- 4 To view additional information about an event source, click the **Name** or **EPS** value of an event source. A dialog box displays the additional information.

Viewing Collector Managers

- 1 From **Sentinel Main**, click **Collection > Event Sources**.

The Collector Manager section is displayed in the Event Sources page.

Health: Indicates the health of the Collector Managers. You can sort the Collector Managers based on their health status.

Name: Displays the names of the Collector Managers. You can sort the Collector Managers in alphabetical order based on their names.

EPS: Displays the events per second value received from the event sources. You can sort the Collector Managers based on the events per second value.

- 2 To select or deselect a Collector Manager, select the check box next to the Collector Manager.

To select all the available Collector Managers, select the check box located at the top of the column.

The right pane displays the list of event sources connected to the selected Collector Managers.

If none of the Collector Managers are selected, the event sources table displays all the configured event sources.

- 3 To sort the Collector Managers by **Health**, **Name**, and **EPS** values, click the column header. The selected column header displays in bold text.
- 4 To get additional information about the Collector Managers, click the **Name** or **EPS** value column. A dialog box displays the additional information.

Viewing Event Source Servers

- 1 From **Sentinel Main**, click **Collection > Event Sources**.

The Event Source Servers section is displayed.

Health: Indicates the health of the Event Source Server. You can sort the Event Source Servers based on their health status.

Name: Displays the names of the Event Source Server used to parse the data from the event sources (for example, Syslog Server SSL). You can sort the event source server in alphabetical order based on their names.

EPS: Displays the events per second value received from the event sources. You can sort the event source servers based on the events per second value.

- 2 To sort the Event Source Servers by **Health**, **Name**, and **EPS** values, click the column header. The selected column header displays in bold text.
- 3 To view additional details, click the **Name** or **EPS** value column. A dialog box displays the additional information.

Viewing Collector Plug-Ins

- 1 From **Sentinel Main**, click **Collection > Event Sources**.

Health: Indicates the aggregate health of all event sources that are connected to the Collector plug-in.

With the exception of the green icon (healthy state), the icon does not necessarily mean that all event sources connected to the Collector plug-in are in the state indicated by the icon.

The red icon (error state) indicates that one or more event sources connected to the Collector plug-in are in an error state. To get a detailed information, click the **Name** or **EPS** column value to view help information.

Name: Displays the names of the Collector plug-in used to parse the data from the event sources (for example, Cisco Firewall 6.1r1).

This is the name of the Collector plug-in, not the name of the Collector instance. You can sort the event sources based on Collector plug-in name.

EPS: Displays the events per second value received from the event sources. You can sort the Collector based on the events per second value.

- 2 To select or deselect the Collector plug-ins, select the check box next to the Collector plug-in. To select all the available Collector plug-ins, select the check box at the top of the column.
- 3 To sort the Collector plug-ins by **Name** or **EPS** values, click the appropriate column header. The selected column header displays in bold text.

The **Collector Instances** field displays the number of instances of the Collector plug-in. Clicking the **Collector Instances** field displays a **Collectors** window with a list of Collector instances associated with the Collector plug-in:

- 4 Click the **Collector Plug-in** column to display a dialog box with additional information about the Collector plug-in.

Changing the Data Logging Status of Event Sources

- 1 From Sentinel Main, click **Collection > Event Sources**.
- 2 To change the data logging status for one or more event sources, select the event sources from the list.
- 3 Click the **Configure** button from the Settings drop-down, then click **Edit** to edit the store raw data settings.

Yes: If **Yes** is selected, the selected event sources forward events received to the Collectors they are connected to.

No: If **No** is selected, the selected event sources drop all the events received. Messages are not sent to the Collectors they are connected to.

If you select a large number of event sources to change, it might take some time to complete. The Event Sources list does not show the store raw data status (**Yes** or **No**) until after the changes are complete and the display is refreshed from the database.

7 Configuring Agent-Based Data Collection

Agent Manager provides host-based data collection that complements agentless data collection by allowing you to:

- ◆ Access logs not available from the network
- ◆ Operate in tightly-controlled network environments
- ◆ Improve security posture by limiting attack surface on critical servers
- ◆ Provide enhanced reliability of data collection during times of network interruption

Agent Manager allows you to deploy agents, manage agent configuration, and act as a collection point for events flowing into Sentinel. For more information about Agent Manager, see the Agent Manager documentation.

Configuring ArcSight SmartConnectors for Data Collection

Sentinel leverages ArcSight SmartConnector to collect events from various types of event sources not directly supported by Sentinel. SmartConnectors collect events from supported devices, normalizes events into the Common Event Format (CEF), and forwards them to Sentinel through the Syslog Connector. The Connector then forwards the events to Universal Common Event Format Collector for parsing.

For more information about configuring Sentinel with SmartConnectors, see the Universal Common Event Format Collector documentation on the [Sentinel Plug-ins Website](#).

9 Managing Event Sources

The Event Sources interface displays the health of the event source and the volume of data being received from it in events per second. The event sources page lists all the event sources, such as Syslog, Audit, File, and Database, which are configured in the Event Source Management interface.

You can refine the displayed event sources by selecting Collector Managers, Event Source Servers, and Collector plug-ins. You can also specify a filter on the event source name and select particular event source health states you want to view. All of these selections and filters are stored on a per-user basis, so that each time you log into the Sentinel server you can view event sources that match your last selections. You can also perform filtering based on tags. For more information, see “Configuring Tags” in the *Sentinel User Guide*.

- ♦ “Viewing the Event Sources Page” on page 127
- ♦ “Filtering Event Sources” on page 131

Viewing the Event Sources Page

The Event Sources page consists of different sections that allow you to perform different functions.

Collector Managers: Lists all the Collector Managers associated with the Sentinel system. It also displays the state and details about the Collector Managers.

Event Source Servers: Lists all the Event Source Servers associated with the Sentinel system. It also displays the state of the Event Source Servers.

Collector Plug-ins: Lists all the Collector plug-ins associated with the Sentinel system. You can also view the details about the installed plug-ins.

The Event Sources section in the right pane lists the event sources based on the options selected from the left pane.

NOTE: The Event Sources page shows event sources that were already configured or automatically detected. To manually configure additional event sources, use the Event Source Management user interface described in “Configuring Data Collection for Other Event Sources” on page 100.

- ♦ “Viewing Event Sources” on page 127
- ♦ “Configuring Event Sources” on page 129
- ♦ “Viewing Collector Managers” on page 129
- ♦ “Viewing Event Source Servers” on page 130
- ♦ “Viewing Collector Plug-Ins” on page 130

Viewing Event Sources

- 1 From **Sentinel Main**, click **Collection** > **Event Sources**.

Each column in the Event Source section has different information:

Health Icon: The colored icon indicates the event source health.

- ♦ **Green:** Indicates that the event source is healthy and Sentinel has received data from it.
- ♦ **Red:** Indicates that the Sentinel server is reporting an error about connecting to or receiving data from this event source.
- ♦ **Gray:** Indicates that the event source is turned off. Sentinel is not processing any data from it.
- ♦ **Orange:** Indicates that the event source is running with some warnings.

You can sort the event sources based on their health status.

Name: Displays the name given to the Event Source by the system (if it was auto-created) or by a user. For Syslog Event Sources, if the Event Source was auto-created by the system, the name is a combination of the hostname/IP address and the Collector connection mode the event source is using.

You can rename any Event Source at any time through the Event Source Management interface.

You can sort the Event Sources in alphabetical order based on their names.

Collector Plug-in: Displays the name of the Collector plug-in that the event source is connected to.

This is the name of the Collector plug-in, not the name of the Collector instance. You can sort the event sources based on Collector plug-in name.

Store raw data: Indicates whether Sentinel stores raw data from the associated event source.

- ♦ **Yes:** Sentinel stores all data received from the event source regardless of filter set on the event source.
- ♦ **No:** Sentinel does not store the data received from the event source and does not generate events.

You can sort the event sources based on the **Store raw data** status.

Parse: Indicates whether Sentinel parses the data received from the event source.

- ♦ **All:** Sentinel parses all the data received from the event source.
- ♦ **Filtered:** Sentinel parses only the filtered data received from the event source.
- ♦ **None:** Sentinel does not parse the data received from the event source.

NOTE: If the **Store raw data** option is set to No, Sentinel does not parse the data.

Create Date: Specifies the date and time when the event source was created. You can sort the event sources based on when they were created.

EPS: Displays the events per second value received from the event source. You can sort the event sources based on their events per second value.

If you see a value of less than one (<1) in this column, it indicates that the EPS rate is greater than zero, but less than one.

- 2 To select or deselect an event source, select the check box next to the event source.
To select all the available event sources, select the check box at the top of the column.
- 3 To sort the event sources by **Health**, **Name**, **Collector Plug-in**, **Drop Data**, **Create Date**, and **EPS** values, click the column header. The selected column header is displayed in bold.

When you first click a column header, the event sources are arranged in ascending order. A blue down-arrow is displayed to indicate that the sort order is ascending. When you click the column header for the second time, the sort order is changed to descending, and a blue up-arrow is displayed to indicate that the sort order is descending.

- 4 To view additional information about an event source, click the **Name** or **EPS** value of an event source. A dialog box displays the additional information.

Configuring Event Sources

- 1 From **Sentinel Main**, click **Collection** > **Event Sources**.
- 2 In the **Event Sources** tab, select one or more event source.

NOTE: If you select multiple event sources, the settings apply to all the selected event sources.

- 3 Click the **Settings** icon.
 - ◆ **Start:** Sentinel starts collecting raw data received from the event sources. Sentinel starts only the event sources that are in the stopped state. If the event sources are already in the start state, they remain unchanged.
 - ◆ **Stop:** Sentinel stops collecting raw data received from the event sources. Sentinel stops only the event sources that are in the start state. If the event sources already in the stopped state, they remain unchanged.
 - ◆ **Delete:** Deletes the selected event sources.
 - ◆ **Collector Plug-in:** Select the Collector plug-in to connect to the event sources.
 - ◆ **Tags:** Select the tags to set on the event sources.
 - ◆ **Configure:** Select Configure to set the following options in the **Configure Event Sources** window:
 - ◆ **No data alert:** Click **Edit** to configure notifications if Sentinel does not receive data from the event sources.
 - ◆ **Alert if no data received in specified time period:** Select this option to receive notifications if no data is received during the specified time period.
 - ◆ **Send repeated alerts every time period:** Select this option to receive repeated notifications at every time interval (specified in the **time period**).
 - ◆ **Time zone:** Select the time zone for the event source.
 - ◆ **Trust event source time** (Optional) Select this option to set the event time to the time the event occurred, rather than the time Sentinel received the data.
 - ◆ **Store raw data:** Select Yes to store the raw data from the event sources. If you select No, Sentinel does not store the raw data.

Click **Save** to apply the selected settings.

Viewing Collector Managers

- 1 From **Sentinel Main**, click **Collection** > **Event Sources**.
The Collector Manager section is displayed in the Event Sources page.

Health: Indicates the health of the Collector Managers. You can sort the Collector Managers based on their health status.

Name: Displays the names of the Collector Managers. You can sort the Collector Managers in alphabetical order based on their names.

EPS: Displays the events per second value received from the event sources. You can sort the Collector Managers based on the events per second value.

- 2 To select or deselect a Collector Manager, select the check box next to the Collector Manager.

To select all the available Collector Managers, select the check box located at the top of the column.

The right pane displays the list of event sources connected to the selected Collector Managers.

If none of the Collector Managers are selected, the event sources table displays all the configured event sources.

- 3 To sort the Collector Managers by **Health**, **Name**, and **EPS** values, click the column header. The selected column header displays in bold text.
- 4 To get additional information about the Collector Managers, click the **Name** or **EPS** value column. A dialog box displays the additional information.

Viewing Event Source Servers

- 1 From **Sentinel Main**, click **Collection** > **Event Sources**.

The Event Source Servers section is displayed.

Health: Indicates the health of the Event Source Server. You can sort the Event Source Servers based on their health status.

Name: Displays the names of the Event Source Server used to parse the data from the event sources (for example, Syslog Server SSL). You can sort the event source server in alphabetical order based on their names.

EPS: Displays the events per second value received from the event sources. You can sort the event source servers based on the events per second value.

- 2 To sort the Event Source Servers by **Health**, **Name**, and **EPS** values, click the column header. The selected column header displays in bold text.
- 3 To view additional details, click the **Name** or **EPS** value column. A dialog box displays the additional information.

Viewing Collector Plug-Ins

- 1 From **Sentinel Main**, click **Collection** > **Event Sources**.

Health: Indicates the aggregate health of all event sources that are connected to the Collector plug-in.

With the exception of the green icon (healthy state), the icon does not necessarily mean that all event sources connected to the Collector plug-in are in the state indicated by the icon.

The red icon (error state) indicates that one or more event sources connected to the Collector plug-in are in an error state. To get a detailed information, click the **Name** or **EPS** column value to view help information.

Name: Displays the names of the Collector plug-in used to parse the data from the event sources (for example, Cisco Firewall 6.1r1).

This is the name of the Collector plug-in, not the name of the Collector instance. You can sort the event sources based on Collector plug-in name.

EPS: Displays the events per second value received from the event sources. You can sort the Collector based on the events per second value.

- 2 To select or deselect the Collector plug-ins, select the check box next to the Collector plug-in. To select all the available Collector plug-ins, select the check box at the top of the column.
- 3 To sort the Collector plug-ins by **Name** or **EPS** values, click the appropriate column header. The selected column header displays in bold text.

The **Collector Instances** field displays the number of instances of the Collector plug-in. Clicking the **Collector Instances** field displays a **Collectors** window with a list of Collector instances associated with the Collector plug-in:

- 4 Click the **Collector Plug-in** column to display a dialog box with additional information about the Collector plug-in.

Filtering Event Sources

- 1 From **Sentinel Main**, click **Collection > Event Sources**.

- 2 Select the desired criteria to filter event sources.

You can use one or more of the following options to filter the event sources:

- ♦ [“Filtering Event Sources by Name” on page 131](#)
- ♦ [“Filtering Event Sources by Health Status” on page 132](#)
- ♦ [“Filtering by Event Sources Event Search Results” on page 132](#)
- ♦ [“Filtering Event Sources by Collector Managers” on page 132](#)
- ♦ [“Filtering Event Sources by Event Source Servers” on page 132](#)
- ♦ [“Filtering Event Sources by Collector Plug-Ins” on page 133](#)
- ♦ [“Changing the Data Logging Status of Event Sources” on page 133](#)
- ♦ [“Changing the Associated Collector Plug-In for Event Sources” on page 133](#)

Filtering Event Sources by Name

To filter the event sources by name, type a name value in the filter text box, then click **Filter**.

Matching is case insensitive. The name value can contain wildcard characters. Use ***** to match zero or more characters and use **?** to match one character. If no wildcard characters are specified in the name value, it is assumed that the name value is intended to mean `contains <name value>`, or `*<name value>*`.

For example, an event source value of `abc` is interpreted as `*abc*`. Some examples of common filter types are:

- ♦ If the event source name starts with `abc`, enter the filter value as `abc*`.

- ♦ If the event source name ends with abc, enter the filter value as *abc .
- ♦ If the event source name contains abc, enter the filter value as abc or *abc* .

The Event Source table displays the list of event sources whose names match the value entered in the filter input box.

Filtering Event Sources by Health Status

To view the event sources based on the health status, select the **Healthy**, **Warning**, **Error**, or **Offline** check boxes.

The Event Source table displays the list of event sources with the selected health states.

If none of the health states are selected, health state filtering is not performed. It is essentially equivalent to selecting all four health states.

In the Event Source section, click the **Next**, **Previous**, **First**, and **Last** arrow links to scroll through all the event sources. The event source section displays 30 Event Sources per page.

Filtering by Event Sources Event Search Results

To view the event search result for an event source, select the event source from the list and click the **Search** link.

A search is performed using the universally unique identifier (UUID) of the event source (for example, `rν24 : "2CBFB8A0-F24B-102C-A498-000C"`).

If multiple event sources are selected for search, the `rν24 : <UUID>` expressions are combined with the OR operator in the search filter expression.

Filtering Event Sources by Collector Managers

To display the event sources connected to particular Collector Managers, select one or more Collector Managers from the Collector Managers section.

If none of the Collector Managers are selected, event source filtering is not performed based on the Collector Managers. This is not the same as selecting all Collector Managers, because it also includes event sources that are not connected to any Collector Manager.

To select or deselect Event Source Servers, select the check boxes next to the Event Source Servers.

Filtering Event Sources by Event Source Servers

To display only event sources connected to particular Event Source Servers, select one or more Event Source servers from the Event Source Servers section.

If none of the Event Source Servers are selected, event source filtering is not performed based on the Event Source servers. This is not the same as selecting all Event Source Servers, because it also includes event sources that are not connected to any Event Source Server.

To select or deselect Event Source Servers, select the check boxes next to the Event Source Servers.

Filtering Event Sources by Collector Plug-Ins

To display only those event sources connected to particular Collector plug-ins, select one or more Collector plug-ins from the **Collectors Plug-ins** section.

If none of the Collector plug-ins are selected, event source filtering is not performed based on the Collector plug-in. It is essentially equivalent to selecting all of the Collector plug-ins.

Changing the Data Logging Status of Event Sources

- 1 From **Sentinel Main**, click **Collection > Event Sources**.
- 2 To change the data logging status for one or more event sources, select the event sources from the list.
- 3 Click the **Configure** button in the table, then select edit option for the **Store raw data**.

Yes: If **Yes** is selected, the selected event sources forward events received to the Collectors they are connected to.

No: If **No** is selected, the selected event sources drop all the events received. Messages are not sent to the Collectors the selected event sources are connected to.

If you select a large number of event sources to change, it might take some time to complete. The Event Sources list does not show the store raw data state (**Yes** or **No**) until after the changes are complete and the display is refreshed from the database.

Changing the Associated Collector Plug-In for Event Sources

- 1 From **Sentinel Main**, click **Collection > Event Sources**.
- 2 Select the event sources from the list, then click the **Configure** button in the toolbar.
- 3 Select the **Collector Plug-in** option.
The Set Collector Plug-in window is displayed with the **Collector Plug-in Name** and **Supported Devices** information.
- 4 Select a new Collector plug-in, then click **Set**.

The event sources are connected to the selected Collector plug-in.

If you select a large number of event sources to change, it might take some time to complete. The Event Sources list does not show the new Collector plug-in until after the changes are complete and the display is refreshed from the database.

10 Configuring Event Routing Rules

You can configure event routing rules to evaluate and filter all incoming events and deliver selected events to designated output actions. For example, each severity 5 event can be logged to a file.

You can configure event routing rules to filter events based on one or more of the searchable fields. You can associate each event routing rule with one or more of the configured actions. You can also assign tags to group the events logically.

Sentinel evaluates the event routing rules on a first-match basis in top-down order and applies the first matched event routing rule to events that match the filter criteria.

- ♦ [“Creating an Event Routing Rule” on page 135](#)
- ♦ [“Ordering Event Routing Rules” on page 136](#)
- ♦ [“Activating or Deactivating an Event Routing Rule” on page 137](#)

Creating an Event Routing Rule

You can create a filter-based event routing rule and then assign one or more configured actions that are executed to handle or output the events that meet the event routing rule criteria.

- 1 From **Sentinel Main**, click **Routing**.
- 2 Click **Create**, then use the following information to create a new event routing rule:

Name: Specify a unique name for the event routing rule.

Filter: Select a saved filter to use in creating event routing rule. This filter determines which events are stored in the event store. For more information, see [“Configuring Filters”](#) in the *Sentinel User Guide*.

Select tag: (Optional) Select a tag for tagging the filter. The tag makes the filter more specific. For more information, see [“Configuring Tags”](#) in the *Sentinel User Guide*.

Route to the following services: Select where the information is routed. The options are:

- ♦ **All:** Routes the event to all services including Correlation, Security Intelligence, and Anomaly Detection.
- ♦ **Event store only:** Routes the event to the event store only.

This option is not applicable for Sentinel Scalable Data Manager. The option to route only specific events for correlation is available in the Correlation Engine. For more information, see [“Distributing Events Across Correlation Engines”](#) in the *Sentinel User Guide*.

- ♦ **None (drop):** Drops or ignores the events.

Perform the following actions: (Optional) Select an action to be performed on every event that meets the filter criteria. The following default actions are available for event routing rules:

- ♦ **Log to File:** For configuration information, see [“Configuring the File Integrator” on page 216](#).

- ◆ **Log to Syslog:** For configuration information, see “[Configuring the Syslog Integrator](#)” on [page 219](#)
- ◆ **Send Events via Sentinel Link:** For configuration information, see “[Configuring the Sentinel Link Integrator](#)” on [page 217](#).
- ◆ **Send SNMP Trap:** For configuration information, see “[Configuring the SNMP Integrator](#)” on [page 218](#).

NOTE: When you associate an action with routing rules, ensure that you write rules that match a small percentage of events, if the rule triggers a Javascript action. If the rules trigger actions frequently, the system might backlog the actions framework. This can slow down the EPS and might affect the performance of the Sentinel system. If the rule triggers non-Javascript actions like Sentinel Link, then there is no limitation.

For the actions to work, you must have configured the Integrator associated with each action for your environment.

The actions listed here are different than the actions displayed in the **Event Actions** tab in the Sentinel Main interface, and are distinguished by the `<EventRouting>` attribute in the `package.xml` file created by the developer.

Adding or Removing Actions: You can add more than one action to perform on the events that meet the filter criteria:

- ◆ Click  to select additional actions to be performed.
- ◆ Click  to remove the selected action for this event routing rule.

3 Click **Save** to save the event routing rule.

The newly created event routing rule appears at the end of the rules list under the **Event Routing Rules** tab. By default, this new event routing rule is active.

Ordering Event Routing Rules

When there is more than one event routing rule, the event routing rules can be reordered by dragging them to a new location. Events are evaluated by event routing rules in the specified order until a match is made, so you should order the event routing rules accordingly. More narrowly defined event routing rules and more important event routing rules should be placed at the beginning of the list.

The first routing rule that matches the event based on the filter is processed. For example, if an event passes the filter for two routing rules, only the first rule is applied. The default routing rule cannot be reordered. It always appears at the end.

- 1 From Sentinel Main, click **Routing**.
- 2 Mouse over the icon to the left of the event routing rule numbering to enable drag-and-drop. The cursor changes.
- 3 Drag the event routing rule to the correct place in the ordered list.
When the event routing rules are ordered, a success message is displayed.

Activating or Deactivating an Event Routing Rule

New event routing rules are activated by default. If you deactivate an event routing rule, incoming events are no longer evaluated according to that event routing rule. If there are already events in the queue for one or more actions, it might take some time to clear the queue after the event routing rule is deactivated. If the **On** check box next to the event routing rule is selected, the event routing rule is activated. If the **On** check box is not selected, the event routing rule is deactivated.

1 From **Sentinel Main**, click **Routing**.

2 To activate the event routing rule, select the check box next to each event routing rule in the **Enabled** column.

If the event routing rule is activated, a success message is displayed.

3 To deactivate the event routing rule, select the check box next to each event routing rule in the **Enabled** column.

When the event routing rule is deactivated, a success message is displayed.

11 Mapping Events

Sentinel provides the ability to use mapping to inject additional information into events. This increases Sentinel's ability to analyze events, execute correlation rules, or provide detailed reports.

- ♦ [“Overview” on page 139](#)
- ♦ [“Default Maps” on page 142](#)
- ♦ [“Accessing Map Definitions” on page 143](#)
- ♦ [“Adding Map Definitions” on page 143](#)
- ♦ [“Adding a Number Range Map Definition” on page 145](#)
- ♦ [“Updating Map Data” on page 148](#)
- ♦ [“Using Maps for Event Configuration” on page 149](#)
- ♦ [“Renaming Event Fields” on page 150](#)

Overview

There are two major components of mapping:

- ♦ [“Maps” on page 139](#)
- ♦ [“Mapping Events” on page 140](#)

Maps

A map is a collection of keys and associated values defined in a simple text CSV (comma-separated value) file format. You can enrich your event data by using maps to add additional information such as host and identity details to the incoming events from your source devices. This additional information can be used for advanced correlation and reporting. The system supports several built-in maps as well as custom user-defined maps. For more information, see [“Using Maps for Event Configuration” on page 149](#).

Maps that are defined in Sentinel are stored in two ways:

- ♦ Built-in maps are stored in the database, updated via APIs in Collector code, and automatically exported the Mapping service.
- ♦ Custom maps are stored as CSV files and can be updated on the file system or via the Map Data Configuration UI, then loaded by the Mapping service.

In both cases, the CSV files are kept on the central Sentinel server but changes to the maps are distributed to each Collector Manager and applied locally. This distributed processing ensures that mapping activity does not overload the main server.

Mapping Events

Event Mapping is a mechanism that allows you to add data to an event by using data already in the event to reference and pull in data from an outside source.

Because virtually any data set can be made into a map, Event Mapping is useful for incorporating data from elsewhere in your organization into the event stream. Some opportunities that Event Mapping provides are:

- ◆ Regulatory compliance monitoring
- ◆ Policy compliance
- ◆ Response prioritization
- ◆ Enabling security data to be analyzed related to business operations
- ◆ Enhancing accountability

When an Event Mapping is defined, it is applied system-wide to all events from all Collectors. Sentinel automatically distributes map data to all processes that perform event mappings and also keeps the map data in these processes up-to-date.

Event Mapping has four main parts:

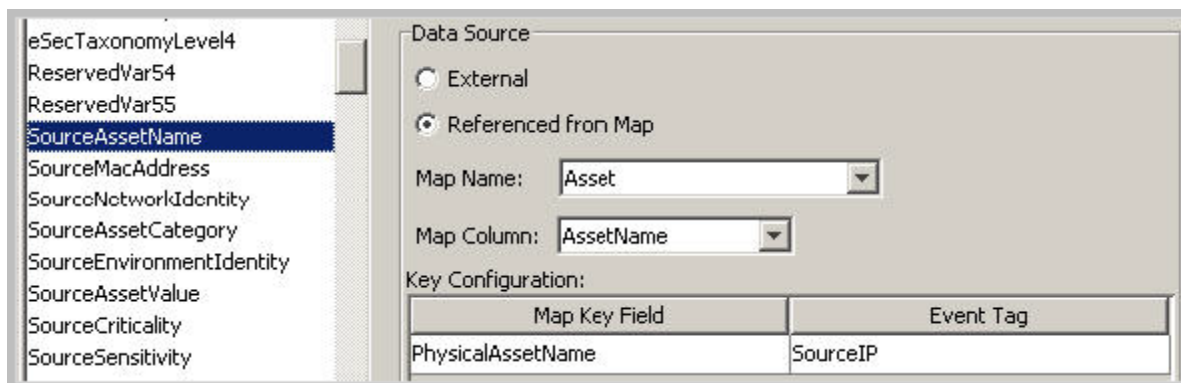

- ◆ **Controller:** Stores all map information
- ◆ **Distributor:** Automatically redistributes modified maps to those processes that register for the map
- ◆ **Monitor:** A monitor to detect changes in map source data
- ◆ **Generator:** Generates maps from source data

One application of Event Mapping is Sentinel's Asset Data functionality. Asset information is collected and stored in the Sentinel database asset schema and is represented by a Physical Asset entry. Soft assets, such as services and applications, are represented by an entry that is linked to a Physical Asset. The primary automated update mechanism for asset data is through an asset Collector reading data from a scanner such as Nmap. The asset Collector automates the retrieval of asset information by reading asset data from the scanner and populating the asset schema tables with this data. For Event Mapping, asset information is mapped from the destination IP and source IP.

There are two types of data sources:

- ◆ **External:** A Collector populates that value in the event ID.
- ◆ **Referenced from Map:** Data is retrieved from a map to populate the event ID.

Figure 11-1 Data Sources

In the above illustration, the SourceAssetName tag is populated from the map called `Asset` (which has `asset.csv` as its map data source file). The specific value for SourceAssetName is taken from the AssetName column from the Asset map. The PhysicalAssetName column is set as the key. When the InitIP tag of the event matches one of the source IP values in the PhysicalAssetName column of the map, the row with the matching key is used to intersect the AssetName Column. For instance, in the following example the IP address corresponds to AssetName Finance35.

Table 11-1 Populating an Event ID with Data from a Map

PhysicalAssetName	CustomerID	MacAddress	AssetName
10.0.0.1			Marketing0
10.0.0.2			Marketing02
10.0.0.3			ProgramMgmt03
10.0.0.4			Finance34
10.0.0.5			Finance35

You can have more than one column set as a key if you do not want the map to be a Range Map (Range Maps can only have one key column, with that column type set to NumberRange). For instance, with column type set to String, the AttackId tag has the DeviceName (name of the security device) and DeviceAttackName columns set as keys and uses the NormalizedAttackID column in the AttackNormalization map for its value. In a row where the DeviceName event ID matches the data in Device map column and the DeviceAttackName matches the data in the AttackSignature map column, the value for AttackId is the value in the NormalizedAttackID column. The configuration for the Event Mapping just described is:

Figure 11-2 Event Mapping Configuration

Table 11-2 Device and Attack Signature Corresponds to Asset Name

Device	Attack Signature	Normalized Attack ID	
Secure	BackDoorProbe (TCP 1234)	3	Trojan: Backdoor.Subeven
Secure	BackDoorProbe (TCP 1999)	3	Trojan: Backdoor.Subeven
Dragon	RWALLD: SYSLOG-FORMAT	4	Sun Microsystems Solaris rwall Elevated
Snort	RPC TCP rwalld request	4	Sun Microsystems Solaris rwall Elevated
Snort	RPC UDP rwalld request	4	Sun Microsystems Solaris rwall Elevated
Snort	WEB-IIS foxweb.dll access	12	Microsoft Exchange Server Arbitrary Code
RealSecure	SMTP_Exchange_Verb_DoS	12	Microsoft Exchange Server Arbitrary Code

Default Maps

Maps defined in this tool work together with the **Referenced from Map** data source setting for individual fields. The following built-in maps are available:

- ◆ **Identity:** Contains information about identities and the accounts associated with them. Data is added to the Identity map through the [Collector API \(http://www.novell.com/developer/develop_to_sentinel.html\)](http://www.novell.com/developer/develop_to_sentinel.html) and Identity Tracking Module for Sentinel. Data is then extracted to the `identityAccountMap.csv` file.
 - ◆ **Keys:** User name and domain, TenantName (mapped to both Initiator and Target users).
 - ◆ **Data added to event:** User identity (an internal GUID), full name, department, workforce ID, and email address.
- ◆ **Asset:** Contains information about hosts in the environment. Data is added to the Asset map using a [Collector API \(http://www.novell.com/developer/develop_to_sentinel.html\)](http://www.novell.com/developer/develop_to_sentinel.html) and Collectors such as the Generic Asset Collector, stored in the database, and then extracted to the `asset.csv` file.
 - ◆ **Keys:** IP address and TenantName (mapped to Initiator, Target, Observer, and Reporter hosts).

- ♦ **Data added to event:** Host identity (an internal GUID), function, class, department, and criticality.
- ♦ **Country:** Contains information about which physical location hosts reside in, including country, latitude, and longitude. Data is downloaded from a commercial IP location database and added to the `IpToCountry.csv` file using the IP2Location Feed plug-in. For more information, see the IP2Location Feed documentation on the [Sentinel Plug-ins Website \(https://marketplace.microfocus.com/arcsight/category/sentinel\)](https://marketplace.microfocus.com/arcsight/category/sentinel).
 - ♦ **Keys:** IP address and TenantName (mapped to Initiator, Target, and Observer hosts).
 - ♦ **Data added to event:** Country, latitude, and longitude.
- ♦ **CustomerHierarchy:** Contains a hierarchical list of tenants that are generating event data. This can be used by security providers that collect data for multiple third parties or departments to provide a hierarchic namespace for users and hosts. Data is added to the `customerhierachy.csv` file manually.
 - ♦ **Keys:** TenantName.
 - ♦ **Data added to event:** TenantHierarchy fields.
- ♦ **Threat Intelligence:** Sentinel populates the `Threat_Intelligence.csv` file when Sentinel process the threat intelligence data sources. For more information about threat intelligence data sources, see [“Configuring Threat Intelligence Data Sources” on page 227](#).
 - ♦ **Keys:** IP address
 - ♦ **Data added to event:** Reputation score, Threat types, Unique Identifier.

NOTE: For map files that have a large number of entries, the `map.h2.db` file in the `/var/opt/novell/sentinel/tmp` directory may grow in size and would eventually stop growing. For example, when the IP2Location feed plug-in updates the `IpToCountry.csv` file, the `map.h2.db` file may grow up to 20 to 25 GB.

Accessing Map Definitions

- 1 Access the Sentinel Control Center.
- 2 Click the **Configuration** tab.
- 3 In the menu bar, click **Configuration > Map Data Configuration**.

The main Mapping GUI displays a list of the maps that have been defined for the system. Default Sentinel maps cannot be edited or deleted.

Adding Map Definitions

- 1 Access the map definitions.

For more information, see [“Accessing Map Definitions” on page 143](#).
- 2 Click **Add**, then use the following information to create the map definition:

Name: Specify the name of the map definition.

NOTE: If you specify a map name that already exists, Sentinel displays a confirmation message. You can either specify that the existing map name can be overwritten, or provide a new map name.

File Name: Select whether the file is local or remote, then browse to and select your map definition.

- ◆ **Local File:** Allows you to browse for your file on your local file system (on the machine where Sentinel Control Center was launched).
- ◆ **Remote File:** Allows you to select from existing map source data files on the Sentinel server. The remote file points to `/var/opt/novell/sentinel/data/map_data`.

Map Definition: Use the following information to define the map. As you configure each setting and filter, the data preview is automatically updated to allow you to preview your data and ensure your data is being parsed as expected.

- ◆ **Delimiter:** Character used to separate the data into rows in the map data source file. Usually a comma, but other delimiters such as pipe, tab, and semicolon are supported. You can also specify other delimiters in the **Other** field.
- ◆ **Start at row:** Some input map files contain header rows that do not contain real data. This option specifies the number of rows to skip from the top of the map data source file.
- ◆ **Column names:** Specify the column names. These names are used later to configure which columns are matched against event fields and which columns are injected into event data.
- ◆ **Key columns:** A key is a unique identifier for the row of data in the map data. If more than one column is selected as a key, then all event fields must match each of the corresponding selected key columns.

When a column is set as a key, it does not appear in the **Column** drop-down field.

- ◆ **Column types:** Specify the data type for the column. The currently supported data types are:
 - ◆ **String:** A string is treated as a simple sequence of characters, and can include any characters except the specified delimiter. Use strings for any data including numeric fields.
 - ◆ **Number Range:** A number range (NumberRange) is a range of numbers. For example, 10 through 200 is represented as 10-200. To use the range map functionality, a map definition must have only one key column and the key column must be of type NumberRange. If there are any other key columns, or if the key column is of a different type, the mapping service does not consider the map to be a range map. For more information, see [“Adding a Number Range Map Definition” on page 145](#).
 - ◆ **Active columns:** When a column is marked as active, the data in the column is distributed to processes using maps. All key columns must be active. Only active columns (but not key columns) can be selected as the Map Column under the **Event Configuration** tab.
 - ◆ **Column filtering:** A row can be explicitly included or excluded based on matching criteria for a particular column. This can be used to exclude rows from the map source data that are not needed or that interfere with your mapping.

3 After you finish configuring all parameters and filters for the definition, click **Finish**.

4 (Conditional) If you selected **Local File** above, you are prompted to upload your file. Specify a file name, then click **OK**.

You can have more than one column set as a key if you do not want the map to be a Range Map (Range Maps can only have one key column, with that column type set to NumberRange). For instance, with column type set to String, the AttackId tag has the DeviceName (name of the security device) and DeviceAttackName columns set as keys and uses the NormalizedAttackID column in the AttackNormalization map for its value. In a row where the DeviceName event ID matches the data in Device map column and the DeviceAttackName matches the data in the AttackSignature map column, the value for AttackId is the value in the NormalizedAttackID column.

Adding a Number Range Map Definition

To use the range map functionality, a map definition can have one key column of type NumberRange and zero or more other key columns of type String. For example, you can create a map that lists the allowed maintenance time for each individual server in an enterprise, for which you need to match both the hostname and the time range. If there are any other key columns, or if the key column is of a different type, the mapping service does not consider the map to be a range map.

To create a range map, select a single column to be the key of the map and select NumberRange as the type of the column. The format of the data in a column of type NumberRange must be “m-n”, where m is the minimum number in the range and n is the maximum number in the range (for example, 10-200). The maximum number in the range is not included in the range (m, n). This means a range of 10-200 only uses numbers equal to 10 to 199. An example set of data has the first column defined as the key column:

```
1-2, AA
2-4, AA
4-12, BB
10-20, BB
30-31, BB
100-200, AA
110-120, CC
```

When the source CSV file is loaded into the system, any common or overlapping number ranges are collapsed into a single entry as follows:

Table 11-3 Transformation

FROM	TO
1-2, AA	1-4, AA
2-4, AA	4-20, BB
4-12, BB	30-31, BB
10-20, BB	100-110, AA
30-31, BB	110-120, CC
100-200, AA	120-200, AA
110-120, CC	

Figure 11-3 Number Range Map Definition

The first 500 rows are shown

	Column 1	Column 2
Name:	Range	Value
Type:	NumberRange	String
Key:	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Active:	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Row 0	1-4	AA
Row 1	4-20	BB
Row 2	30-31	BB
Row 3	100-110	AA
Row 4	110-120	CC
Row 5	120-200	AA

An example event configuration on the above map might look like this:

Figure 11-4 Event Configuration

CustomerVar82	<p>Data Source</p> <p><input type="radio"/> External</p> <p><input checked="" type="radio"/> Referenced from Map</p> <p>Map Name: <input type="text" value="Maps/RangeMap"/></p> <p>Map Column: <input type="text" value="Value"/></p> <p>Key Configuration:</p> <table border="1"> <thead> <tr> <th>Map Key Field</th> <th>Event Tag</th> </tr> </thead> <tbody> <tr> <td>Range</td> <td>CustomerVar97</td> </tr> </tbody> </table>	Map Key Field	Event Tag	Range	CustomerVar97
Map Key Field		Event Tag			
Range		CustomerVar97			
CustomerVar83					
CustomerVar84					
CustomerVar85					
CustomerVar86					
CustomerVar87					
CustomerVar88					
CustomerVar89					
SARBOX					
HIPAA					
GLBA					
FISMA					

In the scenario above, CustomerVar97 must contain a numeric value. That value is compared against each NumberRange defined in the RangeMap until a match is found. The corresponding row from the map is returned and used to set CustomerVar89, as follows:

```
CustomerVar97 = 1; CustomerVar89 will be set to AA
CustomerVar97 = 4; CustomerVar89 will be set to BB
CustomerVar97 = 300; CustomerVar89 will not be set
```

For Sentinel event fields that are defined as having an IP address or Date datatype, Sentinel internally converts those fields to an integer representation of the values of that field.

Fields that are defined as IP address fields are:

- ◆ SourceIP (sip)
- ◆ TargetIP (dip)
- ◆ SourceTranslateIP (sxip)
- ◆ TargetTranslateIP (dxip)
- ◆ ObserverIP (obsip)

Fields that are defined as Data fields are:

- ◆ EventTime (dt)
- ◆ ObserverEventTime (det)
- ◆ SentinelProcessTime (spt)
- ◆ BeginTime (bngt)
- ◆ EndTime (endt)
- ◆ CustomerVar11 to CustomerVar20 (cv11 to cv20)
- ◆ ReservedVar11 to ReservedVar20 (rv11 to rv20)

IP address ranges are automatically converted into decimal integer ranges. The following example shows a numerical range equivalent to an IP range of 10.0.0.0 to 10.0.2.255.

```
167772160-167772415 ,AAA  
167772416-167772671 ,BBB  
167772672-167772927 ,CCC
```

Using the same setup as the previous example, if:

- ◆ In Key Configuration, the Event ID used for comparison is set to TargetIP for the range Map Key field.
- ◆ The Map column returned from the map to set CustomerVar89 is defined as a value, as displayed in the second column below.

If an event contains a target IP of 10.0.1.14 (equivalent to numerical value of 167772430), the output for column CustomerVar89 within the event is BBB.

Dates are represented as an integer number of seconds since midnight January 1, 1970. Data and time ranges can be used in maps in a similar fashion as the IP address sample above.

Sentinel supports the following number ranges:

- ◆ Range from negative number to negative number (for example, -234-34)
- ◆ Range from negative number to positive number (for example, -234-34)
- ◆ Range from positive number to positive number (for example, 234-236)
- ◆ Single number range (negative) (for example, -234). In this case, the min and the max will both be -234.
- ◆ Single number range (positive) (for example, 234). In this case, the min and the max will both be 234.
- ◆ Range from negative number to max number (for example, -234-). In this case, the min will be -234 and the max will be $(2^{63} - 1)$.
- ◆ Range from positive number to max number (for example, 234-). In this case, the min will be 234 and the max will be $(2^{63} - 1)$.

NOTE: In all cases, the min must be less than or equal to the max (for example, “-234- -235” is NOT valid).

Updating Map Data

Updating allows you to replace the map source data file of a map on the server with another file. Your new map source data file must have the same delimiter, number of columns, and overall structure as the existing map data source file in order for the map to function properly after the update. The new map source data file should differ from the existing file only by the values that appear in the columns. If the new map source data file has a different structure than the existing file, use the Edit feature to update the map definition.

Map updates can be performed on demand from the Sentinel Control Center. To set up an automated process to update map data, you can run an equivalent process from the command line using `map_updater.sh`.

There are two map locations: the location referenced by the Event Map Configuration (which is a user-defined location) and the location where Sentinel stores its internal representation of the map (`/var/opt/novell/sentinel/data/map_data`). The internal representation of the map should never be manually updated.

Updating Map Data from the Sentinel Control Center

To update the map data from the Sentinel Control Center:

- 1 If you haven't already done so, create a CSV file containing the new map source data.

This file can be generated (for example, from a data dump script), created manually, or be an edited version of the existing map data source file. If necessary, you can obtain the existing map data source file from `/var/opt/novell/sentinel/data/map_data`.

- 2 Access a map definition.

For more information, see [“Accessing Map Definitions” on page 143](#).

- 3 Expand the folder of interest and select the mapping, then click **Update**.

- 4 Select the new map data source file by clicking **Browse** and selecting the file with the new map data.

After you select the file, the data from the new map data source file displays under the **New** tab. The map data you are replacing is under the **Current** tab.

- 5 Deselect or leave the default setting for **Backup Existing Data On Server**.

Enabling this option puts a backup of the existing map data source file in the `/var/opt/novell/sentinel/data/map_data` folder. The prefix of the name of the backup map data source file is the name of the existing map data source file. The end of the filename includes a set of random numbers followed by the `.bak` suffix. For example: `vuln_attacks10197.bak`.

- 6 Click **OK**.

The data from the new map data source file is uploaded to the server, replacing the contents of the existing map data source file. After the source data is completely uploaded, the map data is regenerated and distributed to map clients such as, Collector Manager.

Updating Map Data by Using the Command Line

- 1 If you haven't already done so, create a file containing the new map source data.

This file can be generated (for example, from a data dump script), created manually from scratch, or be an edited version of the existing map data source file. If needed, you can obtain the existing map data source file from one of the following locations

```
<install_directory>/data/map_data
```

- 2 Log into the Sentinel database.
- 3 Find the UUID for the map in the MD_CONFIG table (refer to the CONFIG_ID column for the appropriate map listed in the VALUE column).
- 4 On the Sentinel Server machine, log in as esecadm.
- 5 Run the following command:

```
map_updater.sh <uuid> <source path> [nobackup]
```

- 6 The data from the new map data source file is uploaded to the server, replacing the contents of the existing map data source file. After the source data is completely uploaded, the map data is regenerated and distributed to map clients (for example, Collector Manager).

Unless the optional `-nobackup` argument is added, the previous map data is saved in a backup file on the server. Enabling this option results in a backup of the existing map data source file being put in the `<install_directory>/data/map_data` folder. The prefix of the name of the backup map data source file is the name of the existing map data source file. The end of the filename contains a set of random numbers followed by the `.bak` suffix. For example: `vuln_attacks10197.bak`.

Using Maps for Event Configuration

After you have created a map, you must decide where the mapped data is injected into the event. You must configure each event to use mapping:

- 1 Access the **Configuration** tab in the Sentinel Control Center.
- 2 Click **Event Configuration** in the navigation pane.

or

In the toolbar, click **Configuration > Event Configuration**.

- 3 Select an entry from the Event Columns, then use the following information to configure the event using a map:

Name: Displays the name of the event ID selected in the **Event Columns** field.

Referenced from Map: Click **Referenced from Map** to configure the event ID to be populated with data from a map.

The default option of **External** keeps the value the Collector put in the event ID (if any).

Map Column: Click the **Map Name** drop-down list, then select one of the available maps.

The maps listed are the default maps or a map you have created.

Map Column: Click the **Map Column** field drop-down list, then select a **Map Column** name.

Depending on your Map Name choice in the previous step, these values vary.

- ◆ **All other choices:** Names of active columns within the map definition that are not set as a key (for example, `CustomerId` column in `Asset` or `NormalizedAttackId` column in `AttackNormalization`)

- ◆ **_EXIST_** : This is a special Map Column that exists in every map. If this Map Column is selected, a 1 is placed in the event ID if the key is in the map data. If the key is not in the map data, a 0 is placed in the event ID.

Key Configuration: For each row in the table, select the event ID in the **Event ID** column that is matched against the map key column specified in the corresponding **Map Key Field** column. The rows in the Key Configuration table depend on the Map Name selected.

A key is a unique identifier for the row of data in the map data.

4 Click **Apply**.

Clicking **Apply** saves the changes you made for the currently selected event column in a temporary buffer. If you don't click **Apply**, the changes you made to the previously selected event column are lost when you select a different event column. Changes aren't be saved to the server until you click **Save**.

5 If you want to edit the event mapping of another event column, repeat the steps above. Remember to click **Apply** after editing the event mapping of each event column.

6 Click **Save**.

Clicking **Save** saves your changes to the server. The save function saves all changes stored in the temporary buffer when you clicked **Apply**.

Renaming Event Fields

The Event Configuration window allows you to rename the event field. When you do this, the event names are changed in the Sentinel Control Center and the Sentinel Main interface.

Renaming event fields does not change the event ID in Collector scripts or in internal Sentinel representations of the event. For example, if you rename the event name BeginTime to StartTime, the ID will still remain as bgnt. Any references to this ID in Correlation or Filters still work, even if they were originally written using bgnt.

To rename an event field:

1 Access the Configuration tab in the Sentinel Control Center.

2 Click **Event Configuration** in the navigation pane.

or

In the menu bar, click **Configuration > Event Configuration**.

3 Select an entry in the **Event Fields** column.

4 Specify a new value for the event name in the **Name** field.

5 Click **Apply**, then click **Save**.

6 Close and launch Sentinel Control Center for the changes to be visible.

12 Linking to Additional Sentinel Systems

Sentinel Link is a mechanism that provides the ability to hierarchically link multiple Sentinel systems, including Sentinel Log Manager, Sentinel, and Sentinel Rapid Deployment. You can hierarchically link two or more Sentinel systems to forward filtered events from one Sentinel system to another for further evaluation.

- ♦ “Benefits” on page 151
- ♦ “Prerequisite” on page 151
- ♦ “Configuring Sentinel Link” on page 151

Benefits

- ♦ Multiple Sentinel servers, local or distributed, can be linked in a hierarchical manner. In this setup, Sentinel servers can manage a large volume of data, retaining raw data and event data locally, while forwarding important events to a central Sentinel server for consolidation.
- ♦ One or more Sentinel servers can forward important data to either a Sentinel server, Sentinel Log Manager server, or a Sentinel Rapid Deployment server. These systems provide real-time visualization of data, advanced correlation and actions, workflow management, and integration with identity management systems.
- ♦ Multiple Sentinel, Sentinel Log Manager, or Sentinel Rapid Deployment servers can be hierarchically linked to monitor the consolidated event information.
- ♦ One or more Sentinel, Sentinel Log Manager, or Sentinel Rapid Deployment servers can forward important events to a Sentinel server for event consolidation.

Prerequisite

Before you forward events from the sender machine, ensure that the Sentinel Link server is up and running on the receiver machine.

Configuring Sentinel Link

In a Sentinel Link Solution setup, the Sentinel system that forwards the events is called the sender and the Sentinel system that receives the events is called the receiver. You can simultaneously link multiple Sentinel systems to a single receiver system.

To configure a Sentinel link, you need to configure at least two systems: the sender machine and the receiver machine. For further details on configuring Sentinel Link, see the [Sentinel Link Overview Guide \(http://www.novell.com/documentation/sentinel70/sentinel_link_overview/data/bookinfo.html\)](http://www.novell.com/documentation/sentinel70/sentinel_link_overview/data/bookinfo.html).

IV

Configuring Data Storage

Sentinel receives two separate but similar data streams from the Collector Managers: raw data and event data.

Raw Data

Raw data files are unprocessed events received by the Connector and sent directly to the Sentinel message bus. This data is written to the Sentinel server. Sentinel receives all raw data without being filtered. When the event is sent to the message bus, the following additional information is also sent without altering the original event:

- ♦ SHA-256 hash of the event
- ♦ Chaining indicator, which is reset to 0 whenever the Sentinel event source is restarted
- ♦ Raw Data ID (in `s_rv25`)
- ♦ Event source, Connector, Collector, and Collector Manager node IDs

Because the raw data is not searched or used to generate reports, the data is not indexed.

Event Data

Event data is created as a result of a Collector parsing and normalizing raw data.

You can set filtering rules on the event source, Connector, and Collector, which selectively prevent the Collector from parsing raw data. Filtering rules avoid the overhead of parsing and normalizing data you do not need for further processing or analysis, and free up hardware resources for more important tasks. These rules do not affect the storage of the raw data. However, event data can be dropped after it is created by the parsing and normalization logic of the Collector by configuring an event routing rule to selectively drop the event data. This is useful when it is more convenient to define the rule on normalized data rather than non-normalized (raw) data. For more information, see [Chapter 10, “Configuring Event Routing Rules,” on page 135](#).

This section provides information about how you must configure your data storage to collect and store raw data and event data.

- ♦ [Chapter 13, “Configuring Traditional Storage,” on page 155](#)
- ♦ [Chapter 14, “Configuring Scalable Storage,” on page 183](#)
- ♦ [Chapter 15, “Configuring Data Retention Policies,” on page 195](#)
- ♦ [Chapter 16, “Re-indexing Event Data Partitions,” on page 199](#)

13 Configuring Traditional Storage

Sentinel stores raw data and compressed event data on the primary location. You can configure Sentinel to store the data in a secondary location for long-term storage.

The data files are deleted from the primary and secondary storage locations on a configured schedule. Raw data retention is governed by a single raw data retention policy. Data retention is governed by a set of event data retention policies. All of these policies are configured by the Sentinel administrator.

- ◆ [“Verifying and Downloading Raw Data Files” on page 168](#)
- ◆ [“Configuring Data Synchronization” on page 169](#)
- ◆ [“Viewing Primary and Secondary Storage Capacity” on page 176](#)
- ◆ [“Using Sequential-Access Storage for Long Term Data Storage” on page 177](#)

Raw Data Storage

Sentinel compresses the raw data and stores it in protected partitions that are based on the time and the event source. New raw data files are created every hour. The data is moved from the primary, compressed, file-based storage to a user-configured, compressed secondary storage location on a regular basis.

Sentinel stores the raw data files in one of the following locations:

- ◆ Primary storage location: `<Sentinel data directory>/rawdata/online`
- ◆ Secondary storage location: `<Sentinel archive directory>/rawdata_archive`

The compressed raw data files are moved from the primary storage to the secondary storage location.

The following table describes the directory structure of the raw data in the primary storage under the installation directory:

Table 13-1 Raw Data Directory Structure

Directory Structure	Description
<code>/data</code>	The primary directory for all data storage.
<code>/data/rawdata</code>	The subdirectory where all raw data is stored.

Directory Structure	Description
<code>/data/rawdata/online</code>	The directory where all the raw data in the primary storage is stored.
<code>/data/rawdata/online/EventSourceUUID</code>	<p>There is one subdirectory for each event source under the <code>online</code> subdirectory. That subdirectory contains all raw data received from that event source.</p> <p>The subdirectory name is the universally unique identifier (UUID) of the event source (for example, E20D0840-1E0A-102C-9F30-000C2949BA91).</p>
<code>/data/rawdata/online/EventSourceUUID/Month</code>	<p>Data in the event source subdirectory is partitioned by month. Each month has its own subdirectory.</p> <p>The subdirectory name is in the <code>yyyy-mm</code> format. For example, 2009-05 indicates May 2009.</p>
<code>/data/rawdata/online/EventSourceUUID/Month/1 Hour Data Files</code>	<p>Each file in the <code>Month</code> directory contains data received during a specific one-hour period. Most data in the file has a time stamp that is within the one-hour period.</p> <p>The name of the file indicates the day of the month and the one-hour period that is represented.</p> <p>The filename format is <code>dd-hhmm.extension</code>.</p> <p><i>dd</i> is the day of the month.</p> <p><i>hh</i> is the hour of the day.</p> <p><i>mm</i> is the minute of the hour.</p> <p>The extension is either <code>.gz</code> or <code>.open</code>.</p> <p>NOTE: Raw data files are compressed and have the extension <code>.gz</code>. However, when the raw data file is being written into, the raw data file appears with the extension <code>.open</code>.</p> <p>For example:</p> <p>A filename of <code>08-0000.gz</code> indicates that the file contains compressed data received on the 8th day of the month between 12.00 a.m. and 01.00 a.m.</p> <p>A filename of <code>08-1300.open</code> indicates that the file contains data received on the 8th day of the month between 01.00 p.m. and 02.00 p.m.</p>

If the raw data files are stored in the primary storage location, the full path name of the file is in the following format:

```
<Sentinel data directory>/rawdata/online/<event source UUID>/<Date>/<RawDataFile>
```

For example:

```
/var/opt/novell/sentinel/data/rawdata/online/A75CF6A0-4948-102D-A615-000C29A9C3DB/2010-05/24-0600.gz
```

In this example, `/var/opt/novell/sentinel/data` is the data directory for Sentinel.

If the raw data files are stored in the secondary storage location, the full path name would be as follows:

```
<Sentinel archive directory>/rawdata_archive/<event source UUID>/<Date>/<RawDataFile>
```

For example:

```
/sentinel_archive_data/rawdata_archive/A75CF6A0-4948-102D-A615-000C29A9C3DB/2010-05/24-0600.gz
```

In this example, `/sentinel_archive_data` is the secondary storage directory configured by the user.

Raw Data Representation

Each raw data event is represented as a single line in a raw data file. Each line is a JSON object with the following format:

```
{
  "EventDate": "<date>",
  "EventRecordID": "<event record uuid>",
  "RawData": "<raw data>",
  "RawDataHash": "<SHA256 hash of raw data, in hex format>",
  "EventSourceManagerID": "<uuid of event source manager>",
  "CollectorID": "<uuid of collector>",
  "EventSourceID": "<uuid of event source>",
  "ChainID": "<chain ID>",
  "ChainSequence": "<Sequence number>"
}
```

The following table describes each of the fields in the raw data event:

Table 13-2 Raw Data Representation

Field Name	Description
EventDate	The date and time when Sentinel received this event and not the date and time when the event occurred. Example: "05/24/2010 06:15:06.676"
EventRecordID	The unique ID identifying the raw data record. Example: "595829C0-1C8F-102C-A922-000C2949BA91" If an event was generated as a result of parsing a raw data record, this ID is set in the event RecordID field. Because of filtering, not all raw data records result in an event.
RawData	The original raw data received by the event source.

Field Name	Description
RawDataHash	<p>The SHA-256 hash of the RawData value represented as a HEX string. The hash is calculated by converting the RawData value to a UTF-8 string and then performing the hash over that string.</p> <p>To detect tampering, each raw data event is stored with a SHA-256 hash value.</p> <p>Example: cc661009e2f3dc565c0c7fe25b705219004dcd8132c0b0a7e987bfdcb55e49cf</p>
EventSourceID	<p>The UUID of the event source from which the raw data originated.</p> <p>Example: A2A0C600-1C6C-102C-A781-000C2949BA91</p>
EventSourceGroupID	<p>The UUID of the event source group (Connector) to which the event source was connected when the raw data was received.</p> <p>Example: A2A0C600-1C6C-102C-A77A-000C2949BA91</p> <p>Different raw events from the same event source can have different event source group IDs, because event sources can be moved from one Connector to another.</p>
CollectorID	<p>The UUID of the Collector that the Connector and event source were connected to when the raw data was received.</p> <p>Different raw events from the same event source can have different Collector IDs, because event sources and event source groups can be moved from one Collector to another.</p> <p>Example: A2A0C600-1C6C-102C-A779-000C2949BA91</p>
EventSourceManagerID	<p>The UUID of the Event Source Manager (Collector Manager) object where this raw data was received.</p> <p>Example: C76D2820-C395-1029-BB86-001321B5C0B3</p>
ChainID	<p>A random number that identifies a raw data chain. Whenever an event source is stopped and restarted between generation of raw data events, a new ChainID number is generated.</p> <p>To detect tampering, each raw data event is stored with a ChainID and a ChainSequence number.</p> <p>Example: 1241630654754</p>

Field Name	Description
ChainSequence	<p>A sequence number within a particular raw data chain.</p> <p>The raw data events in a given raw data chain must have an uninterrupted sequence of numbers starting with 0. In addition, all raw data events in a given raw data chain must appear sequentially in the files, with no other chains intermixed. If a raw data chain can span files, the sequence should continue uninterrupted into the file that represents every hour during which raw data was received.</p> <p>Example: 4</p> <p>If no raw data is received for the one-hour period, the file records only from the next arrival of raw data. Nonetheless, the raw data chain sequence should continue uninterrupted until a new raw data chain begins. A new raw data chain is signaled by a changed ChainID value, and a ChainSequence value of zero (0).</p>

The following examples show three raw data records:

```
{
  "EventDate": "05\24\2010 06:15:06.676",
  "EventRecordID": "A75CF6A0-4948-102D-A61C-000C29A9C3DB",
  "RawData": "Sep 22 10:22:00 testhost Message #100",

  "ChainID": "1274696106664",
  "ChainSequence": "2"
}

```

Disabling Raw Data Collection

By default, raw data collection is enabled for the Collector Manager on the Sentinel server. Collecting raw data can impact the performance of the server or the remote Collector Manager. Perform the following procedure on any Collection Manager where you want to disable raw data collection:

- 1 Open the `/etc/opt/novell/sentinel/config/event-router.properties` file in a text editor.
This is the default location of the file.
- 2 Change `esecurity.router.event.rawdata.send=true` to `esecurity.router.event.rawdata.send=false`.
- 3 Save the file, then restart the Collector Manager.

Event Data

Sentinel closes the event data partitions after one day, and no more events are written to the closed partitions. Even though the duration for event data partitions is one day, a grace period of 10 minutes is given to accommodate events arriving late. You can change the grace period as necessary. For more information, see [“Setting the Grace Period to Close Event Data Partitions” on page 307](#).

By default, after the partitions are closed, Sentinel copies a compressed copy of the partition to secondary storage, but also retains the uncompressed copy on primary storage as a fast-access cache for searching. When the primary storage reaches its maximum disk usage, Sentinel deletes the copy in the primary storage and the copy in the secondary storage remains online for searching.

NOTE: However, if disk space in primary storage is at a premium, you can compress these partitions as soon as they are closed to save the disk space on the primary storage. This requires additional I/O to compress and store on the primary partition, which means that the supported EPS rate will be significantly lower. Also, searches on these partitions will be slower. Therefore, this option is only suitable for lower EPS rates and if you want to get the most out of primary storage space. For information about compressing the storage index on primary partitions, see [“Compressing the Storage Index on Primary Partition” on page 307](#).

The partitions are laid out as follows:

Primary storage: Open partitions + Most recent N days of closed partitions

- ♦ **Open partitions:** The partitions that new data is being written to.
- ♦ **Most recent N days of closed partitions:** As many of the most recently written closed partitions that can fit in primary storage.

Secondary storage: Most recent N days of closed partitions + The rest of the online data

- ♦ **The rest of the online data:** The older closed partitions that primary storage no longer has room to hold. This data is online (searchable), just like the data in primary storage.

NOTE: Because of the above design consideration, the secondary storage size must be always larger than the primary storage size.

Sentinel stores the primary storage partitions in the `/var/opt/novell/sentinel/data/eventdata` directory, which is on the local file system. Sentinel creates partitions based on the dates and retention policies.

A central partition index is maintained in the database that keeps track of all the existing partitions and their location.

The following table describes the directory structure under the installation directory where event data is stored:

Table 13-3 Event Data Directory Structure

Directory Structure	Description
<code>/data</code>	The primary directory for all data storage.
<code>/data/eventdata</code>	The subdirectory where all event data is stored.
<code>/data/eventdata/ events/ YYYYMMDD_<classid></code>	A partition consists of the events for a single day (midnight-midnight UTC) within a given data retention class and is held within a subdirectory named <code>YYYYMMDD_<class-id></code> . YYYYMMDD: is the UTC date stamp. <class_id> : is a UUID identifier associated with the data retention class.
<code>/data/eventdata/ events/ YYYYMMDD_<class_id> /events.evt</code>	<code>events.evt</code> contains the binary event data for the partition. The format of the binary event data is stored as a Reliable Persistent Random Access Compressed Stream.
<code>/data/eventdata/ events/ YYYYMMDD_<class_id> /index</code>	The index directory contains the Lucene index for the partition.
<code>/data/eventdata/ exported_associations</code>	This directory contains the event associations data. It includes both the correlated event association data and the incident event association data.

Configuring Secondary Storage Locations

All closed event data files are copied from the primary storage location to the secondary storage location. The original files are retained on primary storage to facilitate faster searches. However, if the primary storage disk space usage nears a user-defined threshold, duplicate data files on the primary storage area are deleted from the primary storage and remain only on secondary storage.

- ♦ [“Supported Storage Options” on page 162](#)
- ♦ [“Types of Secondary Storage” on page 163](#)
- ♦ [“Configuring Secondary Storage” on page 163](#)
- ♦ [“Changing the Secondary Storage Location” on page 167](#)

Supported Storage Options

Sentinel supports the following types of storage options:

- ♦ **SAN:** The Storage Area Network (SAN) option includes storage that is attached directly to the Sentinel computer. This option provides the best combination of performance, security, and reliability.
- ♦ **CIFS:** The Common Internet File System (CIFS) is a native Windows protocol. It is also known as the Server Message Block (SMB) protocol in later implementations. The latest implementation from Microsoft is referred to as SMB 2.
- ♦ **NFS:** The NFS protocol requires significant configuration to optimize performance and security, and it is recommended only if you already have a well-established NFS infrastructure in your environment.

If the secondary storage is an NFS server, additional configuration is necessary to ensure that the Sentinel server has the necessary permissions. For more information, see [“Exporting the Secondary Storage Volume” on page 165](#).

WARNING: Only one Sentinel server should be configured to use a particular secondary storage directory (remote share). Configuring the same secondary storage location across multiple Sentinel servers might cause system failure.

The primary storage must use a different partition than the partition that is used for the secondary storage.

- ♦ The system monitors the disk usage of both primary storage and secondary storage, freeing space on primary storage when it fills up. If both storage locations share the same underlying file system partition, the way in which the partition usage changes as a result of deleting data confuses the system and could result in undesirable behavior.
- ♦ The event data is first copied to secondary storage rather than moved, because there is an assumption that these are two different disk partitions. If they are in same disk partition instead of being on the different disk partition, the storage usage monitoring is confused by how the usage is changing and could result in undesirable behavior.

Types of Secondary Storage

You can enable and configure secondary storage for raw data and event data stored on the Sentinel server.

- ♦ [“Raw Data Storage” on page 163](#)
- ♦ [“Event Data Storage” on page 163](#)

Raw Data Storage

Raw data files are compressed and have the `.gz` extension. When the data is currently being written into, the raw data file appears with the `.open` extension.

If secondary storage is configured and enabled, Sentinel copies the compressed raw data files to the configured secondary storage location every 15 minutes.

Event Data Storage

If secondary storage is enabled, Sentinel moves the closed files to secondary storage every midnight UTC and also whenever the server starts. These files are compressed in the primary storage location, but the file indexes are compressed before moving to the secondary storage. If the secondary storage location is not configured or if there is any problem while moving the closed files, Sentinel attempts to move the files to secondary storage every 60 seconds until it succeeds.

Configuring Secondary Storage

The NFS, CIFS/SMB, and SAN must be configured so that Sentinel has read and write permissions.

For CIFS/SMB and NFS, if multiple Sentinel instances are moving the closed partitions to the same secondary storage location, ensure that each Sentinel instance has its own unique directory on that secondary storage location.

- ♦ [“Configuring a SAN/Local Directory as a Secondary Storage Location” on page 163](#)
- ♦ [“Configuring an CIFS/SMB Server as a Secondary Storage Location” on page 164](#)
- ♦ [“Configuring an NFS Server as a Secondary Storage Location” on page 164](#)

Configuring a SAN/Local Directory as a Secondary Storage Location

Configuring a SAN/Local directory as a secondary storage location is the preferable configuration for best performance, security, and reliability.

- 1 From **Sentinel Main**, click **Storage > Events**.
- 2 From the Data Storage Location section, select **SAN (locally mounted)** as the secondary storage location.
- 3 In the **Location** field, specify the local directory path or the location on which the storage area network (SAN) is mounted. You must have the novell permissions to specify the location.

The SAN partition must be manually mounted before the location is specified.

- 4 Click **Test** to check if the write permissions for the specified location are available.
- 5 Click **Save** to configure the specified secondary storage location.

Configuring an CIFS/SMB Server as a Secondary Storage Location

- 1 From **Sentinel Main**, click **Storage > Events**.
- 2 In the Data Storage Location section, select **CIFS**.
- 3 Specify the following information:
 - Server:** Specify the IP address or hostname of the computer where the CIFS server, also known as the SMB server, is configured.
 - Share:** Specify the share name of the SMB or CIFS server. The mounted shares are unmounted when the server stops and are mounted again when the server starts. If the configured share unmounts, the Sentinel server detects this and mounts it again.
 - Username:** Specify the user name (if one is assigned) to access the share.
 - Password:** Specify the password (if one is assigned) to access the share.
 - Mount Options:** Specifies the options that are used while mounting the secondary storage location of the SMB or the CIFS server.

You can specify new mount options. For more information about the available NFS mount options, see the [mount.cifs \(8\) - Linux man page \(http://linux.die.net/man/8/mount.cifs\)](http://linux.die.net/man/8/mount.cifs).

The default mount options are `file_mode=0660,dir_mode=0770`.
- 4 (Optional) Click **Restore Defaults** to restore the default mount options.
- 5 Click **Test** to mount the SMB or CIFS server and to check the write permissions on the server.
- 6 Click **Save** to configure the specified secondary storage location.

Configuring an NFS Server as a Secondary Storage Location

NFS servers are fast and efficient. Setting up correctly requires significant configuration and testing. Using an NFS server as a secondary storage location is recommended only when you have a well-established NFS infrastructure in your environment.

- ♦ [“Exporting the Secondary Storage Volume” on page 165](#)
- ♦ [“Squashing User IDs” on page 166](#)
- ♦ [“Testing NFS Exports” on page 166](#)
- ♦ [“Configuring NFS as a Secondary Storage Location” on page 167](#)

Exporting the Secondary Storage Volume

You must configure an NFS server with a storage area large enough to accommodate the planned storage needs for Sentinel secondary storage. You need to export (share) this storage directory so that Sentinel can access it. The procedure to export the secondary storage depends on the technology used by your NFS server.

The following are some examples for several common systems:

- 1 Identify a volume on the NFS server with sufficient space to hold the Sentinel secondary storage data.
- 2 Create a new directory on that volume to store the Sentinel data. For example, `/sentinel-secondary`.
- 3 Create a novell user and novell group on the NFS server with the same user ID and group ID as the corresponding user/group on the Sentinel server. For example, user ID 1000 and group ID 1000. If this is not possible, see [“Squashing User IDs” on page 166](#).
- 4 Change the directory ownership to be owned by novell user and novell group:

```
chown novell:novell /sentinel-secondary
```
- 5 Change the directory permissions to remove the group and other read/write/execute permissions:

```
chmod og-rw /sentinel-secondary
```
- 6 Export the directory using the appropriate NFS server configuration. You can use a GUI client or refer to the appropriate settings or commands for various popular servers.
 - ◆ Set read and write access for sharing the Sentinel server. List the specific Sentinel server hostname or IP address to restrict access.
 - ◆ Use `root_squash` (which maps `root` users who attempt to access the share to an anonymous user ID) to prevent access by root.
 - ◆ You can also explore additional security and performance options, such as `async` by using TCP, and so on depending on the capabilities of your NFS server.

The following table describes an example of exporting the `/sentinel-secondary` directory from the `nfs-server` to the `sentinel-server`.

System Type	Configured location
Linux	Use YaST or add <code>/sentinel-secondary sentinel-server(rw,root_squash)</code> to the <code>/etc/exports</code> file.
Solaris	Add <code>/usr/bin/share -F nfs -i sec=sys,rw=sentinel-server,nosuid /sentinel-secondary</code> to the <code>/etc/dfs/dfstab</code> file.
HP-UX	Add <code>/sentinel-secondary -access=sentinel-server</code> to the <code>/etc/exports</code> file.
NetApp	Add <code>/sentinel-secondary -nosuid,sec=sys,rw=sentinel-server</code> to the <code>/etc/exports</code> file.

Squashing User IDs

In certain circumstances, it is not possible or desirable to create new user IDs on the NFS server that match the user IDs in use by the Sentinel server. The NFS protocol uses the user ID as an important component for granting permissions to read and write the data during the export. Most NFS servers do not provide flexible and specific ways to re-map user IDs used on the Sentinel system to different user IDs on the NFS server.

An alternate solution involves mapping all source user IDs to an anonymous user ID specified by the NFS server. For example, any user ID that attempts to access the NFS export. This reduces security allowing any user to read or write the Sentinel data on the export (subject to the IP-based access permissions of the export). This is called squashing. In most cases, the `root` user is re-mapped and most other users are not. In this case, you need to re-map the `novell` user and all other users.

The following table describes an example of re-mapping the `novell` user with ID 1000 on the Sentinel server to a local user on the NFS server with the ID 2000 who must have permission to the `/secondary-storage` directory.

System Type	Configured location
Linux	Use YaST or add <code>/sentinel-secondary sentinel-server(rw,all_squash,anonuid=2000)</code> to the <code>/etc/exports</code> file.
Solaris	Add <code>/usr/bin/share -F nfs -i sec=sys,rw=sentinel-server,anon=2000,nosuid /sentinel-secondary</code> to the <code>/etc/dfs/dfstab</code> file. If the user ID 1000 is in use on the NFS server, this may not work. In that case use <code>sec=none</code> .
HP-UX	Add <code>/sentinel-secondary -access=sentinel-server,anon=2000</code> to the <code>/etc/exports</code> file If the user ID 1000 is in use on the NFS server, the above may not work.
NetApp	Add <code>/sentinel-secondary -nosuid,sec=none,anon=2000,rw=sentinel-server</code> to the <code>/etc/exports</code> file

Testing NFS Exports

You can test the NFS export outside of Sentinel by using the standard Linux `mount` command to mount the export on the Sentinel server. To do so, log in to the Sentinel server as the `root` user and enter the following command:

```
mount -t nfs nfs-server:/sentinel-secondary /mnt
```

The above command mounts the export on the `/mnt` directory. You can see the mount in the list by re-issuing the `mount` command without options. You may not be able to perform any file actions using the `root` user instead use the `novell` user (`su novell`) to perform the file operations. Use `umount /mnt` command before you attempt to set up the secondary storage within Sentinel.

For more information about NFS security recommendations, see [Chapter 3, "Security Considerations,"](#) on page 21.

Configuring NFS as a Secondary Storage Location

Configure the secondary storage as follows:

- 1 From **Sentinel Main**, click **Storage > Events**.
- 2 In the Data Storage Location section, select the **NFS** option.
- 3 Specify the following information:
 - Server:** Specify the IP address or hostname of the computer where the NFS server is configured.
 - Share:** Specify the share name of the NFS server.

The mounted shares are unmounted when the server stops and are mounted again when the server starts. If the configured share unmounts, the Sentinel server detects this and mounts it again.

 - Mount Options:** Specifies the options that are used while mounting the secondary storage location of the NFS server.

You can also specify new mount options. For more information about the available NFS mount options, see the NFS documentation.

The default mount options are `soft,proto=tcp,retrans=1,timeo=60`.
- 4 (Optional) Click **Restore Defaults** to restore the default mount options.
- 5 Click **Test** to verify the configuration of the NFS server and to check the write permissions on the server.

This procedure tests a subset of all the settings that are necessary for the NFS server and client.
- 6 Click **Save** to configure the specified secondary storage location.

Changing the Secondary Storage Location

- 1 From **Sentinel Main**, click **Storage > Events**.
- 2 In the Data Storage Location section, select **Change Location**. The **Change Location** option is displayed only if the secondary storage location is configured.
- 3 Click **Change Location**.
- 4 Select the option to disable data collection.

You can select this option to avoid filling the primary storage before Sentinel moves the data to the new location. If this option is not selected and if the primary storage is filled before the new data storage location is configured, Sentinel deletes the oldest data to make space for the incoming data.
- 5 Configure the new data storage location.

For more information about configuring the NFS or SMB/CIFS or primary/SAN secondary storage locations, see [“Configuring Secondary Storage” on page 163](#).
- 6 Click **Save** to save the changes and configure the new secondary storage location.
- 7 Manually copy the files from the old secondary storage location to the new secondary storage location.
- 8 After copying the files, select **Copy Done** to start data storage at the new location.

Configuring Disk Space Usage

If secondary storage is enabled, Sentinel copies the event data to the secondary storage location after two days, and a local copy remains on the primary storage until the free space on the local storage needed for storing newer event data.

Sentinel moves the raw data to the secondary storage location after approximately one hour.

To configure disk space usage:

- 1 From **Sentinel Main**, click **Storage > Events**.

In the **Disk Space Usage** section, the **Primary storage size** field displays the total storage size currently used by Sentinel.

- 2 Specify the primary storage utilization values in the following fields:

- ♦ **Start deleting data from primary storage when __% full**: Specify the threshold at which the event data deletion process should start.

Reserve disk space for about a days' worth of event data so that the deletion process has sufficient time to complete. Also, if any other processes need to be able to store data to the same partition, those processes should have sufficient space to do so.

- ♦ **Stop when __% full**: Specify the threshold below which the disk space cleanup process should stop. The amount of freed disk space should be sufficient to store an additional full days' worth of event data.

Sentinel stores as much event data on primary storage as possible to ensure that searches run as quickly as possible. The values specified here help to ensure that primary event storage does not get too full, but that as much data as possible is available on that partition for faster searching. The cleanup process runs once a day, checks the “start deleting” threshold and, if disk space usage is higher than that threshold, begins deleting older event data first until the disk space usage is below the second threshold.

The **Secondary storage size** field specifies the value of the secondary storage space.

NOTE: This field is displayed only if you have enabled secondary storage.

- 3 (Conditional) If you have enabled secondary storage, specify the secondary storage utilization value in the **Use __% of total secondary storage size** field. This is the threshold at which Sentinel stops using the secondary storage disk space.

Verifying and Downloading Raw Data Files

The raw data files for each event source are compressed and moved to secondary storage every hour and the file hash is computed for secondary storage files. The file hash is used to check the integrity of the files in the secondary storage.

- 1 From **Sentinel Main**, click **Storage > Download Raw Data**.
- 2 In the **Event source hierarchy** field, select the desired Collector and Connector combination from the drop-down list.
- 3 In the **Event Source** field, select the event source from the drop-down list.

The **Event Source** field displays the list of associated event sources (hostnames or IP addresses) after the **Event source hierarchy** field is populated.

4 In the table, click **Select All** to select all the files in the table.

or

Select each file separately.

The table displays the list of primary and secondary storage raw data files for the selected event source. The **Verify Integrity** and **Download** options are enabled only when you select a file from the table.

5 Click **Verify Integrity** to verify the integrity of the selected files in the secondary storage by comparing the hash values for the selected files in the secondary storage.

Sentinel computes the hash and updates the database for the files in the secondary storage, but not for the local raw data files. Because the raw data files are updated until they are moved to secondary storage, the hash value cannot be computed or updated for these files. It is not possible to check the integrity of the local raw data files.

6 Select the raw data file, click **Download** to download the selected secondary storage and local raw data files.

The selected files are downloaded in the form of a ZIP file that contains a `.csv` (comma separated values) file. If the secondary storage files are selected, the ZIP file also contains a hash file corresponding to each of the secondary storage files downloaded.

Sentinel uses the SHA-256 algorithm to generate the file hash. The generated hash is Base64 encoded.

7 Select **Save File** and click **OK**.

Configuring Data Synchronization

Sentinel provides the ability to synchronize data to an external database, so that you can use third-party or custom reporting systems to search the data in the external database with more advanced tools than what are provided in Sentinel.

- ♦ [“Overview” on page 169](#)
- ♦ [“Creating Data Synchronization Policies” on page 172](#)
- ♦ [“Managing Data Synchronization Policies” on page 176](#)

Overview

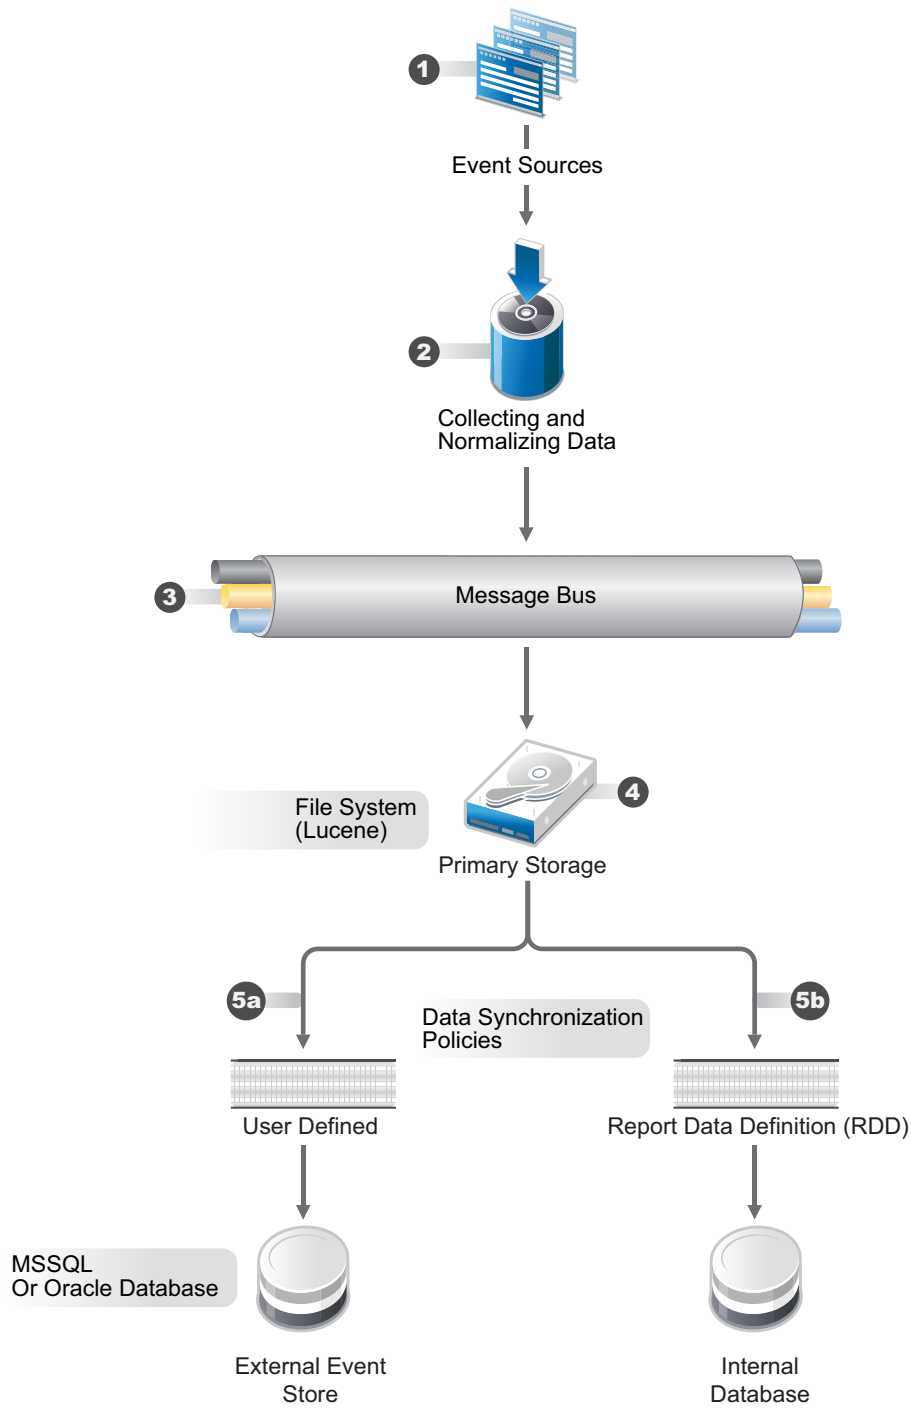

Sentinel can store the data in an external database by synchronizing a subset of the data that Sentinel gathers.

Sentinel uses the following process to synchronize data:

1. Sentinel gathers the events from the Event Sources through the Connectors.
2. Sentinel uses Collectors to normalize the event data.
3. The normalized event data is then sent to the Sentinel message bus.
4. The event data is then stored and indexed in the file system in the primary storage.

5. The data synchronization policies allow events in the primary storage to be copied and stored in PostgreSQL and external SQL databases.
 - a. User-defined data synchronization policies synchronize the filtered event data to an external SQL database. For information about the certified databases, see [Sentinel System Requirements](#).
 - b. Report Data Definitions (RDD) generate system data synchronization policies that are used to copy event data into tables in the internal PostgreSQL database. These data synchronization policies cannot be edited or deleted. Reports that rely on an RDD will search internal database tables for events instead of the primary storage. These kinds of reports search internal tables instead of the event store because they utilize more complex SQL SELECT statements that need to join event data to the data in other tables in the internal database.

Figure 13-1 Data Synchronization

Sentinel allows you to partition tables if they are in the internal PostgreSQL database. When you choose to partition a table in the internal PostgreSQL database, a new table partition is created for each days worth of data.

Partitions are only used with RDD data sync policies. Partitioning has advantages and disadvantages:

Advantages

- ♦ If a retention period is in force, old data can be deleted quickly. When data has aged, it is much quicker to drop a partition than it is to delete individual table records.
- ♦ Reports that query on the event time field might be quicker, because it is only necessary to search the partitions that have the specified event times.

Disadvantages

- ♦ Reports that do not query on event time might be slower where there are multiple of partitions, because every partition must be searched.
- ♦ Each partition causes one or more schema items to be created and managed by the database system. If there is no retention period, the number of partitions just keeps growing.

Creating Data Synchronization Policies

When Sentinel syncs data to an external database, it is not as fast when it writes to the file system. Therefore, you need to ensure that you use filters on the data sync policies to synchronize only the most important data. Consider the following factors based on your business needs for data sync policies:

- ♦ The CPU, RAM, and disk capacity of the Sentinel system
- ♦ Number of EPS scaled per system
- ♦ Number of searches and reports running on a Sentinel system
- ♦ Filters added to the data sync policies

Populating IP addresses in Human Readable Format

By default, Sentinel populates IP address fields in hexadecimal format for efficiency reasons. You can choose to populate the IP address fields in human readable format automatically, by performing the following steps:

- 1 Log on to the Sentinel server as the novell user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file and set the `datasync.saveIPinDottedNotation` property to true.
- 3 Restart the Sentinel server.

Enabling SSL Communication for Data Synchronization

You can establish an SSL connection to synchronize data with external databases. Sentinel does not perform certificate validation or authentication.

To enable SSL communication, performing the following steps:

- 1 Log in to the Sentinel server as the novell user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 If the `jsse.enableCBCProtection` property is not listed, add this property and set it to false as follows:

```
jsse.enableCBCProtection=false
```

4 Open the `/etc/opt/novell/sentinel/config/databasePlatforms.xml` file.

5 Identify the database platform for which you need to enable SSL connection.

6 Set the JDBC property as follows:

For MSSQL: Set the SSL property to `require` as follows:

```
<JDBCProperties>
```

```
  <Property name="ssl" value="require"/>
```

```
</JDBCProperties>
```

For PostgreSQL: Set the SSLOFF property to `false` as follows

```
<JDBCProperties>
```

```
  <Property name="ssloff" value="false"/>
```

```
</JDBCProperties>
```

For Oracle: Set the SSLOFF property to `false` as follows:

```
<JDBCProperties>
```

```
  <Property name="ssloff" value="false"/>
```

```
</JDBCProperties>
```

7 Restart the Sentinel server.

Creating a Data Synchronization Policy

♦ **Prerequisite for IBM DB2:** By default, Sentinel includes the JDBC driver for all the certified databases except for IBM Db2. For Db2, you must manually copy the JDBC driver from the Db2 server to the Sentinel server.

1. Copy the `db2jcc4.jar` file from the Db2 server to the following location on the Sentinel sever:

```
#/opt/novell/sentinel/lib/
```

2. Change the owner of the file to `novell`, using the following command:

```
chown novell:novell <filename>
```

3. Configure the `server.conf` file.

- a. In the `/etc/opt/novell/sentinel/config` directory, open the `server.conf` file.

- b. Add the following `java classpath` property:

```
wrapper.java.classpath.7=/opt/novell/sentinel/lib/db2jar file
```

```
For example, wrapper.java.classpath.7=/opt/novell/sentinel/lib/  
db2jcc4-9.7.0.0.jar
```

4. Restart the Sentinel server:

```
rcsentinel restart
```

To create a data synchronization policy:

- 1 Log in to Sentinel as a user in the administrator role.
- 2 From **Sentinel Main**, click **Storage > Data Synchronization**.
- 3 Click **Create** to create a new data synchronization policy.
- 4 Use the following information to create the data synchronization policy:

Filter query: Select a saved filter to use in the data synchronization policy.

This filter determines which events are stored in the external database. For more information, see “[Configuring Filters](#)” in the *Sentinel User Guide*.

Policy name: Specify a name for the data synchronization policy.

Retention period: Specify how many days to retain the events in the external database.

Start data synchronization time: Specify when to start synchronizing events to the external database.

Batch size: Specify how many events are sent to the external database at once.

Sleep period: Specify the length of time that the data synchronization process sleeps before checking to see if there are more events to process.

Schedule: Select when the data is synchronized to the external database.

- ♦ **All the time:** Synchronizes events to the external database constantly.
- ♦ **Custom:** Allows you to configure specific time periods to perform data synchronization so that it does not occur when the system is busy.

If you select **Custom**, specify the following information to set the custom synchronization time:

- ♦ **Day of the Week:** Select the day of the week, or select **Everyday**.
- ♦ **Start time:** Specify the time to start the synchronization process. You can enter 24:00 hour time and it is converted to 12:00 hour time.
- ♦ **Duration:** Specify the synchronization period in minutes.

If you do not see the data in the database tables immediately, you need to wait for the next synchronization cycle.

- 5 Use the following information to define the connection to the external database:

Database type: Select the type of external database.

Host name: Specify the host name of the server where the external database is installed.

Port: Specify the port used to connect to the external database.

User name: Specify the name of the user that authenticates to the external database.

Password: Specify the password of the database user.

Database: Specify a unique name for the external database. For Oracle database, you can either use the **Database name** or the **Service name**.

Field Mapping: Allows you to map fields in the event to fields in the external database.

- ♦ [“Creating a Table for Event Data Synchronization” on page 175](#)
- ♦ [“Using an Existing Table for Event Data Synchronization” on page 175](#)

6 Click **Save** to create the data synchronization policy.

Creating a Table for Event Data Synchronization

1 Complete [Step 2](#) through [Step 4](#) in [“Creating Data Synchronization Policies” on page 172](#).

2 Click **Field Mapping**.

3 Select **Create table**.

4 Use the following information to create the table:

Table name: Specify a name for the table.

Table Space (Optional): Specify a tablespace for the table.

Index Space (Optional): Specify a tablespace for the index.

Summarize Events: Select this option if you want a summary of events during a specific period.

Summary Period (Minutes): If you selected **Summarize Events**, you must specify the amount of time in minutes to summarize events.

5 Map the fields in the table to the desired fields.

6 Click **Create Table**.

7 Click **Save**.

Using an Existing Table for Event Data Synchronization

1 Complete [Step 2](#) through [Step 4](#) in [“Creating Data Synchronization Policies” on page 172](#).

2 Click **Field Mapping**.

3 Select **Select existing table**.

Starting from Sentinel 8.x, the size of the `Message (msg)` event field has been increased from 4000 to 8000 characters to accommodate more information in the field.

If you are creating a data synchronization policy that synchronizes the `Message (msg)` event field to an external database, you must increase the size of the `Message (msg)` field’s mapped column in the external table accordingly.

NOTE: The above update is applicable only if you are upgrading previous versions of Sentinel to 8.x.

4 Browse to a select an existing table you want to use, then click **OK**.

5 (Optional) Select the **Summarize Events** option if you want a summary of events during a specific period.

6 (Optional) If you selected **Summarize Events**, specify the amount of time in minutes to summarize events.

7 Change the field mappings for the desired fields.

8 Click **Save**.

Setting Retention Period in Default RDD Policies

By default, the retention period value is set to 30 days for all RDD policies that do not have retention period specified. However, you can change the retention period value.

To change the default retention period value:

- 1 Log on to the Sentinel server as the `novell` user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 Add the `default.global.datasync.retentionperiod` property and set it to the required value.

NOTE: If you set the value of this property to zero, the RDD table entries are never deleted.

- 4 Restart the Sentinel server.

Managing Data Synchronization Policies

You can edit, delete, and view the status of each data synchronization policy you create on the Data Synchronization page. If your policy is a custom synchronization policy and you perform a resynchronization, the data synchronizes during the next synchronization cycle.

Event Views use data synchronization policies to display data dynamically and more accurately. Data synchronization policies related to Event Views remain enabled and active while being used by an Event View. If there are no data requests from an Event View for a given data synchronization policy within a specified time period, the data synchronization policy will be automatically deleted.

To specify the time period for which an Event View related data synchronization policy should remain active:

- 1 Log in to the Sentinel server as the `novell` user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 Set the desired time in hours for the `sentinel.realtime.datasynctimeout` property.
- 4 Save the modified `configuration.properties` file.
- 5 Restart Sentinel.

Viewing Primary and Secondary Storage Capacity

The Health page displays primary and secondary data capacity. For more information about configuring secondary storage, see [“Configuring Secondary Storage Locations” on page 162](#).

To view the primary storage and secondary storage capacity:

- 1 From **Sentinel Main**, click **Storage > Health**.

The Health page of Sentinel also displays the current storage capacity and also forecasts the storage capacity for both primary and secondary storage.

WARNING: When the system is running out of primary disk storage space, a warning message is displayed and a system audit event is logged. To avoid data loss, you must increase the primary storage space.

Using Sequential-Access Storage for Long Term Data Storage

Sentinel requires data to be on a storage system that supports random access, such as data on your typical hard drive. It does not support directly interfacing with the data stored on tape.

You can search the raw data by using tools such as `egrep` or a text editor, but this search might not be sufficient for your requirements. The search mechanism provided by Sentinel on event data is more powerful than these tools.

The high-level approach to configure Sentinel is to retain data for a longer duration so you can perform searches and run reports on the data you regularly need to access, and to copy the data to tape before Sentinel deletes it. To search or run reports on data that was copied to tape, but deleted from Sentinel, copy the data from the tape back to Sentinel.

- ♦ [“Determining What Data You Need to Copy to Tape” on page 177](#)
- ♦ [“Backing Up Data” on page 177](#)
- ♦ [“Configuring Storage Utilization” on page 178](#)
- ♦ [“Configuring Data Retention” on page 178](#)
- ♦ [“Copying Data to Tape” on page 178](#)
- ♦ [“Restoring Data” on page 179](#)

Determining What Data You Need to Copy to Tape

There are two types of data in Sentinel: raw data and event data.

If you want to perform searches or reports on the data, copy both the raw data and the event data to tape so that you can copy both sets of data back into Sentinel when the data is needed. If you want to store data only to comply with legal requirements, copy only the raw data to the tape.

Backing Up Data

Events should be moved to secondary storage regularly. The following types of data can be backed up in Sentinel:

Configuration Data: This option includes non-event or raw data backup. It is faster because it contains small amount of data, including all the installation directories except the `data` directory.

Data: This option backs up all the data in the primary storage and secondary storage directories. This option takes a longer time to finish.

Secondary storage directories can be located on a remote computer.

Best practices for data backup include the following:

- ◆ Periodically export all the Event Source Management configurations and save them. When the environment is relatively stable, you can generate a full Event Source Management export including the entire tree of the Event Source Management components. This action captures the plug-ins and the configuration of each node. You must back up the resulting `.zip` file and move it to secondary storage.

If changes such as updating plug-ins or adding nodes are made to Event Source Management later, you must export the configuration and save it again.

- ◆ Back up the entire installation directory so there is no risk of manual mistakes and the process is quicker.

Configuring Storage Utilization

You should configure primary and secondary storage space to store data before the data is deleted from the Sentinel server. While configuring the storage space, ensure that your storage system is not 100% utilized to avoid undesirable behaviors such as data corruption. Additionally, you should also have additional space in your secondary storage to copy data from tape back into Sentinel. You can do this by decreasing the archive utilization setting.

Configuring Data Retention

You can configure the duration for the data to remain on the disk before it is deleted. If your hard drive storage space is not sufficient to store data long enough to meet your legal requirements, you can use tape storage to store data beyond the specified duration.

You must configure data retention policies so that the data that you want to search and report is retained within the Sentinel server until you no longer need it. Additionally, a data retention policy should ensure that Sentinel is not prematurely deleting the data because of storage utilization limits. If the storage utilization limit is exceeded and you notice that the data is being prematurely deleted, change the data retention policy to expand the data storage space.

Copying Data to Tape

You can set up a process to copy raw data and event data to tape, depending on the data that you need. The following sections describe how each type of data is stored in Sentinel so that you can set up copy operations to copy the data out of Sentinel onto tape.

- ◆ [“Copying Raw Data to Tape” on page 179](#)
- ◆ [“Copying Event Data to Tape” on page 179](#)

Copying Raw Data to Tape

Raw data partitions are individual files. They are created every hour. Raw data files are compressed and have the .gz extension.

The directory hierarchy in which the raw data files are placed is organized by the event source and the date of the raw data. You can use this hierarchy to periodically copy a batch of raw data files to tape. For more information on raw data directory hierarchy, see [Table 13-1, “Raw Data Directory Structure,”](#) on page 155.

You cannot copy files that are in the process of being compressed. You must wait until the raw data files are compressed and moved to secondary storage before copying them to tape. The presence of a .log file with the same name as the zip file indicates that the file is still in the process of being compressed. You must also ensure that the raw data files are copied to the tape before the interval configured in the Raw Data Retention policy expires so that the data is not lost.

Copying Event Data to Tape

Event data partitions are created every 24 hours. Event data is stored in the data/eventdata directory with subdirectory names prefixed with the year, month, and day when the partition was created (yyyymmdd). For example, the path to a complete event data partition, relative to the installation directory, is data/eventdata/20090101_408E7E50-C02E-4325-B7C5-2B9FE4853476. You can use this hierarchy to know when a partition is closed. Subdirectories whose date is at least 48 hours old should be in the closed state.

For more information about the event data directory hierarchy, see [Table 13-3, “Event Data Directory Structure,”](#) on page 161.

You should wait until event data partitions have been copied to secondary storage before copying them to tape. Before you copy, ensure that the directory is not currently being copied from primary storage. To do this, see if there is a primary storage directory partition of the same name. If the corresponding primary storage directory partition is not present, the secondary storage directory partition is not being copied. If the corresponding primary storage directory partition is still present, sure that all of the files in the primary storage directory partition are also in the secondary storage directory partition and that they are all of the same size. If they are all present and of the same size, it is highly likely that they are not currently being copied.

Restoring Data

The event data restoration feature enables you to restore old or deleted event data. You can also restore the data from other systems. You can select and restore the event partitions in the Sentinel Main interface. You can also control when these restored event partitions expire.

NOTE: The Data Restoration feature is a licensed feature. This feature is not available with the free or trial licenses. For more information, see [“Understanding License Information”](#) in the *Sentinel Installation and Configuration Guide*.

- ♦ [“Enabling Event Data for Restoration”](#) on page 180
- ♦ [“Viewing Event Data Available for Restoration”](#) on page 180

- ♦ [“Restoring Event Data” on page 180](#)
- ♦ [“Configuring Restored Event Data to Expire” on page 181](#)

Enabling Event Data for Restoration

To enable event data for restoration, you must copy the event data directories that you want to restore to one of the following locations:

- ♦ For primary storage, you can copy the event data directories to `/var/opt/novell/sentinel/data/eventdata/events/`.
- ♦ For secondary storage, you can copy the event data directories to `/var/opt/novell/sentinel/data/archive_remote/<sentinel_server_UUID>/eventdata_archive`.

To determine the Sentinel server UUID, perform a search in the Web interface, in the Search results, click **All** for any local event. The value of the SentinelID attribute is the UUID of your Sentinel server.

Viewing Event Data Available for Restoration

- 1 From **Sentinel Main**, click **Storage > Events**.

The Data Restoration section does not initially display any data.

- 2 Click **Find Data** to search and display all event data partitions available for restoration.

The Data Restoration table chronologically lists all the event data that can be restored. The table displays the date of the event data, the name of event directory, and the location. The **Location** column indicates whether the event directory was found in the primary storage directory of Sentinel or in the configured secondary storage directory.

- 3 Continue with [“Restoring Event Data” on page 180](#) to restore the event data.

Restoring Event Data

- 1 Select the check box in the **Restore** column next to the partition that you want to restore.

The **Restore Data** button is enabled when the Data Restoration section is populated with the restorable data.

- 2 Click **Restore Data** to restore the selected partitions.

The selected events are moved to the **Restored Data** section. It might take approximately 30 seconds for the **Restored Data** section to reflect the restored event partitions.

- 3 (Optional) Click **Refresh** to search for more restorable data.

- 4 To configure the restored event data to expire according to data retention policy, continue with [“Configuring Restored Event Data to Expire” on page 181](#).

Restoring Event Data Where UID and GID are not the Same on the Source and the Destination Server

There may be a scenario where the secondary storage data if the novell user ID (UID) and the group ID (GID) are not the same on both the source (server that has the secondary storage data) and destination (server where the secondary storage data is being restored). In such a scenario, you need to unsquash and squash the squash file system.

To unsquash and squash the file system:

- 1 Copy the partition that you want to restore on the Sentinel server where you want to restore the data at the following location:

```
/var/opt/novell/sentinel/data/archive_remote/<sentinel_server_UUID>/  
eventdata_archive/<partition_ID>
```

- 2 Log in to the Sentinel server where you want to restore the data, as the `root` user.

- 3 Change to the directory where you copied the partition that you want to restore:

```
cd /var/opt/novell/sentinel/data/archive_remote/<sentinel_server_UUID>/  
eventdata_archive/<partition_ID>
```

- 4 Unsquash the `index.sqfs` file:

```
unsquashfs index.sqfs
```

The `index.sqfs` file is unsquashed and the `squashfs-root` folder is created.

- 5 Assign permission for `novell` user and `novell` group to the `<partition_ID>` folder:

```
chown -R novell:novell <partition_ID>
```

- 6 Remove the index:

```
rm -r index.sqfs
```

- 7 Switch to `novell` user:

```
su novell
```

- 8 Squash the `squashfs-root` folder:

```
mksquashfs squashfs-root/ index.sqfs
```

- 9 Restore the partitions. For more information, see [“Restoring Event Data.”](#)

Configuring Restored Event Data to Expire

The restored partitions do not expire by default, according to any data retention policy checks. To enable the restored partitions to return to the normal state and also to allow them to expire according to the data retention policy, select **Set to Expire** for data that you want to expire according to the data retention policy, then click **Apply**.

The restored partitions that are set to expire are removed from the Restored Data table and returned to normal processing.

It might take about 30 seconds for the Restored Data table to reflect the changes.

14 Configuring Scalable Storage

This chapter includes the following topics:

- ♦ “Enabling Scalable Storage Post-Installation” on page 183
- ♦ “Performance Tuning Guidelines” on page 184
- ♦ “Processing Data” on page 189
- ♦ “Working with Sentinel Scalable Data Manager” on page 190
- ♦ “Migrating Data from Sentinel with Traditional Storage” on page 190
- ♦ “Modifying Scalable Storage Configuration” on page 190
- ♦ “Viewing the Complete Event Data and Raw Data” on page 191
- ♦ “Re-Indexing Data from HBase” on page 191
- ♦ “Upgrading Scalable Storage Setup” on page 192
- ♦ “Troubleshooting” on page 192

Enabling Scalable Storage Post-Installation

Enabling scalable storage is a one-time configuration, which cannot be reverted. If you want to disable scalable storage and switch to traditional storage, you must re-install Sentinel and not opt for scalable storage during installation.

When you enable scalable storage, the Sentinel server user interface is trimmed down to just cater to scalable data collection, event routing, events dashboard, and other administrator activities. This trimmed down version of Sentinel is referred to as Sentinel Scalable Data Manager (SSDM).

To configure scalable storage:

- 1 Complete the prerequisites to enable scalable storage. For information about prerequisites, see “Installing and Setting Up Scalable Storage” in the *Sentinel Installation and Configuration Guide*.
- 2 From **Sentinel Main**, click **Storage > Scalable Storage**.
- 3 Select **Configure scalable storage**.
- 4 Specify the IP addresses or hostnames and port numbers of the scalable storage components.
- 5 (Conditional) To customize the default configuration of CDH components, click **Show advanced configuration**.

If the properties you want to modify are not listed in the user interface, click **Add property** and set the value.

Customizing Kafka Configuration

You can customize the following properties in the Sentinel web interface only when you enable scalable storage for the first time. If you want to modify these properties after scalable storage is enabled, you must use appropriate Kafka tools as mentioned in Kafka documentation. For more information, see [Apache Kafka documentation](#).

Property	Recommended Value	Notes
<code>default.replication.factor</code>	2	Indicates the number of replicas of Kafka partitions, not counting the original copy. For example, for a total of 3 copies of the same partition, a value of 2 means 1 original and 2 replicas.
<code>num.partitions</code>	9	Indicates the number of Kafka topic partitions. You can increase this value according to the number of YARN NodeManager vcores. For example: if YARN NodeManager has 16 vcores to utilize, number of Kafka partitions should be 15.

You can customize other properties at any time as needed.

- 6 Click **Save**.
- 7 Log in to the SSDM server.
- 8 Complete CDH and Elasticsearch configuration as mentioned in the following sections:
 - ♦ [Performance Tuning Guidelines](#)
 - ♦ [Processing Data](#)

Performance Tuning Guidelines

- ♦ [“Performance Tuning in CDH” on page 184](#)
- ♦ [“Performance Tuning in SSDM” on page 188](#)

Performance Tuning in CDH

The following table provides information about performance tuning recommendations that you must perform on your CDH setup.

For information about how to set these values, refer to the Cloudera documentation.

Table 14-1 *Tuning Guidelines for CDH*

CDH Component	Scaling Factor	Recommendation
Kafka	Data retention hours <code>log.retention.hours</code>	Configure the retention days based on the disk space available on the Kafka node, EPS rate, and the number of days needed to recover the system from a scalable storage outage if one were to occur. Kafka will retain the data while the scalable storage system is recovered, preventing data loss. For information about the recommended disk storage for various EPS rates, see the Technical Information for Sentinel page .

CDH Component	Scaling Factor	Recommendation
	Data directories	Each directory should be on its own separate drive.
	log.dirs	Configure multiple paths to store Kafka partitions. For example, /kafka1, /kafka2, and /kafka3. For best performance and manageability, mount each path to a separate physical disk (JBOD).
HDFS	HDFS block size	Increase the block size to 256 MB to reduce the disk seek time among data nodes and to reduce the load on NameNodes.
	dfs.block.size	
	Replication factor	Set the value to 3 so that it creates three copies (1 primary and 2 replicas) of files on data nodes.
	dfs.replication	More than 3 copies of files require additional disks on data nodes and reduce the disk I/O latency. The number of data disks required is usually multiplied with the number of replicas.
	DataNode data directory	Each directory should be on its own separate drive.
	dfs.data.dir,dfs.datanode.data.dir	Configure multiple paths for storing HBASE data. Example /dfs1, /dfs2, and so on. For best performance and manageability, mount each path to a separate physical disk (JBOD).
	Maximum number of transfer threads	Set it to 8192.
	dfs.datanode.max.xcievers,dfs.datanode.max.transfer.threads	
HBase	HBase Client Write Buffer	Set this value to 8 MB to increase the write performance of HBase for a higher EPS load.
	hbase.client.write.buffer	
	HBase RegionServer Handler Count	Set this value to 100.
	hbase.regionserver.handler.count	This value must be approximately the number of CPUs on the region servers. For example, if you have 6 region servers with 16 core each, set the region handler count as 100 (6 x 16 = 96).
	HBase table regions	By default, Sentinel assigns (pre-splits) 16 regions per table. Regardless of Sentinel pre-splitting the regions, once a region gets to a certain (HBase maximum file Size exceeds) limit, HBase automatically splits the regions into two so that the total number of region count increases on the region servers.
	security.event.s.normalized	
	security.event.s.raw	Monitor the HBase load distribution. If you see that some regions are getting uneven loads, you may consider splitting those regions manually to distribute the load evenly and improve throughput.

CDH Component	Scaling Factor	Recommendation
	Maximum Size of All Memstores in RegionServer hbase.regionserver.global.memstore.upperLimit hbase.regionserver.global.memstore.size	Set it to 0.7.
	HFile Block Cache Size hfile.block.cache.size	Set it to 0.1.
	HBase Memstore Flush Size hbase.hregion.memstore.flush.size	Set it to 256 MB.
	HStore Compaction Threshold hbase.hstore.compactionThreshold	Set it to 5.
	Java Heap Size of HBase RegionServer in Bytes	Set it to 4 GB.
YARN	Container Virtual CPU Cores yarn.nodemanager.resource.cpu-vcores=14	Increase this value to up to 80% of NodeManager's available vCPUs. For example, If NodeManager has 16 vCPUs resources, set this value to up to 14 vcores so that you leave 2 vcore for operating system utilization. You can increase or decrease this value based on the available vcores for NodeManager.
	Container Virtual CPU Cores Maximum yarn.scheduler.maximum-allocation-vcores	Allocate 1 vcore per Application Master container.

CDH Component	Scaling Factor	Recommendation
	Container Memory	Increase this value to up to 80% of NodeManager's memory.
	<code>yarn.nodemanager.resource.memory-mb</code>	For example, if NodeManager memory is 24 GB, set this value to up to 20 GB. You can increase or decrease this value based on the available NodeManager memory.
	Container Memory Maximum	Spark runs 3 applications: event data, raw data, and event indexer. Ensure that each AM container has sufficient memory to run these applications.
	<code>yarn.scheduler.maximum-allocation-mb</code>	For example, if YARN ResourceManager has 24 GB, allocate a maximum of 8 GB memory per AM container. You can increase or decrease this value based on the available ResourceManager memory.
Spark	Enable Event Log Cleaner	Set it to true.
	<code>spark.history.fs.cleaner.enabled</code>	
	Event Log Cleaner Interval	Set it to 30 minutes.
	<code>spark.history.fs.cleaner.interval</code>	
	Maximum Event Log Age	Set it to 4 hours.
	<code>spark.history.fs.cleaner.maxAge</code>	
Disk Latency		Whenever the disk latency goes beyond 100 ms on a data node, add more JBOD disks to the data node and configure the component causing the highest I/O load to utilize the directories where additional disks are mounted.

Performance Tuning in SSDM

SSDM automatically configures settings of Sentinel components connected to or running within the scalable storage system, which are described in the following table:

Table 14-2 Newly Added Properties for Scalable Storage Configuration

Property	Default Value	Notes
rawdata.fullconnectordump (HDFS)	false	To reduce storage space and for better performance, SSDM stores only the raw data and does not store the full Connector dump for an event. If this property is set to true, SSDM stores the full Connector dump, which is 3 - 5 times larger than the raw data dump.
batch.duration (YARN)	10 (seconds)	Indicates the batch interval for Spark streaming. Events are continuously processed in batches at the specified interval.
kafka.metrics.print (Kafka)	false	If enabled, SSDM periodically prints the Kafka client metrics in Sentinel logs.

To avoid data loss and to optimize performance, SSDM automatically configures certain scalable storage components' settings described in the following table. For more information about these advanced properties and the guidelines to consider when configuring these properties, see the documentation for the specific component.

Table 14-3 Customized Properties of Scalable Storage Components

Component	Property	Customized Value	Reason for Customization
HDFS/HBase	hbase.client.retries.number	3	To prevent data loss
	hbase.zookeeper.recoverable.waittime	5000	To prevent data loss
	hbase.client.pause	3	To prevent data loss
Kafka	compression.type	lz4	For better performance and also for storage size reduction.
	retries	2147483647	To prevent data loss
	request.timeout.ms	2147483647	To prevent data loss
	max.block.ms	2147483647	To prevent data loss
	acks	all	To prevent data loss
	reconnect.backoff.ms	10000	To improve performance
	max.in.flight.requests.per.connection	5	To improve performance
linger.ms	100	To improve performance.	

Component	Property	Customized Value	Reason for Customization
ZooKeeper	zookeeper.session.timeout	5000	To prevent data loss

To view or configure the advanced properties, in the SSDM home page, click [Storage > Scalable Storage > Advanced Properties](#).

IMPORTANT: You can add new properties or modify the existing properties as required. You must specify these settings at your own discretion and validate them because the changes are applied as is.

Processing Data

Data processing includes streaming of event data and raw data to HBase tables and indexing data into Elasticsearch.

You must start or restart data processing in the following scenarios:

- ◆ When you configure scalable storage for the first time.
- ◆ When you modify the IP address or port number of Elasticsearch or any of the CDH components.
- ◆ When data processing fails.
- ◆ When you restart the CDH or YARN cluster.
- ◆ When you reboot the CDH or YARN machine.
- ◆ When you update the event criteria for Correlation Engine or delete the Correlation Engine.

To start or restart data processing:

- 1 Log in to the SSDM server as the `novell` user and copy the files to the Spark history server where HDFS NameNode is installed:

```
cd /etc/opt/novell/sentinel/scalablestore
scp SparkApp-*.jar avroevent-*.avsc avrorawdata-*.avsc spark.properties
log4j.properties manage_spark_jobs.sh
root@<hdfs_node>:<destination_directory>
```

where `<destination_directory>` is any directory where you want to place the copied files. Also, ensure that the `hdfs` user has full permissions to this directory.

- 2 Log in to the `<hdfs_node>` server as the root user and change the ownership of the copied files to `hdfs` user:

```
cd <destination_directory>
chown hdfs SparkApp-*.jar avroevent-*.avsc avrorawdata-*.avsc
spark.properties log4j.properties manage_spark_jobs.sh
```

Assign executable permission to the `manage_spark_jobs.sh` script.

- 3 (Conditional) To restart data processing, stop the currently running Spark jobs by running the following script:

```
./manage_spark_jobs.sh stop
```

- 4 Run the following script to start data processing:

```
./manage_spark_jobs.sh start
```

The above command takes a while to complete the data processing.

- 5 (Optional) Run the following command to verify the data processing status:

```
./manage_spark_jobs.sh status
```

Working with Sentinel Scalable Data Manager

Sentinel Scalable Data Manager enables you to manage data collection and correlation, and provides other SSDM capabilities. For other Sentinel capabilities such as Security Intelligence and reporting, you must install additional Sentinel servers with traditional storage. You can configure event routing rules to forward specific events required for analysis from Sentinel Scalable Data Manager to those Sentinel servers by using Sentinel Link.

To configure data collection and event routing rules, see [Part III, “Collecting and Routing Event Data,” on page 89](#).

To search and visualize events, see the following chapters in the [Sentinel User Guide](#):

- ♦ [Alerts Dashboard](#)
- ♦ [Searching Events](#)

Migrating Data from Sentinel with Traditional Storage

Migrating data from Sentinel with traditional storage allows you to leverage your existing Sentinel data and the time you have invested in it. For information about migrating data from traditional storage, see “[Migrating Data to Scalable Storage](#)” in the [Sentinel Installation and Configuration Guide](#).

Modifying Scalable Storage Configuration

- 1 From [Sentinel Main](#), click **Storage > Scalable Storage**.
- 2 Modify the IP addresses or hostnames or port numbers of the desired components.
- 3 (Optional) Modify the advanced configurations for CDH components.
- 4 Click **Save**.
- 5 (Conditional) If you modified YARN NodeManager IP addresses, SSDM IP address, or the Elasticsearch port number, update the whitelist accordingly to ensure that the Elasticsearch security plug-in grants access to the Elasticsearch clients.
- 6 Verify whether any YARN applications are running:

```
./manage_spark_jobs.sh status
```

If there are any YARN applications running, stop those applications:

```
./manage_spark_jobs.sh stop
```
- 7 Restart data processing. For more information, see “[Processing Data](#)” on page 189.

Viewing the Complete Event Data and Raw Data

SSDM indexes only certain fields of an event and displays only the indexed fields in the search results. To view all the fields of an event including the non-indexed fields, SSDM provides an API that helps you extract the entire event data directly from HBase. Similarly, you can use this API to extract raw data as well.

To extract raw data or event data, you can run the `rest_client.sh` script and specify the RecordID of raw data or EventID of the event respectively along with the time range during which the event occurred. The time range must be in `yyMMddHHmmss` format. To determine the RecordID of the raw data, you must first extract the event data and note down the RecordID (rv25 value) of the event.

To extract raw data or event data from HBase:

1 Log in to the SSDM server as a non-administrator user.

2 (Conditional) To extract event data, run the following command:

```
sudo -u novell /opt/novell/sentinel/bin/rest_client.sh
<sentinel_user_name> <sentinel_password_file> https://
<sentinel_IPaddress>:<sentinel_port>/SentinelRESTServices/objects/sor/
event/<event_ID>/from_date/to_date
```

3 (Conditional) To extract raw data, perform the following:

3a (Conditional) If you do not have the RecordID of the raw data, complete Step 2 to determine the RecordID (rv25 value) of the event.

3b Run the following command:

```
sudo -u novell /opt/novell/sentinel/bin/rest_client.sh
<sentinel_user_name> <sentinel_password_file> https://
<sentinel_IPaddress>:<sentinel_port>/SentinelRESTServices/objects/
sor/rawdata/<raw_data_record_ID>/from_date/to_date
```

Re-Indexing Data from HBase

You can rebuild the Elasticsearch index by using the data stored in HBase. Re-indexing data helps in the following scenarios:

- ♦ Index has been corrupted.
- ♦ Index has been deleted.
- ♦ Event fields to be indexed by Elasticsearch have been modified.

To re-index data from HBase:

1 Log in to the Spark history server and change to the directory where you stored the Spark job related files when submitting Spark jobs.

2 Delete the existing index file to consider any updates to event fields that need to be indexed:

```
curl -XDELETE 'http://<elasticsearch_ipaddress>:<elasticsearch_port>/
security.events.normalized_*/'
```

3 Run the following command:

```
sudo -u hdfs spark-submit --master yarn --files
spark.properties,log4j.properties --deploy-mode client --class
com.novell.sentinel.spark.scanner.HbaseScanner SparkApp-
<latest_file>.jar -confFile=spark.properties -table=<hbase_table_name>
-from=<yyddmmhhmmss> -to=<yyddmmhhmmss> -interval=<seconds> -
outputhandler=com.novell.sentinel.spark.scanner.EventIndexRDDHandler
```

where:

`hbase_table_name` is the HBase table from which data is read for indexing. The HBase table name is in the `<tenant_ID>:security.events.normalized` format.

`from` is the timestamp of the HBase table row from which re-indexing should start.

`to` is the timestamp of the HBase table row where re indexing should stop.

`interval` is the batch interval in seconds. The recommended interval is 60 seconds.

Upgrading Scalable Storage Setup

When you upgrade any of your scalable storage components, to avoid any event loss, you must pause event forwarding from Collector Manager to Kafka before you upgrade. Once the upgrade is complete, you must resume event forwarding to Kafka.

To pause or resume event forwarding to Kafka:

- 1 In Sentinel Main, click **Storage > Scalable Storage > Advanced Configuration > Kafka**.
- 2 (Conditional) Before you upgrade the scalable storage component, pause event forwarding by adding the following property and set it to `true`:
`pause.events.tokafka`
- 3 (Conditional) After you upgrade the scalable storage component, resume event forwarding by setting the following property to `false`:
`pause.events.tokafka`
- 4 Click **Save**.

Troubleshooting

- ♦ [“Sentinel Operations Do Not Complete Successfully When Any of the CDH Components Are Not Running” on page 192](#)
- ♦ [“Event Visualization Interface May Not Launch Due to Time-Out Error” on page 193](#)

Sentinel Operations Do Not Complete Successfully When Any of the CDH Components Are Not Running

Issue: When you are performing any Sentinel operations such as creating a tenant, if any of the associated CDH components are not running, the Sentinel operation will not complete successfully. For example, if ZooKeeper is down, Sentinel creates the tenant but it does not create the corresponding namespace and tables in HBase.

Fix: Restart Sentinel once the CDH components are up and running.

Event Visualization Interface May Not Launch Due to Time-Out Error

Issue: If the network latency between SSDM and Elasticsearch nodes is high, the event visualization interface may not launch due to a time-out error.

Fix: Increase the time-out period in Kibana as follows:

- 1 Log in to the SSDM server as the novell user.
- 2 Open the `/opt/novell/sentinel/3rdparty/kibana/config/kibana.yml` file.
- 3 Set a desired value for the `elasticsearch.requestTimeout` property in milliseconds.

For more information, see Kibana documentation.

- 4 Restart Kibana:

```
rksentinel restartVA
```

15 Configuring Data Retention Policies

The data retention policies control when data should be deleted from the system. A retention policy contains a filter that is used to identify the events for which the retention policy applies and the minimum and maximum number of days these events should be kept in the system.

You can configure one or more data retention policies to control the duration for which specific types of events are retained in Sentinel. Except for the Raw Data Retention policy, all of the configured policies apply to the event data.

The configured retention policies are displayed in the data retention policy table. By default, the data retention policy table is refreshed every 30 seconds to reflect the changes made by multiple administrators.

NOTE: For traditional storage, data retention policies are applied in addition to the configured disk space usage parameters, as described in [“Configuring Disk Space Usage” on page 168](#). These policies are a logical overlay, whereas the disk space usage configuration is related to the physical memory space usage.

- ♦ [“Rules for Applying a Retention Policy” on page 195](#)
- ♦ [“Raw Data Retention Policy” on page 196](#)
- ♦ [“Event Data Retention Policies” on page 196](#)
- ♦ [“Data Deletion Policy for Traditional Storage” on page 197](#)
- ♦ [“Data Deletion Policy for Scalable Storage” on page 198](#)

Rules for Applying a Retention Policy

An event could match the filter criteria of multiple data retention policies.

To determine which data retention policy will apply to an event and, therefore, how long an event will be retained before deleting it from the data storage, apply the following rules:

1. If an event meets the criteria of only one data retention policy filter, that data retention policy is applied to the event.
2. If an event does not meet the criteria for any of the data retention policies, the default data retention policy is applied to that event.
3. If an event meets the criteria for more than one of the data retention policies, the following guidelines are used to determine which data retention policy should be applied:
 - ♦ If the maximum retention period of a policy is shorter than the others, that policy is applied. (If the maximum retention period is not specified for a policy, the policy is considered to have a long maximum retention period.)

- ◆ If multiple matching policies have the same shortest maximum retention period, the policy with the longest minimum retention period is applied.
- ◆ If multiple matching policies have the same shortest maximum retention period and the same longest minimum retention period, the system arbitrarily applies one of the policies.

Raw Data Retention Policy

The raw data retention policy controls the duration for which the raw data is kept in the system before it is deleted. The raw data retention policy cannot be deleted or disabled. However, you can modify the **Keep at most** and **Keep at Least** values, which determine the maximum and minimum number of days to keep the raw data file.

The process to delete raw data files runs every time the server is started, every hour because that is when the raw data files are closed, and whenever the **Keep at most** value is changed. All the files exceeding the retention time are removed permanently from the data storage.

Event Data Retention Policies

The event data retention policies control the duration for which different types of event data are kept in the system before being deleted.

Creating Event Data Retention Policies

To create a data retention policy:

- 1 From **Sentinel Main**, click **Storage > Events**.
- 2 In the Data Retention section, click **Create**.
- 3 Use the following information to create the data retention policy.

Policy name: Specify a name for the retention policy.

The policy name must be unique and must contain alphanumeric characters.

Criteria: Specify the data retention policy criteria, or the filter value. Use the same syntax as searches.

Click the **Build criteria** icon to build a new criteria from available system objects containing criteria.

You can also use existing criteria by clicking the **Select and append criteria** icon.

Keep at least: Specify the minimum number of days to retain the events in the system. The value must be a valid positive integer.

Sentinel might retain the data for more number of days than this value (up to the **Keep at most** value, if specified) if disk space is available. This setting allows Sentinel to preferentially delete event data that is no longer needed when disk space must be freed.

Keep at most: (Optional) Specify the maximum number of days for which the events should be retained in the system. The value must be a valid positive integer and must be greater than or equal to the **Keep at least** value.

NOTE: For scalable storage, if you specify both **Keep at least** and **Keep at most** values, Sentinel considers only the **Keep at most** value for data retention.

Sentinel ensures that partitions that contain this kind of data will never be retained for longer than this value (assuming Sentinel is running and has access) for privacy or compliance reasons.

If no value is specified, Sentinel retains events of this type until the disk space usage policies remove them.

- 4 Click **Save**. The newly created policy is displayed in the data retention table.

The table also contains the following additional columns:

Size: Displays the amount of space used to store the events for each retention policy.

Events: Displays the number of events for the selected retention policy.

The policies are sorted in alphabetical order by policy name. The default retention policy is always shown as the last policy in the list.

Configuring the Retention Period for the Event Associations Data

By default, Sentinel retains the event associations data that is present in the exported associations (`/var/opt/novell/sentinel/data/eventdata/exported_associations`) directory for 14 days.

NOTE: Event associations data is available only in traditional storage.

However, you can change this retention period by performing the following steps:

- 1 Log in to the Sentinel server as the `novell` user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 Add the following line in the file:

```
sentinel.exportedAssociations.retention.period=<retention period>
```

For example, if you want to set the Export Association files retention period to 90 days:

```
sentinel.exportedAssociations.retention.period=90
```
- 4 Save the modified `configuration.properties` file.
- 5 Restart Sentinel.

Data Deletion Policy for Traditional Storage

Sentinel deletes the data types in their listed order until the required space is available.

1. All partitions (both primary storage and secondary storage) are deleted as soon as the **Keep at most** time limit of their retention policy is reached.
2. Partitions that are successfully moved to secondary storage. The oldest partition is deleted first until none are left or until the desired amount of space is available.
3. Partitions that are not yet moved to secondary storage, but have reached their retention policy's **Keep at most** time limit. The partitions that are close to the **Keep at most** limit are deleted first, until none are left or until the desired amount of space is available.

If at least half of the desired space is not yet free, partitions are deleted early, on the assumption that incoming data is more important than old data.

4. Partitions that are not yet moved to secondary storage that have reached their retention policy's **Keep at most** time limit. The partitions that are close to the **Keep at most** limit are moved first, until none are left or at least half of the desired amount of space is available, but the current UTC day partitions are not deleted.

Data Deletion Policy for Scalable Storage

Sentinel deletes data from HDFS when the data has reached its retention policy's time limit. If both **Keep at most** and **Keep at least** values are specified, Sentinel deletes data when it has reached its **Keep at most** time limit. Along with deleting raw data and event data, Sentinel also deletes the corresponding data (document) in Elasticsearch. If a particular index in Elasticsearch does not contain any data, the index will also be deleted.

Sentinel does not delete data based on the disk usage. You must manually monitor the disk usage in the CDH UI and take appropriate measures to avoid data deletion.

16 Re-indexing Event Data Partitions

If indexing libraries are upgraded during the Sentinel upgrade, the underlying data formats also get updated and the data cannot be searched. To enable the data to be searched, you must re-index all event data partitions in the system after the upgrade.

- ♦ [“Overview” on page 199](#)
- ♦ [“Deciding When to Re-Index or Restore Data” on page 199](#)
- ♦ [“Scheduling Re-indexing” on page 200](#)
- ♦ [“Re-indexing By Using the Web Interface” on page 200](#)
- ♦ [“Re-Indexing in the Offline Mode” on page 201](#)

Overview

All event data partitions in the system need to be indexed so that they become searchable. After upgrading Sentinel, if the partitions are not re-indexed, then the existing event data will not be available for Sentinel operations. Because of this, results of search, report, historical views, or other jobs will be inconsistent.

For example, for reports that have information for the past three months, the event data for that period must be re-indexed, before starting report jobs. Else, the generated reports might not be accurate

Re-indexing is required only for the existing event data partitions and not for the new incoming events.

Re-indexing event data is different from event data restoration. Re-indexing is a process of recreating event data partition indexes, which is needed because of underlying indexing library upgrades, whereas event data restoration restores data from other systems.

The **Event Data Partition** page displays a pie chart, which indicates the number, percentage, and size of partitions that were indexed or need to be indexed, across both primary and secondary storage. You can either select all the data or select data for a date range to re-index.

You can re-index event data partition either through the web interface or through a tool, which enables re-indexing in the offline mode. You can re-index event data partitions by using both methods simultaneously.

Deciding When to Re-Index or Restore Data

The following table provides scenarios to help you decide when to re-index or restore data.

Table 16-1 Deciding when to re-index or restore data

Scenario	Action
After upgrading to 8.3.x	Re-index the event data partition, and then restore the data.
After moving an event data partition from the Sentinel server version prior to 8.3.1.	Re-index the event data partition. In this scenario, re-indexing of event data partition also handles restoration of data.
Move an event data partition from one Sentinel 8.3.1.0 server to another Sentinel server running on version 8.3.1.0 or later.	No re-indexing of event data partition is required. You can only restore data.
Event data partitions created on Sentinel 8.3.1.0.	No re-indexing of event data partition is required.

Scheduling Re-indexing

Re-indexing uses both CPU and disk bandwidth. If re-indexing of event data partition is performed during peak hours, it might take more time than expected or might add load on the existing jobs. Hence, we recommend you to perform re-indexing during a scheduled maintenance time or during off-peak hours.

If there are many event data partitions to re-index, to optimize the time taken to re-index, select the date range for event data partitions which contain events that need to be searchable and reportable for priority operations. You can re-index the rest of the event data partitions as per your requirement.

(Conditional) If event visualization is enabled in the Sentinel, before scheduling re-indexing task you must ensure that, the elasticsearch is left intact. See [“Mapping Conflict Warning in the Kibana Search” on page 344](#) for more information.

Re-indexing By Using the Web Interface

- 1 From **Sentinel Main**, click **Storage > Event Partition Administration**.

NOTE: You can also access the Event Partition Administration page from the Sentinel landing page. Click the **Event Partition Administration** link in the warning message at the top of the landing page.

- 2 Select either **Primary Storage** or **Secondary Storage**, depending on the type of event partition that you want to re-index.
- 3 Select the event partitions to re-index, by clicking one of the following options for **Date Range**:

All: Selects all the partitions in the disk for re-indexing.

Date Range: Selects all the event partitions within the specified From and To dates for re-indexing.

- 4 Click **Start Re-indexing**.

The approximate time required to complete the operation is displayed depending on the storage type and the event data time range selected.

The operation summary page displays the status and details about the completed operations.

After the re-indexing operation completes, all log files related to the operation will be available in the following log file:

```
<sentinel_installation_path>/var/opt/novell/sentinel/log/reindex0.0.log
```

Re-Indexing in the Offline Mode

You can also use a tool to re-index event data partition, in the offline mode. The tool uses minimal number of resources without affecting any of the existing processes. Re-indexing operation in the offline mode takes longer when compared to reindexing by using the online mode.

You can run the tool outside the Sentinel server. However, you must copy the Java files and the Sentinel libraries folder to the machine from which you want to run the re-indexing tool.

Before you proceed, ensure that you have the following information:

- ♦ The path to the folder where Java is located. For Sentinel installation, the path is:
`<sentinel_installation_path>/opt/novell/sentinel/jdk/jre/bin/java.`
- ♦ The path to folder where Sentinel libraries are present. For Sentinel installation, the path is:
`<sentinel_installation_path>/opt/novell/sentinel/lib.`
- ♦ The location of event data partitions. For Sentinel installation, the path is:
`<sentinel_installation_path>/var/opt/novell/sentinel/data/eventdata/events/` for primary partitions.
`<Sentinel secondary storage directory>/eventdata_archive/` for secondary partitions.

Using the Offline Tool On the Sentinel Server

To use the offline tool from the Sentinel Server:

- 1 Log in to the Sentinel server.
- 2 Run the following command:

```
<sentinel_installation_path>/opt/  
novell/sentinel/jdk/jre/bin/java -cp /opt/novell/sentinel/lib/ccsapp-  
<sentinel_version>-RELEASE.jar  
esecurity.ccs.comp.event.indexedlog.IndexedLogRebuild -forcerebuild  
<partition-directory>/  
<partition_ID>
```

where, `<sentinel_version>` refers to the release version of Sentinel.

`forcerebuild` is an optional parameter. If this option is not specified, the tool creates a backup of index folder and temporary files, which occupies additional disk-space.

`<partition-directory>` refers to the path where all the partitions are present.

For example, location of primary partition:

```
<sentinel_installation_path>/  
var/opt/novell/sentinel/data/eventdata/events/
```

For example, location of secondary partition:

```
<sentinel_installation_path>/  
var/opt/novell/sentinel/data/archive_remote/<sentinel_server_UUID>/  
eventdata_archive/
```

<partition_ID> refers to the ID of the partition in the following format:

```
0200428_6E1CCA35-4BD4-102D-91CD-000C2907C76D or 20200428_6E1CCA35-4BD4-  
102D-91CD-000C2907C76D_20200607.
```

If there are more than one partition, specify the IDs separated by space. You can also use the wild cards for ID such as, 202004*.

For example, to re-index a single event data partition on primary storage, specify the following command:

```
<sentinel_installation_path>/opt/  
novell/sentinel/jdk/jre/bin/java -cp /opt/novell/sentinel/lib/ccsapp-  
<sentinel_version>-RELEASE.jar  
esecurity.ccs.comp.event.indexedlog.IndexedLogRebuild -forcerebuild /  
var/opt/novell/sentinel/data/eventdata/events/20200428_6E1CCA35-4BD4-  
102D-91CD-000C2907C76D
```

To re-index multiple event data partitions of April 2020 on primary storage, specify the following command:

```
<sentinel_installation_path>/opt/  
novell/sentinel/jdk/jre/bin/java -cp /opt/novell/sentinel/lib/ccsapp-  
<sentinel_version>-RELEASE.jar  
esecurity.ccs.comp.event.indexedlog.IndexedLogRebuild -forcerebuild /  
var/opt/novell/sentinel/data/eventdata/events/202004*
```

NOTE: After completing the re-indexing for **secondary partitions**, remove the **Index** directory from each re-indexed partitions directory.

- 3 Restore the re-indexed partitions. For information about restoring data, see [“Restoring Data” on page 179](#).

Using the Re-Indexing Tool On a Separate Machine

To use the offline tool from a separate machine:

- 1 Log in to the system.
- 2 Create a folder to copy java files and Sentinel libraries from the Sentinel server.
- 3 Copy the Java files from the Sentinel server to the folder created in Step 2.
For Sentinel installation, the Java path is: <sentinel_installation_path>/opt/novell/sentinel/jdk/jre/*.
- 4 Copy the Sentinel libraries from the Sentinel server to the folder created in Step 2.
For Sentinel installation, the Sentinel library path is: <sentinel_installation_path>/opt/novell/sentinel/lib/*.
- 5 Go to the folder created in Step 2 and run the following command:

```
java -cp ccsapp-  
<sentinel_version>-RELEASE.jar  
esecurity.ccs.comp.event.indexedlog.IndexedLogRebuild  
-forcerebuild <partition_directory>  
/<partition_ID>
```

where, <sentinel_version> refers to the release version of Sentinel.

forcerebuild is an optional parameter. If this option is not specified, the tool creates a backup of index folder and temporary files, which occupies additional disk-space.

<partition_directory> refers to the path where all the partitions are present.

<partition_ID> refers to the ID of the partition in the following format:

```
0200428_6E1CCA35-4BD4-102D-91CD-000C2907C76D or 20200428_6E1CCA35-4BD4-  
102D-91CD-000C2907C76D_20200607.
```

If there are more than one partition, specify the IDs separated by space. You can also use wild cards for ID such as, 202004*.

For example, to re-index a single event data partition, specify the following command:

```
java -cp ccsapp-<sentinel_version>-RELEASE.jar  
esecurity.ccs.comp.event.indexedlog.IndexedLogRebuild -forcerebuild /  
<Path to event partition folder>/20200428_6E1CCA35-4BD4-  
102D-91CD-000C2907C76D
```

To re-index multiple event data partitions for April 2020, specify the following command:

```
java -cp ccsapp-<sentinel_version>-RELEASE.jar  
esecurity.ccs.comp.event.indexedlog.IndexedLogRebuild -forcerebuild /  
<Path to event partition folder>/202004*
```

- 6 The event data partitions must be placed in either the primary or secondary storage paths for Sentinel.

NOTE: After completing the re-indexing for **secondary partitions**, remove the **Index** directory from each re-indexed partitions directory.

- 7 Restore the re-indexed partitions. For information about restoring data, see [“Restoring Data” on page 179](#).

V Integrating with External Systems

This section provides information about integrating Sentinel with external systems.

- ♦ [Chapter 17, “Configuring Actions,” on page 207](#)
- ♦ [Chapter 18, “Configuring Integrators,” on page 215](#)
- ♦ [Chapter 19, “Integrating Identity Information,” on page 223](#)
- ♦ [Chapter 20, “Configuring Threat Intelligence Data Sources,” on page 227](#)

17 Configuring Actions

An Action is a configured instance of an Action plug-in. Actions are used to execute some type of action in Sentinel, either manually or automatically. Actions can be triggered by routing rules, by manually executing an event or incident operation, and by correlation rules.

- ♦ [“Overview” on page 207](#)
- ♦ [“Understanding the Action Manager Interface” on page 208](#)
- ♦ [“Managing Actions” on page 209](#)
- ♦ [“Managing Action Plug-Ins” on page 212](#)

Overview

Sentinel provides a list of pre-configured Actions that should be useful in most standard situations. You can use the default Actions and reconfigure them as necessary, or you can add new Actions.

NOTE: Only users in the administrator role can configure and manage Actions.

An Action can be executed on its own, or it can make use of an Integrator instance configured from an Integrator plug-in. Integrators provide the ability to connect to an external system, such as an LDAP, SMTP, or SOAP server, to execute an action.

The general process for using an Action to perform remediation is shown in the following figure:

Figure 17-1 Actions Workflow

1. Determine the best type of Action plug-in that should be used to perform your desired action.
2. Configure the appropriate Action plug-in with appropriate parameter settings for your environment.

For more information, see [“Adding an Action” on page 210](#).

3. If the Action requires an Integrator, configure the appropriate Integrator.

To determine the required Integrators for an Action, see the documentation that is available with the Action on the [Sentinel Plug-ins Web site](#). Alternatively, you can view a specific Action's documentation by clicking the **Help** button while configuring that Action in the Action Manager.

4. For information on configuring the Integrator, see [“Managing Integrators” on page 216](#).
5. Execute actions manually or associate actions to rules for the action to fire automatically when the rule fires:
 - ◆ For information on executing an action in an Incident, see [“Executing Incident Actions”](#) in the *Sentinel User Guide*.
 - ◆ For information on executing an action on events that meet the event routing rule criteria, see [“Creating an Event Routing Rule” on page 135](#).
 - ◆ For information on executing actions on events in Search results, see [“Assigning Actions to Events”](#) in the *Sentinel User Guide*.
 - ◆ For information on associating an action to a Correlation rule, see [“Associating Actions to a Rule”](#) in the *Sentinel User Guide*.

Understanding the Action Manager Interface

The Action Manager allows you to configure actions that can be executed in various contexts throughout the Sentinel system. You can also use the Action Manager to manage Actions and Action plug-ins

Figure 17-2 Action Manager

The Action Manager window lists the pre-configured actions. You can configure these Actions further as necessary.

- ◆ **Actions:** To configure an Action, select the desired action, then click **View/Edit**.
- ◆ **Add:** Allows you to add an action. For more information, see [“Adding an Action” on page 210](#).
- ◆ **Manage Plug-ins:** Allows you to import new and updated action plug-ins, and manage the action plug-ins. For more information, see [“Managing Action Plug-Ins” on page 212](#).

Managing Actions

An Action is a configured instance of an Action plug-in. There can be one or more instances of an Action plug-in with different parameters or settings. A few Actions are available by default. You can also add additional actions as required.

- ◆ [“Adding an Action” on page 210](#)
- ◆ [“Debugging Actions” on page 211](#)

Adding an Action

- 1 Launch the Sentinel Control Center.
- 2 Launch the Action Manager:
 - ♦ If the **Configuration** menu is not enabled, click the **Configuration** tab, then click the **Configuration** menu > **Action Manager** or click the  icon in the toolbar.
 - ♦ If the **Configuration** menu is enabled, click the **Configuration** menu > **Action Manager** or click the  icon in the toolbar.
- 3 Click  **Add**.
- 4 To create an Action, select an existing Action plug-in from the available action types in the **Action** drop-down. Alternatively, you can import another plug-in by clicking the **Add Action Plug-in** button.

The parameters for the selected plug-in are displayed. For Actions provided by Sentinel, more information about configuration and the available parameters are available in the help file for the Action.
- 5 (Conditional) If the selected Action plug-in requires an Integrator, the **Add Integrator** button is displayed to allow you to add the Integrator for this action. Click **Add Integrator** and select the appropriate Integrator for the action.
- 6 Specify the attribute values for the type of action selected.

You can reference an event field value by specifying the event field name enclosed in % or \$ appropriately. For example, in the Send Email action, if you want to reference the TenantName event field from the correlated event in the subject attribute, you can specify the parameter as %TenantName%. If you want to reference an event field value from the last event that triggered the correlated event, you can specify the parameter as \$TenantName\$.

Similarly, you can reference the correlation rule metadata by specifying the parameters %RuleName%, %RuleDescription%, %RuleId%, or %RuleLg% in actions or in custom correlation events.
- 7 Click **Save**.
- 8 Execute actions manually or associate actions to Correlation rules for the action to fire automatically when the rule fires:
 - ♦ For information on executing an action in an Incident, see “[Executing Incident Actions](#)” in the [Sentinel User Guide](#).
 - ♦ For information on executing an action on events that meet the event routing rule criteria, see “[Creating an Event Routing Rule](#)” on page 135.
 - ♦ For information on associating an action to a Correlation rule, see “[Associating Actions to a Rule](#)” in the [Sentinel User Guide](#).

Each individual Action plug-in defines where it can be used and what data it requires as input. Every Action plug-in has certain performance characteristics relating to how quickly it can execute, reset, and be ready for the next event. When an Action instance is created, it inherits the characteristics of the selected Action plug-in. For better performance, not all Actions are available for all the different Action modes in Sentinel. For example, Actions based on the Send E-mail Action plug-in do not appear in Event Routing rules because you might not want to receive messages with a large event stream every time the rule fires.

For information on where an Action plug-in can be used, refer to the Action Modes section in the specific Action plug-in document.

Debugging Actions

You can debug the Action files from the Sentinel Control Center by using the Action debugging option. The debugger is a local debugger that executes scripts on which the Sentinel Control Center is running. The debugger instantiates a debug session from the Sentinel server machine.

Only actions that are executed in an Incident can be debugged. Therefore, a prerequisite to debug an action is to execute that action in an Incident. For more information, see “[Executing Incident Actions](#)” in the *Sentinel User Guide*.

The Action debugger has the following controls:

Table 17-1 *Debugger Controls*

Action	Description
Run	Runs the script until the next breakpoint is encountered.
Step In	Steps into a function, one line at a time.
Pause	Pauses the running script.
Stop	Stops the script.
Step Over	Steps over a function to the next line in the script.
Step Out	Steps out of the function to the next line in the script.

To debug an action:

- 1 Execute an action in an Incident.
For more information, see “[Executing Incident Actions](#)” in the *Sentinel User Guide*.
- 2 In the Sentinel Control Center toolbar, click the **Action Debugging**  icon.
- 3 Click  to start the debugging process. The debugger panel displays the source code and positions the cursor on the first line of the script.
You can debug the script as many times as needed. To debug the script by using a different incident, close the Debug JavaScript Correlation Action window and repeat the debugging process.

Managing Action Plug-Ins

The Sentinel system includes several Action plug-ins by default, but you can download updates, documentation, and additional Actions from the [Sentinel Plug-ins Web site](#). For more information on specific Actions, see the documentation that is available with the Action. Alternatively, you can view a specific Action’s documentation by clicking the **Help** button while configuring that Action in the Action Manager.

Although common Action plug-ins can be obtained from the Sentinel Plug-ins Web site, you can create and manage your own Action plug-ins. New Action plug-ins can be developed by using the [Sentinel Plug-in SDK](#).

- ◆ “Understanding the Action Plug-In Manager Interface” on page 212
- ◆ “Importing an Action Plug-In” on page 213

Understanding the Action Plug-In Manager Interface

The Action Plug-in Manager window lists the available Action plug-ins and allows you to import and manage action plug-ins.

Figure 17-3 Action Plug-In Manager

The Action Plug-in Manager window includes the following options:

- ◆ **Add** : Allows you to import or update an Action plug-in.
- ◆ **Delete** : Allows you to delete an Action plug-in.

NOTE: You can delete an Action plug-in only if there are no Action instances configured to use it. For example, if an Action is referenced by an Integrator, the Action cannot be deleted.

- ◆ **Refresh** : Refreshes the list of plug-ins.
- ◆ **View Details** : Displays the plug-in details such as the version number, release date, and a brief description of the Action.
- ◆ **Add Auxiliary file** : Allows you to add an auxiliary file to the Action plug-in. Auxiliary files are occasionally required if a specific file is not available within the plug-in for licensing reasons, or if you want to customize or extend the Action in some way.

Importing an Action Plug-In

You can download and import an action plug-in package file or you can import an action plug-in file that is in a directory.

When you import a file from a directory, it is important to define the required objects correctly so that the Actions are available for the appropriate Sentinel features.

- ♦ “Downloading and Importing an Action Plug-In” on page 213
- ♦ “Importing an Action Plug-In File from a Directory” on page 213

Downloading and Importing an Action Plug-In

- 1 Download the appropriate Integrator plug-in from the [Sentinel Plug-Ins Web site \(http://support.novell.com/products/sentinel/secure/sentinelplugins.html\)](http://support.novell.com/products/sentinel/secure/sentinelplugins.html).
- 2 Launch the Sentinel Control Center.
- 3 Launch the Action Manager:
 - ♦ If the **Configuration** menu is not enabled, click the **Configuration** tab, then click the **Configuration** menu > **Action Manager** or click the .icon in the toolbar.
 - ♦ If the **Configuration** menu is enabled, click the **Configuration** menu > **Action Manager** or click the .icon in the toolbar.
- 4 Click **Manage Plug-ins**, then click the **Import**  icon.
- 5 To import an Action plug-in package file, select **Import an Action plug-in file (.zip, acz)**, then click **Next**.
- 6 Click **Browse** to select the location of the package file.
The file must be in .zip or acz format.
- 7 (Conditional) If you have selected an Action file that already exists, the Replace Existing Plug-in window is displayed. Click **Next** to replace the existing plug-ins.
- 8 Review the plug-in details, then click **Finish**.

Importing an Action Plug-In File from a Directory

- 1 Download the appropriate Integrator plug-in from the [Sentinel Plug-Ins Web site \(http://support.novell.com/products/sentinel/secure/sentinelplugins.html\)](http://support.novell.com/products/sentinel/secure/sentinelplugins.html).
- 2 Launch the Sentinel Control Center.
- 3 Launch the Action Manager:
 - ♦ If the **Configuration** menu is not enabled, click the **Configuration** tab, then click the **Configuration** menu > **Action Manager** or click the .icon in the toolbar.
 - ♦ If the **Configuration** menu is enabled, click the **Configuration** menu > **Action Manager** or click the .icon in the toolbar.
- 4 Click **Manage Plug-ins**, then click the **Import**  icon.
- 5 Select **Import an Action plug-in from directory**.
- 6 Click **Browse** to select the location of the directory, then click **Next**.

7 Review the details and make changes as necessary.

If you have selected an Action file that already exists, the Replace Existing Plug-in window is displayed. Click **Next** to replace the existing plug-ins.

8 Select the objects you want to associate with the action, then click **Next**.

This affects where the Action is available in the Sentinel interface.

9 (Optional) Customize the plug-in by adding or editing the parameters.

For example, if you want to include the attachment option for the Send E-mail action, you can add a parameter named "Attachment" and configure it appropriately. Also, you must modify the code in the action script to handle the new parameter.

10 Click **Add** to add parameters that can be set when an Action is configured.

This option should be used for any file that expects to receive information as parameters.

10a Specify the parameter name.

The name used here should be identical to the one used in the JavaScript API method `scriptEnv.getParameter("<name>")` in the script that is being imported.

10b Select the parameter type from the **Type** drop-down list.

- ◆ **String:** Passes the string value to the parameter.
- ◆ **Boolean:** The parameter can take a True or False value.
- ◆ **Integrator:** Select an Integrator for the action.
- ◆ **Event Tag:** Select an Event Tag for the parameters.
- ◆ **Severity:** Select a severity for the parameters.

NOTE: The **Options** area is available only for the String type parameters.

10c (Optional) Specify a description.

10d Click **Next**.

11 Review the plug-in details, then click **Finish**.

18 Configuring Integrators

- ♦ [“Overview” on page 215](#)
- ♦ [“Managing Integrators” on page 216](#)
- ♦ [“Managing Integrator Plug-Ins” on page 221](#)

Overview

Integrators are plug-ins that can be used in Sentinel to extend the features and functionality of Sentinel remediation actions. Integrators allow Sentinel to connect to external systems, such as an LDAP server, SMTP server, or SOAP server. Actions use Integrators to interact with other systems. For example, you can set an attribute in eDirectory, an LDAP server, to enable or disable a user, edit details, and so on. You can also start an Identity Manager workflow, such as a provisioning request, by using SOAP calls.

The general process for using an Integrator to perform remediation actions involves the following steps:

1. Determine the best type of Integrator to access the external system with which you want to interact.
2. Import and configure the appropriate Integrator to connect to the external system. Or, you can use the Integrators that are configured by default.
3. Configure the appropriate Action. Or, you can use the Actions that are configured by default. For more information, see [Chapter 17, “Configuring Actions,” on page 207](#).
4. Perform additional configuration, if desired, to associate the action with a deployed correlation rule or an event menu action.
5. The action is executed:
 - ♦ When an associated correlation rule fires.
 - ♦ When you execute actions on the selected events in the Sentinel Main interface > **Event Actions** tab.
 - ♦ When you execute actions on the selected Incident in the Sentinel Control Center > **Incidents > Actions > Execute Incident Action**.

For more information on specific Integrators, see the documentation that is available with the Integrators. Alternatively, you can view a specific Integrator’s documentation by clicking the **Help** button in the Integrator Manager after configuring that Integrator.

NOTE: Only users in the administrator role can configure and manage Integrators.

Managing Integrators

An Integrator is a configured instance of an Integrator plug-in. There can be one or more instances of an Integrator plug-in with different parameters or settings. A few Integrators are available by default. You can also add additional Integrators as required.

- ♦ [“Configuring the Default Integrators” on page 216](#)
- ♦ [“Adding an Integrator” on page 219](#)
- ♦ [“Viewing Integrator Health Details” on page 219](#)

Configuring the Default Integrators

The default Integrators installed with Sentinel are not configured. To use these default Integrators with the actions in your Sentinel system, you must configure the Integrators for your environment.

- ♦ [“Configuring the File Integrator” on page 216](#)
- ♦ [“Configuring the Sentinel Link Integrator” on page 217](#)
- ♦ [“Configuring the Sentinel Mail Integrator” on page 218](#)
- ♦ [“Configuring the SNMP Integrator” on page 218](#)
- ♦ [“Configuring the Syslog Integrator” on page 219](#)

Configuring the File Integrator

The File Integrator is used with the **Log to File** action.

- 1 Access the Sentinel Control Center.
- 2 Launch the Integrator Manager:
 - ♦ If the **Configuration** menu is not enabled, click the **Configuration** tab, then click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
 - ♦ If the **Configuration** menu is enabled, click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
- 3 Select **File** in the Integrators column, then click the **File Configuration** tab.
- 4 Change the default filename and location where the events are stored.
By default, the location is `../data/log_to_file_events.txt`.
- 5 Click **Save**.

Configuring the Sentinel Link Integrator

The Sentinel Link Integrator is used to connect multiple Sentinel systems. For more information, see [Chapter 12, “Linking to Additional Sentinel Systems,”](#) on page 151.

- 1 Access the Sentinel Control Center.
- 2 Launch the Integrator Manager:
 - ♦ If the **Configuration** menu is not enabled, click the **Configuration** tab, then click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
 - ♦ If the **Configuration** menu is enabled, click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
- 3 Select **Sentinel Link** in the Integrators column, then click the **Sentinel Link Connector** tab.
- 4 Use the following information to configure the Sentinel Link Integrator:

Host Name: Specify the hostname or IP address of the destination Sentinel system where a Sentinel Link Connector is configured.

Port Number: Specify the port number for the destination Sentinel system. The default port is 1290.

Encrypted (HTTPS)/Not Encrypted (HTTP): Select whether the connection to the destination Sentinel system is encrypted or not encrypted. If you selected Encrypted, there are additional fields to configure:

 - ♦ **Server Validation Mode:** Select one of the following:
 - ♦ **None:** The Integrator does not validate the receiver's certificate.
 - ♦ **Strict:** The Integrator always verifies the receiver's certificate when connecting to the receiver. If this option is selected, the Integrator immediately attempts to retrieve the receiver's certificate over the network and validate that it is issued by an authorized CA.

If the certificate is not validated, it is still presented to the user to accept or reject. The certificate is considered to be valid if the user accepts it. When a validated certificate is acquired, it is stored in the Integrator's configuration. From now on, the Integrator allows communication only with a receiver that provides that certificate during the initial connection setup.
 - ♦ **Integrator Key Pair:** Select one of the following:
 - ♦ **None:** The receiver system does not validate the sender certificates. Select this option if the receiver's client authentication type is configured to **Open**.
 - ♦ **Custom:** The receiver system validates the sender certificates. Select this option if the receiver's client authentication type is configured to **Strict**. If the receiver system performs a strict validation, it imports a trust store, which contains all the sender certificates that it trusts.

After selecting this option, click the **Import Key Pair** button to import a key pair. The key pair you import must match one of the certificates that is included in the trust store that is imported by the receiver system.
- 5 Click **Save**.

Configuring the Sentinel Mail Integrator

All Sentinel events that meet the filter criteria for which the **Send an E-mail** action is defined are sent to the associated SMTP relay and email addresses by the Sentinel Mail Integrator.

To configure the Sentinel Mail Integrator:

- 1 Access the Sentinel Control Center.
- 2 Launch the Integrator Manager:
 - ♦ If the **Configuration** menu is not enabled, click the **Configuration** tab, then click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
 - ♦ If the **Configuration** menu is enabled, click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
- 3 Select **Sentinel Mail** in the Integrators column, then click the **Connection** tab.
- 4 Use the following information to configure the Sentinel Mail Integrator:
 - Host:** Specify the hostname or IP address of an available SMTP server.
 - Port:** Specify the port number of an available SMTP server. The default port is 25.
 - From (default):** Specify an address to using or sending the email messages are sent. The default value is `siem@yourcompany.com`.
 - User:** If the SMTP server requires authentication, specify a user name.
 - Password:** Specify the password for authentication to the SMTP server.
- 5 Click **Save**.

Configuring the SNMP Integrator

All Sentinel events that meet the filter criteria for which the **Send SNMP Traps** action is defined are sent to the specified SNMP addresses.

To configure the SNMP Integrator:

- 1 Access the Sentinel Control Center.
- 2 Launch the Integrator Manager:
 - ♦ If the **Configuration** menu is not enabled, click the **Configuration** tab, then click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
 - ♦ If the **Configuration** menu is enabled, click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
- 3 Select **snmp** in the Integrators column, then click the **Server Configuration** tab.
- 4 Use the following information to configure the SNMP server:
 - Host:** Specify the IP address or hostname of the SNMP server you want to send the trap to.
 - Port:** Specify the port number for the SNMP server. The default port is 162.
 - Community String (Password):** Specify the community string (password) to access the SNMP management system. If no community string is specified, the Integrator sets the default value to public.

OID: Specify the desired ASN1 object ID you want to associate with this message. If no object ID is specified, the Novell Audit internal OID is used (2.16.840.1.113719.1.347.3.1).

- 5 Click **Save**.

Configuring the Syslog Integrator

All Sentinel events that meet the filter criteria for the **Send to Syslog** action are sent to the specified syslog server.

To configure the Syslog Integrator:

- 1 Access the Sentinel Control Center.
- 2 Launch the Integrator Manager:
 - ♦ If the **Configuration** menu is not enabled, click the **Configuration** tab, then click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
 - ♦ If the **Configuration** menu is enabled, click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
- 3 Select **Syslog** in the Integrators column, then click the **Server Configuration** tab.
- 4 Use the following information to configure the syslog Integrator.

Host: Specify the host name or IP address of the syslog server.

Protocol: Select the protocol used to connect to the syslog server.

Port: Specify the port number used to connect to the syslog server.

Default Facility: Select the default facility for the syslog server from the drop-down list. The facility allows you to classify the syslog messages.

Stream Encoding: Select the encoding standard for the syslog Integrator.
- 5 Click **Save**.

Adding an Integrator

The specific steps to configure an Integrator depend on the type of Integrator. The steps are described in detail in documents that come with the Integrators. Documentation for installed plug-ins can be viewed by selecting an Integrator in the Integrator Manager and clicking **Help**. Or, you can refer to the document that comes with the Integrator plug-in.

Viewing Integrator Health Details

- 1 Launch the Sentinel Control Center.
- 2 Launch the Integrator Manager:
 - ♦ (Conditional) If the **Configuration** menu is not enabled, click the **Configuration** tab, then click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
 - ♦ (Conditional) If the **Configuration** menu is enabled, click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
- 3 In the Integrator Manager window, select an Integrator from the left pane.

4 Click see details.

The Health Details window displays the Refresh Health State, time of last occurrence, its method calls and the related events of the selected Integrator configuration.

- ♦ **Integrator API Calls:** Indicates the status of the connection and the method calls used from the API of the selected integrator. For more information on the JavaScript plug-in, see [Chapter 17, “Configuring Actions,”](#) on page 207.
 - ♦ **Call Success Count:** Displays the number of times the connection was established successfully and the methods were called successfully from the API. Time of Last Occurrence displays the time when the connection and the method call were successful.
 - ♦ **Call Failure (but Connection Success) Count:** Displays the number of times the connection was established successfully but the method call failed. Time of Last Occurrence displays the last time when the connection was successful and the method call failed.
 - ♦ **Connection Failure Count:** Displays the number of times the connection failed. Time of Last Occurrence displays the last time when the connection and method call failed.

NOTE: The most recent success or failure time is shown in the overall health status for the configured Integrator.

- ♦ **Integrator Health Details:** Provides information about the success of the API methods called in the JavaScript action files associated with the Integrator. It provides information specific to the methods called.
 - ♦ **Method Name:** Name of the API method used in the JavaScript.
 - ♦ **Success Count:** Number of times the API method executed successfully.
 - ♦ **Time of Last Successful Call:** The time at which the method was last successfully executed.
 - ♦ **Average Successful Run Time:** Average time to make a successful method call.
 - ♦ **Error Count:** Number of times the API method failed.
 - ♦ **Time of Last Error Call:** The time at which the method call failed.
 - ♦ **Average Error Run Time:** Average time to make a failed method call.

NOTE: The most recent success or failure time is shown in the overall health status of the method.

Managing Integrator Plug-Ins

Sentinel includes several Integrators plug-ins by default, but you can download updates and additional Integrators from the [Sentinel Plug-ins Web site \(http://support.novell.com/products/sentinel/secure/sentinelplugins.html\)](http://support.novell.com/products/sentinel/secure/sentinelplugins.html).

- ♦ [“Importing an Integrator Plug-In” on page 221](#)

Importing an Integrator Plug-In

- 1 Download the appropriate Integrator plug-in from the [Sentinel Plug-Ins Web site \(http://support.novell.com/products/sentinel/secure/sentinelplugins.html\)](http://support.novell.com/products/sentinel/secure/sentinelplugins.html).
- 2 Launch the Sentinel Control Center.
- 3 Launch the Integrator Manager:
 - ♦ If the **Configuration** menu is not enabled, click the **Configuration** tab, then click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
 - ♦ If the **Configuration** menu is enabled, click the **Configuration** menu > **Integrator Manager** or click the  icon in the toolbar.
- 4 Click **Manage Plug-Ins**.
- 5 In the Integrator Plug-in Manager window, click the  icon.
- 6 In the Plug-in Import Type window, select **Import an Integrator plug-in file (.zip)**, then click **Next**.
- 7 In the Choose Plug-in Package File window, click **Browse** to locate the Integrator zip file you want to import to the plug-in repository, then click **Open**.
- 8 (Conditional) If you have selected an Integrator file that already exists, the Replace Existing Plug-in window is displayed. Click **Next** to replace the existing plug-ins.
- 9 Click **Next**.

- 10 In the Plug-in Details window, select **Launch Integrator Configuration Wizard** to deploy the plug-in after importing it.
- 11 Click **Finish**.

After importing the Integrator plug-in, you must configure the Integrator plug-in for your environment. For more information, see [“Configuring the Default Integrators” on page 216](#).

19 Integrating Identity Information

This chapter provides information about integrating Sentinel with identity management systems.

- ♦ [“Overview” on page 223](#)
- ♦ [“Integration with Identity Management Systems” on page 224](#)
- ♦ [“Leveraging Identity Information” on page 226](#)

Overview

Users in an IT environment have multiple accounts and sometimes multiple account identifiers per user. Normally, if a user has multiple account identifiers, Sentinel treats each identifier as a unique account.

This means a user could log in to Active Directory and an LDAP directory and Sentinel tracks these events, but Sentinel does not realize these events are related to the same user account.

In order to overcome this issues, Sentinel provides an integration framework to identity management systems to track the identities of for each user account and what events those identities have performed.

This integration provides functionality on several levels:

- ♦ The Identity Browser provides the ability to look up the following information about a user:
 - ♦ Contact information
 - ♦ Accounts associated with that user
 - ♦ Most recent authentication events
 - ♦ Most recent access events
 - ♦ Most recent permissions changes
- ♦ The Identity Browser lets you do a lookup from events
- ♦ Reports and Correlation rules provide an integrated view of a user's true identity, even across multiple systems on which the user has separate accounts. For example, accounts like COMPANY\testuser; > cn=testuser,ou=engineering,o=company, and TUser@company.com can be mapped to the actual person who owns the accounts.

By displaying information about the people initiating a given action or people affected by an action, incident response times are improved and behavior-based analysis is enabled.

Sentinel provides an optional integration with Identity Manager. The figures and descriptions in this section are based on Identity Manager.

Sentinel synchronizes identity information with major identity management systems and stores local copies of key information about each identity. The following table summarizes the commonly used information provided:

Name	Description
AccountGUID	Auto-generated internal ID
Name	User name that references the account, generally provided by the user to log in.
ID	The numeric or other identifier that represents the account in the event source. This ID is used for resolution when the user name is not available.
Authority	The realm within which this account is unique. Collectors calculate the realm based on event information.
Status	The status of the account
IdentityGUID	A reference to the identity that owns this account

The identities stored by Sentinel are then linked with accounts created on endpoint systems by the identity management system. This helps Sentinel associate the correct identity information with the native events from those endpoint system. Some identity information is injected directly into the inbound event by using the mapping service. The remaining identity information, such as photograph and contact information, is accessible through the Identity Browser.

The identity information injected into the event can be used for correlation and for performing actions on the identities that are associated with detected activity. For example, Sentinel is able to see multiple failed logins from a given person and not just an account. A detected violation could trigger disabling activities for all accounts associated with an identity.

Integration with Identity Management Systems

You can integrate Sentinel with Identity Manager. For other identity systems, similar integration can be achieved by writing an identity synchronization collector that uses the Identity API. For more information, see the [Plug-in SDK Web site for Sentinel](#).

The examples and illustrations in this section use Identity Manager to explain how integration works among identity management systems.

Sentinel integration with Identity Manager is provided using the Identity Manager driver called the Identity Tracking Module for Sentinel. Standard event collection must also be set up with the systems to which Identity Manager has provisioned accounts using the Collectors available at the [Sentinel Plug-ins Web site](#).

After Sentinel and Identity Manager are installed, the Identity Tracking Module for Sentinel sends identity and account information from the Identity Vault to the Sentinel REST API, which populates the Sentinel database.

Figure 19-1 Sentinel Integration with IDM

The time required to initially populate the Sentinel database depends on the amount of data in the Identity Vault; identity information including photographs requires significantly more time to load.

The Identity Tracking Module for Sentinel also keeps the identity information synchronized as information is updated in the Identity Vault during normal Identity Manager operations.

After the identity and account information are loaded, a map named `IdentityAccount` is automatically generated in `/var/opt/novell/sentinel/data/map_data`. The map contains the following information:

- ◆ Account Name
- ◆ Authority
- ◆ Customer Name
- ◆ Identity GUID
- ◆ Full Name
- ◆ Department
- ◆ Job Title

- ◆ Manager GUID
- ◆ Account Status

IMPORTANT: An identity can have multiple accounts but one account cannot be assigned to multiple identities.

The identity map is automatically applied to all events from Collectors to look for an identical match between the information in the event and key fields in the map. The table below shows the fields that are populated if all of the map key fields and event data exactly match. These mappings are automatically configured and are not editable.

Label	Populated by which Column from IdentityAccount Map
InitUserDepartment	Department
InitUserFullName	Full Name
InitUserIdentity	Identity GUID
TargetUserDepartment	Department
TargetUserFullName	Full Name
TargetUserIdentity	Identity GUID

NOTE: To find a match, the event fields and map key fields must match exactly. This might require modifications to existing Collectors to enable them to parse or concatenate data to make these fields match the data from the Identity Vault.

After these fields are added to the event by the mapping service, they are used by Correlation rules, remediation actions, and reports in the Identity Tracking Solution Pack. In addition to using the content included in the Solution Pack, users can also perform the following actions:

- ◆ Create Correlation rules based on identity in addition to account name. This allows you to look for similar events from a single user, which provides a more comprehensive view than looking at events from a single account
- ◆ Create reports that show identity, including all accounts associated with a user
- ◆ Use the Identity Browser to get more information about users and their activities

Leveraging Identity Information

For information about searching and viewing user profiles of the identities synchronized from the identity management system, see “[Searching and Viewing User Identities](#)” in the *Sentinel User Guide*.

20 Configuring Threat Intelligence Data Sources

There are several threat intelligence data sources that provide information about existing or emerging threats to an organization's security. Sentinel supports IP lists data sources. A typical data source might provide a list of known compromised hosts, and when Sentinel receives events from those hosts, the associated event source becomes a suspect. For example, you can download lists of known Zeus botnet IP addresses. You can leverage the data sources in correlation rules to detect communications to known botnets in your network.

Many of these data sources are updated daily. Sentinel provides the ability to download this data into a map file, update it at scheduled intervals or as needed, and incorporate the relevant threat information into correlation rules.

- ♦ [“Adding Threat Intelligence Data Sources” on page 227](#)
- ♦ [“Understanding How Sentinel Processes Data” on page 228](#)
- ♦ [“Managing Feeds from Threat Intelligence Solution Pack” on page 229](#)

Adding Threat Intelligence Data Sources

By default, Sentinel provides the most common threat intelligence data sources. You can add your own data sources as necessary. To add threat intelligence data sources, navigate to **Sentinel Main** and click **Integration > Threat Intelligence Sources**.

NOTE

The out-of-the-box threat feeds are open source feeds. Micro Focus does not maintain or update these feeds. For a better threat protection, Micro Focus recommends you to purchase paid commercial threat feeds that are maintained and frequently updated by the respective vendors.

You can add threat intelligence data sources from any of the following sources:

- ♦ **URL:** Specify the URL from where you want to download threat intelligence information. Since these data sources are updated at regular intervals by external sources, you can configure Sentinel to download the data at regular intervals. You can use the URL option for data feeds that are open and do not require authentication. For commercial data feeds that require authentication, use the File configuration option described below.

Some of the data source URLs including the ones that are available out-of-the-box use HTTPS connection to download the feeds from their data source server. If Sentinel is in FIPS mode, the certificates used by the data source server for secure communication must be added to the Sentinel FIPS keystore database.

1. Download the certificates from the data source server and save them in individual files with the `.cer` extension.

2. Import the certificates into the Sentinel FIPS keystore.

For more information about importing the certificate, see [“Importing Certificates into FIPS Keystore Database”](#) in the *Sentinel Installation and Configuration Guide*.

- ◆ **File:** If you want to subscribe to commercial feeds that require authentication, you can download feeds at regular intervals to a file and use that file as the data source. For Sentinel to process the data, you must place the file in the `<sentinel_data_directory>/data/feed_data` directory and then add the file as a data source.

You can use the following file formats:

- ◆ CSV: Allows you to assign threat types and reputation score to individual IP addresses.
- ◆ TXT: Allows you to specify only a list of IP addresses.

Sentinel processes the data in the file the first time you add it as a data source and thereafter every time you update the file or the data source.

- ◆ **Threat Plug-in:** You can create your own plug-ins by using the preview version of the Sentinel SDK, which is available on the [Sentinel Plug-ins Website](#).

NOTE: If you are using the `curl` command in the plug-in to download data from the data source, ensure that the `curl` package version is minimum `curl-7.37.0-28.1.x86_64`. The plug-in does not work if your operating system has a lower version of this package. For example, as of the publication date of this document, SLES 11 SP4 has a lower version of the `curl` package. SLES 12 SP1 and later have the required version of the `curl` package.

While adding a data source, you can select an appropriate threat type for the data source. By default, Sentinel populates several common threat types in a drop-down list from which you can select. You can also add your own threat type to the list by updating the `configuration.properties` file as follows:

- 1 Log in to the Sentinel server as the `novell` user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 Add the `feeds.custom.threattypes` property with the desired value as follows:

```
feeds.custom.threattypes=<threat_type>
```

Where `<threat_type>` is the name of the threat type you want to add. You can add multiple threat types separated by a comma.

- 4 Restart the Sentinel server.

Understanding How Sentinel Processes Data

Sentinel downloads the data from the data sources to a map file, `<sentinel_data_directory>/data/map_data/Threat_Intelligence.csv`. Each data source is differentiated by a unique ID. When the SourceIP or the Target IP of an incoming event matches with any of the IP addresses in the map file, Sentinel enriches the event with threat information by adding the following source or target event fields accordingly:

- ◆ SourceHostThreatSource (shts)
- ◆ TargetHostThreatSource (thts)
- ◆ SourceHostThreatType (rv198)

- ◆ TargetHostThreatType (rv199)
- ◆ SourceHostReputationScore (rv158)
- ◆ TargetHostReputationScore (rv159)

If the IP addresses are listed in more than one data source, Sentinel considers the values for the above event fields from the data source that has a higher priority.

You can also assign reputation scores to indicate the reputation of a threat intelligence source, based on the threat type and the data source. A higher score indicates a better reputation. After assigning a reputation score, you can determine the events that need to be enriched with the reputation score.

To assign a reputation score:

1 Go to **Integration > Threat Intelligence Sources**.

2 Enter a score between **0** and **100** in the **Source reputation score** field.

Depending on the IP address (source or target) present in the event field, Sentinel enriches the corresponding SourceHostReputationScore (rv158) or TargetHostReputationScore (rv159) field with the specified value.

3 In the **Enrich events only with reputation scores less than or equal to** field, specify the score based on which you want to enrich events.

4 Click **Save**.

For example, if you do not want to enrich internal feed data, set the **Source reputation score** to **80** and set the **Enrich events only with reputation scores less than or equal to** field to **70**.

Sentinel provides the Threat Intelligence Solution Pack out-of-the-box, which includes correlation rules that detect communications to or from these IP addresses in your network. In upgrade installations, you must manually upgrade the Threat Intelligence Solution Pack in Solution Manager to get these latest correlation rules.

You can also create your own correlation rules as necessary. For more information, see “[Correlating Event Data](#)” in the *Sentinel User Guide*.

Managing Feeds from Threat Intelligence Solution Pack

The Threat Intelligence Solution Pack in previous versions of Sentinel includes data sources such as Palevo tracker and ZeuS tracker. The option to schedule downloads and manage these data feeds was available in the **Plug-ins > Feeds** user interface. Starting from Sentinel 8.1, the option to manage these threat intelligence data sources is available in the **Integration > Threat Intelligence Sources** user interface. Sentinel adds these data sources by default. You just need to schedule the download interval for these data sources.

You can uninstall the previously installed Palevo and Zeus feed plug-ins in the **Plug-ins > Catalog** user interface.

VI Monitoring Your Network

You can configure Sentinel to analyze your events, detect patterns, set up baselines, configure workflows to act on the events, manage and remediate threats, visualize network activities, and more. For more information about using these features, see the [Sentinel User Guide](#).

This section provides information about the following:

- ♦ [Chapter 21, “Configuring Data Federation,” on page 233](#)
- ♦ [Chapter 22, “Visualizing IP Flow Communications,” on page 245](#)
- ♦ [Chapter 23, “Viewing Compliance to Configuration Policies,” on page 247](#)
- ♦ [Chapter 24, “Viewing Change Guardian Events,” on page 249](#)
- ♦ [Chapter 25, “Configuring Alert Notifications,” on page 251](#)

21 Configuring Data Federation

The Sentinel Data Federation feature enables you to search for events, view alerts, and run reports not only on your local Sentinel server, but also on other Sentinel and Sentinel Log Manager servers distributed across the globe.

- ♦ [“Overview” on page 233](#)
- ♦ [“Configuring Servers for Data Federation” on page 235](#)
- ♦ [“Searching for Events” on page 238](#)
- ♦ [“Managing the Data Federation Search Results” on page 239](#)
- ♦ [“Viewing the Search Activities” on page 240](#)
- ♦ [“Running Reports” on page 240](#)
- ♦ [“Viewing Alerts” on page 241](#)
- ♦ [“Editing the Data Source Server Details” on page 241](#)
- ♦ [“Troubleshooting” on page 241](#)

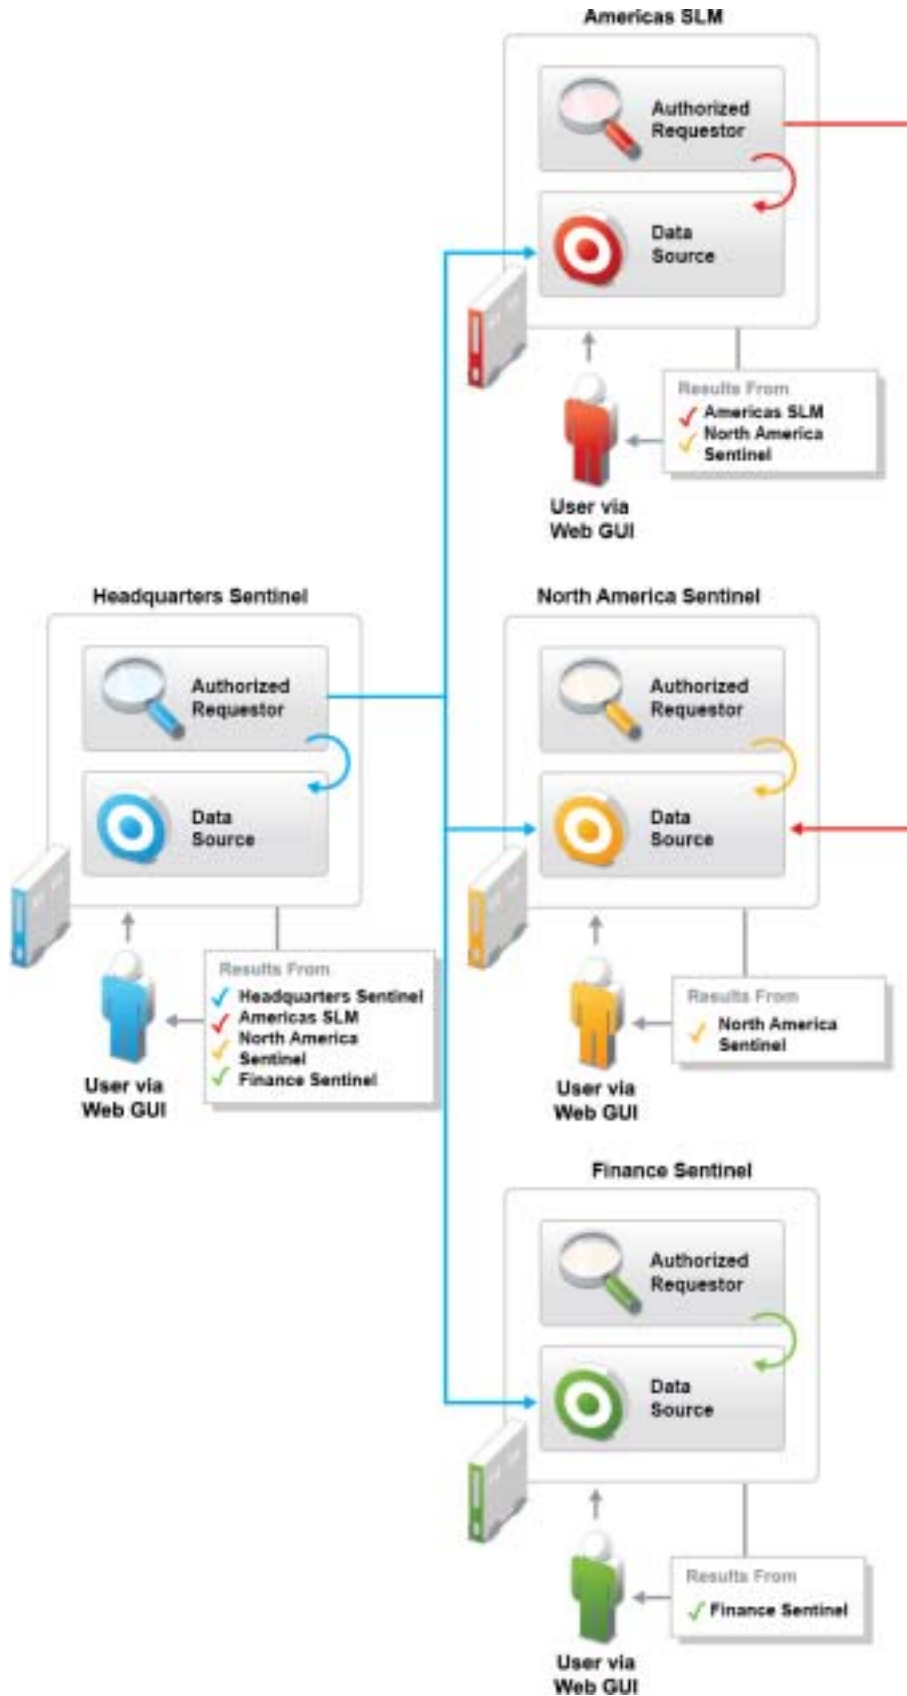

Overview

The Data Federation feature facilitates searching events, viewing alerts, and reporting event data from local and remote Sentinel servers. When you are working with multiple servers, you can perform a search or run a report on just one server and have it automatically run a search or report across the selected remote servers. The server on which the search is initiated is referred to as the authorized requestor, and the remote servers are referred to as the data sources or data source servers.

When you run a search or report on the authorized requestor, search queries are sent to each selected data source server. The data source server authenticates the authorized requestor server, using a password that is exchanged during configuration. Event or alert data is returned to the authorized requestor, where it is merged, sorted, and rolled up for presentation. Individual search results display the data source servers from which they were received. The search status for each server is available for viewing and troubleshooting.

[Figure 21-1](#) shows how you can set up the Sentinel servers across the globe for data federation, which enables distributed search and reporting.

Figure 21-1 Data Federation

Configuring Servers for Data Federation

To configure an authorized requestor for data federation, you must first enable data federation on the authorized requestor server.

After you enable data federation, you need to add data source servers to the authorized requestor server. If you know the administrator user name and password for the data source server, you can add the data source server directly from the authorized requestor.

If you do not know the administrator user name and password for a data source server, you can set up the authorized requestor with an opt-in password that allows administrators of data source servers to add their data source servers to the authorized requestor. When you do this, administrators of data source servers do not need to share their user names and passwords with you. You must share the opt-in password with the data source server administrator.

- ◆ [“Enabling Data Federation” on page 235](#)
- ◆ [“Using the Administrator Credentials to Add a Data Source Server” on page 235](#)
- ◆ [“Using the Opt-in Password to Add a Data Source Server” on page 236](#)

Enabling Data Federation

- 1 From **Sentinel Main**, click **Integration > Sentinel**.
- 2 Select **Local server and other data sources** in the **Data Sources** section.
- 3 Do one of the following to add data source servers to your authorized requestor:
 - ◆ If you are the administrator of the authorized requestor and you know the administrator user name and password on the data source server, continue with [“Using the Administrator Credentials to Add a Data Source Server” on page 235](#).
 - ◆ If you are the administrator of the authorized requestor and you do not know the administrator user name and password on the data source server, you can set an opt-in password to allow administrators of data source servers to add their data source servers to the authorized requestor. Continue with [“Using the Opt-in Password to Add a Data Source Server” on page 236](#).

Using the Administrator Credentials to Add a Data Source Server

If you are the administrator of the authorized requestor and you know the administrator user name and password on the data source server, you can add the data source server while you are logged in to your authorized requestor server.

IMPORTANT: You should ensure that the data source server that you add is able to communicate with the authorized requestor. The data source server should be able to communicate through TCP/IP. The IP address or host name of the data source server must be accessible through firewalls, NATs,

etc. You can use the ping command to ensure that there is communication from both ways. If there is a communication failure between the servers, an error is displayed in the extended status page. For more information, see [“Managing the Data Federation Search Results” on page 239](#).

- 1 If you are continuing from [“Enabling Data Federation” on page 235](#), skip to [Step 3](#); otherwise, continue to [Step 2](#).
- 2 From **Sentinel Main**, click **Integration** > **Sentinel**.
- 3 Select **Local server and other data sources** in the **Data Sources** section.
- 4 Click the **Add a data source** link.
- 5 Specify the following information:
 - IP Address/DNS Name:** IP address or the DNS name of the data source server.
 - Port:** Port number of the data source server. The default port number is 8443. The data source server and authorized requestor do not need to be on the same port.
 - User Name:** User name to log in to the data source server. This must be a user with administrator privileges.
 - Password:** Password associated with the user name.
- 6 Click **Login**, then click **Accept** after verifying that the certificate information is correct.
- 7 Use the following information to configure the data source server:
 - The **Add a data source** page displays a lists of the various proxy roles on the data source server.
 - Name:** Specify a descriptive name that you want to give to the data source.
This helps you to easily identify the data source server by a name instead of by its IP address or DNS name.
 - Search Proxy Role:** Select a search proxy role that you want to assign to the authorized requestor.
When the authorized requestor makes search requests to the data source server, the proxy role's security filter is used when performing the search. Only events that pass the proxy role's security filter are returned to the authorized requestor server.
Only roles that have the `Proxy for Authorized Requestors` permission are listed. This permission is required for the data source server to accept and process incoming search requests from the authorized requestor server.
- 8 Click **OK**.
 - The server information is listed in the **Data Sources** list.

You can now search events, view event reports, and view alerts from the data source server. For more information, see [“Searching for Events” on page 238](#), [“Running Reports” on page 240](#), and [“Viewing Alerts” on page 241](#) respectively.

Using the Opt-in Password to Add a Data Source Server

In organizations where administrative control of Sentinel servers is decentralized, it might violate the security policy to share administrator passwords. However, Sentinel allows you to share a limited-purpose opt-in password to add data source servers, which is more secure than requiring full

administrator credentials. If you are not the administrator of the data source server, you can set an opt-in password in the authorized requestor server, then provide the opt-in password to the data source server administrators to allow them to opt in to the authorized requestor server.

When a data source server opts in to the authorized requestor, a message is sent to the authorized requestor server requesting that it be added to the list of data source servers maintained by the authorized requestor server. The request authorizes the authorized requestor to access data on the data source server. The authorized requestor requires an opt-in password to verify that the opt-in request has originated from a valid data source server. During the opt-in process, the authorized requestor and the data source server exchange the appropriate password, which allows the data source server to authenticate the search requests from the authorized requestor.

This procedure is similar to adding a data source server, but it is done from the data source server instead of the authorized requestor server.

- ♦ [“Setting the Opt-In Password” on page 237](#)
- ♦ [“Authorizing an Authorized Requestor Server” on page 237](#)

Setting the Opt-In Password

- 1 Log in to the authorized requestor server as an administrator.
- 2 Click **Integration** in the toolbar, and then click **Sentinel**.
The Data Federation page that is displayed has two sections: **Data Sources** and **Authorized Requestors**.
- 3 In the **Data Sources** section, select **Local server and other data sources**.
- 4 Click **Set Opt-in Password**.
- 5 Specify the opt-in password, then click **Set Password**.
- 6 Continue with [“Authorizing an Authorized Requestor Server” on page 237](#) to add the data source server to the authorized requestor.

Authorizing an Authorized Requestor Server

- 1 Log in to the data source server as an administrator.
- 2 Click **Integration** in the toolbar, and then click **Sentinel**.
The Data Federation page that is displayed has two sections: **Data Sources** and **Authorized Requestors**.
- 3 In the **Authorized Requestors** section, check the **Allow authorized requestors to access data from your server** box.
- 4 Click the **Add** link.
The Add authorized requestors page is displayed.
- 5 Specify the following information:
 - IP Address/DNS Name:** The IP address or the DNS name of the authorized requestor.
 - Port:** Port number of the authorized requestor. This is the port number on which the authorized requestor listens for incoming opt-in requests. The default port number is 8443.
 - Opt-in Password:** The opt-in password that you configured on the authorized requestor. You must obtain this password from the administrator of the authorized requestor.

6 Click **OK**.

The Confirm Certificate page is displayed.

7 Verify the certificate information, then click **Accept**.

The Add authorized requestors page is displayed that lists the various proxy roles on the data source servers.

8 In the **Name** field, specify a descriptive name that you want to give to the authorized requestor server.

This helps you to easily identify the authorized requestor server by a name instead of by its IP address or DNS name.

9 Select a proxy role that you want to assign to the authorized requestor.

When the authorized requestor makes search requests to the data source server, the proxy role's security filter is used when performing the search. Only events that pass the proxy role's security filter are returned to the authorized requestor.

Only roles in the data source server that have the `Proxy for Authorized Requestors` permission are listed. This permission is required for the data source server to accept and process incoming search requests from the authorized requestor.

10 Click **OK**.

The authorized requestor is added to Authorized Requestors list and is enabled by default.

The data source server is also added in the Data Sources list in the authorized requestor server. Alternatively, you can click the **Refresh** link to see the data source server in the Data Sources list.

Searching for Events

Searching for events in a distributed environment is similar to how you perform a search on your local server, except that you perform the search on the selected data source servers and can also include your local server.

1 Log in to the authorized requestor server as a user with Search Remote Data Sources permission.

2 Click **New Search**.

3 Click the **Data sources** link under the **Search** field.

A dialog box is displayed that lists the data source servers that you have added, including the local server. The data source servers that are disabled are also displayed, but they are dimmed.

4 Select the check boxes next to the data source servers on which you want to perform a search, then click **OK**.

5 Specify the search criteria in the search field, then click **Search**.

If you do not specify any search criteria, the authorized requestor server runs a default search for all events with severity 0 to 5.

The Search Results page displays the events from the selected data source servers and the local server (if selected). The search results are filtered through the combination of the security filter and permissions of the logged-in user and the security filter and permissions of the search proxy role on the data source servers. For information on the distributed search results, see [“Managing the Data Federation Search Results” on page 239](#).

Managing the Data Federation Search Results

The Search Results page displays the events from the selected data source servers and the local server, based on the search criteria you specified. Each event displays the data source server information from which the event is being retrieved.

You can expand the event results to see the details by clicking the **All** link.

For non-internal events, the **get raw data** link is displayed. You can view the raw data only if your role's security filter is set to view all event data.

NOTE: For search results that come from the data source servers, the role that is used to retrieve raw data is not the role of the logged-in user that is performing the search on the authorized requestor server, but the role that is assigned to the authorized requestor server on the data source server.

You can view the status of the search in the extended status page while a search is in progress as well as when the search has finished. To access the extended status page, click the **Displaying N of M events from X data sources** link that appears at the top of the refinement panel.

The extended status page displays the following information:

- ♦ **Data Source Name:** The descriptive name of the data source server. If you did not specify a descriptive name for the data source server, this field displays the IP address or DNS name of the data source server.
- ♦ **Events Available:** Indicates the number of events that have actually been retrieved from the data source server. The value is displayed as **N of M events available**, where N is the number of events that have been retrieved so far and M is the total number of events on the data source server that match the search criteria.
- ♦ **Retrieval Rate (EPS):** An approximate rate of how fast the events were retrieved from a specific data source server.
- ♦ **Status:** Displays the error messages, if any (generally in red). In addition to error messages, this field also displays the status of the search.
 - ♦ **Running:** Indicates that the search is still running on the data source server.
 - ♦ **Buffering events for display:** Indicates that the search is finished on the data source server, but the authorized requestor server is retrieving events from the data source server and buffering them for display.
 - ♦ **Paused buffering events for display:** Indicates that the search is finished on the data source server, and the authorized requestor has paused while retrieving events from the data source. The authorized requestor reads ahead a few pages from the last page that you scrolled down to. When it has buffered enough pages ahead, it pauses so that events are not buffered unnecessarily.
 - ♦ **Searching, paused buffering events for display:** This is similar to pausing and buffering events for display, except that the search is not yet complete on the data source server.
 - ♦ **Done buffering:** Indicates that the search is complete on the data source server, and all of the results are retrieved by the authorized requestor and queued for display.

You can further refine the distributed search results and perform various actions based on your requirements. For more information, see “[Searching Events](#)” in the *Sentinel User Guide*.

Viewing the Search Activities

You can view the search activities that are being done on the data source server by the authorized requestor server. You can see what queries are being done and how frequently they are being done. Based on the search activity, you might want to assign a more/less restrictive proxy role or even disable access to the data source server.

You can also refine the search activity query. For example, you can change the date range to see what queries have been performed today or yesterday or in the last hour, or you can drill down to see the queries that were made by particular users on the authorized requestor.

- 1 Log in to the data source server as an administrator.

- 2 Click **Integration** in the toolbar, and then click **Sentinel**.

The Data Federation page that is displayed has two sections: **Data Sources** and **Authorized Requestors**.

- 3 In the **Authorized Requestors** section, a list of authorized requestor servers is displayed. Click the **Search Activities** link for the authorized requestor server for which you want to view the search activities.

The search activities page is displayed that lists the audit events that are retrieved from all of the distributed search requests the data source server has received from that particular authorized requestor.

Running Reports

Running reports in a distributed environment is similar to running reports on your local server, except that you select the data source servers from which you want to view the reports while specifying the report parameters.

- 1 Log in to the authorized requestor sever as a user with Search Remote Data Sources permission.

- 2 From the Reports section, select the report you want to run, then click **Run**.

The Run Report page is displayed.

- 3 Click the **Data sources** link.

A page is displayed that lists the data source servers that you have added, including the local server. The data source servers that are disabled are also displayed, but they are dimmed.

- 4 Select the data source servers from which you want to view the reports, then click **OK**.

- 5 Specify the other parameters for the report.

For more information on these parameters, see “[Reporting](#)” in the *Sentinel User Guide*.

- 6 Click **Run**.

A report results entry is created and listed under the selected report. For more information on managing reports, see “[Reporting](#)” in the *Sentinel User Guide*.

Viewing Alerts

Viewing alerts in a distributed environment is similar to viewing alerts from your local server, except that you select the data source servers from which you want to view alerts while creating alert views.

To view alerts from data source servers, you must log in to the authorized requestor server as a user with Search Remote Data Sources permission.

For information about creating alert views, see [“Creating an Alert View”](#) in the *Sentinel User Guide*.

When you create an alert view with data source servers specified as data sources, you can view the alerts from the data source servers in that alert view. For information about viewing alerts, see [“Viewing and Triaging Alerts”](#) in the *Sentinel User Guide*.

NOTE: In distributed environments, you can view alerts only from Sentinel data sources and not from Sentinel Log Manager data sources, because Sentinel Log Manager does not support alerts.

Editing the Data Source Server Details

- 1 Log in to the authorized requestor as an administrator.
- 2 Click **Integration** in the toolbar, and then click the **Sentinel** tab.
In the **Data Sources** section, a list of data source servers is displayed under the Data Source Servers list.
- 3 Click the **Edit** link for the data source server for which you want to modify the details, then edit the information.
You can edit the name of the data source server and the port number.
- 4 (Optional) To change the proxy role on the data source server as necessary:
 - 4a Click **View/Change**.
 - 4b Log in to the data source server.
 - 4c Select a proxy role, then click **OK**.
- 5 Click **Save**.

Troubleshooting

You can perform some basic troubleshooting to ensure that you have successfully configured the authorized requestor for data federation. This section lists the most common issues and the probable causes for these issues.

- ♦ [“Permission Denied” on page 242](#)
- ♦ [“Connection Down” on page 242](#)
- ♦ [“Unable to View Raw Data” on page 242](#)
- ♦ [“Problems While Adding Data Source” on page 242](#)
- ♦ [“Some Events Are Only Visible from the Local System” on page 243](#)

- ♦ [“Cannot Run Reports on the Data Source Servers” on page 243](#)
- ♦ [“Different Users Get Different Results” on page 243](#)
- ♦ [“Cannot Set the Admin Role as the Search Proxy Role” on page 243](#)
- ♦ [“Error Logs” on page 243](#)

Permission Denied

After doing a distributed search, check the extended status page to view the search status. If the search is not successful, check the following possible causes:

- ♦ The data source server administrator might have disabled data federation on the data source server. To enable data federation on the data source server, see [Step 3 in “Authorizing an Authorized Requestor Server” on page 237](#).
- ♦ The data source server administrator might have disabled the authorized requestor server for data federation. Ensure that the authorized requestor server is enabled in the data source server. For more information, see [“Authorizing an Authorized Requestor Server” on page 237](#).
- ♦ The role that you used for connecting might not have the `Search Data Targets` permission.

Connection Down

- ♦ Network issues in your organization.
- ♦ Sentinel servers or Sentinel services might be down.
- ♦ Connection time-out.
- ♦ The IP address or the port number of the data source server has changed, but the authorized requestor configuration might not be updated.

Unable to View Raw Data

The Proxy group that is assigned to the authorized requestor might not have the `view all events` permission to view the raw data.

Problems While Adding Data Source

The authorized requestor server and data source server might not be communicating with each other. Ensure that the firewall and NAT are set up properly to allow communication in both directions. Ping both ways to test.

Some Events Are Only Visible from the Local System

You might not be able to view the events from the data source servers for one of the following reasons:

- ♦ The trial license might be expired. You must purchase an enterprise license to reactivate this feature to view the events from the data source servers.
- ♦ The user who has logged in to the authorized requestor has one set of permissions on the local data such as view all data, view system events, security filter settings, and so on. The search proxy group has another set of permissions, possibly more restrictive. Therefore, certain types of data, such as raw data, system events, and PCI events, might be returned only from the local system and not the data source server.

Cannot Run Reports on the Data Source Servers

The trial license might be expired. You must purchase an enterprise license to reactivate this feature to run the reports from the data source servers.

Different Users Get Different Results

Different users might have different security filters or other permissions and therefore get different results from a distributed search.

Cannot Set the Admin Role as the Search Proxy Role

This is by design, for security reasons. Because the data viewing rights for the admin are unrestricted, it is not desirable to allow the admin role to be the search proxy role.

Error Logs

You can also determine the cause of a search failure by examining the log file on the authorized requestor server. The default location for the log file is `/var/opt/novell/sentinel/log`. For example, you might see one of the following messages:

```
Invalid console host name 10.0.0.1
```

```
Error sending target request to console host 10.0.0.1
```

```
Error getting certificate for console host 10.0.0.1
```

```
Authentication credentials in request to opt-in to console 10.0.0.2 were rejected
```

```
Request to opt-in to console 10.0.0.2 was not authorized
```

```
Error sending target request to console host 10.0.0.1
```

22 Visualizing IP Flow Communications

To perform a complete investigation and analysis of a security event, you might want to monitor the entire network activities in detail. Sentinel leverages ArcSight SmartConnectors that help you monitor your enterprise network by collecting IP Flow data (IPFIX, JFlow, sFlow, and so on) in your network. SmartConnectors collect IP Flow data from network devices such as routers, switches, and firewalls.

IP Flow data describes basic information about all the network connections between hosts, including transmitted packets and bytes. This helps you to visualize the behavior of individual hosts or the entire network.

- ♦ [“Configuring IP Flow Data Collection” on page 245](#)
- ♦ [“Visualizing and Analyzing IP Flow Data” on page 245](#)

Configuring IP Flow Data Collection

You can leverage IP Flow data when analyzing and visualizing events. IP Flow data is collected as events and therefore are considered for EPS count. To configure IP Flow data collection, install and configure the ArcSight SmartConnector. While configuring, ensure that you configure the relevant SmartConnectors that collect IP Flow data.

For more information, see the Universal Common Event Format Collector documentation on the [Sentinel Plug-ins Website](#).

Visualizing and Analyzing IP Flow Data

For information about visualizing and analyzing IP Flow data, see [“Visualizing and Analyzing IP Flow Communications”](#) in the *Sentinel User Guide*.

23 Viewing Compliance to Configuration Policies

Sentinel is a compliance monitoring system that helps you verify whether your enterprise is compliant with internal policies, information security standards such as PCI DSS and ISO 27000 series, and government regulations such as Sarbanes-Oxley, HIPAA, GLBA, and FISMA.

Sentinel extends its compliance monitoring capability by integrating seamlessly with your existing security management solutions, such as Secure Configuration Manager (SCM). Integration with SCM helps you to assess system configurations against regulatory requirements, security best practices, and corporate IT policies to demonstrate compliance and manage information security risk. This integration helps you to view the security and audit information from both Sentinel and SCM in a single interface.

Sentinel is auto-configured to receive SCM events. Ensure that SCM is configured to send events to Sentinel. For more information, see [“Integrating Secure Configuration Manager with Sentinel”](#) in the *Secure Configuration Manager User Guide*.

Receiving Compliance Details from Secure Configuration Manager

You must configure Sentinel to receive compliance details associated with the Secure Configuration Manager events.

NOTE: When configuring SCM to send compliance information to Sentinel, SCM administrator can configure it in the following two ways:

- ◆ To send compliance information as an event.
- ◆ To send compliance information as an event, with an attached report.

If SCM administrator configures to send compliance information as an event with attachment, you do not need to perform any configuration in Sentinel to receive compliance information from SCM. Perform the following procedure only if SCM administrator has configured to send compliance information just as an event.

To receive compliance details from Secure Configuration Manager:

- 1 In the Sentinel Main interface, click **Integration > SCM**.

In the SCM Servers page, the list of SCM servers that are configured to send compliance details is displayed.

- 2 To add an SCM server to send compliance details to Sentinel, click **Add** and specify the following information in the **Add SCM Server** window:
 - ◆ **IP address/DNS name:** SCM server IP address or host name.
 - ◆ **Port:** The port on which SCM core service listens.

- ◆ **Protocol:** The security protocol that the SCM core service uses.
 - ◆ **User name:** SCM server user name.
 - ◆ **Password:** SCM server password.
- 3 Click **Save** to save the configuration.
- If the connection is valid, the SCM server displays the certificate information in the **Confirm Certificate** window.
- 4 Click **Accept** to accept the server certificate.
- Sentinel establishes a connection with the SCM server.
- SCM server details are displayed in the SCM Servers page.
- 5 (Optional) You can perform the following actions by clicking appropriate links in the **Action** column in the table:
- ◆ Click **Edit** to edit the SCM server details.
 - ◆ Click **Delete** to delete the SCM server.
 - ◆ Click **Validate** to validate the SCM server configuration.

For information about viewing Secure Configuration Manager events and the associated compliance details, see “[Viewing Compliance to Configuration Policies](#)” in the *Sentinel User Guide*.

24 Viewing Change Guardian Events

You can extend Sentinel's threat monitoring capability by integrating Sentinel with Change Guardian. Change Guardian gives you the security intelligence you need to rapidly identify and respond to privileged-user activities that could signal a security breach or result in compliance gaps. It helps security teams detect and respond to potential threats in real-time through intelligent alerting of authorized and unauthorized access and changes to critical files, systems, and applications.

To receive Change Guardian events, the Change Guardian administrator must configure the Change Guardian server to send events to Sentinel. For more information, see ["Managing Event Destinations"](#) in the *Change Guardian User Guide*.

For information about viewing Change Guardian events, see ["Viewing Secure Configuration Manager Events and Compliance Details"](#) in the *Sentinel User Guide*.

You can also view Change Guardian reports, by importing reports from Change Guardian. For more information, see ["Creating Reports"](#) in the *Sentinel User Guide*.

25 Configuring Alert Notifications

This chapter provides information about configuring and monitoring threat detection notifications by using alerts in Sentinel.

- ♦ “Understanding Alerts” on page 251
- ♦ “Overview” on page 251
- ♦ “Configuring Alert Creation” on page 252
- ♦ “Visualizing and Analyzing Alerts” on page 254
- ♦ “Managing Alerts” on page 254

Understanding Alerts

An event, which is generated externally, represents some activity that might not be always exceptional. But a set of similar or comparable events in a given period, might indicate a potential threat. Sentinel helps you correlate events by using correlation rules, which helps you take appropriate actions to mitigate any problems. However, to receive instant notification about such potential threats, you can configure correlation rules to create alerts.

Alerts notify you about potential threats against some IT resource. In addition to potential threats, alerts can also indicate any performance thresholds, such as system memory full or IT resources not responding. Alerts help you to analyze the events and identities to determine the root cause of potential threats.

Alerts provide some high-level details of an event that allow you to quickly drill down to event details and determine whether it's a potential threat or a false positive. If the alert seems to be a potential threat, you can optionally escalate that alert to an incident. You can attach multiple events, host information, vulnerabilities, and even arbitrary attachments to an incident that may help analysts in further investigation of the incident.

Overview

The following figure provides an overview of creating and monitoring alerts:

Figure 25-1 Alert Overview

1. Configure correlation rules to create alerts when a correlation rule fires.

Correlation rules create alerts. Alerts contain almost the same information as the correlated event and also includes some additional information specific to alerts, such as owner, state, and priority.

As subsequent instances of the same alert are detected, Sentinel associates the trigger events to the existing alert to avoid duplication of alerts.

For more information, see [“Configuring Alert Creation” on page 252](#).

2. View and monitor alerts displayed in charts and the table. As you monitor alerts, you can assign alerts to different users and roles, track the alert from origination to resolution, annotate the correlation rule by adding information to the knowledge base, and so on. For more information, see [“Visualizing and Analyzing Alerts” on page 254](#).
3. If the potential threat that caused the alert is critical such that it needs immediate action or the threat indicates any security compromise, escalate the threat by creating an incident. For more information, see [“Escalating Alerts to an Incident”](#) in the *Sentinel User Guide*.
4. Configure alert retention policies to set the duration to automatically close and delete the alerts from Sentinel. For more information, see [“Configuring Alert Retention Policies” on page 255](#).

Configuring Alert Creation

You can create alerts in Sentinel in either of the following ways:

- ◆ Associate the Create alerts action to a correlation rule. Sentinel generates an alert when the correlation rule fires.
- ◆ Create alerts by using the REST API. For more information, see the API documentation in any of the following ways:
 - ◆ Click **Help** > **APIs** > **API reference** > **Alert Create Method**.
 - ◆ Go to `<Sentinel Server IP address >SentinelRESTServices/apidoc/en/api-ref/Alerts/alert-create.html`

Sentinel automatically rolls up identical and/or duplicate instances of an alert as follows:

1. When a new alert is created, Sentinel initializes the **Occurrences** field value in the alert to 1.
2. Subsequent instances of the same alert are rolled up into the existing alert until the existing alert is closed. After the existing alert is closed, if a new instance of the same alert is detected, a new alert is created.

When rolling up alerts, Sentinel performs the following activities:

- ◆ Increments the value of the **Occurrences** field by one.
- ◆ Associates trigger events of the new alert instance to the existing alert.

Sentinel determines the sameness of alerts by comparing the existing alert fields with the fields of the new alert instance. When comparing the alerts, Sentinel considers all fields except unique and date/time fields.

3. Multiple open alerts with identical fields can exist if one or more alerts are re-opened from the closed state. In this case, Sentinel chooses the most recently created alert for roll up.

Rolling up of alerts helps in reducing the number of open and duplicate alerts in Sentinel.

When the alert is created by a correlation rule, the fields of the correlated event are copied to the alert. The Create alerts action also sets the following properties on the alert: Owner, Priority, and State. Therefore, you can control the alert output by customizing the correlated event. To customize the correlated event, see “[Customizing Correlated Event](#)” in the *Sentinel User Guide*.

TIP: If there are too many distinct alerts, you can reduce the number of unique fields in the correlated event output to create a more generalized alert, so that the subsequent alert instances are rolled up. Similarly, if the alerts are too generic, you can increase the number of unique fields in the correlated event output to create distinct alerts.

For example, consider a correlation rule that generates a correlated event with severity 5 whenever User A logs in to the system and the Create Alerts action is associated to the correlation rule. When the correlation rule fires, Sentinel creates an alert with severity 5. Subsequent alert instances triggered by this correlation rule are identical to the existing alert. Therefore, Sentinel rolls up the alert instances into the existing alert. If the severity field value of the correlated event is customized to 3, Sentinel generates a new alert with severity 3 instead of rolling up the alert instance to the existing alert.

To associate the Create alert action to a Correlation rule:

- 1 In the **Correlation** panel, select the correlation rule to which you want to associate the Create Alerts action, and click the **Edit** icon.
- 2 In the correlation rule builder, in the **Actions** section, select **Create alert**.
- 3 To configure the alert, click **Configure**.
- 4 Specify the following details in the **Configure Alert** window:
 - ◆ **Owner:** You can specify a user or a role as the owner of the alert. If you specify a role as the owner of the alert, all the users in that role are owners for the alert. One of the users in that role can acknowledge the alert to notify that they have taken the ownership of the alert and are investigating the issue.

NOTE: When assigning an alert to a user or a role, ensure that the role or the user has the Manage Alerts permission.

- ◆ **Priority:** Priority indicates the importance of the alert.
 - ◆ **State:** State indicates the status of the alert in the alert resolution cycle.
 - ◆ **New:** This is the default state of the newly created alerts.
 - ◆ **Investigating:** Indicates that the alert has been triaged and the investigation for the alert is in progress.
 - ◆ **Closed:** Indicates that there will not be further activity on the alert and based on the alert retention policy, the alert will be deleted.
- 5 Click **Save**.
 - 6 Click **Save Rule**.

Visualizing and Analyzing Alerts

Sentinel provides a graphical and tabular representation of alerts created by correlation rules. Visualizing alerts helps you identify and analyze potential threats against your IT resources. For more information about visualization and analyzing alerts, see [“Visualizing and Analyzing Alerts”](#) in *Sentinel User Guide*.

Managing Alerts

You can define rules to store only specific alerts in the database so that the database does not get overloaded. You can also define retention policies to automatically close and delete alerts after a specific duration.

This section provides information about the following:

- ♦ [“Filtering Alerts” on page 254](#)
- ♦ [“Configuring Alert Retention Policies” on page 255](#)

Filtering Alerts

You can configure alert routing rules to filter the alerts and choose to either store the alerts in the Sentinel database or drop the filtered alerts. For example, if you want to exclude the alerts involving the initiator user Albert, you can configure the rule criteria to drop all the alerts with the initiator user name Albert.

Sentinel evaluates the alert routing rules on a first-match basis in top-down order and applies the first matched alert routing rule to alerts that match the filter criteria. If no routing rule matches the alerts, Sentinel applies the default rule against the alerts. The default routing rule stores all the alerts generated in Sentinel.

Creating an Alert Routing Rule

To create an alert routing rule to filter the alerts:

1 From **Sentinel Main**, click **Routing > Alert Routing Rules > Create**.

2 Specify the following information:

- ♦ **Name:** Specify a name for the alert routing rule.
- ♦ **Criteria:** Specify the criteria to filter alerts.
- ♦ **Action:** Select either of the following options:
 - ♦ **Store:** Stores the filtered alerts in the alert store.
 - ♦ **Drop:** Drops or ignores the alerts that match the specified criteria.

WARNING: If you select **Drop**, the filtered alerts are lost permanently.

- ♦ **Enable:** Allows you to enable the alert routing rule. By default, this option is deselected.

3 Click **Save** to save the alert routing rule.

Ordering Alert Routing Rules

When there is more than one alert routing rule, you can reorder the alert routing rules by dragging them to a new position or by using the Reorder option. Alert routing rules evaluate alerts in the specified order until a match is made, so you should order the alert routing rules accordingly. Place more narrowly defined alert routing rules and more important alert routing rules at the beginning of the list.

Sentinel processes the first routing rule that matches the alert based on the criteria. For example, if an alert passes the criteria for two routing rules, only the first rule is applied. The default routing rule always appears at the end.

- 1 From **Sentinel Main**, click **Routing > Alert Routing Rules**.
- 2 Perform either of the following:
 - ◆ Drag the alert routing rule to the desired position in the ordered list.
 - ◆ Click **Reorder**, specify the desired position in the ordered list, and click **Save**.

Configuring Alert Retention Policies

The alert retention policies control when the alerts should be closed and deleted from Sentinel. You can configure the alert retention policies to set the duration to automatically close and delete the alerts from Sentinel.

To configure the alert retention policy:

- 1 From **Sentinel Main**, click **Storage > Alerts Retention**.
- 2 Specify the following information:
 - ◆ Specify the number of days from the date of creation of alerts, after which the alert status is set to closed.
 - ◆ Specify the number of days from the date of closure of alerts, after which the alerts are deleted from Sentinel.
- 3 Click **Save** to save the alert retention policy.

Sentinel checks for closure and deletion of alerts once every day, at midnight.

VII

Managing Solution Packs

This section provides information about using the built-in solution packs and creating your own solution packs.

- ◆ [Chapter 26, “Using Solution Packs,” on page 259](#)
- ◆ [Chapter 27, “Creating Solution Packs,” on page 273](#)

26 Using Solution Packs

Solution Packs allow partners and customers to create and easily manage solutions to specific business problems.

- ◆ [“Overview” on page 259](#)
- ◆ [“Solution Pack Components” on page 260](#)
- ◆ [“Using the Import Plug-In Wizard to Import a Solution Pack” on page 261](#)
- ◆ [“Using the Solution Manager” on page 262](#)
- ◆ [“Installing and Managing Solution Packs” on page 265](#)
- ◆ [“Installing an Edited Solution Pack” on page 272](#)
- ◆ [“Solution Designer” on page 272](#)

Overview

Solution Packs provide a framework within which sets of content can be packaged into controls, each of which is designed to enforce a specific business or technical policy. The control can use any of the detection, filtering, alerting, and response features of Sentinel, as well as provide documentation on control status and enforcement. By managing the set of content as a unit within the control, the Solution Pack solves dependency problems and simplifies implementation.

Controls within a Solution Pack can include the following types of content:

- ◆ Correlation rule deployments, including deployment status and associated Correlation rules, Correlation actions, JavaScript plug-ins and integrators, and Dynamic Lists
- ◆ Reports
- ◆ Filters
- ◆ Searches
- ◆ iTRAC workflows, including associated roles
- ◆ Event enrichment, including map definitions and event meta tag configuration
- ◆ Other associated files added when the Solution Pack is created, such as documentation, example report PDFs, or sample map files.

For example, a Solution Pack can package content related to governance and regulatory compliance into a comprehensible and easily enforceable framework that is easy to deploy.

Solution Packs are created with the Solution Designer application. Using this tool, a user creates the Solution Pack, associated controls and documentation, and then associates Sentinel content with each control. The entire package is then exported as a ZIP file. For more information on creating a Solution Pack and adding content to it, see [“Solution Designer” on page 272](#).

The ZIP file containing the Solution Pack is first imported into an existing Sentinel system by using the Solution Packs Manager in the Sentinel Control Center. You then use the Solution Manager to install the imported Solution Pack.

The Solution Manager also displays the implementation and testing steps in the Solution Pack and tracks the status of each control. At any time, users can generate a detailed document with the implementation status for each control. You can also use the Solution Manager to install the predefined Sentinel Core Solution Pack.

NOTE: Only users in the administrator role can access the Solution Packs Manager.

Solution Pack Components

Solution Packs consist of categories, controls, content, and content groups, all in a hierarchy of related components.

The following table describes each level in a Solution Pack hierarchy.

Table 26-1 *Solution Pack Hierarchy Levels*

	Solution Pack	A Solution Pack is the root node in the content hierarchy. Each Solution Pack can contain one or multiple Category nodes.
	Category	A category is a conceptual classification. Each Category can contain one or multiple controls.
	Control	A control is another level of classification, which often corresponds to a particular control defined by a set of regulations. Each control can contain one or multiple content groups.
N/A	Content Group	A content group is a set of related content. There are several types of content groups, such as reports, Correlation rules, and event configurations, each with its own icon.

The following table describes the types of content groups and what the content that they contain:

Table 26-2 *14-2: Content Groups*

	Event Configuration	A content group that contains a map definition and the configuration of one or more related Sentinel meta tags. This icon is also used for the meta tag configuration definition.
	Map	A map definition instance.
	Workflow	An iTRAC Workflow template and any associated roles. This icon is also used for the iTRAC workflow template itself.
	Role	A role used in a workflow.

	Correlation Rule	A Correlation rule, the namespace in which it is stored, and any associated Correlation actions or Dynamic Lists. This icon is also used for the Correlation rule definition.
	Namespace	A namespace instance in which the Correlation rule is stored
	JavaScript Action Plugin	A JavaScript action plug-in.
	JavaScript Action	A configured JavaScript action instance.
	Integrator Plugin	An Integrator plug-in.
	Integrator	A configured Integrator instance.
	Action	An action configuration for a Correlation action.
	Correlation Rule Deployment	The Correlation rule deployment.
	Report	A report. This icon is also used for the .rpt report file.
	Dynamic List	A Dynamic List.

Using the Import Plug-In Wizard to Import a Solution Pack

Solution Packs are available from several sources. They can be downloaded from the [Sentinel Plug-ins download Web page \(http://support.novell.com/products/sentinel/secure/sentinelplugins.html\)](http://support.novell.com/products/sentinel/secure/sentinelplugins.html). They can be provided by a partner, or they can be created from content in your own Sentinel system.

The first step in using a Solution Pack is to import the .zip file into the system through the Import Plug-in Wizard. When a Solution Pack is imported, the .zip file is copied to the server. The actual contents of the Solution Pack are not available in the target Sentinel system until the controls are installed through the Solution Manager. For more information, see [“Installing Content from Solution Packs” on page 265](#).

If you import an updated version of a Solution Pack, you are prompted to replace the existing plug-in.

- 1 Launch the Sentinel Control Center as a user who has the administrator role.
- 2 Launch the Solution Packs Manager.
 - ◆ (Conditional) If the Configuration menu is not enabled, click the **Configuration** tab, then click the **Configuration** menu > **Solution Packs** or click the icon in the toolbar.
 - ◆ (Conditional) If the **Configuration** menu is enabled, click the **Configuration** > **Solution Packs** or click the icon in the toolbar.

The Solution Packs Manager window is displayed.

- 3 Click the **Import** icon in the Solution Packs Manager window to open the Import Plug-in Wizard.

- 4 Select **Import Solution package plugin file (.zip)**, then click **Next** to display the Choose Plugin Package File window.
- 5 Use the **Browse** button to locate the Solution Pack to import to the plug-in repository. Select a `.zip` file and click **Open**.
- 6 Click **Next**.
If you selected a solution pack that already exists, the Replace Existing Plugin window displays.
- 7 If you want to replace the existing plug-in, click **Next**.
The Plug-in Details window displays the details of the plug-in to be imported.
- 8 Select the **Launch Solution Manager** check box if you want to install the plug-in after importing the Solution Pack.
If you select the **Launch Solution Manager** check box, the Solution Manager displays the Solution Pack that is imported.
- 9 Click **Finish**.

Using the Solution Manager

You can use the Solution Manager for several different tasks:

- ♦ Installing a control and the child content for the control into the Sentinel system. When the content is initially installed, its status is Not Implemented.
- ♦ Implementing a control by configuring event source systems and Sentinel to use the content associated with the control. Solution Packs include detailed documentation describing implementation steps.
- ♦ Testing a control to verify the content associated with the control. Solution Packs include detailed documentation describing testing steps.
- ♦ [“Launching the Solution Manager” on page 262](#)
- ♦ [“Solution Manager Interface” on page 262](#)

Launching the Solution Manager

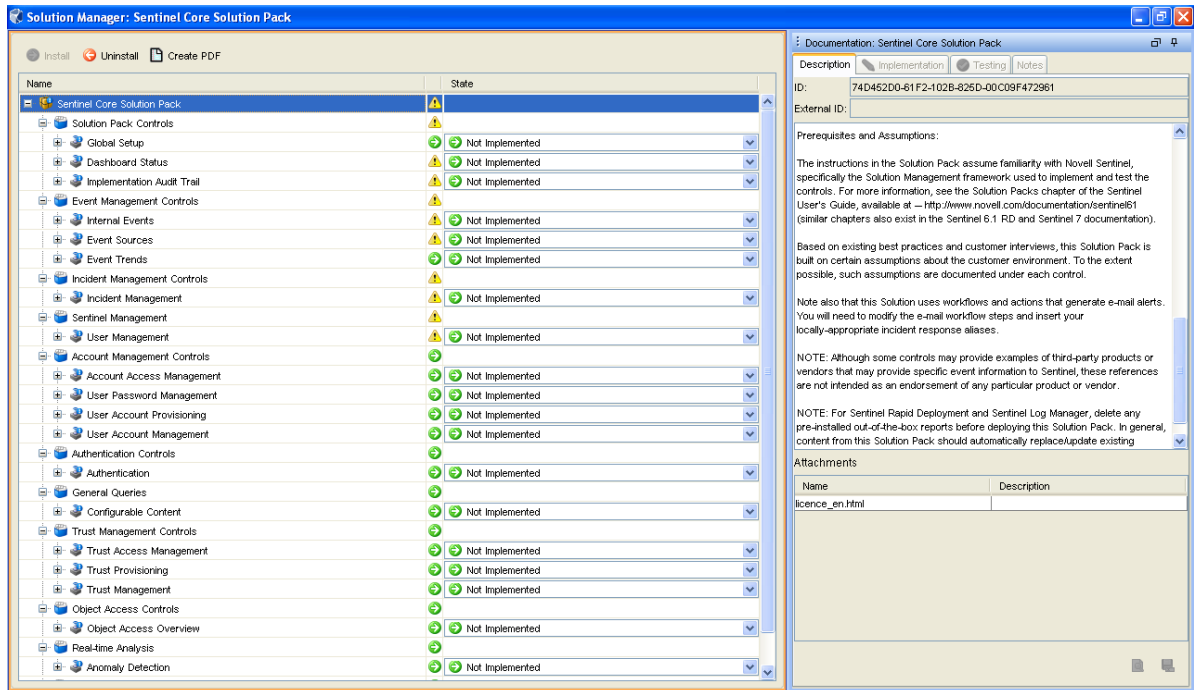

You can launch the Solution Manager by:

- ♦ Selecting **Launch Solution Manager** in the Import Plugin Wizard.
- ♦ Double-clicking the imported Solution Pack in the Solution Packs Manager.
- ♦ In the Solution Packs Manager window, select a Solution Pack and then click the **Open with Solution Manager** icon.

Solution Manager Interface

The Solution Manager window is divided into two panels that contain information about the extracted Solution Pack, along with comparison information, status information, and documentation:

Figure 26-1 Solution Manager

- ◆ “Content Panel” on page 263
- ◆ “Content Comparison” on page 264
- ◆ “Out Of Sync Status” on page 264
- ◆ “Documentation Panel” on page 264

Content Panel

The Content panel provides information about the extracted Solution Pack files. This panel displays a hierarchical view of the category, control, content group, and various types of content. All parent nodes reflect the overall state of the controls they contain. This means that parent nodes have an inherited status based on their child content.

The Content panel has the following columns:

- ◆ **Name:** Displays the name of the node.
- ◆ **Installed:** Indicates whether the content is installed in the target Sentinel system. If not, this column is blank.
- ◆ **State:** This column is available for the control node. This column contain a list with the following values:
 - ◆ **Not Implemented:** The default state when the control is first imported.
 - ◆ **Implemented:** Indicates that you have fully implemented the content by using the associated documentation.
 - ◆ **Tested:** Indicates that you have fully tested the content for this control by using the associated documentation.

NOTE: Because of the regulatory significance of implementing controls, status changes for each control are tracked for auditing purposes.

Content Comparison

When the Solution Pack is opened, the Solution Manager compares the contents of the Solution Pack to other Solution Pack content from different Solution Packs or previous versions of the same Solution Pack.

Table 26-3 Content Status

	Installed	Indicates that the content is already installed in the target Sentinel system. The version is the same in the opened Solution Pack and the previously installed Solution Pack.
	Out of Sync	Indicates that a different version of the content is already installed in the target Sentinel system. A difference in name, definition, or description could trigger an Out of Sync status.

Out Of Sync Status

The Out of Sync icon indicates that content in the newly opened Solution Pack differs from a version that was previously installed by another Solution Pack (either a different Solution Pack or a previous version of the same Solution Pack). The name, definition, or description of the content might be different.

NOTE: The Solution Manager only compares content from different Solution Packs (or different versions of the same Solution Pack) for installed content. It does not compare content that has not yet been installed. It also does not compare Solution Pack content to content in the target system, so manual changes to content in the Sentinel Control Manager are not reflected in Solution Manager.

Documentation Panel

The Documentation panel displays descriptive information provided to describe the Solution Pack when it was created in the Solution Designer. For more information on the Solution Designer, see [“Solution Designer” on page 272](#).

The following informational tabs, populated and edited in the Solution Designer, are available:

- ◆ **Description:** A description of the selected node. You can view attachments and their descriptions in the **Description** tab.

You can add text to the **External ID** field to refer to specific regulations or corporate IDs.
- ◆ **Implementation:** Instructions for implementing the selected control.
- ◆ **Testing:** Instructions for testing the selected control.
- ◆ **Notes:** Use this tab for any notes related to the control, including user comments on the testing or implementation process.

Installing and Managing Solution Packs

- ♦ [“Viewing the Contents of a Solution Pack” on page 265](#)
- ♦ [“Installing Content from Solution Packs” on page 265](#)
- ♦ [“Configuring Controls” on page 266](#)
- ♦ [“Implementing a Control” on page 268](#)
- ♦ [“Testing a Control” on page 269](#)
- ♦ [“Uninstalling a Control” on page 269](#)
- ♦ [“Viewing Solution Pack Status” on page 270](#)
- ♦ [“Deleting a Solution Pack” on page 271](#)

Viewing the Contents of a Solution Pack

To use the Solution Manager and view the contents of a Solution Pack, a user must belong to the administrator role.

- 1 Click the **Configuration** menu and select **Solution Packs** to display the Solution Packs Manager window:
- 2 Double-click a Solution Pack in the Solution Packs window to display the Solution Manager.

Installing Content from Solution Packs

To use the content of a Solution Pack in the Sentinel Control Center, you must install the Solution Pack or selected controls in a Sentinel System (also known as the “target” Sentinel system).

When you install either a Solution Pack or an individual control, all of the child nodes are installed. Only fully defined controls can be installed. For controls that contain placeholders, the Install option is disabled.

- 1 In the Solution Packs Manager window, double-click a Solution Pack to open the Solution Manager.

Alternatively, you can select a Solution Pack that you want to install and click **Open with Solution Manager** icon.

For more information, see [“Launching the Solution Manager” on page 262](#).

- 2 Select a Solution Pack or a control that you want to install. Click **Install**.

Alternatively, right-click a Solution Pack or control and select **Install**.

The Install Control Wizard opens. If you select a Solution Pack, all the controls in that Solution Pack display. If you select an individual control, then that control is displayed in the Install Control Wizard window.

- 3 Click **Next** to display the Install Content window.

If Correlation rules and actions are included in the Solution Pack, you need to proceed through several additional screens until you reach the Install Content window. For more information, see [“Correlation Rules and Actions” on page 266](#).

- 4 Click **Install**.

- 5 After the installation is complete, click **Finish**.

If the installation fails for any content item in the control, the Solution Manager rolls back all the content in that control to Uninstalled. In this situation, create a new content or Solution Pack using the Solution Designer, import it and then try installing it

- 6 Configure the control, then implement it according to the instructions in the documentation for the control.
 - ◆ For information on configuring the controls or content you just installed, continue with [“Configuring Controls” on page 266](#).
 - ◆ For information on implementing the control in order to use the content, continue with [“Implementing a Control” on page 268](#).

Correlation Rules and Actions

Correlation rules are deployed to a specific Correlation Engine. During the control installation, a screen shows the Correlation Engines in the target Sentinel system and the rules that are already running on those engines. Based on the number and complexity of the rules running on the engines, you can decide where you will deploy the Correlation rule.

Correlation rules deploy in an Enabled or Disabled state, depending on their status in the source Sentinel system when the Solution Pack was created.

If an Execute Script Correlation action is associated with the Correlation rule, the Solution Manager attempts to install the associated JavaScript code on all Correlation Engines. If a Correlation Engine is idle, you can still deploy the rule. However, the status of the rule will be disabled in the Sentinel Main interface after importing.

If an Execute Command Correlation action is associated with the Correlation rule, the Solution Manager installs the command and its arguments, but the script or utility must be manually configured on the Correlation Engine. This might require installing the utility, configuring permissions, or manually copying a script file to the proper directory on the Correlation Engine.

In a default installation, the proper directory for the script file is `/opt/novell/sentinel/bin/actions`.

If a JavaScript Action is associated with the Correlation rule, the Solution Manager installs the Action configuration, the Action plug-in, and the associated integrator configuration and Integrator plug-in (if it is needed).

Configuring Controls

- ◆ [“Duplicate Content within a Solution Pack” on page 267](#)
- ◆ [“Content with the Same Name in the Target Sentinel System” on page 267](#)
- ◆ [“Resolving Out of Sync Content” on page 267](#)
- ◆ [“Copying a Map File” on page 268](#)

Duplicate Content within a Solution Pack

If two separate controls contain identical content and one control is installed successfully, the status of the duplicate content in the other control is changed to Installed. The remaining child nodes in the second control stay uninstalled.

Each content item is only installed once. If the same content item (for example, an iTRAC workflow or a Correlation rule) is included in more than one control, it is only installed once. Therefore, if you install one of those controls, the content displays with an installed status in the other control. In this scenario, the Solution Manager might show that the content for the second control is only partially installed.

Content with the Same Name in the Target Sentinel System

If the Solution Manager detects content with the same name but a different unique identifier in the target Sentinel system, the Solution Manager installs the content with a unique ID appended to the name. For example, the rule from the Solution Pack might be named Unauthorized Firewall Change (1). The existing rule in the Sentinel system is unchanged.

NOTE: To prevent confusion for end users, rename one of these rules.

Resolving Out of Sync Content

Out of Sync status indicates that a different version of the content in the Solution Pack has been installed in the Sentinel target system by another Solution Pack or a previous version of the same Solution Pack. The Solution Manager only compares content from different Solution Packs (or different versions of the same Solution Pack) for installed content. Before you implement a control, you need to resolve this out of sync status.

- 1 Open the Solution Pack in the Solution Manager for which you want to resolve the out of sync content.
- 2 Select the out of sync content (not the control or category) in the Solution Manager.
- 3 Select the content, right-click, then select **Out of synchronization content detail**.
A message displays information about which Solution Pack is the source of the out of sync content.
- 4 Compare the content in the two Solution Packs to determine which version you want to keep.
- 5 Uninstall the control from the Solution Pack that you do not want to keep. For more information, see [“Uninstalling a Control” on page 269](#).
Resolve the out of sync issue before installing the new Solution Pack.
- 6 Reinstall the control with the content you want to keep.
- 7 Implement and test as necessary.

Copying a Map File

If the Solution Pack that you install contains a Map control, you need to copy the associated `.csv` file to the system where you are importing and installing the Solution Pack. This file is used by the mapping service for event enrichment. Data from this `.csv` file is used to populate the tag when specified conditions are met for all incoming events.

When you create a Solution Pack using a Map control, the map definition file (`.csv`) that is used to create the Map is not bundled in the Solution Pack. Therefore, when you install this Solution Pack on any other Sentinel server, you do not get the expected behavior. This is because this Map looks for the required information in the map definition file (`.csv`) in the `var/opt/novell/sentinel/data/map_data` folder of the Sentinel Server to populate the tag. If the correct `.csv` file is not there, the Map control does not work properly.

You must copy the map definition file that you used to create the Map to the `var/opt/novell/sentinel/data/map_data` folder whenever you install any Solution Pack that has a Map control.

Implementing a Control

The steps on how to implement a control is added when the Solution Pack is created in the Solution Designer. The steps might include instructions for the following types of implementation actions:

- ◆ Scheduling automatic report execution.
- ◆ Enabling auditing on source devices.
- ◆ Copying an attached script for an Execute Command Correlation Action to the appropriate location on the correlation engines.

You only need to follow the instructions that are in the Implementation tab for the control.

To implement a control:

- 1 Open a Solution Pack in Solution Manager.
For more information, see [“Launching the Solution Manager” on page 262](#).
- 2 Select a control.
- 3 Click the **Implementation** tab in the Documentation panel.
- 4 Follow all of the instructions in the **Implementation** tab.
- 5 Add notes to the **Notes** tab of the Documentation panel as necessary to document progress or necessary changes from the recommended implementation steps.
- 6 When the implementation is complete, select the control and change the status drop-down to **Implemented**.
- 7 An audit event is generated and sent to the Sentinel Control Center.

Because of potential legal and regulatory implications, the status for a control should only be changed after all of the implementation steps have been successfully completed.

Testing a Control

After a control is implemented, the content should be tested to verify that it is working as expected. Testing might require steps such as running a report or generating a failed login. The testing instructions for each control are added when the Solution Pack is created in the Solution Designer.

To test a control:

- 1 Open a Solution Pack in Solution Manager.
For more information, see [“Launching the Solution Manager” on page 262](#).
- 2 Select a control.
- 3 Click the **Testing** tab in the Documentation panel.
- 4 Follow all of the instructions in the **Testing** tab.
- 5 Add notes to the **Notes** tab of the Documentation panel as necessary to document progress or necessary changes from the recommended testing steps.
- 6 When the testing is complete, select the control and change the status drop-down to **Tested**.
- 7 An audit event is generated and sent to the Sentinel Control Center.

Because of potential legal and regulatory implications, the status for a control should only be changed after all of the testing steps have been successfully completed.

Uninstalling a Control

Controls are often used to meet legal or regulatory requirements. After they are implemented and tested, controls can be uninstalled after careful consideration.

When a control is uninstalled, the status for the control reverts to Not Implemented and child content is deleted from the Sentinel system. There are a few exceptions and special cases:

- ♦ Dependencies are checked to ensure that no content that is still in use is deleted. Some examples of this include a Dynamic List that is used by a Correlation rule created in the target Sentinel system, a report that is used in a control that is still installed, an iTRAC workflow template that is used in a Solution Pack that is still installed, or a folder that still contains other content.
- ♦ Reports (.rpt files) copied to a local system cannot be removed if the uninstall is performed from a Sentinel Control Center on a different machine.
- ♦ JavaScript files associated with Execute Script Correlation actions remain on the Correlation Engines.
- ♦ Maps (.csv files) and the data they contain are not deleted.
- ♦ Roles associated with workflows are not deleted.
- ♦ iTRAC workflow processes that are already in progress continue until completion even if the iTRAC workflow is uninstalled.

To uninstall a control:

- 1 Open a Solution Pack in Solution Manager.
For more information, see [“Launching the Solution Manager” on page 262](#).
- 2 Right-click the control you want to uninstall and select **Uninstall**.

Alternatively, click the **Uninstall** icon. The Controls To Uninstall window appears.

3 Click **Next**.

If the control you are uninstalling includes one or more reports, you are prompted whether to uninstall the reports from the server. Ideally, this information was recorded on the **Notes** tab when the reports were installed.

4 Click **Next** to display the Uninstall Content window.

5 Click **Uninstall**. The selected contents are uninstalled.

Local reports cannot be uninstalled from a different Sentinel Control Center machine than the one that was used for the installation, or if the files were copied to a new location after installation. If the Solution Manager cannot find the `.rpt` files in the expected location, a message is logged in the Sentinel Control Center log file.

6 Click **Finish**.

Viewing Solution Pack Status

There are several sources of information about the status of a Solution Pack.

- ♦ [“Viewing the Status in the Solution Manager” on page 270](#)
- ♦ [“Generating Status Documentation” on page 270](#)
- ♦ [“Audit Events in the Sentinel Control Center” on page 271](#)

Viewing the Status in the Solution Manager

You can view the status of Solution Pack contents in the Solution Manager. For more information, see [“Launching the Solution Manager” on page 262](#).

- ♦ **None/Blank:** No status indicator for a control indicates that the associated content has not been installed yet.
- ♦ **Not Implemented:** When none or some of the contents of a control are installed, the control is in the Not Implemented state. If the same content is installed by another control, a control might be Not Implemented even if some of its child content is Installed.
- ♦ **Implemented:** Indicates that a user has completed all of the implementation steps and manually set the control status to Implemented. For more information, see [“Implementing a Control” on page 268](#).
- ♦ **Tested:** Indicates that a user has completed all of the testing steps and manually set the control status to Tested. For more information, see [“Testing a Control” on page 269](#).
- ♦ **Out of Sync:** Indicates that a different version of the content in the Solution Pack has been installed in the Sentinel target system by another Solution Pack or a previous version of the same Solution Pack. For more information, see [“Out Of Sync Status” on page 264](#)

Generating Status Documentation

The information about the Solution Pack can be exported in PDF format. The report contains details about every node in the Solution Pack, including the category, control, and content group.

To generate Solution Pack status documentation:

- 1 Open a Solution Pack in the Solution Manager for which you want to generate a status report.
- 2 Click **Create PDF**. The Report Options window displays.
 - ♦ **Show status information:** Select this option to show deployment status for each control (Not Installed, Not Implemented, Implemented, or Tested) and whether it's Out of Sync.
 - ♦ **Include content nodes:** Select this option to include information about the child content for each control in the documentation.
- 3 Select Show status and Show individual content if desired.
- 4 To view the documentation, click **Preview**.
(Conditional) If this is the first time a PDF has been opened from the Sentinel Control Center, you might need to locate Acrobat Reader.
- 5 (Conditional) Click **Browse**, and locate the Acrobat Reader, then click **OK**.
The report is opened in the PDF format.
- 6 To save the PDF, click **Browse**. Navigate the location where you want to save the PDF and specify a filename.
- 7 Click **Save**.

Audit Events in the Sentinel Control Center

All major actions related to Solution Packs and controls are audited by the Sentinel system, with information about which user performed the action. The following events are visible in the Sentinel Control Center and are stored in the Sentinel database:

- ♦ Solution Pack is imported.
- ♦ Control is installed.
- ♦ Control status is changed to Implemented.
- ♦ Control status is changed to Tested.
- ♦ Control status is changed to Not Implemented.
- ♦ Control is uninstalled.
- ♦ Notes are modified for a control.
- ♦ Solution Pack is deleted.

Deleting a Solution Pack

Solution Packs are often used to meet legal or regulatory requirements. After they are implemented and tested, Solution Packs can be deleted after careful consideration. All deletions are audited by the Sentinel system and sent to both the Sentinel Control Center and the Sentinel database.

You cannot delete a Solution Pack without uninstalling the controls first. For more information, see [“Uninstalling a Control” on page 269](#). If you do not uninstall the controls and try to delete a solution pack, you are notified that content is still deployed.

- 1 Open the Solution Packs Manager.
- 2 Select the Solution Pack that you want to remove, then click **Remove**.

You are prompted to delete the Solution Pack.

- 3 Click **Yes** to delete.

Installing an Edited Solution Pack

When a Solution Pack is modified and saved through the **Save** or **Save As** options in the Solution Designer, it is considered to be a new version of the original Solution Pack. When the new version is imported, it replaces any older versions of the original Solution Pack. There is no immediate impact on any installed content in the target Sentinel system.

After the new Solution Pack is installed, its behavior varies, depending on the status of the original Solution Pack's content.

- ◆ If the content from the original Solution Pack was not installed yet, the content is simply replaced. When a user installs content, the new content is installed to the target Sentinel system.
- ◆ If the content from the original Solution Pack was installed (Not Implemented), Implemented, or Tested, the original content is compared to the new content.
- ◆ If the content version is the same, the original content is still valid and no action is necessary.
- ◆ If the content version is different, the content status is set to Out of Sync. You must decide how to resolve the synchronization issue. For more information, see [“Out Of Sync Status” on page 264](#).
- ◆ If the content did not exist in the original Solution Pack, it is displayed in Solution Manager as not installed. You can install, implement, and test the new content.
- ◆ If the content existed in the original Solution Pack but has been deleted from the modified Solution Pack, it does not appear in the Solution Manager.

NOTE: The Solution Manager only handles differences in the contents of Solution Packs. It does not recognize manual content changes that are performed after content is installed.

Solution Designer

You can use the Solution Designer to package and export different contents, such as a Correlation rule with associated actions and Dynamic Lists. These items can be selected and packaged with their configuration to a `.zip` file. You can then view or select the content of the file in the Solution Manager. For more information, see [Chapter 27, “Creating Solution Packs,” on page 273](#).

27 Creating Solution Packs

You can use the Solution Designer to package and export different contents, such as a Correlation rule with associated actions and dynamic lists. The content can be selected and packaged with its configuration in a ZIP file. You can then view or select the content of the ZIP file by using the Solution Manager. For more information on the Solution Manager, see [Chapter 26, “Using Solution Packs,” on page 259](#).

To use the Solution Designer, you must have the correct permission. All roles contain the permission for the Solution Designer except for the PCI Compliance Audit role and the Search Proxy User role. For more information, see [Chapter 4, “Configuring Roles and Users,” on page 41](#).

- ♦ [“Accessing the Solution Designer” on page 273](#)
- ♦ [“Creating a Solution Pack” on page 273](#)
- ♦ [“Adding Content to a Solution Pack” on page 274](#)
- ♦ [“Initializing Dynamic Lists Through Solution Pack” on page 276](#)
- ♦ [“Documenting a Solution Pack” on page 277](#)
- ♦ [“Synchronizing Content” on page 278](#)
- ♦ [“Handling Inter-control Dependency” on page 278](#)
- ♦ [“Managing a Solution Pack” on page 278](#)

Accessing the Solution Designer

- 1 From **Sentinel Main**, click **Applications**.
- 2 Click **Launch Designer**.
 - 2a When prompted, download `solution_designer.zip` and extract it.
 - 2b Run the `launcher_solutiondesigner.exe` file on a Windows machine or the `launcher_solutiondesigner.sh` file on a Linux machine.
- 3 Click **Yes** to accept the security certificate.
- 4 Specify a user name and password of a user with permission to access the Solution Designer.
- 5 Click **Login**.
- 6 Click **Accept** or **Accept Permanently** to accept the security certificate.

Creating a Solution Pack

You can use the Solution Designer to create a Solution Pack with existing content objects (for example, Actions, Event Actions, Filters, Searches, Correlation Rules, Dynamic Lists, or iTRAC workflow templates) from Sentinel. The Solution Designer analyzes the dependencies for a content object and include all necessary components in the Solution Pack. For example, a Correlation Rule deployment includes a Correlation Rule definition, one or more actions, and the ability to create an

incident using a workflow. The Solution Designer includes the Correlation Rule, the associated correlation actions, the iTRAC template, and the roles associated with the iTRAC template in the Solution Pack.

IMPORTANT: To add a content object to a Solution Pack, it must already exist in Sentinel. Content objects cannot be created in the Solution Designer.

To create a new Solution Pack:

- 1 Access the Solution Designer.
For more information, see [“Accessing the Solution Designer” on page 273](#).
- 2 Click **File > New**.
An empty Solution Pack is displayed in the Solution Pack panel.
- 3 Add Categories, Controls, Content Groups, and content placeholders.
For detailed instructions, see [“Adding Content to a Solution Pack” on page 274](#).
- 4 Add file attachments to the hierarchy nodes as desired.
For detailed instructions, see [“File Attachments” on page 276](#).
- 5 Click **File > Save**.
- 6 Browse to and select a location to save the Solution Pack, then specify a name for the Solution Pack.
- 7 Click **Save** to save the Solution Pack.
The Solution Pack is saved in a .zip format.

Although you can save a Solution Pack with empty placeholders, you cannot install controls in the Solution Manager unless all placeholders have been filled with content.

Adding Content to a Solution Pack

A vital part of creating a Solution Pack is adding content to the controls. Each control can have one or more types of content associated with it.

- ♦ [“Sentinel Content” on page 274](#)
- ♦ [“Using Placeholders” on page 276](#)
- ♦ [“File Attachments” on page 276](#)

Sentinel Content

The same general procedure is used to add all types of Sentinel content to a Solution Pack. The Sentinel content palette includes the following:

- ♦ Actions
- ♦ Correlation Rule deployments, including their deployment status (enabled or disabled) and associated Correlation rules, Correlation Actions, and Dynamic Lists
- ♦ Event Actions
- ♦ Reports

- ◆ Filters
- ◆ Searches
- ◆ iTRAC workflows, including associated roles
- ◆ Event enrichment, including map definitions and event metatag configuration
- ◆ Other associated files added when the Solution Pack is created, such as documentation, example report PDFs, or sample map files.

Adding Sentinel Content to a Control

To add Sentinel content to a control:

- 1 Access the Solutions Designer.
- 2 Open or create a Solution Pack.
- 3 Click the appropriate panel to display the available content:
 - ◆ Actions
 - ◆ Correlation
 - ◆ Event Actions
 - ◆ Event Enrichment
 - ◆ Filters
 - ◆ iTRAC
 - ◆ Jasper Reports
 - ◆ Searches
- 4 Drag the item and drop it into the control.

If you try to drag and drop pre-existing content in the Solution Designer, the existing content is highlighted. After you drop the content, a message prompt indicates that similar content exists.

Setting Content Properties

You can set properties to a content to indicate it is designed for specific Sentinel platforms. Content that is designed in newer versions of Sentinel might not be supported in older versions because of changes in the Sentinel schema. If you try to install a Control on an unsupported Sentinel platform, the installation does not proceed and shows an “Out of date” error.

To set the properties:

- 1 Right-click a content, then select **Properties**.
- 2 (Conditional) For Correlation rules, select **Automatically deploy during installation** to deploy Correlation rules automatically during the solution pack installation.
- 3 Select **Minimum Required Versions**, and then specify the Sentinel versions.
- 4 Click **Apply**.

Using Placeholders

If the user is not ready to associate content with a control, an empty placeholder can be used instead.

- 1 Click the **Correlation**, **Event Actions**, **Actions**, **Filters**, **Event Enrichment**, **iTRAC**, or **Jasper Report** button in the Content Palette to open the panel for the type of placeholder you want to add.
- 2 Drag and drop the placeholder to the appropriate control in the Solution Pack panel.
- 3 Rename the placeholder, if desired.

To replace a placeholder with content:

- 1 Click the **Correlation**, **Event Actions**, **Filters**, **Event Enrichment**, **iTRAC**, or **Jasper Report** button in the Content Palette to open the panel for the type of placeholder you want to add.
- 2 Drag and drop the appropriate Content Group from the Content Palette to the placeholder in the Solution Pack panel or select the appropriate Content Group, then click **Add Selected Content**.

You can set properties for placeholders to indicate whether a placeholder is designed for specific Sentinel platforms. Placeholders that are designed in newer versions of Sentinel might not be supported in older versions because of changes in the Sentinel schema. If you try to install a placeholder on an unsupported Sentinel platform, the install does not proceed and shows an “Out of date” error.

To set the properties:

- 1 Right-click the placeholder, then select **Properties**.
- 2 Select **Minimum Required Versions**, then specify the Sentinel versions.
- 3 Click **Apply**.

File Attachments

You can attach a file or files to any node in the hierarchy. The content in the attachment is included in the Solution Pack. These files can include anything useful for a user who must deploy the Solution Pack, such as a PDF view of a report, sample map data for event enrichment, or a script for an Execute Command Correlation Action. These files can be added, deleted, viewed, renamed, or saved to the local machine.

Initializing Dynamic Lists Through Solution Pack

The Correlation rules in solution packs require some data in the Dynamic Lists for it to work properly. The solution pack framework includes the ability to automatically populate the Dynamic Lists with data when you install a solution pack.

To populate a Dynamic List when you install a solution pack:

- 1 Create a text file with the values you want to add to the Dynamic List. Add each different value on a separate line.
- 2 In the Solution Designer, expand the Correlation content, and then select the Dynamic List.

- 3 Click **Add a new attachment** in the Attachment panel, and attach the file that you created in [Step 1](#).

All the list items in the Dynamic List never expire. For more information, see [“Configuring Dynamic Lists”](#) in the *Sentinel User Guide*.

Documenting a Solution Pack

The Solution Designer provides three different categories of documentation to help you create the documentation for the Solution Pack you are creating.

- ♦ [“Description” on page 277](#)
- ♦ [“Implementation Steps” on page 277](#)
- ♦ [“Testing Steps” on page 277](#)

Description

Allows you to provide a detailed description about the Solution Pack for your users.

Implementation Steps

Lets you add the steps required to implement the content in the target Sentinel system to the **Implementation** tab of the Documentation panel. The steps might include instructions for the following types of implementation actions:

- ♦ Populating a `.csv` file that is used by the mapping service for event enrichment.
- ♦ Scheduling automatic report execution
- ♦ Enabling auditing on source devices.
- ♦ Copying an attached script for an Execute Command Correlation Action to the appropriate location on the correlation engines.

After the content implementation, the content should be tested to verify that it is working as expected.

Testing Steps

Lets you add the steps required to test the content in the target Sentinel system to the **Testing** tab of the Documentation panel. The steps can include instructions for the following types of testing activities:

- ♦ Running a report and verifying that data is returned.
- ♦ Generating a failed login in a critical server and verifying that a correlated event is created and assigned to an iTRAC workflow.

Synchronizing Content

If you modify the content in the source system, the content in the source system and the content in the original Solution Pack can be out of synchronization. To synchronize the content, do one of the following:

- ♦ For content with no dependencies, drag and drop the content from the Content Palette onto the control.

The modified content is immediately updated. For example, a report has no dependencies.
- ♦ For content with dependencies, the dependencies are checked and updates are made when you click the **Synchronize All Content** icon or when you save the Solution Pack. However, you need to ensure that the system that you are connected to has the latest content.
- ♦ To synchronize specific content based on any content group, right-click the content or a content group and click **Synchronize this content**. Using this menu ensures that only the content and the contents within that group are synchronized.

When an action uses the Send Email action, this action always appears as Out of Synchronization. This is expected and does not cause an error.

Handling Inter-control Dependency

You can specify any control as a required control in the Solution Designer. This ensures that the control marked as required is also installed when a user chooses to install any other control first. For example, you can mark the global setup control as a required control, which is then installed when the user installs any other control from a solution pack.

You can also specify if you want to overwrite an existing control during installation. For example, if you include a newer version of a White Label Template and want to ensure that this newer version is automatically installed with a new install of solution pack, you can enable the overwrite properties.

To mark a control as required:

- 1 In the Solution Designer, select the control that you want to mark as required.
- 2 Right-click the control and select **Properties**.
- 3 (Conditional) Select **Required** if you want to ensure that this control is also installed while installing any specific control from a solution pack.
- 4 (Conditional) Select **Enable Overwrite** if you want to automatically install this control with a new install of solution pack.
- 5 Click **Apply**.

Managing a Solution Pack

All content in a Solution Pack is hierarchically organized into categories, controls, and content groups.

- ♦ [“Adding a Node to a Control” on page 279](#)
- ♦ [“Moving Nodes” on page 279](#)

Adding a Node to a Control

- 1 Select a node in the Solution Pack panel.
- 2 Right-click the node, then select **Create**
or
Click **Create** in the Solution Pack panel heading.

Moving Nodes

Category, control, and content group nodes can be created in any order and then reordered or moved to a different parent in the hierarchy.

To move a node to another branch in the hierarchy, drag and drop a node to its new parent node. A control can be moved to a new category. A content group can be moved to a new control.

To reorder a node, drag and drop it on top of the node it should appear after in the Solution Pack.

VIII

Managing Your Sentinel Environment

This section provides information about managing your Sentinel server.

- ♦ [Chapter 32, “Configuring Alert Generation,” on page 291](#)
- ♦ [Chapter 33, “Configuring the Report Retention Period,” on page 293](#)
- ♦ [Chapter 34, “Generating a Report in CSV and PDF Format,” on page 295](#)
- ♦ [Chapter 35, “Backing Up and Restoring Data,” on page 297](#)
- ♦ [Chapter 36, “Updating Sentinel Clients,” on page 303](#)
- ♦ [Chapter 37, “Customizing Sentinel Settings,” on page 305](#)
- ♦ [Chapter 38, “Rebranding Reports,” on page 313](#)
- ♦ [Chapter 39, “Generating an Audit Event when a List Item Expires From a Dynamic List,” on page 315](#)

28 Managing Active Searches and Reports

Sentinel provides an option to monitor and manage active searches and reports on the Sentinel server for the purpose of resource management. You can view all the searches and reports currently active on the Sentinel server, determine which long-running searches or reports are no longer needed, and stop them as necessary.

Sentinel helps you monitor search and report activities and determine whether a search or a report is not retrieving events as expected or whether a search or a report is retrieving more than the expected events, which might indicate that the search or the report needs to be tuned. It also helps you determine if too many searches or reports are running, and helps identify long-running searches and reports that might slow down the system. Searches and reports that consume a lot of memory are a potential liability to a healthy system and should be carefully reviewed to ensure that the search query is specified properly. You can also stop the searches and reports that are no longer needed and thereby free up system resources.

To manage active searches:

- 1 From **Sentinel Main**, click **Storage > Search Jobs**.

The Search Jobs lists all the active event search jobs running in the system, including searches that are initiated when users perform activities, such as:

- ◆ Run a search in the Search interface.
- ◆ View events that fire a correlation rule.
- ◆ View events processed when testing a correlation rule.
- ◆ Generate a report or drill down into report results.
- ◆ Select filters to view events that match the filter criteria.
- ◆ Select tags to view the events that are tagged with the specified criteria.
- ◆ View events from the dashboard, anomaly, continuation breakdown, and so forth.

The Search Jobs page refreshes every 30 seconds.

You can view the following search details. Mouse over each field for information on what the field indicates:

- ◆ **Duration:** The time spent to search events in the event store.
- ◆ **Status:** Whether a search job is pending, running, finished, finished with errors, or canceled.
- ◆ **Owner:** The user who initiated the search. For search jobs initiated by the system, the owner is indicated as "System."
- ◆ **Type:** Indicates the following:
 - ◆ **System:** Search jobs that are run for maintenance purposes. For example, to clean up invalid references to events from the database.
 - ◆ **User:** Search jobs started by users either through the Search interface or through the REST API.
 - ◆ **Reports:** Search jobs started by users, but used for getting event results for reports.

- ♦ **Data sync:** Search jobs started to support the Data Synchronization feature.
 - ♦ **Distributed:** Search jobs initiated by a remote server.
 - ♦ **Start:** The time the search started searching for events.
 - ♦ **Accessed:** The time elapsed since the search was initiated.
 - ♦ **More:** Provides detailed information such as the IP address of the machine that initiated the search, events processed, search criteria, and so forth.
- 2 (Conditional) To stop any active search jobs, select the search jobs you want to stop, then click **Stop selected**.

To manage active reports:

- 1 From **Sentinel Main**, click **Storage > Report Jobs**.
- 2 (Conditional) To stop any report jobs, select the report jobs you want to stop, then click **Stop selected**.
- 3 (Conditional) To delete any report jobs, select the report jobs you want to delete, then click **Delete selected**

29 Monitoring the Events Per Second Rate

Sentinel helps you monitor the events per second (EPS) received for processing. You can use this information to generate reports for auditing purposes, such as verifying license compliance and EPS trends.

- ♦ [“Viewing the Operational EPS” on page 285](#)
- ♦ [“Viewing a Graphical Representation of the Events Per Second Rate” on page 286](#)

Viewing the Operational EPS

Sentinel provides an Operational EPS graph that displays the average EPS rate received by Sentinel before applying filters at the event source, Connector, or Collector level. You can monitor the EPS rate reaching a single Sentinel server or multiple Sentinel servers distributed across your organization. You can also view the EPS rate in day or hour granularity.

NOTE: To view the EPS rate received by other systems, you need to configure other Sentinel servers as search targets. For more information, see [Chapter 21, “Configuring Data Federation,” on page 233](#).

Understanding the operational EPS rate helps you determine whether the EPS rate is as expected and in compliance with the license. You can also generate reports to analyze the EPS rate over a specified time period and from specific Sentinel servers in your organization.

To view the operational EPS:

- 1 From **Sentinel Main**, click **About > Licenses**.
- 2 (Optional) To view the consolidated EPS rate received by other Sentinel servers distributed across your organization, select the IP address or hostname of the desired systems.
- 3 (Optional) Click **Day** or **Hour** to view the EPS rate for the last 7 days or for the last 24 hours.
- 4 (Optional) To export the data to a CSV file, click **Export Report**.
 - 4a Specify the time period for which you want to view the EPS rate, then click **OK**.
- 5 (Optional) To view the EPS rate of events filtered and processed by Sentinel, click **Collection > Overview**.

The Overview graph displays the EPS rate of events filtered and processed by Sentinel, and that actually make it to the event store. For more information, see [“Viewing a Graphical Representation of the Events Per Second Rate” on page 286](#).

Viewing a Graphical Representation of the Events Per Second Rate

- 1 From **Sentinel Main**, click **Collection**.
- 2 In the **Overview** section, view the events per second (eps) value of the incoming events in the last one minute.

The graph shows the 90-day statistics of all the events coming to the Sentinel server. The graph also includes an EPS indicator that enables you to determine whether the current EPS rate is exceeding the licensed EPS rate or is close to the licensed EPS rate.

Viewing the Events Per Second Rate of Event Source Servers

- 1 From **Sentinel Main**, click **Collection > Event Sources**.

The **EPS** column of the **Event Source Servers** section specifies the events per second value received from all the Event Source Servers.

30 Monitoring Sentinel Health

The Sentinel Health page provides information such as CPU utilization, processing, queue status, garbage collection, and so on about various components of Sentinel. The health page enables you to assess the health of Sentinel and also helps you find out the components that are potentially causing decrease in the overall Sentinel performance. You can view the Sentinel Health page in Sentinel Main interface > **Storage** > **Health** tab.

The Component information section provides information about the CPU utilization by various components of Sentinel. The CPU utilization is expressed in the percentage of time. High percentage of CPU utilization, such as more than 60%, might indicate a potential problem with the processing of the particular component. You can investigate further to troubleshoot the component and optimize the Sentinel performance.

The General Information section provides information about the processing of data such as events, alerts, and audit events, alert creation, queue status, garbage collection, and so on. Certain components of Sentinel are combined with a queue. While processing the data, each component stores the incoming data into the corresponding queues. If the particular component is slow or unable to process the data, the data starts accumulating into the queue and the queue size increases. Increase in the queue size of a component indicates potential problem with the processing in the component. Therefore, if the Sentinel performance slows down, you can inspect the queue sizes in the General Information section to find out the component causing decrease in sentinel performance, and then troubleshoot the component. For example, if the Events queued for Correlation increases beyond 70%, it indicates a problem in the correlation rules evaluating the events. You can modify the correlation rules accordingly.

31 Configuring Sentinel for High Availability

You can install Sentinel in an Active-Passive High Availability mode, which allows Sentinel to fail over to a redundant cluster node in case of hardware or software failure. Consulting and partners can help you implement Sentinel high availability and disaster recovery. For more information about configuring Sentinel for High Availability, see “[Upgrading Sentinel in High Availability](#)” in the *Sentinel Installation and Configuration Guide*.

32 Configuring Alert Generation

This section provides information about configuring the default alert generation settings to maintain the stability and optimize performance of Sentinel if large number of alerts are triggered by correlation rules.

When a correlation rule fires, which is configured to create an alert, the correlation engine generates the alert and sends it to Sentinel. By default, Sentinel limits the rate of alerts generation in the local or remote correlation engine to 0.5 alerts per second. To customize the rate of alert generation in the correlation engine, modify the following parameter in the `configuration.properties` file:

```
sentinel.alert.max.ratepersec=.5
```

If the alert generation rate is increased to more than 0.5 alerts per second, the correlation engine stores the additional alerts in a queue. The maximum number of alerts that can be stored in the queue is 10,000. If the number of alerts stored in the queue exceeds the limit, Sentinel starts dropping the alerts and generates an audit event. Increasing the rate of alert generation might impact the overall Sentinel performance. You can view the updated queue size information in the Sentinel Main interface > **Storage** > **Health** > **General Information** section.

To view the audit event, search the query `(evt:BufferOverLimit) AND (sres:Alert-Buffer)` in the search interface. After the alerts queue limit is reached, Sentinel generates audit events every ten minutes. The audit events provide information about the number of alerts dropped after a specific time interval and the total number of dropped alerts so far. You can customize the frequency of audit events creation by adding the following parameter in the `configuration.properties` file:

```
sentinel.pqueue.audit.interval= <time in seconds>
```

33

Configuring the Report Retention Period

Sentinel automatically deletes old report to optimize the usage of disk space. Sentinel performs the auto deletion of reports once per day, the same time the event partitions are processed. You can define the report retention period as desired. You can also define how many reports should be deleted at a time and whether the auto deletion should start the first time you start the Sentinel server.

In new installations of Sentinel, the default report retention period is 60 days. In upgrade installations of Sentinel, the default report retention period is 365 days.

To configure auto deletion of reports:

- 1 Log in to the Sentinel server as an administrator user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.

Configuring the reports retention period:

New installations of Sentinel include the `report.result.retention.period` property. For upgrade installations of Sentinel, you need to manually add the `report.result.retention.period` property.

Set the desired value for the `report.result.retention.period` property.

For example, `report.result.retention.period=70`.

Here, 70 represents the number of days the reports are retained before deleting it.

Configuring the number of reports to be deleted at a time:

By default, the number of report results deleted at a time is 50.

Set the desired value for the `report.result.retention.period.limit` property.

For example, `report.result.retention.period.limit=90`.

Here, 90 represents the number of report results deleted at a time.

Configuring the server to delete reports every time you start the server:

`report.result.retention.period.loop=true`

- 3 Restart the Sentinel server.

34 Generating a Report in CSV and PDF Format

By default, Sentinel generates reports in either CSV or PDF format. You can also generate reports in both CSV and PDF formats by making additional configurations to the Sentinel server.

To generate a report in CSV format:

- 1 Log in to the Sentinel server as `novell` user.
- 2 Change to the `/etc/opt/novell/sentinel/config` directory:

```
cd /etc/opt/novell/sentinel/config/
```
- 3 Open the `obj-component.JasperReportingComponent.properties` file for editing:

```
vi obj-component.JasperReportingComponent.properties
```
- 4 Edit the following entries:
 - ♦ `reporting.csv.enable=true`
 - ♦ `reporting.csv.outputdir=<the directory where the reports must be stored>`
The `novell` user must have read/write permissions on the specified directory.
- 5 (Conditional) To email both the CSV and PDF format of the report, edit the following entry:

```
reporting.csv.email=true
```
- 6 Restart the Sentinel server.

When you generate a report, it is stored in the CSV format in the directory specified in the `reporting.csv.outputdir` attribute.

35

Backing Up and Restoring Data

The Sentinel backup and restore utility is a script that backs up the Sentinel data and also lets you restore the data at any given point in time. This utility helps you back up only the Sentinel data in Sentinel server. This utility is not applicable for Collector Manager, Correlation Engine, and operating system configuration data.

You can use the backup and restore utility in the following scenarios:

- ♦ **System Failure:** In this scenario, you must first reinstall Sentinel and then use the `backup_util.sh` script with the `restore` parameter to restore the most recent data that you backed up.
- ♦ **Data Loss:** In this scenario, use the `backup_util.sh` script with the `restore` parameter to restore the most recent data that you had backed up.

You can back up the following data:

- ♦ **Configuration data:** Data stored in the `config`, `data`, `3rdparty/postgresql`, and `3rdparty/jetty` directories, and the data in the Sentinel database. This data includes configuration files, property files, and keystore files. For traditional storage, it also includes correlation rules and dynamic lists. The Sentinel database contains various configuration information related to users, plug-ins, Collectors, Connectors, and filters.

NOTE: The configuration data is critical and you should always include the configuration data in the backup.

- ♦ **Event data:** Dynamic event data and raw event data stored in the `data/eventdata` and `/var/opt/novell/sentinel/data/rawdata` directories. The event data also includes event associations stored in the `/var/opt/novell/sentinel/data/eventdata/exported_associations` directory. The event associations data includes correlated event association data and the incident event association data.
- ♦ **Secondary storage data:** The closed event data files that have been moved to the secondary storage.
- ♦ **Runtime data:** Dynamic file-based queues used by plug-ins, Sentinel Link, and other Sentinel components. This includes the data in the `data/plugindata` and the `/var/opt/novell/sentinel/data/sentinel_link.queues` directories.
- ♦ **Security Intelligence data:** The Security Intelligence data stored in the PostgreSQL database.
- ♦ **Sentinel logs:** Log files generated by Sentinel and stored in the `/var/opt/novell/sentinel/log` directory.

NOTE:

If you are using scalable storage, you can back up only the configuration data and Sentinel logs.

You can restore data only on the same version of Sentinel in which the data was backed up because there might be changes between Sentinel versions, which might make the data incompatible. Similarly, you can restore data only on the same type of data storage using which the data was backed up. For example, data that you back up in traditional storage can be restored only in traditional storage.

Parameters for the Backup and Restore Utility Script

The following lists the various command line parameters that you can use with the `backup_util.sh` script:

Table 35-1 Backup and Restore Script Parameters

Parameters	Description
-m backup	Backs up of the specified data.
-m restore	Restores the specified data. The restore mode of the script is interactive and allows you to specify the data to be restored from the backup file.
-m info	Displays information for the specified backup file.
-m simple_event_backup	Backs up events located in a specified directory.
-m simple_event_restore	Restores events into a specified directory.
-c	Backs up the configuration data. If you are using scalable storage, this parameter also backs up scalable storage and Kibana configurations. It also backs up the default event visualizations and dashboards. It does not back up any custom event visualizations and dashboards. You have to manually export the custom dashboards and visualizations. For more information, see Managing Saved Searches, Visualizations, and Dashboards section in Kibana documentation.
-e	Backs up the event data. All event partitions are backed up except the current online partition. If the backup is being performed with the Sentinel server shut down, the current online partition is also included in the backup.
-dN	Backs up the event data for the specified number of days. The -dN option backs up the primary storage event data stored for the last N days. Based on the current data retention policy settings, many days of events might be stored on the system. Backing up all of the event data might not always be necessary and might not be desirable. This option allows you to specify how many days to include when backing up the event data. For example, -d7 includes only the event data from the last week in the backup. -d0 just includes the data for the current day. -d1 includes the data from the current day and previous day. -d2 includes the data from the current day and two days ago. Online backups (that is, backups performed while the system is running) only back up the closed event partitions, which means partitions one day old or older. For online backups, a value of -d1 is the appropriate specification for the number of days.

Parameters	Description
-u	<p>Specifies the user name to use when backing up the event associations data. If the user name is not specified, "admin" is used as the default value.</p> <p>This parameter is required only when backing up the event associations data.</p> <p>NOTE: If your environment uses multi-factor authentication (MFA), specify the LDAP user name. For more information about MFA, see “Multi-factor Authentication” on page 78.</p>
-p	<p>Specifies the user password when backing up the event associations data.</p> <p>This parameter is required only when backing up the event associations data.</p> <p>NOTE: If your environment uses MFA, specify the LDAP user name. For more information about MFA, see “Multi-factor Authentication” on page 78.</p>
-x	<p>Specifies a file name that contains the user password when backing up the event associations. This is an alternative to the -p option.</p> <p>This parameter is required only when backing up the event associations data.</p>
-f	Enables you to specify the location and name of the backup file.
-l	Includes the log files in the backup. By default, the log files are not backed up unless you specify this option.
-r	Includes the runtime data in the backup. Runtime data can only be backed up if the Sentinel server is shut down, because the data is dynamic. This means that this parameter can only be used in combination with the -s option (described below). If -s is not specified, this parameter is ignored.
-b	Backs up the baseline Security Intelligence data.
-A	Backs up alerts and the events that triggered the alert.
-s	Shuts down the Sentinel server before performing the backup. Shutting down the server is necessary to back up certain dynamic data such as the Runtime data and the current primary storage partitions. By default, the server is not shut down before performing the backup. If this option is used, the server restarts automatically after the backup is complete.
-w	Backs up the raw event data.
-z	Only available with the <code>simple_event_backup</code> and <code>simple_event_restore</code> options. Specifies the location of the event data directory, such as where the event data is collected during a <code>simple_event_backup</code> and where the event data is placed during a <code>simple_event_restore</code> .

Running the Backup and Restore Utility Script

1 Complete the following prerequisites:

- ◆ Ensure that the time and timezone is same on both the source machine from where the backup is taken and the destination machine where the restoration of data will happen.
- ◆ Ensure that the IP address of both the source and destination machines are the same.

- 2 Open a console, and navigate to the `/opt/novell/sentinel/bin` directory as the novell user.
- 3 Enter `backup_util.sh`, along with the necessary parameters for the data that you want to back up or restore.

NOTE: If you backed up the data by using the `-i` or `-A` options, you must restore the configuration data along with alerts. Otherwise, if you restore only alerts data, all the alerts show as remote alerts because the alerts configuration data is not restored.

For more information on the different parameters, see [Table 35-1](#). The following table lists examples of how to specify the parameters:

Syntax	Action
<pre>backup_util.sh -m backup -c -e -l -r -w -s -u admin -x <mypassword.txt> -f / var/opt/novell/ sentinel/data/ <my_full_backup>.tar .gz</pre>	Shuts down the Sentinel server and performs a full system backup.
<pre>backup_util.sh -m backup -c -e -l -w -u admin -x <mypassword.txt> -f / var/opt/novell/ sentinel/data/ <my_weekly_backup>.t ar.gz</pre>	Performs an online backup without shutting down the server. This backup includes everything except online event data and dynamic runtime data.
<pre>backup_util.sh -m backup -b -c -e -d7 - u admin -x <mypassword.txt> -f / var/opt/novell/ sentinel/data/ <my_weekly_backup>.t ar.gz</pre>	Performs an online backup with event data just from the last week. This backup includes configuration data, the baseline Security Intelligence collections, and the event data for the last 7 days. Event data older than 7 days is not backed up because that data can be extracted selectively, if necessary, from an older backup.
<pre>backup_util.sh -m backup -c -f /var/ opt/novell/sentinel/ data/ config_backup.tar.gz</pre>	Performs a local backup of the configuration data. This is a minimal backup of the system without any event data.
<pre>backup_util.sh -m backup -e -f /var/ opt/novell/sentinel/ data/ events_backup.tar.gz</pre>	Performs a local backup of the event data. This is a minimal backup of the primary storage event data.

Syntax	Action
<pre>backup_util.sh -m backup -e -d5 -f / var/opt/novell/ sentinel/data/ events_5days_backup. tar.gz</pre>	<p>Performs a local backup of the event data from the last 5 days. This is a minimal backup of the primary storage event data from the last five days.</p>
<pre>backup_util.sh -m info -f /var/opt/ novell/sentinel/ data/ config_backup.tar.gz</pre>	<p>Displays the backup information for the specified backup file.</p>
<pre>backup_util.sh -m simple_event_backup -e -z /opt/archives/ archive_dir -f /opt/ archives/ archive_backup.tar.gz z</pre>	<p>Performs a backup of event data on the machine where the secondary storage directory is located.</p> <p>If the <code>/opt/archives/archive_dir</code> is not located in the server, you might need to copy the <code>backup_util.sh</code> script to the machine where the secondary storage is located and then run the <code>simple_event_backup</code> command from that machine.</p> <p>Alternatively, you can also use any 3rd party backup tool to backup the event directories on secondary storage.</p>
<pre>backup_util.sh -m restore -f /var/opt/ novell/sentinel/ data/ config_backup.tar.gz</pre>	<p>Restores the data from the specified filename.</p>
<pre>backup_util.sh -m simple_event_restore -z /opt/archives/ archivedir -f /opt/ archives/ archive_backup.tar.g z</pre>	<p>Restores the secondary storage data.</p>

- 4 (Conditional) If you have restored any data, restart the server because the script might make several modifications to the database.
- 5 (Conditional) For traditional storage, use the Data Restoration feature to restore the extracted partitions. For more information, see [“Restoring Data” on page 179](#).

Restoring Dashboards After Restoring Data from a Different Sentinel Server

When you restore data from a different Sentinel server, the following dashboards are not displayed: Alerts, Threat Hunting, and User Activities. To display these dashboards, you must configure your Sentinel server.

To restore dashboards:

- 1 Ensure that the time and timezone are same in both the source machine from where you take the backup and the destination machine where you restore the data.

- 2 Login to the Sentinel server where you want to restore data as a root user.

Configure the `/opt/novell/sentinel/3rdparty/elasticsearch/config/elasticsearch.yml` file.

Set the `network.host` to *<IP address of the Sentinel server>*.

- 3 Restart the Sentinel Server.

- 4 Delete the **security.events.normalized_*** index pattern from Sentinel:

- 4a Login to Sentinel.

- 4b Open an affected dashboard.

- 4c Click **Management > Index Patterns**.

- 4d Delete **security.events.normalized_***.

- 4e Click **Remove index pattern**.

- 5 Run the following command to delete the **security.events.normalized_*** index from Elasticsearch:

```
curl -X DELETE {ES_IP}:9200/security.events.normalized_*
```

- 6 Re-create the index pattern:

- 6a Go to `cd opt/novell/sentinel/bin`.

- 6b Run the following command to apply mapping template on events index on the Elasticsearch:

```
./elasticsearch_index_template.sh {ES_IP} 9200  
security.events.normalized_* <Number of Shards> <Number of Replicas>
```

- 6c Run the following command to re-create the index pattern:

```
./create_kibana_index_pattern.sh {ES_IP:9200}  
security.events.normalized_*
```

36 Updating Sentinel Clients

Sentinel clients include Collector Manager and Correlation Engine. You must update Sentinel clients' configuration when you change the Sentinel server or change the IP address or port number of your current Sentinel server.

To update Sentinel clients:

1 Log in as novell user to the Sentinel client computer you want update.

2 Run the following script:

```
/opt/novell/sentinel/setup/configure.sh
```

3 Specify the number for the language you want to use for the installation.

The end user license agreement is displayed in the selected language.

4 Press the Spacebar to read through the license agreement.

5 Enter yes or y to accept the license agreement and continue with the installation.

The installation might take a few seconds to load the installation packages and prompt for the configuration type.

6 When prompted, specify the appropriate option to proceed with the Standard or Custom configuration.

7 Enter the default Communication Server Hostname or IP Address of the machine on which Sentinel is installed.

8 Conditional) If you chose Custom configuration, specify the following:

8a Sentinel server communication channel port number.

8b Sentinel Web server port number.

9 When prompted to accept the certificate, run the following command in the Sentinel server to verify the certificate:

For FIPS mode:

```
/opt/novell/sentinel/jdk/jre/bin/keytool -list -keystore  
/etc/opt/novell/sentinel/config/.activemqkeystore.jks
```

For Non-FIPS mode:

```
/opt/novell/sentinel/jdk/jre/bin/keytool -list -keystore  
/etc/opt/novell/sentinel/config/nonfips_backup/.activemqkeystore.jks
```

Compare the certificate output with the Sentinel server certificate displayed in Step 7.

NOTE: If the certificate does not match, the installation stops. Run the installation setup again and check the certificates.

10 Accept the certificate if the certificate output matches the Sentinel server certificate.

- 11** Specify credentials of any user in Administrator role.
- 12** (Conditional) If you chose Custom configuration, enter yes or y to enable FIPS 140-2 mode in Sentinel and continue with the FIPS configuration.

The Sentinel client will start once the configuration is complete.

37 Customizing Sentinel Settings

This section provides information about configuring the default Sentinel settings to optimize the performance.

- ♦ [“Customizing Elasticsearch Settings in Traditional Storage” on page 305](#)
- ♦ [“Configuring the Number of Incidents to be Listed in the Incidents List” on page 306](#)
- ♦ [“Configuring the Number of Alert Trigger Events to be Attached with the Incident” on page 306](#)

- ♦ [“Customizing Incident Probability Refresh Interval” on page 312](#)

Customizing Elasticsearch Settings in Traditional Storage

When you scale Elasticsearch by adding additional nodes in traditional storage, you must update the Elasticsearch configuration.

To modify Elasticsearch configuration:

- 1 Log in to the Sentinel server as the novell user.
- 2 Open the `/etc/opt/novell/sentinel/config/elasticsearch-index.properties` file.
- 3 Add the external Elasticsearch nodes IP addresses to the property `ServerList`.
For example: `ServerList=<ElasticSearch IP1>:<Port>,<ElasticSearch IP2>:<Port>`

Configuring the Number of Incidents to be Listed in the Incidents List

When you escalate an alert to an incident and click **Select an existing incident**, Sentinel displays a list of existing incidents for you to select. By default, Sentinel displays 500 incidents for optimal performance of the user interface. You can configure the number of incidents you want to view by default. However, the user interface may get less responsive.

To configure the number of incidents you want to view in the list:

- 1 Log in to the Sentinel server as the novell user.
- 2 Open the `/etc/opt/novell/sentinel/config/ui-configuration.properties` file.
- 3 Set the desired value for the `webui.escalateAlertMaxIncidentsToShow` property.
- 4 Restart the Sentinel server.

Configuring the Number of Alert Trigger Events to be Attached with the Incident

When you escalate alerts to an incident, Sentinel attaches the alert trigger events to the incident. By default, Sentinel attaches a maximum of 25 trigger events per alert. You can change the default setting. However, there may be performance issues if the number is too high.

To configure the maximum number of trigger events to be attached to the incident:

- 1 Log in to the Sentinel server as the novell user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 Set the desired value to the `sentinel.incident.alert.events.max` property.
- 4 Restart the Sentinel server.

Optimizing the Operating System

Sentinel sets a default limit of 65536 open files for the Sentinel processes. This is sufficient for most installations. However, there might be some scenarios that may cause the Sentinel server to need more open files, such as running a large number of searches or reports concurrently, or running searches and reports that span unusually large time ranges. In such cases you might consider increasing the default open files limit to allow more than 65536 open files.

NOTE: For optimal performance, do not decrease the default limit.

Perform the following steps to change the open file limits:

- 1 Log in to the Sentinel server as the root user.
- 2 Open the `/etc/security/limits.conf` file.
- 3 Change the value in the following lines:

```
novell soft nofile 65536
```

```
novell hard nofile 65536
```

NOTE: Setting the soft limits is optional, however, setting the hard limits is mandatory.

- 4 Save the changes.
- 5 Restart the Sentinel server.

Configuring the Resources for Event Partition Compression

You can specify the number of processors for `mksquashfs` to use when compressing the index on the event data. This capability enables the `mksquashfs` utility to make more use of additional CPUs that may be available on some systems.

- 1 Log in to the system as the `root` user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 Add or edit the `mksquashfs.numprocessors` property and specify the desired value. This value specifies the number of processors you want to allow `mksquashfs` to use.

```
mksquashfs.numprocessors=4
```

- 4 Save the changes.
- 5 Restart the Sentinel server.

Setting the Grace Period to Close Event Data Partitions

The event data partitions are closed after one day, and no more events are written to them. Even though the duration for event data partitions is one day, a grace period of 10 minutes is given to accommodate events arriving late.

You can change the default value as necessary. To customize the grace time period to close a partition, perform the following steps:

- 1 Log in to the system as the `root` user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 Edit the `sentinel.events.online.opengraceminutes` property to specify the desired value.

By default, Sentinel does not set any value to this property. If no value is set, Sentinel considers 10 minutes as the grace time period to close a partition.

- 4 Restart the Sentinel server.

Compressing the Storage Index on Primary Partition

You can compress the partitions in primary storage as soon as they are closed to save disk space. This requires additional I/O to compress and store on the primary partition, which means that the supported EPS rate will be significantly lower. Also, searches on these partitions will be slower. Therefore, this option is only suitable for lower EPS rates and if you want to get the most out of primary storage space.

To compress the storage index on the primary partition:

- 1 Log in to the system as the `root` user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 Set the `localstorage.indexes.compress` property to `true`.
- 4 Restart the Sentinel server.

Configuring Memory for the Sentinel Server

By default, the Sentinel server consumes 75% of the computer memory. The `setmemory.sh` script in Sentinel dynamically calculates and allocates the default memory settings for the Sentinel server based on the amount of physical memory. The `setmemory.sh` script is located in the `/opt/novell/sentinel/bin` directory.

To make changes to the default memory settings, you must create a `setmemory.properties` file. The default location of this file is `/etc/opt/novell/sentinel/config/setmemory.properties`.

You can set the following configuration parameters in the `setmemory.properties` file:

- ♦ **JAVA_MEM_SERVER:** The maximum heap memory allocated to the Java process. The maximum setting for this parameter is 24576 (or 24 GB). Removing or increasing this limit can have a detrimental effect on system performance, including a reduced event rate (EPS).
- ♦ **JAVA_MEM_REPORT_PROCESS:** The maximum memory allocated to the report processes. The maximum setting for this parameter is 16384 (or 16 GB). Removing or increasing this limit can have a detrimental effect on system performance, including a reduced event rate (EPS).
- ♦ **JAVA_MEM_BROKER:** The maximum amount of memory allocated for the message bus broker. This affects how many connections the message bus broker can accept. By default, this value is 10% of the remaining allocated memory for the Sentinel server.
- ♦ **BROKER_MAX_CON:** The maximum number of connections the message bus broker can accept. By default, this value is 10% of the remaining allocated memory for the Sentinel server.
- ♦ **CORRELATION_INPUT_BUFFER_MAX_SIZE:** The memory allocated to hold the Correlation events. By default, this value is 10% of the remaining allocated memory for the Sentinel server. On the remote Correlation Engine, this value is 50% of the allocated memory for the Sentinel server.

When the server starts, these memory settings in the `setmemory.properties` file override the default settings.

Setting the Raw Data Limit

Sentinel now sets a limit of 100,000 when copying raw data to prevent raw data from unnecessarily consuming the disk space and causing the system to become unstable. When the limit reaches 100,000, Sentinel automatically deselects the **Copy Raw Data to a file** option in the Connector configuration window and stops copying the raw data. If you want to collect the raw data again, edit the Connector and select the **Copy Raw Data to a file** option.

You can also change the default value as necessary.

- 1 Log in to the system as novell user.
- 2 Open the `/etc/opt/novell/sentinel/config/server.conf` file.
- 3 Edit the `wrapper.java.additional.60=-DMAX_DUMP_SIZE=10000` property to the desired value.
- 4 Restart the Sentinel server.

Configuring the Number of Trigger Events to be Associated with a Correlated Event

When a correlation rule fires, it creates a correlated event and the corresponding trigger events are associated with the correlated event. If the correlation rule is defined to execute the associated action at specified intervals, Sentinel creates only one correlated event and for all subsequent firings of the rule in the specified interval, it updates all the trigger events to the existing correlated event. In such a case, if the correlation rule is not written carefully, the correlated event will be associated with a large number of trigger events, which might impact the Sentinel server stability.

To limit the number of updates to the correlated event, you can define the maximum number of trigger events to be associated with the correlated event. The default limit is 100. When the number of trigger events exceed the defined limit, the correlated event is not further updated with the trigger events. Sentinel generates the audit event, **CorrelatedEventUpdate**, to indicate the suppression of further correlation updates.

To define the maximum number of trigger events to be associated with a correlated event, set the `maxCorrelationEventUpdates` property in the `/etc/opt/novell/sentinel/config/server.xml` file to the desired value. For more information about modifying the `server.xml` file, see [“Maintaining Custom Settings in XML Files” on page 310](#).

Configuring the Number of Trigger Events to be Displayed in the Alert View

When the correlation rules generates an alert, it associates the trigger events to the alert for further investigation and reference. By default, the Alert Details page displays 10,000 events per alert. You can define the number of trigger events you want to view per alert.

To define the number of trigger events you want to view per alert:

- 1 Log in to the Sentinel server as the novell user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.

- 3 Set the desired value for the `sentinel.alert.max.attachedevents` property.
The maximum limit is 840,000.
- 4 Restart the Sentinel server.

Maintaining Custom Settings in XML Files

The `server.xml`, `collector_mgr.xml`, and `correlation_engine.xml` files include advanced configuration options. If you need to modify the default values, it is important to set the values using the instructions described in this section because these XML files automatically get replaced during upgrade, which results in any modifications getting overwritten.

Consider an example where you want to customize the `tokenExpireTime` property in the `AuthenticationService` component below, which is present in the `server.xml` file:

```
<obj-component id="AuthenticationService">
  <class>esecurity.ccs.comp.auth.AuthenticationService</class>
  <property name="handler">esecurity.login.request</property>
  <property name="maxThreads">100</property>
  <property name="tokenExpireTime">86400000</property>
</obj-component>
```

To ensure that the modifications do not get overwritten during the upgrade, create a file in the `/etc/opt/novell/sentinel/config/` directory with its name in the format: `obj-component.<obj-component id>.properties`. In the `properties` file, set the property to the value you desire in the format `<property name=><value>`.

In the case of the `AuthenticationService` component, create the file as: `obj-component.AuthenticationService.properties` and set the `tokenExpireTime` property as: `tokenExpireTime=90000000`.

The values in the `obj-component.AuthenticationService.properties` file overwrites any default values set in the `server.xml` file. The `properties` files do not get overwritten during the upgrade.

Customizing the Default Search Field

In Sentinel, `_data` is the default search field. You can customize the set of event fields that are concatenated in the default search field by adding `indexedlog.datafield.ids` property in the `configuration.properties` file. This helps you to add or remove the event fields from the default search based on your requirements.

To customize the default search field:

- 1 Log in to the Sentinel server as the `novell` user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 Add the `indexedlog.datafield.ids` property and set it to the required event fields.

For example,

```
indexedlog.datafield.ids=evt,msg,sun,iuid,dun,tuid,sip,sp,dip,dp,rv42,shn,rv35,rv41,dhn,rv45,obsip,sn,obsdom,obssvcname,ttt,ttn,rv36,fn,ei,rt1,rv43,rv40,svcc,repip.
```

- 4 Restart the Sentinel server.

Configuring the Proxy Port

To safeguard the Sentinel proxy port from potential attacks, configure the size of the data sent to the proxy port, the number of client connections, and the read timeout period.

To configure these properties:

- 1 Log in as novell user and open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 2 Set the `proxied.client.max.payload.size` property to the maximum data size for the proxy port.
Default value is 1 GB. If the data exceeds the specified limit, Sentinel stops the data transfer.
- 3 Set the `proxied.client.max.connections` property to the maximum number of times a client can try to send data to the proxy port. Default value is 10.
- 4 Set the `proxied.client.read.timeout` property to the maximum time period after which the data transfer stops. Default value is 30 seconds.
- 5 Save the `configuration.properties` file and restart Sentinel.

Enabling the Use of Special Characters in Event Field Values

Perform the following steps to enable usage of special characters in event fields:

- 1 Log in as novell user and open the `etc/opt/novell/sentinel/config/configuration.properties` file.
- 2 Set the `indexedLog.tokenizedField.enableSplCharSrch` property to `true`.
- 3 Restart Sentinel.

Configuring the Number of User Identities to be Displayed for People Search

By default, Sentinel displays 500 user identities per search when you search for user identities in the **People** navigation panel. You can configure the number of user identities you want to view per search.

To configure the number of user identities you want to view per search:

- 1 Log in to the Sentinel server as the novell user.
- 2 Open the `/etc/opt/novell/sentinel/config/ui-configuration.properties` file.

- 3 Set the desired value for the `webui.numberOfIdentitiesToLoad` property.
- 4 Restart the Sentinel server.

Configuring the Report Generation Idle Timeout Period

By default, the idle timeout period for the report generation process is 15 minutes. You can configure the idle timeout period by performing the following procedure:

- 1 Log in to the Sentinel server as the `novell` user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 Set a desired value of the `sentinel.report.idle.timeout.mins` property in minutes.
- 4 Restart the Sentinel server.

Customizing Incident Probability Refresh Interval

The Incident probability displays the probability of an alert being escalated to an incident. This value is based on alerts that were escalated 3 hours ago. This value is refreshed every 3 hours. You can configure the refresh interval by performing the following procedure:

To configure the refresh interval:

- 1 Log in to the Sentinel server as the `novell` user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 If the `sentinel.incident.recommendation.modelgeneration.interval` property is not listed, add this property and set the value in minutes.

NOTE: Configuring the refresh interval to less than 3 hours takes up lot of memory and may result in performance issues.

- 4 Restart the Sentinel server.

38 Rebranding Reports

Sentinel provides the white label report template that is available under the Sentinel Core Solution Pack. Sentinel uses this template to generate reports. You can customize the template to have your own header, footer and logo to suit your organization needs.

To customize the template, perform the following:

- 1 In the **Reports and Searches** panel, select the Sentinel Core White Label Template report definition, and then click **Export**.
- 2 Save the file to your local computer.
- 3 Create a new folder.
- 4 Extract the file contents to the new folder by using any ZIP extraction tool.
- 5 In the new folder, open the **resources** folder. In this folder, you can modify the following files:
 - ♦ **Header/Footer.jrxml**: Contains the report layout descriptions. You can modify the layout of fields, text, or images in the header and footer, but you must ensure that the overall size of the header and footer does not change. You can manually edit the XML file or use iReport to modify them.
 - ♦ **Header/Footer*.properties**: Contains the text in the layout file, which localized into various languages. You can modify the strings that appear in the header or footer by editing this file. Ensure that the new strings do not exceed the space allocated to them. For information about editing the `.properties` file, see [Oracle Java documentation](#).
 - ♦ **Logo.jpg**: Contains the logo that appears in the footer. You can replace this file with another image. Ensure that the size of the new image is exactly the same size of the existing image.
- 6 Use a ZIP tool to re-zip the modified report template.
- 7 In the **Reports and Searches** panel, click **Import reports or searches**, browse to this zip file, and then click **Import**.

NOTE: If the folder structure is different than the original ZIP file, the import process displays an error. Ensure that you do not modify the folder structure after making the changes.

- 8 Schedule any report definition and view the report to ensure that the changes are applied correctly.

39 Generating an Audit Event when a List Item Expires From a Dynamic List

You can now configure Sentinel to generate an audit event when a list item expires from the dynamic list.

To generate an audit event:

- 1 Log in to the Sentinel server as the `novell` user.
- 2 Open the `/etc/opt/novell/sentinel/config/configuration.properties` file.
- 3 Set the `lists.listItem.expiry.auditEvent` property to `true`.
- 4 Restart the Sentinel server.

40 Configuring Sentinel for Multitenancy

To reduce the total cost of ownership associated with managing security data from several organizations where data sharing across them is not allowed, some users prefer to use Sentinel in a multitenant mode where each organization's data is in a logical silo, preventing one organization from seeing the data of another. A logical silo, as opposed to a physical silo, allows the same hardware and software instances to be used to manage the data from multiple organizations while preserving data privacy. One typical user of this approach are Managed Security Service Providers (MSSPs), which might use this approach to keep their costs low while providing security monitoring for many customers. Multiple MSSP models are possible, ranging from Cloud-based services to outsourced Security Operating Center (SOC) monitoring.

In MSSP environments, the MSSP (Sentinel administrator) administers the Sentinel system and the MSSP's customers, often referred to as tenants, utilize a portion of the system's processing power to perform their security monitoring. Each tenant's data is stored alongside other tenant's data, while the system keeps track of the data that belongs to each tenant and preserves data privacy. Some form of logical separation is important to ensure that one tenant does not see another tenant's data. Only the MSSP should have the ability to see the data across all tenants. Sentinel provides multitenancy capabilities that enable the security monitoring of multiple tenants to be handled by a single instance of hardware and software while preserving data privacy.

- ◆ [Section 40.1, “Understanding MSSP Models,” on page 317](#)
- ◆ [Section 40.2, “Configuring Multitenancy,” on page 321](#)
- ◆ [Section 40.3, “Role-Based Access Control and Multitenancy for Visualization,” on page 325](#)
- ◆ [Section 40.4, “Decommissioning Tenants,” on page 326](#)

40.1 Understanding MSSP Models

This section provides information about the various MSSP models.

- ◆ [Section 40.1.1, “SOC Outsourcing Model,” on page 317](#)
- ◆ [Section 40.1.2, “Hybrid Model,” on page 319](#)
- ◆ [Section 40.1.3, “Full SaaS or Cloud Model,” on page 320](#)

40.1.1 SOC Outsourcing Model

Tenants host the Sentinel infrastructure in their own datacenter, but the MSSP monitors that implementation from their own SOC. This model provides greater flexibility for tenants by letting them control their own Sentinel instance, but get the benefit of expert monitoring from the MSSP.

Figure 40-1 SOC Outsourcing Model

40.1.2 Hybrid Model

Tenants host data collection nodes (typically Collector Managers) in their environment, but all the data is forwarded to the MSSP's SOC. The MSSP SOC hosts the Sentinel implementation. The benefit in this model is that tenants can collect data more thoughtfully and securely while leveraging compression and encryption facilities offered by Sentinel while transmitting events over the network to the MSSP SOC.

Figure 40-2 Hybrid Model

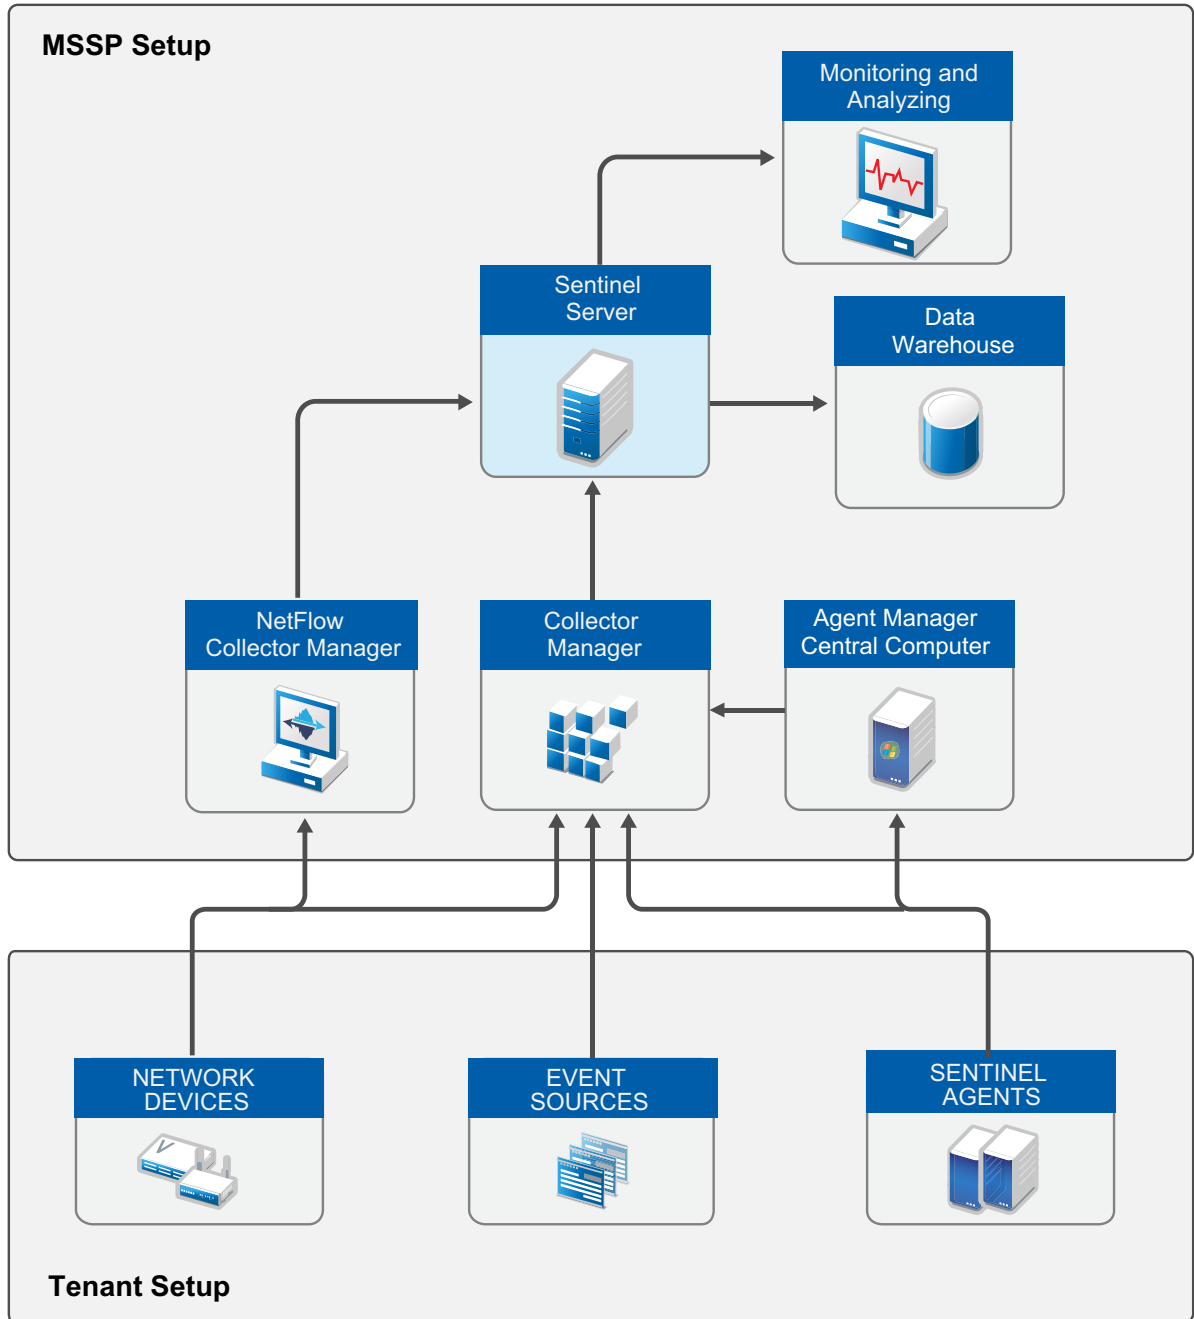

40.1.3 Full SaaS or Cloud Model

In the Sentinel as a Service (SaaS) or Cloud model, tenants forward the event data to the MSSP. The MSSP hosts all Sentinel components, including the Collector Managers. The key benefit is that there is less impact on the tenant environment and the tenant does not need to host any hardware or software. However, tenants should take special measures to ensure that events are transmitted securely to the MSSP.

In an MSSP environment, multiple tenants can deliver data to a single Sentinel instance. Alternatively, the MSSP can also dedicate a Sentinel instance to each tenant.

Figure 40-3 Full SaaS or Cloud Model

40.2 Configuring Multitenancy

This section provides information about configuring multitenancy in Sentinel.

- ♦ [Section 40.2.1, “Creating Tenants,” on page 321](#)
- ♦ [Section 40.2.2, “Associating Incoming Events with a Tenant,” on page 321](#)
- ♦ [Section 40.2.3, “Setting Up Retention Policies for Data Segregation,” on page 322](#)
- ♦ [Section 40.2.4, “Providing Data Access for Tenants,” on page 322](#)
- ♦ [Section 40.2.5, “Configuring Sentinel Functions,” on page 323](#)

40.2.1 Creating Tenants

You can create tenants in the **Tenants** interface and then associate the tenant name to events when configuring Sentinel for data collection.

To create tenants:

- 1 From **Sentinel Main**, click **Users > Tenants**.
- 2 In the **Create New Tenant** field, specify the tenant name and click **Create Tenant**.

By default, tenants are enabled and you can associate tenants to events when collecting data.

You can also create tenants when configuring the Collector for data collection. For more information, see [“Associating Incoming Events with a Tenant.”](#)

40.2.2 Associating Incoming Events with a Tenant

Multitenancy starts with properly identifying the data coming from each tenant. If each tenant hosts their own Sentinel infrastructure (outsourced SOC model), no action is required.

For all other MSSP models, every incoming event should include the tenant name in the **TenantName (rv39)** field. This is handled at the Collector level as a Collector property. The implication is that all the data that passes through a single Collector must belong to a single tenant. If there are multiple tenants sending data from the same type of event source, you should deploy individual instances of the appropriate Collector for each tenant to split the data and specify the **TenantName** in the Collector parameter. The Collector then adds the **TenantName** to the event field as specified by the parameter. The Collector also generates a unique ID for each tenant in the **tid** (TenantID) field.

You can assign a tenant name to events when configuring the Collector for data collection. Each tenant must have a dedicated Collector so that their data can be identified with their tenant name. You can have multiple event sources forward data to one Collector, however, all event sources for the Collector must be from one tenant.

Assigning the Tenant Name to Events

To assign a tenant name:

- 1 Access **Event Source Management**.
For more information, see [“Accessing Event Source Management” on page 100](#).
- 2 Locate the Collector Manager that is associated with the Collector.

- 3 Right-click the Collector Manager, then select **Add Collector**.
- 4 In the **Configure Collector Property** tab, specify the tenant name in the **Tenant Name** field.

For more information about data collection, see [Chapter 6, “Configuring Agentless Data Collection,” on page 91](#).

The tenant information that you add in the Collector sets up a namespace, which you can use to configure other functions of Sentinel. For example, the identity and host (asset) information that Sentinel receives is transferred to maps for the mapping Service. In the case of the Identity Manager Sentinel Driver, you can set the tenant name in the driver parameter. This means that the mapping service and identity services can function properly even if the same IP addresses or user account names are present in more than one tenant environment.

For information about mapping, see [Chapter 11, “Mapping Events,” on page 139](#). For information about Identity Manager Sentinel Driver, see the [Driver for Sentinel Implementation](#) guide.

40.2.3 Setting Up Retention Policies for Data Segregation

If tenants host their own Sentinel server or if you host separate Sentinel server instances for each tenant, data segregation is straightforward. If you have a centralized Sentinel server for multiple tenants, you can design data retention policies to split each tenant data into separate partitions.

You should define at least one retention policy to segregate event data from different tenants into different folders for each tenant. When creating retention policies for each tenant, specify the **Criteria** as `tid: "tenant_ID"` where `tenant_ID` is the ID of the tenant.

Each retention policy creates a separate partition so that you can manage it separately. Sentinel saves the event file in a folder in the format `YYYYMMDD_<Data Retention Policy ID>`. Therefore, with an unique retention policy for each tenant, you can achieve event data segregation on the folder level.

Setting up a data retention policy helps you in the following ways:

- ◆ Flexibility to define data retention parameters for each tenant according to their requirements.
- ◆ Ensures that each tenant data is physically separated in different folders.

NOTE: The recommendations above apply to parsed event data. Sentinel automatically segregates raw data if you configured individual Collector instances for each tenant.

For more information about data retention policies, see [Chapter 15, “Configuring Data Retention Policies,” on page 195](#).

40.2.4 Providing Data Access for Tenants

Tenants who host their own Sentinel server (SOC outsourcing model), will probably create their own users and roles to provide or limit data access. For all other MSSP models, the MSSP decides whether tenants should have access to the Sentinel system and if so, to what data.

If each tenant has a unique Sentinel instance, you can use standard role definitions and users for the tenant. For more information, see [Chapter 4, “Configuring Roles and Users,” on page 41](#).

If multiple tenants have access to the same Sentinel instance, it is important to configure the system to restrict access appropriately. Sentinel provides the ability to define tenants, tenant-specific roles, and tenant-specific users. When creating roles, you can select the relevant tenant name for the role. Users in that role can see data and real-time views specific to only the tenant they belong to. You can assign the `default` tenant for MSSP employees who need to view multiple tenants' data, which gives them access to data and real-time views of all the tenants.

Tenant roles, and the users assigned to them, have a tenant-specific filter built in by default. You can add additional security filters (for example, a filter for operating system events only) as needed. The intersection of the tenant and security filters applies to searches, reports, real-time views, and dashboards.

You can also delegate the responsibility of administering a tenant's roles and users to the tenant by assigning the **Manage roles and users permission** to the tenant. For more information, see [Chapter 4, "Configuring Roles and Users,"](#) on page 41.

You can now restrict the access of the visual analytics features like **Discover**, **Dashboard**, **DevTools**, and **Management** by giving the appropriate visualization permissions. For more information about the visualization permissions, see ["Creating a Role"](#) on page 43.

40.2.5 Configuring Sentinel Functions

This section provides information about configuring various Sentinel functions for multi-tenancy.

- ◆ ["Setting Up Filters for Each Tenant"](#) on page 323
- ◆ ["Setting Up Dynamic Lists"](#) on page 323
- ◆ ["Setting Up Correlation Rules"](#) on page 324
- ◆ ["Creating Real-time Views"](#) on page 325

Setting Up Filters for Each Tenant

You can create a filter for each tenant to use in constructing more complex criteria, which you can use in searches and other places the criteria is called for. When you create a filter, specify the **Criteria** as `tid: "tenant_ID"` (where `tenant_ID` is the ID of the tenant). For more information about creating filters, see ["Configuring Filters"](#) in the *Sentinel User Guide*.

Setting Up Dynamic Lists

You can set up the following types of dynamic lists:

- ◆ Dynamic lists that are global to all tenants. For example, you might want to create a black list of well-known bad IP address ranges.
- ◆ Dynamic lists that are specific to particular tenants. For example, a list of important assets or privileged accounts. In this case, you should create the following:
 - ◆ A separate dynamic list for each tenant
 - ◆ A separate correlation rule for each tenant to refer to the specific dynamic list
 - ◆ A separate action to write to a specific dynamic list

For information about creating dynamic lists, see ["Configuring Dynamic Lists"](#) in the *Sentinel User Guide*.

Setting Up Correlation Rules

WARNING: In any MSSP model where multiple tenants send data to the same Sentinel instance, you must configure correlation rules correctly to ensure that the **TenantID** field is populated. This ensures that automatic tenant filtering applies to keep correlated events and alerts private. If **TenantID** is not populated, there is a risk of one tenant seeing another tenant's data.

Guidelines for a Single Tenant

The following guidelines apply if you want to create a correlation rule that should run only for a single tenant:

- ◆ For correlation rules that fire based on a single event, append `AND tid="Tenant_ID"` to the correlation rule criteria. The correlated event automatically populates the **TenantID** field in the correlated event output.
- ◆ For correlation rules that fire based on multiple events, gate rules, and sequence rules, append `AND tid="Tenant_ID"` to the rule criteria. Set the **TenantID** field to the ID of the tenant in the correlated event output.
- ◆ You can use tenant-specific (for example, "Tenant A Critical Servers") or cross-tenant (MSSP) dynamic lists.
- ◆ You can use a tenant-specific action (for example, "Send email to Tenant A") or an MSSP action (for example, "Send email to MSSP analyst").

Guidelines for Multiple Tenants

The following guidelines apply if you want to create a correlation rule that runs for all tenants and creates output that is viewable by each individual tenant.

- ◆ For rules that fire based on a single event, you do not need to filter by tenant. The correlated event automatically populates the **TenantID** field based on the trigger event.
- ◆ For rules that fire based on multiple events, gate rules, and sequence rules, you do not need to filter by tenant. You should group by the **TenantID** field. The correlated event automatically populates the **TenantID** field.
- ◆ You can add a filter that includes multiple tenants if the rule should only be run for a subset of tenants.
- ◆ Use only cross-tenant (MSSP) dynamic lists. For example, Known Bad Source IPs.
- ◆ Use only cross-tenant (MSSP) actions. For example, Send email to MSSP analyst.

Guidelines for Multiple Tenants and Are Visible Only to the MSSP

The following guidelines apply if you want to create a correlation rule that runs across all tenants and creates output that is viewable only by the MSSP (Sentinel Administrator).

- ◆ For rules that fire based on a single or multiple events, gate rules, and sequence rules, you do not need to filter by tenant. You do not need to group by the **TenantName** field since you want the rule to run across tenants. Set the **TenantName** field to `default` in the correlated event output to ensure only the MSSP users will see the events and alerts.
- ◆ You can add a filter that includes multiple tenants if the rule should be run only across a subset of tenants.

- ♦ Use only cross-tenant (MSSP) dynamic lists. For example, Known Bad Source IPs.
- ♦ Use only cross-tenant (MSSP) actions. For example, Send email to MSSP analyst.

For more information about creating correlation rules, see “[Correlating Event Data](#)” in the *Sentinel User Guide*.

Creating Real-time Views

When creating real-time views such as event views and alert views, you can specify the tenant name for which you want to view data. This is applicable only for MSSP employees assigned to the `default` tenant since they need to view multiple tenants' data. Roles assigned to specific tenants automatically have the tenant's filter applied and can view only the data specific to their tenant.

For more information, see the specific chapters in the *Sentinel User Guide*.

40.3 Role-Based Access Control and Multitenancy for Visualization

Sentinel leverages Kibana, a browser-based analytics and search dashboard, which helps you to visualize events and alerts in dashboard. From the 8.4.0.0 version of the Sentinel, Role-Based Access Control (RBAC) and multitenancy are supported for the visualization features in the Sentinel. With the RBAC, you can provide the right access to the right users based on their permission level for accessing the visualization features. For more information about the visualization permissions, see “[Creating a Role](#)” on page 43. The multitenancy in the visualization provides greater flexibility for tenants by letting them control their dashboards or visualizations.

40.3.1 Use Case

Consider the user is a banking application. They have 10 branches in different states. The manager of the branch must monitor only the activity specific to his or her branch and, he or she should not access the other branch's user information. There are different levels of employees in the bank like the manager, assistant manager, cashier, and other employees. Each of them must see what they are allowed to see. For example, a regular employee should not be allowed to see the **Management** option and, he or she should be given permission only to see the user dashboard and should not be allowed to **Edit** it.

Solution

- ♦ Consider each branch of the bank as a tenant.
- ♦ Use multitenancy in the visualization, not to allow an employee of a specific branch of the bank to access the user-related data or the dashboard of another branch. A branch admin/manager can create his or her own custom domain which can only be accessed by that branch employee and not by others.
- ♦ RBAC in the visualization can help the admin of the branch to assign proper permissions for the employees, based on their employment level. So that they get access only to the features they are supposed to see. A regular employee can be given **View-only** permission for the visualization features so that he or she can only see the dashboard but cannot **Edit** or **Delete** it.

40.4 Decommissioning Tenants

If a tenant's contract ends, you can restrict tenant access to the Sentinel server by disabling the tenant. When you disable a tenant:

- ♦ All users associated with that tenant can no longer access the Sentinel server or use any of the REST APIs.
- ♦ Data collection continues until the tenant stops sending data or until you have disabled the relevant data collection nodes.
- ♦ MSSP users associated with the `default` tenant will no longer see the disabled tenant in Sentinel functions where they could choose a tenant. For example, when creating real-time views or setting the tenancy for a role.
- ♦ You can still see the disabled tenant in the **Tenants** interface and when you select **Show disabled**.

You cannot delete tenants because MSSP employees may want to run reports for a disabled tenant or verify whether they are still receiving events from a disabled tenant.

To disable a tenant:

- 1 From **Sentinel Main**, click **Users > Tenants**.
- 2 In the list of tenants, click **Disable** for the tenant that you want to disable.

IX Appendix

This appendix provides information about managing some of the Sentinel activities by using the command line and troubleshooting instructions.

- ◆ [Appendix A, “Command Line Utilities,” on page 329](#)
- ◆ [Appendix B, “Troubleshooting,” on page 339](#)

A Command Line Utilities

The command line utilities included with Sentinel are useful for managing and configuring many lower level functions of the system.

- ♦ [“Managing the Sentinel Services” on page 329](#)
- ♦ [“Sentinel Scripts” on page 330](#)
- ♦ [“Running the Report Development Utility” on page 331](#)
- ♦ [“Getting the .jar Version Information” on page 332](#)
- ♦ [“Changing the Hostname of a Sentinel Server” on page 332](#)
- ♦ [“Importing or Exporting Event Association Data” on page 333](#)
- ♦ [“Managing the Internal Database” on page 334](#)
- ♦ [“Cleaning Up the Internal Database” on page 335](#)
- ♦ [“Managing the Sentinel Server” on page 337](#)

Managing the Sentinel Services

There is a command line utility included with Sentinel is useful for managing and configuring many lower level functions of the system. The utility is located in `/usr/sbin/rcsentinel`.

The utility has the following options to manage the Sentinel services:

rcsentinel start: Starts the Sentinel service.

rcsentinel stop: Stops the Sentinel service.

rcsentinel status: Displays the status of the Sentinel service.

rcsentinel restart: Restarts the Sentinel service.

rcsentinel try-restart: Restarts the Sentinel service if the Sentinel service is running.

rcsentinel force-reload: Forces the Sentinel service to reload the Sentinel configuration.

rcsentinel startdb: Starts the PostgreSQL database.

rcsentinel stopdb: Stops the PostgreSQL database.

rcsentinel force_stopdb: Forces the PostgreSQL database to stop.

rcsentinel startSldb: Starts the Security Intelligence database.

rcsentinel stopSldb: Stops the Security Intelligence database.

rcsentinel version: Displays the version of the Sentinel service.

rcsentinel -p, --priority=<integer>: Specifies the process priority.

rcsentinel -h, --help: Displays all options for the rcsentinel utility.

rcsentinel -l, --log-file=FILE: Sends log messages to a file.

rcsentinel -q, --quiet: Displays fewer messages.

rcsentinel -v, --verbose: Displays more messages.

Sentinel Scripts

Sentinel provides operational scripts that are appropriate for use during normal operations. These scripts are located in the following directories:

- ♦ /opt/novell/sentinel/bin
- ♦ /opt/novell/sentinel/setup

For most scripts that require arguments, running the scripts without arguments provides details about how to use the arguments.

- ♦ [Table A-1, “Operational Scripts in /opt/novell/sentinel/bin,” on page 330](#)
- ♦ [Table A-2, “Operational Scripts in /opt/novell/sentinel/setup,” on page 331](#)

Table A-1 Operational Scripts in /opt/novell/sentinel/bin

Script File	Description
backup_util.sh	Use this script to back up and restore Sentinel event data and configuration data. For more information, see Chapter 35, “Backing Up and Restoring Data,” on page 297 .
data_uploader.sh	Use this script to upload event and raw data from traditional storage to scalable storage. You can also use this tool to upload Sentinel data in various formats such as JSON and CEF. For more information, see “Migrating Data to Scalable Storage” in the <i>Sentinel Installation and Configuration Guide</i> .
db.sh	Allows you to manage the PostgreSQL database without Sentinel running. For more information, see “Managing the Internal Database” on page 334 .
clean_db.sh	Allows you to clean up data from the PostgreSQL database without Sentinel running. For more information, see “Cleaning Up the Internal Database” on page 335 .
softwarekey.sh	Use this script to add and view a license key through the command line.
event_assoc_data.sh	Use this script to import or export the event association data. For more information, see “Importing or Exporting Event Association Data” on page 333
server.sh	Use this script to manually manage the Sentinel server with this script. For more information, see “Managing the Sentinel Server” on page 337 .
report_dev_setup.sh	Use this utility to set up the report development environment. For more information, see “Running the Report Development Utility” on page 331 .

Script File	Description
updateServerLocale.sh	This utility provides an option to change the language of Sentinel server process. The Sentinel server messages that are displayed on the user interface appear in the language selected by this script. If the appliance language is changed through WebYaST, you can use this script to change the language of the Sentinel process in the server.
versionreader.sh	Displays the version of the .jar files for Sentinel. For more information, see “Getting the .jar Version Information” on page 332.

Table A-2 Operational Scripts in `/opt/novell/sentinel/setup`

Script File	Description
configure.sh	This utility runs on a remote Correlation Engine or Collector Manager if you change the hostname of the Sentinel server. For more information, see “Changing the Hostname of a Sentinel Server” on page 332.
ldap_auth_config.sh	This utility helps you configure Sentinel to receive LDAP authentications. For more information, see “LDAP Authentication Against a Single LDAP Server Or Domain” on page 53.

Running the Report Development Utility

You can use the `/opt/novell/sentinel/bin/report_dev_setup.sh` utility to set up the report development environment. This utility does the following:

- Opens the PostgreSQL database port so that other systems can connect to the database.
- Updates the firewall to allow connection on the PostgreSQL database port.
- Modifies the database configuration files (`postgresql.conf` and `pg_hba`) so that other applications can connect to the database. The database configuration files are located at `/var/opt/novell/sentinel/3rdparty/postgresql/data`.
- Changes the `rptuser` password, if necessary, and saves it in an encoded format in the `obj-component.JasperReportingComponent.properties` file. This password can also be changed in the database.
- Collects the required Sentinel jar files, xml files, and the keystore file for report development and creates a tar file `sentineljarsforireport.tar` file in the `/opt/novell/sentinel/bin` directory.

To run this utility:

- 1 Log in as novell user.
- 2 Change to the following directory:

```
cd /opt/novell/sentinel/bin/
```
- 3 Run the following command:

```
./report_dev_setup.sh
```

A warning message is displayed, indicating that the Sentinel server will be restarted after the script is executed.

- 4 To continue running the script, press 1.
- 5 Specify the `root` password when prompted.

The script opens the database port, updates the firewall configuration files, and modifies the configuration files and database files.

- 6 When you are prompted to change the `rptuser` password, continue without changing the password.

or

Specify a password for `rptuser` and reconfirm the password.

The `rptuser` password is randomly generated during the installation of Sentinel. It is a recommended practice to change it here.

The Sentinel server restarts.

For information or help on commands, use the following command:

```
./report_dev_setup.sh -h
```

Getting the .jar Version Information

You can gather version information for Sentinel `.jar` files for troubleshooting purposes:

- 1 Log in to the Sentinel server as an administrator.
- 2 Go to the `/opt/novell/sentinel/bin` directory.
- 3 At the command line, specify the `./versionreader.sh <path/jar file name>`.

Running the script without any arguments gives the version of the installed Sentinel server. For more information on the arguments that can be used, use the `--help` command.

Changing the Hostname of a Sentinel Server

If the hostname of the Sentinel server changes, you must update any remote Correlation Engines or Collector Managers to point to the updated hostname. To do this, you run the `configure.sh` script on each remote machine.

The `configure.sh` script is located in `/opt/novell/sentinel/setup`. Run this script on each remote machine to update the hostname and IP address of the Sentinel server in the remote machine's configuration files.

The `configure.sh` file also allows you to change the password of the `appuser`. The `appuser` is an internal Sentinel identity that is used to establish a connection and interact with the PostgreSQL database.

Importing or Exporting Event Association Data

Sentinel provides the `event_assoc_data.sh` script that allows you to export event association data from the database to the file system, as well as import previously exported event association data from the file system back into the database. The script is `event_assoc_data.sh` located in the `/opt/novell/sentinel/bin` directory.

There are two types of event association data:

Incident events: There is a record in the database for every event that is associated with an incident, including what partition the event came from. When a partition is deleted, all incident events records for the partition are exported to a file on the file system, and the records are then deleted from the database. The file name is `incidents_events.json`.

Correlated events: There is a record in the database for every trigger event that is associated with a correlated event. The record also indicates what partition the correlated event belongs to. When a partition is deleted, all correlated event records for the partition are exported to a file on the file system, and the records are then deleted from the database. The file name is `correlated_events.json`.

When you export event association data, it is saved to the files in the following default directory structure `/var/opt/novell/sentinel/data/eventdata/exported_associations/<partition name>/*.json`

When a partition is restored from backup, the system automatically attempts to import the event association records for the partition. The `.json` file must be restored to the correct directory structure when the event association records are restored. If these files are not restored, the event association records are not imported, but the partitions are restored without this information. The event association records for the partitions are not available.

You can use the following options with for the `event_assoc_data.sh` file:

-i, --import: Imports event association data. This option works only on partitions that are currently in the restored state, but have not yet imported the event association data.

-x, --export: Exports event association data. This option works only on partitions that are currently in the deleted state, but have not exported their event association data.

-d, --days=<integer>: Specify the last number of days of the partitions.

-s, --startdate=<date>: Specify a start date and end date to select partitions in the specified date range.

-e, --enddate=<date>: Specify an end date and start date to select partitions in the specified date range.

--date=<date>: The utility selects the partitions with the specified date. You can use this option multiple times to select multiple dates.

-u, --user=<user name>: Specify the name of the user with administrative privileges to the Sentinel server.

-p, --password=<user password>: Specify the password of the administrative user.

--host=<host name>: Specify the host name or IP address of the Sentinel server.

- port=<port>**: Specify the port number for communication to the Sentinel server. If this option isn't specified, the default port of 8443 (HTTPS) or 8000 (HTTP) is used.
- https**: If this option is used, the utility communicates over HTTPS.
- http**: If this option is used, the utility communicates over HTTP.
- h, --help**: Displays the help options.
- l, --log file=FILE**: Logs messages from the utility to the file name specified in the parameter.
- no-banner**: Suppresses banner messages.
- q, --quiet**: Displays fewer messages.
- v, --verbose**: Displays more messages.

Managing the Internal Database

Sentinel provides a `db.sh` script that allows you to manage the internal database. You can use this script if you need to start the database without starting Sentinel so you can perform maintenance tasks. You can also use this script to run SQL commands against the internal database.

The script `db.sh` is located in the `/opt/novell/sentinel/bin` directory. The script has commands and options. You must be logged in as the user that installed Sentinel for the script to work. The command must come first, followed by the option.

For example: `./db.sh status --log-file=sentinel_status.txt`

This command writes the status of the internal database to the log file named `sentinel_status.txt`.

- ♦ [“Commands” on page 334](#)
- ♦ [“Options” on page 335](#)

Commands

You can use the following commands with the `db.sh` script.

start: Starts the internal database without starting the Sentinel server.

stop: Stops the internal database.

force_stop: Forces the database to stop when the Sentinel service is still running.

status: Displays the status of the internal database.

sql <db name> <user name> <sql statement>: Allows you to send SQL commands to the internal database.

restart: Restarts the internal database.

force_restart: Forces the database to restart when the Sentinel service is still running.

try-restart: Tries to restart the internal database.

reload: Reloads the internal database.

force-reload: Forces a reload of the database.

Options

You can use the following options with the `db.sh` script. The options must start with a `-` or `--` to be executed.

-w, --wait=<seconds>: Allows you to specify the amount of time to wait for the database to start or stop.

-h, --help: Displays help information for the script.

-l, --log-file=FILE: Logs messages to the specified file name.

--no banner: Suppresses banner messages.

-q, --quiet: Displays fewer messages.

-v, verbose: Displays more messages.

Cleaning Up the Internal Database

Sentinel provides a `clean_db.sh` script that allows you to clean up redundant data from the Sentinel database. You can delete data such as incidents, identities, assets, Advisor data, and vulnerabilities individually. You can run this script even without Sentinel running. For example, an improperly configured correlation rule might create hundreds of unwanted incidents in the database. Or, the identity information might encounter an error when someone attempts to delete the `IdentityAccountMap.csv` file. In such a situation, you can use this script to remove the unusable identity information.

The script `clean_db.sh` is located in the `/opt/novell/sentinel/bin` directory.

WARNING: Because this script is designed to delete information from your database, it should be used carefully and only after understanding the implications.

- ♦ [“Prerequisites” on page 335](#)
- ♦ [“Using the clean_db.sh Script” on page 335](#)

Prerequisites

- ♦ Ensure that you have permission to run the script. Only the user who installed Sentinel has permission to run this script.
- ♦ Ensure that the database is started and is running.

Using the clean_db.sh Script

- 1 In the Terminal mode, log in to Sentinel by using the credentials that were used to install Sentinel.

This script cannot be run by the `root` user.

- 2 Go to `<install_directory>/bin`, then specify `clean_db.sh` to run the script.

The following menu is displayed:

```
Which objects would you like to cleanup?
(1) Incidents
(2) Identities
(3) Assets
(4) Advisor
(5) Vulnerabilities
(6) Incidents and Identities
(7) All
(q) Quit without action
```

- 3 At the prompt, indicate which objects you want to remove from the database.

- 4 Specify the following information to connect to the PostgreSQL database:

```
Database server hostname (Press ENTER for default localhost)=>
Database name (Press ENTER for default SIEM) =>
Database username (press ENTER for default dbauser) =>
```

The database connection is verified before proceeding to the next step. If the connection was not successful, the script exits.

- 5 (Conditional) If you select 1 to delete Incidents data, several options are displayed. Select one of the options and specify the required information:

- ◆ **Delete Incidents By Query:** Specify a custom SELECT query. For example:

```
select inc_id from incidents where inc_id=500
```

Ensure that SELECT statement does not include quotation marks.

- ◆ **Delete Incidents By Id:** Specify the ID of the Incident that you want to delete. For example:

```
101
```

- ◆ **Quit without action:** Specify `q` to exit from the script.

- 6 You are prompted to confirm data cleanup. Specify `start` to start the data cleanup or specify `abort` to quit without performing the data cleanup.

The results of the data cleanup are written to the log file. You should review the log file for any errors and retry.

If Identities data is being cleaned up, the script cleans up the Identities information from the database tables, and deletes the Identity Account Map file (`identityAccountMap.csv`).

NOTE: If you have a distributed Sentinel install, you might need to manually connect to the main Sentinel server to delete the `identityAccountMap.csv` file.

Managing the Sentinel Server

You can use the `server.sh` script to manually manage the Sentinel server. This script is located in the default directory of `/opt/novell/sentinel/bin`. The script has commands and options. The command must come first, followed by the option.

- ♦ [“Commands” on page 337](#)
- ♦ [“Options” on page 337](#)

Commands

You can use the following commands with the `server.sh` script:

- start:** Starts the Sentinel server.
- stop:** Stops the Sentinel server.
- status:** Displays the status of the Sentinel server.
- restart:** Restarts the Sentinel server.
- try-restart:** Tries to restart the Sentinel server.
- force-reload:** Forces a reload of the Sentinel server.
- startdb:** Starts the internal Sentinel database.
- stopdb:** Stops the internal Sentinel database.
- force_stopdb:** Forces the internal database to stop.
- version:** Displays the version of the Sentinel server.

Options

You can use the following options with the `server.sh` script:

- p, --priority=<integer>:** Specifies the process priority for the Sentinel server.
- h, --help:** Displays the help options.
- l, --log-file=FILE:** Logs messages to a file you specify.
- no-banner:** Suppresses banner messages.
- q, --quiet:** Displays fewer messages.
- v, --verbose:** Displays more messages.

B Troubleshooting

This section helps you troubleshoot issues that might occur when using Sentinel.

Collector Manager Logs Display the Copying back to Persist Queue Error

Issue: When the Elasticsearch nodes are down or when the disk space in all the Elasticsearch nodes are almost full, Collector Manager displays the following error in the logs:

```
|SEVERE|I/O dispatcher  
21|esecurity.ccs.comp.event.visualization.EventVisualizationProcessor$3.on  
Failure  
Failed to forward <number> events in this batch, copying back to persist  
queue
```

As a result, Collector Manager starts buffering events and eventually may result in memory dump issue on the Collector Manager.

Fix: Perform any of the following:

- ◆ Ensure that all the nodes are up and running.
- ◆ Increase the disk space in Elasticsearch nodes.
- ◆ Add additional nodes in the Elasticsearch cluster.

Event Visualization Dashboards Take a Longer Time to Load Data

Issue: Event visualization dashboards do not display data and the following message is displayed in the Elasticsearch cluster log:

```
java.lang.OutOfMemoryError: Java heap space
```

Fix: Perform any of the following:

- ◆ Increase Elasticsearch heap size in the `/etc/elasticsearch/jvm.options` file.
- ◆ Increase the number of shards by modifying the `es.num.shards` property. For more information, see [“Performance Tuning for Elasticsearch”](#) in the *Sentinel Installation and Configuration Guide*.

Unable to View Alerts in the Dashboard and Alert Views

Issue: The alert dashboard and the charts in the alert view do not refresh or display new alerts. However, the table in the alert view displays the newly generated alerts. This issue could happen because of a corrupt alert index.

Fix: Re-index all the alerts as follows:

- 1 Login as root user.
- 2 Go to the `<Sentinel_installation_path>/var/opt/novell/sentinel/bin` directory.
- 3 To switch to novell user, run the following script:

```
su novell
```

- 4 To start the alert synchronization process, run the following script:

```
./reSyncAlert.sh
```

The alert index is rebuilt. The alert dashboard and the charts in the alert view display all the alerts.

Unable to Connect to Sentinel Agent Manager Database

Issue: SQL connection from Sentinel to Agent Manager database fails, and Sentinel displays the following error message:

```
Login failed. The login is from an untrusted domain and cannot be used with Windows authentication.
```

Fix: Update the SQL connection security settings in the Agent Manager. For more information, see “Updating Security Settings for SQL Connection” in the *Sentinel Agent Manager User Guide*.

Customizing Logging Settings in Sentinel

By default, Sentinel generates and maintains INFO level logs for all Sentinel components. The log files are located in the `/var/opt/novell/sentinel/log` folder.

You can customize the logging settings as necessary in the respective files:

- ♦ **Sentinel server:** `/etc/opt/novell/sentinel/config/server_log.prop`
- ♦ **Collector Manager:** `/etc/opt/novell/sentinel/config/collector_mgr_log.prop`
- ♦ **Correlation Engine:** `/etc/opt/novell/sentinel/config/correlation_engine_log.prop`

For information about configuring logging settings, see the documentation embedded in the respective files.

To customize logging settings in third-party components such as ActiveMQ, Jetty, and PostgreSQL, see the documentation for the respective components.

NOTE: Changing the log levels to ALL or FINEST results in verbose logs and may slow down the system performance.

Customizing Logging Settings in Elasticsearch

If there are authentication failures or other Elasticsearch related errors when searching and visualizing events or when indexing events in the Spark job, you can increase the logging level to DEBUG in Elasticsearch. For more information, see [Elasticsearch documentation](#).

Sentinel Control Center Does Not Launch When Identity Manager Designer is Installed on the Client Computer

Issue: Sentinel Control Center does not launch when Identity Manager Designer is installed on the client computer and Designer uses the system JRE. Designer needs to add some supporting jar files like `xml-apis.jar` to the `lib/endorsed` directory. Some of the classes in the `xml-apis.jar` file override the corresponding classes in the system JRE that is used by the Sentinel Control Center.

Fix: Configure Designer to use its own JRE.

Error While Installing Correlation Rules

Issue: Solution Manager does not install correlation rules when a correlation rule with an identical name already exists on the system. A `NullPointerException` error is logged in the console.

Workaround: Ensure that all correlation rules have a unique name.

Sentinel High Availability Installation in FIPS 140-2 Mode Displays an Error

Issue: If FIPS 140-2 mode is enabled, the Sentinel High Availability installation displays the following error:

```
Sentinel server configuration.properties file is not correct. Check the configuration file and then run the convert_to_fips.sh script again to enable FIPS mode in Sentinel server.
```

However, the installation completes successfully.

Workaround: The error is expected and you can safely ignore it. Although the installer displays the error, the Sentinel High Availability configuration works successfully in FIPS 140-2 mode.

Sentinel Services Might Not Start Automatically After the Installation

Issue: On systems with more than 2 TB disk space, Sentinel might not start automatically after the installation.

Workaround: As a one-time activity, start the Sentinel services manually by specifying the following command:

```
rcsentinel start
```

Sentinel Does Not Configure the Sentinel Appliance Network Interface By Default

Issue: When installing Sentinel Appliance, the network interface is not configured by default.

Workaround: To configure the network interface:

- 1 In the Network Configuration page, click **Network Interfaces**.
- 2 Select the network interface and click **Edit**.
- 3 Select **Dynamic Address** and then select either **DHCP** or **Static assigned IP Address**.
- 4 Click **Next** and then **OK**.

New Incoming Alerts Incorrectly Appear to be Selected When You Modify Existing Alerts

Issue: When you click **Select All** in alerts views to select alerts, deselect few alerts, and modify them, new incoming alerts are also selected in the refreshed alert views. This results in wrong count of alerts selected for modification, and also it appears as if you are modifying new incoming alerts too. However, only the originally selected alerts are modified.

Workaround: No new alerts will appear in the alert view if you create the alert view with a custom time range.

Error When Configuring the NFS Storage After Upgrading Sentinel Appliance to Version 7.3 SP1 and Later

Issue: Sentinel displays an error when you try to configure NFS as secondary storage location after you Sentinel appliance to version 7.3 SP1 and later.

Workaround: After upgrading the Sentinel appliance, restart the SLES operating system using the following command:

```
init 6
```

Cannot Receive Events from Secure Configuration Manager After Upgrading Sentinel to Version 7.3 SP1 and Later

Issue: Sentinel uses the Diffie-Hellman protocol to communicate with Secure Configuration Manager. As part of fixing the Logjam vulnerability, the certificate key size for the Diffie-Hellman protocol in Sentinel has been increased to 2048. However, Secure Configuration Manager uses the default certificate key size; that is, 1024. Because of this mismatch, Secure Configuration Manager can no longer communicate with Sentinel.

Workaround: Upgrade Secure Configuration Manager to version 6.1. For more information, see the [Secure Configuration Manager 6.1 Release Notes](#).

Cannot Receive Events from Sentinel UNIX Agent 7.4 After Upgrading Sentinel to Version 7.3 SP1 and Later

Issue: The security vulnerability fixes included in Sentinel 7.3 SP1 involved changes to the communication mechanism for a secured connection. These changes are not compatible with Sentinel UNIX Agent 7.4. Therefore, Sentinel cannot receive events from Sentinel UNIX Agent 7.4.

Fix: One of the following:

- ◆ Install [Security Agent for UNIX 7.4 Hotfix 7017336](#).
- ◆ Upgrade the Sentinel UNIX Agent to version 7.5, which is compatible with Sentinel 7.3 SP1 and later.

Cannot Create Reports by Using Sentinel SDK

Issue: You cannot create reports by using Sentinel SDK.

Workaround: To create reports by using Sentinel SDK, perform the steps mentioned in [Knowledgebase Article 7017293](#).

Data Synchronization Fails While Synchronizing IPv6 Addresses in Human Readable Format

Issue: Data synchronization fails when you try to synchronize IPv6 address fields in a human readable format to external databases. For information about configuring Sentinel to populate the IP address fields in human readable dot notation format, see [“Creating Data Synchronization Policies” on page 172](#). (Bug 913014)

Workaround: To fix this issue, manually change the maximum size of the IP address fields to at least 46 characters in the target database, and re-synchronize the database.

Mapping Conflict Warning in the Kibana Search

Issue: Kibana is reporting the following mapping conflict warning:

```
Mapping conflict! A field is defined as several types (string, integer, etc) across the indices that match this pattern. You may still be able to use these conflict fields in parts of Kibana, but they will be unavailable for functions that require Kibana to know their type. Correcting this issue will require reindexing your data.
```

To view the issue in Kibana, perform the following:

1. Launch the Kibana page.
2. Click the **Management** tab.
3. Under Kibana section, select **Index Patterns**.
4. Select `security.events.normalized_*`
5. Ensure that, there are 632 fields indexed and there is no mapping conflict warning.

Workaround: Perform the following, if the number of fields indexed are less than 632 or to fix the Kibana mapping conflict warning:

1. Delete the below index pattern from the Kibana **Management** tab:

```
security.events.normalized_*
```

2. Switch to the following bin directory:

```
cd <sentinel-installation-path>/opt/novell/sentinel/bin
```

3. Switch to the novell user:

```
su novell
```

4. Delete indices by following the below command from the Sentinel’s elasticsearch:

```
./elasticsearchRestClient.sh {sentinel_ip} {port used for elasticsearch} DELETE security.events.normalized_*
```

5. Run the following command to apply mapping template on events index in the Sentinel’s elasticsearch:

```
./elasticsearch_index_template.sh {sentinel-ip} {port used for elasticsearch} security.events.normalized_* 6 1
```

6. Run the following command to create the Index pattern in the Kibana:

```
./create_kibana_index_pattern.sh http://{localhost}:5601  
security.events.normalized_* {tenant-name}
```
